| <b>Description</b>              | <p>Preference value for a static, aggregate, or generated route. You also can specify a secondary preference value (<b>preference2</b>), as well as colors, which are even finer-grained preference values (<b>color</b> and <b>color2</b>).</p> <p>If the Junos OS routing table contains a dynamic route to a destination that has a better (lower) preference value than the static, aggregate, or generated route, the dynamic route is chosen as the active route and is installed in the forwarding table.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Release Information** Statement introduced before Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Statement introduced in Junos OS Release 11.3 for the QFX Series.  
 Statement introduced in Junos OS Release 12.3 for ACX Series routers.

**Description** Configure a static route with multiple possible next hops, each of which can have its own preference value, IGP metric that is used when the route is exported into an IGP, and Bidirectional Forwarding Detection (BFD) settings. If multiple links are operational, the one with the most preferred next hop is used. The most preferred next hop is the one with the lowest preference value.

**Options** *address*—IPv4, IPv6, or ISO network address of the next hop.  
*interface-name*—Name of the interface on which to configure an independent metric or preference for a static route. To configure an unnumbered interface as the next-hop

interface for a static route, specify **qualified-next-hop *interface-name***, where *interface-name* is the name of the IPv4 or IPv6 unnumbered interface.

**NOTE:** For an Ethernet interface to be configured as the qualified next hop for a static route, it must be an unnumbered interface.

To configure an Ethernet interface as an unnumbered interface, configure the `unnumbered-address <interface-name>` statement at the [edit interfaces <interface-name> unit <logical-unit-number> family <family-name>] hierarchy level as described in *Configuring an Unnumbered Interface*.

The remaining statements are explained separately.

| <b>Description</b>              | Configure whether static routes are eligible to be readvertised by routing protocols:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Default</b>                  | Static routes are eligible to be readvertised (that is, exported from the routing table into dynamic routing protocols) if a policy to do so is configured. To mark an IPv4 static route as being ineligible for readvertisement, include the <b>no-readvertise</b> statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>                  | <p><b>readvertise</b>—Readvertise static routes. Include the <b>readvertise</b> statement when configuring an individual route in the <b>route</b> portion of the <b>static</b> statement to override a <b>no-readvertise</b> option specified in the <b>defaults</b> portion of the statement.</p> <p><b>no-readvertise</b>—Mark a static route as being ineligible for readvertisement. Include the <b>no-readvertise</b> option when configuring the route.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Description</b>              | <p>Configure the router to perform custom route resolution on protocol next hops of routes in a certain routing table. The protocol next hop is used to determine the forwarding next-hop.</p> <p>For example, you might want to direct <b>inet.2</b> route resolution to use topology routing tables <b>:red.inet.0</b> and <b>:blue.inet.0</b> for protocol next-hop IP address lookups. Or you might want to direct <b>bgp.l3vpn.0</b> to use the information in <b>inet.0</b> to resolve routes, thus overriding the default behavior, which is to use <b>inet.3</b>.</p> <p>You can specify up to two routing tables in the <b>resolution-ribs</b> statement. The route resolution scheme first checks the first-listed routing table for the protocol next-hop address. If the address is found, it uses this entry. If it is not found, the resolution scheme checks second-listed routing table. Hence, only one routing table is used for each protocol nexthop address. For example, if you configure <b>resolution rib bgp.l3vpn.0 resolution-ribs [inet.0 inet.3]</b>, <b>inet.0</b> is checked first and then <b>inet.3</b> is checked.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 20px;"> <p> <b>NOTE:</b> Customizing route resolution might cause the routing protocol process (rpd) to consume more memory resources than it ordinarily would. When you customize route resolution, we recommend that you check the memory resources by running the <b>show system processes</b> and the <b>show task memory</b> commands. For more information, see <i>Routing Protocol Process Memory FAQs</i>.</p> </div> <p>The remaining statements are explained separately.</p> |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 11.3 for the QFX Series.                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>              | <p>Specify one or more routing tables to use for route resolution.</p> <p>This statement enables you to override the default routing tables that Junos OS uses for route resolution. For example, suppose that the resolution routing table is <b>inet.3</b>, but you want to allow fallback resolution through <b>inet.0</b>. One example use case is overriding the <b>bgp.rtarget.0 (family route-target)</b> routing table resolution from using only <b>inet.3</b> to using both <b>inet.3</b> and <b>inet.0</b>.</p> |
| <b>Options</b>                  | <b><i>routing-table-names</i></b> —Name of one or more routing tables.                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Required Privilege Level</b> | <b>routing</b> —To view this statement in the configuration.<br><b>routing-control</b> —To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Description</b>              | Configure statically configured routes to be deleted from or retained in the forwarding table when the routing protocol process shuts down normally:                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Default</b>                  | Statically configured routes are deleted from the forwarding table when the routing protocol process shuts down normally. Doing this greatly reduces the time required to restart a system that has a large number of routes in its routing table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                  | <p><b>no-retain</b>—Delete statically configured routes from the forwarding table when the routing protocol process shuts down normally. To explicitly specify that routes be deleted from the forwarding table, include the <b>no-retain</b> statement. Include this statement when configuring an individual route in the <b>route</b> portion of the <b>static</b> statement to override a <b>retain</b> option specified in the <b>defaults</b> portion of the statement.</p> <p><b>retain</b>—Have a static route remain in the forwarding table when the routing protocol process shuts down normally. Doing this greatly reduces the time required to restart a system that has a large number of routes in its routing table.</p>                                                                                                                                                                                                                                                                                      |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

[edit routing-options]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Create a routing table.

Explicitly creating a routing table with ***routing-table-name*** is optional if you are not adding any static, martian, aggregate, or generated routes to the routing table and if you also are creating a routing table group.

**NOTE:** The IPv4 multicast routing table (`inet.1`) and the IPv6 multicast routing table (`inet6.1`) are not supported for this statement.

**Default** If you do not specify a routing table name with the *routing-table-name* option, the software uses the default routing tables, which are `inet.0` for unicast routes and `inet.1` for the multicast cache.

**Options** *routing-table-name*—Name of the routing table, in the following format:  
*protocol [.identifier]*.

In a routing instance, the routing table name must include the routing instance name.

For example, if the routing instance name is `link0`, the routing table name might be `link0.inet6.0`.

- *protocol* is the protocol family. It can be `inet6` for the IPv6 family, `inet` for the IPv4 family, `iso` for the ISO protocol family, or *instance-name.iso.0* for an ISO routing instance.
- *identifier* is a positive integer that specifies the instance of the routing table.

**Default:** `inet.0`

The remaining statements are explained separately.

**Required Privilege Level** `routing`—To view this statement in the configuration.  
`routing-control`—To add this statement to the configuration.

| Release Information | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 11.3 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Description         | <p>Group one or more routing tables to form a routing table group. A routing protocol can import routes into all the routing tables in the group and can export routes from a single routing table.</p> <p>Each routing table group must contain one or more routing tables that Junos OS uses when importing routes (specified in the <b>import-rib</b> statement) and optionally can contain one routing table group that Junos OS uses when exporting routes to the routing protocols (specified in the <b>export-rib</b> statement).</p> <p>The first routing table you specify is the <i>primary routing table</i>, and any additional routing tables are the <i>secondary routing tables</i>.</p> <p>The primary routing table determines the address family of the routing table group. To configure an IP version 4 (IPv4) routing table group, specify <b>inet.0</b> as the primary routing table. To configure an IP version 6 (IPv6) routing table group, specify <b>inet6.0</b> as the primary routing table. If you configure an IPv6 routing table group, the primary and all secondary routing tables must be IPv6 routing tables (<b>inet6.x</b>).</p> <p>In Junos OS Release 9.5 and later, you can include both IPv4 and IPv6 routing tables in an IPv4 import routing table group using the <b>import-rib</b> statement. In releases prior to Junos OS Release 9.5, you can only include either IPv4 or IPv6 routing tables in the same <b>import-rib</b> statement. The ability to configure an import routing table group with both IPv4 and IPv6 routing tables enables you, for example, to populate the <b>inet6.3</b> routing table with IPv6 addresses that are compatible with IPv4. Specify <b>inet.0</b> as the primary routing table, and specify <b>inet6.3</b> as a secondary routing table.</p> |

**NOTE:** On EX Series switches, only dynamically learned routes can be imported from one routing table group to another.

---

**NOTE:** If you configure an import routing table group that includes both IPv4 and IPv6 routing tables, any corresponding export routing table group must include only IPv4 routing tables.

If you have configured a routing table, configure the OSPF primary instance at the **[edit protocols ospf]** hierarchy level with the statements needed for your network so that routes are installed in **inet.0** and in the forwarding table. Make sure to include the routing table group. For more information, see *Example: Configuring Multiple Routing Instances of OSPF*.

After specifying the routing table from which to import routes, you can apply one or more policies to control which routes are installed in the routing table group. To apply a policy to routes being imported into the routing table group, include the **import-policy** statement.

**Options** *group-name*—Name of the routing table group. The name must start with a letter and can include letters, numbers, and hyphens.

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 11.3 for the QFX Series.<br>Statement introduced in Junos OS Release 12.3 for ACX Series routers.                                                                                                                                                                                                 |
| <b>Description</b>         | <p>Specify the routing device's IP address.</p> <p>The router identifier is used by BGP and OSPF to identify the routing device from which a packet originated. The router identifier usually is the IP address of the local routing device. If you do not configure a router identifier, the IP address of the first interface to come online is used. This is usually the loopback interface. Otherwise, the first hardware interface with an IP address is used.</p> |

**NOTE:** We strongly recommend that you configure the router identifier under the `[edit routing-options]` hierarchy level to avoid unpredictable behavior if the interface address on a loopback interface changes.

For more information about the router identifier in OSPF, see *Example: Configuring an OSPF Router Identifier*.

You must configure a router-id in order for BGP and OSPF to function in a routing instance. Use the **show route instance detail** command to display the router-id value for a routing instance. If the router-id is **0.0.0.0**, then the routing instance has no router-id.

For more information about the router identifier in OSPF, see *Example: Configuring an OSPF Router Identifier*.

**NOTE:** If you run OSPF for IPv6 or BGP for IPv6 in a routing instance, you must configure an IPv4 router identifier (**router-id**) in the routing instance itself. In other words, the IPv4 **router-id** in the main routing instance is not inherited by other routing instances. Even if you run *only* IPv6 OSPF or BGP in a routing instance, the IPv4 **router-id** must be configured because OSPF and BGP, even when used exclusively with IPv6, use the IPv4 **router-id** for handshaking. If you do not configure the IPv4 **router-id** in the IPv6 OSPF or BGP routing instance, then the IPv6 protocols will use invalid IPv4 address 0.0.0.0 and the adjacencies and connections will fail.

## scope-policy

**Syntax** `scope-policy [ policy-names ];`

**Hierarchy Level** [edit logical-systems *logical-system-name* routing-options multicast],  
[edit routing-options multicast]

**NOTE:** You can configure a scope policy at these two hierarchy levels only. You cannot apply a scope policy to a specific routing instance, because all scoping policies are applied to all routing instances. However, you can apply the `scope` statement to a specific routing instance at the [edit routing-instances *routing-instance-name* routing-options multicast] or [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast] hierarchy level.

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.3 for the QFX Series.  
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

**Description** Apply policies for scoping. The policy must be correctly configured at the **edit policy-options policy-statement** hierarchy level.

**Options** *policy-names*—Name of one or more multicast scope policies.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Configure source-specific multicast (SSM) groups.</p> <p>By default, the SSM group multicast address is limited to the IP address range from 232.0.0.0 through 232.255.255.255. However, you can extend SSM operations into another Class D range by including the <b>ssm-groups</b> statement in the configuration. The default SSM address range from 232.0.0.0 through 232.255.255.255 cannot be used in the <b>ssm-groups</b> statement. This statement is for adding other multicast addresses to the default SSM group addresses. This statement does not override the default SSM group address range.</p> <p>IGMPv3 supports SSM groups. By utilizing inclusion lists, only sources that are specified send to the SSM group.</p> |
| <b>Options</b>                  | <i>ip-addresses</i> —List of one or more additional SSM group addresses separated by a space.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Description</b>         | <p>Configure static routes to be installed in the routing table. You can specify any number of routes within a single <b>static</b> statement, and you can specify any number of <b>static</b> options in the configuration.</p>                                                                                                                                                                                                                                                    |

**Options defaults**—(Optional) Specify global static route options. These options only set default attributes inherited by all newly created static routes. These are treated as global defaults and apply to all the static routes you configure in the **static** statement.

**NOTE:** Specifying the global static route options does not create default routes. These options only set default attributes inherited by all newly created static routes.

**route**—Configure individual static routes. In this part of the **static** statement, you optionally can configure static route options. These options apply to the individual destination only and override any options you configured in the **defaults** part of the **static** statement.

- **destination-prefix/prefix-length—destination-prefix** is the network portion of the IP address, and **prefix-length** is the destination prefix length.

When you configure an individual static route in the **route** part of the **static** statement, specify the destination of the route (in **route destination-prefix**) in one of the following ways:

- **network/mask-length**, where **network** is the network portion of the IP address and **mask-length** is the destination prefix length.
- **default** if this is the default route to the destination. This is equivalent to specifying an IP address of **0.0.0.0/0**.

**NOTE:** IPv4 packets with a destination of 0.0.0.0 (the obsoleted limited broadcast address) and IPv6 packets with a destination of 0::0 are discarded by default. To forward traffic destined to these addresses, you can add a static route to 0.0.0.0/32 for IPv4 or 0::0/128 for IPv6.

- **nsap-prefix—nsap-prefix** is the network service access point (NSAP) address for ISO.
- **next-hop address**—Reach the next-hop routing device by specifying an IP address, an interface name, or an ISO network entity title (NET).

IPv4 or IPv6 address of the next hop to the destination, specified as:

- IPv4 or IPv6 address of the next hop
- Interface name (for point-to-point interfaces only)
- **address** or **interface-name** to specify an IP address of a multipoint interface or an interface name of a point-to-point interface.

**NOTE:** If an interface becomes unavailable, all configured static routes on that interface are withdrawn from the routing table.

**NOTE:** Load balancing is not supported on management and internal Ethernet (fxo) interfaces because this type of interface cannot handle the routing process. On fxp interfaces, you cannot configure multiple next hops and enable load balancing.

**next-hop options**—Additional information for how to manage forwarding of packets to the next hop.

- **discard**—Do not forward packets addressed to this destination. Instead, drop the packets, do not send ICMP (or ICMPv6) unreachable messages to the packets' originators, and install a reject route for this destination into the routing table.
- **iso-net**—Reach the next-hop routing device by specifying an ISO NSAP.

- **next-table *routing-table-name***—Name of the next routing table to the destination.

If you use the **next-table** action, the configuration must include a term qualifier that specifies a different table than the one specified in the **next-table** action. In other words, the term qualifier in the **from** statement must exclude the table in the **next-table** action. In the following example, the first term contains **rib vrf-customer2.inet.0** as a matching condition. The action specifies a next-hop in a different routing table, **vrf-customer1.inet.0**. The second term does the opposite by using **rib vrf-customer1.inet.0** in the match condition and **vrf-customer2.inet.0** in the **next-table** action.

```
term 1 {
  from {
    protocol bgp;
    rib vrf-customer2.inet.0;
    community customer;
  }
  then {
    next-hop next-table vrf-customer1.inet.0;
  }
}
term 2 {
  from {
    protocol bgp;
    rib vrf-customer1.inet.0;
    community customer;
  }
  then {
    next-hop next-table vrf-customer2.inet.0;
  }
}
```

**NOTE:** Within a routing instance, you cannot configure a static route with the **next-table inet.0** statement if any static route in the main routing instance is already configured with the **next-table** statement to point to the **inet.0** routing table of the routing instance. For example, if you configure on the main routing instance a static route 192.168.88.88/32 with the **next-table test.inet.0** statement and the routing instance **test** is also configured with a static route 192.168.88.88/32 with the **next-table inet.0** statement, the commit operation fails. Instead, you must configure a routing table group both on the main instance and on the routing instance, which enables you to install the static route into both routing tables.

- **receive**—Install a route for this next-hop destination into the routing table.

The **receive** option forces the packet to be sent to the Routing Engine.

The **receive** option can be useful in the following cases:

- For receiving MPLS packets destined to a VRF instance's loopback address
- For receiving packets on a link's subnet address, with zeros in the host portion of the address
- **reject**—Do not forward packets addressed to this destination. Instead, drop the packets, send ICMP (or ICMPv6) unreachable messages to the packets' originators, and install a reject route for this destination into the routing table.

**static-options**—(Optional under **route**) Additional information about static routes, which is included with the route when it is installed in the routing table.

You can specify one or more of the following in **static-options**. Each of the options is explained separately.

- (**active** | **passive**);
- **as-path** <as-path> <origin (egp | igp | incomplete)> <atomic-aggregate> <aggregator as-number in-address>;
- **community** [ *community-ids* ];
- (**install** | **no-install**);
- (**metric** | **metric2** | **metric3** | **metric4**) *value* <type type>;
- (**preference** | **preference2** | **color** | **color2**) *preference* <type type>;
- (**readvertise** | **no-readvertise**);
- (**resolve** | **no-resolve**);
- (**retain** | **no-retain**);
- **tag** *metric type number*;

The remaining statements are explained separately.

| Description              | <p>Configure the global suppression, reuse, and warning log message thresholds for multicast forwarding cache limits. You can configure the thresholds globally for the multicast forwarding cache or individually for the IPv4 and IPv6 multicast forwarding caches. Configuring the <b>threshold</b> statement globally for the multicast forwarding cache or including the <b>family</b> statement to configure the thresholds for the IPv4 and IPv6 multicast forwarding caches are mutually exclusive.</p> <p>To confirm the configured threshold values, use the <b>show multicast forwarding-cache statistics</b> command.</p>                                                                                                                                                                                                                                                                                                                  |
| Options                  | <p><b>reuse <i>value</i></b>—(Optional) Value at which to begin creating new multicast forwarding cache entries. If configured, this number should be less than the <b>suppress</b> value.</p> <p><b>Range:</b> 1 through 200,000</p> <p><b>suppress <i>value</i></b>—Value at which to begin suppressing new multicast forwarding cache entries. This value is mandatory. This number should be greater than the <b>reuse</b> value.</p> <p><b>Range:</b> 1 through 200,000</p> <p>The remaining statement is explained separately.</p>                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Description</b>         | <p>Define tracing operations that track all routing protocol functionality in the routing device.</p> <p>To specify more than one tracing operation, include multiple <b>flag</b> statements.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Default</b>             | If you do not include this statement, no global tracing operations are performed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>             | <p><b>Values:</b></p> <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. We recommend that you place global routing protocol tracing output in the file <b>routing-log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and</p>                                                                                                                                                                                                 |

so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

**Range:** 2 through 1000 files

**Default:** 10 files

**flag flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. These are the global routing protocol tracing options:

- **all**—All tracing operations
- **condition-manager**—Condition-manager events
- **config-internal**—Configuration internals
- **general**—All normal operations and routing table changes (a combination of the **normal** and **route** trace operations)
- **graceful-restart**—Graceful restart operations
- **normal**—All normal operations
- **nsr-packet**—Detailed trace information for BFD nonstop active routing only
- **nsr-synchronization**—Tracing operations for nonstop active routing
- **nsr-synchronization-detail**—(MPLS only) Tracing operations for nonstop active routing in detail
- **parse**—Configuration parsing
- **policy**—Routing policy operations and actions
- **regex-parse**—Regular-expression parsing
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 128 KB

**world-readable**—(Optional) Allow any user to read the log file.

**Required Privilege Level** routing and trace—To view this statement in the configuration.  
routing-control and trace-control—To add this statement to the configuration.

| <b>Description</b>              | Configure at least one, but not more than two, upstream interfaces on the rendezvous point (RP) routing device that resides between a customer edge-facing Protocol Independent Multicast (PIM) domain and a core-facing PIM domain. The RP routing device translates PIM join or prune messages into corresponding IGMP report or leave messages (if you include the <b>pim-to-igmp-proxy</b> statement), or into corresponding MLD report or leave messages (if you include the <b>pim-to-mld-proxy</b> statement). The routing device then proxies the IGMP or MLD report or leave messages to one or both upstream interfaces to forward IPv4 multicast traffic (for IGMP) or IPv6 multicast traffic (for MLD) across the PIM domains.                                                                                                                                                                                                                                              |
| <b>Options</b>                  | <b><i>interface-names</i></b> —Names of one or two upstream interfaces to which the RP routing device proxies IGMP or MLD report or leave messages for transmission of multicast traffic across PIM domains. You can specify a maximum of two upstream interfaces on the RP routing device. To configure a set of two upstream interfaces, specify the full interface names, including all physical and logical address components, within square brackets ( [ ] ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Required Privilege Level</b> | <b>routing</b> —To view this statement in the configuration.<br><b>routing-control</b> —To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Routine Monitoring

- [Monitoring Routing Information on page 3537](#)

### Monitoring Routing Information

#### Purpose

**NOTE:** This topic applies only to the J-Web Application package.

Use the monitoring functionality to view the **inet.0** routing table on the routing device.

#### Action

To view the routing tables in the J-Web interface, select **Monitor > Routing > Route Information**. Apply a filter or a combination of filters to view messages. You can use filters to display relevant events.

To view the routing table in the CLI, enter the following commands in the CLI interface:

- **show route terse**
- **show route detail**

#### Meaning

[Table 367 on page 3537](#) describes the different filters, their functions, and the associated actions.

[Table 368 on page 3538](#) summarizes key output fields in the routing information display.

**Table 367: Filtering Route Messages**

| Field               | Function                                                 | Your Action                    |
|---------------------|----------------------------------------------------------|--------------------------------|
| Destination Address | Specifies the destination address of the route.          | Enter the destination address. |
| Protocol            | Specifies the protocol from which the route was learned. | Enter the protocol name.       |

Table 367: Filtering Route Messages (*continued*)

| Field            | Function                                                                                                                             | Your Action                                                     |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------|
| Next hop address | Specifies the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it. | Enter the next hop address.                                     |
| Receive protocol | Specifies the dynamic routing protocol using which the routing information was received through a particular neighbor.               | Enter the routing protocol.                                     |
| Best route       | Specifies only the best route available.                                                                                             | Select the view details of the best route.                      |
| Inactive routes  | Specifies the inactive routes.                                                                                                       | Select the view details of inactive routes.                     |
| Exact route      | Specifies the exact route.                                                                                                           | Select the view details of the exact route.                     |
| Hidden routes    | Specifies the hidden routes.                                                                                                         | Select the view details of hidden routes.                       |
| Search           | Applies the specified filter and displays the matching messages.                                                                     | To apply the filter and display messages, click <b>Search</b> . |

Table 368: Summary of Key Routing Information Output Fields

| Field                  | Values                                                                                                                          | Additional Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Static Route Addresses | The list of static route addresses.                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Protocol               | Protocol from which the route was learned: <b>Static</b> , <b>Direct</b> , <b>Local</b> , or the name of a particular protocol. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Preference             | The preference is the individual preference value for the route.                                                                | The route preference is used as one of the route selection criteria.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Next-Hop               | Network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it.          | <p>If a next hop is listed as <b>Discard</b>, all traffic with that destination address is discarded rather than routed. This value generally means that the route is a static route for which the <b>discard</b> attribute has been set.</p> <p>If a next hop is listed as <b>Reject</b>, all traffic with that destination address is rejected. This value generally means that the address is unreachable. For example, if the address is a configured interface address and the interface is unavailable, traffic bound for that address is rejected.</p> <p>If a next hop is listed as <b>Local</b>, the destination is an address on the host (either the loopback address or Ethernet management port 0 address, for example).</p> |
| Age                    | How long the route has been active.                                                                                             |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

Table 368: Summary of Key Routing Information Output Fields (*continued*)

| Field   | Values                                                                                                                                                                                                                                                                     | Additional Information         |
|---------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------|
| State   | Flags for this route.                                                                                                                                                                                                                                                      | There are many possible flags. |
| AS Path | <p>AS path through which the route was learned. The letters of the AS path indicate the path origin:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>?</b>—Incomplete. Typically, the AS path was aggregated.</li> </ul> |                                |

| Description                 | <p>Display the distribution of autonomous system (AS) paths that the local routing device is using (usually through the routing table). Use this command to debug problems for AS paths and to understand how AS paths have been manipulated through a policy (through the <b>as-path-prepend</b> action) or through aggregation.</p> <p>AS paths are stored in a hash table. A hash table is one method for fast lookup. Each entry in the table is called a bucket. Junos OS computes a hash value that indicates in which bucket the AS path is stored. The AS paths are dispersed among the hash buckets so that a manageable number of AS paths is stored in each bucket. Only unique AS paths are stored. Duplicate AS paths increase a reference count, but do not increase the number of AS paths stored in the hash table.</p> |
| Options                     | <p><b>none</b>—Display basic information about AS paths that the local routing device is using (same as brief).</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Description</b>                 | <p>Display autonomous system (AS) path summary information.</p> <p>AS paths are stored in a hash table. A hash table is one method for fast lookup. Each entry in the table is called a bucket. Junos OS computes a hash value that indicates in which bucket the AS path is stored. The AS paths are dispersed among the hash buckets so that a manageable number of AS paths is stored in each bucket. Only unique AS paths are stored. Duplicate AS paths increase a reference count, but do not increase the number of AS paths stored in the hash table.</p> |
| <b>Options</b>                     | <p><b>none</b>—(Optional) Display AS path summary information for all routing instances.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p>                                                                                                                                                                                                                                                                                                          |

| <i>routing-table-name</i>  | Name of the routing table (for example, inet.0).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <i>number destinations</i> | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <i>number routes</i>       | <p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active).</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive). A holddown route was once the active route and is no longer the active route. The route is in the holddown state because a protocol still has interest in the route, meaning that the interest bit is set. A protocol might have its interest bit set on the previously active route because the protocol is still advertising the route. The route will be deleted after all protocols withdraw their advertisement of the route and remove their interest bit. A persistent holddown state often means that the interested protocol is not releasing its interest bit properly.</li> </ul> <p>However, if you have configured advertisement of multiple routes (with the <b>add-path</b> or <b>advertise-inactive</b> statement), the holddown bit is most likely set because BGP is advertising the route as an active route. In this case, you can ignore the holddown state because nothing is wrong.</p> <ul style="list-style-type: none"> <li>• <b>hidden</b> (routes that are not used because of a routing policy).</li> </ul> |
| <i>destination-prefix</i>  | <p>Route destination (for example:10.0.0.1/24). Sometimes the route information is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only. For example, 10.1.1.195:NoCtrlWord:1:1:Local/96): <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> </ul>                                                                                                                                                                      |

Table 373: show route Output Fields (*continued*)

| Field Name                                        | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|---------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| [ <i>protocol, preference</i> ]                   | <p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• +—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• - —A hyphen indicates the last active route.</li> <li>• *—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>                                                                                                                                                                                                                                   |
| <i>weeks:days</i><br><i>hours:minutes:seconds</i> | How long the route been known (for example, <b>2w4d 13:11:14</b> , or 2 weeks, 4 days, 13 hours, 11 minutes, and 14 seconds).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| metric                                            | Cost value of the indicated route. For routes within an AS, the cost is determined by the IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| localpref                                         | Local preference value included in the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| from                                              | Interface from which the route was received.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| AS path                                           | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• I—IGP.</li> <li>• E—EGP.</li> <li>• ?—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• [ ]—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured.</li> <li>• { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• ( )—Parentheses enclose a confederation.</li> <li>• ( [ ] )—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> |

Table 373: show route Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>validation-state</b> | <p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• <b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>Unverified</b>—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers.</li> <li>• <b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>to</b>               | <p>Next hop to the destination. An angle bracket (&gt;) indicates that the route is the selected route.</p> <p>If the destination is <b>Discard</b>, traffic is dropped.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>via</b>              | <p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> <li>• <b>lsp-path-name</b>—Name of the LSP used to reach the next hop.</li> <li>• <b>label-action</b>—MPLS label and operation occurring at the next hop. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label). For VPNs, expect to see multiple <b>push</b> operations, corresponding to the inner and outer labels required for VPN routes (in the case of a direct PE-to-PE connection, the VPN route would have the inner label push only).</li> </ul> |

## Sample Output

### show route

```

user@host> show route
inet.0: 11 destinations, 12 routes (11 active, 0 holddown, 0 hidden)
+ = Active Route, - = Last Active, * = Both

1:65500:1:10.0.0.20/240
    *[MVPN/70] 19:53:41, metric2 1
    Indirect
1:65500:1:10.0.0.40/240
    *[BGP/170] 19:53:29, localpref 100, from 10.0.0.30
    AS path: I
    > to 10.0.24.4 via lt-0/3/0.24, label-switched-path toD
    [BGP/170] 19:53:26, localpref 100, from 10.0.0.33
    AS path: I
    > to 10.0.24.4 via lt-0/3/0.24, label-switched-path toD
1:65500:1:10.0.0.60/240
    *[BGP/170] 19:53:29, localpref 100, from 10.0.0.30

```

```

AS path: I
> to 10.0.28.8 via lt-0/3/0.28, label-switched-path toF
[BGP/170] 19:53:25, localpref 100, from 10.0.0.33
AS path: I
> to 10.0.28.8 via lt-0/3/0.28, label-switched-path toF

```

## show route

The following sample output shows a VPN route with composite next hops enabled. The first **Push** operation corresponds to the outer label. The second **Push** operation corresponds to the inner label.

```
user@host> show route 70.0.0.0
```

```

13979:665001.inet.0: 871 destinations, 3556 routes (871 active, 0 holddown, 0
hidden)
+ = Active Route, - = Last Active, * = Both

```

```

70.0.0.0/24      @[BGP/170] 00:28:32, localpref 100, from 10.9.9.160
                  AS path: 13980 ?, validation-state: unverified
                  > to 10.100.0.42 via ae2.0, Push 16, Push 300368(top)
                  [BGP/170] 00:28:28, localpref 100, from 10.9.9.169
                  AS path: 13980 ?, validation-state: unverified
                  > to 10.100.0.42 via ae2.0, Push 126016, Push 300368(top)
                  #[Multipath/255] 00:28:28, metric2 102
                  > to 10.100.0.42 via ae2.0, Push 16, Push 300368(top)
                  to 10.100.0.42 via ae2.0, Push 16, Push 300368(top)

```

## show route destination-prefix

```
user@host> show route 172.16.0.0/12
```

```

inet.0: 10 destinations, 10 routes (9 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both

```

```

172.16.0.0/12    *[Static/5] 2w4d 12:54:27
                  > to 192.168.167.254 via fxp0.0

```

## show route extensive

```

| <b>Description</b>                 | Display the entries in the routing table that match the specified autonomous system (AS) path regular expression.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>                     | <b><i>regular-expression</i></b> —Regular expression that matches an entire AS path.<br><br><b><i>logical-system</i> (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Additional Information</b>      | <p>You can specify a regular expression as:</p> <ul style="list-style-type: none"><li>• An individual AS number</li><li>• A period wildcard used in place of an AS number</li><li>• An AS path regular expression that is enclosed in parentheses</li></ul> <p>You also can include the operators described in the table of AS path regular expression operators in the <i>Junos Policy Framework Configuration Guide</i>. The following list summarizes these operators:</p> <ul style="list-style-type: none"><li>• <b><i>{m,n}</i></b>—At least <i>m</i> and at most <i>n</i> repetitions of the AS path term.</li><li>• <b><i>{m}</i></b>—Exactly <i>m</i> repetitions of the AS path term.</li><li>• <b><i>{m,}</i></b>—<i>m</i> or more repetitions of the AS path term.</li><li>• <b><i>*</i></b>—Zero or more repetitions of an AS path term.</li><li>• <b><i>+</i></b>—One or more repetitions of an AS path term.</li><li>• <b><i>?</i></b>—Zero or one repetition of an AS path term.</li><li>• <b><i>aspath_term</i>   <i>aspath_term</i></b>—Match one of the two AS path terms.</li></ul> <p>When you specify more than one AS number or path term, or when you include an operator in the regular expression, enclose the entire regular expression in quotation marks. For example, to match any path that contains AS number 234, specify the following command:</p> <pre>show route aspath-regex ". * 234 ."</pre> |

|                          |                                                                                                                                                                                      |

| Description                 | Display the route entries in each routing table that are members of a Border Gateway Protocol (BGP) community.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Options                     | <p><i>as-number:community-value</i>—One or more community identifiers. <i>as-number</i> is the AS number, and <i>community-value</i> is the community identifier. When you specify more than one community identifier, enclose the identifiers in double quotation marks. Community identifiers can include wildcards.</p> <p><b>brief   detail   extensive   terse</b>—(Optional) Display the specified level of output.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> |
| Additional Information      | Specifying the community option displays all routes matching the community found within the routing table. The community option does not limit the output to only the routes being advertised to the neighbor after any egress routing policy.                                                                                                                                                                                                                                                                                                                                            |
| Required Privilege Level    | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

Table 374: show route damping Output Fields

| Field Name                                   | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Level of Output         |
|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <i>routing-table-name</i>                    | Name of the routing table—for example, <b>inet.0</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | All levels              |
| <b>destinations</b>                          | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | All levels              |
| <b>number routes</b>                         | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li>• <b>active</b></li> <li>• <b>holddown</b> (routes that are in a pending state before being declared inactive)</li> <li>• <b>hidden</b> (the routes are not used because of a routing policy)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | All levels              |
| <b>destination-prefix (entry, announced)</b> | Destination prefix. The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>detail extensive</b> |
| <b>[protocol, preference]</b>                | Protocol from which the route was learned and the preference value for the route. <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p> | All levels              |
| <b>Next-hop reference count</b>              | Number of references made to the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive</b> |
| <b>Source</b>                                | IP address of the route source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>detail extensive</b> |
| <b>Next hop</b>                              | Network layer address of the directly reachable neighboring system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b> |
| <b>via</b>                                   | Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word <b>Selected</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>detail extensive</b> |
| <b>Protocol next hop</b>                     | Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive</b> |
| <b>Indirect next hop</b>                     | Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b> |
| <b>State</b>                                 | Flags for this route. For a description of possible values for this field, see the output field table for the <a href="#">show route detail</a> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive</b> |

Table 374: show route damping Output Fields (*continued*)

| Field Name        | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Level of Output  |

| Task              | Name of the protocol that has added the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | detail extensive |
| Announcement bits | List of protocols that announce this route. <i>n-Resolve inet</i> indicates that the route is used for route resolution for next hops found in the routing table. <i>n</i> is an index used by Juniper Networks customer support only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | detail extensive |
| AS path           | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• I—IGP.</li> <li>• E—EGP.</li> <li>• ?—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• [ ]—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device or if AS path prepending is configured.</li> <li>• { }—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• ( )—Parentheses enclose a confederation.</li> <li>• ( [ ] )—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> | All levels       |
| to                | Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | brief none       |
| via               | Interface used to reach the next hop. If there is more than one interface available to the next hop, the interface that is actually used is followed by the word <b>Selected</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | brief none       |
| Communities       | Community path attribute for the route. See the output field table for the <a href="#">show route detail</a> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | detail extensive |
| Localpref         | Local preference value included in the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | All levels       |
| Router ID         | BGP router ID as advertised by the neighbor in the open message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | detail extensive |

Table 374: show route damping Output Fields (*continued*)

| Field Name                     | Field Description                                                                                                                                                        | Level of Output         |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Merit (last update/now)</b> | Last updated and current figure-of-merit value.                                                                                                                          | <b>detail extensive</b> |
| <b>damping-parameters</b>      | Name that identifies the damping parameters used, which is defined in the damping statement at the <b>[edit policy-options]</b> hierarchy level.                         | <b>detail extensive</b> |
| <b>Last update</b>             | Time of most recent change in path attributes.                                                                                                                           | <b>detail extensive</b> |
| <b>First update</b>            | Time of first change in path attributes, which started the route damping process.                                                                                        | <b>detail extensive</b> |
| <b>Flaps</b>                   | Number of times the route has gone up or down or its path attributes have changed.                                                                                       | <b>detail extensive</b> |
| <b>Suppressed</b>              | ( <b>suppressed</b> keyword only) This route is currently suppressed. A suppressed route does not appear in the forwarding table and routing protocols do not export it. | All levels              |
| <b>Reusable in</b>             | ( <b>suppressed</b> keyword only) Time when a suppressed route will again be available.                                                                                  | All levels              |
| <b>Preference will be</b>      | ( <b>suppressed</b> keyword only) Preference value that will be applied to the route when it is again active.                                                            | All levels              |

| <b>Output Fields</b>               | Table 375 on page 3582 describes the output fields for the <b>show route detail</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                    |

**Table 375: show route detail Output Fields**

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                               |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>routing-table-name</i>  | Name of the routing table (for example, inet.0).                                                                                                                                                                                                                                                                                                                |
| <i>number destinations</i> | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                         |
| <i>number routes</i>       | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li><b>active</b> (routes that are active)</li> <li><b>holddown</b> (routes that are in the pending state before being declared inactive)</li> <li><b>hidden</b> (routes that are not used because of a routing policy)</li> </ul> |

Table 375: show route detail Output Fields (*continued*)

| Field Name                                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>route-destination</i><br>(entry, announced) | <p>Route destination (for example:10.0.0.1/24). The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96). <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> </ul> |
| label stacking                                 | <p>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> <li>• <b>S=0 route</b> indicates that a packet with an incoming label stack depth of 2 or more exits this routing device with one fewer label (the label-popping operation is performed).</li> <li>• If there is no <b>S=</b> information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| [ <i>protocol, preference</i> ]                | <p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• <b>+—</b>A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>- —</b>A hyphen indicates the last active route.</li> <li>• <b>*—</b>An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>                                                                                                                                                                                                                           |
| Level                                          | <p>(IS-IS only). In IS-IS, a single AS can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Next-hop reference count</b>                      | Number of references made to the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Flood nexthop branches exceed maximum message</b> | Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Source</b>                                        | IP address of the route source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Next hop</b>                                      | Network layer address of the directly reachable neighboring system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>via</b>                                           | <p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> </ul> |
| <b>Label-switched-path<br/>lsp-path-name</b>         | Name of the LSP used to reach the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Label operation</b>                               | MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Interface</b>                                     | (Local only) Local interface name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Protocol next hop</b>                             | Network layer address of the remote routing device that advertised the prefix. This address is used to derive a forwarding next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Indirect next hop</b>                             | Index designation used to specify the mapping between protocol next hops, tags, kernel export policy, and the forwarding next hops.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>State</b>                                         | State of the route (a route can be in more than one state). See <a href="#">Table 377 on page 3588</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Local AS</b>                                      | AS number of the local routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Age</b>                                           | How long the route has been known.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>AIGP</b>                                          | Accumulated interior gateway protocol (AIGP) BGP attribute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Metricn</b>                                       | Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

Table 375: show route detail Output Fields (*continued*)

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>MED-plus-IGP</b>        | Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>TTL-Action</b>          | <p>For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.</p> <p>For sample output, see <a href="#">show route table</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Task</b>                | Name of the protocol that has added the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Announcement bits</b>   | List of protocols that announce this route. <b>n-Resolve inet</b> indicates that the route is used for route resolution for next hops found in the routing table. <b>n</b> is an index used by Juniper Networks customer support only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>AS path</b>             | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>Recorded</b>—The AS path is recorded by the sample process (sampled).</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• <b>[ ]</b>—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used in the AS-path merge process, as defined in RFC 4893.</li> <li>• <b>[ ]</b>—If more than one AS number is configured on the routing device, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path.</li> <li>• <b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• <b>( )</b>—Parentheses enclose a confederation.</li> <li>• <b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> |
| <b>validation-state</b>    | <p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• <b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>Unverified</b>—Indicates that the origin of the prefix is not verified against the database. This is because the database got populated and the validation is not called for in the BGP import policy, although origin validation is enabled, or the origin validation is not enabled for the BGP peers.</li> <li>• <b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>FECs bound to route</b> | Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

Table 375: show route detail Output Fields (*continued*)

| Field Name                | Field Description                                                                                                                                                                                                                                                                                                   |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Primary Upstream          | When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path. |
| RPF Nexthops              | When multipoint LDP with MoFRR is configured, the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.                                             |
| Label                     | Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.                         |
| weight                    | Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.                                                                                                                                                  |
| VC Label                  | MPLS label assigned to the Layer 2 circuit virtual connection.                                                                                                                                                                                                                                                      |
| MTU                       | Maximum transmission unit (MTU) of the Layer 2 circuit.                                                                                                                                                                                                                                                             |
| VLAN ID                   | VLAN identifier of the Layer 2 circuit.                                                                                                                                                                                                                                                                             |
| Prefixes bound to route   | Forwarding equivalent class (FEC) bound to this route. Applicable only to routes installed by LDP.                                                                                                                                                                                                                  |
| Communities               | Community path attribute for the route. See <a href="#">Table 378 on page 3590</a> for all possible values for this field.                                                                                                                                                                                          |
| Layer2-info: encaps       | Layer 2 encapsulation (for example, VPLS).                                                                                                                                                                                                                                                                          |
| control flags             | Control flags: <b>none</b> or <b>Site Down</b> .                                                                                                                                                                                                                                                                    |
| mtu                       | Maximum transmission unit (MTU) information.                                                                                                                                                                                                                                                                        |
| Label-Base, range         | First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.                                                                                                                                              |
| status vector             | Layer 2 VPN and VPLS network layer reachability information (NLRI).                                                                                                                                                                                                                                                 |
| Accepted Multipath        | Current active path when BGP multipath is configured.                                                                                                                                                                                                                                                               |
| Accepted MultipathContrib | Path currently contributing to BGP multipath.                                                                                                                                                                                                                                                                       |
| Localpref                 | Local preference value included in the route.                                                                                                                                                                                                                                                                       |
| Router ID                 | BGP router ID as advertised by the neighbor in the open message.                                                                                                                                                                                                                                                    |
| Primary Routing Table     | In a routing table group, the name of the primary routing table in which the route resides.                                                                                                                                                                                                                         |
| Secondary Tables          | In a routing table group, the name of one or more secondary tables in which the route resides.                                                                                                                                                                                                                      |

Table 376 on page 3587 describes all possible values for the Next-hop Types output field.

**Table 376: Next-hop Types Output Field Values**

| Next-Hop Type                   | Description                                                                                                                                                                                                                                                                    |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Broadcast (bcast)</b>        | Broadcast next hop.                                                                                                                                                                                                                                                            |
| <b>Deny</b>                     | Deny next hop.                                                                                                                                                                                                                                                                 |
| <b>Discard</b>                  | Discard next hop.                                                                                                                                                                                                                                                              |
| <b>Flood</b>                    | Flood next hop. Consists of components called branches, up to a maximum of 32 branches. Each flood next-hop branch sends a copy of the traffic to the forwarding interface. Used by point-to-multipoint RSVP, point-to-multipoint LDP, point-to-multipoint CCC, and multicast. |
| <b>Hold</b>                     | Next hop is waiting to be resolved into a unicast or multicast type.                                                                                                                                                                                                           |
| <b>Indexed (idxd)</b>           | Indexed next hop.                                                                                                                                                                                                                                                              |
| <b>Indirect (indr)</b>          | Used with applications that have a protocol next hop address that is remote. You are likely to see this next-hop type for internal BGP (IBGP) routes when the BGP next hop is a BGP neighbor that is not directly connected.                                                   |
| <b>Interface</b>                | Used for a network address assigned to an interface. Unlike the router next hop, the interface next hop does not reference any specific node on the network.                                                                                                                   |
| <b>Local (locl)</b>             | Local address on an interface. This next-hop type causes packets with this destination address to be received locally.                                                                                                                                                         |
| <b>Multicast (mcst)</b>         | Wire multicast next hop (limited to the LAN).                                                                                                                                                                                                                                  |
| <b>Multicast discard (mdsc)</b> | Multicast discard.                                                                                                                                                                                                                                                             |
| <b>Multicast group (mgrp)</b>   | Multicast group member.                                                                                                                                                                                                                                                        |
| <b>Receive (recv)</b>           | Receive.                                                                                                                                                                                                                                                                       |
| <b>Reject (rjct)</b>            | Discard. An ICMP unreachable message was sent.                                                                                                                                                                                                                                 |
| <b>Resolve (rslv)</b>           | Resolving next hop.                                                                                                                                                                                                                                                            |
| <b>Routed multicast (mcrt)</b>  | Regular multicast next hop.                                                                                                                                                                                                                                                    |

Table 376: Next-hop Types Output Field Values (*continued*)

| Next-Hop Type         | Description                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Router</b>         | <p>A specific node or set of nodes to which the routing device forwards packets that match the route prefix.</p> <p>To qualify as next-hop type router, the route must meet the following criteria:</p> <ul style="list-style-type: none"> <li>• Must not be a direct or local subnet for the routing device.</li> <li>• Must have a next hop that is directly connected to the routing device.</li> </ul> |
| <b>Table</b>          | Routing table next hop.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Unicast (ucst)</b> | Unicast.                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Unilist (ulst)</b> | List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.                                                                                                                                                                                                                                                                                                                |

Table 377 on page 3588 describes all possible values for the State output field. A route can be in more than one state (for example, <Active NoReadvrt Int Ext>).

Table 377: State Output Field Values

| Value                                        | Description                                                                      |
|----------------------------------------------|----------------------------------------------------------------------------------|
| <b>Accounting</b>                            | Route needs accounting.                                                          |
| <b>Active</b>                                | Route is active.                                                                 |
| <b>Always Compare MED</b>                    | Path with a lower multiple exit discriminator (MED) is available.                |
| <b>AS path</b>                               | Shorter AS path is available.                                                    |
| <b>Cisco Non-deterministic MED selection</b> | Cisco nondeterministic MED is enabled, and a path with a lower MED is available. |
| <b>Clone</b>                                 | Route is a clone.                                                                |
| <b>Cluster list length</b>                   | Length of cluster list sent by the route reflector.                              |
| <b>Delete</b>                                | Route has been deleted.                                                          |
| <b>Ex</b>                                    | Exterior route.                                                                  |
| <b>Ext</b>                                   | BGP route received from an external BGP neighbor.                                |

Table 377: State Output Field Values (*continued*)

| Value                                                    | Description                                                                                                                                                                          |
|----------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>FlashAll</b>                                          | Forces all protocols to be notified of a change to any route, active or inactive, for a prefix. When not set, protocols are informed of a prefix only when the active route changes. |
| <b>Hidden</b>                                            | Route not used because of routing policy.                                                                                                                                            |
| <b>IfCheck</b>                                           | Route needs forwarding RPF check.                                                                                                                                                    |
| <b>IGP metric</b>                                        | Path through next hop with lower IGP metric is available.                                                                                                                            |
| <b>Inactive reason</b>                                   | Flags for this route, which was not selected as best for a particular destination.                                                                                                   |
| <b>Initial</b>                                           | Route being added.                                                                                                                                                                   |
| <b>Int</b>                                               | Interior route.                                                                                                                                                                      |
| <b>Int Ext</b>                                           | BGP route received from an internal BGP peer or a BGP confederation peer.                                                                                                            |
| <b>Interior &gt; Exterior &gt; Exterior via Interior</b> | Direct, static, IGP, or EBGP path is available.                                                                                                                                      |
| <b>Local Preference</b>                                  | Path with a higher local preference value is available.                                                                                                                              |
| <b>Martian</b>                                           | Route is a martian (ignored because it is obviously invalid).                                                                                                                        |
| <b>MartianOK</b>                                         | Route exempt from martian filtering.                                                                                                                                                 |
| <b>Next hop address</b>                                  | Path with lower metric next hop is available.                                                                                                                                        |
| <b>No difference</b>                                     | Path from neighbor with lower IP address is available.                                                                                                                               |
| <b>NoReadvrt</b>                                         | Route not to be advertised.                                                                                                                                                          |
| <b>NotBest</b>                                           | Route not chosen because it does not have the lowest MED.                                                                                                                            |
| <b>Not Best in its group</b>                             | Incoming BGP AS is not the best of a group (only one AS can be the best).                                                                                                            |
| <b>NotInstall</b>                                        | Route not to be installed in the forwarding table.                                                                                                                                   |
| <b>Number of gateways</b>                                | Path with a greater number of next hops is available.                                                                                                                                |
| <b>Origin</b>                                            | Path with a lower origin code is available.                                                                                                                                          |
| <b>Pending</b>                                           | Route pending because of a hold-down configured on another route.                                                                                                                    |

Table 377: State Output Field Values (*continued*)

| Value                                 | Description                                                                                                                                                                                                                       |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Release</b>                        | Route scheduled for release.                                                                                                                                                                                                      |
| <b>RIB preference</b>                 | Route from a higher-numbered routing table is available.                                                                                                                                                                          |
| <b>Route Distinguisher</b>            | 64-bit prefix added to IP subnets to make them unique.                                                                                                                                                                            |
| <b>Route Metric or MED comparison</b> | Route with a lower metric or MED is available.                                                                                                                                                                                    |
| <b>Route Preference</b>               | Route with lower preference value is available                                                                                                                                                                                    |
| <b>Router ID</b>                      | Path through a neighbor with lower ID is available.                                                                                                                                                                               |
| <b>Secondary</b>                      | Route not a primary route.                                                                                                                                                                                                        |
| <b>Unusable path</b>                  | Path is not usable because of one of the following conditions: <ul style="list-style-type: none"> <li>• The route is damped.</li> <li>• The route is rejected by an import policy.</li> <li>• The route is unresolved.</li> </ul> |
| <b>Update source</b>                  | Last tiebreaker is the lowest IP address value.                                                                                                                                                                                   |

Table 378 on page 3590 describes the possible values for the Communities output field.

Table 378: Communities Output Field Values

| Value                                                   | Description                                                                                                                                                                                                                                                                           |
|---------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>area-number</i>                                      | 4 bytes, encoding a 32-bit area number. For AS-external routes, the value is 0. A nonzero value identifies the route as internal to the OSPF domain, and as within the identified area. Area numbers are relative to a particular OSPF domain.                                        |
| <b>bandwidth: local AS number:link-bandwidth-number</b> | Link-bandwidth community value used for unequal-cost load balancing. When BGP has several candidate paths available for multipath purposes, it does not perform unequal-cost load balancing according to the link-bandwidth community unless all candidate paths have this attribute. |
| <b>domain-id</b>                                        | Unique configurable number that identifies the OSPF domain.                                                                                                                                                                                                                           |
| <b>domain-id-vendor</b>                                 | Unique configurable number that further identifies the OSPF domain.                                                                                                                                                                                                                   |
| <i>link-bandwidth-number</i>                            | Link-bandwidth number: from 0 through 4,294,967,295 (bytes per second).                                                                                                                                                                                                               |
| <i>local AS number</i>                                  | Local AS number: from 1 through 65,535.                                                                                                                                                                                                                                               |
| <i>options</i>                                          | 1 byte. Currently this is only used if the route type is 5 or 7. Setting the least significant bit in the field indicates that the route carries a type 2 metric.                                                                                                                     |

Table 378: Communities Output Field Values (*continued*)

| Value                                | Description                                                                                                                                                                                                                                           |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>origin</b>                        | (Used with VPNs) Identifies where the route came from.                                                                                                                                                                                                |
| <b>ospf-route-type</b>               | 1 byte, encoded as 1 or 2 for intra-area routes (depending on whether the route came from a type 1 or a type 2 LSA); 3 for summary routes; 5 for external routes (area number must be 0); 7 for NSSA routes; or 129 for sham link endpoint addresses. |
| <b>route-type-vendor</b>             | Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute <b>0x8000</b> . The format is <b>area-number:ospf-route-type:options</b> .                                          |
| <b>rte-type</b>                      | Displays the area number, OSPF route type, and option of the route. This is configured using the BGP extended community attribute <b>0x0306</b> . The format is <b>area-number:ospf-route-type:options</b> .                                          |
| <b>target</b>                        | Defines which VPN the route participates in; <b>target</b> has the format <b>32-bit IP address:16-bit number</b> . For example, 10.19.0.0:100.                                                                                                        |
| <b>unknown IANA</b>                  | Incoming IANA codes with a value between <b>0x1</b> and <b>0x7fff</b> . This code of the BGP extended community attribute is accepted, but it is not recognized.                                                                                      |
| <b>unknown OSPF vendor community</b> | Incoming IANA codes with a value above <b>0x8000</b> . This code of the BGP extended community attribute is accepted, but it is not recognized.                                                                                                       |

| <b>Description</b>                 | Display policy-based route export information. Policy-based export simplifies the process of exchanging route information between routing instances.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>                     | <p><b>none</b>—(Same as <b>brief</b>.) Display standard information about policy-based export for all instances and routing tables on all systems.</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>instance &lt;instance-name&gt;</b>—(Optional) Display a particular routing instance for which policy-based export is currently enabled.</p> <p><b>logical-system (all   logical-system-name)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>routing-table-name</b>—(Optional) Display information about policy-based export for all routing tables whose name begins with this string (for example, inet.0 and inet6.0 are both displayed when you run the <b>show route export inet</b> command).</p> |
| <b>Required Privilege Level</b>    | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Sample Output

### show route export

```

user@host> show route export
Table      Export      Routes
inet.0     N            0
black.inet.0 Y           3
red.inet.0 Y            4

```

### show route export detail

```

user@host> show route export detail
inet.0                                Routes:      0
black.inet.0                          Routes:      3
  Import: [ inet.0 ]
red.inet.0                            Routes:      4
  Import: [ inet.0 ]

```

### show route export instance detail

```

user@host> show route export instance detail
Instance: master                      Type: forwarding
Flags: <config auto-policy> Options: <unicast multicast>
Import policy: [ (ospf-master-from-red || isis-master-from-black) ]

```

Instance: black  
Instance: red

Type: non-forwarding  
Type: non-forwarding

## show route extensive

| <i>number routes</i>                           | <p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active).</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive).</li> <li>• <b>hidden</b> (routes that are not used because of a routing policy).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <i>route-destination</i><br>(entry, announced) | <p>Route destination (for example: 10.0.0.1/24). The <b>entry</b> value is the number of route for this destination, and the <b>announced</b> value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96). <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> </ul> |
| <b>TSI</b>                                     | Protocol header information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>label stacking</b>                          | <p>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> <li>• <b>S=0 route</b> indicates that a packet with an incoming label stack depth of two or more exits this router with one fewer label (the label-popping operation is performed).</li> <li>• If there is no <b>S=</b> information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>[protocol, preference]</b>                  | <p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>                                                                                                                                                                                                                            |

Table 380: show route extensive Output Fields (*continued*)

| Field Name                                           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Level</b>                                         | (IS-IS only). In IS-IS, a single autonomous system (AS) can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Route Distinguisher</b>                           | IP subnet augmented with a 64-bit prefix.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>PMSI</b>                                          | Provider multicast service interface (MVPN routing table).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Next-hop type</b>                                 | Type of next hop. For a description of possible values for this field, see the Output Field table in the <a href="#">show route detail</a> command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Next-hop reference count</b>                      | Number of references made to the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Flood nexthop branches exceed maximum message</b> | Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Source</b>                                        | IP address of the route source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Next hop</b>                                      | Network layer address of the directly reachable neighboring system.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>via</b>                                           | <p>Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word <b>Selected</b>. This field can also contain the following information:</p> <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> </ul> |
| <b>Label-switched-path<br/>lsp-path-name</b>         | Name of the LSP used to reach the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Label operation</b>                               | MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Offset</b>                                        | Whether the metric has been increased or decreased by an offset value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Interface</b>                                     | (Local only) Local interface name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Protocol next hop</b>                             | Network layer address of the remote routing device that advertised the prefix. This address is used to recursively derive a forwarding next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

Table 380: show route extensive Output Fields (*continued*)

| Field Name                    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b><i>label-operation</i></b> | MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).                                                                                                                                                                                                                                                 |
| <b>Indirect next hops</b>     | <p>When present, a list of nodes that are used to resolve the path to the next-hop destination, in the order that they are resolved.</p> <p>When BGP PIC Edge is enabled, the output lines that contain <b>Indirect next hop: weight</b> follow next hops that the software can use to repair paths where a link failure occurs. The next-hop weight has one of the following values:</p> <ul style="list-style-type: none"> <li>• 0x1 indicates active next hops.</li> <li>• 0x4000 indicates passive next hops.</li> </ul> |
| <b>State</b>                  | State of the route (a route can be in more than one state). See the Output Field table in the <a href="#">show route detail</a> command.                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Session ID</b>             | The BFD session ID number that represents the protection using MPLS fast reroute (FRR) and loop-free alternate (LFA).                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Weight</b>                 | <p>Weight for the backup path. If the weight of an indirect next hop is larger than zero, the weight value is shown.</p> <p>For sample output, see <a href="#">show route table</a>.</p>                                                                                                                                                                                                                                                                                                                                     |

Table 380: show route extensive Output Fields (*continued*)

| Field Name      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Inactive reason | <p>If the route is inactive, the reason for its current state is indicated. Typical reasons include:</p> <ul style="list-style-type: none"> <li>• <b>Active preferred</b>—Currently active route was selected over this route.</li> <li>• <b>Always compare MED</b>—Path with a lower multiple exit discriminator (MED) is available.</li> <li>• <b>AS path</b>—Shorter AS path is available.</li> <li>• <b>Cisco Non-deterministic MED selection</b>—Cisco nondeterministic MED is enabled and a path with a lower MED is available.</li> <li>• <b>Cluster list length</b>—Path with a shorter cluster list length is available.</li> <li>• <b>Forwarding use only</b>—Path is only available for forwarding purposes.</li> <li>• <b>IGP metric</b>—Path through the next hop with a lower IGP metric is available.</li> <li>• <b>IGP metric type</b>—Path with a lower OSPF link-state advertisement type is available.</li> <li>• <b>Interior &gt; Exterior &gt; Exterior via Interior</b>—Direct, static, IGP, or EBGP path is available.</li> <li>• <b>Local preference</b>—Path with a higher local preference value is available.</li> <li>• <b>Next hop address</b>—Path with a lower metric next hop is available.</li> <li>• <b>No difference</b>—Path from a neighbor with a lower IP address is available.</li> <li>• <b>Not Best in its group</b>—Occurs when multiple peers of the same external AS advertise the same prefix and are grouped together in the selection process. When this reason is displayed, an additional reason is provided (typically one of the other reasons listed).</li> <li>• <b>Number of gateways</b>—Path with a higher number of next hops is available.</li> <li>• <b>Origin</b>—Path with a lower origin code is available.</li> <li>• <b>OSPF version</b>—Path does not support the indicated OSPF version.</li> <li>• <b>RIB preference</b>—Route from a higher-numbered routing table is available.</li> <li>• <b>Route distinguisher</b>—64-bit prefix added to IP subnets to make them unique.</li> <li>• <b>Route metric or MED comparison</b>—Route with a lower metric or MED is available.</li> <li>• <b>Route preference</b>—Route with a lower preference value is available.</li> <li>• <b>Router ID</b>—Path through a neighbor with a lower ID is available.</li> <li>• <b>Unusable path</b>—Path is not usable because of one of the following conditions: the route is damped, the route is rejected by an import policy, or the route is unresolved.</li> <li>• <b>Update source</b>—Last tiebreaker is the lowest IP address value.</li> </ul> |
| Local AS        | Autonomous system (AS) number of the local routing device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Age             | How long the route has been known.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| AIGP            | Accumulated interior gateway protocol (AIGP) BGP attribute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Metric          | Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| MED-plus-IGP    | Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| TTL-Action      | <p>For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.</p> <p>For sample output, see <a href="#">show route table</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

Table 380: show route extensive Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Task                    | Name of the protocol that has added the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Announcement bits       | List of protocols that announce this route. <b>n-Resolve inet</b> indicates that the route is used for route resolution for next hops found in the routing table. <b>n</b> is an index used by Juniper Networks customer support only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| AS path                 | <p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>Recorded</b>—The AS path is recorded by the sample process (sampled).</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• <b>[ ]</b>—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured.</li> <li>• <b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• <b>( )</b>—Parentheses enclose a confederation.</li> <li>• <b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> |
| validation-state        | <p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• <b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>Unverified</b>—Indicates that origin validation is not enabled for the BGP peers.</li> <li>• <b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| FECs bound to route     | Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| AS path: I <Originator> | (For route reflected output only) Originator ID attribute set by the route reflector.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Primary Upstream        | When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| RPF Nexthops            | When multipoint LDP with MoFRR is configured, the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

Table 380: show route extensive Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Label                   | Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.                      |
| weight                  | Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.                                                                                                                                               |
| VC Label                | MPLS label assigned to the Layer 2 circuit virtual connection.                                                                                                                                                                                                                                                   |
| MTU                     | Maximum transmission unit (MTU) of the Layer 2 circuit.                                                                                                                                                                                                                                                          |
| VLAN ID                 | VLAN identifier of the Layer 2 circuit.                                                                                                                                                                                                                                                                          |
| Cluster list            | (For route reflected output only) Cluster ID sent by the route reflector.                                                                                                                                                                                                                                        |
| Originator ID           | (For route reflected output only) Address of router that originally sent the route to the route reflector.                                                                                                                                                                                                       |
| Prefixes bound to route | Forwarding equivalent class (FEC) bound to this route. Applicable only to routes installed by LDP.                                                                                                                                                                                                               |
| Communities             | Community path attribute for the route. See the Output Field table in the <a href="#">show route detail</a> command for all possible values for this field.                                                                                                                                                      |
| Layer2-info: encaps     | Layer 2 encapsulation (for example, VPLS).                                                                                                                                                                                                                                                                       |
| control flags           | Control flags: <b>none</b> or Site Down.                                                                                                                                                                                                                                                                         |
| mtu                     | Maximum transmission unit (MTU) information.                                                                                                                                                                                                                                                                     |
| Label-Base, range       | First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.                                                                                                                                           |
| status vector           | Layer 2 VPN and VPLS network layer reachability information (NLRI).                                                                                                                                                                                                                                              |
| Localpref               | Local preference value included in the route.                                                                                                                                                                                                                                                                    |
| Router ID               | BGP router ID as advertised by the neighbor in the open message.                                                                                                                                                                                                                                                 |
| Primary Routing Table   | In a routing table group, the name of the primary routing table in which the route resides.                                                                                                                                                                                                                      |
| Secondary Tables        | In a routing table group, the name of one or more secondary tables in which the route resides.                                                                                                                                                                                                                   |
| Originating RIB         | Name of the routing table whose active route was used to determine the forwarding next-hop entry in the resolution database. For example, in the case of inet.0 resolving through inet.0 and inet.3, this field indicates which routing table, inet.0 or inet.3, provided the best path for a particular prefix. |
| Node path count         | Number of nodes in the path.                                                                                                                                                                                                                                                                                     |

Table 380: show route extensive Output Fields (*continued*)

| Field Name                 | Field Description                                                                                                                                                                     |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Forwarding nexthops</b> | Number of forwarding next hops. The forwarding next hop is the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it. |

## Sample Output

### show route extensive

```

user@host> show route extensive
inet.0: 22 destinations, 23 routes (21 active, 0 holddown, 1 hidden)
10.10.0.0/16 (1 entry, 1 announced)

## show route flow validation

**List of Syntax** [Syntax on page 3621](#)  
[Syntax \(EX Series Switches\) on page 3621](#)

**Syntax** show route flow validation  
 <brief | detail>  
 <ip-prefix>  
 <table *table-name*>  
 <logical-system (all | *logical-system-name*)>

**Syntax (EX Series Switches)** show route flow validation  
 <brief | detail>  
 <ip-prefix>  
 <table *table-name*>

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Display flow route information.

**Options** none—Display flow route information.

**brief | detail**—(Optional) Display the specified level of output. If you do not specify a level of output, the system defaults to brief.

**ip-prefix**—(Optional) IP address for the flow route.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**table *table-name***—(Optional) Display flow route information for all routing tables whose name begins with this string (for example, inet.0 and inet6.0 are both displayed when you run the **show route flow validation inet** command).

**Required Privilege Level** view

**List of Sample Output** [show route flow validation on page 3622](#)

**Output Fields** [Table 381 on page 3621](#) lists the output fields for the **show route flow validation** command. Output fields are listed in the approximate order in which they appear.

**Table 381: show route flow validation Output Fields**

| Field Name                | Field Description                                | Level of Output |
|---------------------------|--------------------------------------------------|-----------------|
| <i>routing-table-name</i> | Name of the routing table (for example, inet.0). | All levels      |
| <i>prefix</i>             | Route address.                                   | All levels      |
| Active unicast route      | Active route in the routing table.               | All levels      |

Table 381: show route flow validation Output Fields (*continued*)

| Field Name                  | Field Description                                                       | Level of Output |
|-----------------------------|-------------------------------------------------------------------------|-----------------|
| Dependent flow destinations | Number of flows for which there are routes in the routing table.        | All levels      |
| Origin                      | Source of the route flow.                                               | All levels      |
| Neighbor AS                 | Autonomous system identifier of the neighbor.                           | All levels      |
| Flow destination            | Number of entries and number of destinations that match the route flow. | All levels      |
| Unicast best match          | Destination that is the best match for the route flow.                  | All levels      |
| Flags                       | Information about the route flow.                                       | All levels      |

## Sample Output

### show route flow validation

```
user@host> show route flow validation
inet.0:
10.0.5.0/24Active unicast route
Dependent flow destinations: 1
Origin: 192.168.224.218, Neighbor AS: 65001
Flow destination (3 entries, 1 match origin)
Unicast best match: 10.0.5.0/24
Flags: SubtreeApex Consistent
```

## show route inactive-path

## Sample Output

### show route inactive-prefix

```
user@host> show route inactive-prefix

inet.0: 14 destinations, 14 routes (13 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both

127.0.0.1/32          [Direct/0] 00:04:54
> via lo0.0
```

### show route inactive-prefix detail

```
user@host> show route inactive-prefix detail

inet.0: 14 destinations, 14 routes (13 active, 0 holddown, 1 hidden)
```

```

127.0.0.1/32 (1 entry, 0 announced)
  Direct Preference: 0
    Next hop type: Interface
    Next-hop reference count: 1
    Next hop: via lo0.0, selected
    State: <Hidden Martian Int>
    Age: 4:51
    Task: IF
    AS path: I00:04:54
      > via lo0.0

```

### show route inactive-prefix extensive

The output for the **show route inactive-prefix extensive** command is identical to that of the **show route inactive-path detail** command. For sample output, see [show route inactive-prefix detail on page 3626](#).

### show route inactive-prefix terse

```
user@host> show route inactive-prefix terse
```

```
inet.0: 18 destinations, 18 routes (17 active, 0 holddown, 1 hidden)
+ = Active Route, - = Last Active, * = Both
```

| A Destination | P Prf | Metric 1 | Metric 2 | Next hop | AS path |
|---------------|-------|----------|----------|----------|---------|
| 127.0.0.1/32  | D 0   |          |          | >lo0.0   |         |

## show route instance

---

**Output Fields** Table 382 on page 3629 lists the output fields for the **show route instance** command. Output fields are listed in the approximate order in which they appear.

**Table 382: show route instance Output Fields**

| Field Name                       | Field Description                                                                                                                                                                                                                                                  | Level of Output                  |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------|
| Instance or <i>instance-name</i> | Name of the routing instance.                                                                                                                                                                                                                                      | All levels                       |
| Operational Routing Instances    | ( <b>operational</b> keyword only) Names of all operational routing instances.                                                                                                                                                                                     | —                                |
| Type                             | Type of routing instance: <b>forwarding</b> , <b>l2vpn</b> , <b>no-forwarding</b> , <b>vpls</b> , <b>virtual-router</b> , or <b>vrf</b> .                                                                                                                          | All levels                       |
| State                            | State of the routing instance: <b>active</b> or <b>inactive</b> .                                                                                                                                                                                                  | <b>brief detail</b> none         |
| Interfaces                       | Name of interfaces belonging to this routing instance.                                                                                                                                                                                                             | <b>brief detail</b> none         |
| Restart State                    | Status of graceful restart for this instance: <b>Pending</b> or <b>Complete</b> .                                                                                                                                                                                  | <b>detail</b>                    |
| Path selection timeout           | Maximum amount of time, in seconds, remaining until graceful restart is declared complete. The default is <b>300</b> .                                                                                                                                             | <b>detail</b>                    |
| Tables                           | Tables (and number of routes) associated with this routing instance.                                                                                                                                                                                               | <b>brief detail</b> none         |
| Route-distinguisher              | Unique route distinguisher associated with this routing instance.                                                                                                                                                                                                  | <b>detail</b>                    |
| Vrf-import                       | VPN routing and forwarding instance import policy name.                                                                                                                                                                                                            | <b>detail</b>                    |
| Vrf-export                       | VPN routing and forwarding instance export policy name.                                                                                                                                                                                                            | <b>detail</b>                    |
| Vrf-import-target                | VPN routing and forwarding instance import target community name.                                                                                                                                                                                                  | <b>detail</b>                    |
| Vrf-export-target                | VPN routing and forwarding instance export target community name.                                                                                                                                                                                                  | <b>detail</b>                    |
| Fast-reroute-priority            | Fast reroute priority setting for a VPLS routing instance: <b>high</b> , <b>medium</b> , or <b>low</b> . The default is <b>low</b> .                                                                                                                               | <b>detail</b>                    |
| Restart State                    | Restart state: <ul style="list-style-type: none"> <li><b>Pending;protocol-name</b>—List of protocols that have not yet completed graceful restart for this routing table.</li> <li><b>Complete</b>—All protocols have restarted for this routing table.</li> </ul> | <b>detail</b>                    |
| Primary rib                      | Primary table for this routing instance.                                                                                                                                                                                                                           | <b>brief</b> none <b>summary</b> |
| Active/holddown/hidden           | Number of active, hold-down, and hidden routes.                                                                                                                                                                                                                    | All levels                       |

## Sample Output

### show route instance

```

user@host> show route instance
Instance           Type
Primary RIB
master             forwarding
inet.0             16/0/1
iso.0               1/0/0
mpls.0             0/0/0
inet6.0            2/0/0
l2circuit.0        0/0/0
__juniper_private1__ forwarding
__juniper_private1__.inet.0 12/0/0
__juniper_private1__.inet6.0 1/0/0

```

### show route instance detail (Graceful Restart Complete)

```

user@host> show route instance detail
master:
  Router ID: 10.255.14.176

| <b>Output Fields</b>               | <a href="#">Table 384 on page 3668</a> describes the output fields for the <b>show route receive-protocol</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**Table 384: show route receive-protocol Output Fields**

| Field Name                | Field Description                              | Level of Output |
|---------------------------|------------------------------------------------|-----------------|
| <i>routing-table-name</i> | Name of the routing table—for example, inet.0. | All levels      |

Table 384: show route receive-protocol Output Fields (*continued*)

| Field Name                                   | Field Description                                                                                                                                                                                                                                                                                                                               | Level of Output         |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <i>number destinations</i>                   | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                         | All levels              |
| <i>number routes</i>                         | <p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> <li>• <b>active</b></li> <li>• <b>holddown</b> (routes that are in pending state before being declared inactive)</li> <li>• <b>hidden</b> (routes that are not used because of a routing policy)</li> </ul> | All levels              |
| Prefix                                       | Destination prefix.                                                                                                                                                                                                                                                                                                                             | none <b>brief</b>       |
| MED                                          | Multiple exit discriminator value included in the route.                                                                                                                                                                                                                                                                                        | none <b>brief</b>       |
| <i>destination-prefix (entry, announced)</i> | Destination prefix. The <b>entry</b> value is the number of routes for this destination, and the <b>announced</b> value is the number of routes being announced for this destination.                                                                                                                                                           | <b>detail extensive</b> |
| Route Distinguisher                          | 64-bit prefix added to IP subnets to make them unique.                                                                                                                                                                                                                                                                                          | <b>detail extensive</b> |
| Label-Base, range                            | First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.                                                                                                                                                                          | <b>detail extensive</b> |
| VPN Label                                    | Virtual private network (VPN) label. Packets are sent between CE and PE routing devices by advertising VPN labels. VPN labels transit over either an RSVP or an LDP label-switched path (LSP) tunnel.                                                                                                                                           | <b>detail extensive</b> |
| Next hop                                     | Next hop to the destination. An angle bracket (>) indicates that the route is the selected route.                                                                                                                                                                                                                                               | All levels              |
| Localpref or Lclpref                         | Local preference value included in the route.                                                                                                                                                                                                                                                                                                   | All levels              |

Table 384: show route receive-protocol Output Fields (*continued*)

| Field Name          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Level of Output         |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| AS path             | <p>Autonomous system (AS) path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• <b>[ ]</b>—Brackets enclose the number that precedes the AS path. This number represents the number of ASs present in the AS path, when calculated as defined in RFC 4271. This value is used the AS-path merge process, as defined in RFC 4893.</li> <li>• <b>[ ]</b>—If more than one AS number is configured on the router, or if AS path prepending is configured, brackets enclose the local AS number associated with the AS path.</li> <li>• <b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• <b>( )</b>—Parentheses enclose a confederation.</li> <li>• <b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p> | All levels              |
| Cluster list        | (For route reflected output only) Cluster ID sent by the route reflector.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive</b> |
| Originator ID       | (For route reflected output only) Address of routing device that originally sent the route to the route reflector.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b> |

| <b>Release Information</b>         | Command introduced before Junos OS Release 7.4.<br>Command introduced in Junos OS Release 9.0 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b>                 | Display the entries in the next-hop resolution database. This database provides for recursive resolution of next hops through other prefixes in the routing table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>                     | <p><b>none</b>—Display standard information about all entries in the next-hop resolution database.</p> <p><b>brief   detail   extensive   summary</b>—(Optional) Display the specified level of output.</p> <p><b>index <i>index</i></b>—(Optional) Show the index of the resolution tree.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>prefix <i>network/destination-prefix</i></b>—(Optional) Display database entries for the specified address.</p> <p><b>table <i>routing-table-name</i></b>—(Optional) Display information about a particular routing table (for example, <b>inet.0</b>) where policy-based export is currently enabled.</p> <p><b>unresolved</b>—(Optional) Display routes that could not be resolved.</p> |
| <b>Required Privilege Level</b>    | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**Output Fields** Table 385 on page 3677 describes the output fields for the **show route resolution** command. Output fields are listed in the approximate order in which they appear.

**Table 385: show route resolution Output Fields**

| Field Name                         | Field Description                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>routing-table-name</i>          | Name of the routing table whose prefixes are resolved using the entries in the route resolution database. For routing table groups, this is the name of the primary routing table whose prefixes are resolved using the entries in the route resolution database.                                                                                     |
| <b>Tree index</b>                  | Tree index identifier.                                                                                                                                                                                                                                                                                                                                |
| <b>Nodes</b>                       | Number of nodes in the tree.                                                                                                                                                                                                                                                                                                                          |
| <b>Reference count</b>             | Number of references made to the next hop.                                                                                                                                                                                                                                                                                                            |
| <b>Contributing routing tables</b> | Routing tables used for next-hop resolution.                                                                                                                                                                                                                                                                                                          |
| <b>Originating RIB</b>             | Name of the routing table whose active route was used to determine the forwarding next-hop entry in the resolution database. For example, in the case of <b>inet.0</b> resolving through <b>inet.0</b> and <b>inet.3</b> , this field indicates which routing table, <b>inet.0</b> or <b>inet.3</b> , provided the best path for a particular prefix. |
| <b>Metric</b>                      | Metric associated with the forwarding next hop.                                                                                                                                                                                                                                                                                                       |
| <b>Node path count</b>             | Number of nodes in the path.                                                                                                                                                                                                                                                                                                                          |
| <b>Forwarding next hops</b>        | Number of forwarding next hops. The forwarding next hop is the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it.                                                                                                                                                                 |

## Sample Output

### show route resolution detail

```

user@host> show route resolution detail

| <b>Description</b>                 | <p>Display summary statistics about the entries in the routing table.</p> <p>CPU utilization might increase while the device learns routes. We recommend that you use the <b>show route summary</b> command after the device learns and enters the routes into the routing table. Depending on the size of your network, this might take several minutes. If you receive a “timeout communicating with routing daemon” error when using the <b>show route summary</b> command, wait several minutes before attempting to use the command again. This is not a critical system error, but you might experience a delay in using the command-line interface (CLI).</p> |
| <b>Options</b>                     | <p><b>none</b>—Display summary statistics about the entries in the routing table.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>table <i>routing-table-name</i></b>—(Optional) Display summary statistics for all routing tables whose name begins with this string (for example, <b>inet.0</b> and <b>inet6.0</b> are both displayed when you run the <b>show route summary table inet</b> command). If you only want to display statistics for a specific routing table, make sure to enter the exact name of that routing table.</p>      |
| <b>Required Privilege Level</b>    | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Router ID  | Address of the local routing device. |

Table 386: show route summary Output Fields (*continued*)

| Field Name                | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>routing-table-name</i> | Name of the routing table (for example, <b>inet.0</b> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>destinations</b>       | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>routes</b>             | Number of routes in the routing table: <ul style="list-style-type: none"> <li><b>active</b>—Number of routes that are active.</li> <li><b>holddown</b>—Number of routes that are in the hold-down state before being declared inactive.</li> <li><b>hidden</b>—Number of routes that are not used because of routing policy.</li> </ul>                                                                                                                                                                                                                                                                                                                                                     |
| <b>Limit/Threshold</b>    | Displays the configured route limits for the routing table set with the <b>maximum-prefixes</b> and the <b>maximum-paths</b> statements. If you do not configure route limits for the routing table, the show output does not display this information. <ul style="list-style-type: none"> <li><b>destinations</b>—The first number represents the maximum number of route prefixes installed in the routing table. The second number represents the number of route prefixes that trigger a warning message.</li> <li><b>routes</b>—The first number represents the maximum number of routes. The second number represents the number of routes that trigger a warning message.</li> </ul> |
| <b>Direct</b>             | Routes on the directly connected network.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Local</b>              | Local routes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <i>protocol-name</i>      | Name of the protocol from which the route was learned. For example, <b>OSPF</b> , <b>RSVP</b> , and <b>Static</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Sample Output

### show route summary

```

user@host> show route summary
Autonomous system number: 69
Router ID: 10.255.71.52
Maximum-ECMP: 32
inet.0: 24 destinations, 25 routes (23 active, 0 holddown, 1 hidden)
Restart Complete
      Direct:    6 routes,      5 active
      Local:    4 routes,      4 active
      OSPF:     5 routes,      4 active
      Static:   7 routes,      7 active
      IGMP:     1 routes,      1 active
      PIM:      2 routes,      2 active

inet.3: 2 destinations, 2 routes (2 active, 0 holddown, 0 hidden)
Restart Complete
      RSVP:      2 routes,      2 active

iso.0: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)

```

```

Restart Complete
  Direct:      1 routes,      1 active

mpls.0: 7 destinations, 7 routes (5 active, 0 holddown, 2 hidden)
Restart Complete
  MPLS:       3 routes,      3 active
  VPLS:       4 routes,      2 active

inet6.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)
Restart Complete
  Direct:      2 routes,      2 active
  PIM:         2 routes,      2 active
  MLD:         1 routes,      1 active

green.l2vpn.0: 4 destinations, 4 routes (4 active, 0 holddown, 0 hidden)
Restart Complete
  BGP:         2 routes,      2 active
  L2VPN:       2 routes,      2 active

red.l2vpn.0: 3 destinations, 3 routes (3 active, 0 holddown, 0 hidden)
Restart Complete
  BGP:         2 routes,      2 active
  L2VPN:       1 routes,      1 active

bgp.l2vpn.0: 4 destinations, 4 routes (4 active, 0 holddown, 0 hidden)
Restart Complete
  BGP:         4 routes,      4 active

```

#### show route summary table

```

user@host> show route summary table inet
Router ID: 192.168.0.1

inet.0: 32 destinations, 34 routes (31 active, 0 holddown, 1 hidden)
  Direct:      6 routes,      5 active
  Local:       9 routes,      9 active
  OSPF:        3 routes,      1 active
  Static:     13 routes,     13 active
  ICMP:        1 routes,      1 active
  PIM:         2 routes,      2 active

inet.1: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)
  Multicast:    1 routes,      1 active

inet6.0: 3 destinations, 3 routes (3 active, 0 holddown, 0 hidden)
  Local:        1 routes,      1 active
  PIM:          2 routes,      2 active

inet6.1: 1 destinations, 1 routes (1 active, 0 holddown, 0 hidden)
  Multicast:    1 routes,      1 active

```

#### show route summary table (with Route Limits Configured for the Routing Table)

```

user@host> show route summary table VPN-A.inet.0
Autonomous system number: 100
Router ID: 10.255.182.142

VPN-A.inet.0: 13 destinations, 14 routes (13 active, 0 holddown, 0 hidden)
Limit/Threshold: 2000/200 destinations 20/12 routes
  Direct:      2 routes,      2 active
  Local:       1 routes,      1 active

```

|       |           |          |
|-------|-----------|----------|
| OSPF: | 4 routes, | 3 active |
| BGP:  | 4 routes, | 4 active |
| IGMP: | 1 routes, | 1 active |
| PIM:  | 2 routes, | 2 active |

## show route table

---

|                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**Table 387: show route terse Output Fields**

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                               |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>routing-table-name</i>  | Name of the routing table (for example, inet.0).                                                                                                                                                                                                                                                                                                                |
| <i>number destinations</i> | Number of destinations for which there are routes in the routing table.                                                                                                                                                                                                                                                                                         |
| <i>number routes</i>       | Number of routes in the routing table and total number of routes in the following states: <ul style="list-style-type: none"> <li><b>active</b> (routes that are active)</li> <li><b>holddown</b> (routes that are in the pending state before being declared inactive)</li> <li><b>hidden</b> (routes that are not used because of a routing policy)</li> </ul> |

Table 387: show route terse Output Fields (*continued*)

| Field Name       | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>route key</i> | Key for the state of the route: <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul>                                                                                                                                                                                                                |
| <b>A</b>         | Active route. An asterisk (*) indicates this is the active route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>V</b>         | Validation status of the route: <ul style="list-style-type: none"> <li>• <b>?</b>—Not evaluated. Indicates that the route was not learned through BGP.</li> <li>• <b>I</b>—Invalid. Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>N</b>—Unknown. Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>V</b>—Valid. Indicates that the prefix and autonomous system pair are found in the database.</li> </ul> |
| Destination      | Destination of the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>P</b>         | Protocol through which the route was learned: <ul style="list-style-type: none"> <li>• <b>A</b>—Aggregate</li> <li>• <b>B</b>—BGP</li> <li>• <b>C</b>—CCC</li> <li>• <b>D</b>—Direct</li> <li>• <b>G</b>—GMPLS</li> <li>• <b>I</b>—IS-IS</li> <li>• <b>L</b>—L2CKT, L2VPN, LDP, Local</li> <li>• <b>K</b>—Kernel</li> <li>• <b>M</b>—MPLS, MSDP</li> <li>• <b>O</b>—OSPF</li> <li>• <b>P</b>—PIM</li> <li>• <b>R</b>—RIP, RIPng</li> <li>• <b>S</b>—Static</li> <li>• <b>T</b>—Tunnel</li> </ul>                                                                                                                                                                                     |
| <b>Prf</b>       | Preference value of the route. In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.                                                                                              |
| Metric 1         | First metric value in the route. For routes learned from BGP, this is the MED metric.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Metric 2         | Second metric value in the route. For routes learned from BGP, this is the IGP metric.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## IGMP Snooping on EX Series Switches Overview

Internet Group Management Protocol (IGMP) snooping constrains the flooding of IPv4 multicast traffic on VLANs on a switch. When IGMP snooping is enabled on a VLAN, a Juniper Networks EX Series Ethernet Switch examines IGMP messages between hosts and multicast routers and learns which hosts are interested in receiving traffic for a multicast group. Based on what it learns, the switch then forwards multicast traffic only to those interfaces in the VLAN that are connected to interested receivers instead of flooding the traffic to all interfaces.

IGMP snooping on EX Series switches supports IGMP version 1 (IGMPv1), IGMPv2, and IGMPv3. For details on IGMP, see the following standards:

- IGMPv1—See RFC 1112, *Host extensions for IP multicasting*.
- IGMPv2—See RFC 2236, *Internet Group Management Protocol, Version 2*.
- For IGMPv3—See RFC 3376, *Internet Group Management Protocol, Version 3*.

This topic covers:

## How IGMP Snooping Works

A Layer 2 switch usually learns *unicast* media access control (MAC) addresses by checking the source address field of the frames it receives. However, a *multicast* MAC address can never be the source address for a packet. As a result, the switch floods multicast traffic on the VLAN, consuming significant amounts of bandwidth.

You can enable IGMP snooping on a switch to avoid this flooding. When IGMP snooping is enabled, the switch monitors IGMP messages between receivers and multicast routers and uses the content of the messages to build an IPv4 multicast forwarding table—a database of multicast groups and the interfaces that are connected to members of the groups. When the switch receives multicast traffic for a multicast group, it uses the forwarding table to forward the traffic only to interfaces that are connected to receivers that belong to the multicast group.

Figure 45 on page 3718 shows an example of multicast traffic flow with IGMP snooping enabled.

**Figure 45: Multicast Traffic Flow with IGMP Snooping Enabled**

## IGMP Message Types

Multicast routers use IGMP to learn, for each of their attached physical networks, which groups have interested listeners. In any given subnet, one multicast router acts as an IGMP querier. The IGMP querier sends out the following types of queries to hosts:

- General query—Asks whether any host is listening to any group.
- Group-specific query—(IGMPv2 and IGMPv3 only) Asks whether any host is listening to a specific multicast group. This query is sent in response to a host leaving the multicast group and allows the router to quickly determine if any remaining hosts are interested in the group.

- Group-and-source-specific query—(IGMPv3 only) Asks whether any host is listening to group multicast traffic from a specific multicast source. This query is sent in response to a host indicating that it is not longer interested in receiving group multicast traffic from the multicast source and allows the router to quickly determine any remaining hosts are interested in receiving group multicast traffic from that source.

Hosts that are multicast listeners send the following kinds of messages:

- Membership report—Indicates that the host wants to join a particular multicast group.
- Leave report—(IGMPv2 and IGMPv3 only) Indicates that the host wants to leave a particular multicast group.

### How Hosts Join and Leave Multicast Groups

Hosts can join multicast groups in either of two ways:

- By sending an unsolicited IGMP join message to a multicast router that specifies the IP multicast group that the host is attempting to join.
- By sending an IGMP join message in response to a general query from a multicast router.

A multicast router continues to forward multicast traffic to a VLAN provided that at least one host on that VLAN responds to the periodic general IGMP queries. For a host to remain a member of a multicast group, therefore, it must continue to respond to the periodic general IGMP queries.

Hosts can leave a multicast group in either of two ways:

- By not responding to periodic queries within a set interval of time. This results in what is known as a “silent leave.” This is the only method available to IGMPv1 hosts.
- By sending a leave report. This method can be used by IGMPv2 and IGMPv3 hosts.

**NOTE:** If a host is connected to the switch through a hub, the host does not automatically leave the multicast group if it disconnects from the hub. The host remains a member of the group until group membership times out and a silent leave occurs. If another host connects to the hub port before the silent leave occurs, the new host might receive the group multicast traffic until the silent leave, even though it never sent an membership report.

### Support for IGMPv3 Multicast Sources

In IGMPv3, a host can send a membership report that includes a list of source addresses. When the host sends a membership report in INCLUDE mode, the host is interested in group multicast traffic only from those sources in the source address list. If host sends a membership report in EXCLUDE mode, the host is interested in group multicast traffic from any source *except* the sources in the source address list. A host can also send an EXCLUDE report in which the source-list parameter is empty, which is known as an

EXCLUDE NULL report. An EXCLUDE NULL report indicates that the host wants to join the multicast group and receive packets from all sources.

EX Series switches support IGMPv3 membership reports that are in INCLUDE and EXCLUDE mode. However, EX Series switches do not support forwarding on a per-source basis. Instead, a switch consolidates all INCLUDE and EXCLUDE mode reports it receives on a VLAN for a specified group into a single route that includes all multicast sources for that group, with the next hop being all interfaces that have interested receivers for the group. As a result, interested receivers on the VLAN can receive traffic from a source that they did not include in their INCLUDE report or from a source they excluded in their EXCLUDE report. For example, if Host 1 wants traffic for G from Source A and Host 2 wants traffic for G from Source B, they both receive traffic for G regardless of whether A or B sends the traffic.

### IGMP Snooping and Forwarding Interfaces

---

To determine how to forward multicast traffic, a switch with IGMP snooping enabled maintains information about the following interfaces in its multicast forwarding table:

- Multicast-router interfaces—These interfaces lead toward multicast routers or IGMP queriers.
- Group-member interfaces—These interfaces lead toward hosts that are members of multicast groups.

The switch learns about these interfaces by monitoring IGMP traffic. If an interface receives IGMP queries or Protocol Independent Multicast (PIM) updates, the switch adds the interface to its multicast forwarding table as a multicast-router interface. If an interface receives membership reports for a multicast group, the switch adds the interface to its multicast forwarding table as a group-member interface.

Table entries for interfaces that the switch learns about are subject to aging. For example, if a learned multicast-router interface does not receive IGMP queries or PIM hellos within a certain interval, the switch removes the entry for that interface from its multicast forwarding table.

**NOTE:** For a switch to learn multicast-router interfaces and group-member interfaces, an IGMP querier must exist in the network. For the switch itself to function as an IGMP querier, IGMP must be enabled on the switch.

---

You can statically configure an interface to be a multicast-router interface or a group-member interface. The switch adds a static interface to its multicast forwarding table without having to learn about the interface, and the entry in the table is not subject to aging. You can have a mix of statically configured and dynamically learned interfaces on a switch.

### General Forwarding Rules

---

Multicast traffic received on a switch interface in a VLAN on which IGMP snooping is enabled is forwarded according to the following rules.

IGMP traffic is forwarded as follows:

- IGMP general queries received on a multicast-router interface are forwarded to all other interfaces in the VLAN.
- IGMP group-specific queries received on a multicast-router interface are forwarded to only those interfaces in the VLAN that are members of the group.
- IGMP reports received on a host interface are forwarded to multicast-router interfaces in the same VLAN, but not to the other host interfaces in the VLAN.

Multicast traffic that is not IGMP traffic is forwarded as follows:

- A multicast packet with a destination address of 224.0.0.0/24 is flooded to all other interfaces on the VLAN.
- An unregistered multicast packet—that is, a packet for a group that has no current members—is forwarded to all multicast-router interfaces in the VLAN.
- A registered multicast packet is forwarded only to those host interfaces in the VLAN that are members of the multicast group and to all multicast-router interfaces in the VLAN.

### Examples of IGMP Snooping Multicast Forwarding

The following examples are provided to illustrate how IGMP snooping forwards multicast traffic in different topologies:

- [Scenario 1: Switch Forwarding Multicast Traffic to a Multicast Router and Hosts on page 3721](#)
- [Scenario 2: Switch Forwarding Multicast Traffic to Another Switch on page 3722](#)
- [Scenario 3: Switch Connected to Hosts Only \(No IGMP Querier\) on page 3723](#)
- [Scenario 4: Layer 2/Layer 3 Switch Forwarding Multicast Traffic Between VLANs on page 3724](#)

#### ***Scenario 1: Switch Forwarding Multicast Traffic to a Multicast Router and Hosts***

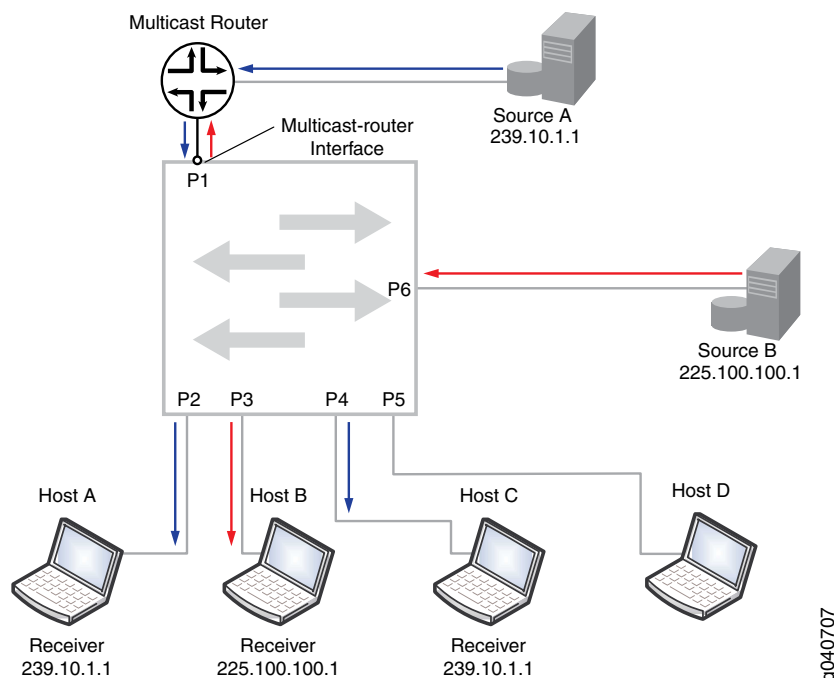

In the topology shown in [Figure 46 on page 3722](#), a switch acting as a Layer 2 device receives multicast traffic belonging to multicast group **239.10.1.1** from Source A, which is connected to the multicast router. It also receives multicast traffic belonging to multicast group **225.100.100.1** from Source B, which is connected directly to the switch. All interfaces on the switch belong to the same VLAN.

Because the switch receives IGMP queries from the multicast router on interface P1, IGMP snooping learns that interface P1 is a multicast-router interface and adds the interface to its multicast cache table. It forwards any IGMP general queries it receives on this interface to all host interfaces on the switch, and, in turn, forwards membership reports it receives from hosts to the multicast-router interface.

In the example, Hosts A and C have responded to the membership queries with membership reports for group **239.10.1.1**. IGMP snooping adds interfaces P2 and P4 to its multicast cache table as member interfaces for group **239.10.1.1**. It forwards the group multicast traffic received from Source A to Hosts A and C, but not to Hosts B and D.

Host B has responded to the membership queries with a membership report for group **225.100.100.1**. The switch adds interface P3 to its multicast cache table as a member interface for group **225.100.100.1** and forwards multicast traffic it receives from Source B to Host B. The switch also forwards the multicast traffic it receives from Source B to the multicast-router interface P1.

**Figure 46: Scenario 1: Switch Forwarding Multicast Traffic to a Multicast Router and Hosts**

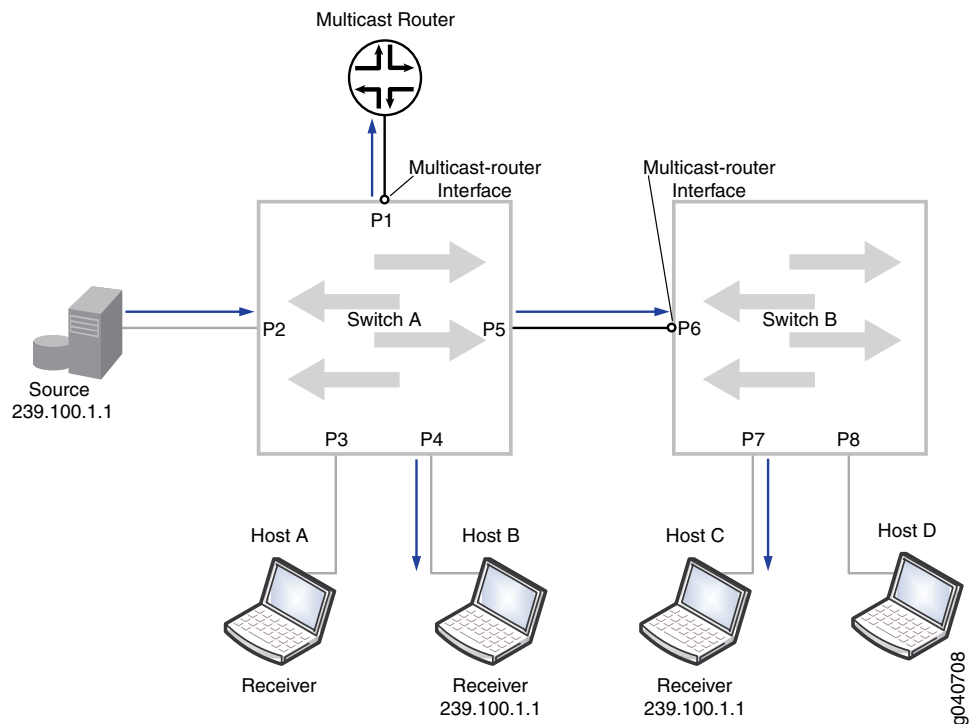

#### **Scenario 2: Switch Forwarding Multicast Traffic to Another Switch**

In the topology shown in [Figure 47 on page 3723](#), a multicast source is connected to Switch A. Switch A in turn is connected to another switch, Switch B. Hosts on both Switch A and B are potential members of the multicast group. Both switches are acting as Layer 2 devices and all interfaces on the switches are members of the same VLAN.

Switch A receives IGMP queries from the multicast router on interface P1, making interface P1 a multicast-router interface for Switch A. Switch A forwards all general IGMP queries it receives on this interface to the other interfaces on the switch, including the interface connecting Switch B. Because Switch B receives the forwarded IGMP queries on interface P6, P6 is the multicast-router interface for Switch B. Switch B forwards the group membership report it receives from Host C to Switch A through its multicast-router interface. Switch A forwards the membership report to its multicast-router interface, includes interface P5 in its multicast cache table as a group-member interface, and forwards multicast traffic from the source to Switch B.

**Figure 47: Scenario 2: Switch Forwarding Multicast Traffic to Another Switch**

In certain implementations, you might have to configure P6 on Switch B as a static multicast-router interface to avoid a delay in a host receiving multicast traffic. For example, if Switch B receives unsolicited membership reports from its hosts before it learns which interface is its multicast-router interface, it does not forward those reports to Switch A. If Switch A then receives multicast traffic, it does not forward the traffic to Switch B, because it has not received any membership reports on interface P5. This issue will resolve when the multicast router sends out its next general query; however, it can cause a delay in the host receiving multicast traffic. You can statically configure interface P6 as a multicast-router interface to solve this issue.

### **Scenario 3: Switch Connected to Hosts Only (No IGMP Querier)**

In the topology shown in [Figure 48 on page 3724](#), a switch is connected to a multicast source and to hosts. There is no multicast router in this topology—hence there is no IGMP querier. Without an IGMP querier to respond to, a host does not send periodic membership reports. As a result, even if the host sends an unsolicited join to join a multicast group, its membership in the multicast group times out.

For IGMP snooping to work correctly in this network so that the switch forwards multicast traffic to Hosts A and C only, you can either:

- Configure interfaces P2 and P4 as static group-member interfaces.
- Configure a routed VLAN interface (RVI) on the VLAN and enable IGMP on it. In this case, the switch itself acts as an IGMP querier, and the hosts can dynamically join the multicast group and refresh their group membership by responding to the queries.

Figure 48: Scenario 3: Switch Connected to Hosts Only (No IGMP Querier)

**Scenario 4: Layer 2/Layer 3 Switch Forwarding Multicast Traffic Between VLANs**

In the topology shown in [Figure 49 on page 3725](#), a multicast source, Multicast Router A, and Hosts A and B are connected to the switch and are in VLAN 10. Multicast Router B and Hosts C and D are also connected to the switch and are in VLAN 20.

In a pure Layer 2 environment, traffic is not forwarded between VLANs. For Host C to receive the multicast traffic from the source on VLAN 10, RVIs must be created on VLAN 10 and VLAN 20 to permit routing of the multicast traffic between the VLANs. In addition, PIM must be enabled on the switch to perform the multicast routing.

Figure 49: Scenario 4: Layer 2/Layer 3 Switch Forwarding Multicast Traffic Between VLANs

## Configuration Examples

---

- [Example: Configuring IGMP Snooping on page 3727](#)

### Example: Configuring IGMP Snooping

**NOTE:** This example uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see, *Example: Configuring IGMP Snooping on EX Series Switches*. For ELS details, see, “[Getting Started with Enhanced Layer 2 Software](#)” on page 3.

You can enable IGMP snooping on a VLAN to constrain the flooding of IPv4 multicast traffic on a VLAN. When IGMP snooping is enabled, a switch examines IGMP messages between hosts and multicast routers and learns which hosts are interested in receiving multicast traffic for a multicast group. Based on what it learns, the switch then forwards multicast traffic only to those interfaces that are connected to relevant receivers instead of flooding the traffic to all interfaces.

This example describes how to configure IGMP snooping:

- [Requirements on page 3727](#)
- [Overview and Topology on page 3728](#)
- [Configuration on page 3729](#)
- [Verifying IGMP Snooping Operation on page 3730](#)

#### Requirements

---

This example uses the following hardware and software components:

- One EX4300 Series switch

- Junos OS Release 13.2X50-D10 or later for EX Series switches

Before you configure IGMP snooping, be sure you have:

- Configured a VLAN, vlan100, on the switch
- Assigned interfaces ge-0/0/0, ge-0/0/1, ge-0/0/2, and ge-0/0/12 to vlan100
- Configured ge-0/0/12 as a trunk interface

See “Configuring VLANs for EX Series Switches (CLI Procedure)” on page 2337.

### Overview and Topology

In this example, interfaces ge-0/0/0, ge-0/0/1, and ge-0/0/2 on the switch are in vlan100 and are connected to hosts that are potential multicast receivers. Interface ge-0/0/12, a trunk interface also in vlan100, is connected to a multicast router. The router acts as the IGMP querier and forwards multicast traffic for group 225.100.100.100 to the switch from a multicast source.

The sample topology is illustrated in [Figure 50 on page 3728](#).

**Figure 50: IGMP Snooping Topology Sample Topology**

In this sample topology, the multicast router forwards multicast traffic to the switch from the source when it receives a membership report for group 255.100.100.100 from one of the hosts—for example, Host B. If IGMP snooping is not enabled on vlan100, the switch floods the multicast traffic on all interfaces in vlan100 (except for interface ge-0/0/12). If IGMP snooping is enabled on vlan100, the switch monitors the IGMP messages between the hosts and router, allowing it to determine that only Host B is interested in receiving the multicast traffic. The switch then forwards the multicast traffic only to interface ge-0/0/1.

This example shows how to perform the following optional configurations, which can reduce group join and leave latency:

- Configure immediate leave on the VLAN. When immediate leave is configured, the switch stops forwarding multicast traffic on an interface when it detects that the last member of the multicast group has left the group. If immediate leave is not configured, the switch waits until the group-specific queries time out before it stops forwarding traffic.

Immediate leave is supported by IGMP version 2 (IGMPv2) and IGMPv3. With IGMPv2, we recommend that you configure immediate leave only when there is only one IGMP host on an interface. In IGMPv2, only one host on a interface sends a membership report in response to a group-specific query—any other interested hosts suppress their reports to avoid a flood of reports for the same group. This report-suppression feature implies that the switch knows about only one interested host at any given time.

- Configure ge-0/0/12 as a static multicast-router interface. In this topology, ge-0/0/12 always leads to the multicast router. By statically configuring ge-0/0/12 as a multicast-router interface, you avoid any delay imposed by the switch having to learn that ge-0/0/12 is a multicast-router interface.

### Configuration

To configure IGMP snooping on a switch:

#### CLI Quick Configuration

To quickly configure IGMP snooping, copy the following commands and paste them into the switch terminal window:

```
[edit]
set protocols igmp-snooping vlan vlan100 immediate-leave
set protocols igmp-snooping vlan vlan100 interface ge-0/0/12 multicast-router-interface
```

#### Step-by-Step Procedure

To configure IGMP snooping on vlan100:

1. Configure the switch to immediately remove a group membership from an interface when it receives a leave report from the last member of the group on the interface:

```
[edit protocols]
user@switch# set igmp-snooping vlan vlan100 immediate-leave
```

2. Statically configure interface ge-0/0/12 as a multicast-router interface:

```
[edit protocols]
user@switch# set igmp-snooping vlan vlan100 interface ge-0/0/12
multicast-router-interface
```

**Results** Check the results of the configuration:

```
[edit protocols]
user@switch# show igmp-snooping
vlan vlan100 {
    immediate-leave;
    interface ge-0/0/12.0 {
        multicast-router-interface;
    }
}
```

### Verifying IGMP Snooping Operation

---

To verify that IGMP snooping is operating as configured, perform the following task:

- [Displaying IGMP Snooping Information for VLAN vlan100 on page 3730](#)

#### *Displaying IGMP Snooping Information for VLAN vlan100*

**Purpose** Verify that IGMP snooping is enabled on vlan100 and that ge-0/0/12 is recognized as a multicast-router interface.

**Action** Enter the following command:

```
user@switch>show igmp snooping membership
VLAN: vlan100
    Interfaces: ge-0/0/12.0,
```

**Meaning** By showing information for vlan100, the command output confirms that IGMP snooping is configured on the VLAN. Interface ge-0/0/12.0 is listed as a multicast-router interface, as configured. Because none of the host interfaces are listed, none of the hosts are currently receivers for the multicast group.

### Configuring IGMP Snooping (CLI Procedure)

**NOTE:** This topic uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see: [Configuring IGMP Snooping](#). For ELS details see, [“Getting Started with Enhanced Layer 2 Software” on page 3](#).

Internet Group Management Protocol (IGMP) snooping constrains the flooding of IPv4 multicast traffic on a VLAN. When IGMP snooping is enabled, a switch examines IGMP messages between hosts and multicast routers and learns which hosts are interested in receiving multicast traffic for a multicast group. Based on what it learns, the switch then forwards multicast traffic only to those interfaces connected to interested receivers instead of flooding the traffic to all interfaces. In IGMPv2, only one host on a interface sends a membership report in response to a group-specific query—any other interested

hosts suppress their reports to avoid a flood of reports for the same group. This report-suppression feature means that the switch only knows about only one interested host at any given time.

By default, IGMP snooping is enabled on the default VLAN. For many networks, IGMP snooping requires no further configuration.

You can perform the following optional configurations for each VLAN:

- Selectively enable IGMP snooping on specific VLANs.
- Enable immediate leave on a VLAN or all VLANs. Enabling immediate leave ensures that the switch stops forwarding multicast traffic immediately after the last member host on the interface leaves the group.
- Configure an interface as a static multicast-router interface for a VLAN so that the switch does not need to dynamically learn that the interface is a multicast-router interface.
- Configure an interface as a static member of a multicast group so that the switch does not need to dynamically learn the interface's membership.
- Change the value for certain timers and counters to match the values configured on the multicast router serving as the IGMP querier.

This topic covers:

- [Enabling IGMP Snooping on VLANs on page 3731](#)
- [Enabling Immediate Leave on page 3731](#)
- [Configuring an Interface as a Multicast-Router Interface on page 3732](#)
- [Configuring Static Group Membership on an Interface on page 3733](#)
- [Changing the Timer and Counter Values on page 3734](#)

### Enabling IGMP Snooping on VLANs

This topic describes how you can selectively enable IGMP snooping on VLANs. It assumes that you are beginning with the factory default configuration.

- To enable IGMP snooping on a VLAN:

```
[edit protocols igmp-snooping]
user@switch# set vlan vlan-name
```

You can also deactivate the IGMP snooping protocol on the switch without changing the IGMP snooping VLAN configurations:

```
[edit]
user@switch# deactivate protocols igmp-snooping
```

### Enabling Immediate Leave

By default, when a switch with IGMP snooping enabled receives an IGMP leave report on a member interface, it waits for hosts on the interface to respond to IGMP group-specific queries to determine whether there still are hosts on the interface interested

in receiving the group multicast traffic. If the switch does not see any membership reports for the group within a set interval of time, it removes the interface's group membership from the multicast forwarding table and stops forwarding multicast traffic for the group to the interface.

You can decrease the leave latency created by this default behavior by enabling immediate leave on a VLAN.

When you enable immediate leave on a VLAN, host tracking is also enabled, which allows the switch to keep track of the hosts on an interface that have joined a multicast group. When the switch receives a leave report from the last member of the group, it immediately stops forwarding traffic to the interface and does not wait for the interface group membership to time out.

Immediate leave is supported for both IGMP version 2 (IGMPv2) and IGMPv3. However, with IGMPv2, we recommend that you configure immediate leave only when there is only one IGMP host on an interface.

To enable immediate leave on a VLAN:

```
[edit protocols]
user@switch# set igmp-snooping vlan vlan-name immediate-leave
```

---

### Configuring an Interface as a Multicast-Router Interface

---

When IGMP snooping is enabled on a switch, the switch determines which interfaces face a multicast router by monitoring interfaces for IGMP queries. If the switch receives these messages on an interface, it adds the interface to its multicast forwarding table as a multicast-router interface.

In addition to dynamically learned interfaces, the multicast forwarding table can include interfaces that you explicitly configure to be multicast-router interfaces. Unlike the table entries for dynamically learned interfaces, table entries for statically configured interfaces are not subject to aging and deletion from the forwarding table.

Examples of when you might want to configure a static multicast-router interface include:

- You have an unusual network configuration that prevents IGMP snooping from reliably learning about a multicast-router interface through monitoring IGMP queries.
- Your implementation does not require an IGMP querier.
- You have a stable topology and want to avoid the delay the dynamic learning process entails.

**NOTE:** All unregistered multicast packets, whether they are IPv4 or IPv6 packets, are forwarded only to the multicast-router interface.

---

To configure an interface as a static multicast-router interface:

```
[edit protocols]
```

```
user@switch# set igmp-snooping vlan vlan-name interface interface-name
multicast-router-interface
```

For example, to configure ge-0/0/5.0 as a multicast-router interface on a VLAN vlan100 on the switch:

```
[edit protocols]
user@switch# set igmp-snooping vlan vlan100 interface ge-0/0/5.0
multicast-router-interface
```

### Configuring Static Group Membership on an Interface

To determine how to forward multicast packets, a switch with IGMP snooping enabled maintains a multicast forwarding table containing a list of host interfaces that have interested listeners for a specific multicast group. The switch learns which host interfaces to add or delete from this table by examining IGMP membership reports as they arrive on interfaces on which IGMP snooping is enabled.

In addition to such dynamically learned interfaces, the multicast forwarding table can include interfaces that you statically configure to be members of multicast groups. When you configure a static group interface, the switch adds the interface to the forwarding table as a host interface for the group. Unlike an entry for a dynamically learned interface, a static interface entry is not subject to aging and deletion from the forwarding table.

Examples of when you might want to configure static group membership on an interface include:

- You want to simulate an attached multicast receiver for testing purposes.
- The interface has receivers that cannot send IGMP membership reports.
- You want the multicast traffic for a specific group to be immediately available to a receiver without any delay imposed by the dynamic join process.

**NOTE:** The switch does not simulate IGMP membership reports on behalf of a statically configured interface. Thus a multicast router might be unaware that the switch has an interface that is a member of the multicast group. You can configure a static group interface on the router to ensure that the switch receives the group multicast traffic.

To configure a host interface as a static member of a multicast group:

```
[edit protocols]
user@switch# set igmp-snooping vlan vlan-name interface interface-name static group
ip-address
```

For example, to configure interface ge-0/0/11.0 in vlan100 as a static member of multicast group 225.0.0.1:

```
[edit protocols]
user@switch# set igmp-snooping vlan vlan100 interface ge-0/0/11.0 static group
225.0.0.1
```

## Changing the Timer and Counter Values

---

IGMP uses various timers and counters to determine how often an IGMP querier sends out membership queries and when group memberships time out. On EX Series switches, the default values of the IGMP and IGMP snooping timers and counters are set to the values recommended in RFC 2236, *Internet Group Management Protocol, Version 2*. These values work well for most multicast implementations.

There might be cases, however, where you might want to modify the timer and counter values—for example, to reduce burstiness, to reduce leave latency, or to adjust for expected packet loss on a subnet. If you change a timer or counter value for the IGMP querier on a VLAN, we recommend that you change the value for all multicast routers and switches on the VLAN so that all devices time out group memberships at approximately the same time.

You can configure the following timers and counters on a switch:

- **query-interval**—The length of time the IGMP querier waits between sending general queries (the default is 125 seconds). You can change this interval to tune the number of IGMP messages on the subnet; larger values cause general queries to be sent less often.

You cannot configure this value directly for IGMP snooping. IGMP snooping inherits the value from the IGMP value configured on the switch, which is applied to all VLANs on the switch.

To configure the IGMP **query-interval**:

```
[edit protocols]
user@switch# set igmp-snooping vlan
vlan-name query-interval seconds
```

- **query-response-interval**—The maximum length of time the host can wait until it responds (the default is 10 seconds). You can change this interval to adjust the burst peaks of IGMP messages on the subnet. Set a larger interval to make the traffic less bursty.

You cannot configure this value directly for IGMP snooping. IGMP snooping inherits the value from the IGMP value configured on the switch, which is applied to all VLANs on the switch.

To configure the IGMP **query-response-interval**:

```
[edit protocols]
user@switch# set igmp-snooping vlan vlan-name

query-response-interval seconds
```

- **query-last-member-interval**—The length of time the IGMP querier waits between sending group-specific membership queries (the default is 1 second). The IGMP querier sends a group-specific query after receiving a leave report from a host. You can decrease this interval to reduce the amount of time it takes for multicast traffic to stop forwarding traffic after the last member leaves a group.

You cannot configure this value directly for IGMP snooping. IGMP snooping inherits the value from the IGMP value configured on the switch, which is applied to all VLANs on the switch.

To configure the IGMP **query-last-member-interval**:

```
[edit protocols]
user@switch# set igmp-snooping vlan vlan-name query-last-member-interval seconds
```

- **robust-count**—The number of times the querier resends a general membership query or a group-specific membership query (the default is 2 times). You can increase this count to tune for higher expected packet loss.

For IGMP snooping, you can configure **robust-count** for a specific VLAN. If a VLAN does not have **robust-count** configured, the robust-count value is the value configured for IGMP.

To configure robust-count for IGMP snooping on a VLAN:

```
[edit protocols]
user@switch# set igmp-snooping vlan vlan-name robust-count number
```

The values configured for **query-interval**, **query-response-interval**, and **robust-count** determine the multicast listener interval—the length of time the switch waits for a group membership report after a general query before removing a multicast group from its multicast forwarding table. The switch calculates the multicast listener interval by multiplying **query-interval** by the **robust-count** and then adding **query-response-interval** to the product:

$(\text{query-interval} * \text{robust-count}) + \text{query-response-interval} = \text{multicast listener interval}$ .

For example, the multicast listener interval is 260 seconds when the default settings for **query-interval**, **query-response-interval**, and **robust-count** are used:

$(125 * 2) + 10 = 260$

You can display the time remaining in the multicast listener interval before a group times out by using the **show igmp-snooping membership** command.

#### Related Documentation

- [Example: Configuring IGMP Snooping on page 3727](#)

## Configuring IGMP Snooping (J-Web Procedure)

**NOTE:** This topic applies only to the J-Web Application package.

IGMP snooping regulates multicast traffic in a switched network. With IGMP snooping enabled, the EX Series switch monitors the IGMP transmissions between a host (a network device) and a multicast router, keeping track of the multicast groups and associated

member interfaces. The switch uses that information to make intelligent multicast-forwarding decisions and forward traffic to the intended destination interfaces.

You can configure IGMP snooping on one or more VLANs to allow the switch to examine IGMP packets and make forwarding decisions based on packet content. By default, IGMP snooping is enabled on EX Series switches.

To enable IGMP snooping and configure individual options by using the J-Web interface:

1. Select **Configure > Switching > IGMP Snooping**.

**NOTE:** After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See [Using the Commit Options to Commit Configuration Changes](#) for details about all commit options.

2. Click one of the following options:

- **Add**—Creates an IGMP snooping configuration for the VLAN.
- **Edit**—Modifies an IGMP snooping configuration for the VLAN.
- **Delete**—Deletes a selected VLAN from the IGMP snooping configuration.

When you are adding or editing an IGMP snooping configuration, enter information as described in [Table 388 on page 3736](#).

3. Click **OK** to apply changes to the configuration or click **Cancel** to cancel without saving changes.

To disable IGMP snooping on a VLAN, select the VLAN from the list and click **Disable**.

**NOTE:** The **Disable** option is not available for EX4300 switches.

**Table 388: IGMP Snooping Configuration Fields**

| Field           | Function                                                                                                                                                                                                                      | Your Action                                                                                    |

## Configuring IGMP Snooping Tracing Operations (CLI Procedure)

By enabling tracing operations for IGMP snooping, you can record detailed messages about the operation of the protocol, such as the various types of protocol packets sent and received. [Table 389 on page 3737](#) describes the tracing operations you can enable and the flags used to specify them in the tracing configuration.

Table 389: Supported Tracing Operations for IGMP Snooping

| Tracing Operation                               | Flag           |
|-------------------------------------------------|----------------|
| Trace all (equivalent of including all flags).  | <b>all</b>     |
| Trace general IGMP snooping protocol events.    | <b>general</b> |
| Trace communication over routing socket events. | <b>krt</b>     |
| Trace leave reports (IGMPv2 and IGMPv3 only).   | <b>leave</b>   |

Table 389: Supported Tracing Operations for IGMP Snooping (*continued*)

| Tracing Operation                                                                                                            | Flag           |
|------------------------------------------------------------------------------------------------------------------------------|----------------|
| Trace nexthop-related events.                                                                                                | <b>nexthop</b> |
| Trace normal IGMP snooping protocol events. If you do not specify this flag, only unusual or abnormal operations are traced. | <b>normal</b>  |
| Trace all IGMP packets.                                                                                                      | <b>packets</b> |
| Trace policy processing.                                                                                                     | <b>policy</b>  |
| Trace IGMP membership query messages.                                                                                        | <b>query</b>   |
| Trace membership reports                                                                                                     | <b>report</b>  |
| Trace routing information.                                                                                                   | <b>route</b>   |
| Trace state transitions.                                                                                                     | <b>state</b>   |
| Trace routing protocol task processing.                                                                                      | <b>task</b>    |
| Trace timer processing.                                                                                                      | <b>timer</b>   |
| Trace VLAN-related events.                                                                                                   | <b>vlan</b>    |

This topic covers:

- [Configuring Tracing Operations on page 3738](#)
- [Viewing, Stopping, and Restarting Tracing Operations on page 3739](#)

### Configuring Tracing Operations

To configure tracing operations for IGMP snooping:

1. Configure the filename for the trace file:

```
[edit protocols igmp-snooping ]
user@switch# set traceoptions file filename
```

For example:

```
[edit protocols igmp-snooping ]
user@switch# set traceoptions file mld-snoop-trace
```

2. (Optional) Configure the maximum number of trace files and size of the trace files:

```
[edit protocols igmp-snooping ]
user@switch # set file files number size size
```

For example:

```
[edit protocols igmp-snooping ]
user@switch # set traceoptions file files 5 size 1m
```

causes the contents of the trace file to be emptied and archived in a .gz file when the file reaches 1 MB. Four archive files are maintained, the contents of which are rotated whenever the current active trace file is archived.

If you omit this step, the maximum number of trace files defaults to 10, with the maximum file size defaulting to 128 K.

3. Specify one of the tracing flags shown in [Table 389 on page 3737](#):

```
[edit protocols igmp-snooping ]
user@switch # set traceoptions flag flagname
```

For example, to perform trace operations on VLAN-related events and IGMP query messages:

```
[edit protocols igmp-snooping ]
user@switch# set traceoptions flag vlan

[edit protocols igmp-snooping ]
user@switch# set traceoptions flag query
```

### Viewing, Stopping, and Restarting Tracing Operations

When you commit the configuration, tracing operations begin. You can view the trace file in the `/var/log` directory. For example:

```
user@switch> file show /var/log/igmp-snoop-trace
```

You can stop and restart tracing operations by deactivating and reactivating the configuration:

```
[edit]
user@switch# deactivate protocols igmp-snooping traceoptions

[edit]
user@switch# activate protocols igmp-snooping traceoptions
```

## [\[edit protocols igmp-snooping\] Configuration Statement Hierarchy](#)

This topic lists supported and unsupported configuration statements in the [\[edit protocols igmp-snooping\]](#) hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.
- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see *EX Series Switch Software Features Overview*.

This topic lists:

- [Supported Statements in the \[edit protocols igmp-snooping\] Hierarchy Level on page 3744](#)
- [Unsupported Statements in the \[edit protocols igmp-snooping\] Hierarchy Level on page 3744](#)

### Supported Statements in the [edit protocols igmp-snooping] Hierarchy Level

The following hierarchy shows the **[edit protocols igmp-snooping]** configuration statements supported on EX Series switches:

```
protocols {
  igmp-snooping {
    vlan vlan-name {
      immediate-leave;
      interface interface-name {
        group-limit <1..65535>
        host-only-interface
        multicast-router-interface;
        immediate-leave;
        static {
          group multicast-ip-address {
            source <>
          }
        }
      }
    }
  }
  l2-querier {
    source-address ip-address;
  }
  proxy {
    source-address ip-address;
  }
  query-interval number;
  query-last-member-interval number;
  query-response-interval number;
  robust-count number;
  traceoptions {
    file filename <files number> <no-stamp> <replace> <size maximum-file-size>
      <world-readable | no-world-readable>;
    flag flag <flag-modifier>;
  }
}
```

### Unsupported Statements in the [edit protocols igmp-snooping] Hierarchy Level

All statements in the **[edit protocols igmp-snooping]** hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented.

| <b>Description</b>              | Multicast routing devices running PIM sparse mode often forward the same stream of multicast packets onto the same LAN through the rendezvous-point tree (RPT) and shortest-path tree (SPT). PIM assert messages help routing devices determine which routing device forwards the traffic and prunes the RPT for this group. By default, routing devices enter an assert cycle every 180 seconds. You can configure this assert timeout to be between 5 and 210 seconds. |
| <b>Options</b>                  | <b>seconds</b> —Time for routing device to wait before another assert message cycle.<br><b>Range:</b> 5 through 210 seconds<br><b>Default:</b> 180 seconds                                                                                                                                                                                                                                                                                                               |

## igmp-snooping

---

**Syntax** `igmp-snooping {  
 traceoptions {  
 file filename <files number> <no-stamp> <replace> <size size> <world-readable |  
 no-world-readable>;  
 flag flag <flag-modifier>;  
 }  
 vlan (all | vlan-name) {  
 data-forwarding {  
 source {  
 groups group-prefix;  
 }  
 receiver {  
 source-vlans vlan-list;  
 install;  
 }  
 }  
 disable;  
 immediate-leave;  
 interface (all | interface-name) {  
 multicast-router-interface;  
 static {  
 group ip-address;  
 }  
 }  
 proxy {  
 source-address ip-address;  
 }  
 robust-count number;  
 version version;  
 }  
}`

**Hierarchy Level** [edit protocols]

**Release Information** Statement introduced in Junos OS Release 9.1 for EX Series switches.

**Description** Configure IGMP snooping. The factory default configuration enables IGMP snooping on all VLANs.

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>              | <p>The immediate leave setting is useful for minimizing the leave latency of IGMP memberships. When this setting is enabled, the routing device leaves the multicast group immediately after the last host leaves the multicast group.</p> <p>Starting in Junos OS Release 9.3, both IGMP version 2 and IGMP version 3 do host tracking when the <b>immediate-leave</b> statement is configured. This means that the multicast group leaves only when the last host leaves. The routing device keeps track of the hosts that send join messages. This allows IGMP to determine when the last host sends a leave message for the multicast group.</p> <p>When the immediate leave setting is enabled, the device removes an interface from the forwarding-table entry without first sending IGMP group-specific queries to the interface. The interface is pruned from the multicast tree for the multicast group specified in the IGMP leave message. The immediate leave setting ensures optimal bandwidth management for hosts on a switched network, even when multiple multicast groups are being used simultaneously.</p> <p>When immediate leave is disabled and one host sends a leave group message, the routing device first sends a group query to determine if another receiver responds. If no receiver responds, the routing device removes all hosts on the interface from the multicast group. Immediate leave is disabled by default for both IGMP version 2 and IGMP version 3.</p> |
|                                 | <p> <b>NOTE:</b> Although host tracking is enabled for IGMPv2 and MLDv1 when you enable immediate leave, use immediate leave with these versions only when there is one host on the interface. The reason is that IGMPv2 and MLDv1 use a report suppression mechanism whereby only one host on an interface sends a group join report in response to a membership query. The other interested hosts suppress their reports. The purpose of this mechanism is to avoid a flood of reports for the same group. But it also interferes with host tracking, because the routing device only knows about the one interested host and does not know about the others.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Description</b>              | <p>Configure IGMP snooping immediate leave for the specified VLAN. When you configure immediate leave, host tracking is enabled, which allows the switch to track the hosts that send membership reports. The switch can then determine when the last host on an interface leaves the multicast group and immediately stop forwarding multicast traffic to the interface.</p> <p>Configuring immediate leave reduces the amount of time it takes for the switch to stop sending multicast traffic to an interface when the last host leaves the group. When immediate leave is disabled, the switch no longer tracks hosts. Instead, whenever it receives a leave report from a host, it sends out a group-specific query to all hosts. If it does not receive any membership reports on the interface in response to the group-specific query within a set interval, it stops forwarding multicast traffic to the interface.</p> |
|                                 | <div> <b>NOTE:</b> Immediate leave is supported for both IGMP version 2 (IGMPv2) and IGMPv3. However, with IGMPv2, we recommend that you configure immediate leave only when there is only one IGMP host on an interface. In IGMPv2, only one host on a interface sends a membership report in response to a general query—any other interested hosts suppress their reports. Report suppression avoids a flood of reports for the same group, but it also interferes with host tracking because the switch knows only about one interested host on the interface at any given time.</div>                                                                                                                                                                                                                                                     |
| <b>Default</b>                  | The immediate-leave feature is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Release Information</b>      | <p>Statement introduced in Junos OS Release 8.0.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>                                                                                                                                                                                                                      |
| <b>Description</b>              | Apply one or more policies to set the SPT threshold to infinity for a source-group address pair. Use the <b>infinity</b> statement to prevent the last-hop routing device from transitioning from the RPT rooted at the RP to an SPT rooted at the source for that source-group address pair.                                                                                                                                  |
| <b>Options</b>                  | <i>policy-names</i> —Name of one or more policies.                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                 |

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Enable PIM on an interface and configure interface-specific properties.

**Options** *interface-name*—Name of the interface. Specify the full interface name, including the physical and logical address components. To configure all interfaces, you can specify [all](#).

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>              | For PIM-SM, configure this routing device's priority for becoming an RP.<br><br>For bidirectional PIM, configure this RP address' priority for becoming an RP.<br><br>The bootstrap router uses this field when selecting the list of candidate rendezvous points to send in the bootstrap message. A smaller number increases the likelihood that the routing device or RP address becomes the RP. A priority value of 0 means that bootstrap router can override the group range being advertised by the candidate RP.                                                                                                                                                                                       |
| <b>Options</b>                  | <b><i>number</i></b> —Priority for becoming an RP. A lower value corresponds to a higher priority.<br><b>Range:</b> 0 through 255<br><b>Default:</b> 1                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b>              | <p>Set the SPT threshold to infinity for a source-group address pair. Last-hop multicast routing devices running PIM sparse mode can forward the same stream of multicast packets onto the same LAN through an RPT rooted at the RP or an SPT rooted at the source. By default, last-hop routing devices transition to a direct SPT to the source. You can configure this routing device to set the SPT transition value to infinity to prevent this transition for any source-group address pair.</p> <p>The remaining statements are explained separately.</p> |

## static (Protocols IGMP)

**Syntax**

```
static {
    group multicast-group-address {
        exclude;
        group-count number;
        group-increment increment;
        source ip-address {
            source-count number;
            source-increment increment;
        }
    }
}
```

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols igmp **interface** *interface-name*],  
[edit protocols igmp **interface** *interface-name*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description** Test multicast forwarding on an interface without a receiver host.

The **static** statement simulates IGMP joins on a routing device statically on an interface without any IGMP hosts. It is supported for both IGMPv2 and IGMPv3 joins. This statement is especially useful for testing multicast forwarding on an interface without a receiver host.

**NOTE:** To prevent joining too many groups accidentally, the **static** statement is not supported with the **interface all** statement.

The remaining statements are explained separately.

**Required Privilege Level** routing and trace—To view this statement in the configuration.  
routing-control and trace-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Configure PIM tracing options.</p> <p>To specify more than one tracing operation, include multiple <b>flag</b> statements.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Default</b>             | The default PIM trace options are those inherited from the routing protocol's <b>traceoptions</b> statement included at the [edit <b>routing-options</b> ] hierarchy level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>             | <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. We recommend that you place tracing output in the <b>pim-log</b> file.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you must also include the <b>size</b> statement to specify the maximum file size.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 2 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <p><b>PIM Tracing Flags</b></p> <ul style="list-style-type: none"><li>• <b>assert</b>—Assert messages</li><li>• <b>bidirectional-df-election</b>—Bidirectional PIM designated-forwarder (DF) election events</li></ul> |

- **bootstrap**—Bootstrap messages
- **cache**—Packets in the PIM sparse mode routing cache
- **graft**—Graft and graft acknowledgment messages
- **hello**—Hello packets
- **join**—Join messages
- **mt**—Multicast tunnel messages
- **nsr-synchronization**—Nonstop active routing (NSR) synchronization messages
- **packets**—All PIM packets
- **prune**—Prune messages
- **register**—Register and register stop messages
- **rp**—Candidate RP advertisements
- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

**no-stamp**—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Do not allow users to read the log file.

**replace**—(Optional) Replace an existing trace file if there is one.

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When **trace-file** again reaches this size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of trace files.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 0 KB through the maximum file size supported on your system

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b>         | <p>Configure IGMP tracing options.</p> <p>To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <p>To trace the paths of multicast packets, use the <b>mtrace</b> command.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Default</b>             | The default IGMP trace options are those inherited from the routing protocols <b>traceoptions</b> statement included at the [edit routing-options] hierarchy level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>             | <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. We recommend that you place tracing output in the file <b>igmp-log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you must also include the <b>size</b> statement to specify the maximum file size.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 2 files</p> <p><b>flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <p><b>IGMP Tracing Flags</b></p> <ul style="list-style-type: none"> <li><b>leave</b>—Leave group messages (for IGMP version 2 only).</li> <li><b>mtrace</b>—Mtrace packets. Use the <b>mtrace</b> command to troubleshoot the software.</li> <li><b>packets</b>—All IGMP packets.</li> </ul> |

- **query**—IGMP membership query messages, including general and group-specific queries.
- **report**—Membership report messages.

#### Global Tracing Flags

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Detailed trace information
- **receive**—Packets being received
- **send**—Packets being transmitted

**no-stamp**—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Do not allow users to read the log file.

**replace**—(Optional) Replace an existing trace file if there is one.

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When **trace-file** again reaches this size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also include the **files** statement to specify the maximum number of trace files.

**Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

| <b>Release Information</b> | Statement introduced in Junos OS Release 9.1 for EX Series switches.<br>Statement introduced in Junos OS Release 13.2 for the QFX series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>         | Define tracing operations for IGMP snooping.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Default</b>             | The <b>traceoptions</b> feature is disabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files, including the active trace file. When a trace file reaches its maximum size, its contents are archived into a compressed file named <b><i>filename.0</i></b> and the trace file is emptied. When the trace file reaches its maximum size again, the <b><i>filename.0</i></b> archive file is renamed <b><i>filename.1</i></b> and a new <b><i>filename.0</i></b> archive file is created from the contents of the trace file. This process continues until the maximum number of trace files is reached, at which point the system starts overwriting the oldest archive file each time the trace file is archived. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000<br/><b>Default:</b> 10 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:</p> <ul style="list-style-type: none"><li>• <b>all</b>—All tracing operations.</li><li>• <b>general</b>—Trace general IGMP snooping protocol events.</li><li>• <b>krt</b>—Trace communication over routing socket.</li><li>• <b>leave</b>—Trace leave group messages (IGMPv2 and IGMPv3 only).</li><li>• <b>nexthop</b>—Trace nexthop-related events.</li><li>• <b>normal</b>—Trace normal IGMP snooping protocol events. If you do not specify this flag, only unusual or abnormal operations are traced.</li><li>• <b>packets</b>—Trace all IGMP packets.</li><li>• <b>policy</b>—Trace policy processing.</li><li>• <b>query</b>—Trace IGMP membership query messages.</li></ul> |

- **report**—Trace membership report messages.
- **route**—Trace routing information.
- **state**—Trace IGMP state transitions.
- **task**—Trace routing protocol task processing.
- **timer**—Trace routing protocol timer processing.
- **vlan**—Trace VLAN-related events.

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers per flag:

- **detail**—Provide detailed trace information
- **disable**—Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as all.
- **receive**—Packets being received.
- **send**—Packets being transmitted.

**no-stamp**—(Optional) Omit the timestamp at the beginning of each line in the trace file.

**no-world-readable**—(Optional) Restrict file access to the user who created the file.

**replace**—(Optional) Replace an existing trace file if there is one. If you do not include this option, tracing output is appended to an existing trace file.

**size size** —(Optional) Maximum size of each trace file, in bytes, kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is zipped and renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum size, you also must specify a maximum number of files with the **files** option.

**Syntax:** *x* to specify bytes, *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

**Range:** 10240 through 4294967295 bytes

**Default:** 128 KB

**world-readable**—(Optional) Allow unrestricted file access.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for EX Series switches.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.                                                                                                                                                                                                                                                             |
| <b>Description</b>              | Specify the IGMP version for the IGMP general query that the switch sends to hosts when an interface comes up. The configured IGMP version affects only the version of the general queries sent by a switch. It does not affect the version of IGMP messages that the switch can snoop. For example, If the switch is configured for IGMP version 1 (IGMPv1), it can snoop IGMPv2 and IGMPv3 messages. |
| <b>Default</b>                  | If you do not configure the <b>version</b> statement, the default is IGMPv2.                                                                                                                                                                                                                                                                                                                           |

## vlan (IGMP Snooping)

```
Syntax  vlan (all | vlan-name) {
        data-forwarding {
            source {
                groups group-prefix;
            }
            receiver {
                source-vlans vlan-list;
                install;
            }
        }
        disable;
        immediate-leave;
        interface (all | interface-name) {
            multicast-router-interface;
            static {
                group ip-address;
            }
        }
        proxy {
            source-address ip-address;
        }
        robust-count number;
        version version;
    }
```

Hierarchy Level [edit protocols **igmp-snooping**]

**Release Information** Statement introduced in Junos OS Release 9.1 for EX Series switches.  
Statement updated with enhanced ? (CLI completion feature) functionality in Junos OS Release 9.5 for EX Series switches.

**Description** Configure IGMP snooping parameters for a VLAN.

When the **vlan** configuration statement is used without the **disable** statement, IGMP snooping is enabled on the specified VLAN or on all VLANs.

**NOTE:** You cannot configure IGMP snooping on a secondary VLAN.

**Default** If the **vlan** statement is not included in the configuration, IGMP snooping is disabled.

- Options**
- **all**—All VLANs on the switch
  - ***vlan-name***—Name of a VLAN.

**TIP:** When you configure IGMP snooping parameters using the **vlan all** statement, any VLAN that is not individually configured for IGMP snooping

inherits the `vlan all` configuration. Any VLAN that is individually configured for IGMP snooping, on the other hand, inherits none of its configuration from `vlan all`. Any parameters that are not explicitly defined for the individual VLAN assume their default values, not the values specified in the `vlan all` configuration.

For example, in the following configuration:

```
protocols {
  igmp-snooping {
    vlan all {
      robust-count 8;
    }
    vlan employee {
      interface ge-0/0/8.0 {
        static {
          group 239.0.10.3
        }
      }
    }
  }
}
```

all VLANs, except `employee`, have a robust count of 8. Because `employee` has been individually configured, its robust count value is not determined by the value set under `vlan all`. Instead, its robust count is the default value of 2.

.....

The remaining statements are explained separately.

## Routine Monitoring

---

- [Monitoring IGMP Snooping on page 3823](#)
- [Verifying IGMP Snooping \(CLI Procedure\) on page 3826](#)

## Monitoring IGMP Snooping

**Purpose**

**NOTE:** This topic applies only to the J-Web Application package.

Use the monitoring feature to view status and information about IGMP snooping configuration on your EX Series switch.

**Action**

To display IGMP snooping details in the J-Web interface, select **Monitor > Switching > IGMP Snooping**.

To display IGMP snooping details in the CLI, enter the following commands:

- `show igmp-snooping route`
- `show igmp-snooping statistics`
- `show igmp-snooping vlans`

**NOTE:** On EX4300 switches, to display IGMP snooping details in the CLI, enter the following commands:

- `show igmp snooping interface`
- `show igmp snooping statistics`
- `show multicast snooping next-hops`
- `show multicast snooping route`

**Meaning** Table 390 on page 3824 summarizes the IGMP snooping details displayed.

**Table 390: Summary of IGMP Snooping Output Fields**

| Field                                                          | Values                                                                                                     |
|----------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|
| IGMP Snooping Monitor                                          |                                                                                                            |
| VLAN                                                           | The VLAN for which IGMP snooping is enabled.                                                               |
| Interfaces                                                     | Indicates the interfaces configured as switching interfaces that are associated with the multicast router. |
| Groups                                                         | Indicates the number of the multicast groups learned by the VLAN.                                          |
| Learning Domain                                                | Learning domain for snooping.                                                                              |
| <b>NOTE:</b> This option is supported only on EX4300 switches. |                                                                                                            |
| Query Interval                                                 | Frequency (in seconds) with which the router sends membership queries when it is the querier.              |
| <b>NOTE:</b> This option is supported only on EX4300 switches. |                                                                                                            |
| Query Response Interval                                        | Time (in seconds) that the router waits for a response to a general query.                                 |
| <b>NOTE:</b> This option is supported only on EX4300 switches. |                                                                                                            |
| Last Member Query Interval                                     | Time (in seconds) that the router waits for a report in response to a group-specific query.                |
| <b>NOTE:</b> This option is supported only on EX4300 switches. |                                                                                                            |
| Robustness Count                                               | Number of times the router retries a query.                                                                |
| <b>NOTE:</b> This option is supported only on EX4300 switches. |                                                                                                            |
| MRouters                                                       | Specifies the multicast router.                                                                            |
| <b>NOTE:</b> This option is not supported on EX4300 switches.  |                                                                                                            |
| Receivers                                                      | Specifies the multicast receiver.                                                                          |
| <b>NOTE:</b> This option is not supported on EX4300 switches.  |                                                                                                            |

## Verifying IGMP Snooping (CLI Procedure)

Internet Group Management Protocol (IGMP) snooping constrains the flooding of IPv4 multicast traffic on VLANs on a switch. This topic describes how to verify IGMP snooping operation on the switch.

It covers:

- [Verifying IGMP Snooping Memberships on page 3826](#)
- [Viewing IGMP Snooping Statistics on page 3827](#)
- [Viewing IGMP Snooping Routing Information on page 3828](#)

### Verifying IGMP Snooping Memberships

**Purpose** Determine group memberships, multicast-router interfaces, host IGMP versions, and the current values of timeout counters.

**Action** Enter the following command:

```
user@switch> show igmp-snooping membership detail
VLAN: vlan2 Tag: 2 (Index: 3)
  Router interfaces:
    ge-1/0/0.0 dynamic Uptime: 00:14:24 timeout: 253
  Group: 225.0.0.1
    ge-1/0/17.0 259 Last reporter: 13.0.0.90 Receiver count: 1
    Uptime: 00:00:19 timeout: 259 Flags: <V3-hosts>
    Include source: 10.2.11.5, 10.2.11.12
```

**Meaning** The switch has multicast membership information for one VLAN on the switch, **vlan2**. IGMP snooping might be enabled on other VLANs, but the switch does not have any multicast membership information for them. The following information is provided:

- Information on the multicast-router interfaces for the VLAN—in this case, **ge-1/0/0.0**. The multicast-router interface has been learned by IGMP snooping, as indicated by the dynamic value. The timeout value shows how many seconds from now the interface will be removed from the multicast forwarding table if the switch does not receive IGMP queries or Protocol Independent Multicast (PIM) updates on the interface.
- Information about the group memberships for the VLAN:
  - Currently, the VLAN has membership in only one multicast group, **225.0.0.1**.
  - The host or hosts that have reported membership in the group are on interface **ge-1/0/17.0**. The last host that reported membership in the group has address **13.0.0.90**. The number of hosts belonging to the group on the interface is shown in the Receiver count field, which is displayed only when host tracking is enabled if immediate leave is configured on the VLAN.
  - The Uptime field shows that the multicast group has been active on the interface for 19 seconds. The interface group membership will time out in 259 seconds if no hosts respond to membership queries during this interval. The Flags field shows the lowest version of IGMP used by a host that is currently a member of the group, which in this case is IGMP version 3 (IGMPv3).
  - Because the interface has IGMPv3 hosts on it, the source addresses from which the IGMPv3 hosts want to receive group multicast traffic are shown (addresses **10.2.11.5** and **10.2.11.12**). The timeout value for the interface group membership is derived from the largest timeout value for all sources addresses for the group.

### Viewing IGMP Snooping Statistics

**Purpose** Display IGMP snooping statistics, such as number of IGMP queries, reports, and leaves received and how many of these IGMP messages contained errors.

**Action** Enter the following command:

```
user@switch> show igmp-snooping statistics
Bad length: 0 Bad checksum: 0 Invalid interface: 0
Not local: 0 Receive unknown: 0 Timed out: 0
```

| IGMP Type | Received | Transmitted | Recv Errors |
|-----------|----------|-------------|-------------|
| Queries:  | 74295    | 0           | 0           |
| Reports:  | 18148423 | 0           | 16333523    |
| Leaves:   | 0        | 0           | 0           |
| Other:    | 0        | 0           | 0           |

**Meaning** The output shows how many IGMP messages of each type—**Queries**, **Reports**, **Leaves**—the switch received or transmitted on interfaces on which IGMP snooping is enabled. For each message type, it also shows the number of IGMP packets the switch received that had errors—for example, packets that do not conform to the IGMPv1, IGMPv2, or IGMPv3 standards. If the **Recv Errors** count increases, verify that the hosts are compliant with

IGMP standards. If the switch is unable to recognize the IGMP message type for a packet, it counts the packet under **Receive unknown**.

### Viewing IGMP Snooping Routing Information

---

**Purpose** Display the next-hop information maintained in the multicast forwarding table.

**Action** Enter the following command:

```
user@switch> show igmp-snooping route detail
VLAN          Group          Next-hop
v100          224.0.0.0, *    1323
               Interfaces: ge-0/0/0.0
VLAN          Group          Next-hop
v100          226.0.0.1, *    1322
               Interfaces: ge-0/0/0.0, ge-0/0/1.0, ge-0/0/47.0
```

**Meaning** The output shows the next-hop interfaces for a given multicast group on a VLAN. For example, route **226.0.0.1** on **v100** has next-hop interfaces **ge-0/0/0.0**, **ge-0/0/1.0**, and **ge-0/0/47.0**.

## Sample Output

### clear igmp membership

The following sample output displays IGMP group information before and after the **clear igmp membership** command is entered:

```
user@host> show igmp group
```

| Interface | Group           | Last Reported | Timeout |
|-----------|-----------------|---------------|---------|
| so-0/0/0  | 224.2.127.253   | 10.1.128.1    | 186     |
| so-0/0/0  | 224.2.127.254   | 10.1.128.1    | 186     |
| so-0/0/0  | 239.255.255.255 | 10.1.128.1    | 187     |
| so-0/0/0  | 224.1.127.255   | 10.1.128.1    | 188     |
| local     | 224.0.0.6       | (null)        | 0       |
| local     | 224.0.0.5       | (null)        | 0       |
| local     | 224.2.127.254   | (null)        | 0       |
| local     | 239.255.255.255 | (null)        | 0       |
| local     | 224.0.0.2       | (null)        | 0       |
| local     | 224.0.0.13      | (null)        | 0       |

```

user@host> clear igmp membership
Clearing Group Membership Info for so-0/0/0
Clearing Group Membership Info for so-1/0/0
Clearing Group Membership Info for so-2/0/0

```

```

user@host> show igmp group

```

| Interface | Group           | Last Reported | Timeout |
|-----------|-----------------|---------------|---------|
| local     | 224.0.0.6       | (null)        | 0       |
| local     | 224.0.0.5       | (null)        | 0       |
| local     | 224.2.127.254   | (null)        | 0       |
| local     | 239.255.255.255 | (null)        | 0       |
| local     | 224.0.0.2       | (null)        | 0       |
| local     | 224.0.0.13      | (null)        | 0       |

### clear igmp membership interface

The following sample output displays IGMP group information before and after the **clear igmp membership interface** command is issued:

```

user@host> show igmp group

```

| Interface | Group           | Last Reported | Timeout |
|-----------|-----------------|---------------|---------|

              <rp *ip-address/prefix* | source *ip-address/prefix*>  
              <sg | star-g>

**Syntax (EX Series Switch and the QFX Series)**    clear pim join  
                                                          <group-address>  
                                                          <dense | sparse>  
                                                          <exact>  
                                                          <inet | inet6>  
                                                          <instance *instance-name*>  
                                                          <rp *ip-address/prefix* | source *ip-address/prefix*>  
                                                          <sg | star-g>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.0 for EX Series switches.  
                              **inet6** and **instance** options introduced in Junos OS Release 10.0 for EX Series switches.  
                              Command introduced in Junos OS Release 11.3 for the QFX Series.  
                              Multiple new filter options introduced in Junos OS Release 13.2.

**Description**    Clear the Protocol Independent Multicast (PIM) join and prune states.

**Options**    **none**—Clear the PIM join and prune states for all groups, family addresses, and instances.

**group-address**—(Optional) Clear the PIM join and prune states for a group address.

**bidirectional | dense | sparse**—(Optional) Clear PIM bidirectional mode, dense mode, or sparse and source-specific multicast (SSM) mode entries.

**exact**—(Optional) Clear only the group that exactly matches the specified group address.

**inet | inet6**—(Optional) Clear the PIM entries for IPv4 or IPv6 family addresses, respectively.

**instance *instance-name***—(Optional) Clear the entries for a specific PIM-enabled routing instance.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**rp *ip-address/prefix* | source *ip-address/prefix***—(Optional) Clear the PIM entries with a specified rendezvous point (RP) address and prefix or with a specified source address and prefix. You can omit the prefix.

**sg | star-g**—(Optional) Clear PIM (S,G) or (\*,G) entries.

**Additional Information** The `clear pim join` command cannot be used to clear the PIM join and prune state on a backup Routing Engine when nonstop active routing is enabled.

**Required Privilege Level** clear

- [clear pim join inet6 star-g on page 3843](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

`clear pim join`

```
user@host> clear pim join
Cleared 8 Join/Prune states
```

`clear pim join inet6`

```
user@host> clear pim join inet6
Cleared 4 Join/Prune states
```

`clear pim join inet6 star-g`

```
user@host> clear pim join inet6 star-g
Cleared 1 Join/Prune states
```

## clear pim register

| <b>Release Information</b>      | Command introduced before Junos OS Release 7.4.<br>Command introduced in Junos OS Release 9.0 for EX Series switches.<br>Command introduced in Junos OS Release 9.5 for SRX1400, SRX3400, SRX3600, SRX5600, and SRX5800 devices.<br>Command introduced in Junos OS Release 11.3 for the QFX Series.<br>Command introduced in Junos OS Release 12.3 for the PTX Series. |
| <b>Description</b>              | Display trace information about an IP multicast path.                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>                  | <i>source</i> —Source hostname or address.<br><br><i>logical-system (logical-system-name)</i> —(Optional) Perform this operation on a logical system.<br><br><i>routing-instance routing-instance-name</i> —(Optional) Trace a particular routing instance.                                                                                                            |
| <b>Additional Information</b>   | The <b>mtrace</b> command for multicast traffic is similar to the <b>traceroute</b> command used for unicast traffic. Unlike <b>traceroute</b> , <b>mtrace</b> traces traffic backwards, from the receiver to the source.                                                                                                                                              |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                   |
| <b>List of Sample Output</b>    | <a href="#">mtrace source on page 3851</a>                                                                                                                                                                                                                                                                                                                             |
| <b>Output Fields</b>            | <a href="#">Table 391 on page 3849</a> describes the output fields for the <b>mtrace</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                              |

**Table 391: mtrace Output Fields**

| Field Name                        | Field Description                                             |
|-----------------------------------|---------------------------------------------------------------|
| <b>Mtrace from</b>                | IP address of the receiver.                                   |
| <b>to</b>                         | IP address of the source.                                     |
| <b>via group</b>                  | IP address of the multicast group (if any).                   |
| <b>Querying full reverse path</b> | Indicates the full reverse path query has begun.              |
| <i>number-of-hops</i>             | Number of hops from the source to the named router or switch. |
| <i>router-name</i>                | Name of the router or switch for this hop.                    |
| <i>address</i>                    | Address of the router or switch for this hop.                 |

Table 391: mtrace Output Fields (*continued*)

| Field Name      | Field Description                              |
|-----------------|------------------------------------------------|
| <i>protocol</i> | Protocol used (for example, PIM).              |
| Round trip time | Average round-trip time, in milliseconds (ms). |
| total ttl of    | Time-to-live (TTL) threshold.                  |

## Sample Output

### mtrace source

```
user@host> mtrace 192.1.4.2
Mtrace from 192.1.4.2 to 192.1.1.2 via group 0.0.0.0
Querying full reverse path... * *
 0 routerA.lab.mycompany.net (192.1.1.2)
-1 routerB.lab.mycompany.net (192.1.2.2) PIM thresh^ 1
-2 routerC.lab.mycompany.net (192.1.3.2) PIM thresh^ 1
-3 hostA.lab.mycompany.net (192.1.4.2)
Round trip time 2 ms; total ttl of 2 required.
```

## mtrace from-source

---

**Syntax** `mtrace from-source source source`  
`<brief | detail>`  
`<extra-hops extra-hops>`  
`<group group>`  
`<interval interval>`  
`<loop>`  
`<max-hops max-hops>`  
`<max-queries max-queries>`  
`<multicast-response | unicast-response>`  
`<no-resolve>`  
`<no-router-alert>`  
`<response response>`  
`<routing-instance routing-instance-name>`  
`<ttl tll>`  
`<wait-time wait-time>`

**Release Information** Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Display trace information about an IP multicast path from a source to this router or switch. If you specify a group address with this command, Junos OS returns additional information, such as packet rates and losses.

**Options** **brief | detail**—(Optional) Display the specified level of output.

**extra-hops *extra-hops***—(Optional) Number of hops to take after reaching a nonresponsive router. You can specify a number between **0** and **255**.

**group *group***—(Optional) Group address for which to trace the path. The default group address is **0.0.0.0**.

**interval *interval***—(Optional) Number of seconds to wait before gathering statistics again. The default value is **10** seconds.

**loop**—(Optional) Loop indefinitely, displaying rate and loss statistics.

**max-hops *max-hops***—(Optional) Maximum hops to trace toward the source. The range of values is **0** through **255**. The default value is **32** hops.

**max-queries *max-queries***—(Optional) Maximum number of query attempts for any hop. The range of values is 1 through **32**. The default is **3**.

**multicast-response**—(Optional) Always request the response using multicast.

**no-resolve**—(Optional) Do not attempt to display addresses symbolically.

**no-router-alert**—(Optional) Do not use the router-alert IP option.

**response *response***—(Optional) Send trace response to a host or multicast address.

**routing-instance** *routing-instance-name*—(Optional) Trace a particular routing instance.

**source** *source*—Source hostname or address.

**ttl** *ttl*—(Optional) IP time-to-live (TTL) value. You can specify a number between 0 and 255. Local queries to the multicast group use a value of 1. Otherwise, the default value is 127.

**unicast-response**—(Optional) Always request the response using unicast.

**wait-time** *wait-time*—(Optional) Number of seconds to wait for a response. The default value is 3.

**Required Privilege Level**

**List of Sample Output** [mtrace from-source on page 3854](#)

**Output Fields** [Table 392 on page 3853](#) describes the output fields for the **mtrace from-source** command. Output fields are listed in the approximate order in which they appear.

**Table 392: mtrace from-source Output Fields**

| Field Name                        | Field Description                                             |
|-----------------------------------|---------------------------------------------------------------|
| <b>Mtrace from</b>                | IP address of the receiver.                                   |
| <b>to</b>                         | IP address of the source.                                     |
| <b>via group</b>                  | IP address of the multicast group (if any).                   |
| <b>Querying full reverse path</b> | Indicates the full reverse path query has begun.              |
| <b>number-of-hops</b>             | Number of hops from the source to the named router or switch. |
| <b>router-name</b>                | Name of the router or switch for this hop.                    |
| <b>address</b>                    | Address of the router or switch for this hop.                 |
| <b>protocol</b>                   | Protocol used (for example, PIM).                             |
| <b>Round trip time</b>            | Average round-trip time, in milliseconds (ms).                |
| <b>total ttl of</b>               | Time-to-live (TTL) threshold.                                 |
| <b>source</b>                     | Source address.                                               |
| <b>Response Dest</b>              | Response destination address.                                 |
| <b>Overall</b>                    | Average packet rate for all traffic at each hop.              |

Table 392: mtrace from-source Output Fields (*continued*)

| Field Name                                | Field Description                                                                                                |
|-------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| <b>Packet Statistics for Traffic From</b> | Number of packets lost, number of packets sent, percentage of packets lost, and average packet rate at each hop. |
| <b>Receiver</b>                           | IP address receiving the multicast.                                                                              |
| <b>Query source</b>                       | IP address sending the mtrace query.                                                                             |

| <b>Release Information</b> | <p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.3 for the QFX Series.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>         | Display trace information about a multicast path from this router or switch to a gateway router or switch.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>             | <p><b>gateway gateway</b>—Send the trace query to a gateway multicast address.</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>extra-hops extra-hops</b>—(Optional) Number of hops to take after reaching a nonresponsive router or switch. You can specify a number between <b>0</b> and <b>255</b>.</p> <p><b>group group</b>—(Optional) Group address for which to trace the path. The default group address is <b>0.0.0.0</b>.</p> <p><b>interface interface-name</b>—(Optional) Source address for sending the trace query.</p> <p><b>interval interval</b>—(Optional) Number of seconds to wait before gathering statistics again. The default value is <b>10</b>.</p> <p><b>loop</b>—(Optional) Loop indefinitely, displaying rate and loss statistics.</p> <p><b>max-hops max-hops</b>—(Optional) Maximum hops to trace toward the source. You can specify a number between <b>0</b> and <b>255</b>. The default value is <b>32</b>.</p> <p><b>max-queries max-queries</b>—(Optional) Maximum number of query attempts for any hop. You can specify a number between <b>0</b> and <b>255</b>. The default value is <b>3</b>.</p> <p><b>multicast-response</b>—(Optional) Always request the response using multicast.</p> <p><b>no-resolve</b>—(Optional) Do not attempt to display addresses symbolically.</p> |

**no-router-alert**—(Optional) Do not use the router-alert IP option.

**response *response***—(Optional) Send trace response to a host or multicast address.

**routing-instance *routing-instance-name***—(Optional) Trace a particular routing instance.

**ttl *tll***—(Optional) IP time-to-live value. You can specify a number between 0 and 225. Local queries to the multicast group use TTL 1. Otherwise, the default value is 127.

**unicast-response**—(Optional) Always request the response using unicast.

**wait-time *wait-time***—(Optional) Number of seconds to wait for a response. The default value is 3.

Required Privilege Level

List of Sample Output [mtrace to-gateway on page 3858](#)

Output Fields [Table 394 on page 3858](#) describes the output fields for the **mtrace to-gateway** command. Output fields are listed in the approximate order in which they appear.

**Table 394: mtrace to-gateway Output Fields**

| Field Name                        | Field Description                                             |
|-----------------------------------|---------------------------------------------------------------|
| <b>Mtrace from</b>                | IP address of the receiver.                                   |
| <b>to</b>                         | IP address of the source.                                     |
| <b>via group</b>                  | IP address of the multicast group (if any).                   |
| <b>Querying full reverse path</b> | Indicates the full reverse path query has begun.              |
| <b><i>number-of-hops</i></b>      | Number of hops from the source to the named router or switch. |
| <b><i>router-name</i></b>         | Name of the router or switch for this hop.                    |
| <b><i>address</i></b>             | Address of the router or switch for this hop.                 |
| <b><i>protocol</i></b>            | Protocol used (for example, PIM).                             |
| <b>Round trip time</b>            | Average round-trip time, in milliseconds (ms).                |
| <b>total ttl of</b>               | Time-to-live (TTL) threshold.                                 |

## Sample Output

### mtrace to-gateway

```
user@host> mtrace to-gateway gateway 192.1.3.2 group 225.1.1.1 interface 192.1.1.73 brief
```

```
Mtrace from 192.1.1.73 to 192.1.1.2 via group 225.1.1.1
```

```
Querying full reverse path... * *  
 0 routerA.lab.mycompany.net (192.1.1.2)  
-1 routerA.lab.mycompany.net (192.1.1.2) PIM thresh^ 1  
-2 routerB.lab.mycompany.net (192.1.2.2) PIM thresh^ 1  
-3 routerC.lab.mycompany.net (192.1.3.2) PIM thresh^ 1  
Round trip time 2 ms; total ttl of 3 required.
```

**Table 395: show igmp group Output Fields**

| Field Name        | Field Description                                                                                                                                       | Level of Output |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Interface</b>  | Name of the interface that received the IGMP membership report. A name of <b>local</b> indicates that the local routing device joined the group itself. | All levels      |
| <b>Group</b>      | Group address.                                                                                                                                          | All levels      |
| <b>Group Mode</b> | Mode the SSM group is operating in: <b>Include</b> or <b>Exclude</b> .                                                                                  | All levels      |

Table 395: show igmp group Output Fields (*continued*)

| Field Name       | Field Description                                                                                                                                                                                                         | Level of Output |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Source           | Source address.                                                                                                                                                                                                           | All levels      |
| Source timeout   | Time remaining until the group traffic is no longer forwarded. The timer is refreshed when a listener in include mode sends a report. A group in exclude mode or configured as a static group displays a zero timer.      | detail          |
| Last reported by | Address of the host that last reported membership in this group.                                                                                                                                                          | All levels      |
| Timeout          | Time remaining until the group membership is removed.                                                                                                                                                                     | brief none      |
| Group timeout    | Time remaining until a group in exclude mode moves to include mode. The timer is refreshed when a listener in exclude mode sends a report. A group in include mode or configured as a static group displays a zero timer. | detail          |
| Type             | Type of group membership: <ul style="list-style-type: none"> <li>• <b>Dynamic</b>—Host reported the membership.</li> <li>• <b>Static</b>—Membership is configured.</li> </ul>                                             | All levels      |

## Sample Output

### show igmp group (Include Mode)

```

user@host> show igmp group
Interface: t1-0/1/0.0
  Group: 232.1.1.1
    Group mode: Include
    Source: 10.0.0.2
    Last reported by: 10.9.5.2
    Timeout:      24 Type: Dynamic
  Group: 232.1.1.1
    Group mode: Include
    Source: 10.0.0.3
    Last reported by: 10.9.5.2
    Timeout:      24 Type: Dynamic
  Group: 232.1.1.1
    Group mode: Include
    Source: 10.0.0.4
    Last reported by: 10.9.5.2
    Timeout:      24 Type: Dynamic
  Group: 232.1.1.2
    Group mode: Include
    Source: 10.0.0.4
    Last reported by: 10.9.5.2
    Timeout:      24 Type: Dynamic
Interface: t1-0/1/1.0
Interface: ge-0/2/2.0
Interface: ge-0/2/0.0
Interface: local
  Group: 224.0.0.2
    Source: 0.0.0.0
    Last reported by: Local
    Timeout:      0 Type: Dynamic

```

```
Group: 224.0.0.22
Source: 0.0.0.0
Last reported by: Local
Timeout: 0 Type: Dynamic
```

### show igmp group (Exclude Mode)

```
user@host> show igmp group
Interface: t1-0/1/0.0
Interface: t1-0/1/1.0
Interface: ge-0/2/2.0
Interface: ge-0/2/0.0
Interface: local
  Group: 224.0.0.2
    Source: 0.0.0.0
    Last reported by: Local
    Timeout: 0 Type: Dynamic
  Group: 224.0.0.22
    Source: 0.0.0.0
    Last reported by: Local
    Timeout: 0 Type: Dynamic
```

### show igmp group brief

The output for the **show igmp group brief** command is identical to that for the **show igmp group** command.

### show igmp group detail

```
user@host> show igmp group detail
Interface: t1-0/1/0.0
  Group: 232.1.1.1
    Group mode: Include
    Source: 10.0.0.2
    Source timeout: 12
    Last reported by: 10.9.5.2
    Group timeout: 0 Type: Dynamic
  Group: 232.1.1.1
    Group mode: Include
    Source: 10.0.0.3
    Source timeout: 12
    Last reported by: 10.9.5.2
    Group timeout: 0 Type: Dynamic
  Group: 232.1.1.1
    Group mode: Include
    Source: 10.0.0.4
    Source timeout: 12
    Last reported by: 10.9.5.2
    Group timeout: 0 Type: Dynamic
  Group: 232.1.1.2
    Group mode: Include
    Source: 10.0.0.4
    Source timeout: 12
    Last reported by: 10.9.5.2
    Group timeout: 0 Type: Dynamic
Interface: t1-0/1/1.0
Interface: ge-0/2/2.0
Interface: ge-0/2/0.0
Interface: local
  Group: 224.0.0.2
    Group mode: Exclude
```

```
Source: 0.0.0.0
Source timeout: 0
Last reported by: Local
Group timeout:      0 Type: Dynamic
Group: 224.0.0.22
Group mode: Exclude

| <b>State</b>              | State of the interface: <b>Up</b> or <b>Down</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | All levels      |
| <b>SSM Map Policy</b>     | Name of the source-specific multicast (SSM) map policy that has been applied to the IGMP interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | All levels      |
| <b>Timeout</b>            | How long until the IGMP querier is declared to be unreachable, in seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | All levels      |
| <b>Version</b>            | IGMP version being used on the interface: <b>1</b> , <b>2</b> , or <b>3</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | All levels      |
| <b>Groups</b>             | Number of groups on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | All levels      |
| <b>Group limit</b>        | Maximum number of groups allowed on the interface. Any joins requested after the limit is reached are rejected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | All levels      |
| <b>Group threshold</b>    | Configured threshold at which a warning message is generated.<br><br>This threshold is based on a percentage of groups received on the interface. If the number of groups received reaches the configured threshold, the device generates a warning message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | All levels      |
| <b>Group log-interval</b> | Time (in seconds) between consecutive log messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | All levels      |
| <b>Immediate Leave</b>    | State of the immediate leave option: <ul style="list-style-type: none"> <li>• <b>On</b>—Indicates that the router removes a host from the multicast group as soon as the router receives a leave group message from a host associated with the interface.</li> <li>• <b>Off</b>—Indicates that after receiving a leave group message, instead of removing a host from the multicast group immediately, the router sends a group query to determine if another receiver responds.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                         | All levels      |
| <b>Promiscuous Mode</b>   | State of the promiscuous mode option: <ul style="list-style-type: none"> <li>• <b>On</b>—Indicates that the router can accept IGMP reports from subnetworks that are not associated with its interfaces.</li> <li>• <b>Off</b>—Indicates that the router can accept IGMP reports only from subnetworks that are associated with its interfaces.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | All levels      |
| <b>Passive</b>            | State of the passive mode option: <ul style="list-style-type: none"> <li>• <b>On</b>—Indicates that the router can run IGMP on the interface but not send or receive control traffic such as IGMP reports, queries, and leaves.</li> <li>• <b>Off</b>—Indicates that the router can run IGMP on the interface and send or receive control traffic such as IGMP reports, queries, and leaves.</li> </ul> <p>The <b>passive</b> statement enables you to selectively activate up to two out of a possible three available query or control traffic options. When enabled, the following options appear after the <b>on</b> state declaration:</p> <ul style="list-style-type: none"> <li>• <b>send-general-query</b>—The interface sends general queries.</li> <li>• <b>send-group-query</b>—The interface sends group-specific and group-source-specific queries.</li> <li>• <b>allow-receive</b>—The interface receives control traffic.</li> </ul> | All levels      |

Table 396: show igmp interface Output Fields (*continued*)

| Field Name            | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Level of Output |
|-----------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| OIF map               | Name of the OIF map (if configured) associated with the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | All levels      |
| SSM map               | Name of the source-specific multicast (SSM) map (if configured) used on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | All levels      |
| Configured Parameters | Information configured by the user: <ul style="list-style-type: none"> <li>• <b>IGMP Query Interval</b>—Interval (in seconds) at which this router sends membership queries when it is the querier.</li> <li>• <b>IGMP Query Response Interval</b>—Time (in seconds) that the router waits for a report in response to a general query.</li> <li>• <b>IGMP Last Member Query Interval</b>—Time (in seconds) that the router waits for a report in response to a group-specific query.</li> <li>• <b>IGMP Robustness Count</b>—Number of times the router retries a query.</li> </ul> | All levels      |
| Derived Parameters    | Derived information: <ul style="list-style-type: none"> <li>• <b>IGMP Membership Timeout</b>—Timeout period (in seconds) for group membership. If no report is received for these groups before the timeout expires, the group membership is removed.</li> <li>• <b>IGMP Other Querier Present Timeout</b>—Time (in seconds) that the router waits for the IGMP querier to send a query.</li> </ul>                                                                                                                                                                                  | All levels      |

## Sample Output

### show igmp interface

```

user@host> show igmp interface
Interface: at-0/3/1.0
  Querier: 10.111.30.1
  State:      Up Timeout:  None Version:  2 Groups:      4
  SSM Map Policy: ssm-policy-A
Interface: so-1/0/0.0
  Querier: 10.111.10.1
  State:      Up Timeout:  None Version:  2 Groups:      2
  SSM Map Policy: ssm-policy-B
Interface: so-1/0/1.0
  Querier: 10.111.20.1
  State:      Up Timeout:  None Version:  2 Groups:      4
  SSM Map Policy: ssm-policy-C
Immediate Leave: On
Promiscuous Mode: Off

Configured Parameters:
IGMP Query Interval: 125.0
IGMP Query Response Interval: 10.0
IGMP Last Member Query Interval: 1.0
IGMP Robustness Count: 2

Derived Parameters:
IGMP Membership Timeout: 260.0
IGMP Other Querier Present Timeout: 255.0

```

### show igmp interface brief

The output for the **show igmp interface brief** command is identical to that for the **show igmp interface** command. For sample output, see [show igmp interface on page 3866](#).

### show igmp interface detail

The output for the **show igmp interface detail** command is identical to that for the **show igmp interface** command. For sample output, see [show igmp interface on page 3866](#).

### show igmp interface <interface-name>

```
user@host# show igmp interface ge-3/2/0.0
Interface: ge-3/2/0.0
Querier: 20.1.1.1
State: Up Timeout:      None Version: 3 Groups:      1
Group limit: 8
Group threshold: 60
Group log-interval: 10
Immediate leave: Off
Promiscuous mode: Off
```

| <b>Router interfaces</b> | <p>List of information about multicast-router interfaces:</p> <ul style="list-style-type: none"> <li>Name of the multicast-router interface.</li> <li><b>static</b> or <b>dynamic</b>—Whether the multicast-router interface is static or dynamic.</li> <li><b>Uptime</b>—For static interfaces, amount of time since the interface was configured as a multicast-router interface or since the interface last flapped. For dynamic interfaces, amount of time since the first query was received on the interface or since the interface last flapped.</li> <li><b>timeout</b>—Seconds remaining before a dynamic multicast-router interface times out.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail</b>   |
| <b>Group</b>             | <p>IP multicast address of the multicast group.</p> <p>The following information is provided for the multicast group:</p> <ul style="list-style-type: none"> <li>Name of the interface belonging to the multicast group.</li> <li><b>Last reporter</b>—Last host to report membership for the multicast group.</li> <li><b>Receiver count</b>—Number of hosts on the interface that are members of the multicast group. This field appears only if <b>immediate-leave</b> is configured on the VLAN.</li> <li><b>Uptime</b>—Length of time (in hours, minutes, and seconds) a multicast group has been active on the interface.</li> <li><b>timeout</b>—Time (in seconds) left until the entry for the multicast group is removed from the multicast group if no membership reports are received on the interface. This counter is reset to its maximum value when a membership report is received.</li> <li><b>Flags</b>—The lowest IGMP version in use by a host that is a member of the group on the interface.<br/>If the flag <b>static</b> is included, the interface has been configured as static member of the multicast group.</li> <li><b>Include source</b>—Multicast source addresses of all IGMPv3 membership reports received for the group on the interface.</li> </ul> | <b>detail</b>   |

## Sample Output

### show igmp-snooping membership

```

user@switch> show igmp-snooping membership
VLAN: vlan24
  224.1.1.1      *
    Interfaces: ge-0/0/0.0
  224.1.1.100   *
    Interfaces: ge-0/0/0.0
  225.1.1.100   *
    Interfaces: ge-0/0/0.0

```

### show igmp-snooping membership detail

```

user@switch> show igmp-snooping membership detail

VLAN: vlan2 Tag: 2 (Index: 3)
Router interfaces:

```

```
ge-1/0/0.0 dynamic Uptime: 00:14:24 timeout: 253
Group: 225.0.0.1
ge-1/0/17.0 259 Last reporter: 13.0.0.90 Receiver count: 1
Uptime: 00:00:19 timeout: 259 Flags: <V3-hosts>
Include source: 10.2.11.5, 10.2.11.12
```

#### show igmp-snooping membership vlan detail

```
user@switch> show igmp-snooping membership vlan vlan700 detail
VLAN: vlan700 Tag: 700 (Index: 52)
Router interfaces:
  ae2.0 dynamic Uptime: 16:53:13 timeout: 245
Group: 230.150.10.1
  ge-0/0/1.0 Last reporter: 100.2.188.201
  Uptime: 17:00:52 timeout: 237 Flags: <V2-hosts>
  ge-0/0/0.0 Last reporter: 100.2.188.202
  Uptime: 17:00:50 timeout: 243 Flags: <V2-hosts>
```

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                           |

**Table 399: show igmp-snooping route Output Fields**

| Field Name    | Field Description                                   |
|---------------|-----------------------------------------------------|
| Table         | Routing table ID for virtual routing instances.     |
| Routing Table | Routing table ID for virtual routing instances.     |
| VLAN          | Name of the VLAN on which IGMP snooping is enabled. |
| Group         | Multicast IPv4 group address.                       |

Table 399: show igmp-snooping route Output Fields (*continued*)

| Field Name                     | Field Description                                                                    |
|--------------------------------|--------------------------------------------------------------------------------------|
| <b>Next-hop</b>                | ID associated with the next-hop device.                                              |
| <b>Routing next-hop</b>        | ID associated with the Layer 3 next-hop device.                                      |
| <b>Interface or Interfaces</b> | Name of the interface or interfaces in the VLAN associated with the multicast group. |
| <b>Layer 2 next-hop</b>        | ID associated with the Layer 2 next-hop device.                                      |

## Sample Output

### show igmp-snooping route vlan v18

```

user@switch> show igmp-snooping route vlan v18
VLAN      Group      Next-hop
v1an18    224.0.0.0, *
v1an18    225.20.20.1, *    1539

```

### show igmp-snooping route detail

```

user@switch> show igmp-snooping route detail
VLAN      Group      Next-hop
default   224.0.0.0, *
v1an100    224.0.0.0, *    1332
          Interfaces: ge-1/0/1.0
VLAN      Group      Next-hop
v1an100    226.0.0.1, *    1334
          Interfaces: ge-1/0/1.0, ge-5/0/30.0

```

### show igmp-snooping route inet detail

```

user@switch> show igmp-snooping route inet detail
Routing table: 0
Group: 229.0.0.1, 171.2.60.100
  Routing next-hop: 3448
  vlan.100
  Interface: vlan.100, VLAN: vlan100, Layer 2 next-hop: 3343

```

## show igmp-snooping statistics

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Output Fields** Table 404 on page 3885 describes the output fields for the **show multicast next-hops** command. Output fields are listed in the approximate order in which they appear.

**Table 404: show multicast next-hops Output Fields**

| Field Name                     | Field Description                                                                                                                                      |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Family</b>                  | Protocol family (such as <b>INET</b> ).                                                                                                                |
| <b>ID</b>                      | Next-hop identifier of the prefix. The identifier is returned by the routing device's Packet Forwarding Engine.                                        |
| <b>Refcount</b>                | Number of cache entries that are using this next hop.                                                                                                  |
| <b>KRefcount</b>               | Kernel reference count for the next hop.                                                                                                               |
| <b>Downstream interface</b>    | Interface names associated with each multicast next-hop ID.                                                                                            |
| <b>Incoming interface list</b> | List of interfaces that accept incoming traffic. Only shown for routes that do not use strict RPF-based forwarding, for example for bidirectional PIM. |

## Sample Output

### show multicast next-hops

```
user@host> show multicast next-hops
Family: INET
ID      Refcount  KRefcount  Downstream interface
262142      4          2  so-1/0/0.0
262143      2          1  mt-1/1/0.49152
262148      2          1  mt-1/1/0.32769
```

### show multicast next-hops (Bidirectional PIM)

```
user@host> show multicast next-hops
Family: INET
ID      Refcount  KRefcount  Downstream interface
2097151      8          4  ge-0/0/1.0

Family: INET6
ID      Refcount  KRefcount  Downstream interface
2097157      2          1  ge-0/0/1.0

Family: Incoming interface list
ID      Refcount  KRefcount  Downstream interface
513      5          2  lo0.0
                    ge-0/0/1.0
514      5          2  lo0.0
                    ge-0/0/1.0
                    xe-4/1/0.0
515      3          1  lo0.0
                    ge-0/0/1.0
                    xe-4/1/0.0
544      1          0  lo0.0
                    xe-4/1/0.0
```

### show multicast next-hops brief

The output for the **show multicast next-hops brief** command is identical to that for the **show multicast next-hops** command. For sample output, see [show multicast next-hops on page 3885](#).

### show multicast next-hops detail

```
user@host> show multicast next-hops detail
Family: INET
ID          Refcount KRefCount Downstream interface
1048577      2          1 fe-0/1/2.0-(1048574)
              ge-0/2/3.0-(1048576)
```

## show multicast pim-to-igmp-proxy

|                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Table 405: show multicast pim-to-igmp-proxy Output Fields**

| Field Name         | Field Description                                                                                                                                     |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Instance</b>    | Routing instance. Default instance is <b>master</b> (inet.0 routing table).                                                                           |
| <b>Proxy state</b> | State of PIM-to-IGMP message translation, also known as PIM-to-IGMP proxy, on the configured upstream interfaces: <b>enabled</b> or <b>disabled</b> . |

Table 405: show multicast pim-to-igmp-proxy Output Fields (*continued*)

| Field Name            | Field Description                                                                                             |
|-----------------------|---------------------------------------------------------------------------------------------------------------|
| <i>interface-name</i> | Name of upstream interface (no more than two allowed) on which PIM-to-IGMP message translation is configured. |

## Sample Output

### show multicast pim-to-igmp-proxy

```
user@host> show multicast pim-to-igmp-proxy
Instance: master Proxy state: enabled
ge-0/1/0.1
ge-0/1/0.2
```

### show multicast pim-to-igmp-proxy instance

```
user@host> show multicast pim-to-igmp-proxy instance VPN-A
Instance: VPN-A Proxy state: enabled
ge-0/1/0.1
```

## show multicast pim-to-mld-proxy

|                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                               |

Output fields are listed in the order in which they appear.                                                                                                                                                                                                                                                        |

**Table 406: show multicast pim-to-mld-proxy Output Fields**

| Field Name            | Field Description                                                                                                                                   |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Proxy state</b>    | State of PIM-to-MLD message translation, also known as PIM-to-MLD proxy, on the configured upstream interfaces: <b>enabled</b> or <b>disabled</b> . |
| <i>interface-name</i> | Name of upstream interface (no more than two allowed) on which PIM-to-MLD message translation is configured.                                        |

## Sample Output

### show multicast pim-to-mld-proxy

```
user@host> show multicast pim-to-mld-proxy
Instance: master Proxy state: enabled
ge-0/5/0.1
ge-0/5/0.2
```

### show multicast pim-to-mld-proxy instance

```
user@host> show multicast pim-to-mld-proxy instance VPN-A
Instance: VPN-A Proxy state: enabled
ge-0/5/0.1
```

## show multicast route

**List of Syntax**   [Syntax on page 3891](#)  
[Syntax \(EX Series Switch and the QFX Series\) on page 3891](#)

**Syntax**   `show multicast route`  
                   `<brief | detail | extensive | summary>`  
                   `<active | all | inactive>`  
                   `<group group>`  
                   `<inet | inet6>`  
                   `<instance instance name>`  
                   `<logical-system (all | logical-system-name)>`  
                   `<regular-expression>`  
                   `<source-prefix source-prefix>`

**Syntax (EX Series Switch and the QFX Series)**   `show multicast route`  
                   `<brief | detail | extensive | summary>`  
                   `<active | all | inactive>`  
                   `<group group>`  
                   `<inet | inet6>`  
                   `<instance instance name>`  
                   `<regular-expression>`  
                   `<source-prefix source-prefix>`

**Release Information**   Command introduced before Junos OS Release 7.4.  
                                   Command introduced in Junos OS Release 9.0 for EX Series switches.  
                                   inet6 and **instance** options introduced in Junos OS Release 10.0 for EX Series switches.  
                                   Command introduced in Junos OS Release 11.3 for the QFX Series.  
                                   Support for bidirectional PIM added in Junos OS Release 12.1.

**Description**   Display the entries in the IP multicast forwarding table. You can display similar information with the **show route table inet.1** command.

**Options**   **none**—Display standard information about all entries in the multicast forwarding table for all routing instances.

**brief | detail | extensive | summary**—(Optional) Display the specified level of output.

**active | all | inactive**—(Optional) Display all active entries, all entries, or all inactive entries, respectively, in the multicast forwarding table.

**group group**—(Optional) Display the cache entries for a particular group.

**inet | inet6**—(Optional) Display multicast forwarding table entries for IPv4 or IPv6 family addresses, respectively.

**instance instance-name**—(Optional) Display entries in the multicast forwarding table for a specific multicast instance.

**logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**regular-expression**—(Optional) Display information about the multicast forwarding table entries that match a UNIX OS-style regular expression.

**source-prefix source-prefix**—(Optional) Display the cache entries for a particular source prefix.

**Required Privilege Level** view

**Output Fields** [Table 407 on page 3892](#) describes the output fields for the **show multicast route** command. Output fields are listed in the approximate order in which they appear.

**Table 407: show multicast route Output Fields**

| Field Name                    | Field Description                                                                                                                                                                               | Level of Output  |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| family                        | IPv4 address family ( <b>INET</b> ) or IPv6 address family ( <b>INET6</b> ).                                                                                                                    | All levels       |
| Group                         | Group address.<br><br>For any-source multicast routes, for example for bidirectional PIM, the group address includes the prefix length.                                                         | All levels       |
| Source                        | Prefix and length of the source as it is in the multicast forwarding table.                                                                                                                     | All levels       |
| Incoming interface list       | List of interfaces that accept incoming traffic. Only shown for routes that do not use strict RPF-based forwarding, for example for bidirectional PIM.                                          | All levels       |
| Upstream interface            | Name of the interface on which the packet with this source prefix is expected to arrive.                                                                                                        | All levels       |
| Upstream rpf interface list   | When multicast-only fast reroute (MoFRR) is enabled, a PIM router propagates join messages on two upstream RPF interfaces to receive multicast traffic on both links for the same join request. | All levels       |
| Downstream interface list     | List of interface names to which the packet with this source prefix is forwarded.                                                                                                               | All levels       |
| Number of outgoing interfaces | Total number of outgoing interfaces for each (S,G) entry.                                                                                                                                       | <b>extensive</b> |

Table 407: show multicast route Output Fields (*continued*)

| Field Name                             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                     | Level of Output   |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| Session description                    | Name of the multicast session.                                                                                                                                                                                                                                                                                                                                                                                                        | detail extensive  |
| Statistics                             | Rate at which packets are being forwarded for this source and group entry (in Kbps and pps), and number of packets that have been forwarded to this prefix. If one or more of the kilobits per second packet forwarding statistic queries fails or times out, the statistics field displays <b>Forwarding statistics are not available</b> .<br><br><b>NOTE:</b> On QFX Series switches, this field does not report valid statistics. | detail extensive  |
| Next-hop ID                            | Next-hop identifier of the prefix. The identifier is returned by the routing device's Packet Forwarding Engine and is also displayed in the output of the <b>show multicast nexthops</b> command.                                                                                                                                                                                                                                     | detail extensive  |
| Incoming interface list ID             | For bidirectional PIM, incoming interface list identifier.<br><br>Identifiers for interfaces that accept incoming traffic. Only shown for routes that do not use strict RPF-based forwarding, for example for bidirectional PIM.                                                                                                                                                                                                      | detail extensive  |
| Upstream protocol                      | The protocol that maintains the active multicast forwarding route for this group or source.<br><br>When the <b>show multicast route extensive</b> command is used with the <b>display-origin-protocol</b> option, the field name is only <b>Protocol</b> and not <b>Upstream Protocol</b> . However, this field also displays the protocol that installed the active route.                                                           | detail extensive  |
| Route type                             | Type of multicast route. Values can be (S,G) or (*G).                                                                                                                                                                                                                                                                                                                                                                                 | summary           |
| Route state                            | Whether the group is <b>Active</b> or <b>Inactive</b> .                                                                                                                                                                                                                                                                                                                                                                               | summary extensive |
| Route count                            | Number of multicast routes.                                                                                                                                                                                                                                                                                                                                                                                                           | summary           |
| Forwarding state                       | Whether the prefix is pruned or forwarding.                                                                                                                                                                                                                                                                                                                                                                                           | extensive         |
| Cache lifetime/timeout                 | Number of seconds until the prefix is removed from the multicast forwarding table. A value of <b>never</b> indicates a permanent forwarding entry. A value of <b>forever</b> indicates routes that do not have keepalive times.                                                                                                                                                                                                       | extensive         |
| Wrong incoming interface notifications | Number of times that the upstream interface was not available.                                                                                                                                                                                                                                                                                                                                                                        | extensive         |
| Uptime                                 | Time since the creation of a multicast route.                                                                                                                                                                                                                                                                                                                                                                                         | extensive         |

## Sample Output

### show multicast route

```
user@host> show multicast route
Family: INET
```

```
Group: 228.0.0.0

**Output Fields** Table 408 on page 3899 describes the output fields for the **show multicast rpf** command. Output fields are listed in the approximate order in which they appear.

**Table 408: show multicast rpf Output Fields**

| Field Name           | Field Description                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Instance</b>      | Name of the routing instance. (Displayed when multicast is configured within a routing instance.)                                                                                                                                                                                                                                                                                                             |
| <b>Source prefix</b> | Prefix and length of the source as it exists in the multicast forwarding table.                                                                                                                                                                                                                                                                                                                               |
| <b>Protocol</b>      | How the route was learned.                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Interface</b>     | Upstream RPF interface.<br><br><b>NOTE:</b> The displayed interface information does not apply to bidirectional PIM RP addresses. This is because the <b>show multicast rpf</b> command does not take into account equal-cost paths or the designated forwarder. For accurate upstream RPF interface information, always use the <b>show pim join extensive</b> command when bidirectional PIM is configured. |
| <b>Neighbor</b>      | Upstream RPF neighbor.<br><br><b>NOTE:</b> The displayed neighbor information does not apply to bidirectional PIM. This is because the <b>show multicast rpf</b> command does not take into account equal-cost paths or the designated forwarder. For accurate upstream RPF neighbor information, always use the <b>show pim join extensive</b> command when bidirectional PIM is configured.                 |

## Sample Output

### show multicast rpf

```

user@host> show multicast rpf

Multicast RPF table: inet.0, 12 entries

**Table 409: show multicast scope Output Fields**

| Field Name   | Field Description                                           |
|--------------|-------------------------------------------------------------|
| Scope name   | Name of the multicast scope.                                |
| Group Prefix | Range of multicast groups that are scoped.                  |
| Interface    | Interface that is the boundary of the administrative scope. |

Table 409: show multicast scope Output Fields (*continued*)

| Field Name      | Field Description                 |
|-----------------|-----------------------------------|
| Resolve Rejects | Number of kernel resolve rejects. |

## Sample Output

### show multicast scope

```
user@host> show multicast scope
```

| Scope name | Group Prefix   | Interface  | Resolve Rejects |
|------------|----------------|------------|-----------------|
| 232-net    | 232.232.0.0/16 | fe-0/0/0.1 | 0               |
| local      | 239.255.0.0/16 | fe-0/0/0.1 | 0               |
| local      | ff05::/16      | fe-0/0/0.1 | 0               |
| larry      | ff05::1234/128 | fe-0/0/0.1 | 0               |

### show multicast scope inet

```
user@host> show multicast scope inet
```

| Scope name | Group Prefix   | Interface  | Resolve Rejects |
|------------|----------------|------------|-----------------|
| 232-net    | 232.232.0.0/16 | fe-0/0/0.1 | 0               |
| local      | 239.255.0.0/16 | fe-0/0/0.1 | 0               |

### show multicast scope inet6

```
user@host> show multicast scope inet6
```

| Scope name | Group Prefix   | Interface  | Resolve Rejects |
|------------|----------------|------------|-----------------|

Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                           |

Table 411: show multicast usage Output Fields

| Field Name      | Field Description                                                                                                                                                                        |
|-----------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Instance</b> | Name of the routing instance. (Displayed when multicast is configured within a routing instance.)                                                                                        |
| <b>Group</b>    | Group address.                                                                                                                                                                           |
| <b>Sources</b>  | Number of sources.                                                                                                                                                                       |
| <b>Packets</b>  | Number of packets that have been forwarded to this prefix. If one or more of the packets forwarded statistic queries fails or times out, the packets field displays <b>unavailable</b> . |
| <b>Bytes</b>    | Number of bytes that have been forwarded to this prefix. If one or more of the packets forwarded statistic queries fails or times out, the bytes field displays <b>unavailable</b> .     |
| <b>Prefix</b>   | IP address.                                                                                                                                                                              |
| <b>/len</b>     | Prefix length.                                                                                                                                                                           |
| <b>Groups</b>   | Number of multicast groups.                                                                                                                                                              |

## Sample Output

### show multicast usage

```

user@host> show multicast usage
Group          Sources  Packets      Bytes
228.0.0.0      1        52847      4439148
239.1.1.1      2        13450      1125530

Prefix         /len  Groups  Packets      Bytes
10.255.14.144  /32   2        66254      5561304
10.255.70.15   /32   1         43        3374...
```

### show multicast usage brief

The output for the **show multicast usage brief** command is identical to that for the **show multicast usage** command. For sample output, see [show multicast usage on page 3908](#).

### show multicast usage instance

```

user@host> show multicast usage instance VPN-A
Group          Sources  Packets      Bytes
224.2.127.254  1        5538      509496
224.0.1.39     1         13         624
224.0.1.40     1         13         624

Prefix         /len  Groups  Packets      Bytes
192.168.195.34 /32   1        5538      509496
10.255.14.30   /32   1         13         624
```

```
10.255.245.91 /32 1 13 624
...
```

### show multicast usage detail

```
user@host> show multicast usage detail
Group          Sources Packets          Bytes
228.0.0.0      1          53159          4465356
  Source: 10.255.14.144 /32 Packets: 53159 Bytes: 4465356

Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                                                       |

**Table 412: show pim bootstrap Output Fields**

| Field Name           | Field Description                                                            |
|----------------------|------------------------------------------------------------------------------|
| <b>Instance</b>      | Name of the routing instance.                                                |
| <b>BSR</b>           | Bootstrap router.                                                            |
| <b>Pri</b>           | Priority of the routing device as elected to be the bootstrap router.        |
| <b>Local address</b> | Local routing device address.                                                |
| <b>Pri</b>           | Local routing device address priority to be elected as the bootstrap router. |

Table 412: show pim bootstrap Output Fields (*continued*)

| Field Name     | Field Description                                                                                    |
|----------------|------------------------------------------------------------------------------------------------------|
| <b>State</b>   | Local routing device election state: <b>Candidate</b> , <b>Elected</b> , or <b>Ineligible</b> .      |
| <b>Timeout</b> | How long until the local routing device declares the bootstrap router to be unreachable, in seconds. |

## Sample Output

### show pim bootstrap

```
user@host> show pim bootstrap
Instance: PIM.master
```

| BSR                     | Pri | Local address           | Pri | State      | Timeout |
|-------------------------|-----|-------------------------|-----|------------|---------|
| None                    | 0   | 10.255.71.46            | 0   | InEligible | 0       |
| feco:1:1:1:1:0:aff:785c | 34  | feco:1:1:1:1:0:aff:7c12 | 0   | InEligible | 0       |

### show pim bootstrap instance

```
user@host> show pim bootstrap instance VPN-A
Instance: PIM.VPN-A
```

| BSR  | Pri | Local address   | Pri | State      | Timeout |
|------|-----|-----------------|-----|------------|---------|
| None | 0   | 192.168.196.105 | 0   | InEligible | 0       |

## show pim interfaces

|                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>State</b>    | State of the interface. The state also is displayed in the <b>show interfaces</b> command. |

Table 413: show pim interfaces Output Fields (*continued*)

| Field Name          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Mode</b>         | <p>PIM mode running on the interface:</p> <ul style="list-style-type: none"> <li>• <b>B</b>—In bidirectional mode, multicast groups are carried across the network over bidirectional shared trees. This type of tree minimizes PIM routing state, which is especially important in networks with numerous and dispersed senders and receivers.</li> <li>• <b>S</b>—In sparse mode, routing devices must join and leave multicast groups explicitly. Upstream routing devices do not forward multicast traffic to this routing device unless this device has sent an explicit request (using a join message) to receive multicast traffic.</li> <li>• <b>Dense</b>—Unlike sparse mode, where data is forwarded only to routing devices sending an explicit request, dense mode implements a flood-and-prune mechanism, similar to DVMRP (the first multicast protocol used to support the multicast backbone). (Not supported on QFX Series.)</li> <li>• <b>Sparse-Dense</b>—Sparse-dense mode allows the interface to operate on a per-group basis in either sparse or dense mode. A group specified as <b>dense</b> is not mapped to a rendezvous point (RP). Instead, data packets destined for that group are forwarded using PIM-Dense Mode (PIM-DM) rules. A group specified as <b>sparse</b> is mapped to an RP, and data packets are forwarded using PIM-Sparse Mode (PIM-SM) rules.</li> </ul> <p>When sparse-dense mode is configured, the output includes both <b>S</b> and <b>D</b>. When bidirectional-sparse mode is configured, the output includes <b>S</b> and <b>B</b>. When bidirectional-sparse-dense mode is configured, the output includes <b>B</b>, <b>S</b>, and <b>D</b>.</p> |
| <b>IP</b>           | Version number of the address family on the interface: <b>4</b> (IPv4) or <b>6</b> (IPv6).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>V</b>            | PIM version running on the interface: 1 or 2.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>State</b>        | <p>State of PIM on the interface:</p> <ul style="list-style-type: none"> <li>• <b>Active</b>—Bidirectional mode is enabled on the interface and on all PIM neighbors.</li> <li>• <b>DR</b>—Designated router.</li> <li>• <b>NotCap</b>—Bidirectional mode is not enabled on the interface. This can happen when bidirectional PIM is not configured locally, when one of the neighbors is not configured for bidirectional PIM, or when one of the neighbors has not implemented the bidirectional PIM protocol.</li> <li>• <b>NotDR</b>—Not the designated router.</li> <li>• <b>P2P</b>—Point to point.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Release Information**   Command introduced before Junos OS Release 7.4.  
                               Command introduced in Junos OS Release 9.0 for EX Series switches.  
                               **summary** option introduced in Junos OS Release 9.6.  
                               **inet6** and **instance** options introduced in Junos OS Release 10.0 for EX Series switches.  
                               Support for bidirectional PIM added in Junos OS Release 12.1.  
                               Command introduced in Junos OS Release 11.3 for the QFX Series.  
                               Multiple new filter options introduced in Junos OS Release 13.2.

**Description**   Display information about Protocol Independent Multicast (PIM) groups for all PIM modes.

For bidirectional PIM, display information about PIM group ranges (\*G-range) for each active bidirectional RP group range, in addition to each of the joined (\*G) routes.

**Options**   **none**—Display the standard information about PIM groups for all supported family addresses for all routing instances.

**brief | detail | extensive | summary**—(Optional) Display the specified level of output.

**bidirectional | dense | sparse**—(Optional) Display information about PIM bidirectional mode, dense mode, or sparse and source-specific multicast (SSM) mode entries.

**exact**—(Optional) Display information about only the group that exactly matches the specified group address.

**inet | inet6**—(Optional) Display PIM group information for IPv4 or IPv6 family addresses, respectively.

**instance *instance-name***—(Optional) Display information about groups for the specified PIM-enabled routing instance only.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**range**—(Optional) Address range of the group, specified as *prefix/prefix-length*.

**rp *ip-address/prefix* | source *ip-address/prefix***—(Optional) Display information about the PIM entries with a specified rendezvous point (RP) address and prefix or with a specified source address and prefix. You can omit the prefix.

**sg | star-g**—(Optional) Display information about PIM (S,G) or (\*,G) entries.

**Required Privilege Level**

| Field Name                      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Level of Output  |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Upstream neighbor</b>        | <p>Information about the upstream neighbor: <b>Direct</b>, <b>Local</b>, <b>Unknown</b>, or a specific IP address.</p> <p>For bidirectional PIM, <b>Direct</b> means that the interface is directly connected to a subnet that contains a phantom RP address.</p> <p>The multipoint LDP (M-LDP) root appears on egress nodes in M-LDP point-to-multipoint LSPs with inband signaling.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>extensive</b> |
| Active upstream interface       | When multicast-only fast reroute (MoFRR) is configured in a PIM domain, the upstream interface for the active path. A PIM router propagates join messages on two upstream RPF interfaces to receive multicast traffic on both links for the same join request. Preference is given to two paths that do not converge to the same immediate upstream router. PIM installs appropriate multicast routes with upstream neighbors as RPF next hops with two (primary and backup) interfaces.                                                                                                                                                                                                                                                                                                                                                                                        | <b>extensive</b> |
| Active upstream neighbor        | On the MoFRR primary path, the IP address of the neighbor that is directly connected to the active upstream interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>extensive</b> |
| MoFRR Backup upstream interface | <p>The MoFRR upstream interface that is used when the primary path fails.</p> <p>When the primary path fails, the backup path is upgraded to primary, and traffic is forwarded accordingly. If there are alternate paths available, a new backup path is calculated and the appropriate multicast route is updated or installed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>extensive</b> |
| <b>Upstream state</b>           | <p>Information about the upstream interface:</p> <ul style="list-style-type: none"> <li>• <b>Join to RP</b>—Sending a join to the rendezvous point.</li> <li>• <b>Join to Source</b>—Sending a join to the source.</li> <li>• <b>Local RP</b>—Sending neither join messages nor prune messages toward the RP, because this routing device is the rendezvous point.</li> <li>• <b>Local Source</b>—Sending neither join messages nor prune messages toward the source, because the source is locally attached to this routing device.</li> <li>• <b>Prune to RP</b>—Sending a prune to the rendezvous point.</li> <li>• <b>Prune to Source</b>—Sending a prune to the source.</li> </ul> <p><b>NOTE:</b> RP group range entries have <b>None</b> in the <b>Upstream state</b> field because RP group ranges do not trigger actual PIM join messages between routing devices.</p> | <b>extensive</b> |

| <b>Interface</b>                                 | Interface through which the neighbor is reachable.                                                                                                                                                                                                                                                             | All levels        |
| <b>Neighbor addr</b>                             | Address of the neighboring PIM routing device.                                                                                                                                                                                                                                                                 | All levels        |
| <b>IP</b>                                        | IP version: 4 or 6.                                                                                                                                                                                                                                                                                            | All levels        |
| <b>V</b>                                         | PIM version running on the neighbor: 1 or 2.                                                                                                                                                                                                                                                                   | All levels        |
| <b>Mode</b>                                      | PIM mode of the neighbor: <b>Sparse</b> , <b>Dense</b> , <b>SparseDense</b> , or <b>Unknown</b> . When the neighbor is running PIM version 2, this mode is always <b>Unknown</b> .                                                                                                                             | All levels        |
| <b>Option</b>                                    | Can be one or more of the following: <ul style="list-style-type: none"> <li>• <b>B</b>—Bidirectional Capable.</li> <li>• <b>H</b>—Hello Option Holdtime.</li> <li>• <b>G</b>—Generation Identifier.</li> <li>• <b>P</b>—Hello Option DR Priority.</li> <li>• <b>L</b>—Hello Option LAN Prune Delay.</li> </ul> | <b>brief</b> none |
| <b>Uptime</b>                                    | Time the neighbor has been operational since the PIM process was last initialized, in the format <b>dd:hh:mm:ss ago</b> for less than a week and <b>nwnd:hh:mm:ss ago</b> for more than a week.                                                                                                                | All levels        |
| <b>Address</b>                                   | Address of the neighboring PIM routing device.                                                                                                                                                                                                                                                                 | <b>detail</b>     |
| <b>BFD</b>                                       | Status and operational state of the Bidirectional Forwarding Detection (BFD) protocol on the interface: <b>Enabled</b> , <b>Operational state is up</b> , or <b>Disabled</b> .                                                                                                                                 | <b>detail</b>     |
| <b>Hello Option Holdtime</b>                     | Time for which the neighbor is available, in seconds. The range of values is 0 through 65,535.                                                                                                                                                                                                                 | <b>detail</b>     |
| <b>Hello Default Holdtime</b>                    | Default holdtime and the time remaining if the <b>holdtime</b> option is not in the received hello message.                                                                                                                                                                                                    | <b>detail</b>     |
| <b>Hello Option DR Priority</b>                  | Designated router election priority. The range of values is 0 through 255.                                                                                                                                                                                                                                     | <b>detail</b>     |
| <b>Hello Option Generation ID</b>                | 9-digit or 10-digit number used to tag hello messages.                                                                                                                                                                                                                                                         | <b>detail</b>     |
| <b>Hello Option Bi-Directional PIM supported</b> | Neighbor can process bidirectional PIM messages.                                                                                                                                                                                                                                                               | <b>detail</b>     |
| <b>Hello Option LAN Prune Delay</b>              | Time to wait before the neighbor receives prune messages, in the format <b>delay nnn ms override nnnn ms</b> .                                                                                                                                                                                                 | <b>detail</b>     |

Table 415: show pim neighbors Output Fields (*continued*)

| Field Name                 | Field Description                                                                                                                                                                                                                                                                   | Level of Output |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Join Suppression supported | Neighbor is capable of join suppression.                                                                                                                                                                                                                                            | detail          |
| Rx Join                    | Information about joins received from the neighbor. <ul style="list-style-type: none"> <li><b>Group</b>—Group addresses in the join message.</li> <li><b>Source</b>—Address of the source in the join message.</li> <li><b>Timeout</b>—Time for which the join is valid.</li> </ul> | detail          |

## Sample Output

### show pim neighbors

```

user@host> show pim neighbors
Instance: PIM.master
B = Bidirectional Capable, G = Generation Identifier,
H = Hello Option Holdtime, L = Hello Option LAN Prune Delay,
P = Hello Option DR Priority

Interface      IP V Mode      Option      Uptime Neighbor addr
so-1/0/0.0      4 2            HPLG        00:07:10 10.111.10.2

```

### show pim neighbors brief

The output for the **show pim neighbors brief** command is identical to that for the **show pim neighbors** command. For sample output, see [show pim neighbors on page 3931](#).

### show pim neighbors instance

```

user@host> show pim neighbors instance VPN-A
Instance: PIM.VPN-A
B = Bidirectional Capable, G = Generation Identifier,
H = Hello Option Holdtime, L = Hello Option LAN Prune Delay,
P = Hello Option DR Priority

Interface      IP V Mode      Option      Uptime Neighbor addr
at-0/3/1.0      4 2            HPLG        00:07:54 10.111.30.2
mt-1/1/0.32768  4 2            HPLG        00:07:22 10.10.47.101
so-1/0/1.0      4 2            HPLG        00:07:50 10.111.20.2

```

### show pim neighbors detail

```

user@host> show pim neighbors detail
Instance: PIM.master
Interface: ge-0/0/1.0

Address: 10.10.1.1, IPv4, PIM v2, Mode: SparseDense, sg Join Count: 0, tsf
Join Count: 2
Hello Option Holdtime: 65535 seconds
Hello Option DR Priority: 1
Hello Option Generation ID: 2053759302
Hello Option Bi-Directional PIM supported
Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
Join Suppression supported

```

```
Address: 10.10.1.2, IPv4, PIM v2, sg Join Count: 0, tsg Join Count: 2
  BFD: Disabled
  Hello Option Holdtime: 105 seconds 93 remaining
  Hello Option DR Priority: 1
  Hello Option Generation ID: 1734018161
  Hello Option Bi-Directional PIM supported
  Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
                                Join Suppression supported
```

Interface: lo0.0

```
Address: 10.255.179.246, IPv4, PIM v2, Mode: SparseDense, sg Join Count:
0, tsg Join Count: 0
  Hello Option Holdtime: 65535 seconds
  Hello Option DR Priority: 1
  Hello Option Generation ID: 1997462267
  Hello Option Bi-Directional PIM supported
  Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
                                Join Suppression supported
```

#### show pim neighbors detail (With BFD)

```
user@host> show pim neighbors detail
```

Instance: PIM.master

Interface: fe-1/0/0.0

```
Address: 192.168.11.1, IPv4, PIM v2, Mode: Sparse
  Hello Option Holdtime: 65535 seconds
  Hello Option DR Priority: 1
  Hello Option Generation ID: 836607909
  Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
```

```
Address: 192.168.11.2, IPv4, PIM v2
  BFD: Enabled, Operational state is up
  Hello Default Holdtime: 105 seconds 104 remaining
  Hello Option DR Priority: 1
  Hello Option Generation ID: 1907549685
  Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
```

Interface: fe-1/0/1.0

```
Address: 192.168.12.1, IPv4, PIM v2
  BFD: Disabled
  Hello Default Holdtime: 105 seconds 80 remaining
  Hello Option DR Priority: 1
  Hello Option Generation ID: 1971554705
  Hello Option LAN Prune Delay: delay 500 ms override 2000 ms
```

Table 416: show pim rps Output Fields (*continued*)

| Field Name                        | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Level of Output      |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|
| <b>Anycast-PIM Register State</b> | <p>If anycast RP is configured, the current register state for each group:</p> <ul style="list-style-type: none"> <li>• <b>Group</b>—Multicast group address.</li> <li>• <b>Source</b>—Multicast source address for which the PIM register is sent or received, depending on whether this routing device is a designated router facing an RP router, or is the local RP, respectively.</li> <li>• <b>Origin</b>—How the information was obtained: <ul style="list-style-type: none"> <li>• <b>DIRECT</b>—From a local attachment</li> <li>• <b>MSDP</b>—From the Multicast Source Discovery Protocol (MSDP)</li> <li>• <b>DR</b>—From the designated router</li> </ul> </li> </ul> | <b>extensive</b>     |
| <b>RP selected</b>                | For sparse mode and bidirectional mode, the identity of the RP for the specified group address.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <i>group-address</i> |

## Sample Output

### show pim rps

```

user@host> show pim rps
Instance: PIM.master
Address family INET
RP address      Type      Mode   Holdtime Timeout Groups  Group prefixes
10.10.1.3       static   bidir   150     None     2  224.1.3.0/24
                225.1.3.0/24
10.10.13.2      static   bidir   150     None     2  224.1.1.0/24
                225.1.1.0/24

```

### show pim rps brief

The output for the **show pim rps brief** command is identical to that for the **show pim rps** command. For sample output, see [show pim rps on page 3936](#).

### show pim rps <group-address> (Bidirectional PIM)

```

user@host> show pim rps 224.1.1.1
Instance: PIM.master

224.1.0.0/16
  11.4.12.75 (Bidirectional)

RP selected: 11.4.12.75

```

### show pim rps <group-address> (PIM Dense Mode)

```

user@host> show pim rps 224.1.1.1
Instance: PIM.master

Dense Mode active for group 224.1.1.1

```

### show pim rps <group-address> (SSM Range Without asm-override-ssm Configured)

```

user@host> show pim rps 224.1.1.1

```

Instance: PIM.master

Source-specific Mode (SSM) active for group 224.1.1.1

#### show pim rps <group-address> (SSM Range With asm-override-ssm Configured and a Sparse-Mode RP)

user@host> show pim rps 224.1.1.1

Instance: PIM.master

Source-specific Mode (SSM) active with Sparse Mode ASM override for group 224.1.1.1

224.1.0.0/16  
11.4.12.75

RP selected: 11.4.12.75

#### show pim rps <group-address> (SSM Range With asm-override-ssm Configured and a Bidirectional RP)

user@host> show pim rps 224.1.1.1

Instance: PIM.master

Source-specific Mode (SSM) active with Sparse Mode ASM override for group 224.1.1.1

224.1.0.0/16  
11.4.12.75 (Bidirectional)

RP selected: (null)

#### show pim rps instance

user@host> show pim rps instance VPN-A

Instance: PIM.VPN-A

Address family INET

| RP address   | Type   | Holdtime | Timeout | Groups | Group prefixes |
|--------------|--------|----------|---------|--------|----------------|
| 10.10.47.100 | static | 0        | None    | 1      | 224.0.0.0/4    |

Address family INET6

#### show pim rps extensive (PIM Sparse Mode)

user@host> show pim rps extensive

Instance: PIM.master

Family: INET

RP: 10.255.245.91

Learned via: static configuration

Time Active: 00:05:48

Holdtime: 45 with 36 remaining

Device Index: 122

Subunit: 32768

Interface: pd-6/0/0.32768

Group Ranges:

224.0.0.0/4, 36s remaining

Active groups using RP:

225.1.1.1

total 1 groups active

Register State for RP:

| Group     | Source         | FirstHop      | RP Address    | State   | Timeout |

| <b>Output Fields</b>                                | <a href="#">Table 417 on page 3941</a> describes the output fields for the <b>show pim source</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Table 417: show pim source Output Fields

| Field Name                | Field Description                                                                                                                                                                     |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Instance</b>           | Name of the routing instance.                                                                                                                                                         |
| <b>Source</b>             | Address of the source or reverse path.                                                                                                                                                |
| <b>Prefix/length</b>      | Prefix and prefix length for the route used to reach the RPF address.                                                                                                                 |
| <b>Upstream Protocol</b>  | Protocol toward the source address.                                                                                                                                                   |
| <b>Upstream interface</b> | RPF interface toward the source address.<br><br>A pseudo multipoint LDP (M-LDP) interface appears on egress nodes in M-LDP point-to-multipoint LSPs with inband signaling.            |
| <b>Upstream Neighbor</b>  | Address of the RPF neighbor used to reach the source address.<br><br>The multipoint LDP (M-LDP) root appears on egress nodes in M-LDP point-to-multipoint LSPs with inband signaling. |

## Sample Output

### show pim source

```

user@host> show pim source
Instance: PIM.master Family: INET

Source 10.255.14.144
  Prefix 10.255.14.144/32
  Upstream interface Local
  Upstream neighbor Local

Source 10.255.70.15
  Prefix 10.255.70.15/32
  Upstream interface so-1/0/0.0
  Upstream neighbor 10.111.10.2

Instance: PIM.master Family: INET6

```

### show pim source brief

The output for the **show pim source brief** command is identical to that for the **show pim source** command. For sample output, see [show pim source on page 3941](#).

### show pim source detail

```

user@host> show pim source detail
Instance: PIM.master Family: INET

Source 10.255.14.144
  Prefix 10.255.14.144/32
  Upstream interface Local
  Upstream neighbor Local
  Active groups:228.0.0.0
  239.1.1.1

```

239.1.1.1

Source 10.255.70.15  
Prefix 10.255.70.15/32  
Upstream interface so-1/0/0.0  
Upstream neighbor 10.111.10.2  
Active groups:239.1.1.1

Instance: PIM.master Family: INET6

#### show pim source (Egress Node with Multipoint LDP Inband Signaling for Point-to-Multipoint LSPs)

user@host> show pim source

Instance: PIM.master Family: INET

Source 1.1.1.1  
Prefix 1.1.1.1/32  
Upstream interface Local  
Upstream neighbor Local

Source 1.2.7.7  
Prefix 1.2.7.0/24  
Upstream protocol MLDP  
Upstream interface Pseudo MLDP  
Upstream neighbor MLDP LSP root <1.1.1.2>

Source 192.168.219.11  
Prefix 192.168.219.0/28  
Upstream protocol MLDP  
Upstream interface Pseudo MLDP  
Upstream neighbor MLDP LSP root <1.1.1.2>

Instance: PIM.master Family: INET6

Source abcd::1:2:7:7  
Prefix abcd::1:2:7:0/120  
Upstream protocol MLDP  
Upstream interface Pseudo MLDP  
Upstream neighbor MLDP LSP root <1.1.1.2>

Table 418: show pim statistics Output Fields

| Field Name       | Field Description                                                                                                                                                                                                                                                                                                                                                                                                       |
|------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Instance         | <p>Name of the routing instance.</p> <p>This field only appears if you specify an interface, for example:</p> <ul style="list-style-type: none"> <li>• <b>inet interface <i>interface-name</i></b></li> <li>• <b>inet6 interface <i>interface-name</i></b></li> <li>• <b>interface <i>interface-name</i></b></li> </ul>                                                                                                 |
| Family           | <p>Output is for IPv4 or IPv6 PIM statistics. <b>INET</b> indicates IPv4 statistics, and <b>INET6</b> indicates IPv6 statistics.</p> <p>This field only appears if you specify an interface, for example:</p> <ul style="list-style-type: none"> <li>• <b>inet interface <i>interface-name</i></b></li> <li>• <b>inet6 interface <i>interface-name</i></b></li> <li>• <b>interface <i>interface-name</i></b></li> </ul> |
| PIM statistics   | PIM statistics for all interfaces or for the specified interface.                                                                                                                                                                                                                                                                                                                                                       |
| PIM message type | Message type for which statistics are displayed.                                                                                                                                                                                                                                                                                                                                                                        |
| Received         | Number of received statistics.                                                                                                                                                                                                                                                                                                                                                                                          |
| Sent             | Number of messages sent of a certain type.                                                                                                                                                                                                                                                                                                                                                                              |
| Rx errors        | Number of received packets that contained errors.                                                                                                                                                                                                                                                                                                                                                                       |
| V2 Hello         | PIM version 2 hello packets.                                                                                                                                                                                                                                                                                                                                                                                            |
| V2 Register      | PIM version 2 register packets.                                                                                                                                                                                                                                                                                                                                                                                         |
| V2 Register Stop | PIM version 2 register stop packets.                                                                                                                                                                                                                                                                                                                                                                                    |
| V2 Join Prune    | PIM version 2 join and prune packets.                                                                                                                                                                                                                                                                                                                                                                                   |
| V2 Bootstrap     | PIM version 2 bootstrap packets.                                                                                                                                                                                                                                                                                                                                                                                        |
| V2 Assert        | PIM version 2 assert packets.                                                                                                                                                                                                                                                                                                                                                                                           |
| V2 Graft         | PIM version 2 graft packets.                                                                                                                                                                                                                                                                                                                                                                                            |
| V2 Graft Ack     | PIM version 2 graft acknowledgment packets.                                                                                                                                                                                                                                                                                                                                                                             |
| V2 Candidate RP  | PIM version 2 candidate RP packets.                                                                                                                                                                                                                                                                                                                                                                                     |
| V2 State Refresh | <p>PIM version 2 control messages related to PIM dense mode (PIM-DM) state refresh.</p> <p>State refresh is an extension to PIM-DM. It not supported in Junos OS.</p>                                                                                                                                                                                                                                                   |

Table 418: show pim statistics Output Fields (*continued*)

| Field Name                       | Field Description                                                                                                   |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------|
| V2 DF Election                   | PIM version 2 send and receive messages associated with bidirectional PIM designated forwarder election.            |
| V1 Query                         | PIM version 1 query packets.                                                                                        |
| V1 Register                      | PIM version 1 register packets.                                                                                     |
| V1 Register Stop                 | PIM version 1 register stop packets.                                                                                |
| V1 Join Prune                    | PIM version 1 join and prune packets.                                                                               |
| V1 RP Reachability               | PIM version 1 RP reachability packets.                                                                              |
| V1 Assert                        | PIM version 1 assert packets.                                                                                       |
| V1 Graft                         | PIM version 1 graft packets.                                                                                        |
| V1 Graft Ack                     | PIM version 1 graft acknowledgment packets.                                                                         |
| AutoRP Announce                  | Auto-RP announce packets.                                                                                           |
| AutoRP Mapping                   | Auto-RP mapping packets.                                                                                            |
| AutoRP Unknown type              | Auto-RP packets with an unknown type.                                                                               |
| Anycast Register                 | Auto-RP announce packets.                                                                                           |
| Anycast Register Stop            | Auto-RP announce packets.                                                                                           |
| Global Statistics                | Summary of PIM statistics for all interfaces.                                                                       |
| Hello dropped on neighbor policy | Number of hello packets dropped because of a configured neighbor policy.                                            |
| Unknown type                     | Number of PIM control packets received with an unknown type.                                                        |
| V1 Unknown type                  | Number of PIM version 1 control packets received with an unknown type.                                              |
| Unknown Version                  | Number of PIM control packets received with an unknown version. The version is not version 1 or version 2.          |
| Neighbor unknown                 | Number of PIM control packets received (excluding PIM hello) without first receiving the hello packet.              |
| Bad Length                       | Number of PIM control packets received for which the packet size does not match the PIM length field in the packet. |

Table 418: show pim statistics Output Fields (*continued*)

| Field Name                      | Field Description                                                                                                         |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------|
| Bad Checksum                    | Number of PIM control packets received for which the calculated checksum does not match the checksum field in the packet. |
| Bad Receive If                  | Number of PIM control packets received on an interface that does not have PIM configured.                                 |
| Rx Bad Data                     | Number of PIM control packets received that contain data for TCP Bad register packets.                                    |
| Rx Intf disabled                | Number of PIM control packets received on an interface that has PIM disabled.                                             |
| Rx V1 Require V2                | Number of PIM version 1 control packets received on an interface configured for PIM version 2.                            |
| Rx V2 Require V1                | Number of PIM version 2 control packets received on an interface configured for PIM version 1.                            |
| Rx Register not RP              | Number of PIM register packets received when the routing device is not the RP for the group.                              |
| Rx Register no route            | Number of PIM register packets received when the RP does not have a unicast route back to the source.                     |
| Rx Register no decap if         | Number of PIM register packets received when the RP does not have a de-encapsulation interface.                           |
| Null Register Timeout           | Number of NULL register timeout packets.                                                                                  |
| RP Filtered Source              | Number of PIM packets received when the routing device has a source address filter configured for the RP.                 |
| Rx Unknown Reg Stop             | Number of register stop messages received with an unknown type.                                                           |
| Rx Join/Prune no state          | Number of join and prune messages received for which the routing device has no state.                                     |
| Rx Join/Prune on upstream if    | Number of join and prune messages received on the interface used to reach the upstream routing device, toward the RP.     |
| Rx Join/Prune for invalid group | Number of join or prune messages received for invalid multicast group addresses.                                          |
| Rx Join/Prune messages dropped  | Number of join and prune messages received and dropped.                                                                   |
| Rx sparse join for dense group  | Number of PIM sparse mode join messages received for a group that is configured for dense mode.                           |

Table 418: show pim statistics Output Fields (*continued*)

| Field Name                  | Field Description                                                                                                                                                           |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rx Graft/Graft Ack no state | Number of graft and graft acknowledgment messages received for which the router or switch has no state.                                                                     |
| Rx Graft on upstream if     | Number of graft messages received on the interface used to reach the upstream routing device, toward the RP.                                                                |
| Rx CRP not BSR              | Number of BSR messages received in which the PIM message type is Candidate-RP-Advertisement, not Bootstrap.                                                                 |
| Rx BSR when BSR             | Number of BSR messages received in which the PIM message type is Bootstrap.                                                                                                 |
| Rx BSR not RPF if           | Number of BSR messages received on an interface that is not the RPF interface.                                                                                              |
| Rx unknown hello opt        | Number of PIM hello packets received with options that Junos OS does not support.                                                                                           |
| Rx data no state            | Number of PIM control packets received for which the routing device has no state for the data type.                                                                         |
| Rx RP no state              | Number of PIM control packets received for which the routing device has no state for the RP.                                                                                |
| Rx aggregate                | Number of PIM aggregate MDT packets received.                                                                                                                               |
| Rx malformed packet         | Number of PIM control packets received with a malformed IP unicast or multicast address family.                                                                             |
| No RP                       | Number of PIM control packets received with no RP address.                                                                                                                  |
| No register encaps if       | Number of PIM register packets received when the first-hop routing device does not have an encapsulation interface.                                                         |
| No route upstream           | Number of PIM control packets received when the routing device does not have a unicast route to the the interface used to reach the upstream routing device, toward the RP. |
| Nexthop Unusable            | Number of PIM control packets with an unusable nexthop. A path can be unusable if the route is hidden or the link is down.                                                  |
| RP mismatch                 | Number of PIM control packets received for which the routing device has an RP mismatch.                                                                                     |
| RP mode mismatch            | RP mode (sparse or bidirectional) mismatches encountered when processing join and prune messages.                                                                           |
| RPF neighbor unknown        | Number of PIM control packets received for which the routing device has an unknown RPF neighbor for the source.                                                             |

Table 418: show pim statistics Output Fields (*continued*)

| Field Name                          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Rx Joins/Prunes filtered            | The number of join and prune messages filtered because of configured route filters and source address filters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Tx Joins/Prunes filtered            | The number of join and prune messages filtered because of configured route filters and source address filters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Embedded-RP invalid addr            | Number of packets received with an invalid embedded RP address in PIM join messages and other types of messages sent between routing domains.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Embedded-RP limit exceed            | Number of times the limit configured with the <b>maximum-rps</b> statement is exceeded. The <b>maximum-rps</b> statement limits the number of embedded RPs created in a specific routing instance. The range is from 1 through 500. The default is 100.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Embedded-RP added                   | <p>Number of packets in which the embedded RP for IPv6 is added.</p> <p>The following receive events trigger extraction of an IPv6 embedded RP address on the routing device:</p> <ul style="list-style-type: none"> <li>• Multicast Listener Discovery (MLD) report for an embedded RP multicast group address</li> <li>• PIM join message with an embedded RP multicast group address</li> <li>• Static embedded RP multicast group address associated with an interface</li> <li>• Packets sent to an embedded RP multicast group address received on the DR</li> </ul> <p>An embedded RP node discovered through these receive events is added if it does not already exist on the routing platform.</p> |
| Embedded-RP removed                 | Number of packets in which the embedded RP for IPv6 is removed. The embedded RP is removed whenever all PIM join states using this RP are removed or the configuration changes to remove the embedded RP feature.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Rx Register msgs filtering drop     | Number of received register messages dropped because of a filter configured for PIM register messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Tx Register msgs filtering drop     | Number of register messages dropped because of a filter configured for PIM register messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Rx Bidir Join/Prune on non-Bidir if | Error counter for join and prune messages received on non-bidirectional PIM interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Rx Bidir Join/Prune on non-DF if    | Error counter for join and prune messages received on non-designated forwarder interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| V4 (S,G) Maximum                    | Maximum number of (S,G) IPv4 multicast routes accepted for the VPN routing and forwarding (VRF) routing instance. If this number is met, additional (S,G) entries are not accepted.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Table 418: show pim statistics Output Fields (*continued*)

| Field Name                       | Field Description                                                                                                                                                                   |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| V4 (S,G) Accepted                | Number of accepted (S,G) IPv4 multicast routes.                                                                                                                                     |
| V4 (S,G) Threshold               | Threshold at which a warning message is logged (percentage of the maximum number of (S,G) IPv4 multicast routes accepted by the device).                                            |
| V4 (S,G) Log Interval            | Time (in seconds) between consecutive log messages.                                                                                                                                 |
| V6 (S,G) Maximum                 | Maximum number of (S,G) IPv6 multicast routes accepted for the VPN routing and forwarding (VRF) routing instance. If this number is met, additional (S,G) entries are not accepted. |
| V6 (S,G) Accepted                | Number of accepted (S,G) IPv6 multicast routes.                                                                                                                                     |
| V6 (S,G) Threshold               | Threshold at which a warning message is logged (percentage of the maximum number of (S,G) IPv6 multicast routes accepted by the device).                                            |
| V6 (S,G) Log Interval            | Time (in seconds) between consecutive log messages.                                                                                                                                 |
| V4 (grp-prefix, RP) Maximum      | Maximum number of group-to-rendezvous point (RP) IPv4 multicast mappings accepted for the VRF routing instance. If this number is met, additional mappings are not accepted.        |
| V4 (grp-prefix, RP) Accepted     | Number of accepted group-to-RP IPv4 multicast mappings.                                                                                                                             |
| V4 (grp-prefix, RP) Threshold    | Threshold at which a warning message is logged (percentage of the maximum number of group-to-RP IPv4 multicast mappings accepted by the device).                                    |
| V4 (grp-prefix, RP) Log Interval | Time (in seconds) between consecutive log messages.                                                                                                                                 |
| V6 (grp-prefix, RP) Maximum      | Maximum number of group-to RP IPv6 multicast mappings accepted for the VRF routing instance. If this number is met, additional mappings are not accepted.                           |
| V6 (grp-prefix, RP) Accepted     | Number of accepted group-to-RP IPv6 multicast mappings.                                                                                                                             |
| V6 (grp-prefix, RP) Threshold    | Threshold at which a warning message is logged (percentage of the maximum number of group-to-RP IPv6 multicast mappings accepted by the device).                                    |
| V6 (grp-prefix, RP) Log Interval | Time (in seconds) between consecutive log messages.                                                                                                                                 |

## Understanding Real-Time Performance Monitoring on EX Series Switches

Real-time performance monitoring (RPM) enables you to configure active probes to track and monitor traffic across the network and to investigate network problems. You can use RPM with Juniper Networks EX Series Ethernet Switches.

The ways in which you can use RPM include:

- Monitor time delays between devices.
- Monitor time delays at the protocol level.
- Set thresholds to trigger SNMP traps when values are exceeded.

You can configure thresholds for round-trip time, ingress or egress delay, standard deviation, jitter, successive lost probes, and total lost probes per test. (SNMP trap results are stored in **pingResultsTable**, **jnxPingResultsTable**, **jnxPingProbeHistoryTable**, and **pingProbeHistoryTable**.)

- Determine automatically whether a path exists between a host router or switch and its configured BGP neighbors. You can view the results of the discovery using an SNMP client.
- Use the history of the most recent 50 probes to analyze trends in your network and predict future needs.

RPM provides MIB support with extensions for RFC 2925, *Definitions of Managed Objects for Remote Ping, Traceroute, and Lookup Operations*.

This topic includes:

- [RPM Packet Collection on page 3960](#)
- [Tests and Probe Types on page 3960](#)
- [Hardware Timestamps on page 3961](#)
- [Limitations of RPM on EX Series Switches on page 3963](#)

---

### RPM Packet Collection

Probes collect packets per destination and per application, including ping Internet Control Message Protocol (ICMP) packets, User Datagram Protocol and Transmission Control Protocol (UDP/TCP) packets with user-configured ports, user-configured Differentiated Services code point (DSCP) type-of-service (ToS) packets, and Hypertext Transfer Protocol (HTTP) packets.

---

### Tests and Probe Types

A test can contain multiple probes. The probe type specifies the packet and protocol contents of the probe.

EX Series switches support the following tests and probe types:

- Ping tests:
  - ICMP echo probe

- ICMP timestamp probe
- HTTP tests:
  - HTTP get probe (not available for BGP RPM services)
  - HTTP get metadata probe
- UDP and TCP tests with user-configured ports:
  - UDP echo probe
  - TCP connection probe
  - UDP timestamp probe

### Hardware Timestamps

To account for latency or jitter in the communication of probe messages, you can enable timestamping of the probe packets (hardware timestamps). If hardware timestamps are not configured, then timers are generated at the software level and are less accurate than they would have been with hardware timestamps.

**NOTE:** EX Series switches support hardware timestamps for UDP and ICMP probes. EX Series switches do not support hardware timestamps for HTTP or TCP probes.

You can timestamp the following RPM probes to improve the measurement of latency or jitter:

- ICMP ping
- ICMP ping timestamp
- UDP ping
- UDP ping timestamp

You should configure the requester (the RPM client) with hardware timestamps (see [Figure 51 on page 3962](#)) to get more meaningful results than you would get without the timestamps. The responder (the RPM server) does not need to be configured to support hardware timestamps. If the responder supports hardware timestamps, it timestamps the RPM probes. If the responder does not support hardware timestamps, RPM can only report round-trip measurements that include the processing time on the responder.

**NOTE:** Hardware timestamps are supported on all EX Series switches.

[Figure 51 on page 3962](#) shows the timestamps:

Figure 51: RPM Timestamps

- T1 is the time the packet leaves the requester port.
- T2 is the time the responder receives the packet.
- T3 is the time the responder sends the response.
- T4 is the time the requester receives the response.

The round-trip time is  $(T2 - T1) + (T4 - T3)$ . If the responder does not support hardware timestamps, then the round-trip time is  $(T4 - T1) / 2$ , and thus includes the processing time of the responder.

You can use RPM probes to find the following time measurements:

- Minimum round-trip time
- Maximum round-trip time
- Average round-trip time
- Standard deviation of the round-trip time
- Jitter of the round-trip time—Difference between the minimum and maximum round-trip time

**NOTE:** See “[Configuring the Interface for RPM Timestamping for Client/Server on an EX Series Switch \(CLI Procedure\)](#)” on [page 4057](#) for information on how to configure hardware timestamps on the requester.

The RPM feature provides a configuration option to set one-way hardware timestamps. Use one-way timestamps when you want information about one-way time, rather than round-trip times, for packets to traverse the network between the requester and the responder. As shown in [Figure 51 on page 3962](#), one-way timestamps represent the time  $T2 - T1$  and the time from  $T4 - T3$ . Use one-way timestamps when you want to gather information about delay in each direction and to find egress and ingress jitter values.

**NOTE:** For correct one-way measurement, the clocks of the requester and responder must be synchronized. If the clocks are not synchronized, one-way jitter measurements and calculations can include significant variations, in some cases orders of magnitude greater than the round-trip times.

When you enable one-way timestamps in a probe, the following one-way measurements are reported:

- Minimum, maximum, standard deviation, and jitter measurements for egress and ingress times
- Number of probes sent
- Number of probe responses received
- Percentage of lost probes

---

### Limitations of RPM on EX Series Switches

- Two-Way Active Measurement Protocol (TWAMP) is not supported on EX Series switches.
- EX Series switches do not support user-configured class-of-service (CoS) classifiers or prioritization of RPM packets over regular data packets received on an input interface.
- Timestamps:
  - If the responder does not support hardware timestamps, RPM can only report the round-trip measurements and cannot calculate round-trip jitter.
  - EX Series switches do not support hardware timestamps for HTTP and TCP probes.
  - Timestamps apply only to IPv4 traffic.

## Understanding Port Mirroring and Analyzers on EX4300 Switches

**NOTE:** This concept uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Understanding Port Mirroring on EX Series Switches*. For ELS details, see *Getting Started with Enhanced Layer 2 Software*.

Mirroring might be needed for traffic analysis on a switch because a switch, unlike a hub, does not broadcast packets to every port on the destination device. The switch sends packets only to the port to which the destination device is connected.

Juniper Networks EX4300 Ethernet Switches support the following mirroring methods: port mirroring and analyzers. You can use port mirroring or analyzers to facilitate analyzing traffic on EX4300 switches at the packet level. You might use analyzers as part of monitoring switch traffic for such purposes as enforcing policies concerning network usage and file sharing and for identifying sources of problems on your network by locating abnormal or heavy bandwidth usage by particular stations or applications.

Mirrored packets can be copied either to a local interface for local monitoring or to a VLAN for remote monitoring. The following packets can be copied:

- **Packets entering or exiting a port**—You can mirror the packets in any combination of packets entering or exiting ports on up to 256 ports. For example, you can send copies of the packets entering some ports and the packets exiting other ports to the same local analyzer port or analyzer VLAN.
- **Packets entering a VLAN**—You can mirror the packets entering a VLAN to either a local analyzer port or to an analyzer VLAN. You can configure multiple VLANs (up to 256 VLANs), including a VLAN range and PVLANS, as ingress input to an analyzer.
- **Policy-based sample packets**—You can mirror a policy-based sample of packets that are entering a port or a VLAN. You configure a firewall filter to establish a policy to select the packets to be mirrored. You can send the sample to a port-mirroring instance or to an analyzer VLAN.

This topic describes:

### Port Mirroring Overview

You configure port mirroring on an EX4300 switch to send copies of unicast traffic to an output destination such as an interface, a routing-instance, or a VLAN. Then, you can analyze the mirrored traffic by using a protocol analyzer application. The protocol analyzer

application can run either on a computer connected to the analyzer output interface or on a remote monitoring station. For the input traffic, you can configure a firewall filter term to specify whether port mirroring must be applied to all packets at the interface to which the firewall filter is applied. You can apply a firewall filter configured with the action **port-mirror** or **port-mirror-instance *name*** to the input or output logical interfaces (including aggregated Ethernet logical interfaces), to traffic forwarded or flooded to a VLAN, or traffic forwarded or flooded to a VPLS routing instance. EX4300 switches support port mirroring of VPLS (**family ethernet-switching** or **family vpls**) traffic and VPN traffic with **family ccc** in a Layer 2 environment. Within a firewall filter term, you can specify the port-mirroring properties under the **then** statement in either of the following ways:

- Implicitly reference the port-mirroring properties in effect on the port.
- Explicitly reference a particular named instance of port mirroring.

You can configure port mirroring at the **[edit forwarding-options port-mirroring]** hierarchy level.

### Analyzer Overview

You can configure an analyzer to define both the input traffic and output traffic in the same analyzer configuration. The input traffic to be analyzed can be traffic that enters or exits an interface, or traffic that enters a VLAN. The analyzer configuration enables you to send this traffic to an output interface, instance, or VLAN. You can configure an analyzer at the **[edit forwarding-options analyzer]** hierarchy.

### Port Mirroring and Analyzer Terminologies

Table 419 on page 3965 lists some port mirroring terms and their descriptions.

**Table 419: Mirroring Terminologies**

| Term                                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Analyzer                                                  | <p>In a mirroring configuration (analyzer) on an EX4300 switch, the analyzer includes:</p> <ul style="list-style-type: none"> <li>• The name of the analyzer</li> <li>• Source (input) ports or VLAN</li> <li>• A destination for mirrored packets (either a monitor port or a monitor VLAN)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                         |
| Analyzer output interface<br>(Also known as monitor port) | <p>Interface to which mirrored traffic is sent and to which a protocol analyzer application is connected.</p> <p><b>NOTE:</b> Interfaces used as output for an analyzer must be configured under the <b>ethernet-switching</b> family.</p> <p>Analyzer output interfaces have the following limitations:</p> <ul style="list-style-type: none"> <li>• Cannot also be a source port.</li> <li>• Do not participate in Layer 2 protocols, such as Spanning Tree Protocol (STP), when part of a port-mirroring configuration.</li> <li>• If the bandwidth of the analyzer output interface is not sufficient to handle the traffic from the source ports, overflow packets are dropped.</li> </ul> |

Table 419: Mirroring Terminologies (*continued*)

| Term                                                                      | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|---------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Analyzer VLAN<br>(Also known as monitor VLAN)                             | VLAN to which mirrored traffic is sent. The mirrored traffic can be used by a protocol analyzer application. The member interfaces in the monitor VLAN are spread across the switches in your network.                                                                                                                                                                                                                                                                                                      |
| Port mirroring                                                            | A port-mirroring configuration that does not specify an input source; it specifies only an output destination. A firewall filter configuration must be defined for the input source. A firewall filter configuration must be defined to mirror packets that match the match conditions defined in the firewall filter term. The action item <b>port-mirror-instance instance-name</b> in the firewall filter configuration is used to send packets to the analyzer and these packets form the input source. |
| Global port mirror                                                        | A port mirroring configuration that does not have an instance name. The firewall filter action <b>port-mirror</b> will be the action for the firewall filter configuration.                                                                                                                                                                                                                                                                                                                                 |
| Input interface<br>(Also known as mirrored ports or monitored interfaces) | An interface on the switch that is being mirrored. Traffic that is either entering or exiting this interface is mirrored.                                                                                                                                                                                                                                                                                                                                                                                   |
| LAG-based analyzer                                                        | An analyzer that has a link aggregation group (LAG) specified as the input (ingress) interface in the analyzer configuration.                                                                                                                                                                                                                                                                                                                                                                               |
| Local mirroring                                                           | An analyzer configuration in which packets are mirrored to a local analyzer port.                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Monitoring station                                                        | A computer running a protocol analyzer application.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Native analyzer session                                                   | An analyzer session that has both <b>input</b> and <b>output</b> definitions in its analyzer configuration.                                                                                                                                                                                                                                                                                                                                                                                                 |
| Policy-based mirroring<br>(Also known as port mirroring)                  | Mirroring of packets that match the match items in the defined firewall filter term. The action item <b>port-mirror-instance instance-name</b> is used in the firewall filter to send the packets to the monitor port.                                                                                                                                                                                                                                                                                      |
| Port-based analyzer                                                       | An analyzer session whose configuration defines interfaces for both input and output.                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Protocol analyzer application                                             | An application used to examine packets transmitted across a network segment. Also commonly called network analyzer, packet sniffer, or probe.                                                                                                                                                                                                                                                                                                                                                               |
| Remote port mirroring                                                     | Functions the same way as local port mirroring, except that the mirrored traffic is not copied to a local analyzer port but is flooded to an analyzer VLAN that you create specifically for the purpose of receiving mirrored traffic.                                                                                                                                                                                                                                                                      |
| VLAN-based analyzer                                                       | An analyzer session whose configuration uses VLANs for both input and output or for either input or output.                                                                                                                                                                                                                                                                                                                                                                                                 |

### Configuration Guidelines for Port Mirroring and Analyzers on EX4300 Switches

When you configure port mirroring or analyzers on EX4300 switches, we recommend that you follow certain guidelines to ensure that you obtain optimum benefit from mirroring. Additionally, we recommend that you disable mirroring when you are not using it and that you select specific interfaces for which packets must be mirrored (that is,

select specific interfaces as input to the analyzer) in preference to using the **all** keyword option, which will enable mirroring on all interfaces. Mirroring only the necessary packets reduces any potential performance impact.

With local mirroring, traffic from multiple ports is replicated to the analyzer output interface. If the output interface for an analyzer reaches capacity, packets are dropped. Thus, while configuring an analyzer, you must consider whether the traffic being mirrored exceeds the capacity of the analyzer output interface.

[Table 420 on page 3967](#) summarizes further configuration guidelines for mirroring on EX4300 switches.

**Table 420: Configuration Guidelines for Port Mirroring and Analyzers on EX4300 Switches**

| Guideline                                                                                    | Value or Support Information                                                                                                                                                                                                                                                                  | Comment                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Number of VLANs that you can use as ingress input to an analyzer.                            | 256                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Number of port-mirroring sessions and analyzers that you can enable concurrently.            | 4                                                                                                                                                                                                                                                                                             | <ul style="list-style-type: none"> <li>You can configure a total of four sessions and you can enable only one of the following at any point in time: <ul style="list-style-type: none"> <li>A maximum of four port-mirroring sessions (including the global port-mirroring session). See <a href="#">Table 419 on page 3965</a> for a description of global port mirror.</li> <li>A maximum of four analyzer sessions.</li> <li>A combination of port-mirroring and analyzer sessions, and the total of this combination must be four.</li> </ul> </li> <li>You can configure more than the specified number of port-mirroring instances or analyzers on the switch, but you can enable only the specified number for a session. Use <b>disable forwarding-options analyzer name</b> to disable an analyzer and use <b>disable forwarding-options port-mirroring instance name</b> to disable a port-mirroring instance.</li> </ul> |
| Types of ports on which you cannot mirror traffic.                                           | <ul style="list-style-type: none"> <li>Virtual Chassis ports (VCPs)</li> <li>Management Ethernet ports (<b>me0</b> or <b>vme0</b>)</li> <li>Integrated routing and bridging (IRB) interfaces; also known as routed VLAN interfaces (RVIs).</li> <li>VLAN-tagged Layer 3 interfaces</li> </ul> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Protocol families that you can include in a port-mirroring configuration for remote traffic. | any                                                                                                                                                                                                                                                                                           |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Table 420: Configuration Guidelines for Port Mirroring and Analyzers on EX4300 Switches** (*continued*)

| Guideline                                                                                                     | Value or Support Information | Comment                                                                           |
|---------------------------------------------------------------------------------------------------------------|------------------------------|-----------------------------------------------------------------------------------|
| Traffic directions that you can configure for mirroring on ports in firewall-filter-based configurations.     | Ingress only                 |                                                                                   |
| Mirrored packets exiting an interface reflect rewritten class-of-service (CoS) DSCP or 802.1p bits.           | Applicable                   |                                                                                   |
| Packets with physical layer errors are not sent to the local or remote analyzer.                              | Applicable                   | Packets with these errors are filtered out and thus are not sent to the analyzer. |
| Port mirroring does not support line-rate traffic.                                                            | Applicable                   | Port mirroring for line-rate traffic is done on a best-effort basis.              |
| Mirroring of packets egressing a VLAN.                                                                        | Not supported                |                                                                                   |
| Port-mirroring or analyzer output on a LAG interface.                                                         | Supported                    |                                                                                   |
| Maximum number of child members on a port-mirroring or analyzer output LAG interface.                         | 8                            |                                                                                   |
| Maximum number of interfaces in a remote port-mirroring or analyzer VLAN.                                     | 1                            |                                                                                   |
| Egress mirroring of host-generated control packets.                                                           | Not Supported                |                                                                                   |
| Configuring Layer 3 logical interfaces in the <b>input</b> stanza of an analyzer.                             | Not supported                | This functionality can be achieved by configuring port mirroring.                 |
| The analyzer input and output stanzas containing members of the same VLAN or the VLAN itself must be avoided. | Applicable                   |                                                                                   |

## sFlow Monitoring Technology

- [Understanding How to Use sFlow Technology for Network Monitoring on an EX Series Switch on page 3969](#)

### Understanding How to Use sFlow Technology for Network Monitoring on an EX Series Switch

The sFlow technology is a monitoring technology for high-speed switched or routed networks. sFlow monitoring technology randomly samples network packets and sends the samples to a monitoring station. You can configure sFlow technology on a Juniper Networks EX Series Ethernet Switch to continuously monitor traffic at wire speed on all interfaces simultaneously.

This topic describes:

- [Sampling Mechanism and Architecture of sFlow Technology on EX Series Switches on page 3969](#)
- [Adaptive Sampling on page 3970](#)
- [sFlow Agent Address Assignment on page 3971](#)

### Sampling Mechanism and Architecture of sFlow Technology on EX Series Switches

sFlow technology uses the following two sampling mechanisms:

- **Packet-based sampling:** Samples one packet out of a specified number of packets from an interface enabled for sFlow technology.
- **Time-based sampling:** Samples interface statistics at a specified interval from an interface enabled for sFlow technology.

The sampling information is used to create a network traffic visibility picture. The Juniper Networks Junos operating system (Junos OS) fully supports the sFlow standard described in RFC 3176, *InMon Corporation's sFlow: A Method for Monitoring Traffic in Switched and Routed Networks*.

**NOTE:** sFlow technology on the switches samples only raw packet headers. A raw Ethernet packet is the complete Layer 2 network frame.

An sFlow monitoring system consists of an sFlow agent embedded in the switch and a centralized collector. The sFlow agent's two main activities are random sampling and statistics gathering. The sFlow agent combines interface counters and flow samples and sends them across the network to the sFlow collector in UDP datagrams, directing those datagrams to the IP address and UDP destination port of the collector. Each datagram contains the following information:

- The IP address of the sFlow agent
- The number of samples
- The interface through which the packets entered the agent

- The interface through which the packets exited the agent
- The source and destination interface for the packets
- The source and destination VLAN for the packets

EX Series switches adopt the distributed sFlow architecture. The sFlow agent has two separate sampling entities that are associated with each Packet Forwarding Engine. These sampling entities are known as subagents. Each subagent has a unique ID that is used by the collector to identify the data source. A subagent has its own independent state and forwards its own sample packets to the sFlow agent. The sFlow agent is responsible for packaging the samples into datagrams and sending them to the sFlow collector. Because sampling is distributed across subagents, the protocol overhead associated with sFlow technology is significantly reduced at the collector.

**NOTE:** You cannot configure sFlow monitoring on a link aggregation group (LAG), but you can configure it individually on a LAG member interface.

**NOTE:** If the mastership assignment changes in a Virtual Chassis setup, sFlow technology continues to function.

---

### Adaptive Sampling

The switches use adaptive sampling to ensure both sampling accuracy and efficiency. Adaptive sampling is a process of monitoring the overall incoming traffic rate on the network device and providing intelligent feedback to interfaces to dynamically adapt the sampling rates on interfaces on the basis of traffic conditions. Interfaces on which incoming traffic exceeds the system threshold are checked so that all violations can be regulated without affecting the traffic on other interfaces. Every 12 seconds, the agent checks interfaces to get the number of samples, and interfaces are grouped on the basis of the slot that they belong to. The top five interfaces that produce the highest number of samples are selected. Using the binary backoff algorithm, the sampling load on these interfaces is reduced by half and allotted to interfaces that have a lower sampling rate. Therefore, when the processor's sampling limit is reached, the sampling rate is adapted such that it does not load the processor any further. If the switch is rebooted, the adaptive sampling rate is reset to the user-configured sampling rate. Also, if you modify the sampling rate, the adaptive sampling rate changes.

The advantage of adaptive sampling is that the switch continues to operate at its optimum level even when there is a change in the traffic patterns in the interfaces. You do not need to make any changes. Because the sampling rate adapts dynamically to changing network conditions, the resources are utilized optimally resulting in a high-performance network.

Infrequent sampling flows might not be reported in the sFlow information, but over time, the majority of flows are reported. On the basis of the configured sampling rate  $N$ , 1 out of  $N$  packets is captured and sent to the collector. This type of sampling does not provide a result that is 100 percent accurate in the analysis, but it does provide a result of quantifiable accuracy. A user-configured polling interval defines how often the sFlow

data for a specific interface are sent to the collector, but an sFlow agent can also schedule polling.

**NOTE:** sFlow technology on EX Series switches does not support graceful restart. When a graceful restart occurs, the adaptive sampling rate is set to the user-configured sampling rate.

### sFlow Agent Address Assignment

The sFlow collector uses the sFlow agent's IP address to determine the source of the sFlow data. You can configure the IP address of the sFlow agent to ensure that the agent ID of the sFlow agent remains constant. If you do not configure the IP address of the sFlow agent, an IP address is automatically assigned to the agent. This is the IP address of one of the following interfaces configured on the switch taken in the given order of priority:

1. Virtual management Ethernet (VME) interface
2. Management Ethernet interface

If neither of the preceding interfaces has been configured, the IP address of any Layer 3 interface or the routed VLAN interface (RVI) is assigned to the agent. At least one interface must be configured on the switch for an IP address to be automatically assigned to the agent. When the agent's IP address is assigned automatically, the IP address is dynamic and changes when the switch reboots.

sFlow data can be used to provide network traffic visibility information. You can explicitly configure the IP address to be assigned to source data (sFlow datagrams). If you do not explicitly configure that address, the IP address of the configured Gigabit Ethernet interface, 10-Gigabit Ethernet interface, or the RVI is used as the source IP address.

## Ethernet OAM Link Fault Management and Connectivity Fault Management

- [Understanding Ethernet OAM Link Fault Management for an EX Series Switch on page 3972](#)
- [Understanding Ethernet OAM Connectivity Fault Management for an EX Series Switch on page 3973](#)
- [Understanding Ethernet Frame Delay Measurements on Switches on page 3974](#)

## Understanding Ethernet OAM Link Fault Management for an EX Series Switch

Juniper Networks Junos operating system (Junos OS) for Juniper Networks EX Series Ethernet Switches allows the Ethernet interfaces on these switches to support the IEEE 802.3ah standard for the Operation, Administration, and Maintenance (OAM) of Ethernet in access networks. The standard defines OAM link fault management (LFM). You can configure IEEE 802.3ah OAM LFM on point-to-point Ethernet links that are connected either directly or through Ethernet repeaters. The IEEE 802.3ah standard meets the requirement for OAM capabilities even as Ethernet moves from being solely an enterprise technology to a WAN and access technology, and the standard remains backward-compatible with existing Ethernet technology.

Ethernet OAM provides the tools that network management software and network managers can use to determine how a network of Ethernet links is functioning. Ethernet OAM should:

- Rely only on the media access control (MAC) address or virtual LAN identifier for troubleshooting.
- Work independently of the actual Ethernet transport and function over physical Ethernet ports or a virtual service such as pseudowire.
- Isolate faults over a flat (or single operator) network architecture or nested or hierarchical (or multiprovider) networks.

The following OAM LFM features are supported on EX Series switches:

- Discovery and Link Monitoring

The discovery process is triggered automatically when OAM is enabled on the interface. The discovery process permits Ethernet interfaces to discover and monitor the peer on the link if it also supports the IEEE 802.3ah standard. You can specify the discovery mode used for IEEE 802.3ah OAM support. In active mode, the interface discovers and monitors the peer on the link if the peer also supports IEEE 802.3ah OAM functionality. In passive mode, the peer initiates the discovery process. After the discovery process has been initiated, both sides participate in discovery. The switch performs link monitoring by sending periodic OAM protocol data units (PDUs) to advertise OAM mode, configuration, and capabilities.

You can specify the number of OAM PDUs that an interface can miss before the link between peers is considered down.

- Remote Fault Detection

Remote fault detection uses flags and events. Flags are used to convey the following: Link Fault means a loss of signal, Dying Gasp means an unrecoverable condition such as a power failure, and Critical Event means an unspecified vendor-specific critical event. You can specify the periodic OAM PDU sending interval for fault detection. The EX Series switch uses the Event Notification OAM PDU to notify the remote OAM device when a problem is detected. You can specify the action to be taken by the system when the configured link-fault event occurs.

- Remote Loopback Mode

Remote loopback mode ensures link quality between the switch and a remote peer during installation or troubleshooting. In this mode, when the interface receives a frame that is not an OAM PDU or a pause frame, it sends it back on the same interface on which it was received. The link appears to be in the active state. You can use the returned loopback acknowledgement to test delay, jitter, and throughput.

Junos OS can place a remote DTE into loopback mode (if remote loopback mode is supported by the remote DTE). When you place a remote DTE into loopback mode, the interface receives the remote loopback request and puts the interface into remote loopback mode. When the interface is in remote loopback mode, all frames except OAM PDUs are looped back without any changes made to the frames. OAM PDUs continue to be sent and processed.

## Understanding Ethernet OAM Connectivity Fault Management for an EX Series Switch

Ethernet interfaces on Juniper Networks EX Series Ethernet Switches and Juniper Networks Junos operating system (Junos OS) for EX Series switches support the IEEE 802.1ag standard for Operation, Administration, and Management (OAM). The IEEE 802.1ag specification provides for Ethernet connectivity fault management (CFM). CFM monitors Ethernet networks that might comprise one or more service instances for network-compromising connectivity faults.

The major features of CFM are:

- Fault monitoring using the continuity check protocol. This is a neighbor discovery and health check protocol that discovers and maintains adjacencies at the VLAN or link level.
- Path discovery and fault verification using the linktrace protocol.
- Fault isolation using the loopback protocol.

CFM partitions the service network into various administrative domains. For example, operators, providers, and customers might be part of different administrative domains. Each administrative domain is mapped into one maintenance domain providing enough information to perform its own management, thus avoiding security breaches and making end-to-end monitoring possible.

In a CFM maintenance domain, each service instance is called a maintenance association. A maintenance association can be thought of as a full mesh of maintenance association endpoints (MEPs) having similar characteristics. MEPs are active CFM entities generating and responding to CFM protocol messages. There is also a maintenance intermediate point (MIP), which is a CFM entity similar to the MEP, but more passive (MIPs only respond to CFM messages).

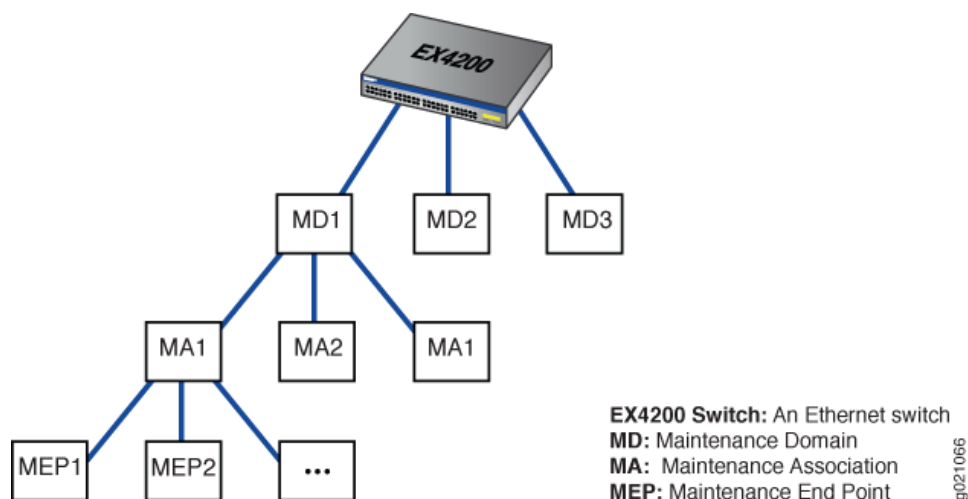

Each maintenance domain is associated with a maintenance domain level from 0 through 7. Level allocation is based on the network hierarchy, where outer domains are assigned

a higher level than the inner domains. Configure customer end points to have the highest maintenance domain level. The maintenance domain level is a mandatory parameter that indicates the nesting relationships between various maintenance domains. The level is embedded in each CFM frame. CFM messages within a given level are processed by MEPs at that same level.

To enable CFM on an Ethernet interface, you must configure maintenance domains, maintenance associations, and maintenance association end points (MEPs).

Figure 52 on page 3974 shows the relationships among maintenance domains, maintenance association end points (MEPs), and maintenance intermediate points (MIPs) configured on a switch.

**Figure 52: Relationship Among MEPs, MIPs, and Maintenance Domain Levels**

## Understanding Ethernet Frame Delay Measurements on Switches

Performance management depends on the accurate measurement of service-level agreement (SLA) objective parameters, which can include bandwidth and reliability. In many cases, a service provider could be subject to penalties imposed by regulation, statute, or contract if network performance is not within the bounds established for the service. One key performance objective is delay, along with its close relative, delay variation (often called jitter). Some applications (such as bulk file transfer) will function just as well with high delays across the network and high delay variations, while other applications (such as voice) can function only with low and stable delays. Many networks invoke protocols or features available at Layer 3 (the packet layer) or higher to measure network delays and jitter link by link. However, when the network consists of many Ethernet links, there are few protocols and features available at Layer 2 (the frame layer) that allow routers and switches to measure frame delay and jitter. This is where the ability to configure and monitor Ethernet frame delay is helpful.

This topic includes:

- [Ethernet Frame Delay Measurements on page 3975](#)
- [Types of Ethernet Frame Delay Measurements on page 3975](#)
- [Limitations on page 3976](#)

## Ethernet Frame Delay Measurements

---

You can perform Ethernet frame delay measurements (referred to as ETH-DM in Ethernet specifications) on Juniper Networks EX Series Ethernet Switches. This feature allows you to configure on-demand Operation, Administration, and Maintenance (OAM) statements for the measurement of frame delay and frame delay variation (jitter). You can configure Ethernet frame delay measurement in either one-way or two-way (round-trip) mode to gather frame delay statistics simultaneously from multiple sessions. Ethernet frame delay measurement provides fine control to operators for triggering delay measurement on a given service and can be used to monitor SLAs.

Ethernet frame delay measurement also collects other useful information, such as worst and best case delays, average delay, and average delay variation. It supports software-assisted timestamping in the receive direction for delay measurements. It also provides runtime display of delay statistics when two-way delay measurement is triggered. Ethernet frame delay measurement records the last 100 samples collected per remote maintenance association end point (MEP) or per connectivity fault management (CFM) session. You can retrieve the history at any time using simple commands. You can clear all Ethernet frame delay measurement statistics and PDU counters. Ethernet frame delay measurement is fully compliant with the ITU-T Y.1731 (*OAM Functions and Mechanisms for Ethernet-based Networks*) specification.

Ethernet frame delay measurement uses the IEEE 802.1ag CFM infrastructure.

Generally, Ethernet frame delay measurements are made in a peer fashion from one MEP or CFM session to another. However, these measurements are not made to maintenance association intermediate points (MIPs).

For a complete description of Ethernet frame delay measurement, see the *ITU-T Y.1731 Ethernet Service OAM* topics in the *Junos OS Network Interfaces Library for Routing Devices*.

## Types of Ethernet Frame Delay Measurements

---

There are two types of Ethernet frame delay measurements:

- One-way
- Two-way (round-trip)

For one-way Ethernet frame delay measurement, either MEP can send a request to begin a one-way delay measurement to its peer MEP. However, the statistics are collected only at the receiver MEP. This feature requires the clocks at the transmitting and receiving MEPs to be synchronized. If these clocks fall out of synchronization, only one-way delay variation and average delay variation values are computed correctly (and will, therefore, be valid). Use the **show** commands at the receiver MEP to display one-way delay statistics.

For two-way (round-trip) Ethernet frame delay measurement, either MEP can send a request to begin a two-way delay measurement to its peer MEP, which responds with timestamp information. Run-time statistics are collected and displayed at the initiator MEP. The clocks do not need to be synchronized at the transmitting and receiving MEPs. Junos OS supports timestamps in delay measurement reply (DMR) frames to increase the accuracy of delay calculations.

Use the **show** commands at the initiator MEP to display two-way delay statistics, and at the receiver MEP to display one-way delay statistics.

You can create an iterator profile to periodically transmit SLA measurement packets in the form of ITU-Y.1731-compliant frames for delay measurement or loss measurement.

---

### Limitations

The following are some limitations with regard to using Ethernet frame delay measurement:

- Ethernet frame delay measurements are available only when distributed periodic packet management (PPM) is enabled.
- The statistics collected are lost after a graceful Routing Engine switchover (GRES).
- You can monitor only one session to the same remote MEP or MAC address.
- Accuracy is compromised when the system configuration changes (such as from reconfiguration). We recommend performing Ethernet frame delay measurements on a stable system.

## Uplink Failure Detection

- [Understanding Uplink Failure Detection on page 3977](#)

## Understanding Uplink Failure Detection

Uplink failure detection allows Juniper Networks EX Series Ethernet Switches to detect link failure on uplink interfaces and to propagate the failure to the downlink interfaces so that servers connected to those downlink interfaces can switch over to secondary interfaces.

Uplink failure detection supports network adapter teaming and provides network redundancy. In network adapter teaming, all the network interface cards (NICs) on a server are configured in a primary or secondary relationship and share the same IP address. When the primary link goes down, the server transparently shifts the connection to the secondary link. With uplink failure detection, the switch monitors uplink interfaces for link failures. When it detects a failure, it disables the downlink interfaces. When the server detects disabled downlink interfaces, it switches over to the secondary link to help ensure balanced traffic flow on switches.

This topic describes:

- [Uplink Failure Detection Overview on page 3977](#)
- [Failure Detection Pair on page 3978](#)

### Uplink Failure Detection Overview

Uplink failure detection allows switches to monitor uplink interfaces to spot link failures. When a switch detects a link failure, it automatically disables the downlink interfaces in that group. The server that is connected to the disabled downlink interfaces triggers a network-adapter failover to a secondary link to avoid any information drop.

[Figure 53 on page 3977](#) illustrates a typical setup for uplink failure detection.

**Figure 53: Uplink Failure Detection Configuration on Switches**

g040577

For uplink failure detection, you specify a group of uplink interfaces to be monitored and downlink interfaces to be brought down when an uplink fails. The downlink interfaces are bound to the uplink interfaces within the group. If all uplink interfaces in a group go down, then the switch brings down all downlink interfaces within that group. If any uplink interface returns to service, then the switch brings all downlink interfaces in that group back to service.

**NOTE:** Routed VLAN interfaces (RVIs) cannot be configured as uplink interfaces to be monitored.

The switch can monitor both physical-interface links and logical-interface links for uplink failures, but you must put the two types of interfaces in separate groups.

**NOTE:** To detect failure of logical interfaces, the server must run some high level protocol such as keepalives between the switch and the server.

---

### Failure Detection Pair

Uplink failure detection requires that you create groups that contain uplink interfaces and downlink interfaces. Each group includes one of each of the following:

- A link-to-monitor interface—The link-to-monitor interfaces specify the uplink interfaces the switch monitors. You can configure a maximum of 48 uplink interfaces as link-to-monitor in a group.
- A link-to-disable interface—The link-to-disable interfaces specify the downlink interfaces the switch disables when the switch detects an uplink failure. You can configure a maximum of 48 downlink interfaces as link-to-disable in a group.

The link-to-disable interfaces are bound to the link-to-monitor interfaces within the group. When a link-to-monitor interface returns to service, the switch automatically enables all link-to-disable interfaces in the group.

## Network Analytics

- [Network Analytics Overview on page 3978](#)
- [Understanding Enhanced Network Analytics Streaming Data on page 3985](#)
- [Understanding Enhanced Analytics Local File Output on page 3991](#)
- [Prototype File for the Google Protocol Buffer Stream Format on page 3993](#)

### Network Analytics Overview

The network analytics feature provides visibility into the performance and behavior of the data center infrastructure. This feature collects data from the switch, analyzes the

data using sophisticated algorithms, and captures the results in reports. Network administrators can use the reports to help troubleshoot problems, make decisions, and adjust resources as needed. The analytics manager (analyticsm) in the Packet Forwarding Engine collects traffic and queue statistics, and the analytics daemon (analyticsd) in the Routing Engine analyzes the data and generates reports. You can enable network analytics by configuring microburst monitoring and high-frequency traffic statistics monitoring.

**NOTE:** In Junos OS Release 13.2X51-D15, the network analytics feature was enhanced, and extensive changes were made to the CLI statements and hierarchies. If you upgrade to Junos OS Release 13.2X51-D15 or later from a release prior to 13.2X51-D15, network analytics configurations committed in previous releases will appear on your device, but the feature is disabled. To enable this feature, you must reconfigure it using the new CLI statements and hierarchies.

For more information, see:

- [Analytics Feature Overview on page 3979](#)
- [Network Analytics Enhancements Overview on page 3980](#)
- [Summary of CLI Changes on page 3981](#)

### Analytics Feature Overview

You enable network analytics by configuring queue (microburst) monitoring and high-frequency traffic statistics monitoring. You use microburst monitoring to look at traffic queue conditions in the network. A microburst occurrence indicates to the Packet Forwarding Engine that a user-specified queue depth or latency threshold is reached. The queue depth is the buffer (in bytes) containing the data, and latency is the time (in nanoseconds or microseconds) the data stays in the queue.

You can configure queue monitoring based on either queue depth or latency (but not both), and configure the frequency (polling interval) at which the Packet Forwarding Engine checks for microbursts and sends the data to the Routing Engine for processing. You may configure queue monitoring globally for all physical interfaces on the system, or for a specific interface on the switch. However, the specified queue monitoring interval applies either to all interfaces, or none; you cannot configure the interval for each interface.

You use high-frequency traffic statistics monitoring to collect traffic statistics at specified polling intervals. Similar to the queue monitoring interval, the traffic monitoring interval applies either to all interfaces, or none; you cannot configure the interval for each interface.

Both traffic and queue monitoring are disabled by default. You must configure each type of monitoring using the CLI. In each case, the configuration for an interface always takes precedence over the global configuration.

**NOTE:** You can configure traffic and queue monitoring for physical interfaces only; logical interfaces and Virtual Chassis port (VCP) interfaces are not supported.

The analyticsd daemon in the Routing Engine generates local log files containing queue and traffic statistics records. You can specify the log filename and size, and the number of log files. If you do not configure a filename, the data is not saved.

You can display the local log file or specify a server to receive the streaming data containing the queue and traffic statistics.

For each port, information for the last 10 records of traffic statistics and 100 records of queue statistics is cached. You may view this information by using the **show analytics** commands.

To store traceoptions data, you configure the **traceoptions** statement at the **[edit services analytics]** hierarchy level.

### Network Analytics Enhancements Overview

---

Beginning in Junos OS Release 13.2X51-D15, the network analytics feature provides the following enhancements:

- **Resources**—Consist of interfaces and system. The interfaces resource allows you to configure an interface name and an associated resource profile name for each interface. With the system resource, you can configure the polling intervals for queue monitoring and traffic monitoring, and an associated resource profile for the system.
- **Resource profile**—A template that contains the configurations for queue and traffic monitoring, such as depth threshold and latency threshold values, and whether each type of monitoring is enabled or disabled. Once a resource profile is configured, you apply it to a system or interfaces resource.
- **Collector**—A server for collecting queue and traffic monitoring statistics, and can be a local or remote server. You can configure a local server to store monitoring statistics in a log file, or a remote server to receive streamed statistics data.
- **Export profile**—You must configure an export profile if you wish to send streaming data to a remote collector. In the export profile, you define the category of streamed data (system-wide or interface-specific) to determine stream type the collector will receive. You can specify both system and interface stream categories. System data includes system information and status of queue and traffic monitoring. Interface-specific data includes interface information, queue and traffic statistics, and link, queue, and traffic status.
- **Google Protocol Buffer (GBP) stream format**—A new streaming format for monitoring statistics data that is sent to a remote collector in a single AnRecord message. This stream format provides nine types of information, including:
  - **System information**—General system information, including boot time, model information, serial number, number of ports, and so on.
  - **System queue status**—Queue status for the system in general.
  - **System traffic status**—Traffic status for the system in general.
  - **Interface information**—Includes SNMP index, slot, port, and other information.
  - **Queue statistics for interfaces**—Queue statistics for specific interfaces.

- Traffic statistics for interfaces—Traffic statistics for specific interfaces.
- Link status for interfaces—Includes link speed, state, and so on.
- Queue status for interfaces—Queue status for specific interfaces.
- Traffic status for interfaces—Traffic status for specific interfaces.
- The **analytics.proto** file—Provides a template for the GBP stream format. This file can be used for writing your analytics server application. To download the file, go to:  
[http://www.juniper.net/techpubs/en\\_US/junos13.2/topics/reference/proto-files/analytics-proto.txt](http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/proto-files/analytics-proto.txt)
- Use of threshold values—The Analytics Manager (analyticsm) will generate a queue statistics record when the lower queue depth or latency threshold value is exceeded.
- User Datagram Protocol (UDP)—Additional transport protocol you can configure, in addition to Transmission Control Protocol (TCP), for the remote streaming server port.
- Single file for local logging—Replaces the separate log files for queue and traffic statistics.
- Change in latency measurement—Configuration and reporting of latency values have changed from microseconds to nanoseconds.
- Change in reporting of the collection time in UTC format—Statistics collection time is reported in microseconds instead of milliseconds.
- New operational mode command **show analytics collector**—Replaces the **show analytics streaming-server** command.
- Changes in command output format—Include the following changes:
  - Addition of unicast, multicast, and broadcast packet counters in queue and traffic statistics.
  - Reversal of the sequence of statistics information in the output. The most recent record is displayed at the beginning, and the oldest record at the end of the output.
  - Removal of traffic or queue monitoring status information from the global portion of the **show analytics configuration** and **show analytics status** command output if there is no global configuration.
  - Addition of **n/a** to the interface-specific portion of the **show analytics configuration** and **show analytics status** command output if a parameter is not configured (for example, depth threshold or latency threshold).

### Summary of CLI Changes

Beginning in Junos OS Release 13.2X51-D15, enhancements to the network analytics feature result in changes in the CLI when you configure the feature. See [Table 421 on page 3982](#) for a summary of CLI changes.

Table 421: Network Analytics CLI Changes

| Task                                                                                                               | CLI for Junos OS Release 13.2X50-D15 and 13.2X51-D10                                                                                                                                                                    | CLI for Junos OS Release 13.2X51-D15 and later                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Understanding Enhanced Network Analytics Streaming Data

Network analytics monitoring data can be streamed to remote servers called collectors. You can configure one or more collectors to receive streamed data containing queue and traffic statistics. This topic describes the streamed data output.

**NOTE:** This topic applies to Junos OS Release 13.2X51-D15 or later.

Starting in Junos OS Release 13.2X51-D15, network analytics supports the following streaming data formats and output:

- [Google Protocol Buffer \(GPB\) on page 3985](#)
- [JavaScript Object Notation \(JSON\) on page 3988](#)
- [Comma-separated Values \(CSV\) on page 3988](#)
- [Tab-separated Values \(TSV\) on page 3988](#)
- [Queue Statistics Output for JSON, CSV, and TSV on page 3989](#)
- [Traffic Statistics Output for JSON, CSV, and TSV on page 3989](#)

### Google Protocol Buffer (GPB)

Support for the Google Protocol Buffer (GPB) streaming format has been added in Junos OS Release 13.2X51-D15. This streaming format provides:

- Support for nine types of messages, based on resource type (system-wide or interface-specific).
- Sends messages in a hierarchical format.
- You can generate other stream format messages (JSON, CSV, TSV) from GPB formatted messages.
- Includes a 8-byte message header. See [Table 422 on page 3986](#) for more information.

[Table 422 on page 3986](#) describes the GPB stream format message header.

**Table 422: GPB Stream Format Message Header Information**

| Byte Position | Field                   |
|---------------|-------------------------|
| 0 to 3        | Length of message       |
| 4             | Message version         |
| 5 to 7        | Reserved for future use |

The following GPB prototype file (**analytics.proto**) provides details about the streamed data:

```
package analytics;

// Traffic statistics related info
message TrafficStatus {
    optional uint32      status          = 1;
    optional uint32      poll_interval   = 2;
}

// Queue statistics related info
message QueueStatus {
    optional uint32      status          = 1;
    optional uint32      poll_interval   = 2;
    optional uint64      lt_high         = 3;
    optional uint64      lt_low          = 4;

### JavaScript Object Notation (JSON)

The JavaScript Object Notation (JSON) streaming format supports the following data:

- Queue statistics data. For example:

```

{"record-type":"queue-stats","time":1383453988263,"router-id":"qfx5100-switch",
"port":"xe-0/0/18","latency":0,"queue-depth":208}

```

See [Table 423 on page 3989](#) for more information about queue statistics output fields.

- Traffic statistics. For example:

```

{"record-type":"traffic-stats","time":1383453986763,"router-id":"qfx5100-switch",
"port":"xe-0/0/16","rxpkt":26524223621,"rxpps":8399588,"rxbyte":3395100629632,
"rxbps":423997832,"rxdrop":0,"rxerr":0,"txpkt":795746503,"txpps":0,"txbyte":101855533467,
"txbps":0,"txdrop":0,"txerr":0}

```

See [Table 424 on page 3989](#) for more information about traffic statistics output fields.

### Comma-separated Values (CSV)

The Comma-separated Values (CSV) streaming format supports the following data:

- Queue statistics. For example:

```

q,1383454067604,qfx5100-switch,xe-0/0/18,0,208

```

See [Table 423 on page 3989](#) for more information about queue statistics output fields.

- Traffic statistics. For example:

```

t,1383454072924,qfx5100-switch,xe-0/0/19,1274299748,82950,163110341556,85603312,0,0,
27254178291,8300088,3488534810679,600002408,27268587050,3490379142400

```

See [Table 424 on page 3989](#) for more information about traffic statistics output fields.

### Tab-separated Values (TSV)

The Tab-separated Values (TSV) streaming format supports the following data:

- Queue statistics. For example:

```

q      585870192561703872      qfx5100-switch      xe-0/0/18      (null)
208    2

```

See [Table 423 on page 3989](#) for more information about queue statistics output fields.

- Traffic statistics. For example:

```
t          1383454139025  qfx5100-switch  xe-0/0/19      1279874033      82022
163823850036  84801488        0              0              27811618258      8199630
3559887126455  919998736       27827356915    3561901685120
```

See [Table 424 on page 3989](#) for more information about traffic statistics output fields.

### Queue Statistics Output for JSON, CSV, and TSV

[Table 423 on page 3989](#) describes the output fields for streamed queue statistics data in the order they appear.

**Table 423: Streamed Queue Statistics Data Output Fields**

| Field       | Description                                                                                                                                                    |
|-------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| record-type | Type of statistics. Displayed as: <ul style="list-style-type: none"> <li>• <b>queue-stats</b> (JSON format)</li> <li>• <b>q</b> (CSV or TSV format)</li> </ul> |
| time        | Time (in Unix epoch format) at which the statistics were captured.                                                                                             |
| router-id   | ID of the network analytics host device.                                                                                                                       |
| port        | Name of the physical port configured for network analytics.                                                                                                    |
| latency     | Traffic queue latency in milliseconds.                                                                                                                         |
| queue depth | Depth of the traffic queue in bytes.                                                                                                                           |

### Traffic Statistics Output for JSON, CSV, and TSV

[Table 424 on page 3989](#) describes the output fields for streamed traffic statistics data in the order they appear.

**Table 424: Streamed Traffic Statistics Data Output Fields**

| Field       | Description                                                                                                                                                      |
|-------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| record-type | Type of statistics. Displayed as: <ul style="list-style-type: none"> <li>• <b>traffic-stats</b> (JSON format)</li> <li>• <b>t</b> (CSV or TSV format)</li> </ul> |
| time        | Time (in Unix epoch format) at which the statistics were captured.                                                                                               |
| router-id   | ID of the network analytics host device.                                                                                                                         |
| port        | Name of the physical port configured for network analytics.                                                                                                      |
| rxpkt       | Total packets received.                                                                                                                                          |

Table 424: Streamed Traffic Statistics Data Output Fields (*continued*)

| Field  | Description                                      |
|--------|--------------------------------------------------|
| rxpps  | Total packets received per second.               |
| rxbyte | Total bytes received.                            |
| rxbps  | Total bytes received per second.                 |
| rxdrop | Total incoming packets dropped.                  |
| rxerr  | Total packets with errors.                       |
| txpkt  | Total packets transmitted.                       |
| txpps  | Total packets transmitted per second.            |
| txbyte | Total bytes transmitted.                         |
| txbps  | Total bytes transmitted per second.              |
| txdrop | Total transmitted bytes dropped.                 |
| txerr  | Total transmitted packets with errors (dropped). |

## Understanding Enhanced Analytics Local File Output

The network analytics feature provides visibility into the performance and behavior of the data center infrastructure. You enable network analytics by configuring queue or traffic statistics monitoring, or both. In addition, you can configure a local file for storing the traffic and queue statistics records.

**NOTE:** This topic describes the local file output in Junos OS Release 13.2X51-D15 and later. For information about local file output from earlier releases, see the [monitor start \(Analytics\)](#) topic.

Beginning in Junos OS Release 13.2X51-D15, the traffic and queue monitoring statistics can be stored locally in a single file. The following example shows the output from the **monitor start** command.

```
root@qfx5100-33> monitor start an
root@qfx5100-33>

See [Table 425 on page 3991](#) for queue statistics output, and [Table 426 on page 3992](#) for traffic statistics output. The fields in the tables are listed in the order they appear in the output example.

**Table 425: Output Fields for Queue Statistics in Local Analytics File**

| Field                 | Description                                                                      | Example in Output       |
|-----------------------|----------------------------------------------------------------------------------|-------------------------|
| Record type           | Type of statistics (queue or traffic monitoring)                                 | <b>q</b>                |
| Time (microseconds)   | Unix epoch (or Unix time) in microseconds at which the statistics were captured. | <b>1393947567698432</b> |
| Router ID             | ID of the network analytics host device.                                         | <b>qfx5100-33</b>       |
| Port                  | Name of the physical port configured for network analytics.                      | <b>xe-0/0/19</b>        |
| Latency (nanoseconds) | Traffic queue latency in nanoseconds.                                            | <b>1098572</b>          |
| Queue depth (bytes)   | Depth of the traffic queue in bytes.                                             | <b>1373216</b>          |

Table 426: Output Fields for Traffic Statistics in Local Analytics File

| Field               | Description                                                                      | Example in Output       |
|---------------------|----------------------------------------------------------------------------------|-------------------------|
| Record type         | Type of statistics (queue or traffic monitoring)                                 | <b>t</b>                |
| Time (microseconds) | Unix epoch (or Unix time) in microseconds at which the statistics were captured. | <b>1393947569874528</b> |
| Router ID           | ID of the network analytics host device.                                         | <b>qfx5100-33</b>       |
| Port                | Name of the physical port configured for network analytics.                      | <b>xe-0/0/16</b>        |
| rxpkt               | Total packets received.                                                          | <b>12603371884</b>      |
| rxucpkt             | Total unicast packets received.                                                  | <b>12603371884</b>      |
| rxmcpkt             | Total multicast packets received.                                                | <b>0</b>                |
| rxbcpkt             | Total broadcast packets received.                                                | <b>0</b>                |
| rxpps               | Total packets received per second.                                               | <b>8426023</b>          |
| rxbyte              | Total octets received.                                                           | <b>1613231610488</b>    |
| rxbps               | Total bytes received per second.                                                 | <b>8628248712</b>       |
| rxdroppkt           | Total incoming packets dropped.                                                  | <b>0</b>                |
| rxrcerr             | CRC/Align errors received.                                                       | <b>3</b>                |
| txpkt               | Total packets transmitted.                                                       | <b>5916761</b>          |
| txucpkt             | Total unicast packets transmitted.                                               | <b>5916761</b>          |
| txmcpkt             | Total multicast packets transmitted.                                             | <b>0</b>                |
| txbcpkt             | Total broadcast packets transmitted.                                             | <b>0</b>                |
| txpps               | Total packets transmitted per second.                                            | <b>0</b>                |
| txbyte              | Total octets transmitted.                                                        | <b>757345408</b>        |
| txbps               | Bytes per second transmitted.                                                    | <b>0</b>                |
| txdroppkt           | Total transmitted packets dropped.                                               | <b>0</b>                |
| txrcerr             | CRC/Align errors transmitted.                                                    | <b>0</b>                |

## Prototype File for the Google Protocol Buffer Stream Format

The Google Protocol Buffer (GPB) stream format is used for streaming monitoring statistics data to a remote collector in a single AnRecord message.

The **analytics.proto** file provides a template for the GPB stream format. This file can be used for writing your analytics server application.

To download the GPB prototype file, go to:

[http://www.juniper.net/techpubs/en\\_US/junos13.2/topics/reference/proto-files/analytics-proto.txt](http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/proto-files/analytics-proto.txt)

### Example: Configuring sFlow Technology to Monitor Network Traffic on EX Series Switches

sFlow technology is a networking monitoring technology for high-speed switched or routed networks. It is a technology that is based on statistical sampling. You can configure sFlow technology to continuously monitor traffic at wire speed on all interfaces simultaneously. sFlow data can be used to provide network traffic visibility information.

You can specify sampling rates for ingress and egress packets. Junos OS fully supports the sFlow standard described in RFC 3176, *InMon Corporation's sFlow: A Method for Monitoring Traffic in Switched and Routed Networks*.

This example describes how to configure and use sFlow technology to monitor network traffic.

- [Requirements on page 3996](#)
- [Overview and Topology on page 3996](#)
- [Configuration on page 3997](#)
- [Verification on page 3999](#)

---

### Requirements

This example uses the following hardware and software components:

- One EX Series switch
- Junos OS Release 9.3 or later for EX Series switches

---

### Overview and Topology

sFlow technology samples network packets and sends the samples to a monitoring station. You can specify sampling rates for ingress and egress packets. The information gathered is used to create a network traffic visibility picture.

An sFlow monitoring system consists of an sFlow agent embedded in the switch and a centralized collector. The sFlow agent runs on the switch. It combines interface counters and flow samples and sends them across the network to the sFlow collector.

[Figure 54 on page 3997](#) depicts the basic elements of the sFlow system.

Figure 54: sFlow Technology Monitoring System

### Configuration

To configure sFlow technology, perform the following tasks:

#### CLI Quick Configuration

To quickly configure sFlow technology, copy the following commands and paste them into the switch terminal window:

```
[edit protocols]
set sflow collector 10.204.32.46 udp-port 5600
set sflow interfaces ge-0/0/0
set sflow polling-interval 20
set sflow sample-rate egress 1000
```

**Step-by-Step  
Procedure**

To configure sFlow technology:

1. Configure the IP address and UDP port of the collector:

```
[edit protocols]  
user@switch# set sflow collector 10.204.32.46 udp-port 5600
```

**NOTE:** You can configure a maximum of 4 collectors.

The default UDP port is 6343.

2. Enable sFlow technology on a specific interface:

```
[edit protocols sflow]  
user@switch# set interfaces ge-0/0/0
```

**NOTE:** You cannot enable sFlow technology on a Layer 3 VLAN-tagged interface.

You cannot enable sFlow technology on a link aggregation group (LAG) interface, but you can enable it on the member interfaces of a LAG.

3. Specify in seconds how often the sFlow agent polls the interface:

```
[edit protocols sflow]  
user@switch# set polling-interval 20
```

**NOTE:** The polling interval can be specified as a global parameter also. Specify 0 if you do not want to poll the interface.

4. Specify the rate at which egress packets must be sampled:

```
[edit protocols sflow]  
user@switch# set sample-rate egress 1000
```

**NOTE:** You can specify both egress and ingress sampling rates. If you set only the egress sampling rate, the ingress sampling rate will be disabled.

**NOTE:** We recommend that you configure the same sampling rates on all the ports on a line card. If you configure different sampling rates are different, the lowest value is used for all ports. You could still configure different rates on different line cards.

**Results** Check the results of the configuration:

```
[edit protocols sflow]
user@switch# show
polling-interval 20;
sample-rate egress 1000;
collector 10.204.32.46 {
  udp-port 5600;
}
interfaces ge-0/0/0.0;
```

### Verification

To confirm that the configuration is correct, perform these tasks:

- [Verifying That sFlow Technology Is Configured Properly on page 3999](#)
- [Verifying That sFlow Technology Is Enabled on the Specified Interface on page 3999](#)
- [Verifying the sFlow Collector Configuration on page 4000](#)

#### *Verifying That sFlow Technology Is Configured Properly*

**Purpose** Verify that sFlow technology is configured properly.

**Action** Use the **show sflow** command:

```
user@switch> show sflow
sFlow: Enabled
Sample limit: 300 packets/second
Polling interval: 20 seconds
Sample rate egress: 1:1000: Enabled
Sample rate ingress: 1:2048: Disabled
Agent ID: 10.204.96.222
```

**NOTE:** The sampling limit cannot be configured and is set to 300 packets/second per FPC.

**Meaning** The output shows that sFlow technology is enabled and specifies the values for the sampling limit, polling interval, and the egress sampling rate.

#### *Verifying That sFlow Technology Is Enabled on the Specified Interface*

**Purpose** Verify that sFlow technology is enabled on the specified interfaces and display the sampling parameters.

**Action** Use the **show sflow interface** command:

```
user@switch> show sflow interface
```

| Interface  | Status           | Sample rate    | Adapted sample rate | Polling-interval |
|------------|------------------|----------------|---------------------|------------------|
|            | Egress Ingress   | Egress Ingress | Egress Ingress      |                  |
| ge-0/0/0.0 | Enabled Disabled | 1000 2048      | 1000 2048           | 20               |

**Meaning** The output indicates that sFlow technology is enabled on the ge-0/0/0.0 interface with an egress sampling rate of 1000, a disabled ingress sampling rate, and a polling interval of 20 seconds.

#### *Verifying the sFlow Collector Configuration*

**Purpose** Verify the sFlow collector's configuration.

**Action** Use the **show sflow collector** command:

```
user@switch> show sflow collector
```

| Collector address | Udp-port | No. of samples |
|-------------------|----------|----------------|
| 10.204.32.46      | 5600     | 1000           |
| 10.204.32.76      | 3400     | 1000           |

**Meaning** The output displays the IP address of the collectors and the UDP ports. It also displays the number of samples.

### Example: Configuring Mirroring for Local Monitoring of Employee Resource Use on EX4300 Switches

**NOTE:** This example uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Example: Configuring Port Mirroring for Local Monitoring of Employee Resource Use on EX Series Switches*. For ELS details, see *Getting Started with Enhanced Layer 2 Software*.

EX4300 switches enable you to configure mirroring to send copies of packets to either a local interface for local monitoring or to a VLAN for remote monitoring. You can use mirroring to copy these packets:

- Packets entering or exiting a port
- Packets entering a VLAN

You can analyze the mirrored traffic by using a protocol analyzer application installed on a system connected to the local destination interface (or running on a remote monitoring station if you are sending mirrored traffic to an analyzer VLAN).

This example describes how to configure local mirroring on an EX4300 switch. This example describes how to configure the switch to mirror traffic entering interfaces connected to employee computers to an analyzer output interface on the same switch.

- [Requirements on page 4001](#)
- [Overview and Topology on page 4001](#)
- [Mirroring All Employee Traffic for Local Analysis on page 4002](#)
- [Mirroring Employee-to-Web Traffic for Local Analysis on page 4003](#)
- [Verification on page 4005](#)

### Requirements

---

This example uses the following hardware and software components:

- One EX4300 switch
- Junos OS Release 13.2X50-D10, or later for EX Series switches

Before you configure mirroring, be sure you have an understanding of mirroring concepts. For information about mirroring, see [“Understanding Port Mirroring and Analyzers on EX4300 Switches” on page 3964](#).

### Overview and Topology

---

This topic includes two examples that describe how to mirror traffic entering ports on the switch to a destination interface on the same switch (local mirroring). The first example shows how to mirror all traffic entering the ports connected to employee computers. The second example shows the same scenario, but includes a filter to mirror only the employee traffic going to the Web.

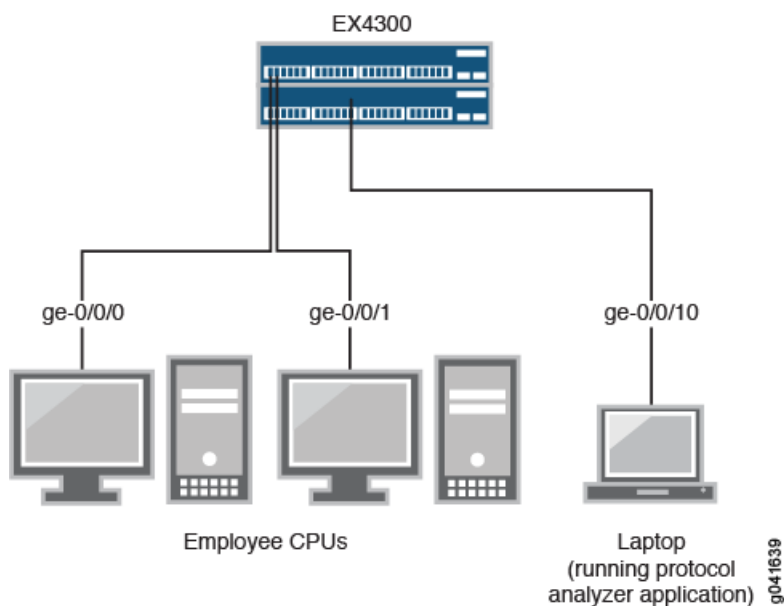

The interfaces ge-0/0/0 and ge-0/0/1 serve as connections for employee computers. The interface ge0/0/10 is reserved for analysis of mirrored traffic. Connect a PC running a protocol analyzer application to the analyzer output interface to analyze the mirrored traffic.

**NOTE:** Multiple ports mirrored to one interface can cause buffer overflow and dropped packets.

Both examples use the network topology shown in [Figure 55 on page 4002](#).

Figure 55: Network Topology for Local Mirroring Example

### Mirroring All Employee Traffic for Local Analysis

To configure mirroring for all employee traffic for local analysis, perform these tasks:

#### CLI Quick Configuration

To quickly configure local mirroring for ingress traffic to the two ports connected to employee computers, copy the following commands and paste them into the switch terminal window:

```
[edit]
set interfaces ge-0/0/0 unit 0 family ethernet-switching
set interfaces ge-0/0/1 unit 0 family inet 192.1.1.1/24
set interfaces ge-0/0/10 unit 0 family ethernet-switching
set forwarding-options analyzer employee-monitor input ingress interface ge-0/0/0.0
set forwarding-options analyzer employee-monitor input ingress interface ge-0/0/1.0
set forwarding-options analyzer employee-monitor output interface ge-0/0/10.0
```

#### Step-by-Step Procedure

To configure an analyzer called **employee-monitor** and specify the input (source) interfaces and the analyzer output interface:

1. Configure each interface connected to employee computers as an input interface for the analyzer **employee-monitor**:  
  

```
[edit forwarding-options]
user@switch# set analyzer employee-monitor input ingress interface ge-0/0/0.0
user@switch# set analyzer employee-monitor input ingress interface ge-0/0/1.0
```
2. Configure the output analyzer interface for the analyzer **employee-monitor**. This will be the destination interface for the mirrored packets:  
  

```
[edit forwarding-options]
user@switch# set analyzer employee-monitor output interface ge-0/0/10.0
```

**Results** Check the results of the configuration:

```
[edit]
user@switch> show
```

```

forwarding-options {
  analyzer employee-monitor {
    input {
      ingress {
        interface ge-0/0/0.0;
        interface ge-0/0/1.0;}
      }
    output {
      interface {
        ge-0/0/10.0;
      }
    }
  }
}

```

### Mirroring Employee-to-Web Traffic for Local Analysis

To configure mirroring for employee to Web traffic, perform these tasks:

#### CLI Quick Configuration

To quickly configure local mirroring of traffic from the two ports connected to employee computers, filtering so that only traffic to the external Web is mirrored, copy the following commands and paste them into the switch terminal window:

```

[edit]
set forwarding-options port-mirroring instance employee-web-monitor output interface
ge-0/0/10.0
set firewall family ethernet-switching filter watch-employee term employee-to-corp from
destination-address 192.0.2.16/28
set firewall family ethernet-switching filter watch-employee term employee-to-corp from
source-address 192.0.2.16/28
set firewall family ethernet-switching filter watch-employee term employee-to-corp then accept
set firewall family ethernet-switching filter watch-employee term employee-to-web from
destination-port 80
set firewall family ethernet-switching filter watch-employee term employee-to-web then
port-mirroring-instance employee-web-monitor
set interfaces ge-0/0/0 unit 0 family ethernet-switching filter input watch-employee
set interfaces ge-0/0/1 unit 0 family ethernet-switching filter input watch-employee

```

#### Step-by-Step Procedure

To configure local mirroring of employee to Web traffic from the two ports connected to employee computers:

1. Configure the local analyzer interface:

```

[edit interfaces]
user@switch# set ge-0/0/10 unit 0 family ethernet-switching

```

2. Configure the **employee-web-monitor** output instance (the input to the instance comes from the action of the filter):

```

[edit forwarding-options port-mirroring]
user@switch# set instance employee-web-monitor output interface ge-0/0/10.0

```

3. Configure a firewall filter called **watch-employee** to send mirrored copies of employee requests to the Web to the **employee-web-monitor** instance. Accept all traffic to and from the corporate subnet (destination or source address of **192.0.2.16/28**). Send mirrored copies of all packets destined for the Internet (**destination port 80**) to the **employee-web-monitor** instance.

```

[edit firewall family ethernet-switching]

```

```
user@switch# set filter watch-employee term employee-to-corp from destination-address
192.0.2.16/28
user@switch# set filter watch-employee term employee-to-corp from source-address
192.0.2.16/28
user@switch# set filter watch-employee term employee-to-corp then accept
user@switch# set filter watch-employee term employee-to-web from destination-port 80
user@switch# set filter watch-employee term employee-to-web then
port-mirroring-instance employee-web-monitor
4. Apply the watch-employee filter to the appropriate ports:

[edit interfaces]
user@switch# set ge-0/0/0 unit 0 family ethernet-switching filter input watch-employee
user@switch# set ge-0/0/1 unit 0 family ethernet-switching filter input watch-employee
```

**Results** Check the results of the configuration:

```
[edit]
user@switch> show
forwarding-options {
  port-mirroring {
    instance {
      employee-web-monitor {
        family ethernet-switching {
          output {
            interface ge-0/0/10.0;
          }
        }
      }
    }
  }
}
...
firewall family ethernet-switching {
  filter watch-employee {
    term employee-to-corp {
      from {
        destination-address 192.0.2.16/28;
        source-address 192.0.2.16/28;
      }
      then accept {
      }
    }
    term employee-to-web {
      from {
        destination-port 80;
      }
      then port-mirroring-instance employee-web-monitor;
    }
  }
}
...
interfaces {
  ge-0/0/0 {
    unit 0 {
      family ethernet-switching {
        interface-mode trunk;
        vlan members [employee-vlan, voice-vlan];
        filter {
```

```

        input watch-employee;
    }
}
}
ge-0/0/1 {
    family ethernet-switching {
        filter {
            input watch-employee;
        }
    }
}
}
}

```

### Verification

To confirm that the configuration is correct, perform these tasks:

- [Verifying That the Analyzer Has Been Correctly Created on page 4005](#)
- [Verifying That The Port-Mirroring Instance Is Configured Properly on page 4005](#)

#### *Verifying That the Analyzer Has Been Correctly Created*

**Purpose** Verify that the analyzer **employee-monitor** or **employee-web-monitor** has been created on the switch with the appropriate input interfaces, and appropriate output interface.

**Action** You can use the **show forwarding-options analyzer** command to verify that the analyzer is configured properly.

```

user@switch> show forwarding-options analyzer
Analyzer name           : employee-monitor
Mirror rate             : 1
Maximum packet length   : 0
State                   : up
Ingress monitored interfaces : ge-0/0/0.0
Ingress monitored interfaces : ge-0/0/1.0
Output interface        : ge-0/0/10.0

```

**Meaning** This output shows that the analyzer **employee-monitor** has a ratio of 1 (mirroring every packet, the default setting), the maximum size of the original packet that was mirrored (0 indicates the entire packet), the state of the configuration (is up indicates that the analyzer is mirroring the traffic entering the ge-0/0/0, and ge-0/0/1 interfaces, and sending the mirrored traffic to the ge-0/0/10 interface). If the state of the output interface is down or if the output interface is not configured, the value of state will be **down** and the analyzer will not be programmed for mirroring.

#### *Verifying That The Port-Mirroring Instance Is Configured Properly*

**Purpose** Verify that the port-mirroring instance **employee-web-monitor** has been configured properly on the switch with the appropriate input interfaces.

**Action** You can verify that the port-mirroring instance is configured properly by using the **show forwarding-options port-mirroring** command.

```
user@switch> show forwarding-options port-mirroring
Instance Name: employee-web-monitor
Instance Id: 3
Input parameters:
  Rate           : 1
  Run-length     : 0
  Maximum-packet-length : 0
Output parameters:
  Family      State      Destination      Next-hop
  ethernet-switching up      ge-0/0/10.0
```

**Meaning** This output shows that the **employee-web-monitor** instance has a ratio of 1 (mirroring every packet, the default), the maximum size of the original packet that was mirrored (0 indicates an entire packet), the state of the configuration is up and port mirroring is programmed, and that mirrored traffic from the firewall filter action is sent out on interface ge-0/0/10.0. If the state of the output interface is down or if the interface is not configured, the value for state will be down and port mirroring will not be programmed for mirroring.

- Related Documentation**
- [Example: Configuring Mirroring for Remote Monitoring of Employee Resource Use on EX4300 Switches on page 4006](#)
  - [Configuring Mirroring on EX4300 Switches to Analyze Traffic \(CLI Procedure\) on page 4043](#)
  - [Configuring Port Mirroring to Analyze Traffic \(J-Web Procedure\) on page 4047](#)
  - [Understanding Port Mirroring and Analyzers on EX4300 Switches on page 3964](#)

## Example: Configuring Mirroring for Remote Monitoring of Employee Resource Use on EX4300 Switches

**NOTE:** This example uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see [“Example: Configuring Mirroring for Remote Monitoring of Employee Resource Use on EX4300 Switches” on page 4006](#). For ELS details see: *Getting Started with Enhanced Layer 2 Software*.

EX4300 switches enable you to configure mirroring to send copies of packets to either a local interface for local monitoring or to a VLAN for remote monitoring. You can use mirroring to copy these packets:

- Packets entering or exiting a port
- Packets entering a VLAN on EX4300 switches

You can analyze the mirrored traffic by using a protocol analyzer application running on a remote monitoring station if you are sending mirrored traffic to an analyzer VLAN.

This topic includes two related examples that describe how to mirror traffic entering ports on the switch to the **remote-analyzer** VLAN so that you can perform analysis from a remote monitoring station. The first example shows how to mirror all traffic entering the ports connected to employee computers. The second example shows the same scenario but includes a filter to mirror only the employee traffic going to the Web.

**BEST PRACTICE:** Mirror only necessary packets to reduce potential performance impact. We recommend that you:

- Disable your configured mirroring sessions when you are not using them.
- Specify individual interfaces as input to analyzers rather than specifying all interfaces as input.
- Limit the amount of mirrored traffic by using firewall filters.

This example describes how to configure remote mirroring:

- [Requirements on page 4007](#)
- [Overview and Topology on page 4007](#)
- [Mirroring All Employee Traffic for Remote Analysis on page 4008](#)
- [Mirroring Employee-to-Web Traffic for Remote Analysis on page 4011](#)
- [Verification on page 4015](#)

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 13.2X50-D10 or later for EX Series switches
- An EX4300 switch connected to another EX4300 switch

The diagram shows an EX4300 Virtual Chassis connected to an EX4300 destination switch.

Before you configure remote mirroring, be sure that:

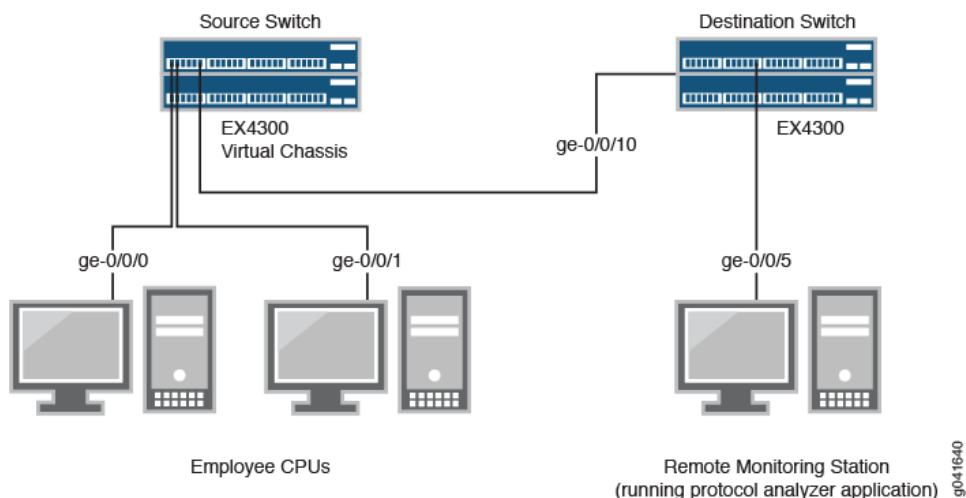

- You have an understanding of mirroring concepts.
- The interfaces that the analyzer will use as input interfaces have been configured on the switch.

### Overview and Topology

This topic includes two related examples that describe how to configure mirroring to the **remote-analyzer** VLAN so that analysis can be performed from a remote monitoring station. The first example shows how to configure a switch to mirror all traffic from employee computers. The second example shows the same scenario, but the setup includes a filter to mirror only the employee traffic going to the Web.

[Figure 56 on page 4008](#) shows the network topology for both these example scenarios.

Figure 56: Remote Mirroring Network Topology Example

In this example:

- Interface ge-0/0/0 is a Layer 2 interface, and interface ge-0/0/1 is a Layer 3 interface (both interfaces on the source switch) that serve as connections for employee computers.
- Interface ge-0/0/10 is a Layer 2 interface that connects the source switch to the destination switch.
- Interface ge-0/0/5 is a Layer 2 interface that connects the destination switch to the remote monitoring station.
- VLAN **remote-analyzer** is configured on all switches in the topology to carry the mirrored traffic.

### Mirroring All Employee Traffic for Remote Analysis

To configure an analyzer for remote traffic analysis for all incoming and outgoing employee traffic, perform these tasks:

#### CLI Quick Configuration

To quickly configure an analyzer for remote traffic analysis for incoming and outgoing employee traffic, copy the following commands and paste them into the switch terminal window:

- Copy and paste the following commands in the source switch terminal window:

```
[edit]
set vlans remote-analyzer vlan-id 999
set interfaces ge-0/0/10 unit 0 family ethernet-switching interface-mode trunk
set interfaces ge-0/0/10 unit 0 family ethernet-switching vlan members 999
set forwarding-options analyzer employee-monitor input ingress interface ge-0/0/0.0
set forwarding-options analyzer employee-monitor input ingress interface ge-0/0/1.0
set forwarding-options analyzer employee-monitor input egress interface ge-0/0/0.0
set forwarding-options analyzer employee-monitor input egress interface ge-0/0/1.0
set forwarding-options analyzer employee-monitor output vlan remote-analyzer
```

- Copy and paste the following commands in the destination switch terminal window:

```
[edit]
set vlans remote-analyzer vlan-id 999
set interfaces ge-0/0/10 unit 0 family ethernet-switching interface-mode trunk
set interfaces ge-0/0/10 unit 0 family ethernet-switching vlan members 999
set interfaces ge-0/0/5 unit 0 family ethernet-switching interface-mode trunk
set forwarding-options analyzer employee-monitor input ingress vlan remote-analyzer
set forwarding-options analyzer employee-monitor output interface ge-0/0/5.0
```

**Step-by-Step Procedure** To configure basic remote port mirroring:

1. On the source switch:

- Configure the VLAN ID for the **remote-analyzer** VLAN:

```
[edit vlans]
user@switch# set remote-analyzer vlan-id 999
```

- Configure the interface on the network port connected to the destination switch for trunk mode and associate it with the **remote-analyzer** VLAN:

```
[edit interfaces]
user@switch# set ge-0/0/10 unit 0 family ethernet-switching interface-mode trunk
user@switch# set ge-0/0/10 unit 0 family ethernet-switching vlan members 999
```

- Configure the **employee-monitor** analyzer:

```
[edit forwarding-options]
user@switch# set analyzer employee-monitor input ingress interface ge-0/0/0.0
user@switch# set analyzer employee-monitor input ingress interface ge-0/0/1.0
user@switch# set instance employee-monitor input egress interface ge-0/0/0.0
user@switch# set analyzer employee-monitor input egress interface ge-0/0/1.0
user@switch# set analyzer employee-monitor output vlan remote-analyzer
```

2. On the destination switch:

- Configure the VLAN ID for the **remote-analyzer** VLAN:

```
[edit vlans]
user@switch# set remote-analyzer vlan-id 999
```

- Configure the interface on the destination switch for trunk mode and associate it with the **remote-analyzer** VLAN:

```
[edit interfaces]
user@switch# set ge-0/0/10 unit 0 family ethernet-switching interface-mode trunk
user@switch# set ge-0/0/10 unit 0 family ethernet-switching vlan members 999
```

- Configure the interface connected to the destination switch for trunk mode:

```
[edit interfaces]
user@switch# set ge-0/0/5 unit 0 family ethernet-switching interface-mode trunk
```

- Configure the **employee-monitor** analyzer:

```
[edit forwarding-options]
user@switch# set analyzer employee-monitor input ingress vlan remote-analyzer
user@switch# set analyzer employee-monitor output interface ge-0/0/5.0
```

**Results** Check the results of the configuration on the source switch:

```
[edit]
user@switch> show
forwarding-options {
  analyzer employee-monitor {
```

```
input {
  ingress {
    interface ge-0/0/0.0;
    interface ge-0/0/1.0;
  }
  egress {
    interface ge-0/0/0.0;
    interface ge-0/0/1.0;
  }
}
output {
  vlan {
    remote-analyzer;
  }
}
}
interfaces {
  ge-0/0/10 {
    unit 0 {
      family ethernet-switching {
        interface-mode trunk;
        vlan {
          members 999;
        }
      }
    }
  }
}
}
vlangs {
  remote-analyzer {
    vlan-id 999;
    interface {
      ge-0/0/10.0
    }
  }
}
}
```

Check the results of the configuration on the destination switch:

```
[edit]
user@switch> show
interfaces {
  ge0/0/5 {
    unit 0 {
      family ethernet-switching {
        interface-mode trunk;
      }
    }
  }
  ge-0/0/10 {
    unit 0 {
      family ethernet-switching {
        interface-mode trunk;
        vlan {
```

```

        members 999;
    }
}
}
}
vpls {
    remote-analyzer {
        vlan-id 999;
        interface {
            ge-0/0/10.0
        }
    }
}
}
forwarding-options {
    analyzer employee-monitor {
        input {
            ingress {
                vlan remote-analyzer;
            }
        }
        output {
            interface {
                ge-0/0/5.0;
            }
        }
    }
}
}
}

```

### Mirroring Employee-to-Web Traffic for Remote Analysis

To configure port mirroring for remote traffic analysis of employee- to- Web traffic, perform these tasks:

#### CLI Quick Configuration

To quickly configure port mirroring to mirror employee traffic to the external Web, copy the following commands and paste them into the switch terminal window:

- Copy and paste the following commands in the source switch terminal window:
 

```

[edit]
set forwarding-options port-mirroring instance employee-web-monitor output vlan 999
set vpls remote-analyzer vlan-id 999
set interfaces ge-0/0/10 unit 0 family ethernet-switching port mode trunk
set interfaces ge-0/0/10 unit 0 family ethernet-switching vlan members 999
set firewall family ethernet-switching filter watch-employee term employee-to-corp from
destination-address 192.0.2.16/28
set firewall family ethernet-switching filter watch-employee term employee-to-corp from
source-address 192.0.2.16/28
set firewall family ethernet-switching filter watch-employee term employee-to-corp then
accept
set firewall family ethernet-switching filter watch-employee term employee-to-web from
destination-port 80
set firewall family ethernet-switching filter watch-employee term employee-to-web then
port-mirror-instance employee-web-monitor
set interfaces ge-0/0/0 unit 0 family ethernet-switching filter input watch-employee
set interfaces ge-0/0/1 unit 0 family ethernet-switching filter input watch-employee
      
```

- Copy and paste the following commands in the destination switch terminal window:

```
[edit]
set vlans remote-analyzer vlan-id 999
set interfaces ge-0/0/10 unit 0 family ethernet-switching interface-mode trunk
set interfaces ge-0/0/10 unit 0 family ethernet-switching vlan members 999
set interfaces ge-0/0/5 unit 0 family ethernet-switching interface-mode trunk
set forwarding-options analyzer employee-web-monitor input ingress vlan remote-analyzer
set forwarding-options analyzer employee-web-monitor output interface ge-0/0/5.0
```

#### Step-by-Step Procedure

To configure port mirroring of all traffic from the two ports connected to employee computers to the **remote-analyzer** VLAN for use from a remote monitoring station:

1. On the source switch:

- Configure the **employee-web-monitor** port mirroring instance:

```
[edit ]
user@switch# set interfaces ge-0/0/10 unit 0 family ethernet-switching port mode trunk
user@switch# set forwarding-options port-mirroring instance employee-web-monitor
output vlan 999
```

- Configure the VLAN ID for the **remote-analyzer** VLAN:

```
[edit vlans]
user@switch# set remote-analyzer vlan-id 999
```

- Configure the interface to associate it with the **remote-analyzer** VLAN:

```
[edit interfaces]
user@switch# set ge-0/0/10 unit 0 family ethernet-switching vlan members 999
```

- Configure the firewall filter called **watch-employee**:

```
[edit firewall family ethernet-switching]
user@switch# set filter (Firewall Filters) watch-employee term employee-to-corp from
destination-address 192.0.2.16/28
user@switch# set filter watch-employee term employee-to-corp from source-address
192.0.2.16/28
user@switch# set filter watch-employee term employee-to-corp then accept
user@switch# set filter watch-employee term employee-to-web from destination-port
80
user@switch# set filter watch-employee term employee-to-web then port-mirror-instance
employee-web-monitor
```

- Apply the firewall filter to the employee interfaces:

```
[edit interfaces]
user@switch# set ge-0/0/0 unit 0 family ethernet-switching filter input watch-employee
user@switch# set ge-0/0/1 unit 0 family ethernet-switching filter input watch-employee
```

2. On the destination switch:

- Configure the VLAN ID for the **remote-analyzer** VLAN:

```
[edit vlans]
user@switch# set remote-analyzer vlan-id 999
```

- Configure the interface on the destination switch for trunk mode and associate it with the **remote-analyzer** VLAN:

```
[edit interfaces]
user@switch# set ge-0/0/10 unit 0 family ethernet-switching interface-mode trunk
user@switch# set ge-0/0/10 unit 0 family ethernet-switching vlan members 999
```

- Configure the interface connected to the destination switch for trunk mode:

```
[edit interfaces]
user@switch# set ge-0/0/5 unit 0 family ethernet-switching interface-mode trunk
```

- Configure the **employee-monitor** analyzer:

```
[edit forwarding-options port-mirroring]
user@switch# set instance employee-web-monitor input ingress vlan remote-analyzer
user@switch# set instance employee-web-monitor output interface ge-0/0/5.0
```

**Results** Check the results of the configuration on the source switch:

```
[edit]
user@switch> show
interfaces {
  ge-0/0/10 {
    unit 0 {
      family ethernet-switching {
        interface-mode trunk;
        vlan {
          members remote-analyzer;
        }
      }
    }
  }
  ge-0/0/0 {
    unit 0 {
      family ethernet-switching {
        filter {
          input watch-employee;
        }
      }
    }
  }
  ge-0/0/1 {
    unit 0 {
      family ethernet-switching {
        filter {
          input watch-employee;
        }
      }
    }
  }
}
firewall {
  family ethernet-switching {
    filter watch-employee {
      term employee-to-corp {
        from {
          source-address {
            192.0.2.16/28;
          }
          destination-address {
            192.0.2.16/28;
          }
        }
        then accept;
      }
    }
  }
}
```

```
        term employee-to-web {
            from {
                destination-port 80;
            }
            then port-mirror-instance employee-web-monitor;
        }
    }
}
forwarding-options {
    analyzer employee-web-monitor {
        output {
            vlan {
                999;
            }
        }
    }
}
vlangs {
    remote-analyzer {
        vlan-id 999;
    }
}
```

Check the results of the configuration on the destination switch:

```
[edit]
user@switch> show
vlangs {
    remote-analyzer {
        vlan-id 999;
    }
}
interfaces {
    ge-0/0/10 {
        unit 0 {
            family ethernet-switching {
                interface-mode trunk;
                vlan {
                    members remote-analyzer;
                }
            }
        }
    }
    ge-0/0/5 {
        unit 0 {
            family ethernet-switching {
                interface-mode trunk;
            }
        }
    }
}
forwarding-options {
    port-mirroring {
        instance employee-web-monitor {
            input {
                ingress {
```

```

        vlan remote-analyzer;
    }
}
output {
    interface {
        ge-0/0/5.0;
    }
}
}
}

```

### Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying That the Analyzer Has Been Correctly Created on page 4015](#)

#### *Verifying That the Analyzer Has Been Correctly Created*

**Purpose** Verify that the analyzer named **employee-monitor** or **employee-web-monitor** has been created on the switch with the appropriate input interfaces and appropriate output interface.

**Action** You can verify the analyzer is configured as expected by using the **show forwarding-options analyzer** command. To view previously created analyzers that are disabled, go to the J-Web interface.

To verify that the analyzer is configured as expected while monitoring all employee traffic on the source switch, run the **show analyzer** command on the source switch. The following output is displayed for this configuration example:

```

user@switch> show forwarding-options analyzer
Analyzer name           : employee-monitor
Mirror rate             : 1
Maximum packet length   : 0
State                   : up
Ingress monitored interfaces : ge-0/0/0.0
Ingress monitored interfaces : ge-0/0/1.0
Egress monitored interfaces : ge-0/0/0.0
Egress monitored interfaces : ge-0/0/1.0
Output VLAN             : default-switch/remote-analyzer

```

**Meaning** This output shows that the **employee-monitor** instance has a ratio of 1 (mirroring every packet, the default), the maximum size of the original packet that was mirrored (0 indicates the entire packet), the state of the configuration is up (which indicates the proper state and that the analyzer is programmed, and is mirroring the traffic entering ge-0/0/0 and ge-0/0/1 and is sending the mirrored traffic to the VLAN called **remote-analyzer**). If the state of the output interface is down or if the output interface is not configured, the value of state will be down and the analyzer will not be programmed for mirroring.

## Example: Configuring Mirroring for Remote Monitoring of Employee Resource Use Through a Transit Switch on EX4300 Switches

**NOTE:** This example uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Example: Configuring Port Mirroring for Remote Monitoring of Employee Resource Use Through a Transit Switch on EX Series Switches*. For ELS details, see *Getting Started with Enhanced Layer 2 Software*.

EX4300 switches enable you to configure mirroring to send copies of packets to either a local interface for local monitoring or to a VLAN for remote monitoring. You can use mirroring to copy these packets:

- Packets entering or exiting a port
- Packets entering a VLAN on EX4300 switches

You can analyze the mirrored traffic by using a protocol analyzer application running on a remote monitoring station if you are sending mirrored traffic to an analyzer VLAN.

This topic includes an example that describes how to mirror traffic entering ports on the switch to the **remote-analyzer** VLAN through a transit switch, so that you can perform analysis from a remote monitoring station.
