| <b>Tunneling</b>             | Status of tunneling on the interface: either <b>enabled</b> or <b>disabled</b> .         |

## Sample Output

### show lldp local-information (EX Series Switch)

```
user@switch> show lldp local-information
```

#### LLDP Local Information details

```
Chassis ID   : 00:1d:b5:aa:b9:f0
System name  : switch
System descr : Juniper Networks, Inc. ex8208 , version 10.4I0 [builder] Build
               date: 2010-11-17 12:38:30 UTC
```

#### System Capabilities

```
Supported   : Bridge Router
Enabled     : Bridge Router
```

#### Management Information

```
Port Name    : -
Port Address  : 10.93.54.6
Address Type  : IPv4
Port ID       : 34
Port ID Subtype : local(7)
Port Subtype  : ifIndex(2)
```

| Interface name | Parent Interface | SNMP Index | Interface description | Status | Tunneling |
|----------------|------------------|------------|-----------------------|--------|-----------|
| me0.0          | -                | 34         | -                     | Down   | Disabled  |
| xe-3/0/0.0     | ae31.0           | 769        | xe-3/0/0.0            | Up     | Disabled  |
| xe-3/0/1.0     | ae31.0           | 770        | xe-3/0/1.0            | Up     | Disabled  |
| xe-3/0/2.0     | ae31.0           | 771        | xe-3/0/2.0            | Up     | Disabled  |
| xe-3/0/3.0     | ae31.0           | 772        | xe-3/0/3.0            | Up     | Disabled  |
| xe-3/0/4.0     | ae31.0           | 577        | xe-3/0/4.0            | Up     | Disabled  |
| xe-3/0/5.0     | ae31.0           | 578        | xe-3/0/5.0            | Up     | Disabled  |
| xe-3/0/6.0     | ae31.0           | 579        | xe-3/0/6.0            | Up     | Disabled  |
| xe-3/0/7.0     | ae31.0           | 581        | xe-3/0/7.0            | Up     | Disabled  |

## show lldp neighbors

**Syntax** `show lldp neighbors`  
`<interface interface>`

**Release Information** Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Display the information about neighboring devices learned by the switch by using the Link Layer Discovery Protocol (LLDP).

**NOTE:** The Chassis ID TLV has a subtype for Network Address Family. The supported network address families are IPv4 and IPv6. LLDP frames are validated only if the Network Address subtype of the Chassis ID TLV has a value of 1 (IPv4) or 2 (IPv6). For any other value, the transmitting device is detected by LLDP as a neighbor and displayed in the output of the `show lldp neighbors` command, but is not assigned to the VLAN.

**Options** `interface interface`—(Optional) Display LLDP neighbor information for a selected interface.

**Required Privilege Level** view

[show lldp neighbors on page 2027](#)  
[show lldp neighbors interface ge-0/0/2 on page 2028](#)  
[show lldp neighbors interface ge-0/0/0.0 \(for a VoIP Avaya Telephone with LLDP-MED Support\) on page 2029](#)  
[show lldp neighbors interface ge-0/0/5.0 \(with NetBIOS Snooping Enabled on the Switch\) on page 2030](#)

**Output Fields** [Table 187 on page 2025](#) lists the output fields for the `show lldp neighbors` command. Output fields are listed in the approximate order in which they appear.

**Table 187: show lldp neighbors Output Fields**

| Field Name       | Field Description                                                                     |
|------------------|---------------------------------------------------------------------------------------|
| Local Interface  | List of local interfaces for which neighbor information is available.                 |
| Parent Interface | List of aggregated Ethernet interfaces, if any, to which the local interfaces belong. |
| Chassis ID       | List of chassis identifiers for neighbors.                                            |
| Port info        | This field displays the port information received from neighbors.                     |

Table 187: show lldp neighbors Output Fields (*continued*)

| Field Name                       | Field Description                                                                                                                                                                                                                                                 |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System name</b>               | List of system names gathered from neighbors.                                                                                                                                                                                                                     |
| <b>LLDP Neighbor Information</b> | Information about both the local system (the switch) and a neighbor system on the interface (appears when the <b>interface</b> option is used).                                                                                                                   |
| <b>Local Information</b>         | Information about the local system (appears when the <b>interface</b> option is used).                                                                                                                                                                            |
| <b>Index</b>                     | Local interface index (appears when the <b>interface</b> option is used).                                                                                                                                                                                         |
| <b>Time to live</b>              | Number of seconds for which this information is valid (appears when the <b>interface</b> option is used).                                                                                                                                                         |
| <b>Time mark</b>                 | Date and timestamp of information (appears when the <b>interface</b> option is used).                                                                                                                                                                             |
| <b>Local Interface</b>           | Name of the local physical interface (appears when the <b>interface</b> option is used).                                                                                                                                                                          |
| <b>Parent Interface</b>          | Name of the aggregated Ethernet interface, if any, to which the interface belongs (appears when the <b>interface</b> option is used).                                                                                                                             |
| <b>Local Port ID</b>             | Local interface SNMP index (appears when the <b>interface</b> option is used).                                                                                                                                                                                    |
| <b>Ageout Count</b>              | Number of times the complete set of information advertised by the neighbor has been deleted from LLDP neighbor information maintained by the local system because the information timeliness interval expired (appears when the <b>interface</b> option is used). |
| <b>Neighbor Information</b>      | Information about a neighbor system on the interface (appears when the <b>interface</b> option is used).                                                                                                                                                          |
| <b>Chassis type</b>              | Type of chassis identifier supplied, such as <b>Mac address</b> (appears when the <b>interface</b> option is used).                                                                                                                                               |
| <b>Chassis ID</b>                | Chassis identifier of the chassis type listed (appears when the <b>interface</b> option is used).                                                                                                                                                                 |
| <b>Port type</b>                 | Type of port identifier supplied, such as <b>Locally assigned</b> (appears when the <b>interface</b> option is used).                                                                                                                                             |
| <b>Port ID</b>                   | Port identifier of the port type listed (appears when the <b>interface</b> option is used).                                                                                                                                                                       |
| <b>Port description</b>          | The port description field uses the configured port description, the port name or the SNMP ifIndex (appears when the <b>interface</b> option is used).                                                                                                            |
| <b>System name</b>               | Name supplied by the system on the interface (appears when the <b>interface</b> option is used).                                                                                                                                                                  |

Table 187: show lldp neighbors Output Fields (*continued*)

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>System Description</b>  | Description supplied by the system on the interface (appears when the <b>interface</b> option is used).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>System capabilities</b> | Capabilities (such as <b>Bridge</b> , <b>Bridge Router</b> , and <b>Bridge Telephone</b> ) that are supported or enabled by the system on the interface (appears when the <b>interface</b> option is used).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Management Info</b>     | <p>Details of management information: <b>Type</b> (such as <b>IPv4</b> or <b>IPv6</b>), <b>Address</b> (such as <b>10.204.34.35</b>), <b>Port ID</b>, <b>Subtype</b>, <b>Interface Subtype</b>, and organization identifier (<b>OID</b>) (appears when the <b>interface</b> option is used).</p> <p>The <b>Interface Subtype</b> displays:</p> <ul style="list-style-type: none"> <li><b>ifIndex(2)</b>—IP address of the neighbor's management Ethernet interface (<b>me0</b>) or virtual management Ethernet (<b>VME</b>) interface address (for a Virtual Chassis) is used to manage the switch.</li> <li><b>unknown(1)</b>—Neighbor's IP management address has been configured with set <b>protocols lldp management-address</b>.</li> </ul> |
| <b>Media Info</b>          | Additional details about the endpoint device appear when a device that supports LLDP-MED is attached to the interface. The specific details depend upon the capabilities of the device. Details might include: <b>Media endpoint class</b> (such as Class 3 for communication devices such as IP phones), <b>MED Hardware revision</b> , <b>MED Firmware revision</b> , <b>MED Software revision</b> , <b>MED Serial number</b> , <b>MED Manufacturer name</b> , <b>MED Model name</b> .                                                                                                                                                                                                                                                          |
| <b>Organization Info</b>   | One or more entries listing remote information by organizationally unique identifier ( <b>OUI</b> ), <b>Subtype</b> , <b>Index</b> , and <b>Info</b> (appears when the <b>interface</b> option is used).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Age</b>                 | How long the neighbor has been identified (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Local Interface</b>     | Name of the local physical interface (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Parent Interface</b>    | Name of the aggregated Ethernet interface, if any, to which the interface belongs (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Chassis ID</b>          | Chassis identifier of the chassis type listed (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>System name</b>         | NetBIOS name of the host (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

## Sample Output

### show lldp neighbors

```
user@switch> show lldp neighbors
```

### show lldp neighbors interface ge-0/0/2

```
user@switch> show lldp neighbors interface ge-0/0/2
```

#### LLDP Neighbor Information:

##### Local Information:

```
Index: 1 Time to live: 240 Time mark: Wed Dec 1 10:23:24 2010 Age: 29 secs
Local Interface   : ge-0/0/2.0
Parent Interface  : -
Local Port ID     : 507
Ageout Count     : 0
```

##### Neighbour Information:

```
Chassis type      : Mac address
Chassis ID       : 00:1f:12:38:7f:c0
Port type        : Locally assigned
Port ID          : 507
Port description  : ge-0/0/2.0
System name      : bng-148p5-dev
```

```
System Description : Juniper Networks, Inc. ex4200-48p , version 10.4I0 Build
date: 2010-11-30 09:32:17 UTC
```

#### System capabilities

```
Supported : Bridge Router
Enabled   : Bridge Router
```

#### Management Info

```
Type           : IPv4
Address        : 10.204.96.235
Port ID       : 34
Subtype       : 1
Interface Subtype : ifIndex(2)
OID           : 1.3.6.1.2.1.31.1.1.1.1.34
```

```
Media endpoint class: Network Connectivity
```

#### Organization Info

```
OUI       : IEEE 802.3 Private (0x00120f)
Subtype   : MAC/PHY Configuration/Status (1)
Info      : Autonegotiation [supported, enabled (0x3)], PMD Autonegotiation
Capability (0x1d00), MAU Type (0x0)
Index     : 1
```

#### Organization Info

```
OUI       : IEEE 802.3 Private (0x00120f)
Subtype   : MDI Power (2)
Info      : MDI Power Support [PSE supported ], MDI Power Pair (signal),
MDI Power Class (class0)
Index     : 2
```

| <b>List of Sample Output</b>    | <a href="#">show lldp remote-global-statistics on page 2032</a>                                                                                                                                                            |
| <b>Output Fields</b>            | <a href="#">Table 188 on page 2031</a> describes the output fields for the <b>show lldp remote-global-statistics</b> command. Output fields are listed in the approximate order in which they appear.                      |

**Table 188: show lldp remote-global-statistics Output Fields**

| Field Name                          | Field Description                                                                                     |
|-------------------------------------|-------------------------------------------------------------------------------------------------------|
| LLDP Remote Database Table Counters | Information about remote database table counters.                                                     |
| LastchangeTime                      | Time elapsed between LLDP agent startup and the last change to the remote database table information. |
| Inserts                             | Number of insertions made in the remote database table.                                               |
| Deletes                             | Number of deletions made in the remote database table.                                                |
| Drops                               | Number of LLDP frames dropped from the remote database table because of errors.                       |
| Ageouts                             | Number of remote database table entries that have aged out of the table.                              |

## Sample Output

### show lldp remote-global-statistics

```
user@host> show lldp remote-global-statistics
user@host> show lldp remote-global-statistics
LLDP Remote Database Table Counters
LastchangeTime      Inserts    Deletes    Drops    Ageouts
00:00:76 (76 sec)   192        0           0         0
```

## Junos OS CoS for EX Series Switches Overview

When a network experiences congestion and delay, some packets must be dropped. Junos operating system (Junos OS) class of service (CoS) divides traffic into classes to which you can apply different levels of throughput and packet loss when congestion occurs. This allows packet loss to happen according to rules that you configure.

For interfaces that carry IPv4, IPv6, and MPLS traffic, you can configure Junos OS CoS features to provide multiple classes of service for different applications. CoS also allows you to rewrite the Differentiated Services code point (DSCP), IP precedence, 802.1p, or EXP CoS bits of packets egressing out of an interface, thus allowing you to tailor packets for the remote peers' network requirements. See *Understanding Using CoS with MPLS Networks on EX Series Switches* for more information about CoS for MPLS networks.

CoS provides multiple classes of service for different applications. You can configure multiple forwarding classes for transmitting packets, define which packets are placed into each output queue, and schedule the transmission service level for each queue.

In designing CoS applications, you must give careful consideration to your service needs and thoroughly plan and design your CoS configuration to ensure consistency and interoperability across all platforms in a CoS domain.

Because Juniper Networks EX Series Ethernet Switches implement CoS in hardware rather than in software, you can experiment with and deploy CoS features without affecting packet-forwarding and switching performance.

**NOTE:** CoS policies can be enabled or disabled on each interface of an EX Series switch. Also, each physical and logical interface on the switch can have custom CoS rules associated with it. When CoS is used in an MPLS network, there are some additional restrictions. See *Understanding Using CoS with MPLS Networks on EX Series Switches*.

### How Junos OS CoS Works

Junos OS CoS works by examining traffic entering at the edge of your network. The switches classify traffic into defined service groups to provide the special treatment of traffic across the network. For example, voice traffic can be sent across certain links, and data traffic can use other links. In addition, the data traffic streams can be serviced differently along the network path. As the traffic leaves the network at the far edge, you can rewrite the traffic to meet the policies of the targeted peer.

To support CoS, you must configure each switch in the network. Generally, each switch examines the packets that enter it to determine their CoS settings. These settings then dictate which packets are transmitted first to the next downstream switch. Switches at the edges of the network might be required to alter the CoS settings of the packets that enter the network to classify the packets into the appropriate service groups.

Figure 22 on page 2043 represents the network scenario of an enterprise. Switch A is receiving traffic from various network nodes such as desktop computers, servers, surveillance cameras, and VoIP telephones. As each packet enters, Switch A examines the packet's CoS settings and classifies the traffic into one of the groupings defined by the enterprise. This definition allows Switch A to prioritize resources for servicing the traffic streams it receives. Switch A might alter the CoS settings of the packets to better match the enterprise's traffic groups.

When Switch B receives the packets, it examines the CoS settings, determines the appropriate traffic groups, and processes the packets according to those settings. It then transmits the packets to Switch C, which performs the same actions. Switch D also examines the packets and determines the appropriate groups. Because Switch D sits at the far end of the network, it can rewrite the CoS bits of the packets before transmitting them.

Figure 22: Packet Flow Across the Network

### Default CoS Behavior on EX Series Switches

If you do not configure any CoS settings on the switch, the software performs some CoS functions to ensure that user traffic and protocol packets are forwarded with minimum delay when the network is experiencing congestion. Some CoS settings, such as classifiers, are automatically applied to each logical interface that you configure. Other settings, such as rewrite rules, are applied only if you explicitly associate them with an interface.

### Understanding Junos OS CoS Components for EX Series Switches

This topic describes the Juniper Networks Junos operating system (Junos OS) class-of-service (CoS) components for Juniper Networks EX Series Ethernet Switches:

- [Code-Point Aliases on page 2044](#)
- [Policers on page 2044](#)

- [Classifiers on page 2044](#)
- [Forwarding Classes on page 2044](#)
- [Tail Drop Profiles on page 2045](#)
- [Schedulers on page 2045](#)
- [Rewrite Rules on page 2045](#)

---

## Code-Point Aliases

A code-point alias assigns a name to a pattern of code-point bits. You can use this name instead of the bit pattern when you configure other CoS components such as classifiers, drop-profile maps, and rewrite rules.

---

## Policers

Policers limit traffic of a certain class to a specified bandwidth and *burst size*. Packets exceeding the policer limits can be discarded. You define policers with filters that can be associated with input interfaces.

For more information about policers, see [“Understanding the Use of Policers in Firewall Filters” on page 4767](#).

**NOTE:** You can configure policers to discard packets that exceed the rate limits. If you want to configure CoS parameters such as *loss-priority* and *forwarding-class*, you must use firewall filters.

---

## Classifiers

Packet classification associates incoming packets with a particular CoS servicing level. In Juniper Networks Junos operating system (Junos OS), *classifiers* associate packets with a forwarding class and loss priority and assign packets to output queues based on the associated forwarding class. Junos OS supports two general types of classifiers:

- Behavior aggregate or CoS value traffic classifiers—Examines the CoS value in the packet header. The value in this single field determines the CoS settings applied to the packet. BA classifiers allow you to set the forwarding class and loss priority of a packet based on the Differentiated Services code point (DSCP) value, IP precedence value, and IEEE 802.1p value.
- Multifield traffic classifiers—Examines multiple fields in the packet such as source and destination addresses and source and destination port numbers of the packet. With multifield classifiers, you set the forwarding class and loss priority of a packet based on firewall filter rules.

---

## Forwarding Classes

Forwarding classes group the packets for transmission. Based on forwarding classes, you assign packets to output queues. Forwarding classes affect the forwarding, scheduling, and marking policies applied to packets as they transit a switch. By default, four categories of forwarding classes are defined: best effort, assured forwarding, expedited forwarding,

and network control. For EX Series switches, 16 forwarding classes are supported, providing granular classification capability.

### Tail Drop Profiles

Drop profile is a mechanism that defines parameters that allow packets to be dropped from the network. Drop profiles define the meanings of the loss priorities. When you configure drop profiles you are essentially setting the value for queue fullness. The queue fullness represents a percentage of the queue used to store packets in relation to the total amount that has been allocated for that specific queue.

Loss priorities set the priority of dropping a packet. Loss priority affects the scheduling of a packet without affecting the packet's relative ordering. You can use the loss priority setting to identify packets that have experienced congestion. Typically you mark packets exceeding some service level with a high loss priority.

### Schedulers

Each switch interface has multiple queues assigned to store packets. The switch determines which queue to service based on a particular method of scheduling. This process often involves determining which type of packet should be transmitted before another. You can define the priority, bandwidth, delay buffer size, and tail drop profiles to be applied to a particular queue for packet transmission.

A scheduler map associates a specified forwarding class with a scheduler configuration. You can associate up to four user-defined scheduler maps with the interfaces.

### Rewrite Rules

A *rewrite rule* sets the appropriate CoS bits in the outgoing packet, thus allowing the next downstream device to classify the packet into the appropriate service group. Rewriting, or marking, outbound packets is useful when the switch is at the border of a network and must alter the CoS values to meet the policies of the targeted peer.

**NOTE:** Egress firewall filters can also assign forwarding class and loss priority so that the packets are rewritten based on forwarding class and loss priority.

## Understanding CoS Code-Point Aliases

A code-point alias assigns a name to a pattern of code-point bits. You can use this name instead of the bit pattern when you configure other CoS components such as classifiers, drop-profile maps, and rewrite rules.

Behavior aggregate classifiers use class-of-service (CoS) values such as Differentiated Services code points (DSCPs), IP precedence, and IEEE 802.1p bits to associate incoming packets with a particular CoS servicing level. On a switch, you can assign a meaningful name or alias to the CoS values and use this alias instead of bits when configuring CoS components. These aliases are not part of the specifications but are well known through usage. For example, the alias for DSCP 101110 is widely accepted as ef (expedited forwarding).

When you configure classes and define classifiers, you can refer to the markers by alias names. You can configure user-defined classifiers in terms of alias names. If the value of an alias changes, it alters the behavior of any classifier that references it.

This topic covers:

## Understanding CoS Classifiers

Packet classification associates incoming packets with a particular class-of-service (CoS) servicing level. Classifiers associate packets with a forwarding class and loss priority, and packets are associated to an output queue based on the forwarding class. You can define classifiers for IPv4 and IPv6 traffic to network interfaces, aggregated Ethernet interfaces (also known as link aggregation groups (LAGs)), integrated routing and bridging (IRB) interfaces (also known as routed VLAN interfaces (RVIs)), Layer 3 interfaces, and Layer 3 VLAN-tagged logical interfaces.

There are two general types of classifiers:

- Behavior aggregate (BA) classifiers
- Multifield (MF) classifiers

You can configure both a BA classifier and an MF classifier on an interface. If you do this, the BA classification is performed first and then the MF classification. If the two classification results conflict, the MF classification result overrides the BA classification result.

On Juniper Networks EX8200 Ethernet Switches, you can specify BA classifiers for bridged multdestination traffic and for IP multdestination traffic. A BA classifier for multicast packets is applied to all interfaces on the EX8200 switch.

**NOTE:** EX8200 switches implement the on-demand allocation of memory space for ternary content addressable memory (TCAM) so that when additional TCAM space is required for CoS classifiers, it is allocated from the free TCAM space or from the unused TCAM space. An error log message is generated when you configure CoS classifiers to use memory space that exceeds the available TCAM space that includes both the free and unused space.

This topic describes:

- [Behavior Aggregate Classifiers on page 2049](#)
- [Multifield Classifiers on page 2051](#)

### Behavior Aggregate Classifiers

The behavior aggregate classifier maps packets to a forwarding class and a loss priority. The forwarding class determines the output queue for a packet. The loss priority is used by a scheduler to control packet discard during periods of congestion.

There are three types of BA classifiers:

- Differentiated Services Code Point (DSCP) for IP DiffServ
- IP precedence bits
- IEEE 802.1p CoS bits

BA classifiers are based on fixed-length fields, which makes them computationally more efficient than MF classifiers. Therefore core devices, which handle high traffic volumes, are normally configured to perform BA classification.

#### **Default Behavior Aggregate Classification**

Juniper Networks Junos operating system (Junos OS) automatically assigns implicit default BA classifiers to logical interfaces based on the type of interface.

[Table 194 on page 2050](#) lists different types of interfaces and the corresponding implicit default BA classification.

**Table 194: Default BA Classification**

| Type of Interface                                | Default BA Classification                                                                                                       |
|--------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| Trunk and Circuit Cross-Connect (CCC) interfaces | <b>ieee8021p-default</b><br><br><b>NOTE:</b> This BA classification for a CCC interface is applicable only for EX8200 switches. |
| Layer 3 interface (IPv4)                         | <b>dscp-default</b>                                                                                                             |
| Layer 3 interface (IPv6)                         | <b>dscp-ipv6-default</b>                                                                                                        |
| Access interface                                 | Untrusted                                                                                                                       |
| Routed VLAN interface (RVI)                      | No default classification                                                                                                       |
| MPLS                                             | EXP<br><br><b>NOTE:</b> This BA classification is applicable only for EX8200 switches.                                          |

When you explicitly associate a BA classifier with a logical interface, you are overriding the implicit (default) BA classifier with an explicit BA classifier.

[Table 195 on page 2050](#) describes the BA classifier types you can configure on Layer 2 and Layer 3 interfaces.

**Table 195: Allowed BA Classification**

| Type of Interface        | Allowed BA Classification                   |
|--------------------------|---------------------------------------------|
| Layer 2 interface        | IEEE 802.1p, IP precedence, DSCP, DSCP IPv6 |
| Layer 3 interface (IPv4) | IEEE 802.1p, IP precedence, DSCP            |
| Layer 3 interface (IPv6) | IEEE 802.1p, IP precedence, DSCP IPv6       |

You can configure all the allowed classifier types on the same logical interface or on different logical interfaces. If you need to apply all classifier rules on the same logical interface, configure the classifier rules allowed for both IPv4 and IPv6 on the logical interface.

If you have not explicitly configured a classifier on a logical interface, the default classifiers are assigned and classification works as follows:

- To a logical interface configured with an IPv4 address, a DSCP classifier is assigned by default, and IPv4 and IPv6 packets are classified using the DSCP classifier.
- To logical interface configured with an IPv6 address, a DSCP IPv6 classifier is assigned by default, and IPv4 and IPv6 packets are classified using the DSCP IPv6 classifier.

**NOTE:** On EX8200 switches, you can configure either one classifier of type DSCP or IEEE802.1p, or you can configure one classifier each of type DSCP and IEEE802.1p.

You can configure integrated routing and bridging (IRB) interfaces (also known as routed VLAN interfaces (RVIs)) to classify packets. After you do this, the User Priority (UP) bits in the incoming packets are rewritten according to the default IEEE 802.1p rewrite rule, except on EX8200 switches. On EX8200 switches, you must explicitly assign the default IEEE 802.1p rewrite rule to RVIs.

**NOTE:** By default, all BA classifiers classify traffic into either the best-effort forwarding class or the network-control forwarding class.

### Multifield Classifiers

Multifield classifiers examine multiple fields in a packet such as source and destination addresses and source and destination port numbers of the packet. With MF classifiers, you set the forwarding class and loss priority of a packet based on firewall filter rules.

MF classification is normally performed at the network edge because of the general lack of support for DSCP or IP precedence classifiers in end-user applications. On an edge switch, an MF classifier provides the filtering functionality that scans through a variety of packet fields to determine the forwarding class for a packet. Typically, any classifier performs matching operations on the selected fields against a configured value.

## Understanding CoS Forwarding Classes

Class-of-Service (CoS) forwarding classes can be thought of as output queues. In effect, the result of classifying packets is the identification of an output queue for a particular packet. For a classifier to assign an output queue to a packet, it must associate the packet with one of the following forwarding classes:

- best-effort (be)—Provides no service profile. Loss priority is typically not carried in a CoS value.
- expedited-forwarding (ef)—Provides a low loss, low latency, low jitter, assured bandwidth, end-to-end service.
- assured-forwarding (af)—Provides a group of values you can define and includes four subclasses: AF1, AF2, AF3, and AF4, each with two drop probabilities: low and high.
- network-control (nc)—Supports protocol control and thus is typically high priority.
- multicast best-effort (mcast-be)—Provides no service profile for multicast packets.
- multicast expedited forwarding (mcast-ef)—Supports high-priority multicast packets.
- multicast assured-forwarding (mcast-af)—Provides two drop profiles; high, and low, for multicast packets.

**NOTE:** The forwarding classes multicast expedited-forwarding, multicast assured-forwarding, and multicast best-effort are applicable only to Juniper Networks EX8200 and Juniper Networks EX4300 Ethernet Switches.

Juniper Networks EX Series Ethernet Switches support up to 16 forwarding classes, thus allowing granular packet classification. For example, you can configure multiple classes of expedited forwarding (EF) traffic such as EF, EF1, and EF2.

EX Series switches except EX4300 switches support up to eight output queues. Therefore, if you configure more than eight forwarding classes, you must map multiple forwarding classes to single output queues. EX4300 switches support up to 12 output queues. On EX8200 Virtual Chassis, you can configure only eight forwarding classes and you can assign only one forwarding class to each output queue.

**NOTE:** On EX8200 Virtual Chassis, the queue number seven carries Virtual Chassis port (VCP) traffic and can also carry high-priority user traffic.

This topic describes:

- [Default Forwarding Classes on page 2053](#)

## Default Forwarding Classes

Table 196 on page 2053 shows the four default forwarding classes defined for unicast traffic, and Table 197 on page 2053 shows the three default forwarding classes defined for multicast traffic.

**NOTE:** The default forwarding classes for multicast traffic are applicable only to EX8200 switches.

You can rename the forwarding classes associated with the queues supported on your switch. Assigning a new class name to an output queue does not alter the default classification or scheduling that is applicable to that queue. However, because CoS configurations can be quite complicated, we recommend that you avoid altering the default class names or queue number associations.

**Table 196: Default Forwarding Classes for Unicast Traffic**

| Forwarding Class Name     | Comments                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| best-effort (be)          | The software does not apply any special CoS handling to packets with 000000 in the DiffServ field. This is a backward compatibility feature. These packets are usually dropped under congested network conditions.                                                                                                                                                                                                        |
| expedited-forwarding (ef) | The software delivers assured bandwidth, low loss, low delay, and low delay variation (jitter) end-to-end for packets in this service class. The software accepts excess traffic in this class, but in contrast to the assured forwarding class, the out-of-profile expedited-forwarding class packets can be forwarded out of sequence or dropped.                                                                       |
| assured-forwarding (af)   | <p>The software offers a high level of assurance that the packets are delivered as long as the packet flow from the customer stays within a certain service profile that you define.</p> <p>The software accepts excess traffic, but it applies a tail drop profile to determine that excess packets are dropped, and not forwarded.</p> <p>Two drop probabilities (low and high) are defined for this service class.</p> |
| network-control (nc)      | <p>The software delivers packets in this service class with a high priority. (These packets are not delay-sensitive.)</p> <p>Typically, these packets represent routing protocol hello or keep alive messages. Because loss of these packets jeopardizes proper network operation, packet delay is preferable to packet discard for these packets.</p>                                                                    |

**Table 197: Default Forwarding Classes for Multicast Traffic**

| Forwarding Class Name                     | Comments                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| multicast expedited-forwarding (mcast-ef) | The software delivers assured bandwidth, low loss, low delay, and low delay variation (jitter) end-to-end for multicast packets in this service class. The software accepts excess traffic in this class, but in contrast to the multicast assured forwarding class, out-of-profile multicast expedited-forwarding class packets can be forwarded out of sequence or dropped.                                                        |
| multicast assured-forwarding (mcast-af)   | <p>The software offers a high level of assurance that the multicast packets are delivered as long as the packet flow from the customer stays within a certain service profile that you define.</p> <p>The software accepts excess traffic, but it applies a tail drop profile to determine if the excess packets are dropped and not forwarded.</p> <p>Two drop probabilities (low and high) are defined for this service class.</p> |
| multicast network-control (mcast-nc)      | <p>The software delivers packets in this service class with a high priority. (These packets are not delay-sensitive.)</p> <p>Typically, these packets represent routing protocol hello or keep alive messages. Because loss of these packets jeopardizes proper network operation, packet delay is preferable to packet discard for these packets.</p>                                                                               |

The following rules govern queue assignment:

- CoS configurations that specify more queues than the switch can support are not accepted. If you commit such a configuration, the commit fails and a message displays that states the number of queues available.
- All default CoS configurations are based on queue number. The name of the forwarding class that is displayed in the default configuration for a queue number is that of the forwarding class currently associated with that queue.

## Understanding CoS Congestion Management

A congestion in a network occurs because of various parameters and some packets must be dropped to avoid congestion and to facilitate easy flow of traffic in the network. On Juniper Networks EX Series Ethernet Switches, class of service (CoS) provides congestion management mechanisms for a switch to drop arriving packets based on certain parameters when a queue is full. Based on the EX Series switch that you are using, packets are dropped depending on the priority of a packet or on both priority and drop probability of a packet.

You can specify parameters at the **[edit class-of-service drop-profiles]** hierarchy level for dropping packets and reference the parameters in a scheduler configuration.

This topic describes:

- [Weighted Tail Drop Congestion Management on page 2055](#)
- [Weighted Random Early Detection Congestion Management on page 2056](#)

### Weighted Tail Drop Congestion Management

A weighted tail drop (WTD) is a congestion management mechanism for packets to be dropped from the tail of the queue when the queue reaches a certain buffer capacity (that is, the fill level), and hence the name weighted tail drop. The packets that are dropped are based on priority and are those marked with a packet loss priority (PLP) of *high*. You can configure a WTD profile (a WTD mechanism) usually on edge devices in a network.

**NOTE:** A WTD profile is supported only on the Juniper Networks EX2200, EX3200, EX3300, EX4200, EX4500, EX4550, and EX6200 Ethernet Switches.

When you configure a WTD profile, you are essentially setting the value for queue fullness. The queue fullness represents a percentage of the memory, known as delay-buffer bandwidth, that is used to store packets in relation to the total amount of memory that has been allocated for that specific queue. The delay-buffer bandwidth provides packet buffer space to absorb burst traffic up to the specified duration of delay. When the specified delay buffer becomes full, packets are dropped from the tail of the buffer.

By default, if you do not configure any drop profile, WTD profile is in effect and functions as the primary mechanism for managing congestion.

**NOTE:** The default WTD profile associated with the packets whose PLP is *low* cannot be modified. You can configure custom drop profile only for those packets whose PLP is *high*.

## Weighted Random Early Detection Congestion Management

---

In a weighted random early detection (WRED) congestion management mechanism, random packets with a PLP of low or high are gradually dropped (based on drop probability) when the queue reaches a certain buffer capacity (that is, fill level).

**NOTE:** The WRED mechanism is supported only on Juniper Networks EX4300 standalone switches, EX4300 Virtual Chassis, Juniper Networks EX8200 standalone switches, and EX8200 Virtual Chassis.

Following are the different implementations of WRED:

- Segmented Drop Profile
- Interpolated Drop Profile

From a high level, segmented drop profile is a stair-step-like drop profile, whereas interpolated drop profile is a smother (curve) drop profile. [Figure 23 on page 2057](#) and [Figure 24 on page 2058](#) show a graphical representation of segmented and interpolated drop profiles. Regardless of the implementation, a drop profile represents a graph where the x-axis represents the percentage of fill level (l) and the y-axis represents the percentage of drop probability (p). The origin (0,0) represents the drop profile in which the drop probability is 0 percent when the queue fullness is 0 percent, and the point (100,100) represents that the drop probability is 100 percent when the queue fullness is 100 percent. Although the formation of graph lines in [Figure 23 on page 2057](#) and [Figure 24 on page 2058](#) is different, the application of the profile is the same. When a packet reaches the head of the queue, a random number between 0 and 100 is calculated. This random number is plotted against the drop profile graph using the current queue fullness of that particular queue. When the random number falls above the graph line, the packet is transmitted. When the number falls below the graph line, the packet is dropped from the network.

The following sections discuss the WRED drop profile implementations and parameters:

- [Segmented Drop Profile on page 2056](#)
- [Interpolated Drop Profile on page 2057](#)
- [Drop Profile Parameters on page 2059](#)

### ***Segmented Drop Profile***

In a segmented drop profile configuration, you can define multiple data points for fill level and drop probability. [Figure 23 on page 2057](#) shows a graphical representation of a segmented drop profile.

Figure 23: Graphical Representation of a Segmented Drop Profile

To create the profile's graph line, the software begins at the bottom-left corner of the graph, representing a 0 percent fill level and a 0 percent drop probability (that is the point (0,0)). The configuration draws a line directly to the right until it reaches the first defined fill level (that is, 25 percent represented in the graph on the x-axis). The software then continues the line vertically until the first drop probability is reached (that is, 25 percent represented in the graph in the y-axis). This process is repeated for all of the defined fill levels and drop probabilities until the top-right corner of the graph is reached (that is point (100,100) in the graph).

### ***Interpolated Drop Profile***

An interpolated drop profile configuration forms a smoother graph line compared to the graph in a segmented drop profile configuration. In this method of congestion management also, a switch uses multiple drop profile values to drop incoming packets to reduce congestion in the output queue.

Following are interpolated drop profile configurations on EX Series switches:

- [Interpolated Drop Profile Configuration on EX Series Switches Except EX4300 Switches on page 2057](#)
- [Interpolated Drop Profile Configuration on EX4300 Switches on page 2058](#)

### ***Interpolated Drop Profile Configuration on EX Series Switches Except EX4300 Switches***

An interpolated drop profile on all EX Series switches except EX4300 switches automatically generates 64 pairs of data points on the graph beginning at (0, 0) and

ending at (100, 100). Along the way, the graph line intersects specific data points that you define for fullness and drop probability.

Figure 24 on page 2058 shows a graphical representation of an interpolated drop profile.

**Figure 24: Graphical Representation of an Interpolated Drop Profile on EX Series Switches Except EX4300 Switches**

#### *Interpolated Drop Profile Configuration on EX4300 Switches*

On EX4300 switches, you can set two queue fill levels and two drop probabilities in each drop profile. The two fill levels and the two drop probabilities create two pairs of values. The first fill level and the first drop probability create one value pair and the second fill level and the second drop probability create the second value pair.

**NOTE:** You can configure a maximum of 64 drop profiles on EX4300 switches.

The first fill level value specifies the percentage of queue fullness at which packets begin to drop, known as the drop start point. Until the queue reaches this level of fullness, no packets are dropped. The second fill level value specifies the percentage of queue fullness at which all packets are dropped, known as the drop end point.

The first drop probability value is always 0 (zero). This pairs with the drop start point and specifies that until the queue fullness level reaches the first fill level, no packets drop. When the queue fullness exceeds the drop start point, packets begin to drop until the queue exceeds the second fill level, when all packets drop. The second drop probability value, known as the maximum drop rate, specifies the likelihood of dropping packets

when the queue fullness reaches the drop end point. As the queue fills from the drop start point to the drop end point, packets drop in a smooth, linear pattern (called an interpolated graph) as shown in [Figure 25 on page 2059](#). After the drop end point, all packets drop.

**Figure 25: Tail-Drop Profile Packet Drop on EX4300 Switches**

The thick line in [Figure 25 on page 2059](#) shows the packet drop characteristics for a sample tail drop profile. At the drop start point, the queue reaches a fill level of 30 percent. At the drop end point, the queue fill level reaches 50 percent, and the maximum drop rate is 80 percent.

No packets drop until the queue fill level reaches the drop start point of 30 percent. When the queue reaches the 30 percent fill level, packets begin to drop. As the queue fills, the percentage of packets dropped increases in a linear fashion. When the queue fills to the drop end point of 50 percent, the rate of packet drop has increased to the maximum drop rate of 80 percent. When the queue fill level exceeds the drop end point of 50 percent, all of the packets drop until the queue fill level drops below 50 percent.

#### **Drop Profile Parameters**

You can specify the following two values in drop profile configuration:

- **Fill level**—The queue fullness value, which represents a percentage of the memory used to store packets in relation to the total amount of memory allocated to the queue.
- **Drop probability**—The percentage value that corresponds to the likelihood that an individual packet is dropped.

## Understanding CoS Schedulers

You use class-of-service (CoS) schedulers to define the properties of output queues on Juniper Networks EX Series Ethernet Switches. These properties include the amount of interface bandwidth assigned to the queue, the size of the memory buffer allocated for storing packets, the priority of the queue, and the drop profiles associated with the queue.

You associate the schedulers with forwarding classes by means of scheduler maps. You can then associate each scheduler map with an interface, thereby configuring the queues, packet schedulers, and tail drop processes that operate according to this mapping.

This topic describes:

- [Default Schedulers on page 2060](#)
- [Excess Rate on page 2061](#)
- [Transmission Rate on page 2061](#)
- [Scheduler Buffer Size on page 2061](#)
- [Priority Scheduling on page 2062](#)
- [Scheduler Drop-Profile Maps on page 2063](#)
- [Scheduler Maps on page 2063](#)

---

### Default Schedulers

Each forwarding class has an associated scheduler priority. On EX Series switches other than Juniper Networks EX8200 and Juniper Networks EX4300 Ethernet Switches, only two forwarding classes—best-effort (queue 0) and network-control (queue 7)—are used in the default configuration. On EX8200 switches three forwarding classes—best-effort (queue 0), multicast best-effort (queue 2), and network-control (queue 7)—are used in the default configuration.

On EX Series switches other than EX8200 and EX4300 switches, by default, the best-effort forwarding class (queue 0) receives 95 percent of the bandwidth and the buffer space for the output link, and the network-control forwarding class (queue 7) receives 5 percent. The default drop profile causes the buffer to fill completely and then to discard all incoming packets until it has free space. On EX8200 switches, by default, the best-effort forwarding class (queue 0) receives 75 percent of the bandwidth, the multicast best-effort forwarding class (queue 2) receives 20 percent, and the network-control forwarding class (queue 7) receives 5 percent of the bandwidth and buffer space for the output link.

On EX4300 switches, four forwarding classes—best-effort (queue 0), multicast best-effort (queue 8), network-control (queue 3), and multicast network-control (queue 11)—are used in the default configuration. By default, all the multicast traffic flows through the multicast best-effort queue. EX4300 switches support 12 queues (0–11), and the default scheduler transmission rates for queues 0 through 11 are 75, 0, 0, 5, 0, 0, 0, 0, 15, 0, 0 and 5 percent, respectively, of the total available bandwidth.

On EX Series switches other than EX4300 switches, the expedited-forwarding (queue 5) and assured-forwarding (queue 1) classes have no scheduler because no resources are

assigned to queue 5 or queue 1, by default. However, you can manually configure resources to be assigned to the expedited-forwarding and assured-forwarding classes. On EX4300 switches, the expedited-forwarding (queue 1) and assured-forwarding (queue 2) classes have no scheduler because no resources are assigned to queue 1 or queue 2, by default. However, you can manually configure resources to be assigned to the expedited-forwarding and assured-forwarding classes.

Also by default, any queue can exceed the assigned bandwidth if additional bandwidth is available from other queues. When a forwarding class does not fully use the allocated transmission bandwidth, the remaining bandwidth can be used by other forwarding classes if they have a traffic load that exceeds their allocated bandwidth.

### Excess Rate

Excess rate traffic determines the percentage of the excess bandwidth to share when a queue receives traffic in excess of its bandwidth allocation. By default, the excess bandwidth is shared in the ratio of the transmit rates. You can control this distribution by configuring the **excess-rate** statement at the **[edit class-of-service schedulers scheduler-name]** hierarchy. You can specify the excess rate sharing in percentage.

### Transmission Rate

Transmission-rate control determines the actual traffic bandwidth for each forwarding class you configure. The transmission rate is specified in bits per second. Each queue is allocated some portion of the bandwidth of the interface. This bandwidth can be a fixed value, such as 1 megabit per second (Mbps), a percentage of the total available bandwidth, or the rest of the available bandwidth. In case of congestion, the configured transmission rate is guaranteed for the queue. Transmission-rate control allows you to ensure that each queue receives the bandwidth appropriate for its level of service.

### Scheduler Buffer Size

To control congestion at the output stage, you can configure the delay-buffer bandwidth by using the **buffer-size** configuration statement. The delay-buffer bandwidth provides packet buffer space to absorb burst traffic up to the specified duration of delay. When the specified delay buffer becomes full, packets with 100 percent drop probability are dropped from the tail of the buffer.

On EX Series switches other than EX8200 and EX4300 switches, the default scheduler transmission rates for queues 0 through 7 are 95, 0, 0, 0, 0, 0, 0, and 5 percent, respectively, of the total available bandwidth. The default buffer-size percentages for queues 0 through 7 are 95, 0, 0, 0, 0, 0, 0, and 5 percent, respectively, of the total available buffer. On EX8200 switches, the default scheduler transmission rates for queues 0 through 7 are 75, 0, 20, 0, 0, 0, 0, and 5 percent, respectively, of the total available bandwidth, and the default buffer-size percentages for queues 0 through 7 are 75, 0, 20, 0, 0, 0, 0, and 5 percent, respectively, of the total available buffer. On EX4300 switches, the default scheduler transmission rates for queues 0 through 11 are 75, 0, 0, 5, 0, 0, 0, 0, 15, 0, 0 and 5 percent, respectively, of the total available buffer. On EX4300 switches, the default buffer-size percentages for queues 0 through 11 are 75, 0, 0, 5, 0, 0, 0, 0, 15, 0, 0 and 5 percent, respectively, of the total available buffer.

For each scheduler on EX Series switches other than EX8200 switches, you can configure the buffer size as one of the following:

- The exact buffer size.
- A percentage of the total buffer.
- The remaining buffer available. The remainder is the buffer percentage that is not assigned to other queues. For example, if you assign 40 percent of the delay buffer to queue 0, allow queue 2 to keep the default allotment of 20 percent, allow queue 7 to keep the default allotment of 5 percent, and assign the remainder to queue 3, then queue 3 uses 35 percent of the delay buffer.

On EX8200 switches, you can configure the buffer size as a temporal value (in microseconds), percentage of the total buffer, or the remaining buffer available. You can configure the buffer size as a temporal value on Juniper Networks EX4200 and EX4300 Ethernet Switches also.

When you configure buffer size as a temporal value on EX4200 switches, if sufficient buffer size is not available in the shared pool, an error message is logged in the system log (syslog) file and the default profile is applied to the interface. After the temporal buffer space is allocated successfully, if the shared buffer size is less than the current value (which was set using the **set class-of-service shared-buffer percent value** command), the new reduced value must be greater than a sum of the existing reserved temporal buffer size and the required minimum buffer size. Otherwise, the modification to the shared-buffer configuration fails and an error message is logged in the system log.

### Priority Scheduling

---

Priority scheduling determines the order in which an interface transmits traffic from queues, thus ensuring that queues containing important traffic are provided faster access.

Priority scheduling is accomplished through a procedure in which the scheduler examines the priority of the queue. Juniper Networks Junos operating system (Junos OS) supports two levels of transmission priority:

- Low—The scheduler determines whether the individual queue is within its defined bandwidth profile or not. This binary decision, which is re-evaluated on a regular time cycle, involves comparing the amount of data transmitted by the queue against the bandwidth allocated to it by the scheduler. If the transmitted amount is less than the allocated amount, the queue is considered to be in profile. A queue is out of profile when the amount of traffic that it transmits is larger than the queue's allocated limit. An out-of-profile queue is transmitted only if bandwidth is available. Otherwise, it is buffered.

On EX Series switches other than EX4300 switches, a queue from a set of queues is selected based on the shaped deficit weighted round robin (SDWRR) algorithm, which operates within the set. On EX4300 switches, the weighted deficit round-robin (WDRR) algorithm is used to select a queue from a set of queues.

- Strict-high—A strict-high priority queue receives preferential treatment over a low-priority queue. Unlimited bandwidth is assigned to a strict-high priority queue. On EX Series switches other than EX4300 switches, queues are scheduled according to

the queue number, starting with the highest queue, 7, with decreasing priority down through queue 0. Traffic in higher-numbered queues is always scheduled prior to traffic in lower-numbered queues. In other words, if there are two high-priority queues, the queue with the higher queue number is processed first. On EX4300 switches, you can configure multiple strict-high priority queues on an interface and an EX4300 switch processes these queues in a round-robin method.

Packets in low-priority queues are transmitted only when strict-high priority queues are empty.

### Scheduler Drop-Profile Maps

Drop-profile maps associate drop profiles with a scheduler. A drop-profile map sets the drop profile for a specific packet loss priority (PLP) and protocol type. The inputs for a drop-profile map are the PLP and the protocol type. The output is the drop profile.

### Scheduler Maps

A scheduler map associates a specified forwarding class with a scheduler configuration. After configuring a scheduler, you must include it in a scheduler map and then associate the scheduler map with an output interface.

On EX Series switches, if you configure more than the supported number of scheduler maps on a switch or for a port group in a line card, an error is logged in the system log. On any interface in a port group on a line card or on a switch, if you configure a scheduler map that causes the number of scheduler maps for that port group to exceed the maximum number supported, the default scheduler map is bound to that interface. We recommend that you check the system log for errors after the commit operation to verify that you have not configured more than the maximum permitted number of scheduler maps.

**NOTE:** On EX Series switches, you cannot configure a scheduler map on an individual interface that is a member of a link aggregation group (LAG). Instead, you must configure the scheduler map on the LAG itself (that is, on the aggregated Ethernet (ae) interface).

Table 198 on page 2063 shows the number of scheduler maps supported for each port group in a switch or line card.

**Table 198: Support for Scheduler Maps on Switches and Line Cards**

| Switch/Line Card                       | Number of Port Groups | Port Grouping Details                                | Number of Scheduler Maps Supported for Each Port Group |

## Understanding CoS Two-Color Marking

Networks police traffic by limiting the input or output transmission rate of a class of traffic on the basis of user-defined criteria. Policing traffic allows you to control the maximum rate of traffic sent or received on an interface and to partition a network into multiple priority levels or classes of service.

Policers require you to apply limits to the traffic flow and set a consequence for packets that exceed these limits—usually a higher loss priority, so that packets exceeding the policer limits are discarded first.

Juniper Networks EX Series Ethernet Switches support a single-rate two-color marking type of policer, which is a simplified version of Single-Rate-Three-Color marking, defined in RFC 2697, *A Single Rate Three Color Marker*. This type of policer meters traffic based on the configured committed information rate (CIR) and committed burst size (CBS).

The single-rate two-color marker meters traffic and marks incoming packets depending on whether they are smaller than the committed burst size (CBS)—marked green—or exceed it—marked red.

The single-rate two-color marking policer operates in color-blind mode. In this mode, the policer's actions are not affected by any previous marking or metering of the examined packets. In other words, the policer is “blind” to any previous coloring a packet might have had.

## Understanding CoS Rewrite Rules

As packets enter or exit a network, edge switches might be required to alter the class-of-service (CoS) settings of the packets. This topic describes how to use rewrite rules to alter the CoS settings. It covers:

This topic covers:

- [How Rewrite Rules Work on page 2067](#)
- [Default Rewrite Rule on page 2068](#)

### How Rewrite Rules Work

Rewrite rules set the value of the CoS bits within a packet's header. Each rewrite rule reads the current forwarding class and loss priority associated with the packet, locates the chosen CoS value from a table, and writes this CoS value into the packet header. For rewrites to occur, rewrite rules must be explicitly assigned to an interface.

On EX Series switches, you can define rewrite rules for IPv4 and IPv6 traffic to network interfaces, aggregated Ethernet interfaces (also known as link aggregation groups (LAGs)), routed VLAN interfaces (RVIs), Layer 3 interfaces, and Layer 3 VLAN-tagged sub-interfaces. Multiple rewrite rules of different types can be assigned to a single interface.

On EX4300 switches, you cannot configure separate DSCPv4 and DSCPv6 rewrite rules on network interfaces, aggregated Ethernet interfaces, Layer 3 interfaces, and integrated routing and bridging (IRB) interfaces. If you configure a DSCPv4 rewrite rule on an interface to rewrite IPv4 traffic, then the same rewrite rule is applied to IPv6 traffic also on that interface, and vice versa. You can define only DSCPv4 rewrite rules on integrated routing and bridging (IRB) interfaces and Layer 3 VLAN-tagged logical interfaces.

In effect, the rewrite rule performs the reverse function of the behavior aggregate (BA) classifier, which is used when the packet enters the switch. As the packet leaves the switch, the final CoS action is generally the application of a rewrite rule.

You configure rewrite rules to alter CoS values in outgoing packets on the outbound interfaces of an edge switch to meet the policies of a targeted peer. This allows the downstream switch in a neighboring network to classify each packet into the appropriate service group.

**NOTE:** When an IP precedence rewrite rule is active, bits 3, 4, and 5 of the type-of-service (ToS) byte are always reset to zero when code points are rewritten.

---

### Default Rewrite Rule

To define a rewrite rule on an interface, you can either create your own rewrite rule and enable it on the interface or enable a default rewrite rule. See [“Defining CoS Rewrite Rules \(CLI Procedure\)” on page 2120](#).

[Table 199 on page 2069](#) shows the default rewrite-rule mappings. These are based on the default bit definitions of Differentiated Services code point (DSCP), IEEE 802.1p, and IP precedence values and the default forwarding classes. You can configure multiple CoS rewrite rules for DSCP, IP precedence and IEEE 802.1p.

**NOTE:** By default, rewrite rules are not assigned to an interface. You must explicitly assign a user-defined or system-defined rewrite rule to an interface for the rewrites to occur.

When the CoS values of a packet match the forwarding class and packet-loss-priority (PLP) values, the switch rewrites markings on the packet based on the rewrite table.

Table 199: Default Packet Header Rewrite Mappings

| Map from Forwarding Class | PLP Value | Map to DSCP/IEEE 802.1p/IP Precedence Value |
|---------------------------|-----------|---------------------------------------------|
| expedited-forwarding      | low       | ef                                          |
| expedited-forwarding      | high      | ef                                          |
| assured-forwarding        | low       | af11                                        |
| assured-forwarding        | high      | af12 (DSCP)                                 |
| best-effort               | low       | be                                          |
| best-effort               | high      | be                                          |
| network-control           | low       | nc1/cs6                                     |
| network-control           | high      | nc2/cs7                                     |

## Understanding Port Shaping and Queue Shaping for CoS on EX Series Switches

When the amount of traffic on a switch's network exceeds the maximum bandwidth, packets are lost because of congestion in the network. The excess traffic in the network must be handled carefully to ensure minimum or no data loss in the network. A class-of-service (CoS) configuration includes several parameters that classify traffic into different queues and also define packet loss priorities (PLPs) to ensure smooth transmission of data in the network. You can use these configuration parameters to control or shape traffic for a specific port on a switch or for a specific CoS queue. While port shaping defines the maximum bandwidth allocated to an interface, queue shaping defines a limit on excess-bandwidth usage for each queue.

This topic covers:

- [Port Shaping on page 2069](#)
- [Queue Shaping on page 2070](#)

### Port Shaping

Port shaping enables you to shape the aggregate traffic through a port or channel to a rate that is less than the line rate. You can configure interfaces to shape traffic based on the rate-limited bandwidth of the total interface bandwidth. This allows you to shape the output of the interface so that the interface transmits less traffic than it is capable

of transmitting. For port shaping, you can specify shaping rate as the peak rate at which traffic can pass through the interface. You can specify rate as a value in bits per second (bps) either as a decimal number or as a decimal number followed by the abbreviation k (1000), m (1,000,000), or g (1,000,000,000) and the value can range from 1000 through 160,000,000,000 bps.

By default, shaping is not configured on an interface. If you do not configure a shaping rate on an interface, the default shaping rate is 100 percent, which is the equivalent to no shaping configured for that interface.

On EX Series switches except EX4300 switches, when you configure a shaping rate on an aggregated Ethernet (ae) interface, all members of the ae interface are shaped at the configured shaping rate. For example, consider an interface ae0 that consists of three interfaces: ge-0/0/0, ge-0/0/1, and ge-0/0/2. If a shaping rate of X Mbps is configured on ae0, traffic at the rate of X Mbps flows through each of the three interfaces. Therefore, the total traffic flowing through ae0 would be at the rate of 3X Mbps. On EX4300 switches, when you configure a shaping rate on an ae interface, the traffic is equally divided among the members of the ae interface.

---

### Queue Shaping

Queue shaping throttles the rate at which queues transmit packets. For example, using queue shaping, you can rate-limit a strict-priority queue so that the strict-priority queue does not lock out (or starve) low-priority queues. Similarly, for any queue, you can configure queue shaping.

You can specify queue shaping as the maximum rate at which traffic can pass through the queue or as a percentage of the available bandwidth. On EX Series switches except EX4300 switches, you can specify the rate as a value between 3200 and 160,000,000,000 bps and the percentage as a value from 0 to 100 percent. On EX4300 switches, you can specify the rate as a value between 8000 and 160,000,000,000 bps and the percentage as a value from 0 to 100 percent.

## Understanding Junos OS EZQoS for CoS Configurations on EX Series Switches

Junos operating system (Junos OS) EZQoS on Juniper Networks EX Series Ethernet Switches eliminates the complexities involved in configuring class of service (CoS) across the network. EZQoS offers templates for key traffic classes.

Junos OS CoS allows you to divide traffic into classes and offer various levels of throughput and packet loss when congestion occurs. You can use CoS to ensure that different types of traffic (voice, video, and data) get the bandwidth and consideration they need to meet user expectations and business objectives.

Configuring CoS requires careful consideration of your service needs and thorough planning and design to ensure consistency across all switches in a CoS domain. To configure CoS manually, you must define and fine-tune all CoS components such as classifiers, rewrite rules, forwarding classes, schedulers, and scheduler-maps and then apply these

components to the interfaces. Therefore, configuring CoS can be a fairly complex and time-consuming task.

EZQoS works by automatically assigning preconfigured values to all CoS parameters based on the typical application requirements. These preconfigured values are stored in a template with a unique name. You can change the preconfigured values of these parameters to suit your particular application needs.

For using EZQoS, you must identify which switch ports are being used for a specific application (such as VoIP, video, and data) and manually apply the corresponding application-specific EZQoS template to these switch ports.

**NOTE:** Currently, we provide an EZQoS template for configuring CoS for VoIP.

**NOTE:** We recommend that you do not use the term EZQoS for defining a classifier.

## Understanding CoS Queues on EX8200 Line Cards That Include Oversubscribed Ports

Some line cards available for Juniper Networks EX8200 Ethernet Switches include oversubscribed ports that are combined in logical port groups that share bandwidth. These oversubscribed ports handle traffic differently than ports that provide continuous line-rate bandwidth. You might need to configure CoS queues differently for oversubscribed ports than for line-rate ports.

This topic describes:

- [Oversubscribed Ports on Line Cards on page 2071](#)
- [EX8200 Line Cards That Include Oversubscribed Ports on page 2072](#)
- [Ingress Queueing on page 2072](#)
- [Egress Queues on page 2073](#)

### Oversubscribed Ports on Line Cards

Oversubscribed ports on a line card are grouped into logical port groups. A port group collectively supports a certain bandwidth.

An EX8200 switch supports different line cards that provide line-rate and oversubscribed ports. Based on your requirement, you can choose the appropriate line card for an EX8200 switch. Line cards are field-replaceable units (FRUs) that can be installed in the line card slots in an EX8200 switch. In a line-rate EX8200 line card, each port in the line card supports the same amount of bandwidth and a single port can utilize that complete bandwidth. In an oversubscribed line card, a group of ports collectively support a certain

total bandwidth and each port in that group can use either a portion or all of the available bandwidth. However, the total utilization of bandwidth by the ports in the group cannot exceed the bandwidth available for that group.

Because the port groups share bandwidth, class-of-service (CoS) ingress and egress queues are handled differently for these shared-bandwidth ports in logical port groups than they are for ports that individually support line-rate bandwidth. Some EX8200 line cards combine both port types, those that share bandwidth across port groups and those that individually support line-rate bandwidth.

### EX8200 Line Cards That Include Oversubscribed Ports

Table 200 on page 2072 lists EX8200 line cards that include oversubscribed ports in logical port groups.

**Table 200: EX8200 Line Cards That Include Oversubscribed Ports**

| Line Card Model | Name                                          | Number of Oversubscribed Ports/Port Connector                                                                                                                                                     |
|-----------------|-----------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| EX8200-40XS     | 40-port SFP+                                  | 40 oversubscribed 10-gigabit SFP+ ports                                                                                                                                                           |
| EX8200-2XS-40P  | 40-port PoE+ with 4-port SFP and 2-port SFP+  | 40 oversubscribed 10/100/1000 Gigabit Ethernet ports with RJ-45 connectors, four small form-factor pluggable (SFP) ports (in which you can install 1-gigabit SFP transceivers) and two SFP+ ports |
| EX8200-2XS-40T  | 40-port RJ-45 with 4-port SFP and 2-port SFP+ | 40 oversubscribed 10/100/1000 Gigabit Ethernet ports with RJ-45 connectors, four SFP ports (in which you can install 1-gigabit small form-factor pluggable (SFP) transceivers) and two SFP+ ports |
| EX8200-48PL     | 48-port PoE+ 20 Gbps                          | 48 oversubscribed 10/100/1000 Gigabit Ethernet ports with RJ-45 connectors                                                                                                                        |
| EX8200-48TL     | 48-port RJ-45 20 Gbps                         | 48 oversubscribed 10/100/1000 Gigabit Ethernet ports with RJ-45 connectors                                                                                                                        |

### Ingress Queueing

Classification of packets occurs in two phases for the oversubscribed ports in the port groups.

- [Preclassification of Packets and Port Ingress Queueing on page 2072](#)
- [Full Classification of Packets and Fabric Ingress Queueing on page 2073](#)

#### ***Preclassification of Packets and Port Ingress Queueing***

Packets entering ports are forwarded to one of the ingress queues. The ingress queues schedule traffic from ports into the Packet Forwarding Engine.

The ingress queues are:

- Low-priority queue—Each interface in the line card has one low-priority queue. Traffic on these queues is scheduled using the shaped deficit weighted round-robin (SDWRR) algorithm, with each interface's queue having equal weight. On EX4300 switches, traffic is queued using the weighted deficit round-robin (WDRR) algorithm.
- High-priority queue—A set of interfaces in the line card shares a single high-priority queue. Traffic on this queue is scheduled by strict-high priority. The switch always sends critical network control packets on the high-priority queue.
- Line-rate priority queue—The packets entering line-rate ports are forwarded to this queue. Traffic on this queue is scheduled by strict priority and is always given higher priority than the traffic on the high-priority queue. This queue is used only in the following oversubscribed lines cards for an EX8200 switch:
  - EX8200-2XS-40P
  - EX8200-2XS-40T

For the purpose of port ingress queuing on oversubscribed ports, packets are classified only by behavior aggregate (BA) classification. To control the ingress queue (high priority or low priority) to which packets are sent, configure a BA classifier on the physical port and specify switch fabric priorities for the forwarding classes. On EX8200 switches, fabric priority determines the priority of packets ingressing the switch fabric. For the EX8200-40XS line card, fabric priority also determines the priority of packets ingressing the port group.

By default, the fabric priority for all forwarding classes is low. To direct packets belonging to a forwarding class to the high-priority ingress queue, set the fabric priority to high for that class.

Critical network-control packets and line-rate packets are handled differently from other packets. Instead of using the BA classifier to classify critical network-control packets, the switch always sends critical network packets to the high-priority queue. The line-rate packets are always sent to the line-rate priority queue. This difference in handling of network-control packets and line-rate packets ensures that these packets are not dropped because of congestion on the shared-bandwidth ports.

### ***Full Classification of Packets and Fabric Ingress Queuing***

When packets (apart from line-rate and critical network-control packets) from an oversubscribed port reach the Packet Forwarding Engine, it performs full packet classification, along with other actions, such as multifield (MF) classification, traffic policing, and storm control. It then schedules and queues the packets for ingressing the fabric. The fabric priority associated with the forwarding class determines whether packets are sent to the low priority or high-priority ingress queues.

### **Egress Queues**

On EX Series switches except EX4300 switches, each interface supports eight egress CoS queues. You can map up to 16 forwarding classes to these queues. An EX4300 switch interface supports 12 egress CoS queues.

In the EX8200-40XS line card, all interfaces in a port group share a single set of eight egress queues at the Packet Forwarding Engine. Egress traffic is fanned out from the Packet Forwarding Engine queues to the corresponding queues for the individual ports. For this reason, the interfaces in a port group must share the same scheduler map configuration. If you configure different scheduler map configurations for the different interfaces in a port group, an error is logged in the system log and the default scheduler map is used for all ports in the port group.

- [Configuration Tasks on page 2099](#)
- [Configuration Statements on page 2127](#)

### Configuration Examples

---

- [Example: Configuring CoS on EX Series Switches on page 2075](#)

#### Example: Configuring CoS on EX Series Switches

Configure class of service (CoS) on your switch to manage traffic so that when the network experiences congestion and delay, critical applications are protected. Using CoS, you can divide traffic on your switch into classes and provide various levels of throughput and packet loss. This is especially important for traffic that is sensitive to jitter and delay, such as voice traffic.

This example shows how to configure CoS on a single EX Series switch in the network.

- [Requirements on page 2075](#)
- [Overview and Topology on page 2075](#)
- [Configuration on page 2078](#)
- [Verification on page 2088](#)

#### Requirements

---

This example uses the following hardware and software components:

- EX3200 and EX4200 switches
- Junos OS Release 9.0 or later for EX Series switches

#### Overview and Topology

---

This example uses the topology shown in [Figure 26 on page 2076](#).

Figure 26: Topology for Configuring CoS

The topology for this configuration example consists of EX3200 and EX4200 switches at the access layer.

The EX Series access switch is configured to support VLAN membership. Interfaces **ge-0/0/0** and **ge-0/0/1** are assigned to the voice VLAN (**voice-vlan**) for two VoIP phones. Switch port **ge-0/0/2** is assigned to the camera VLAN (**camera-vlan**) for the surveillance camera. Switch ports **ge-0/0/3**, **ge-0/0/4**, **ge-0/0/5**, and **ge-0/0/6** are assigned to the server VLAN (**server-vlan**) for the servers hosting various applications such as those provided by Citrix, Microsoft, Oracle, and SAP.

Table 201 on page 2077 shows the VLAN configuration components.

Table 201: Configuration Components: VLANs

| VLAN Name   | VLAN ID | VLAN Subnet and Available IP Addresses                                                                      | VLAN Description                                      |
|-------------|---------|-------------------------------------------------------------------------------------------------------------|-------------------------------------------------------|
| voice-vlan  | 10      | 192.168.1.0/28<br>192.168.1.1 through 192.168.1.14<br><br>192.168.1.15 is the subnet's broadcast address.   | Voice VLAN used for employee VoIP communication.      |
| camera-vlan | 20      | 192.168.1.16/28<br>192.168.1.17 through 192.168.1.30<br><br>192.168.1.31 is the subnet's broadcast address. | VLAN for the surveillance cameras.                    |
| server-vlan | 30      | 192.168.1.32/28<br>192.168.1.33 through 192.168.1.46<br><br>192.168.1.47 is the subnet's broadcast address. | VLAN for the servers hosting enterprise applications. |

PoE-capable ports on EX Series switches support Power over Ethernet (PoE) to provide both network connectivity and power for VoIP telephones connecting to the ports. [Table 202 on page 2077](#) shows the switch interfaces that are assigned to the VLANs and the IP addresses for devices connected to the switch ports on a 48-port switch, all ports of which are PoE-capable.

Table 202: Configuration Components: Switch Ports on a 48-Port All-PoE Switch

| Interfaces                             | VLAN Membership | IP Addresses                            | Port Devices                                                                                    |
|----------------------------------------|-----------------|-----------------------------------------|-------------------------------------------------------------------------------------------------|
| ge-0/0/0, ge-0/0/1                     | voice-vlan      | 192.168.1.1/28 through 192.168.1.2/28   | Two VoIP telephones.                                                                            |
| ge-0/0/2                               | camera-vlan     | 192.168.1.17/28                         | Surveillance camera.                                                                            |
| ge-0/0/3, ge-0/0/4, ge-0/0/5, ge-0/0/6 | server-vlan     | 192.168.1.33/28 through 192.168.1.36/28 | Four servers hosting applications such as those provided by Citrix, Microsoft, Oracle, and SAP. |

**NOTE:** This example shows how to configure CoS on a standalone EX Series switch. This example does not consider across-the-network applications of CoS in which you might implement different configurations on ingress and egress switches to provide differentiated treatment to different classes across a set of nodes in a network.

## Configuration

**CLI Quick Configuration** To quickly configure CoS, copy the following commands and paste them into the switch terminal window:

```
[edit]
set class-of-service forwarding-classes class app queue-num 5
set class-of-service forwarding-classes class mail queue-num 1
set class-of-service forwarding-classes class db queue-num 2
set class-of-service forwarding-classes class erp queue-num 3
set class-of-service forwarding-classes class video queue-num 4
set class-of-service forwarding-classes class best-effort queue-num 0
set class-of-service forwarding-classes class voice queue-num 6
set class-of-service forwarding-classes class network-control queue-num 7
set firewall family ethernet-switching filter voip_class term voip from source-address 192.168.1.1/28

```

```

set class-of-service scheduler-maps sched-map-be forwarding-class best-effort scheduler
voice-sched-queue-shap
set class-of-service interfaces ge-0/0/2 scheduler-map sched-map-be

```

### Step-by-Step Procedure

To configure and apply CoS:

1. Configure one-to-one mappings between eight forwarding classes and eight queues:

```

[edit class-of-service]
user@switch# set forwarding-classes class app queue-num 5
user@switch# set forwarding-classes class mail queue-num 1
user@switch# set forwarding-classes class db queue-num 2
user@switch# set forwarding-classes class erp queue-num 3
user@switch# set forwarding-classes class video queue-num 4
user@switch# set forwarding-classes class best-effort queue-num 0
user@switch# set forwarding-classes class voice queue-num 6
user@switch# set forwarding-classes class network-control queue-num 7

```

2. Define the firewall filter **voip\_class** to classify the VoIP traffic:

```

[edit firewall]
user@switch# set family ethernet-switching filter voip_class

```

3. Define the term **voip**:

```

[edit firewall]
user@switch# set family ethernet-switching filter voip_class term voip from source-address
192.168.1.1/28
user@switch# set family ethernet-switching filter voip_class term voip from source-address
192.168.1.2/28
user@switch# set family ethernet-switching filter voip_class term voip protocol udp
user@switch# set family ethernet-switching filter voip_class term voip source-port 2698
user@switch# set family ethernet-switching filter voip_class term voip then forwarding-class
voice loss-priority low

```

4. Define the term **network\_control** (for the **voip\_class** filter):

```

[edit firewall]
user@switch# set family ethernet-switching filter voip_class term network_control from
precedence [net-control internet-control]
user@switch# set family ethernet-switching filter voip_class term network_control then
forwarding-class network-control loss-priority low

```

5. Define the term **best\_effort\_traffic** with no match conditions (for the **voip\_class** filter):

```

[edit firewall]
user@switch# set family ethernet-switching filter voip_class term best_effort_traffic then
forwarding-class best-effort loss-priority low

```

6. Apply the firewall filter **voip\_class** as an input filter to the interfaces for the VoIP phones:

```

[edit interfaces]
user@switch# set ge-0/0/0 description phone1-voip-ingress-port
user@switch# set ge-0/0/0 unit 0 family ethernet-switching filter input voip_class
user@switch# set ge-0/0/1 description phone2-voip-ingress-port
user@switch# set ge-0/0/1 unit 0 family ethernet-switching filter input voip_class

```

7. Apply port shaping on the interface **ge-0/0/0**:

```

[edit]
user@switch# set class-of-service interfaces ge-0/0/0 shaping-rate 100m

```

8. Define the firewall filter **video\_class** to classify the video traffic:

```

[edit firewall]
user@switch# set family ethernet-switching filter video_class

```

9. Define the term **video**:

```
[edit firewall]
user@switch# set family ethernet-switching filter video_class term video from
source-address 192.168.1.17/28
user@switch# set family ethernet-switching filter video_class term video protocol udp
user@switch# set family ethernet-switching filter video_class term video source-port 2979
user@switch# set family ethernet-switching filter video_class term video then
forwarding-class video loss-priority low
```

10. Define the term **network\_control** (for the **video\_class** filter):

```
[edit firewall]
user@switch# set family ethernet-switching filter video_class term network_control from
precedence [net-control internet-control]
user@switch# set family ethernet-switching filter video_class term network_control then
forwarding-class network-control loss-priority low
```

11. Define the term **best\_effort\_traffic** with no match conditions (for the **video\_class** filter):

```
[edit firewall]
user@switch# set family ethernet-switching filter video_class term best_effort_traffic then
forwarding-class best-effort loss-priority low
```

12. Apply the firewall filter **video\_class** as an input filter to the interface for the surveillance camera:

```
[edit interfaces]
user@switch# set ge-0/0/2 description video-ingress-port
user@switch# set ge-0/0/2 unit 0 family ethernet-switching filter input video_class
```

13. Define the firewall filter **app\_class** to classify the application server traffic:

```
[edit firewall]
user@switch# set family ethernet-switching filter app_class
```

14. Define the term **app** (for the **app\_class** filter):

```
[edit firewall]
user@switch# set family ethernet-switching filter app_class term app from source-address
192.168.1.33/28
user@switch# set family ethernet-switching filter app_class term app protocol tcp
user@switch# set family ethernet-switching filter app_class term app source-port [1494
2512 2513 2598 2897]
user@switch# set family ethernet-switching filter app_class term app then forwarding-class
app loss-priority low
```

15. Define the term **mail** (for the **app\_class** filter):

```
[edit firewall]
user@switch# set family ethernet-switching filter app_class term mail from source-address
192.168.1.34/28
user@switch# set family ethernet-switching filter app_class term mail protocol tcp
user@switch# set family ethernet-switching filter app_class term mail source-port [25 143
389 691 993 3268 3269]
user@switch# set family ethernet-switching filter app_class term mail then forwarding-class
mail loss-priority low
```

16. Define the term **db** (for the **app\_class** filter):

```
[edit firewall]
user@switch# set family ethernet-switching filter app_class term db from source-address
192.168.1.35/28
user@switch# set family ethernet-switching filter app_class term db protocol tcp
user@switch# set family ethernet-switching filter app_class term db source-port [1521
1525 1527 1571 1810 2481]
```

- ```

user@switch# set family ethernet-switching filter app_class term db then forwarding-class
db loss-priority low

```
17. Define the term **erp** (for the **app\_class** filter):
 

```

[edit firewall]
user@switch# set family ethernet-switching filter app_class term erp from source-address
192.168.1.36/28
user@switch# set family ethernet-switching filter app_class term erp protocol tcp
user@switch# set family ethernet-switching filter app_class term erp source-port [3200
3300 3301 3600]
user@switch# set family ethernet-switching filter app_class term erp then forwarding-class
erp loss-priority low

```
  18. Define the term **network\_control** (for the **app\_class** filter):
 

```

[edit firewall]
user@switch# set family ethernet-switching filter app_class term network_control from
precedence [net-control internet-control]
user@switch# set family ethernet-switching filter app_class term network_control then
forwarding-class network-control loss-priority low

```
  19. Define the term **best\_effort\_traffic** (for the **app\_class** filter):
 

```

[edit firewall]
user@switch# set family ethernet-switching filter app_class term best_effort_traffic then
forwarding-class best-effort loss-priority low

```
  20. Apply the firewall filter **app\_class** as an input filter to the interfaces for the servers hosting applications:
 

```

[edit interfaces]
user@switch# set ge-0/0/3 unit 0 family ethernet-switching filter input app_class
user@switch# set ge-0/0/4 unit 0 family ethernet-switching filter input app_class
user@switch# set ge-0/0/5 unit 0 family ethernet-switching filter input app_class
user@switch# set ge-0/0/6 unit 0 family ethernet-switching filter input app_class

```
  21. Configure schedulers:
 

```

[edit class-of-service]
user@switch# set schedulers voice-sched buffer-size percent 10
user@switch# set schedulers voice-sched priority strict-high
user@switch# set schedulers voice-sched transmit-rate percent 10
user@switch# set schedulers video-sched buffer-size percent 15
user@switch# set schedulers video-sched priority low
user@switch# set schedulers video-sched transmit-rate percent 15
user@switch# set schedulers app-sched buffer-size percent 10
user@switch# set schedulers app-sched priority low
user@switch# set schedulers app-sched transmit-rate percent 10
user@switch# set schedulers mail-sched buffer-size percent 5
user@switch# set schedulers mail-sched priority low
user@switch# set schedulers mail-sched transmit-rate percent 5
user@switch# set schedulers db-sched buffer-size percent 10
user@switch# set schedulers db-sched priority low
user@switch# set schedulers db-sched transmit-rate percent 10
user@switch# set schedulers erp-sched buffer-size percent 10
user@switch# set schedulers erp-sched priority low
user@switch# set schedulers erp-sched transmit-rate percent 10
user@switch# set schedulers nc-sched buffer-size percent 5
user@switch# set schedulers nc-sched priority strict-high
user@switch# set schedulers nc-sched transmit-rate percent 5
user@switch# set schedulers be-sched buffer-size percent 35
user@switch# set schedulers be-sched priority low
user@switch# set schedulers be-sched transmit-rate percent 35

```

22. Assign the forwarding classes to schedulers with the scheduler map **ethernet-cos-map**:
 

```
[edit class-of-service]
user@switch# set scheduler-maps ethernet-cos-map forwarding-class voice scheduler
voice-sched
user@switch# set scheduler-maps ethernet-cos-map forwarding-class video scheduler
video-sched
user@switch# set scheduler-maps ethernet-cos-map forwarding-class app scheduler
app-sched
user@switch# set scheduler-maps ethernet-cos-map forwarding-class mail scheduler
mail-sched
user@switch# set scheduler-maps ethernet-cos-map forwarding-class db scheduler
db-sched
user@switch# set scheduler-maps ethernet-cos-map forwarding-class erp scheduler
erp-sched
user@switch# set scheduler-maps ethernet-cos-map forwarding-class network-control
scheduler nc-sched
user@switch# set scheduler-maps ethernet-cos-map forwarding-class best-effort scheduler
be-sched
```
23. Associate the scheduler map with the outgoing interface:
 

```
[edit class-of-service interfaces]
user@switch# set ge-0/0/20 scheduler-map ethernet-cos-map
```
24. Apply queue shaping for the best-effort queue:
 

```
[edit]
user@switch# set class-of-service schedulers voice-sched-queue-shap shaping-rate 30m
user@switch# set class-of-service scheduler-maps sched-map-be forwarding-class
best-effort scheduler voice-sched-queue-shap
user@switch# set class-of-service interfaces ge-0/0/2 scheduler-map sched-map-be
```

**Results** Display the results of the configuration:

```
user@switch> show firewall

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying That the Defined Forwarding Classes Exist and Are Mapped to Queues on page 2088](#)
- [Verifying That the Forwarding Classes Have Been Assigned to Schedulers on page 2089](#)
- [Verifying That the Scheduler Map Has Been Applied to the Interface on page 2091](#)
- [Verifying That Port Shaping Has Been Applied on page 2091](#)
- [Verifying That Queue Shaping Has Been Applied on page 2095](#)

### *Verifying That the Defined Forwarding Classes Exist and Are Mapped to Queues*

**Purpose** Verify that the forwarding classes **app**, **best-effort**, **db**, **erp**, **mail**, **network-control**, **video**, and **voice** have been defined and mapped to queues.

**Action** user@switch> show class-of-service forwarding-class

Forwarding class	ID	Queue
app	0	5
db	1	2
erp	2	3
best-effort	3	0
mail	4	1
voice	5	6
video	6	4
network-control	7	7

**Meaning** This output shows that the forwarding classes have been defined and mapped to appropriate queues.

***Verifying That the Forwarding Classes Have Been Assigned to Schedulers***

**Purpose** Verify that the forwarding classes have been assigned to schedulers.

**Action** user@switch> **show class-of-service scheduler-map**

Scheduler map: ethernet-cos-map, Index: 2

Scheduler: voice-sched, Forwarding class: voice, Index: 22

Transmit rate: 5 percent, Rate Limit: none, Buffer size: 15 percent,

High	non-TCP	1	<default-drop-profile>
High	TCP	1	<default-drop-profile>

Scheduler: be-sched, Forwarding class: best-effort, Index: 20

Transmit rate: 35 percent, Rate Limit: none, Buffer size: 35 percent,

Priority: low

Drop profiles:

Loss priority	Protocol	Index	Name
High	non-TCP	1	<default-drop-profile>
High	TCP	1	<default-drop-profile>

Scheduler: nc-sched, Forwarding class: network-control, Index: 22

Transmit rate: 5 percent, Rate Limit: none, Buffer size: 5 percent,

```

Priority: Strict-high
Drop profiles:
  Loss priority  Protocol  Index  Name
  High          non-TCP    1      <default-drop-profile>
  High          TCP        1      <default-drop-profile>

```

**Meaning** This output shows that the forwarding classes have been assigned to schedulers.

### *Verifying That the Scheduler Map Has Been Applied to the Interface*

**Purpose** Verify that the scheduler map has been applied to the interface.

```

Action  user@switch> show class-of-service interface
...
Physical interface: ge-0/0/20, Index: 149
Queues supported: 8, Queues in use: 8
Scheduler map: ethernet-cos-map, Index: 43366
Input scheduler map: <default>, Index: 3
...

```

**Meaning** This output shows that the scheduler map (**ethernet-cos-map**) has been applied to the interface (**ge-0/0/20**).

### *Verifying That Port Shaping Has Been Applied*

**Purpose** Verify that the port shaping has been applied to an interface.

**Action** Following is the output before port shaping is applied to the interface **ge-0/0/0**, when there is egress traffic of 400 Mbps exiting on that interface:

```

user@switch> show interfaces ge-0/0/0 extensive
Physical interface: ge-0/0/0, Enabled, Physical link is Up
Interface index: 239, SNMP ifIndex: 548, Generation: 242
Link-level type: Ethernet, MTU: 1514, Speed: Auto, Duplex: Auto, BPDU Error:
None, MAC-REWRITE Error: None, Loopback: Disabled, Source filtering: Disabled,
Flow control: Enabled, Auto-negotiation: Enabled, Remote fault: Online,

```

user@switch> show class-of-service interface ge-0/0/0
Physical interface: ge-0/0/0, Index: 165
Queues supported: 8, Queues in use: 4
Shaping rate: 100000000 bps
...
...

```

**Meaning** In the output for the **show interfaces ge-0/0/0 statistics** command, the Traffic statistics: field shows that egress traffic is ~100 Mbps (100,223,104 bps). The output for the **show class-of-service interface ge-0/0/0** command shows that the shaping rate is 100,000,000 bps, which indicates that a port shaping of 100 Mbps is applied to the ge-0/0/0 interface.

### *Verifying That Queue Shaping Has Been Applied*

**Purpose** Verify that the queue shaping has been applied to the best-effort queue.

**Action** Following is the output before queue shaping is applied to the best-effort queue when there is egress traffic of 400 Mbps exiting on that interface:

```

user@switch> show interfaces ge-0/0/2 extensive
Physical interface: ge-0/0/2, Enabled, Physical link is Up
Interface index: 239, SNMP ifIndex: 548, Generation: 242

## Configuring CoS (J-Web Procedure)

The Class of Service Configuration pages allow you to configure the Junos CoS components. You can configure forwarding classes for transmitting packets, define which packets are placed into each output queue, and schedule the transmission service level for each queue. After defining the CoS components you must assign classifiers to the required physical and logical interfaces.

Using the Class of Service Configuration pages, you can configure various CoS components individually or in combination to define particular CoS services.

To configure CoS components :

1. In the J-Web interface, select **Configure>Class of Service**.
2. On the Class of Service Configuration page, select one of the following options depending on the CoS component that you want to define. Enter information into the pages as described in the respective table:
  - To define or edit CoS value aliases, select **CoS Value Aliases** .
  - To define or edit forwarding classes and assign queues, select **Forwarding Classes**.
  - To define or edit classifiers, select **Classifiers** .
  - To define or edit rewrite rules, select **Rewrite Rules**.
  - To define or edit schedulers, select **Schedulers**.
  - To define or edit virtual channel groups, select **Interface Associations**.
3. Click **Apply** after completing configuration on any Configuration page.

## Defining CoS Code-Point Aliases (CLI Procedure)

You can use code-point aliases to streamline the process of configuring CoS features on your EX Series switch. A code-point alias assigns a name to a pattern of code-point bits. You can use this name instead of the bit pattern when you configure other CoS components such as classifiers, drop-profile maps, and rewrite rules.

You can configure code-point aliases for the following CoS marker types:

- **dscp** and **dscp-ipv6**—Handles incoming IPv4 and IPv6 packets, respectively.
- **ieee-802.1**—Handles Layer 2 CoS.
- **inet-precedence**—Handles incoming IPv4 packets. IP precedence mapping requires only the higher order three bits of the DSCP field.

To configure a code-point alias for a specified CoS marker type (**dscp**), assign an alias (**my1**) to the code-point (**110001**):

```
[edit class-of-service code-point-aliases]
user@switch# set dscp my1 110001
```

The **my1** alias will be applicable for incoming IPv4 packets.

## Defining CoS Code-Point Aliases (J-Web Procedure)

**NOTE:** This topic applies only to the J-Web Application package.

You can use the J-Web interface to define CoS code-point aliases on an EX Series switch. By defining aliases you can assign meaningful names to a particular set of bit values and refer to them when configuring CoS components.

To define CoS code-point aliases:

1. Select **Configure > Class of Service > CoS Value Aliases**.

**NOTE:** After you make changes to the configuration on this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See [Using the Commit Options to Commit Configuration Changes](#) for details about all commit options.

2. Click one of the following options:

- **Add**—Adds a code-point alias. Enter information into the code point alias page as described in [Table 203 on page 2102](#).
- **Edit**—Modifies an existing code-point alias. Enter information into the code point alias page as described in [Table 203 on page 2102](#).
- **Delete**—Deletes an existing code-point alias.

[Table 203 on page 2102](#) describes the related fields.

**Table 203: CoS Value Aliases Configuration Fields**

Field	Function	Your Action
Code point name	Specifies the name for a code-point—for example, <b>af11</b> or <b>be</b> .	Enter a name.
Code point type	Specifies a code-point type. The code-point type can be DSCP or IP precedence.	Select a value.
Code point value bits	Specifies the CoS value for which an alias is defined.  Changing this value alters the behavior of all classifiers that refer to this alias.	To specify a CoS value, type it in the appropriate format: <ul style="list-style-type: none"> <li>• For DSCP CoS values, use the format <b>xxxxxx</b>, where x is 1 or 0—for example, <b>101110</b>.</li> <li>• For IP precedence CoS values, use the format <b>xxx</b>, where x is 1 or 0—for example, <b>111</b>.</li> </ul>

## Defining CoS Classifiers (CLI Procedure)

Packet classification associates incoming packets with a particular CoS servicing level. Classifiers associate packets with a forwarding class and loss priority and assign packets to output queues based on the associated forwarding class. Junos OS supports two general types of classifiers:

- Behavior aggregate (BA) classifier—Examine the CoS value in the packet header. The value in this single field determines the CoS settings applied to the packet. BA classifiers allow you to set the forwarding class and loss priority of a packet based on the Differentiated Services code point (DSCP) value, IP precedence value, or IEEE 802.1p value. EX Series switches except EX4300 switches support two types of loss priorities: **high** and **low**. EX4300 switches support four types of loss priorities: **high**, **medium-high**, **low**, and **medium-low**.

You can configure BA classifiers for the following CoS marker types:

- **dscp** and **dscp-ipv6**—Handles incoming IPv4 and IPv6 packets, respectively.
- **ieee-802.1**—Handles Layer 2 CoS.
- **inet-precedence**—Handles incoming IPv4 packets. IP precedence mapping requires only the higher order three bits of the DSCP field.
- Multifield (MF) classifier—Examine multiple fields in the packet such as source and destination addresses and source and destination port numbers of the packet. With MF classifiers, you set the forwarding class and loss priority of a packet based on firewall filter rules.

**NOTE:** Juniper Networks EX8200 Ethernet Switches implement the on-demand ternary content addressable memory (TCAM) allocation of memory so that when additional TCAM space is required for CoS, the space is allocated from the free TCAM space or from the unused TCAM space. An error log message is generated when you configure CoS classifiers beyond the available TCAM space that includes both the free and unused space.

The following example describes how to configure a BA classifier (**ba-classifier**) as the default DSCP map for handling IPv4 traffic and to apply the BA classifier to either a specific Gigabit Ethernet interface or to all the Gigabit Ethernet interfaces on the switch. The BA classifier assigns loss priorities, as shown in [Table 204 on page 2103](#), to incoming packets in the four forwarding classes.

You can use the same procedure to set MF classifiers (except that you would use firewall filter rules).

**Table 204: BA-classifier Loss Priority Assignments**

Forwarding Class	For CoS Traffic Type	ba-classifier Assignment
<b>be</b>	Best-effort traffic	High-priority code point: <b>000001</b>

Table 204: BA-classifier Loss Priority Assignments (*continued*)

<b>ef</b>	Expedited-forwarding traffic	High-priority code point: <b>101110</b>
<b>af</b>	Assured-forwarding traffic	High-priority code point: <b>001100</b>
<b>nc</b>	Network-control traffic	High-priority code point: <b>110001</b>

To configure a DSCP BA classifier named **ba-classifier** as the default DSCP map:

- Associate code point **000001** with forwarding class **be** and loss priority **high**:

```
[edit class-of-service classifiers]
user@switch# set dscp ba-classifier import default forwarding-class be loss-priority high
code-points 000001
```

- Associate code point **101110** with forwarding class **ef** and loss priority **high**:

```
[edit class-of-service classifiers]
user@switch# set dscp ba-classifier forwarding-class ef loss-priority high code-points 101110
```

- Associate code point **001100** with forwarding class **af** and loss priority **high**:

```
[edit class-of-service classifiers]
user@switch# set dscp ba-classifier forwarding-class af loss-priority high code-points 001100
```

- Associate code point **110001** with forwarding class **nc** and loss priority **high**:

```
[edit class-of-service classifiers]
user@switch# set dscp ba-classifier forwarding-class nc loss-priority high code-points 110001
```

- Apply the classifier to a specific interface or to all Gigabit Ethernet interfaces on the switch.

- To apply the classifier to a specific interface:

```
[edit class-of-service interfaces]
user@switch# set ge-0/0/0 unit 0 classifiers dscp ba-classifier
```

- To apply the classifier to all Gigabit Ethernet interfaces on the switch, use wildcards for the interface name and the logical-interface (unit) number:

```
[edit class-of-service interfaces]
user@switch# set ge-* unit * classifiers dscp ba-classifier
```

**NOTE:** On EX8200 switches, it can take a long time to install code-point classifiers on multiple interfaces (for example, approximately 25 minutes to install 64 code-point classifiers on multiple interfaces in the order of 280 or more).

### Defining CoS Classifiers (J-Web Procedure)

**NOTE:** This topic applies only to the J-Web Application package.

You can use the J-Web interface to define CoS classifiers on an EX Series switch. Classifiers examine the CoS value or alias of an incoming packet and assign the packet a level of service by setting its forwarding class and loss priority.

To define CoS classifiers:

1. Select **Configure > Class of Service > Classifiers**.

**NOTE:** After you make changes to the configuration on this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See [Using the Commit Options to Commit Configuration Changes](#) for details about all commit options.

2. Click one of the following options:
  - **Add**—Adds a classifier. Enter information into the classifier page as described in [Table 205 on page 2105](#).
  - **Edit**—Modifies an existing classifier. Enter information into the classifier page as described in [Table 205 on page 2105](#).
  - **Delete**—Deletes an existing classifier.

**Table 205: Classifiers Configuration Fields**

Field	Function	Your Action
Classifier Name	Specifies the name for a classifier.	To name a classifier, type the name—for example, <b>ba-classifier</b> .
Classifier Type	Specifies the type of classifier: <b>dscp</b> , <b>ieee-802.1</b> , or <b>inet-precedence</b> .	Select a value from the list.

Table 205: Classifiers Configuration Fields (*continued*)

Field	Function	Your Action
Code Point Mapping	Sets the forwarding classes and the packet loss priorities (PLPs) for specific CoS values and aliases.	<p>To add a code point mapping:</p> <ol style="list-style-type: none"> <li>1. Click <b>Add</b>.</li> <li>2. Select the code point.</li> <li>3. Select a forwarding class from the following list: <ul style="list-style-type: none"> <li>• <b>expedited-forwarding</b>—Provides low loss, low delay, low jitter, assured bandwidth, and end-to-end service. Packets can be forwarded out of sequence or dropped.</li> <li>• <b>best-effort</b>—Provides no special CoS handling of packets. Typically, RED drop profile is aggressive and no loss priority is defined.</li> <li>• <b>assured-forwarding</b>—Provides high assurance for packets within the specified service profile. Excess packets are dropped.</li> <li>• <b>network-control</b>—Packets can be delayed but not dropped.</li> </ul> </li> <li>4. Select the loss priority. <p>To assign a loss priority, select one:</p> <ul style="list-style-type: none"> <li>• <b>high</b>—Packet has a high loss priority.</li> <li>• <b>low</b>—Packet has a low loss priority.</li> </ul> </li> </ol>

  - [Understanding CoS Classifiers](#)

## Defining CoS Forwarding Classes (CLI Procedure)

Forwarding classes allow you to group packets for transmission. Based on forwarding classes, you assign packets to output queues.

By default, four categories of forwarding classes are defined: best effort, assured forwarding, expedited forwarding, and network control. EX Series switches support up to 16 forwarding classes.

You can configure forwarding classes in one of the following ways:

- Using **class** statement—You can configure up to 16 forwarding classes and you can map multiple forwarding classes to single queue.
- Using **queue** statement—You can configure up to 8 forwarding classes and you can map one forwarding class to one queue.

This example uses the **class** statement to configure forwarding classes.

To configure CoS forwarding classes, map the forwarding classes to queues:

```
[edit class-of-service forwarding-classes]
user@switch# set class be queue-num 0
user@switch# set class ef queue-num 1
user@switch# set class af queue-num 2
user@switch# set class nc queue-num 3
user@switch# set class ef1 queue-num 4
user@switch# set class ef2 queue-num 5
user@switch# set class af1 queue-num 6
user@switch# set class nc1 queue-num 7
```

## Defining CoS Forwarding Classes (J-Web Procedure)

**NOTE:** This topic applies only to the J-Web Application package.

You can define CoS forwarding classes on an EX Series switch using the J-Web interface. Assigning a forwarding class to a queue number affects the scheduling and marking of a packet as it transits a switch.

To define forwarding classes:

1. Select **Configure > Class of Service > Forwarding Classes**.

**NOTE:** After you make changes to the configuration on this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See *Using the Commit Options to Commit Configuration Changes* for details about all commit options.

2. Click one of the following options:
  - **Add**—Adds a forwarding class. Enter information into the forwarding class page as described in [Table 206 on page 2108](#).
  - **Edit**—Modifies an existing forwarding class. Enter information into the forwarding class page as described in [Table 206 on page 2108](#).
  - **Delete**—Deletes an existing forwarding class.

**Table 206: Forwarding Classes Configuration Fields**

Field	Function	Your Action
<b>Forwarding Class Summary</b>		
Queue #	<p>Specifies the internal queue numbers to which forwarding classes are assigned.</p> <p>By default, if a packet is not classified, it is assigned to the class associated with queue 0. You can have more than one forwarding class to a queue number.</p>	<p>To specify an internal queue number, select an integer from 0 through 7, appropriate for your platform.</p> <p><b>NOTE:</b> For EX4300 switches, to specify an internal queue number, select an integer from 0 through 11.</p>
Forwarding Class Name	<p>Specifies the forwarding class names assigned to specific internal queue numbers.</p> <p>By default, four forwarding classes are assigned to queue numbers 0 (best-effort), 1 (assured-forwarding), 5 (expedited-forwarding), and 7 (network-connect).</p> <p><b>NOTE:</b> For EX4300 switches, by default the forwarding classes are assigned to queue numbers 0 (best-effort), 1 (expedited-forwarding), 2 (assured-forwarding), 3 (network-connect), 8 (mcast-be), 9 (mcast-ef), 10 (mcast-af), and 11 (mcast-nc).</p>	Type the name—for example, <b>be-class</b> .

## Defining CoS Schedulers and Scheduler Maps (CLI Procedure)

You use schedulers to define the class-of-service (CoS) properties of output queues. These properties include the amount of interface bandwidth assigned to the queue, the size of the memory buffer allocated for storing packets, the priority of the queue, and the drop profiles associated with the queue.

You associate the schedulers with forwarding classes by means of scheduler maps. You can then associate each scheduler map with an interface, thereby configuring the queues and packet schedulers that operate according to this mapping.

**NOTE:** On EX Series switches, you cannot configure a scheduler map on an individual interface that is a member of a link aggregation group (LAG). Instead, you must configure the scheduler map on the LAG itself (that is, on the aggregated Ethernet (ae) interface).

You can associate up to four user-defined scheduler maps with an interface.

This topic describes:

- [Configuring a Scheduler and a Scheduler Map on page 2109](#)
- [Assigning a Scheduler Map to Interfaces on page 2110](#)
- [Assigning Scheduler Maps to Interfaces on EX8200 Line Cards That Include Oversubscribed Ports on page 2110](#)

### Configuring a Scheduler and a Scheduler Map

You can define the properties for an output queue by configuring a scheduler. You can then define a scheduler map to associate a forwarding class with a scheduler.

To configure a scheduler and a scheduler map:

1. Create a scheduler, and assign one or more output queue properties to it:

**[edit class-of-service]**

```
user@switch# set schedulers scheduler-name output-queue-properties
```

For various properties that you can define for an output queue, see the [schedulers](#) hierarchy.

2. Configure a scheduler map that associates the scheduler with the forwarding class:

**[edit class-of-service]**

```
user@switch# set scheduler-maps map-name forwarding-class class-name scheduler scheduler-name
```

### Assigning a Scheduler Map to Interfaces

---

After defining a scheduler map, you can assign the scheduler map to one or more interfaces. You can also assign the scheduler map to multiple interfaces by using a wildcard representation of the interface or Virtual Chassis Ports (VCPs).

Following are sample syntaxes and examples for assigning a scheduler map to a single or to multiple interfaces:

- To assign the scheduler map to one interface:

```
[edit class-of-service interfaces]
user@switch# set interface-name scheduler-map map-name
```

- To assign the scheduler map to more than one interface, you can use a wildcard representation of the interface:

```
[edit class-of-service interfaces]
user@switch# set wild-card-representation-of-interface-name scheduler-map map-name
```

For example, following is the configuration to assign the **be-map** scheduler map to all Gigabit Ethernet interfaces (**ge-\***):

```
[edit class-of-service interfaces]
user@switch# set ge-* scheduler-map be-map
```

- To assign the scheduler map to all VCPs:

```
[edit class-of-service interfaces]
user@switch# set wild-card-representation-of-vcp scheduler-map map-name
```

**NOTE:** You can assign a scheduler map to a VCP only on EX4200, EX4300 or EX4500 switches that are members of Virtual Chassis composed exclusively either of EX4200 switches, EX4300 switches or of EX4500 switches, or that are members of a mixed Virtual Chassis composed of EX4200, EX4300, and EX4500 switches.

For example, following is the configuration to assign the **be-map** scheduler map to all VCPs:

```
[edit class-of-service interfaces]
user@switch# set vcp-* scheduler-map be-map
```

### Assigning Scheduler Maps to Interfaces on EX8200 Line Cards That Include Oversubscribed Ports

---

Some line cards available for Juniper Networks EX8200 Ethernet Switches include oversubscribed ports that are combined in logical port groups that share bandwidth. These oversubscribed ports handle traffic differently than ports that provide continuous line-rate bandwidth. You might need to configure CoS queues differently for oversubscribed ports than for line-rate ports. For more information about EX8200 line cards that include oversubscribed ports, see [“Understanding CoS Queues on EX8200 Line Cards That Include Oversubscribed Ports” on page 2071](#).

For interfaces on oversubscribed EX8200 line cards, you use the same procedure to configure CoS schedulers as you do for other interfaces. However, you must assign the

same scheduler map to all the interfaces in a port group. When you assign a scheduler map to one interface in a port group, you do not need to assign the scheduler map to the remaining interfaces in the port group. The switch automatically uses that scheduler map for all the interfaces in the port group when you bring the interfaces up. Therefore, you do not need to assign the scheduler map to the remaining interfaces in that port group.

If you assign different scheduler maps to different interfaces in a port group, you do not receive an error when you commit the configuration. Instead, an error is logged in the system log. When you bring an interface in the port group up, the default scheduler map is assigned to all interfaces in the port group. If you assign a scheduler map to an interface that is down and if that scheduler map is different from the scheduler map being used by the currently operating interfaces in the port group, then the default scheduler map is used by all interfaces in the port group, even the currently operating ones, when you bring the interface up.

To assign a scheduler map to a port group, assign a scheduler map to at least one interface in the port group:

```
[edit class-of-service interfaces]
user@switch# set interface-name scheduler-map map-name
```

Considering that the xe-0/0/2 interface is part of a port group, following is the configuration to assign a scheduler map named **ef-map** to a port group that contains xe-0/0/2:

```
[edit class-of-service interfaces]
user@switch# set xe-0/0/2 scheduler-map ef-map
```

## Defining CoS Schedulers (J-Web Procedure)

**NOTE:** This topic applies only to the J-Web Application package.

You can use the J-Web interface to define CoS schedulers on an EX Series switch. Using schedulers, you can assign attributes to queues and thereby provide congestion control for a particular class of traffic. These attributes include the amount of interface bandwidth, memory buffer size, transmit rate, and schedule priority.

To configure schedulers:

1. Select **Configure > Class of Service > Schedulers**.

**NOTE:** After you make changes to the configuration on this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See [Using the Commit Options to Commit Configuration Changes](#) for details about all commit options.

2. Click one of the following options:

- **Add**—Adds a scheduler. Enter information into the Schedulers page as described in [Table 207 on page 2112](#).
- **Edit**—Modifies an existing scheduler. Enter information into the Schedulers page as described in [Table 207 on page 2112](#).
- **Delete**—Deletes an existing scheduler.

**Table 207: Schedulers Configuration Page**

Field	Function	Your Action
Scheduler name	Specifies the name for a scheduler.	To name a scheduler, type the name—for example, <b>be-scheduler</b> .
Scheduling priority	<p>Sets the transmission priority of the scheduler, which determines the order in which an output interface transmits traffic from the queues.</p> <p>You can set the scheduling priority at different levels in the order of increasing priority from low to high.</p> <p>A high-priority queue with a high transmission rate might lock out lower-priority traffic.</p>	<p>To set a priority, select one:</p> <ul style="list-style-type: none"> <li>• <b>low</b>—Packets in this queue are transmitted last.</li> <li>• <b>strict-high</b>—Packets in this queue are transmitted first.</li> <li>• To specify no scheduling priority, select the blank check box.</li> </ul>

Table 207: Schedulers Configuration Page (*continued*)

Field	Function	Your Action
Buffer size	<p>Defines the size of the delay buffer.</p> <p>By default, queues 0 through 11 are allotted the following percentages of the total available buffer space:</p> <ul style="list-style-type: none"> <li>• Queue 0—75 percent</li> <li>• Queue 1—0 percent</li> <li>• Queue 2—0 percent</li> <li>• Queue 3—5 percent</li> <li>• Queue 4—0 percent</li> <li>• Queue 5—0 percent</li> <li>• Queue 6—0 percent</li> <li>• Queue 7—0 percent</li> <li>• Queue 8—15 percent</li> <li>• Queue 9—0 percent</li> <li>• Queue 10—0 percent</li> <li>• Queue 11—5 percent</li> </ul> <p><b>NOTE:</b> A large buffer size value correlates with a greater possibility of packet delays. Such a value might not be practical for sensitive traffic such as voice or video.</p>	<p>To define a delay buffer size for a scheduler, select the appropriate option:</p> <ul style="list-style-type: none"> <li>• To specify no buffer size, select the blank check box.</li> <li>• To specify buffer size as a percentage of the total buffer, select <b>Percent</b> and type an integer from 1 through 100.</li> <li>• To specify buffer size as the remaining available buffer, select <b>Remainder</b>.</li> </ul> <p><b>NOTE:</b> On EX8200 and EX4300 switches, you can specify the buffer size as a temporal value. The queuing algorithm will then drop packets after it has queued a computed number of bytes. This number is the product of the logical interface speed and the configured temporal value.</p>
Shaping rate	<p>Specifies the rate at which queues transmit packets.</p>	<ul style="list-style-type: none"> <li>• To specify shaping rate as a percentage, select <b>Percent</b> and type an integer from 1 through 100.</li> <li>• To specify shaping rate as a number, select <b>Rate</b> and enter a value.</li> <li>• To specify no shaping rate, select the blank check box.</li> </ul>

## Defining CoS Scheduler Maps (J-Web Procedure)

**NOTE:** This topic applies only to the J-Web Application package.

You can use the J-Web interface to configure CoS scheduler maps on an EX Series switch.

**NOTE:** On EX Series switches, you cannot configure a scheduler map on an individual interface that is a member of a link aggregation group (LAG). Instead, you must configure the scheduler map on the LAG itself (that is, on the aggregated Ethernet (ae) interface).

To configure scheduler maps:

1. Select **Configure > Class of Service > Scheduler Maps**.

**NOTE:** After you make changes to the configuration on this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See *Using the Commit Options to Commit Configuration Changes* for details about all commit options.

2. Click one of the following options:
  - **Add**—Adds a scheduler map. Enter information into the scheduler map page as described in [Table 208 on page 2115](#).
  - **Edit**—Modifies an existing scheduler map. Enter information into the scheduler map page as described in [Table 208 on page 2115](#).
  - **Delete**—Deletes an existing scheduler map.

**Table 208: Scheduler Maps Configuration Fields**

Field	Function	Your Action
Scheduler Map Name	Specifies the name for a scheduler map.	To name a map, type the name—for example, <b>be-scheduler-map</b> .
Scheduler Mapping	<p>Allows you to associate a preconfigured scheduler with a forwarding class.</p> <p>After scheduler maps have been applied to an interface, they affect the hardware queues and packet schedulers.</p>	<p>To associate a scheduler with a forwarding class, locate the forwarding class and select the scheduler in the box next to it.</p> <p>For example, for the <b>best-effort</b> forwarding class, select the configured scheduler from the list.</p>

## Configuring CoS Congestion Management (CLI Procedure)

An effective congestion management mechanism is imperative to ensure smooth flow of traffic in a network and also to ensure minimum packet drops in the network. Class of

service (CoS) provides congestion management methods that allow you to define parameters based on which packets can be dropped when the output queue is full. These parameters vary depending on the EX Series switch that you are using in a network.

You can specify parameters for dropping packets at the **[edit class-of-service drop-profiles]** hierarchy level and reference them in a scheduler configuration. The parameters that you can specify are **fill-level** and **drop-probability**. The first parameter defines the delay-buffer bandwidth, which provides packet buffer space to absorb burst traffic up to the specified duration of delay. When the specified delay buffer becomes full, packets with 100 percent drop probability are dropped from the head of the buffer. The second parameter represents a percentage value that correlates to the likelihood that an individual packet is dropped from the network.

Depending on the switch on which you are configuring a drop profile, you can configure either a weighted tail drop (WTD) profile or a weighted random early detection (WRED) profile.

This topic describes:

- [Configuring a Weighted Tail Drop Profile on page 2116](#)
- [Configuring a Weighted Random Early Detection Drop Profile on page 2116](#)

---

### Configuring a Weighted Tail Drop Profile

A weighted tail drop (WTD) is a congestion management mechanism in which packets are dropped from the tail of the queue when the queue reaches a certain buffer capacity (that is, the fill level), and hence the name weighted tail drop. When that level is reached on EX2200, EX3200, or EX4200 Switches, packets marked with a packet loss priority (PLP) of high are prevented from entering the queue (that is, they are discarded).

To configure a WTD profile, create a drop profile name and assign a fill level:

```
[edit class-of-service drop-profiles]
user@switch# set profile-name fill-level percentage
```

Following is a sample WTD profile in which the fill level is set to 80 percent:

```
[edit class-of-service drop-profiles]
user@switch# set wtd-profile fill-level 80
```

---

### Configuring a Weighted Random Early Detection Drop Profile

A WRED drop profile enables you to define multiple data points for fill level and drop probability so that packets are dropped at various levels of queue fullness, and for various drop probabilities. Unlike the WTD drop profile that can be defined only for packets with a PLP of high, WRED can be defined for packets with a PLP of high and also for packets with a PLP of low.

**NOTE:** The WRED drop profile is supported only on EX4300 standalone switches, EX4300 Virtual Chassis, EX8200 standalone switches and EX8200 Virtual Chassis.

---

WRED has two implementations: segmented and interpolated. From a high level, segmented is a stair-step-like drop profile, whereas interpolated is a smoother (curve) drop profile. For a graphical representation of both these implementations, see [“Understanding CoS Congestion Management” on page 2055](#). Although the formation of graph lines is different for both these implementations, the application of the profile is the same. On EX Series switches except EX4300 switches, when a packet reaches the head of the queue, a random number between 0 and 100 is calculated. This random number is plotted against the drop profile using the current queue fullness of that particular queue. When the random number falls above the graph line, the packet is transmitted. When the number falls below the graph line, the packet is dropped from the network.

For information about congestion management on EX4300 switches, see [“Understanding CoS Congestion Management” on page 2055](#).

**NOTE:** On EX4300 switches, you cannot enable WRED on multidestination (multicast) queues. You can enable WRED only on unicast queues.

Following is the procedure to define a segmented and an interpolated drop profiles:

- To configure a segmented drop profile, specify multiple data points for fill level (l) and drop probability (p) as follows:

**[edit class-of-service drop-profiles]**

```
user@switch# set profile-name fill-level percentage-l1 drop-probability percentage-p1
user@switch# set profile-name fill-level percentage-l2 drop-probability percentage-p2
user@switch# set profile-name fill-level percentage-l3 drop-probability percentage-p3
user@switch# set profile-name fill-level percentage-l4 drop-probability percentage-p4
```

Following is a sample segmented drop profile:

**[edit class-of-service drop-profiles]**

```
user@switch# set seg-prof fill-level 20 drop-probability 25
user@switch# set seg-prof fill-level 40 drop-probability 50
user@switch# set seg-prof fill-level 60 drop-probability 75
user@switch# set seg-prof fill-level 80 drop-probability 100
```

- To configure an interpolated drop profile on EX Series switches except EX4300 switches, specify multiple data points for fill level (l) and drop probability (p) using the **interpolate** statement as follows:

**[edit class-of-service drop-profiles]**

```
user@switch# set profile-name interpolate fill-level percentage-l1 drop-probability
percentage-l1
user@switch# set profile-name interpolate fill-level percentage-l2 drop-probability
percentage-l2
user@switch# set profile-name interpolate fill-level percentage-l3 drop-probability
percentage-p3
user@switch# set profile-name interpolate fill-level percentage-l4 drop-probability
percentage-p4
```

Following is a sample interpolated drop profile:

**[edit class-of-service drop-profiles]**

```
user@switch# set inter-prof interpolate fill-level 20 drop-probability 25
user@switch# set inter-prof interpolate fill-level 40 drop-probability 50
user@switch# set inter-prof interpolate fill-level 60 drop-probability 75
```

```
user@switch# set inter-prof interpolate fill-level 80 drop-probability 100
```

- To configure an interpolated drop profile EX4300 switches, specify two data points for fill level (l) and drop probability (p) by using the **interpolate** statement as follows:

```
[edit class-of-service drop-profiles]
```

```
user@switch# set profile-name interpolate fill-level percentage-l1 fill-level percentage-l2  
drop-probability percentage-l1 percentage-l2
```

Following is a sample interpolated drop profile:

```
[edit class-of-service drop-profiles]
```

```
user@switch# set inter-prof interpolate fill-level 20 fill-level 80 drop-probability 25  
drop-probability 100
```

## Defining CoS Rewrite Rules (CLI Procedure)

You configure rewrite rules to alter CoS values in outgoing packets on the outbound interfaces of an EX Series switch to match the policies of a targeted peer. Policy matching allows the downstream routing platform or switch in a neighboring network to classify each packet into the appropriate service group.

To configure a CoS rewrite rule, create the rule by giving it a name and associating it with a forwarding class, loss priority, and a code point, thus creating a rewrite table, and you can enable the rewrite rule on an interface. On EX Series switches except EX4300 switches, you can also enable a rewrite rule on routed VLAN interfaces (RVIs). On EX4300 switches, you can also enable rewrite rules on integrated routing and bridging (IRB) interfaces. If you need to customize a rewrite rule, you can create a customized rewrite rule using a firewall filter configuration. You can configure CoS rewrite rules for DSCP, IP precedence and IEEE 802.1p.

You can configure rewrite rules for the following CoS marker types:

- **dscp** and **dscp-ipv6**—Handles incoming IPv4 and IPv6 packets, respectively. On EX4300 switches, you cannot configure DSCP IPv4 and DSCP IPv6 rewrite rules on the same interface. If you configure a DSCP IPv4 rewrite rule on an interface to rewrite IPv4 traffic, then the same rewrite rule is applied to IPv6 traffic also on that interface, and vice versa.
- **ieee-802.1**—Handles Layer 2 CoS.
- **inet-precedence**—Handles incoming IPv4 packets. IP precedence mapping requires only the higher order three bits of the DSCP field.

**NOTE:** To replace an existing rewrite rule on the interface with a new rewrite rule of the same type, first explicitly remove the rewrite rule and then apply the new rule.

To create IEEE 802.1p rewrite rules and enable them on Layer 2 interfaces:

- To create an IEEE 802.1p rewrite rule named `customup-rw` in the rewrite table for all Layer 2 interfaces:

```
[edit class-of-service rewrite-rules]
user@switch# set ieee-802.1 customup-rw forwarding-class be loss-priority low code-point 000
user@switch# set ieee-802.1 customup-rw forwarding-class be loss-priority high code-point 001
user@switch# set ieee-802.1 customup-rw forwarding-class af loss-priority low code-point 010
user@switch# set ieee-802.1 customup-rw forwarding-class af loss-priority high code-point 011
user@switch# set ieee-802.1 customup-rw forwarding-class ef loss-priority low code-point 100
user@switch# set ieee-802.1 customup-rw forwarding-class ef loss-priority high code-point 101
```

```

user@switch# set ieee-802.1p customup-rw forwarding-class nc loss-priority low code-point
110
user@switch# set ieee-802.1p customup-rw forwarding-class nc loss-priority high code-point
111

```

- To enable an IEEE 802.1p rewrite rule named customup-rw on a Layer 2 interface:

```

[edit]
user@switch# set class-of-service interfaces ge-0/0/0 unit 0 rewrite-rules ieee-802.1
customup-rw

```

(On EX4300 switches) To enable an IEEE 802.1p rewrite rule named customup-rw on a Layer 2 interface:

```

[edit]
user@switch# set class-of-service interfaces ge-0/0/0 rewrite-rules ieee-802.1 customup-rw

```

- To enable an IEEE 802.1p rewrite rule named customup-rw on all Gigabit Ethernet interfaces on the switch, use wildcards for the interface name and logical-interface (unit) number:

```

[edit]
user@switch# set class-of-service interfaces ge-* unit * rewrite-rules customup-rw

```

(On EX4300 switches) To enable an IEEE 802.1p rewrite rule named customup-rw on all Gigabit Ethernet interfaces on the switch, use wildcards for the interface name:

```

[edit]
user@switch# set class-of-service interfaces ge-* rewrite-rules customup-rw

```

## Defining CoS Rewrite Rules (J-Web Procedure)

**NOTE:** This topic applies only to the J-Web Application package.

You can use the J-Web interface to define CoS rewrite rules. Use the rewrite rules to alter the CoS values in outgoing packets to meet the requirements of the targeted peer. A rewrite rule examines the forwarding class and loss priority of a packet and sets its bits to a corresponding value specified in the rule.

To define rewrite rules:

1. Select **Configure > Class of Service > Rewrite Rules**.

**NOTE:** After you make changes to the configuration on this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See [Using the Commit Options to Commit Configuration Changes](#) for details about all commit options.

2. Click one of the following options:

- **Add**—Adds a rewrite rule. Enter information into the rewrite rule page as described in [Table 210 on page 2122](#).
- **Edit**—Modifies an existing rewrite rule. Enter information into the rewrite rule page as described in [Table 210 on page 2122](#).
- **Delete**—Deletes an existing rewrite rule.

**Table 210: Rewrite Rules Configuration Page Summary**

Field	Function	Your Action
Rewrite Rule Name	Specifies the name for the rewrite rule.	To name a rule, type the name—for example, <b>rewrite-dscps</b> .
Rewrite rule type	Specifies the type of rewrite rule: <b>dscp</b> , <b>ieee-802.1</b> , or <b>inet-precedence</b> .	Select a value from the list.
Code Point Mapping	<p>Rewrites outgoing CoS values of a packet based on the forwarding class and loss priority.</p> <p>Allows you to remove a code point mapping entry.</p>	<p>To configure a CoS value assignment, follow these steps:</p> <p>To add a code point mapping:</p> <ol style="list-style-type: none"> <li>1. Click <b>Add</b>.</li> <li>2. Select the code point.</li> <li>3. Select a forwarding class from the following list: <ul style="list-style-type: none"> <li>• <b>expedited-forwarding</b>—Provides low loss, low delay, low jitter, assured bandwidth, and end-to-end service. Packets can be forwarded out of sequence or dropped.</li> <li>• <b>best-effort</b>—Provides no special CoS handling of packets. Typically, RED drop profile is aggressive and no loss priority is defined.</li> <li>• <b>assured-forwarding</b>—Provides high assurance for packets within the specified service profile. Excess packets are dropped.</li> <li>• <b>network-control</b>—Packets can be delayed but not dropped.</li> </ul> </li> <li>4. Select the loss priority. <p>To assign a loss priority, select one:</p> <ul style="list-style-type: none"> <li>• <b>high</b>—Packet has a high loss priority.</li> <li>• <b>low</b>—Packet has a low loss priority.</li> </ul> <p>To edit an existing code point mapping, select it and click <b>Edit</b>.</p> <p>To remove a code point mapping entry, select it and click <b>Remove</b>.</p> </li> </ol>

## Assigning CoS Components to Interfaces (CLI Procedure)

After you have defined the following CoS components, you must assign them to logical or physical interfaces.

- Forwarding classes—Assign only to logical interfaces.
- Classifiers—Assign only to logical interfaces.
- Scheduler maps—Assign to either physical or logical interfaces.
- Rewrite rules—Assign to either physical or logical interfaces.

You can assign a CoS component to a single interface or to multiple interfaces using wild cards.

To assign CoS components to interfaces:

- To assign CoS components to a single interface, associate a CoS component (for example a scheduler map named **ethernet-cos-map**) with an interface:

```
[edit class-of-service interfaces]
user@switch# set ge-0/0/20 scheduler-map ethernet-cos-map
```

- To assign a CoS component to multiple interfaces, associate a CoS component (for example, a rewrite rule named **customup-rw**) to all Gigabit Ethernet interfaces on the switch, use wild characters for the interface name and logical-interface (unit) number:

```
[edit class-of-service interfaces]
user@switch# set ge-* unit * rewrite-rules ieee-802.1 customup-rw
```

- Related Documentation**
- [Assigning CoS Components to Interfaces \(J-Web Procedure\) on page 2123](#)
  - [Example: Configuring CoS on EX Series Switches on page 2075](#)
  - [Monitoring Interfaces That Have CoS Components on page 2160](#)
  - [Understanding Junos OS CoS Components for EX Series Switches on page 2043](#)

## Assigning CoS Components to Interfaces (J-Web Procedure)

**NOTE:** This topic applies only to the J-Web Application package.

After you have defined CoS components on an EX Series switch, you must assign them to logical or physical interfaces. You can use the J-Web interface to assign scheduler

maps to physical or logical interfaces and to assign forwarding classes or classifiers to logical interfaces.

To assign CoS components to interfaces:

1. Select **Configure > Class of Service > Assign to Interface**.

**NOTE:** After you make changes to the configuration on this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See *Using the Commit Options to Commit Configuration Changes* for details about all commit options.

2. To configure interface association, select an interface from the list and click **Edit**. For an EX8200 Virtual Chassis configuration, select the member, the FPC, and the interface from the list, and click **Edit**.
3. Select one of the following:
  - **Associate system default scheduler map**—Associates the interface with the default scheduler map.
  - **Select the scheduler map**—Associates the interface with a configured scheduler map. Select the scheduler map from the list.

**NOTE:** On the 40-port SFP+ line card for EX8200 switches, you cannot commit your changes using the J-Web interface unless you assign the same scheduler map or the default scheduler map to all interfaces in a port group.

4. Click **OK**.
5. To manage a CoS service assignment on a logical interface, Click one of the following options:
  - **Add**—Adds a CoS service to a logical interface on a specified physical interface. Enter information as described in [Table 211 on page 2124](#).
  - **Edit**—Modifies a CoS service assignment to a logical interface. Enter information as described in [Table 211 on page 2124](#).
  - **Delete**—Deletes the CoS service assignment to a logical interface.

**Table 211: Assigning CoS Components to Logical Interfaces**

Field	Function	Your Action
Unit	Specifies the name of a logical interface. Allows you to assign CoS components while configuring a logical interface on a physical interface at the same time.	Type the interface name.  To assign CoS services to all logical interfaces configured on this physical interface, type the wildcard character (*).

Table 211: Assigning CoS Components to Logical Interfaces (*continued*)

Field	Function	Your Action
Forwarding Class	Assigns a predefined forwarding class to incoming packets on a logical interface.	To assign a forwarding class to an interface, select the forwarding class.
Classifiers	Allows you to apply classification maps to a logical interface. Classifiers assign a forwarding class and loss priority to an incoming packet based on its CoS value.	To assign a classification map to an interface, select an appropriate classifier for each CoS value type used on the interface.
Rewrite Rules	<p>Allows you to alter the CoS values in outgoing packets to meet the requirements of the targeted peer. A rewrite rule examines the forwarding class and loss priority of a packet and sets its bits to a corresponding value specified in the rule.</p> <p><b>NOTE:</b> In EX4300 switches, this option is available only when you click <b>Edit</b> button in the Configure Interface Association table.</p>	To assign rewrite rules to the interface, select the appropriate rewrite rule for each CoS value type used on the interface.

## Configuring Junos OS EZQoS for CoS (CLI Procedure)

You use Junos OS EZQoS on EX Series switches to eliminate the complexities involved in configuring class of service (CoS) across the network. EZQoS offers templates for key traffic classes.

When you configure EZQoS on EX Series switches, preconfigured values are assigned to all CoS parameters based on the typical application requirements. These preconfigured values are stored in a template with a unique name.

**NOTE:** Currently, we provide an EZQoS template for configuring CoS for VoIP applications. The EZQoS VoIP template is stored in `/etc/config/ezqos-voip.conf`.

To configure EZQoS using the CLI:

1. Load the EZQoS configuration file (`/etc/config/ezqos-voip.conf`):
 

```
[edit]
user@switch# load merge /etc/config/ezqos-voip.conf
```
2. Apply the EZQoS group (`ezqos-voip`):
 

```
[edit]
user@switch# set apply-groups ezqos-voip
```
3. Apply the DSCP classifier (`ezqos-dscp-classifier`) to a Gigabit Ethernet interface (`ge-0/0/0`):
 

```
[edit class-of-service interfaces]
```

- ```
user@switch# set ge-0/0/0 unit 0 classifiers dscp ezqos-dscp-classifier
```
4. Apply the scheduler map (**ezqos-voip-sched-maps**) to a Gigabit Ethernet interface (**ge-0/0/1**):

```
[edit class-of-service interfaces]
```

```
user@switch# set ge-0/0/1 scheduler-map ezqos-voip-sched-maps
```

**Related  
Documentation**

## Configuring CoS Traffic Classification for Ingress Queuing on Oversubscribed Ports on EX8200 Line Cards (CLI Procedure)

EX8200 switches provide certain line cards that include oversubscribed ports. These ports are logically grouped into a port group and each port group share a certain fixed bandwidth. Because oversubscribed ports handle traffic differently than ports that provide continuous line-rate bandwidth, configuring CoS queues is different for oversubscribed ports than for line-rate ports.

Packets arriving on an oversubscribed port in a line card are directed to a high-priority, low priority, or line-rate queue. These queues are used for scheduling traffic from the port into the Packet Forwarding Engine. The fabric priority associated with the packet's forwarding class determines which queue the packet is sent to. The forwarding class of the packet in turn is determined by the behavior aggregate (BA) classifier assigned to the port. By default, the fabric priority of all forwarding classes is low. Thus all packets, with the exception of critical network packets and line-rate packets, are sent to the low-priority ingress queue by default. The critical network packets and line-rate packets do not need a BA classifier as they are always sent on the high-priority and line-rate queues, respectively.

This procedure describes how you can direct traffic into the high-priority ingress queue and thus avoid congestion at the port group.

To direct traffic to the high-priority ingress queue for a port group:

1. Create the BA classifier for the forwarding class:

```
[edit class-of-service]
```

```
user@switch# set classifiers classifier-type classifier-name
```

```
forwarding-class class-name loss-priority level code-points code-point
```

2. Assign a queue number and fabric priority to the forwarding class:

```
[edit class-of-service]
```

```
user@switch# set forwarding-classes class class-name queue-num number  
priority level
```

3. Assign the BA classifier to the physical interface:

```
[edit class-of-service]
```

```
user@switch# set interfaces interface-name unit 0  
classifiers classifier-type classifier-name
```

For example, to direct voice traffic to the high-priority ingress queue for interface **xe-1/0/2**:

```
[edit class-of-service]
user@switch# set classifiers dscp dscp1 forwarding-class cos-voice
loss-priority low code-points ef
```

```
[edit class-of-service]
user@switch# set forwarding-classes class cos-voice queue-num 5 priority high
```

```
[edit class-of-service]
user@switch# set interfaces xe-1/0/2 unit 0 classifiers dscp dscp1
```

**NOTE:** You must use a BA classifier to classify traffic for ingress queuing. Multifield (MF) classification and port classification (that is, assigning a forwarding class to the interface) are not supported for classifying traffic for ingress queuing. The BA classifier must be assigned to a physical interface, not a Layer 3 tagged interface or a routed VLAN interface (RVI).

## **[edit class-of-service] Configuration Statement Hierarchy on EX Series Switches**

This topic lists supported and unsupported configuration statements in the **[edit class-of-service]** hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.
- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see [Feature Explorer](#).

This topic lists:

- [Supported Statements in the \[edit class-of-service\] Hierarchy Level on page 2128](#)
- [Unsupported Statements in the \[edit class-of-service\] Hierarchy Level on page 2130](#)

### **Supported Statements in the [edit class-of-service] Hierarchy Level**

The following hierarchy shows the **[edit class-of-service]** configuration statements supported on EX Series switches:

```
class-of-service {
  classifiers {
    (dscp | dscp-ipv6 | ieee-802.1 | inet-precedence) classifier-name {
      forwarding-class class-name {
        loss-priority (high | low | medium-high | medium-low) {
          code-points [ aliases ] [ 6 bit-patterns ];
        }
      }
      import (classifier-name | default);
    }
  }
  code-point-aliases {
    (dscp | dscp-ipv6 | ieee-802.1 | inet-precedence) {
      alias-name bits;
    }
  }
}
```

```

drop-profiles {
  profile-name {
    interpolate {
      drop-probability [values];
      fill-level [values]
    }
  }
}
forwarding-classes {
  class class-name
  queue queue-number;
}
interfaces interface-name {
  scheduler-map map-name;
  shaping-rate rate;
  unit (logical-unit-number | * ) {
    classifiers {
      (dscp | dscp-ipv6 | ieee-802.1 | inet-precedence) (classifier-name | default);
    }
    forwarding-class class-name ;
  }
}
rewrite-rules {
  (dscp | dscp-ipv6 | ieee-802.1 | inet-precedence) (rewrite-rule-name | default);
}
rewrite-rules {
  (dscp | dscp-ipv6 | ieee-802.1 | inet-precedence) rewrite-name {
    import (default | rewrite-name);
    forwarding-class class-name {
      loss-priority (high | low | medium-high | medium-low) code-point (alias | bits);
    }
  }
}
scheduler-maps {
  map-name {
    forwarding-class class-name {
      scheduler scheduler-name;
    }
  }
}
schedulers {
  scheduler-name {
    buffer-size (exact | percent percentage | remainder);
    drop-profile-map {
      loss-priority (any | high | medium-high | medium-low);
      protocol any;
      {
        drop-profile profile-name
      }
    }
    excess-rate {
      percent percentage;
    }
    priority (low | strict-high);
    shaping-rate (rate | percent percentage);
  }
}

```

```
        transmit-rate (EX Series Switches) (rate | percent percentage | remainder) ;
    }
}
shared-buffer {
    percent;
}
traceoptions {
    file (file-name | files files | match match | no-world-readable | size size | world-readable);
    flag ( all | asynch | chassis-scheduler | cos-adjustment | dynamic | hardware-database
        | init | parse | performance-monitor | process | restart | route-socket | show | snmp |
        util);
    no-remote-trace;
}
tri-color;
}
```

### Unsupported Statements in the [edit class-of-service] Hierarchy Level

All statements in the [edit class-of-service] hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.0 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>              | Specify buffer size in a scheduler configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Default</b>                  | On EX Series switches except EX4300 switches, the default scheduler transmission rate and buffer size percentages for queues 0 through 7 are 95, 0, 0, 0, 0, 0, 0, and 5 percent, respectively. On EX4300 switches, the default scheduler transmission rate and buffer size for queues 0 through 11 are 75, 0, 0, 5, 0, 0, 0, 0, 15, 0, 0 and 5 percent, respectively, of the total available buffer.                                                                                                                                                                                                               |
| <b>Options</b>                  | <p><b>exact</b>—(Except on EX8200 standalone switches and EX8200 Virtual Chassis) Enforce the exact buffer size. When this option is configured, sharing is disabled on the queue, restricting the usage to guaranteed buffers only.</p> <p><b>percent <i>percentage</i></b>—Buffer size as a percentage of the total buffer.</p> <p><b>remainder</b>—Remaining buffer available.</p> <p><b>temporal</b>—(EX4200 standalone switches, EX4200 Virtual Chassis, EX4300 standalone switches, EX4300 Virtual Chassis, EX8200 standalone switches, and EX8200 Virtual Chassis only) Buffer size as a temporal value.</p> |

## interfaces

```
Syntax interfaces {
    interface-name {
        congestion-notification-profile profile-name {
            input {
                ieee-802.1 {
                    code-point up-bits pfc;
                }
            }
        }
        scheduler-map map-name;
        unit logical-unit-number {
            forwarding-class class-name;
            classifiers {
                (dscp | ieee-802.1 | inet-precedence) (classifier-name | default);
            }
        }
    }
}
```

**Hierarchy Level** [edit class-of-service]

**Release Information** Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Configure interface-specific class-of-service (CoS) properties for incoming packets.

**Options** *interface-name*—Name of the interface.

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## Monitoring CoS Classifiers

**Purpose**

**NOTE:** This topic applies only to the J-Web Application package.

Use the monitoring functionality to display the mapping of incoming CoS values to forwarding class and loss priority for each classifier.

**Action**

To monitor CoS classifiers in the J-Web interface, select **Monitor > Class of Service > Classifiers**.

To monitor CoS classifiers in the CLI, enter the following CLI command:

**show class-of-service classifier**

**Meaning**

[Table 212 on page 2158](#) summarizes key output fields for CoS classifiers.

Table 212: Summary of Key CoS Classifier Output Fields

| Field                      | Values                                                                                                                                                                                                                                                                                     | Additional Information                                      |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------|
| Classifier Name            | Name of a classifier.                                                                                                                                                                                                                                                                      | To display classifier assignments, click the plus sign (+). |
| CoS Value Type             | The classifiers are displayed by type: <ul style="list-style-type: none"> <li>• <b>dscp</b>—All classifiers of the DSCP type.</li> <li>• <b>ieee-802.1</b>—All classifiers of the IEEE 802.1 type.</li> <li>• <b>inet-precedence</b>—All classifiers of the IP precedence type.</li> </ul> |                                                             |
| Index                      | Internal index of the classifier.                                                                                                                                                                                                                                                          |                                                             |
| Incoming CoS Value         | CoS value of the incoming packets, in bits. These values are used for classification.                                                                                                                                                                                                      |                                                             |
| Assign to Forwarding Class | Forwarding class that the classifier assigns to an incoming packet. This class affects the forwarding and scheduling policies that are applied to the packet as it transits the switch.                                                                                                    |                                                             |
| Assign to Loss Priority    | Loss priority value that the classifier assigns to the incoming packet based on its CoS value.                                                                                                                                                                                             |                                                             |

## Monitoring CoS Forwarding Classes

### Purpose

**NOTE:** This topic applies only to the J-Web Application package.

View the current assignment of class-of-service (CoS) forwarding classes to queues on the switch.

### Action

To monitor CoS forwarding classes in the J-Web interface, select **Monitor > Class of Service > Forwarding Classes**.

To monitor CoS forwarding classes in the CLI, enter the following CLI command:

```
show class-of-service forwarding-class
```

**Meaning** Table 213 on page 2159 summarizes key output fields for CoS forwarding classes.

**Table 213: Summary of Key CoS Forwarding Class Output Fields**

| Field            | Values                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Forwarding Class | <p>Names of forwarding classes assigned to queue numbers. The following are the default forwarding classes:</p> <ul style="list-style-type: none"> <li>• <b>best-effort</b>—Provides no special CoS handling of packets. Loss priority is typically not carried in a CoS value.</li> <li>• <b>expedited-forwarding</b>—Provides low loss, low delay, low jitter, assured bandwidth, and end-to-end service.</li> <li>• <b>assured-forwarding</b>—Provides high assurance for packets within the specified service profile. Excess packets are dropped.</li> <li>• <b>network-control</b>—Packets can be delayed but not dropped.</li> </ul> <p>EX8200 switches have the following additional default forwarding classes:</p> <ul style="list-style-type: none"> <li>• <b>mcast-be</b>—Provides no special CoS handling of packets.</li> <li>• <b>mcast-ef</b>—Provides low loss, low delay, low jitter, assured bandwidth, and end-to-end service.</li> <li>• <b>mcast-af</b>—Provides high assurance for packets within the specified service profile. Excess packets are dropped.</li> </ul> <p>EX4300 switches supports all the forwarding classes mentioned above and the one mentioned in this section:</p> <ul style="list-style-type: none"> <li>• <b>mcast-nc</b>—Provides multicast network-control traffic.</li> </ul> |
| Queue            | <p>Queue number corresponding to the forwarding class name. The default forwarding classes are assigned as follows:</p> <ul style="list-style-type: none"> <li>• <b>best-effort</b>—0</li> <li>• <b>expedited-forwarding</b>—5</li> <li>• <b>assured-forwarding</b>—1</li> <li>• <b>network-control</b>—7</li> <li>• <b>mcast-be</b>—2</li> <li>• <b>mcast-ef</b>—4</li> <li>• <b>mcast-af</b>—6</li> </ul> <p>EX4300 switches have the following queue numbers for the forwarding classes:</p> <ul style="list-style-type: none"> <li>• <b>best-effort</b>—0</li> <li>• <b>expedited-forwarding</b>—1</li> <li>• <b>assured-forwarding</b>—2</li> <li>• <b>network-control</b>—3</li> <li>• <b>mcast-be</b>—8</li> <li>• <b>mcast-ef</b>—9</li> <li>• <b>mcast-af</b>—10</li> <li>• <b>mcast-nc</b>—11</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Fabric Priority  | <p>(EX8200 switches only) Fabric priority for the forwarding class, either <b>high</b> or <b>low</b>. The fabric priority determines the priority of packets entering the switch fabric.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Monitoring Interfaces That Have CoS Components

### Purpose

**NOTE:** This topic applies only to the J-Web Application package.

Use the monitoring functionality to display details about the physical and logical interfaces and the CoS components assigned to them.

### Action

To monitor interfaces that have CoS components in the J-Web interface, select **Monitor > Class of Service > Interface Association**.

To monitor interfaces that have CoS components in the CLI, enter the following command:

**show class-of-service interface *interface***

### Meaning

[Table 214 on page 2160](#) summarizes key output fields for CoS interfaces.

**Table 214: Summary of Key CoS Interfaces Output Fields**

| Field             | Values                                                                                            | Additional Information                                                                                 |
|-------------------|---------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| Interface         | Name of a physical interface to which CoS components are assigned.                                | To display names of logical interfaces configured on this physical interface, click the plus sign (+). |
| Scheduler Map     | Name of the scheduler map associated with this interface.                                         |                                                                                                        |
| Queues Supported  | Number of queues you can configure on the interface.                                              |                                                                                                        |
| Queues in Use     | Number of queues currently configured.                                                            |                                                                                                        |
| Logical Interface | Name of a logical interface on the physical interface to which CoS components are assigned.       |                                                                                                        |
| Object            | Category of an object—for example, <b>classifier</b> , <b>scheduler-map</b> , or <b>rewrite</b> . |                                                                                                        |
| Name              | Name that you have given to an object—for example, <b>ba-classifier</b> .                         |                                                                                                        |

Table 214: Summary of Key CoS Interfaces Output Fields (*continued*)

| Field | Values                                                              | Additional Information |
|-------|---------------------------------------------------------------------|------------------------|
| Type  | Type of an object—for example, <b>dscp</b> for a classifier.        |                        |
| Index | Index of this interface or the internal index of a specific object. |                        |

## Monitoring CoS Rewrite Rules

**Purpose**

**NOTE:** This topic applies only to the J-Web Application package.

Use the monitoring functionality to display information about CoS value rewrite rules, which are based on the forwarding class and loss priority.

**Action**

To monitor CoS rewrite rules in the J-Web interface, select **Monitor > Class of Service > Rewrite Rules**.

To monitor CoS rewrite rules in the CLI, enter the following command:

```
show class-of-service rewrite-rules
```

**Meaning**

[Table 215 on page 2161](#) summarizes key output fields for CoS rewrite rules.

Table 215: Summary of Key CoS Rewrite Rules Output Fields

| Field             | Values                                                                                                                                                                                                                                                      | Additional Information                                                                             |
|-------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|
| Rewrite Rule Name | Names of rewrite rules.                                                                                                                                                                                                                                     |                                                                                                    |
| CoS Value Type    | Rewrite rule type: <ul style="list-style-type: none"> <li>• <b>dscp</b>—For IPv4 DiffServ traffic.</li> <li>• <b>exp</b>—For MPLS traffic.</li> <li>• <b>ieee-802.1</b>—For Layer 2 traffic.</li> <li>• <b>inet-precedence</b>—For IPv4 traffic.</li> </ul> | To display forwarding classes, loss priorities, and rewritten CoS values, click the plus sign (+). |
| Index             | Internal index for this particular rewrite rule.                                                                                                                                                                                                            |                                                                                                    |

Table 215: Summary of Key CoS Rewrite Rules Output Fields (*continued*)

| Field                | Values                                                                                                 | Additional Information                                                                                           |
|----------------------|--------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|
| Forwarding Class     | Forwarding class that is used to determine CoS values for rewriting in combination with loss priority. | Rewrite rules are applied to CoS values in outgoing packets based on forwarding class and loss priority setting. |
| Loss Priority        | Loss priority that is used to determine CoS values for rewriting in combination with forwarding class. |                                                                                                                  |
| Rewrite CoS Value To | Value that the CoS value is rewritten to.                                                              |                                                                                                                  |

## Monitoring CoS Scheduler Maps

### Purpose

**NOTE:** This topic applies only to the J-Web Application package.

Use the monitoring functionality to display assignments of CoS forwarding classes to schedulers.

### Action

To monitor CoS scheduler maps in the J-Web interface, select **Monitor > Class of Service > Scheduler Maps**.

To monitor CoS scheduler maps in the CLI, enter the following CLI command:

```
show class-of-service scheduler-map
```

### Meaning

[Table 216 on page 2162](#) summarizes key output fields for CoS scheduler maps.

Table 216: Summary of Key CoS Scheduler Maps Output Fields

| Field            | Values                                                                   | Additional Information                |
|------------------|--------------------------------------------------------------------------|---------------------------------------|
| Scheduler Map    | Name of a scheduler map.                                                 | For details, click the plus sign (+). |
| Index            | Index of a specific object—scheduler maps, schedulers, or drop profiles. |                                       |
| Scheduler Name   | Name of a scheduler.                                                     |                                       |
| Forwarding Class | Forwarding classes this scheduler is assigned to.                        |                                       |

Table 216: Summary of Key CoS Scheduler Maps Output Fields (*continued*)

| Field             | Values                                                                                                                                                                                                                                                                                                                                                                                                         | Additional Information |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------|
| Transmit Rate     | Configured transmit rate of the scheduler in bits per second (bps). The rate value can be either of the following: <ul style="list-style-type: none"> <li>A percentage—The scheduler receives the specified percentage of the total interface bandwidth.</li> <li><b>remainder</b>— The scheduler receives the remaining bandwidth of the interface after bandwidth allocation to other schedulers.</li> </ul> |                        |
| Buffer Size       | Delay buffer size in the queue or the amount of transmit delay (in milliseconds). The buffer size can be either of the following: <ul style="list-style-type: none"> <li>A percentage—The buffer is a percentage of the total buffer allocation.</li> <li><b>remainder</b>—The buffer is sized according to what remains after other scheduler buffer allocations.</li> </ul>                                  |                        |
| Priority          | Scheduling priority of a queue: <ul style="list-style-type: none"> <li><b>strict-high</b>—Packets in this queue are transmitted first.</li> <li><b>low</b>—Packets in this queue are transmitted last.</li> </ul>                                                                                                                                                                                              |                        |
| Excess rate       | The percentage of excess bandwidth traffic to share.                                                                                                                                                                                                                                                                                                                                                           |                        |
| Drop Profiles     | Name and index of a drop profile that is assigned to a specific loss priority and protocol pair.                                                                                                                                                                                                                                                                                                               |                        |
| Loss Priority     | Packet loss priority corresponding to a drop profile.                                                                                                                                                                                                                                                                                                                                                          |                        |
| Protocol          | Transport protocol corresponding to a drop profile.                                                                                                                                                                                                                                                                                                                                                            |                        |
| Drop Profile Name | Name of the drop profile.                                                                                                                                                                                                                                                                                                                                                                                      |                        |
| Index             | Index of a specific object—scheduler maps, schedulers, or drop profiles.                                                                                                                                                                                                                                                                                                                                       |                        |

## Monitoring CoS Value Aliases

### Purpose

**NOTE:** This topic applies only to the J-Web Application package.

Use the monitoring functionality to display information about the CoS value aliases that the system is currently using to represent DSCP, IEEE 802.1p, and IPv4 precedence bits.

### Action

To monitor CoS value aliases in the J-Web interface, select **Monitor > Class of Service > CoS Value Aliases**.

To monitor CoS value aliases in the CLI, enter the following command:

```
show class-of-service code-point-aliases
```

### Meaning

Table 217 on page 2164 summarizes key output fields for CoS value aliases.

**Table 217: Summary of Key CoS Value Alias Output Fields**

| Field           | Values                                                                                                                                                                                                                                                                                                                                 | Additional Information                                        |
|-----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------|
| CoS Value Type  | Type of the CoS value: <ul style="list-style-type: none"> <li><b>dscp</b>—Examines Layer 3 packet headers for IP packet classification.</li> <li><b>ieee-802.1</b>—Examines Layer 2 packet headers for packet classification.</li> <li><b>inet-precedence</b>—Examines Layer 3 packet headers for IP packet classification.</li> </ul> | To display aliases and bit patterns, click the plus sign (+). |
| CoS Value Alias | Name given to a set of bits—for example, <b>af11</b> is a name for <b>001010</b> bits.                                                                                                                                                                                                                                                 |                                                               |
| CoS Value       | Set of bits associated with an alias.                                                                                                                                                                                                                                                                                                  |                                                               |

## Monitoring CoS Drop Profiles

### Purpose

**NOTE:** This topic applies only to the J-Web Application package.

Use the monitoring functionality to view data point information for each CoS random early detection (RED) drop profile on the EX8200 switch.

**Action** To monitor CoS RED drop profiles in the J-Web interface, select **Monitor > Class of Service > RED Drop Profiles**.

To monitor CoS RED drop profiles in the CLI, enter the following CLI command:  
`show class-of-service drop-profile`

**Meaning** [Table 218 on page 2165](#) summarizes the key output fields for CoS RED drop profiles.

**Table 218: Summary of the Key Output Fields for CoS Red Drop Profiles**

| Field                 | Values                                                                                                                                                                                                                                                                                                                                 | Additional Information                                                                             |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|
| RED Drop Profile Name | Name of the RED drop profile.<br><br>A drop profile consists of pairs of values between 0 and 100, one for queue buffer fill level and the other for drop probability, that determine the relationship between a buffer's fullness and the likelihood it will drop packets.                                                            | To display profile values, click the plus sign (+).                                                |
| Graph RED Profile     | Links to a graph of a RED curve that the system uses to determine the drop probability based on queue buffer fullness.                                                                                                                                                                                                                 | The x axis represents the queue buffer fill level, and the y axis represents the drop probability. |
| Type                  | Type of a specific drop profile: <ul style="list-style-type: none"> <li><b>interpolated</b>—The two coordinates (x and y) of the graph are interpolated to produce a smooth profile.</li> <li><b>segmented</b>—The two coordinates (x and y) of the graph are represented by line fragments to produce a segmented profile.</li> </ul> |                                                                                                    |
| Index                 | Internal index of this drop profile.                                                                                                                                                                                                                                                                                                   |                                                                                                    |
| Fill Level            | Percentage fullness of a buffer queue. This value is the x coordinate of the RED drop profile graph.                                                                                                                                                                                                                                   |                                                                                                    |
| Drop Probability      | Drop probability of a packet corresponding to a specific queue buffer fill level. This value is the y coordinate of the RED drop profile graph.                                                                                                                                                                                        |                                                                                                    |

| <b>Output Fields</b>            | Table 219 on page 2167 lists the output fields for the <b>show class-of-service</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                         |

**Table 219: show class-of-service Output Fields**

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                      | Level of Output |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Forwarding class</b> | The forwarding class configuration: <ul style="list-style-type: none"> <li>• <b>Forwarding class</b>—Name of the forwarding class.</li> <li>• <b>ID</b>—Forwarding class ID.</li> <li>• <b>Queue</b>—Queue number.</li> <li>• <b>Fabric Priority</b>—(EX8200 switches only) Fabric priority: either <b>high</b> or <b>low</b>. The fabric priority determines which CoS ingress queues packets are sent to.</li> </ul> | All levels      |
| <b>Code point type</b>  | The type of code-point alias: <ul style="list-style-type: none"> <li>• <b>dscp</b>—Aliases for DiffServ code point (DSCP) values.</li> <li>• <b>ieee-802.1</b>—Aliases for IEEE 802.1p values.</li> <li>• <b>inet-precedence</b>—Aliases for IP precedence values.</li> <li>• <b>exp</b>—Aliases for experimental (EXP) values.</li> </ul>                                                                             | All levels      |
| <b>Alias</b>            | Names given to CoS values.                                                                                                                                                                                                                                                                                                                                                                                             | All levels      |
| <b>Bit pattern</b>      | Set of bits associated with an alias.                                                                                                                                                                                                                                                                                                                                                                                  | All levels      |
| <b>Classifier</b>       | Name of the classifier.                                                                                                                                                                                                                                                                                                                                                                                                | All levels      |

Table 219: show class-of-service Output Fields (*continued*)

| Field Name                | Field Description                                                                                        | Level of Output |
|---------------------------|----------------------------------------------------------------------------------------------------------|-----------------|
| <b>Code point</b>         | Code-point values.                                                                                       | All levels      |
| <b>Loss priority</b>      | Loss priority assigned to specific CoS values and aliases of the classifier.                             | All levels      |
| <b>Rewrite rule</b>       | Name of the rewrite-rule.                                                                                | All levels      |
| <b>Drop profile</b>       | Name of the drop profile.                                                                                | All levels      |
| <b>Type</b>               | Type of drop profile. EX Series switches support only the <b>discrete</b> type of drop profile.          | All levels      |
| <b>Fill level</b>         | Percentage of queue buffer fullness of <i>high</i> packets beyond which <i>high</i> packets are dropped. | All levels      |
| <b>Scheduler</b>          | Name of the scheduler.                                                                                   | All levels      |
| <b>Transmit rate</b>      | Transmission rate of the scheduler.                                                                      | All levels      |
| <b>Excess rate</b>        | Percentage of excess bandwidth traffic to share.                                                         | All levels      |
| <b>Buffer size</b>        | Delay buffer size in the queue.                                                                          | All levels      |
| <b>Drop profiles</b>      | Drop profiles configured for the specified scheduler.                                                    | All levels      |
| <b>Protocol</b>           | Transport protocol corresponding to the drop profile.                                                    | All levels      |
| <b>Name</b>               | Name of the drop profile.                                                                                | All levels      |
| <b>Queues supported</b>   | Number of queues that can be configured on the interface.                                                | All levels      |
| <b>Queues in use</b>      | Number of queues currently configured.                                                                   | All levels      |
| <b>Physical interface</b> | Name of the physical interface.                                                                          | All levels      |
| <b>Scheduler map</b>      | Name of the scheduler map.                                                                               | All levels      |
| <b>Index</b>              | Internal index of a specific object.                                                                     | All levels      |

## Sample Output

### show class-of- service

```

user@switch> show class-of-service
Forwarding class      ID      Queue
best-effort           0        0
expedited-forwarding  1        5
assured-forwarding    2        1
network-control       3        7

```

| <b>Output Fields</b>            | Table 220 on page 2172 describes the output fields for the <b>show class-of-service classifier</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Table 220: show class-of-service classifier Output Fields**

| Field Name              | Field Description                                                                                                                                                       |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Classifier</b>       | Name of the classifier.                                                                                                                                                 |
| <b>Code point type</b>  | Type of the classifier: <b>exp</b> (not on EX Series switch), <b>dscp</b> , <b>dscp-ipv6</b> (not on EX Series switch), <b>ieee-802.1</b> , or <b>inet-precedence</b> . |
| <b>Index</b>            | Internal index of the classifier.                                                                                                                                       |
| <b>Code point</b>       | Code point value used for classification                                                                                                                                |
| <b>Forwarding class</b> | Classification of a packet affecting the forwarding, scheduling, and marking policies applied as the packet transits the router.                                        |

Table 220: show class-of-service classifier Output Fields (*continued*)

| Field Name    | Field Description                                                                                                                                                                                                 |
|---------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Loss priority | Loss priority value used for classification. For most platforms, the value is <b>high</b> or <b>low</b> . For some platforms, the value is <b>high</b> , <b>medium-high</b> , <b>medium-low</b> , or <b>low</b> . |

## Sample Output

### show class-of-service classifier type ieee-802.1

```

user@host> show class-of-service classifier type ieee-802.1
Classifier: ieee802.1-default, Code point type: ieee-802.1, Index: 3
Code Point      Forwarding Class      Loss priority
000             best-effort           low
001             best-effort           high
010             expedited-forwarding  low
011             expedited-forwarding  high
100             assured-forwarding    low
101             assured-forwarding    medium-high
110             network-control       low
111             network-control       high

Classifier: users-ieee802.1, Code point type: ieee-802.1
Code point      Forwarding class      Loss priority
100             expedited-forwarding  low

```

### show class-of-service classifier type ieee-802.1 (QFX Series)

```

user@switch> show class-of-service classifier type ieee-802.1
Classifier: ieee8021p-default, Code point type: ieee-802.1, Index: 11
Code point      Forwarding class      Loss priority
000             best-effort           low
001             best-effort           low
010             best-effort           low
011             fcoe                  low
100             no-loss               low
101             best-effort           low
110             network-control       low
111             network-control       low

Classifier: ieee-mcast, Code point type: ieee-802.1, Index: 46
Code point      Forwarding class      Loss priority
000             mcast                 low
001             mcast                 low
010             mcast                 low
011             mcast                 low
100             mcast                 low
101             mcast                 low
110             mcast                 low
111             mcast                 low

```

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Table 223: show class-of-service forwarding-class Output Fields**

| Field Name               | Field Description                                                                                                                                                  |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Forwarding class</b>  | Name of the forwarding class.                                                                                                                                      |
| <b>ID</b>                | Forwarding class identifier.                                                                                                                                       |
| <b>Queue</b>             | CoS queue mapped to the forwarding class.                                                                                                                          |
| <b>Policing priority</b> | Not supported on EX Series switches or the QFX Series and can be ignored.                                                                                          |
| <b>Fabric priority</b>   | (EX8200 switches only) Fabric priority for the forwarding class, either <b>high</b> or <b>low</b> . Determines the priority of packets entering the switch fabric. |

Table 223: show class-of-service forwarding-class Output Fields (*continued*)

| Field Name     | Field Description                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>No-Loss</b> | <p>(QFX Series only) Packet loss attribute to differentiate lossless forwarding classes from lossy forwarding classes:</p> <ul style="list-style-type: none"> <li>Disabled—Lossless transport is not configured on the forwarding class (packet drop attribute is <b>drop</b>).</li> <li>Enabled—Lossless transport is configured on the forwarding class (packet drop attribute is <b>no-loss</b>).</li> </ul> |

## Sample Output

### show class-of-service forwarding-class

```

user@switch> show class-of-service forwarding-class
Forwarding class      ID      Queue Policing priority
best-effort           0        0      normal
expedited-forwarding  1        5      normal
assured-forwarding    2        1      normal
network-control       3        7      normal

```

## Sample Output

### show class-of-service forwarding-class (EX8200 Switch)

```

user@switch> show class-of-service forwarding-class
Forwarding class      ID      Queue Fabric priority
best-effort           0        0      low
expedited-forwarding  1        5      low
assured-forwarding    2        1      low
network-control       3        7      low
mcast-be              4        2      low
mcast-ef              5        4      low
mcast-af              6        6      low

```

## Sample Output

### show class-of-service forwarding-class (QFX Series)

```

user@switch> show class-of-service forwarding-class
Forwarding class      ID      Queue Policing priority No-Loss
best-effort           0        0      normal      Disabled

mcast                 8        8      normal      Disabled

```

## show pfe statistics traffic cpu

**Syntax** `show pfe statistics traffic cpu <fpc fpc-slot>`

**Release Information** Command introduced in Junos OS Release 9.5 for EX Series switches.

**Description** (On EX8200 switches only) Display count of multidestination packets ingressing from the physical interface to the CPU.

**NOTE:** Multidestination packets include unknown unicast, broadcast, and multicast packets.

**Options** **none**—Displays the count of packets ingressing from all the physical interfaces (line cards) to the CPU.

**fpc fpc-slot**—(Optional) Displays the count of packets ingressing from the physical interface, referred to by the slot number, to the CPU.

On an EX8200 switch, the FPC slot number is the slot number for the line card. Possible values are **0** through **7** on the EX8208 switch and **0** through **15** on the EX8216 switch.

**Output Fields** [Table 224 on page 2181](#) lists the output fields for the `show pfe statistics traffic cpu` command. Output fields are listed in the approximate order in which they appear.

**Table 224: show pfe statistics traffic cpu Output Fields**

| Field Name         | Field Description                       |
|--------------------|-----------------------------------------|
| Queue              | CoS queue number.                       |
| Forwarding classes | Forwarding class name.                  |
| Queued Packets     | Number of packets queued to this queue. |

Table 224: show pfe statistics traffic cpu Output Fields (*continued*)

| Field Name           | Field Description                                                                                                                                                                                                                                                               |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Queued Bytes         | Number of bytes queued to this queue.                                                                                                                                                                                                                                           |
| Packets              | Number of packets transmitted by this queue.                                                                                                                                                                                                                                    |
| Bytes                | Number of bytes transmitted by this queue.                                                                                                                                                                                                                                      |
| Tail-dropped packets | Count of packets dropped at the tail end of the queue because of lack of buffer space.                                                                                                                                                                                          |
| RED-dropped packets  | Number of packets dropped because of Random Early Discard (RED): <ul style="list-style-type: none"> <li>• <b>Low</b>—Number of low-loss priority packets dropped because of RED.</li> <li>• <b>High</b>—Number of high-loss priority packets dropped because of RED.</li> </ul> |
| RED-dropped bytes    | Number of bytes dropped because of Random Early Discard (RED): <ul style="list-style-type: none"> <li>• <b>Low</b>—Number of low-loss priority bytes dropped because of RED.</li> <li>• <b>High</b>—Number of high-loss priority bytes dropped because of RED.</li> </ul>       |

## show pfe statistics traffic egress-queues

**Syntax** `show pfe statistics traffic egress-queues <fpc fpc-slot>`

**Release Information** Command introduced in Junos OS Release 9.5 for EX Series switches.

**Description** (On EX8200 switches only) Display count of multidestination packets dropped on egress ports when the egress queues are oversubscribed due to multidestination traffic.

**NOTE:** Multidestination packets include unknown unicast, broadcast, and multicast packets.

**Options** **none**—Displays count of packets dropped on egress ports of all physical interfaces (line cards) when egress queues are oversubscribed due to multidestination traffic.

**fpc fpc-slot**—(Optional) Displays count of packets dropped on egress ports of the physical interface (line card) referred to by the slot number.

**NOTE:** On an EX8200 switch, the FPC slot number is the slot number for the line card. Possible values are 0 through 7 on the EX8208 switch and 0 through 15 on the EX8216 switch.

**Table 225: show pfe statistics traffic egress-queues Output Fields**

| Field Name           | Field Description                                                             |
|----------------------|-------------------------------------------------------------------------------|
| Tail-dropped packets | Number of arriving packets dropped because the output queue buffers are full. |

## Sample Output

### show pfe statistics traffic egress-queues fpc 4 (EX8208 Switch)

```
user@switch> show pfe statistics traffic egress-queues fpc 4
Tail-dropped packets :                0
```

## show pfe statistics traffic multicast

**Syntax** `show pfe statistics traffic multicast <fpc fpc-slot dev-number>`

**Release Information** Command introduced in Junos OS Release 9.5 for EX Series switches.

**Description** (On EX8200 switches only) Display class-of-service (CoS) queue information for multdestination traffic on a physical interface (line card).

**NOTE:** Multidestination packets include unknown unicast, broadcast, and multicast packets.

**NOTE:** To view statistical information for unicast traffic, use the `show interfaces queue` command.

**Options** `fpc fpc-slot dev-number`—(Optional) Displays class-of-service (CoS) queue information for multdestination traffic on the physical interface (line card) referred to by the slot number and device number.

**NOTE:** On an EX8200 switch, the FPC slot number is the slot number for the line card. Possible values for the FPC slot number are 0 through 7 on the EX8208 switch and 0 through 15 on the EX8216 switch. The value for the device number ranges from 0–5, where 0–4 values correspond to the statistics only from that specific device and the value 5 corresponds to the combined statistics from all the devices in the FPC.

# Troubleshooting Procedures

- [Troubleshooting CoS Schedulers on a 40-port SFP+ Line Card in an EX8200 Switch on page 2191](#)
- [Troubleshooting a CoS Classifier Configuration for a TCAM Space Error on page 2192](#)

## Troubleshooting CoS Schedulers on a 40-port SFP+ Line Card in an EX8200 Switch

- Problem** **Description:** After you configure a scheduler map on an interface on the 40-port SFP+ line card, you notice one or both of the following:
- All packets are being dropped on a class-of-service queue configured on the interface.
  - A message in the system log states that the interface is using the default scheduler map, not the scheduler map you configured. For example:
- ```
Sep 19 21:26:50 hostname cosd[907]: COSD_SCHED_MAP_GROUP_CONFLICT:  
Interface xe-5/0/15 cannot be bound to scheduler-map m1. It will be bound to  
default scheduler-map
```
- Cause** The ports in a 40-port SFP+ line card are divided into eight groups, each group comprising five ports. The ports in a port group share 10 gigabits of bandwidth. Because the port groups share bandwidth, only one scheduler map can be active at a time in a port group. If you configure different scheduler maps for different interfaces in a port group, you do not receive an error when you commit the configuration. Instead, default scheduler map becomes the active scheduler map for all interfaces in the port group, and messages in the system log report that the default scheduler map is in use for the affected interfaces. If the default scheduler map does not define a queue, all traffic is dropped on that queue.
- Solution** Check your CoS configuration for the interfaces in the port group. If you have different scheduler maps assigned to different interfaces in the port group:
1. Delete the scheduler map configuration for all interfaces in the port group.
  2. Determine the scheduler map that you want all interfaces in the port group to use.
  3. Assign that scheduler map to at least one interface in the port group. The remaining interfaces in the port group will adopt this scheduler map.

**BEST PRACTICE:** To prevent confusion and future configuration conflicts, explicitly assign the scheduler map to each interface in the port group.

4. After you commit the configuration, verify that the scheduler map is the active scheduler map for the interfaces in the port group by using the **show class-of-service forwarding-table scheduler-map** command.

## Troubleshooting a CoS Classifier Configuration for a TCAM Space Error

---

**Problem**    **Description:** When a CoS classifier configuration exceeds the amount of available ternary content addressable memory (TCAM) space, the switch returns the following system log message:

```
<number_of_rules_being_added> rules for <filter_name> class <filter_class> will  
not be installed, key: <bind_point>. no space in tcam db(<shared_pool_information>)
```

The switch returns this message during the commit operation if the number of classifiers defined in the CoS configuration or the number of bind points (interfaces) to which classifiers are bound causes the CoS configuration to exceed the amount of available TCAM space. However, the commit operation for the CoS configuration is completed in the CLI module.

**Solution**    When a CoS configuration exceeds the amount of available TCAM table space, you must either define fewer classifiers or bind them to fewer interfaces, or both, so that the space requirements for the CoS configuration do not exceed the available space in TCAM.

To delete classifier definitions and bind points in a CoS configuration, and to apply a new CoS classifier definition to fewer bind points:

1. Delete either the CoS classifier definition or the bind points:

- To delete the CoS classifier definition:

- For behavioral classifiers:

```
[edit class-of-service]
user@switch# delete classifier dscp d1
```

- For multifield classifiers:

```
[edit]
user@switch# delete interfaces ge-3/0/2 unit 0 family ethernet-switching filter input
ipacl
```

This command deletes a multifield classifier defined for a port. Similarly, you can delete a multifield classifier defined for a VLAN or router.

You can also delete terms defined in a single multifield classifier:

```
[edit]
user@switch# delete firewall family inet filter f1 term t1
```

In both these examples (for behavioral and multifield classifiers), the assumption is that too many classifier definitions resulted in the error message.

- To delete the bind points:

```
[edit class-of-service]
user@switch# delete class-of-service interfaces ge-0/0/0
user@switch# delete class-of-service interfaces ge-0/0/1
user@switch# delete class-of-service interfaces ge-0/0/2
user@switch# delete class-of-service interfaces ge-0/0/3
user@switch# delete class-of-service interfaces ge-0/0/4
user@switch# delete class-of-service interfaces ge-0/0/5
user@switch# delete class-of-service interfaces ge-0/0/6
user@switch# delete class-of-service interfaces ge-0/0/7
user@switch# delete class-of-service interfaces ge-0/0/8
```

Here the assumption is that too many bind points (nine) in the configuration resulted in the error message.

2. Commit the operation:

```
[edit]
user@switch# commit
```

3. Define fewer classifiers in the CoS configuration or bind classifiers to fewer interfaces, or both, so that the CoS classifier configuration does not exceed the amount of available TCAM space on the switch:

- To define CoS classifiers:

- For behavioral classifiers:

```
[edit]
user@switch# set class-of-service classifiers dscp d2 forwarding-class fc1 loss-priority
low code-points 000001
user@switch# set class-of-service classifiers dscp d2 forwarding-class fc2 loss-priority
low code-points 000010
user@switch# set class-of-service classifiers dscp d2 forwarding-class fc3 loss-priority
low code-points 000011
```

```
user@switch# set class-of-service classifiers dscp d2 forwarding-class fc4 loss-priority
low code-points 000100
user@switch# set class-of-service classifiers dscp d2 forwarding-class fc5 loss-priority
low code-points 000101
user@switch# set class-of-service classifiers dscp d2 forwarding-class fc6 loss-priority
low code-points 000110
user@switch# set class-of-service classifiers dscp d2 forwarding-class fc7 loss-priority
low code-points 000111
```

- For multifield Classifiers:

```
[edit]
user@switch# set firewall family inet filter f1 term t1 from protocol tcp
user@switch# set firewall family inet filter f1 term t1 then loss-priority high
user@switch# set firewall family inet filter f1 term t1 then forwarding-class best-effort
user@switch# set firewall family inet filter f1 term t2 from protocol udp
user@switch# set firewall family inet filter f1 term t2 then loss-priority high
user@switch# set firewall family inet filter f1 term t2 then forwarding-class
assured-forwarding
user@switch# set firewall family inet filter f1 term t3 from source-port ssh
user@switch# set firewall family inet filter f1 term t3 then loss-priority low
user@switch# set firewall family inet filter f1 term t3 then forwarding-class fc8
user@switch# set class-of-service forwarding-classes best-effort, assured-forwarding,
fc8
```

- To bind classifiers to fewer interfaces:

```
[edit]
user@switch# set class-of-service interfaces ge-0/0/0 unit 0 classifiers dscp d2
user@switch# set class-of-service interfaces ge-0/0/1 unit 0 classifiers dscp d2
user@switch# set class-of-service interfaces ge-0/0/2 unit 0 forwarding-class best-effort
user@switch# set class-of-service interfaces ge-0/0/3 unit 0 forwarding-class
assured-forwarding
user@switch# set class-of-service interfaces ge-0/0/4 unit 0 forwarding-class fc8
```

4. Commit the operation:

```
[edit]
user@switch# commit
```

5. Check system log for an error message. If an error message is not logged, then your classifier configuration has not exceeded the TCAM space limit.

If an error message is logged, then repeat this procedure by defining fewer classifiers or binding classifiers to fewer bind points.

## Understanding Storm Control on Switching Devices

**NOTE:** This topic uses Junos OS with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switching device is an EX Series switch and runs software that does not support ELS, see *Understanding Storm Control on EX Series Switches*. If your switching device is an EX Series switch and runs software that does support ELS, see [“Getting Started with Enhanced Layer 2 Software” on page 3](#).

A traffic storm is generated when messages are broadcast on a network and each message prompts a receiving node to respond by broadcasting its own messages on the network. This, in turn, prompts further responses, creating a snowball effect. The LAN is suddenly flooded with packets, creating unnecessary traffic that leads to poor network performance or even a complete loss of network service.

Storm control enables the switching device to monitor traffic levels and to drop broadcast, multicast, and unknown unicast packets when a specified traffic level—called the *storm control level* or *storm control bandwidth*—is exceeded, thus preventing packets from proliferating and degrading the LAN. As an alternative to having the switching device drop packets, you can configure storm control to shut down interfaces or temporarily disable interfaces (see the [action-shutdown](#) statement and the [recovery-timeout](#) statement) when the storm control level is exceeded.

**NOTE:** On Juniper Networks EX4300 Ethernet Switches, the factory default configuration enables storm control on all Layer 2 interfaces, with the storm control level set to 80 percent of the combined broadcast, multicast, and unknown unicast traffic streams.

Storm control is not enabled by default on Juniper Networks EX9200 Ethernet Switches.

Storm control is not enabled by default on Juniper Networks MX Series routers.

You can customize the storm control level for a specific interface by explicitly configuring either bandwidth level or bandwidth percentage.

- **Bandwidth level**—Configures the storm control level as the bandwidth in kilobits per second of the applicable traffic streams on that interface.
- **Bandwidth percentage**—Configures the storm control level as a percentage of the available bandwidth used by the combined applicable traffic streams that are subject to storm control on that interface.

**NOTE:** You cannot configure both bandwidth level and bandwidth percentage for the same interface.

You can disable storm control selectively for broadcast, multicast, or unknown unicast traffic, or any combination of traffic types. When disabling storm control for multicast traffic, you can specify the traffic to be either registered multicast or unregistered multicast. Registered multicast MAC addresses are multicast MAC addresses that are within the range 01-00-5E-00-00-00 through 01-00-5E-7F-FF-FF. This range has been reserved by the Internet Assigned Numbers Association (IANA) for multicast Ethernet addresses. Multicast MAC addresses that are outside this range are called unregistered multicast addresses.

The sending and receiving of broadcast, multicast, and unicast packets are part of normal LAN operation. Therefore, to recognize a storm, you must be able to identify when traffic has reached a level that is abnormal for your LAN. Suspect a storm when operations begin timing out and network response times slow down. As more packets flood the LAN, network users might be unable to access servers or e-mail.

Monitor the level of broadcast, multicast, and unknown unicast traffic in the LAN when it is operating normally. Use this data as a benchmark to determine when traffic levels are too high. Then configure storm control to set the level at which you want the switching device to drop broadcast traffic, multicast traffic, unknown unicast traffic, or two or all three of those traffic types.

**NOTE:** When you configure storm control level on an aggregated Ethernet interface, the storm control level for each member of the aggregated Ethernet interface is set to that bandwidth or level. For example, if you configure a storm control level of 15,000 Kbps on ae1, and ae1 has two members, ge-0/0/0 and ge-0/0/1, each member has a storm control level of 15,000 Kbps. Thus, the storm control level on ae1 allows a traffic rate of up to 30,000 Kbps of combined traffic streams. Traffic might include broadcast, multicast, and unknown unicast traffic, depending upon the configuration.

## Unknown Unicast Forwarding Overview

- [Understanding Unknown Unicast Forwarding on page 2199](#)

### Understanding Unknown Unicast Forwarding

Unknown unicast traffic consists of unicast packets with unknown destination MAC addresses. By default, the switch floods these unicast packets that are traveling in a VLAN to all interfaces that are members of the VLAN. Forwarding this type of traffic can create unnecessary traffic that leads to poor network performance or even a complete loss of network service. This is known as a traffic storm.

To prevent a storm, you can disable the flooding of unknown unicast packets to all VLAN interfaces by configuring one VLAN or all VLANs to forward all unknown unicast traffic to a specific interface. This channels the unknown unicast traffic to a single interface.

## Configuration Examples

---

- [Example: Configuring Storm Control to Prevent Network Outages on EX Series Switches on page 2201](#)

### Example: Configuring Storm Control to Prevent Network Outages on EX Series Switches

**NOTE:** This example uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Example: Configuring Storm Control to Prevent Network Outages on EX Series Switches*. For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 3](#).

Storm control enables you to prevent network outages caused by broadcast storms on the LAN. You can configure storm control on an EX Series switch to rate-limit broadcast traffic, multicast traffic, and unknown unicast traffic at a specified level and to have packets dropped when the specified traffic level is exceeded, thereby preventing packets from proliferating and degrading the LAN.

**NOTE:** On EX4300 switches, the factory default configuration enables storm control on all Layer 2 interfaces, with the storm control level set to 80 percent of the available bandwidth used by the applicable traffic streams on that interface.

This example shows how to configure storm control on an EX Series switch running Junos OS with ELS.

- [Requirements on page 2202](#)
- [Overview and Topology on page 2202](#)

- [Configuration on page 2202](#)
- [Verification on page 2203](#)

## Requirements

---

This example uses the following hardware and software components:

- One EX Series switch running Junos OS with ELS
- Junos OS Release 13.2 or later for EX Series switches

## Overview and Topology

---

A storm is generated when messages are broadcast on a network and each message prompts a receiving node to respond by broadcasting its own messages on the network. This, in turn, prompts further responses, creating a snowball effect and resulting in a broadcast storm that can cause network outages.

You can use storm control to prevent broadcast storms by specifying the amount, also known as the *storm control level*, of broadcast traffic, multicast traffic, and unknown unicast traffic to be allowed on an interface. You specify the storm control level as the traffic rate in kilobits per second (Kbps) of the combined applicable traffic streams or as the percentage of available bandwidth used by the combined applicable traffic streams.

Storm control monitors the level of applicable incoming traffic and compares it with the level that you specify. If the combined level of the applicable traffic exceeds the specified level, the switch drops packets for the controlled traffic types. As an alternative to having the switch drop packets, you can configure storm control to shut down interfaces or temporarily disable interfaces (see the [action-shutdown](#) statement or the [recovery-timeout](#) statement) when the storm control level is exceeded.

The topology used in this example consists of one switch connected to various network devices. This example shows how to configure the storm control level on interface ge-0/0/0 by setting the level to a traffic rate of 15,000 Kbps, based on the traffic rate of the combined applicable traffic streams. If the combined traffic exceeds this level, the switch drops packets for the controlled traffic types to prevent a network outage.

## Configuration

---

### CLI Quick Configuration

To quickly configure storm control based on the traffic rate in Kbps of the combined traffic streams, copy the following command and paste it into the switch terminal window:

```
[edit]
set forwarding-options storm-control-profiles sc all bandwidth-level 15000
set interfaces ge-0/0/0 unit 0 family ethernet-switching storm-control sc
```

### Step-by-Step Procedure

To configure storm control:

1. Configure a storm control profile, **sc**, and specify the traffic rate in Kbps of the combined traffic streams:  
  
[edit]  
user@switch> set forwarding-options storm-control-profiles sc all bandwidth-level 15000
2. Bind the storm control profile, **sc**, to a logical interface:

```
[edit]
user@switch> set interfaces ge-0/0/0 unit 0 family ethernet-switching storm-control sc
```

**Results** Display the results of the configuration:

```
[edit forwarding-options]
user@switch> show storm-control-profiles sc
all {
    bandwidth 15000;
}

[edit]
user@switch> show interfaces ge-0/0/0
unit 0 {
    family ethernet-switching {
        vlan {
            members default;
        }
    }
    storm-control sc;
}
}
```

### Verification

#### *Verifying That the Storm Control Configuration Is in Effect*

**Purpose** Confirm that storm control is limiting the rate of traffic on the interface.

**Action** Use the **show interfaces ge-0/0/0 detail** operational mode command to view traffic statistics on the storm controlled interface. The input rate (bps) must not exceed the storm control limit.

```
user@switch> show interfaces ge-0/0/0 detail
Physical interface: ge-0/0/0, Enabled, Physical link is Up

## Configuration Tasks

- [Configuring Unknown Unicast Forwarding \(CLI Procedure\) on page 2205](#)
- [Configuring Autorecovery From the Disabled State on Secure or Storm Control Interfaces \(CLI Procedure\) on page 2206](#)
- [Configuring or Disabling Storm Control \(CLI Procedure\) on page 2207](#)

## Configuring Unknown Unicast Forwarding (CLI Procedure)

**NOTE:** This task uses Junos OS for EX Series switches or QFX Series with support for the Enhanced Layer 2 Software (ELS) configuration style. If your EX Series switch runs software that does not support ELS, see *Configuring Unknown Unicast Forwarding (CLI Procedure)*. For ELS details, see “[Getting Started with Enhanced Layer 2 Software](#)” on page 3

Unknown unicast traffic consists of packets with unknown destination MAC addresses. By default, the switch floods these packets to all interfaces associated with a VLAN. Forwarding such traffic to interfaces on the switch can create a security issue.

To prevent flooding unknown unicast traffic across the switch, configure unknown unicast forwarding to direct all unknown unicast packets within a VLAN out to a specific interface. You can configure each VLAN to divert unknown unicast traffic to different interfaces or use one interface for multiple VLANs.

To configure unknown unicast forwarding options:

- Configure unknown unicast forwarding for a specific VLAN (here, the VLAN name is employee), and specify the interface to which all unknown unicast traffic will be forwarded:

```
[edit switch-options]
user@switch# set unknown-unicast-forwarding vlan vlan-name interface ge-x/y/z.0
```

### Related Documentation

- [Verifying That Unknown Unicast Packets Are Forwarded to a Single Interface on page 2233](#)
- [Understanding Unknown Unicast Forwarding on page 2199](#)

## Configuring Autorecovery From the Disabled State on Secure or Storm Control Interfaces (CLI Procedure)

**NOTE:** This example uses Junos OS with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switching device is an EX Series switch and runs software that does not support ELS, see *Understanding Storm Control on EX Series Switches*. If your switching device is an EX Series switch and runs software that does support ELS, see [“Getting Started with Enhanced Layer 2 Software” on page 3](#).

An Ethernet switching access interface on a switching device might shut down or be disabled as a result of one of the following port-security or storm-control configurations:

- MAC limiting—(Not supported for MX Series routers) The **mac-limit** statement is configured with the **action-shutdown** statement.
- MAC move limiting—(Not supported on EX9200 switches or MX Series routers) The **mac-move-limit** statement is configured with the **action-shutdown** statement.
- Storm control—The **storm-control** statement is configured with the **action-shutdown** statement.

You can configure the switching device to automatically restore the disabled interfaces to service after a specified period of time. The specified time configured in the **recovery-timeout** statement applies to all the interfaces that have been disabled due to MAC limiting, MAC move limiting, or storm control errors.

**NOTE:** To enable autorecovery, specify the recovery timeout value for the interfaces to recover automatically. There is no default recovery timeout. If you do not specify a timeout value, you need to use the [clear ethernet-switching recovery-timeout](#) command for EX Series switches and the [clear bridge recovery-timeout](#) command for MX Series routers to clear the errors and restore the interfaces to service.

To specify the recovery timeout period for the interface:

- Set the **recovery-timeout** statement.

For EX Series switches:

```
[edit interfaces interface-name family unit 0 ethernet-switching]  
user@switch# set recovery-timeout seconds
```

For MX Series routers:

```
[edit interfaces interface-name family unit 0 bridge]  
user@switch# set recovery-timeout seconds
```

If your switching device is an EX Series switch and runs software that does not support ELS, see *Understanding Storm Control on EX Series Switches*. If your switching device is an EX Series switch and runs software that does support ELS, see [“Getting Started with Enhanced Layer 2 Software” on page 3](#).

On EX4300 switches, the factory default configuration enables storm control on all Layer 2 switch interfaces. The default storm control level is set to 80 percent of the available bandwidth used by the combined broadcast, multicast, and unknown unicast traffic streams.

Storm control is not enabled by default on EX9200 switches or MX Series routers.

You can customize the storm control level for a specific interface. You specify the storm control level as the traffic rate in kilobits per second (Kbps) of the combined traffic streams or as the percentage of available bandwidth used by the combined traffic streams.

You can selectively disable storm control for broadcast, multicast, or unknown unicast traffic on all interfaces or on a specified interface. You can additionally disable storm control on registered or unregistered multicast traffic.

This topic describes the following tasks. In these tasks, you use the **[edit interfaces *interface-name* unit 0 family ethernet-switching]** hierarchy level to bind the storm control profile for EX Series switches and the **[edit interfaces *interface-name* unit 0 family bridge]** hierarchy level to bind the storm control profile for MX Series routers.

## Configuring Storm Control

---

You can configure storm control for a specific interface. The storm control level can be customized by explicitly configuring either the bandwidth level or the bandwidth percentage.

- **bandwidth-level**—Configures the storm control level as the bandwidth in kilobits per second of the combined traffic streams.
- **bandwidth-percentage**—Configures the storm control level as a percentage of the available bandwidth used by the combined traffic streams.

To configure storm control:

1. Create a storm control profile and set the storm control level as the traffic rate in kilobits per second of the combined traffic streams:

```
[edit forwarding-options]
user@device# set storm-control-profiles profile-name all bandwidth-level kbps
```

2. Bind the storm control profile to a logical interface:

For EX Series switches:

```
[edit]
user@device# set interfaces interface-name unit 0 family ethernet-switching storm-control
profile-name
```

For MX Series routers:

```
[edit]
user@device# set interfaces interface-name unit 0 family bridge storm-control profile-name
```

## Disabling Storm Control on Broadcast Traffic

---

To disable storm control on broadcast traffic:

1. Create a storm control profile with the storm control level set as the traffic rate in kilobits per second of the combined traffic streams and exclude broadcast traffic:

```
[edit forwarding-options]
user@device# set storm-control-profiles profile-name all bandwidth-level kbps no-broadcast
```

2. Bind the storm control profile to a logical interface:

For EX Series switches:

```
[edit]
user@device# set interfaces interface-name unit 0 family ethernet-switching storm-control
profile-name
```

For MX Series routers:

```
[edit]
user@device# set interfaces interface-name unit 0 family bridge storm-control profile-name
```

### Disabling Storm Control on All Multicast Traffic

To disable storm control on all multicast traffic:

1. Create a storm control profile with the storm control level set as the traffic rate in kilobits per second of the combined traffic streams but exclude multicast traffic:  

```
[edit forwarding-options]
user@device# set storm-control-profiles profile-name all bandwidth-level kbps no-multicast
```
2. Bind the storm control profile to a logical interface:

For EX Series switches:

```
[edit]
user@device# set interfaces interface-name unit 0 family ethernet-switching storm-control
profile-name
```

For MX Series routers:

```
[edit]
user@device# set interfaces interface-name unit 0 family bridge storm-control profile-name
```

### Disabling Storm Control on Registered Multicast Traffic

To disable storm control on only registered multicast traffic:

1. Create a storm control profile with the storm control level set as the traffic rate in kilobits per second of the combined traffic streams but exclude registered multicast traffic:

```
[edit forwarding-options]
user@device# set storm-control-profiles profile-name all bandwidth-level kbps
no-registered-multicast
```

2. Bind the storm control profile to a logical interface:

For EX Series switches:

```
[edit]
user@device# set interfaces interface-name unit 0 family ethernet-switching storm-control
profile-name
```

For MX Series routers:

```
[edit]
user@device# set interfaces interface-name unit 0 family bridge storm-control profile-name
```

### Disabling Storm Control on Unregistered Multicast Traffic

To disable storm control on only unregistered multicast traffic:

1. Create a storm control profile with the storm control level set as the traffic rate in kilobits per second of the combined traffic streams but exclude unregistered multicast traffic:

```
[edit forwarding-options]
user@device# set storm-control-profiles profile-name all bandwidth-level kbps
no-unregistered-multicast
```

2. Bind the storm control profile to a logical interface:

For EX Series switches:

```
[edit]
user@device# set interfaces interface-name unit 0 family ethernet-switching storm-control
profile-name
```

For MX Series routers:

```
[edit]
user@device# set interfaces interface-name unit 0 family bridge storm-control profile-name
```

---

### Disabling Storm Control on Unknown Unicast Traffic

To disable storm control on only unknown unicast traffic:

1. Create a storm control profile with the storm control level set as the traffic rate in kilobits per second of the combined traffic streams but exclude unregistered multicast traffic:

```
[edit forwarding-options]
user@device# set storm-control-profiles profile-name all bandwidth-level kbps
no-unknown-unicast
```

2. Bind the storm control profile to a logical interface:

For EX Series switches:

```
[edit]
user@device# set interfaces interface-name unit 0 family ethernet-switching storm-control
profile-name
```

For MX Series routers:

```
[edit]
user@device# set interfaces interface-name unit 0 family bridge storm-control profile-name
```

---

### Disabling Storm Control on Multiple Types of Traffic

To disable storm control on broadcast and multicast traffic:

1. Create a storm control profile with the storm control level set as the traffic rate in kilobits per second of the combined traffic streams but exclude broadcast and multicast traffic:

```
[edit forwarding-options]
user@device# set storm-control-profiles profile-name all bandwidth-level kbps no-broadcast
no-multicast
```

2. Bind the storm control profile to a logical interface:

For EX Series switches:

```
[edit]
user@device# set interfaces interface-name unit 0 family ethernet-switching storm-control
profile-name
```

For MX Series routers:

```
[edit]
user@device# set interfaces interface-name unit 0 family bridge storm-control profile-name
```

### [edit forwarding-options storm-control-profiles] Configuration Statement Hierarchy for EX Series Switches

This topic lists supported and unsupported configuration statements in the **[edit forwarding-options storm-control-profiles]** hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.
- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see [Feature Explorer](#).

This topic lists:

- [Supported Statements in the \[edit forwarding-options storm-control-profiles\] Hierarchy Level on page 2212](#)
- [Unsupported Statements in the \[edit forwarding-options storm-control-profiles\] Hierarchy Level on page 2212](#)

### Supported Statements in the [edit forwarding-options storm-control-profiles] Hierarchy Level

---

The following hierarchy shows the [edit forwarding-options storm-control-profiles] configuration statements supported on EX Series switches:

```
forwarding-options {
  storm-control-profiles profile-name{
    action-shutdown;
    all {
      bandwidth-level bandwidth-level;
      bandwidth-percentage bandwidth-percentage;
      no-broadcast;
      no-multicast;
      no-registered-multicast;
      no-unknown-unicast;
      no-unregistered-multicast;
    }
  }
}
```

### Unsupported Statements in the [edit forwarding-options storm-control-profiles] Hierarchy Level

---

All statements in the [edit forwarding-options storm-control-profiles] hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented.

- [Unsupported Statements in the \[edit switch-options\] Hierarchy Level on page 2213](#)

### Supported Statements in the [edit switch-options] Hierarchy Level

The following hierarchy shows the [edit switch-options] configuration statements supported on EX Series switches:

```
switch-options {
  authentication-whitelist mac-address {
    interface interface-name;
    vlan-assignment (vlan-id | vlan-name);
  }
  interface interface-name {
    interface-mac-limit number {
      packet-action action;
    }
    no-mac-learning;
    persistent-learning
  }
  no-mac-learning;
  redundant-trunk-group {
    group name {
      description text;
      interface interface-name {
        primary;
      }
      preempt-cutover-timer seconds
    }
  }
  unknown-unicast-forwarding {
    vlan (all | vlan-name | vlan-tag) {
      interface interface-name;
    }
  }
  voip {
    interface (all | [interface-name | access-ports]) {
      forwarding-class (assured-forwarding | best-effort | expedited-forwarding | mcast-af
        | mcast-be | mcast-ef | mcast-nc | network-control);
      vlan vlan-name;
    }
  }
}
```

### Unsupported Statements in the [edit switch-options] Hierarchy Level

All statements in the [edit switch-options] hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented with the following exceptions:

**Table 227: Unsupported [edit switch-options] Configuration Statements on EX Series Switches**

Statement	Hierarchy Level
NOTE: Variables, such as <i>filename</i> , are not shown in the statements or hierarchies.	
port-error-disable	[edit switch-options]

Table 227: Unsupported [edit switch-options] Configuration Statements on EX Series Switches *(continued)*

Statement	Hierarchy Level
disable-timeout	[edit switch-options port-error-disable]

## action-shutdown

<b>Syntax</b>	action-shutdown;
<b>Hierarchy Level</b>	<ul style="list-style-type: none"> <li>For platforms with Enhanced Layer 2 Software (ELS) (EX Series switches and MX Series routers): [edit forwarding-options <b>storm-control-profiles</b> <i>profile-name</i>]</li> <li>For platforms without ELS: [edit ethernet-switching-options storm-control]</li> </ul>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.6 for EX Series switches.</p> <p>Hierarchy level [edit forwarding-options] introduced in Junos OS Release 13.2X50-D10. (See “Getting Started with Enhanced Layer 2 Software” on page 3 for information about ELS.)</p> <p>Statement introduced in Junos OS Release 14.1 for MX Series routers.</p>
<b>Description</b>	<p>Shut down or temporarily disable interfaces when the storm control level is exceeded, as follows:</p> <ul style="list-style-type: none"> <li>If you set both the <b>action-shutdown</b> and the <b>port-error-disable</b> statements, the interfaces are disabled temporarily and recover automatically when the disable timeout expires. (The <b>port-error-disable</b> statement is not available for MX Series routers.)</li> <li>If you set both the <b>action-shutdown</b> and the <b>recovery-timeout</b> statements, the interfaces are disabled temporarily and recover automatically when the recovery timeout expires.</li> <li>If you set the <b>action-shutdown</b> statement and do not specify the <b>port-error-disable</b> statement (the <b>port-error-disable</b> statement is not available for MX Series routers), the interfaces that are enabled for storm control are shut down when the storm control level is exceeded and they do not recover automatically from that port-error condition. You must issue the <b>clear ethernet-switching port-error</b> command to clear the port error and restore the interfaces to service. (The <b>clear ethernet-switching port-error</b> command is not available for MX Series routers.)</li> <li>If you set the <b>action-shutdown</b> statement and do not specify the <b>recovery-timeout</b> statement, the interfaces that are enabled for storm control are shut down when the storm control level is exceeded and they do not recover automatically from that port-error condition. For EX Series switches you must issue the <b>clear ethernet-switching recovery-timeout</b> command and for MX Series routers you must issue the <b>clear bridge recovery-timeout</b> command to clear the port error and restore the interfaces to service.</li> </ul>
<b>Default</b>	The <b>action-shutdown</b> option is not enabled by default. The switching device drops packets for the controlled traffic types if the ingress rate of the combined traffic streams exceeds the specified storm control level. Depending upon the configuration, applicable traffic could include broadcast, unknown unicast, and multicast traffic.
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>

## bandwidth-level

<b>Syntax</b>	<code>bandwidth-level <i>kbps</i>;</code>
<b>Hierarchy Level</b>	[edit forwarding-options <a href="#">storm-control-profiles</a> <i>profile-name</i> all]
<b>Release Information</b>	Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches. Statement introduced in Junos OS Release 13.2 for the QFX Series. Statement introduced in Junos OS Release 14.1 for MX Series routers.
<b>Description</b>	Configure the storm control level as the bandwidth in kilobits per second of the available bandwidth used by the combined broadcast, multicast, and unknown unicast traffic streams.
<div>  <p><b>NOTE:</b> When you configure storm control level on an aggregated Ethernet interface, the storm control level for each member of the aggregated Ethernet interface is set to that bandwidth. For example, if you configure a storm control level of 15,000 Kbps on ae1, and ae1 has two members, ge-0/0/0 and ge-0/0/1, each member has a storm control level of 15,000 Kbps. Thus, the storm control level on ae1 allows a traffic rate of up to 30,000 Kbps of combined broadcast, multicast, and unknown unicast traffic.</p> </div>	
<b>Default</b>	<p>On EX4300 switches—If you do not specify the storm control level using either the <b>bandwidth-level</b> or the <b>bandwidth-percentage</b> statements, the storm control level defaults to 80 percent of the available bandwidth used by the combined broadcast, unknown unicast, and multicast traffic streams.</p> <p>On EX9200 switches—Storm control is not enabled by default.</p> <p>On MX Series routers—Storm control is not enabled by default.</p>
<b>Options</b>	<p><b>bandwidth-level <i>kbps</i></b>—Traffic rate in kilobits per second of the combined broadcast, multicast, and unknown unicast traffic streams.</p> <p><b>Range:</b> 100 through 10,000,000</p> <p><b>Default:</b> None</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">bandwidth-percentage on page 2218</a></li> <li>• <a href="#">Example: Configuring Storm Control to Prevent Network Outages on EX Series Switches on page 2201</a></li> <li>• <a href="#">Example: Configuring Storm Control to Prevent Network Outages on MX Series Routers</a></li> <li>• <a href="#">Configuring or Disabling Storm Control (CLI Procedure) on page 2207</a></li> </ul>

## bandwidth-percentage

---

<b>Syntax</b>	<code>bandwidth-percentage <i>percentage</i>;</code>
<b>Hierarchy Level</b>	[edit forwarding-options <a href="#">storm-control-profiles</a> <i>profile-name</i> all]
<b>Release Information</b>	Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches. Statement introduced in Junos OS Release 13.2 for the QFX series. Statement introduced in Junos OS Release 14.1 for MX Series routers.
<b>Description</b>	Configure the storm control level as the percentage of available bandwidth used by the combined broadcast, multicast, and unknown unicast traffic streams on an interface. The storm control level is configured as part of the storm control profile.
<hr/>	
<div> <b>NOTE:</b> When you configure storm control level on an aggregated Ethernet interface, the storm control level for each member of the aggregated Ethernet interface is set to that bandwidth. For example, if you configure a storm control level of 15,000 Kbps on ae1, and ae1 has two members, ge-0/0/0 and ge-0/0/1, each member has a storm control level of 15,000 Kbps. Thus, the storm control level on ae1 allows a traffic rate of up to 30,000 Kbps of combined broadcast, multicast, and unknown unicast traffic.</div> <hr/>	
<b>Default</b>	On EX4300 switches—The storm control level is 80 percent of the available bandwidth used by the combined broadcast, unknown unicast, and multicast traffic streams.  On EX9200 switches—Storm control is not enabled by default.  On MX Series routers—Storm control is not enabled by default.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">bandwidth-level on page 2217</a></li><li>• <a href="#">Example: Configuring Storm Control to Prevent Network Outages on EX Series Switches on page 2201</a></li><li>• <a href="#">Example: Configuring Storm Control to Prevent Network Outages on MX Series Routers</a></li><li>• <a href="#">Configuring or Disabling Storm Control (CLI Procedure) on page 2207</a></li></ul>

## interface (Unknown Unicast Forwarding)

<b>Syntax</b>	<code>interface <i>interface-name</i>;</code>
<b>Hierarchy Level</b>	<ul style="list-style-type: none"> <li>For platforms with ELS: [edit switch-options <b>unknown-unicast-forwarding</b> vlan <i>vlan-name</i>]</li> <li>For platforms without ELS: [edit ethernet-switching-options <b>unknown-unicast-forwarding</b> vlan <i>vlan-name</i>]</li> </ul>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.3 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 13.2 for the QFX Series.</p> <p>Hierarchy level <b>[edit switch-options]</b> introduced in Junos OS Release 13.2X50-D10. (See <a href="#">“Getting Started with Enhanced Layer 2 Software” on page 3</a> for information about ELS.)</p>
<b>Description</b>	Specify the interface to which unknown unicast packets will be forwarded.
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><code>show vlans</code></li> <li><a href="#">show ethernet-switching table on page 2238</a></li> <li><a href="#">Configuring Unknown Unicast Forwarding (CLI Procedure)</a></li> <li><a href="#">Understanding Unknown Unicast Forwarding on page 2199</a></li> </ul>

## no-broadcast

---

<b>Syntax</b>	no-broadcast;
<b>Hierarchy Level</b>	<ul style="list-style-type: none"><li>For platforms with Enhanced Layer 2 Software (ELS) (EX Series switches and MX Series routers): [edit forwarding-options <b>storm-control-profiles</b> <i>profile-name</i> all]</li><li>For platforms without ELS: [edit ethernet-switching-options storm-control interface (all   <i>interface-name</i>)]</li></ul>

## recovery-timeout

<b>Syntax</b>	<code>recovery-timeout seconds;</code>
<b>Hierarchy Level (EX Series and QFX Series)</b>	[edit interfaces <i>interface-name</i> unit 0 family ethernet-switching]
<b>Hierarchy Level (MX Series)</b>	[edit interfaces <i>interface-name</i> unit 0 family bridge]
<b>Release Information</b>	Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches. Statement introduced in Junos OS Release 13.2 for the QFX Series. Statement introduced in Junos OS Release 14.1 for the MX Series routers.
<b>Description</b>	<p>Disable rather than block an interface when enforcing MAC limiting, MAC move limiting, or rate-limiting configuration options for shutting down the interface, and allow the interface to recover automatically from the error condition after the specified period of time:</p> <ul style="list-style-type: none"> <li>• If you have enabled MAC limiting with the <b>shutdown</b> option and you enable <b>recovery-timeout</b>, the switch disables (rather than shuts down) the interface when the MAC address limit is reached.</li> <li>• If you have enabled MAC move limiting (not supported on EX9200) with the <b>shutdown</b> option and you enable <b>recovery-timeout</b>, the switch disables (rather than shuts down) the interface when the maximum number of moves to a new interface is reached.</li> <li>• If you have enabled storm control with the <b>action-shutdown</b> option and you enable <b>recovery-timeout</b>, the switch disables (rather than shuts down) the interface when applicable traffic exceeds the specified levels. Depending upon the configuration, applicable traffic could include broadcast, unknown unicast, and multicast traffic.</li> </ul>
	<p> <b>NOTE:</b> The <b>recovery-timeout</b> configuration does not apply to pre-existing error conditions. It impacts only error conditions that are detected after the <b>recovery-timeout</b> statement has been enabled and committed. To clear a pre-existing error condition and restore the interface to service, use the operational mode command <b>clear ethernet-switching recovery-timeout</b> for EX Series and QFX Series and <b>clear bridge recovery-timeout</b> for MX Series routers.</p>
<b>Default</b>	Not enabled.
<b>Options</b>	<p><b>seconds</b>— Number of seconds that the interface remains in a disabled state due to a port error prior to automatic recovery.</p> <p><b>Range:</b> 10 through 3600</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>

## storm-control

<b>Syntax</b>	<code>storm-control <i>storm-control-profile</i>;</code>
<b>Hierarchy Level</b>	[edit interfaces <i>interface-name</i> unit <i>number</i> family ethernet-switching], [edit interfaces <i>interface-name</i> unit <i>number</i> family bridge]
<b>Release Information</b>	Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches. Statement introduced in Junos OS Release 13.2 for the QFX series. Statement introduced in Junos OS Release 14.1 for the MX Series routers.
<b>Description</b>	Bind a storm control profile to a logical interface.  On switches running ELS software, storm control is enabled by default on all switch interfaces at a level of 80 percent of the combined broadcast and unknown unicast streams. (For the equivalent statement for platforms running non-ELS software, see <i>storm-control</i> .)
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Storm Control to Prevent Network Outages on EX Series Switches on page 2201</a></li> <li>• <a href="#">Understanding Storm Control on Switching Devices on page 2197</a></li> </ul>

## storm-control-profiles

---

**Syntax**    storm-control-profiles *profile-name* {  
              action-shutdown;  
              all {  
                  bandwidth-level;  
                  bandwidth-percentage;  
                  no-broadcast;  
                  no-multicast;  
                  no-registered-multicast;  
                  no-unknown-unicast;  
                  no-unregistered-multicast;  
              }  
              }

**Hierarchy Level**    [edit forwarding-options]

**Release Information**    Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.  
                              Statement introduced in Junos OS Release 13.2 for the QFX Series.  
                              Statement introduced in Junos OS Release 14.1 for MX Series routers.

**Description**    Configure a storm control profile on a switch or router.  
  
                      The remaining statements are explained separately.

**Required Privilege Level**    system—To view this statement in the configuration.  
                                  system-control—To add this statement to the configuration.

## Routine Monitoring

---

- [Verifying That Unknown Unicast Packets Are Forwarded to a Single Interface on page 2233](#)

### Verifying That Unknown Unicast Packets Are Forwarded to a Single Interface

**Purpose** Verify that a VLAN is forwarding all unknown unicast packets (those with unknown destination MAC addresses) to a single interface instead of flooding unknown unicast packets across all interfaces that are members of the same VLAN.

**NOTE:** This example uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, See: *Verifying That Unknown Unicast Packets Are Forwarded to a Trunk Interface*. For ELS details see: “[Getting Started with Enhanced Layer 2 Software](#)” on page 3.

**Action** Display the forwarding interface for unknown unicast packets for a VLAN (here, the VLAN name is v1):

```
user@switch> show configuration switch-options

unknown-unicast-forwarding {
  vlan v1 {
    interface ge-0/0/7.0;
  }
}
```

**Meaning** The sample output from the **show configuration switch-options** command shows that the unknown unicast forwarding interface for VLAN v1 is interface ge-0/0/7. The **show ethernet-switching table** command shows that an unknown unicast packet is received on interface ge-0/0/3 with the destination MAC address (DMAC) 00:01:09:00:00:00 and the source MAC address (SMAC) of 00:11:09:00:01:00. This shows that the SMAC

of the packet is learned in the normal way (through the interface ge-0/0/3.0), while the DMAC is learned on interface ge-0/0/7.

## clear ethernet-switching recovery-timeout

---

<b>Syntax</b>	clear ethernet-switching recovery-timeout
<b>Release Information</b>	Command introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
<b>Description</b>	Clear all MAC limiting, MAC move limiting, and storm control errors from all the Ethernet switching interfaces on the switch, and restore the interfaces to service.
<b>Options</b>	<b>none</b> —Clear all MAC limiting, MAC move limiting, and storm control errors from all the Ethernet switching interfaces on the switch and restore these interfaces to service.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Autorecovery From the Disabled State on Secure or Storm Control Interfaces (CLI Procedure)</a> on page 2206</li></ul>
<b>Output Fields</b>	This command produces no output.

## clear ethernet-switching table

<b>Syntax</b>	clear ethernet-switching table <interface <i>interface-name</i> > <mac <i>mac-address</i> > <management-vlan> <persistent-mac < <i>interface</i>   <i>mac-address</i> >> <vlan <i>vlan-name</i> >
<b>Syntax (QFX Series)</b>	clear ethernet-switching table <interface <i>interface-name</i> > <mac <i>mac-address</i> > <persistent-mac < <i>interface</i>   <i>mac-address</i> >> <vlan <i>vlan-name</i> >
<b>Release Information</b>	Command introduced in Junos OS Release 9.3 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<div>  <p><b>NOTE:</b> On a QFabric system, using this command on an FCoE-enabled VLAN when FCoE sessions are active can cause traffic flooding and FCoE traffic drop. The FCoE sessions are not terminated and the traffic reconverges after a short period of time.</p> </div> <p>Clear learned entries, which are media access control (MAC) addresses, in the Ethernet switching table (also called the forwarding database table).</p>
<b>Options</b>	<p><b>none</b>—Clear learned entries in the Ethernet switching table, except for persistent MAC addresses.</p> <p><b>interface <i>interface-name</i></b>—(Optional) Clear all learned MAC addresses for the specified interface from the Ethernet switching table.</p> <p><b>mac <i>mac-address</i></b>—(Optional) Clear the specified learned MAC address from the Ethernet switching table.</p> <p><b>management-vlan</b>—(Optional) Clear all MAC addresses learned for the management VLAN from the Ethernet switching table. Note that you do not specify a VLAN name because only one management VLAN exists.</p> <p><b>persistent-mac &lt;<i>interface</i>   <i>mac-address</i>&gt;</b>—(Optional) Clear all MAC addresses, including persistent MAC addresses. Use the <b>interface</b> option to clear all MAC addresses on an interface, or use the <b>mac-address</b> option to clear all entries for a specific MAC address.</p> <p>Use this command whenever you move a device in your network that has a persistent MAC address on the switch. If you move the device to another port on the switch and do not clear the persistent MAC address from the original port it was learned on, then the new port will not learn the MAC address and the device will not be able to connect. If the original port is down when you move the device, then the new port</p>

will learn the MAC address and the device can connect—however, unless you cleared the MAC address on the original port, when the port comes back up, the system reinstalls the persistent MAC address in the forwarding table for that port. If this occurs, the address is removed from the new port and the device loses connectivity.

**vlan *vlan-name***—(Optional) Clear all MAC addresses learned for the specified VLAN from the Ethernet switching table.

**Output Fields** [Table 228 on page 2239](#) lists the output fields for the **show ethernet-switching table** command. Output fields are listed in the approximate order in which they appear.

**Table 228: show ethernet-switching table Output Fields**

Field Name	Field Description	Level of Output
<b>VLAN</b>	The name of a VLAN.	All levels
<b>Tag</b>	The VLAN ID tag name or number.	<b>extensive</b>
<b>MAC or MAC address</b>	The MAC address associated with the VLAN.	All levels
<b>Type</b>	The type of MAC address. Values are: <ul style="list-style-type: none"> <li>• <b>static</b>—The MAC address is manually created.</li> <li>• <b>learn</b>—The MAC address is learned dynamically from a packet's source MAC address.</li> <li>• <b>flood</b>—The MAC address is unknown and flooded to all members.</li> <li>• <b>persistent</b>—The learned MAC addresses that will persist across restarts of the switch or interface-down events.</li> </ul>	All levels except <b>persistent-mac</b>
<b>Type</b>	The type of MAC address. Values are: <ul style="list-style-type: none"> <li>• <b>installed</b>—addresses that are in the Ethernet switching table.</li> <li>• <b>uninstalled</b>—addresses that could not be installed in the table or were uninstalled in an interface-down event and will be reinstalled in the table when the interface comes back up.</li> </ul>	<b>persistent-mac</b>
<b>Age</b>	The time remaining before the entry ages out and is removed from the Ethernet switching table.	All levels
<b>Interfaces</b>	Interface associated with learned MAC addresses or <b>All-members</b> (flood entry).	All levels
<b>Learned</b>	For learned entries, the time which the entry was added to the Ethernet switching table.	<b>detail, extensive</b>
<b>Nexthop index</b>	The next-hop index number.	<b>detail, extensive</b>

Table 228: show ethernet-switching table Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>persistent-mac</b>	<b>installed</b> indicates MAC addresses that are in the Ethernet switching table and <b>uninstalled</b> indicates MAC addresses that could not be installed in the table or were uninstalled in an interface-down event (and will be reinstalled in the table when the interface comes back up).

## Understanding Bridging and VLANs on EX Series Switches

Network switches use Layer 2 bridging protocols to discover the topology of their LAN and to forward traffic toward destinations on the LAN. This topic explains the following concepts regarding bridging and VLANs on Juniper Networks EX Series Ethernet Switches:

---

## History of VLANs

Ethernet LANs were originally designed for small, simple networks that primarily carried text. However, over time, the type of data carried by LANs grew to include voice, graphics, and video. This more complex data, when combined with the ever-increasing speed of transmission, eventually became too much of a load for the original Ethernet LAN design. Multiple packet collisions were significantly slowing down the larger LANs.

The IEEE 802.1D-2004 standard helped evolve Ethernet LANs to cope with the higher data and transmission requirements by defining the concept of *transparent bridging* (generally called simply *bridging*). Bridging divides a single physical LAN (now called a single *broadcast domain*) into two or more virtual LANs, or VLANs. Each VLAN is a collection of some of the LAN nodes grouped together to form individual broadcast domains.

When VLANs are grouped logically by function or organization, a significant percentage of data traffic stays within the VLAN. This relieves the load on the LAN because all traffic no longer has to be forwarded to all nodes on the LAN. A VLAN first transmits packets within the VLAN, thereby reducing the number of packets transmitted on the entire LAN. Because packets whose origin and destination are in the same VLAN are forwarded only within the local VLAN, packets that are not destined for the local VLAN are the only ones forwarded to other broadcast domains. This way, bridging and VLANs limit the amount of traffic flowing across the entire LAN by reducing the possible number of collisions and packet retransmissions within VLANs and on the LAN as a whole.

---

## How Bridging of VLAN Traffic Works

Because the objective of the IEEE 802.1D-2004 standard was to reduce traffic and therefore reduce potential transmission collisions for Ethernet, a system was implemented to reuse information. Instead of having a switch go through a location process every time a frame is sent to a node, the transparent bridging protocol allows a switch to record the location of known nodes. When packets are sent to nodes, those destination node locations are stored in address-lookup tables called *Ethernet switching tables*. Before sending a packet, a switch using bridging first consults the switching tables to see if that node has already been located. If the location of a node is known, the frame is sent directly to that node.

Transparent bridging uses five mechanisms to create and maintain Ethernet switching tables on the switch:

- Learning
- Forwarding
- Flooding
- Filtering
- Aging

The key bridging mechanism used by LANs and VLANs is *learning*. When a switch is first connected to an Ethernet LAN or VLAN, it has no information about other nodes on the network. As packets are sent, the switch learns the embedded MAC addresses of the sending nodes and stores them in the Ethernet switching table, along with two other pieces of information—the interface (or port) on which the traffic was received on the destination node and the time the address was learned.

Learning allows switches to then do *forwarding*. By consulting the Ethernet switching table to see whether the table already contains the frame's destination MAC address, switches save time and resources when forwarding packets to the known MAC addresses. If the Ethernet switching table does not contain an entry for an address, the switch uses flooding to learn that address.

*Flooding* finds a particular destination MAC address without using the Ethernet switching table. When traffic originates on the switch and the Ethernet switching table does not yet contain the destination MAC address, the switch first floods the traffic to all other interfaces within the VLAN. When the destination node receives the flooded traffic, it can send an acknowledgment packet back to the switch, allowing it to learn the MAC address of the node and add the address to its Ethernet switching table.

*Filtering*, the fourth bridging mechanism, is how broadcast traffic is limited to the local VLAN whenever possible. As the number of entries in the Ethernet switching table grows, the switch pieces together an increasingly complete picture of the VLAN and the larger LAN—it learns which nodes are in the local VLAN and which are on other network segments. The switch uses this information to filter traffic. Specifically, for traffic whose source and destination MAC addresses are in the local VLAN, filtering prevents the switch from forwarding this traffic to other network segments.

To keep entries in the Ethernet switching table current, the switch uses a fifth bridging mechanism, *aging*. Aging is the reason that the Ethernet switching table entries include timestamps. Each time the switch detects traffic from a MAC address, it updates the timestamp. A timer on the switch periodically checks the timestamp, and if it is older than a user-configured value, the switch removes the node's MAC address from the Ethernet switching table. This aging process eventually flushes unavailable network nodes out of the Ethernet switching table.

### Packets Are Either Tagged or Untagged

When an Ethernet LAN is divided into VLANs, each VLAN is identified by a unique 802.1Q ID. The VLAN IDs 1 through 4094 can be assigned to VLANs, while VLAN IDs 0 and 4095 are reserved by Junos OS and cannot be assigned.

Ethernet packets include a tag protocol identifier (TPID) EtherType field, which identifies the protocol being transported. When a device within a VLAN generates a packet, this field includes a value of 0x8100, which indicates that the packet is a VLAN-tagged packet. The packet also has a VLAN ID field that includes the unique 802.1Q ID, which identifies the VLAN to which the packet belongs.

In addition to the TPID EtherType value of 0x8100, EX Series switches that run Junos OS that does not support the Enhanced Layer 2 Software (ELS) configuration style also

support values of 0x88a8 (Provider Bridging and Shortest Path Bridging) and 0x9100 (Q-inQ).

For a simple network that has only a single VLAN, all packets include a default 802.1Q tag, which is the only VLAN membership that does not mark the packet as tagged. These packets are untagged packets.

### Switch Interface Modes—Access, Trunk, or Tagged Access

---

Ports, or interfaces, on a switch operate in one of three modes:

- Access mode
- Trunk mode
- Tagged-access mode

#### **Access Mode**

An interface in access mode connects a switch to a single network device, such as a desktop computer, an IP telephone, a printer, a file server, or a security camera. Access interfaces accept only untagged packets.

By default, when you boot an EX Series switch that runs Junos OS that does not support ELS and use the factory default configuration, or when you boot such a switch and do not explicitly configure a port mode, all interfaces on the switch are in access mode and accept only untagged packets from the VLAN named **default**. You can optionally configure another VLAN and use that VLAN instead of **default**.

On an EX Series switch that runs Junos OS that supports ELS, the VLAN named **default** is not supported. Therefore, on such switches, you must explicitly configure at least one VLAN, even if your network is simple and you want only one broadcast domain to exist. After you assign an interface to a VLAN, the interface functions in access mode.

For EX Series switches that run either type of software, you can also configure a trunk port or interface to accept untagged packets from a user-configured VLAN. For details about this concept (native VLAN), see [“Trunk Mode and Native VLAN” on page 2249](#).

#### **Trunk Mode**

Trunk mode interfaces are generally used to connect switches to one another. Traffic sent between switches can then consist of packets from multiple VLANs, with those packets multiplexed so that they can be sent over the same physical connection. Trunk interfaces usually accept only tagged packets and use the VLAN ID tag to determine both the packets' VLAN origin and VLAN destination.

On an EX Series switch that runs software that does not support ELS, an untagged packet is not recognized on a trunk port unless you configure additional settings on that port.

On an EX Series switch that runs Junos OS that supports ELS, a trunk port recognizes untagged control packets for protocols such as the Link Aggregation Control Protocol (LACP) and the Link Layer Discovery Protocol (LLDP). However, the trunk port does not recognize untagged data packets unless you configure additional settings on that port.

In the rare case where you want untagged packets to be recognized by a trunk port on EX Series switches that run either type of software, you must configure the single VLAN on a trunk port as a *native VLAN*. For more information about native VLANs, see [“Trunk Mode and Native VLAN” on page 2249](#).

### **Trunk Mode and Native VLAN**

On an EX Series switch that runs Junos OS that does not support ELS, a trunk port does not recognize packets that do not include VLAN tags, which are also known as untagged packets. On an EX Series switch that runs Junos OS that supports ELS, a trunk port recognizes untagged control packets, but it does not recognize untagged data packets. With native VLAN configured, untagged packets that a trunk port normally does not recognize are sent over the trunk interface. In a situation where packets pass from a device, such as an IP phone or printer, to a switch in access mode, and you want those packets sent from the switch over a trunk port, use native VLAN mode. Create a native VLAN by configuring a VLAN ID for it, and specify that the trunk port is a member of the native VLAN.

The switch's trunk port will then treat those packets differently than the other tagged packets. For example, if a trunk port has three VLANs, 10, 20, and 30, assigned to it with VLAN 10 being the native VLAN, packets on VLAN 10 that leave the trunk port on the other end have no 802.1Q header (tag).

There is another native VLAN option for EX Series switches that do not support ELS. You can have the switch add and remove tags for untagged packets. To do this, you first configure the single VLAN as a native VLAN on a port attached to a device on the edge. Then, assign a VLAN ID tag to the single native VLAN on the port connected to a device. Last, add the VLAN ID to the trunk port. Now, when the switch receives the untagged packet, it adds the ID you specified and sends and receives the tagged packets on the trunk port configured to accept that VLAN.

### **Tagged-Access Mode**

Only EX Series switches that run Junos OS that does not use the ELS configuration style support tagged-access mode.

Tagged-access mode accommodates cloud computing scenarios, specifically deployments including servers that adhere to the edge virtual bridging (EVB) standard (IEEE 803.1Qbg). See *Understanding Edge Virtual Bridging for Use with VEPA Technology*.

Because several virtual computers can be included on one physical server, the packets generated by one server can contain an aggregation of VLAN packets from different virtual machines on that server. To accommodate this situation, tagged-access mode reflects packets back to the physical server on the same downstream port when the destination address of the packet was learned on that downstream port. Packets are also reflected back to the physical server on the downstream port when the destination has not yet been learned. Therefore, the third interface mode, tagged access, has some characteristics of access mode and some characteristics of trunk mode:

- Like access mode, tagged-access mode connects the switch to an access layer device. Unlike access mode, tagged-access mode is capable of accepting VLAN tagged packets.

- Like trunk mode, tagged-access mode accepts VLAN tagged packets from multiple VLANs. Unlike trunk port interfaces, which are connected at the core/distribution layer, tagged-access port interfaces connect devices at the access layer.

Like trunk mode, tagged-access mode also supports native VLAN.

**NOTE:** Control packets are never reflected back on the downstream port.

---

### Additional Advantages of Using VLANs

In addition to reducing traffic and thereby speeding up the network, VLANs have the following advantages:

- VLANs provide segmentation services traditionally provided by routers in LAN configurations, thereby reducing hardware equipment costs.
- Packets coupled to a VLAN can be reliably identified and sorted into different domains. You can contain broadcasts within parts of the network, thereby freeing up network resources. For example, when a DHCP server is plugged into a switch and starts broadcasting its presence, you can prevent some hosts from accessing it by using VLANs to split up the network.
- For security issues, VLANs provide granular control of the network because each VLAN is identified by a single IP subnetwork. All packets passing in and out of a VLAN are consistently tagged with the VLAN ID of that VLAN, thereby providing easy identification, because a VLAN ID on a packet cannot be altered. (For an EX Series switch that runs Junos OS that does not support ELS, we recommend that you avoid using 1 as a VLAN ID, because that ID is a default value.)
- VLANs react quickly to host relocation—this is also due to the persistent VLAN tag on packets.
- On an Ethernet LAN, all network nodes must be physically connected to the same network. In VLANs, the physical location of nodes is not important—you can group network devices in any way that makes sense for your organization, such as by department or business function, types of network nodes, or physical location.

---

### Maximum VLANs and VLAN Members Per Switch

The number of VLANs supported per switch varies for each switch. Use the configuration-mode command **set vlans *vlan-name* *vlan-id* ?** to determine the maximum number of VLANs allowed on a switch. You cannot exceed this VLAN limit because you have to assign a specific ID number when you create a VLAN—you could overwrite one of the numbers, but you cannot exceed the limit.

You can, however, exceed the recommended VLAN member maximum for a switch.

On an EX Series switch that runs Junos OS that does not support the ELS configuration style, the maximum number of VLAN members allowed on the switch is eight times the maximum number of VLANs that the switch supports ( $\text{vmember limit} = \text{vlan max} * 8$ ). If the configuration of the switch exceeds the recommended VLAN member maximum,

a warning message appears when you commit the configuration. If you commit the configuration despite the warning, the commit succeeds, but there is a risk of the Ethernet switching process (eswd) failing as a result of memory allocation failure.

On an EX Series switch that runs Junos OS that supports ELS, the maximum number of VLAN members allowed on the switch is 24 times the maximum number of VLANs that the switch supports ( $\text{vmember limit} = \text{vlan max} * 24$ ). If the configuration of the switch exceeds the recommended VLAN member maximum, a warning message appears in the system log (syslog).

### A Default VLAN Is Configured on Most Switches

**NOTE:** EX Series switches that run Junos OS with the ELS configuration style do not support a default VLAN.

Some EX Series switches that run Junos OS that does not support the ELS configuration style are preconfigured with a VLAN named **default** that does not tag packets and operates only with untagged packets. On these switches, each interface already belongs to the VLAN named **default** and all traffic uses this VLAN until you configure more VLANs and assign traffic to those VLANs.

The following EX Series switches that run Junos OS that does not support the ELS are not preconfigured to belong to **default** or any other VLAN:.

- Modular switches, such as the EX8200 switches and EX6200 switches
- Switches that are part of a Virtual Chassis

The reason that these switches are not preconfigured is that the physical configuration in both situations is flexible. There is no way of knowing which line cards have been inserted in either the EX8200 switch or EX6200 switch. There is also no way of knowing which switches are included in the Virtual Chassis. Switch interfaces in these two cases must first be defined as Ethernet switching interfaces. After an interface is defined as an Ethernet switching interface, the default VLAN appears in the output from the ? help and other commands.

**NOTE:** When a Juniper Networks EX4500 Ethernet Switch, EX4200 Ethernet Switch, or EX3300 Ethernet Switch is interconnected with other switches in a Virtual Chassis configuration, each individual switch that is included as a member of the configuration is identified with a member ID. The member ID functions as an FPC slot number. When you are configuring interfaces for a Virtual Chassis configuration, you specify the appropriate member ID (0 through 9) as the slot element of the interface name. The default factory settings for a Virtual Chassis configuration include FPC 0 as a member of the default VLAN because FPC 0 is configured as part of the ethernet-switching family. In order to include FPC 1 through FPC 9 in the default VLAN, add the ethernet-switching family to the configurations for those interfaces.

## Assigning Traffic to VLANs

---

You can assign traffic on any switch to a particular VLAN by referencing either the interface port of the traffic or the MAC addresses of devices sending traffic.

### ***Assign VLAN Traffic According to the Interface Port Source***

This method is most commonly used to assign traffic to VLANs. In this case, you specify that all traffic received on a particular switch interface is assigned to a specific VLAN. You configure this VLAN assignment when you configure the switch, by using either the VLAN number (called a VLAN ID) or by using the VLAN name, which the switch then translates into a numeric VLAN ID. This method is referred to simply as creating a VLAN because it is the most commonly used method.

### ***Assign VLAN Traffic According to the Source MAC Address***

In this case, all traffic received from a specific MAC address is forwarded to a specific egress interface (next hop) on the switch. MAC-based VLANs are either static (named MAC addresses configured one at a time) or dynamic (configured using a RADIUS server).

To configure a static MAC-based VLAN on an EX Series switch that supports ELS, see *Adding a Static MAC Address Entry to the Ethernet Switching Table (CLI Procedure)*. To configure a static MAC-based VLAN on an EX Series switch that does not support ELS, see *Adding a Static MAC Address Entry to the Ethernet Switching Table (CLI Procedure)*.

For information about using 802.1X authentication to authenticate end devices and allow access to dynamic VLANs configured on a RADIUS server, see [“Understanding Dynamic VLANs for 802.1X on EX Series Switches” on page 1837](#). You can optionally implement this feature to offload the manual assignment of VLAN traffic to automated RADIUS server databases.

## Forwarding VLAN Traffic

---

To pass traffic within a VLAN, the switch uses Layer 2 forwarding protocols, including IEEE 802.1Q spanning-tree protocols and Multiple VLAN Registration Protocol (MVRP).

To pass traffic between two VLANs, the switch uses standard Layer 3 routing protocols, such as static routing, OSPF, and RIP. On EX Series switches, the same interfaces that support Layer 2 bridging protocols also support Layer 3 routing protocols, providing multilayer switching.

To pass traffic from a single device on an access port to a switch and then pass those packets on a trunk port, use the native mode configuration previously discussed under [“Trunk Mode” on page 2248](#).

## VLANs Communicate with Integrated Routing and Bridging Interfaces or Routed VLAN Interfaces

---

Traditionally, switches sent traffic to hosts that were part of the same broadcast domain (VLAN) but routers were needed to route traffic from one broadcast domain to another. Also, only routers performed other Layer 3 functions such as traffic engineering.

EX Series switches that run Junos OS that supports the ELS configuration style perform inter-VLAN routing functions using an integrated routing and bridging (IRB) interface named `irb`, while EX Series switches that run Junos OS that does not support ELS perform these functions using a routed VLAN interface (RVI) named `vlan`. These interfaces detect both MAC addresses and IP addresses and route data to Layer 3 interfaces, thereby frequently eliminating the need to have both a switch and a router.

## Understanding Integrated Routing and Bridging Interfaces and Routed VLAN Interfaces on EX Series Switches

Virtual LANs (VLANs), by definition, divide a LAN's broadcast environment into isolated virtual broadcast domains, thereby limiting the amount of traffic flowing across the entire LAN and reducing the possible number of collisions and packet retransmissions within the LAN. For example, you might want to create a VLAN that includes the employees in a department and the resources that they use often, such as printers, servers, and so on.

Of course, you also want to allow these employees to communicate with people and resources in other VLANs. To forward packets between VLANs, you traditionally needed a router that connected the VLANs. However, you can also accomplish this forwarding with a switch by configuring one of the following features:

- On Juniper Networks EX Series Ethernet Switches that run Juniper Networks Junos operating system (Junos OS) that supports the Enhanced Layer 2 Software (ELS) configuration style, configure an integrated routing and bridging (IRB) interface.
- On EX Series switches that run Junos OS that does not support ELS, configure a routed VLAN interface (RVI).

**NOTE:** IRB interfaces and RVIs provide the same functionality. Where the functionality for both features is the same, this topic uses the term *these interfaces* to refer collectively to both IRB interfaces and RVIs. Where differences exist between the two features, this topic calls out the IRB interfaces and RVIs separately.

Configuring a switch to route traffic between VLANs reduces complexity and eliminates the costs associated with purchasing, installing, managing, powering, and cooling a router.

These interfaces route only VLAN traffic and work by logically dividing a switch into multiple virtual routing instances, thereby isolating VLAN traffic traveling across the network into virtual segments. These interfaces allow switches to recognize which packets are being sent to another VLAN's MAC addresses—then, packets are bridged (switched) whenever the destination is within the same VLAN and are routed through these interfaces only when necessary. Whenever packets can be switched instead of routed, several layers of processing are eliminated. The switches rely on their Layer 3 capabilities to provide this basic routing between VLANs:

- Two VLANs on the same switch
- Two VLANs on different switches (routing is provided by an intermediary third switch.)

Figure 27 on page 2255 illustrates a switch routing VLAN traffic between two access layer switches using one of these interfaces.

**Figure 27: An IRB Interface or RVI on a Switch Providing Routing Between Two Access Switches**

This topic describes:

- [When Should I Use an IRB Interface or RVI? on page 2255](#)
- [How Does an IRB Interface or RVI Work? on page 2255](#)
- [Creating an IRB Interface or RVI on page 2256](#)
- [Viewing IRB Interface and RVI Statistics on page 2257](#)
- [IRB Interfaces and RVI Functions and Other Technologies on page 2257](#)

### When Should I Use an IRB Interface or RVI?

Configure an IRB interface or an RVI for a VLAN if you need to:

- Allow traffic to be routed between VLANs.
- Provide Layer 3 IP connectivity to the switch.
- Monitor individual VLANs for billing purposes. Service providers often need to monitor traffic for this purpose, but this capability can be useful for enterprises where various groups share the cost of the network.

### How Does an IRB Interface or RVI Work?

For an IRB interface, the switch provides the name `irb`, and for an RVI, the switch provides the name `vlan`. Like all Layer 3 interfaces, these interfaces require a logical unit number with an IP address assigned to it. In fact, to be useful, the implementation of these interfaces in an enterprise with multiple VLANs requires at least two logical units and two IP addresses—you must create units with addresses in each of the subnets associated with the VLANs between which you want traffic to be routed. That is, if you have two

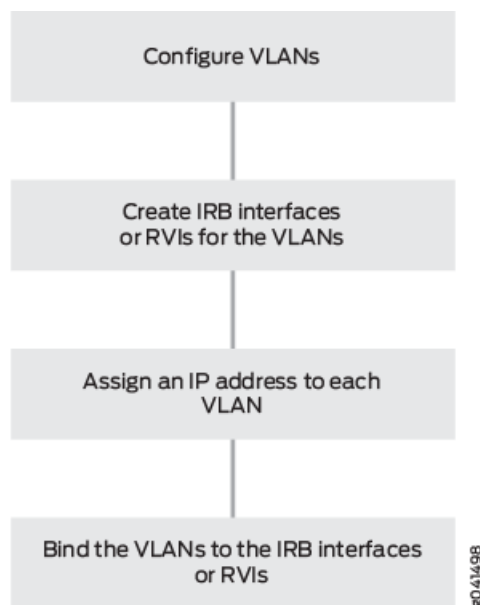

VLANs (for example, VLAN **red** and VLAN **blue**) with corresponding subnets, your interfaces must have a logical unit with an address in the subnet for **red** and a logical unit with an address in the subnet for **blue**. The switch automatically creates direct routes to these subnets and uses these routes to forward traffic between VLANs.

The interface on the switch detects both MAC addresses and IP addresses, then routes data to other Layer 3 interfaces on routers or other switches. These interfaces detect both IPv4 and IPv6 unicast and multicast virtual routing and forwarding (VRF) traffic. Each logical interface can belong to only one routing instance and is further subdivided into logical interfaces, each with a logical interface number appended as a suffix to the names `irb` and `vlan`—for example, `irb.10` and `vlan.10`.

### Creating an IRB Interface or RVI

There are four basic steps in creating an IRB interface or RVI as shown in [Figure 28 on page 2256](#).

**Figure 28: Creating an IRB Interface or RVI**

The following explanations correspond to the four steps for creating a VLAN, as depicted in [Figure 28 on page 2256](#).

- **Configure VLANs**—Virtual LANs are groups of hosts that communicate as if they were attached to the same broadcast stream. VLANs are created with software and do not require a physical router to forward traffic. VLANs are Layer 2 constructs.
- **Create IRB interfaces or RVIs for the VLANs**—The switch's IRB interfaces and RVIs use Layer 3 logical interfaces (unlike routers, which can use either physical or logical interfaces).

- Assign an IP address to each VLAN—An IRB interface or RVI cannot be activated unless it is associated with a physical interface.
- Bind the VLANs to the logical interfaces—There is a one-to-one mapping between a VLAN and an IRB interface or RVI, which means that only one of these interfaces can be mapped to a VLAN.

For specific instructions for creating an IRB interface, see [“Configuring Integrated Routing and Bridging Interfaces \(CLI Procedure\)” on page 2340](#), and for an RVI, see [Configuring Routed VLAN Interfaces \(CLI Procedure\)](#).

### Viewing IRB Interface and RVI Statistics

Some switches automatically track IRB interface and RVI traffic statistics. Other switches allow you to configure tracking. [Table 229 on page 2257](#) illustrates the IRB interface- and RVI-tracking capability on various switches.

**Table 229: Tracking IRB Interface and RVI Usage**

Switch	Input (ingress)	Output (Egress)
EX4300	Automatic	Automatic
EX3200, EX4200	Automatic	–
EX8200	Configurable	Automatic
EX2200, EX3300, EX4500, EX6200	–	–

You can view input (ingress) and output (egress) totals with the following commands:

- For IRB interfaces, use the **show interfaces irb extensive** command. Look at the input and output values in the Transit Statistics field for IRB interface activity values.
- For RVI, use the **show interfaces vlan extensive** command. Look at the input and output values in the Logical Interface Transit Statistics field for RVI activity values.

### IRB Interfaces and RVI Functions and Other Technologies

IRB interfaces and RVIs are similar to switch virtual interfaces (SVIs) and bridge-group virtual interfaces (BVI), which are supported on other vendors' devices. They can also be combined with other functions:

- VRF is often used in conjunction with Layer 3 subinterfaces, allowing traffic on a single physical interface to be differentiated and associated with multiple virtual routers. For more information about VRF, see [“Understanding Virtual Routing Instances on EX Series Switches” on page 2263](#).
- For redundancy, you can combine an IRB interface or RVI with implementations of the Virtual Router Redundancy Protocol (VRRP) in both bridging and virtual private LAN service (VPLS) environments. For more information about VRRP, see [“Understanding VRRP on EX Series Switches” on page 2501](#).

- Related Documentation**
- [Understanding Bridging and VLANs on EX Series Switches on page 2245](#)

## Understanding Private VLANs

**NOTE:** This topic describes support for private VLANs on Junos OS switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your EX Series switch runs software that does not support ELS, see *Understanding Private VLANs on EX Series Switches*. For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 3](#).

VLANs limit broadcasts to specified users. Private VLANs (PVLANS) take this concept a step further by limiting communication within a VLAN. PVLANS accomplish this by restricting traffic flows through their member switch ports (which are called *private ports*) so that these ports communicate only with a specified uplink trunk port or with specified ports within the same VLAN. The uplink trunk port is usually connected to a router, firewall, server, or provider network.

PVLANS provide Layer 2 isolation between ports within a VLAN, splitting a broadcast domain into multiple discrete broadcast subdomains by creating secondary VLANs (community VLANs and an isolated VLAN) inside a primary VLAN. Ports within the same community VLAN can communicate with each other. Ports within an isolated VLAN can communicate *only* with a single uplink port.

PVLANS are useful for restricting the flow of broadcast and unknown unicast traffic and for limiting the communication between hosts. The need to segregate a single VLAN is particularly useful in the following deployment scenarios:

- **Server farms**—A typical Internet service provider uses a server farm to provide Web hosting for numerous customers. Locating the various servers within a single server farm provides ease of management. Security concerns arise if all servers are in the same VLAN because Layer 2 broadcasts go to all servers in the VLAN.
- **Metropolitan Ethernet networks**—A metro service provider offers Layer 2 Ethernet access to assorted homes, rental communities, and businesses. The traditional solution of deploying one VLAN per customer is not scalable and is difficult to manage, leading to potential waste of IP addresses. PVLANS provide a more secure and more efficient solution.

This topic explains the following concepts regarding PVLANS:

- [Typical Structure and Primary Application of PVLANS on page 2259](#)
- [Routing Between Isolated and Community VLANs on page 2261](#)
- [PVLANS Use 802.1Q Tags to Identify Packets on page 2261](#)
- [PVLANS Use IP Addresses Efficiently on page 2262](#)
- [PVLAN Port Types and Forwarding Rules on page 2262](#)
- [Guidelines and Restrictions for PVLANS on page 2262](#)

### Typical Structure and Primary Application of PVLANS

A PVLAN can be configured on a single switch or can be configured to span multiple switches. The types of domains and ports are:

- **Primary VLAN**—The primary VLAN of the PVLAN is defined with an 802.1Q tag (VLAN ID) for the complete PVLAN. The primary PVLAN can contain multiple secondary VLANs (one isolated VLAN and multiple community VLANs).
- **Isolated VLAN**—A primary VLAN can contain only one isolated VLAN. An interface within an isolated VLAN can forward packets only to a promiscuous port or the Inter-Switch Link (ISL) port. An isolated interface cannot forward packets to another isolated interface; and an isolated interface cannot receive packets from another isolated interface. If a customer device needs to have access *only* to a gateway router, the device must be attached to an isolated trunk port.
- **Community VLAN**—You can configure multiple community VLANs within a single PVLAN. An interface within a specific community VLAN can establish Layer 2 communications with any other interface that belongs to the same community VLAN. An interface within a community VLAN can also communicate with a promiscuous port or the ISL port.
- **Promiscuous port**—A promiscuous port has Layer 2 communications with all the interfaces that are in the PVLAN, regardless of whether the interface belongs to an isolated VLAN or a community VLAN. A promiscuous port is a member of the primary VLAN, but is not included within any of the secondary subdomains. Layer 3 gateways, DHCP servers, and other trusted devices that need to communicate with endpoint devices are typically connected to a promiscuous port.
- **Inter-Switch Link (ISL)**—An ISL is a trunk port that connects multiple switches in a PVLAN and is required only when a PVLAN spans multiple switches..

**NOTE:** The primary VLAN of the PVLAN is defined with an 802.1Q tag (VLAN ID).

For information on configuring an isolated VLAN or community VLANs, see [“Creating a Private VLAN on a Single Switch \(CLI Procedure\)” on page 2343](#) or [“Creating a Private VLAN Spanning Multiple Switches \(CLI Procedure\)” on page 2345](#).

[Figure 29 on page 2260](#) shows a PVLAN on a single switch in which the primary VLAN (100) contains two community VLANs and one isolated VLAN.

Figure 29: Private VLAN on a Single Switch

Figure 30 on page 2261 shows a PVLAN spanning multiple switches in which the primary VLAN (100) contains two community VLANs (300) and (400) and one isolated VLAN (200).

Figure 30: PVLAN Spanning Multiple Switches

### Routing Between Isolated and Community VLANs

To route Layer 3 traffic between isolated and community VLANs, you must connect an external router or switch to a trunk port of the primary VLAN. The trunk port of the primary VLAN is a *promiscuous* port; therefore, it can communicate with *all* the ports in the PVLAN.

### PVLANS Use 802.1Q Tags to Identify Packets

You must specify an 802.1Q tag on the primary VLAN and on each of the secondary VLANs, regardless of whether the PVLAN is configured on a single switch or across

multiple switches. (You can also configure a VLAN name for the primary VLAN and for each of the secondary VLANs. This is optional.)

### PVLANS Use IP Addresses Efficiently

PVLANS provide IP address conservation and efficient allocation of IP addresses. In a typical network, VLANs usually correspond to a single IP subnet. In PVLANS, the hosts in all secondary VLANs belong to the same IP subnet because the subnet is allocated to the primary VLAN. Hosts within the secondary VLAN are assigned IP addresses based on IP subnets associated with the primary VLAN, and their IP subnet masking information reflects that of the primary VLAN subnet.

### PVLAN Port Types and Forwarding Rules

Table 230 on page 2262 summarizes Layer 2 connectivity between the different types of ports within a PVLAN.

**Table 230: PVLAN Ports and Layer 2 Forwarding**

From Port Type	To Isolated Ports?	To Promiscuous Ports?	To Community Ports?	To Inter-switch Link Port?
Isolated	Deny	Permit	Deny	Permit
Promiscuous	Permit	Permit	Permit	Permit
Community 1	Deny	Permit	Permit	Permit

### Guidelines and Restrictions for PVLANS

When configuring PVLANS, adhere to the following guidelines:

- An access interface can belong to only one PVLAN domain, that is, it cannot participate in two different primary VLANs..
- A trunk interface can be a member of two secondary VLANs as long as the secondary VLANs are in two *different* primary VLANs. A trunk interface cannot be a member of two secondary VLANs that are in the *same* primary VLAN.
- A single region of Multiple Spanning Tree Protocol (MSTP) must be configured on all VLANs that are included within the PVLAN.
- VLAN Spanning Tree Protocol (VSTP) is not supported.

Some configuration statements cannot be specified on a secondary VLAN. You can configure the following statements at the **[edit vlans vlan-name switch-options]** hierarchy level *only* on the primary PVLAN:

- **mac-table-size**
- **no-mac-learning**
- **mac-statistics**
- **interface-mac-limit**

The following features are *not* supported on PVLANS on Junos switches with support for the ELS configuration style:

- DHCP security features (DHCP snooping, dynamic ARP inspection, IP source guard)
- Egress VLAN firewall filters
- Ethernet ring protection (ERP)
- Flexible VLAN tagging
- *global-mac-statistics*
- Integrated routing and bridging (IRB) interfaces/routed VLAN interfaces (RVIs)
- Multicast snooping or IGMP snooping
- Multichassis link aggregation groups (MC-LAGs)
- Port mirroring
- Q-in-Q tunneling
- VLAN Spanning Tree Protocol (VSTP)
- Voice over IP (VoIP)

## Understanding Virtual Routing Instances on EX Series Switches

Virtual routing instances allow administrators to divide a Juniper Networks EX Series Ethernet Switch into multiple independent virtual routers, each with its own routing table. Splitting a device into many virtual routing instances isolates traffic traveling across the network without requiring multiple devices to segment the network.

You can use virtual routing instances to isolate customer traffic on your network and to bind customer-specific instances to customer-owned interfaces.

Virtual routing and forwarding (VRF) is often used in conjunction with Layer 3 subinterfaces, allowing traffic on a single physical interface to be differentiated and associated with multiple virtual routers. Each logical Layer 3 subinterface can belong to only one routing instance.

EX Series switches support IPv4 and IPv6 unicast and multicast VRF traffic. See *EX Series Switch Software Features Overview* for details on VRF support by switch per Junos OS release.

## Understanding Multiple VLAN Registration Protocol (MVRP) on EX Series Switches

Multiple VLAN Registration Protocol (MVRP) is a Layer 2 messaging protocol that manages the addition, deletion, and renaming of active virtual LANs, thereby reducing network administrators' time spent on these tasks. Use MVRP on Juniper Networks EX Series Ethernet Switches to dynamically register and unregister active VLANs on trunk interfaces. Using MVRP means that you do not have to manually register VLANs on all connections—that is, you do not need to explicitly bind a VLAN to each trunk interface. With MVRP, you configure a VLAN on one switch interface and the VLAN configuration is distributed through all active switches in the domain.

MVRP is an application protocol of the Multiple Registration Protocol (MRP) and is defined in the IEEE 802.1ak standard. MRP and MVRP replace Generic Attribute Registration Protocol (GARP) and GARP VLAN Registration Protocol (GVRP) and overcome GARP and GVRP limitations.

This topic describes:

- [How MVRP Updates, Creates, and Deletes VLANs on the Switches on page 2264](#)
- [MVRP Is Disabled by Default on the Switches on page 2264](#)
- [MRP Timers Control MVRP Updates on page 2265](#)
- [MVRP Uses MRP Messages to Transmit Switch and VLAN States on page 2265](#)
- [Compatibility Issues with Junos OS Releases of MVRP on page 2266](#)

### How MVRP Updates, Creates, and Deletes VLANs on the Switches

---

When any MVRP-member VLAN is changed, that VLAN sends a protocol data unit (PDU) to all other MVRP-member active VLANs. The PDU informs the other VLANs which switches and interfaces currently belong to the sending VLAN. This way, all MVRP-member VLANs are always updated with the current VLAN state of all other MVRP-member VLANs. Timers dictate when PDUs can be sent and when switches receiving MVRP PDUs can update their MVRP VLAN information.

In addition to sending PDU updates, MVRP dynamically creates VLANs on member interfaces when a new VLAN is added to any one interface. This way, VLANs created on one member switch are propagated to other member switches as part of the MVRP message exchange process.

To keep VLAN membership information current, MVRP removes switches and interfaces when they become unavailable. Pruning VLAN information has these benefits:

- Limits the network VLAN configuration to active participants, thereby reducing network overhead.
- Limits broadcast, unknown unicast, and multicast (BUM) traffic to interested devices.

### MVRP Is Disabled by Default on the Switches

---

MVRP is disabled by default on the switches and, when enabled, affects only trunk interfaces. Once you enable MVRP, all VLAN interfaces on the switch belong to MVRP

(the default **normal** registration mode) and those interfaces accept PDU messages and send their own PDU messages. To prevent one or more interfaces from participating in MVRP, you can specifically configure an interface to **forbidden** registration mode instead of the default **normal** mode.

VLAN updating, dynamic VLAN configuration through MVRP, and VLAN pruning are all active on trunk interfaces when MVRP is enabled.

### MRP Timers Control MVRP Updates

MVRP registration and updates are controlled by timers that are part of the MRP. The timers define when MVRP PDUs can be sent and when MVRP information can be updated on a switch.

The timers are set on a per-interface basis, and on EX Series switches that use Juniper Networks Junos operating system (Junos OS) with support for the Enhanced Layer 2 Software (ELS) configuration style, the timers are also set on a per-switch basis.

On an EX Series switch that uses Junos OS with support for ELS, if the timer value set on an interface level is different from the value set on a switch level, the value on the interface level takes precedence.

The following MRP timers are used to control the operation of MVRP:

- Join timer—Controls the interval for the next MVRP PDU transmit opportunity.
- Leave timer—Controls the period of time that an interface on the switch waits in the leave state before changing to the unregistered state.
- LeaveAll timer—Controls the frequency with which the interface generates LeaveAll messages.

**BEST PRACTICE:** Unless there is a compelling reason to change the timer settings, leave the default settings in place. Modifying timers to inappropriate values can cause an imbalance in the operation of MVRP.

### MVRP Uses MRP Messages to Transmit Switch and VLAN States

MVRP uses MRP messages to register and declare MVRP states for a switch or VLAN and to inform the switching network that a switch or VLAN is leaving MVRP. These messages are communicated as part of the PDU sent by any switch interface to the other switches in the network.

The following MRP messages are communicated for MVRP:

- Empty—MVRP information is not declared and no VLAN is registered.
- In—MVRP information is not declared but a VLAN is registered.
- JoinEmpty—MVRP information is declared but no VLAN is registered.
- JoinIn—MVRP information is declared and a VLAN is registered.

- Leave—MVRP information that was previously declared is withdrawn.
- LeaveAll—Unregister all VLANs on the switch. VLANs must re-register to participate in MVRP.
- New—The MVRP information is new and a VLAN might not be registered yet.

### Compatibility Issues with Junos OS Releases of MVRP

Except in Junos OS Releases 11.2 and earlier, MVRP has conformed with IEEE standard 802.1ak and IEEE Draft 802.1Q regarding the inclusion of an extra byte in the protocol data units (PDUs) sent and received by MVRP. [Table 231 on page 2266](#) outlines the MVRP versions and whether or not each version includes the extra byte in the PDU.

[Table 231 on page 2266](#) also labels each MVRP version with a scenario number, which is used throughout the remainder of this discussion for brevity.

**Table 231: Junos OS MVRP Versions and Inclusion of Extra Byte in PDU**

MVRP in Junos OS Releases 11.2 and Earlier For EX Series Switches That Do Not Support Enhanced Layer 2 Software (ELS) Configuration Style	MVRP in Junos OS Releases 11.3 and Later For EX Series Switches That Do Not Support ELS	MVRP in Junos OS Releases 13.2 and Later For EX Series Switches With Support For ELS
Scenario 1	Scenario 2	Scenario 3
Includes extra byte in the PDU	By default, does not include extra byte in the PDU	By default, includes extra byte in the PDU

As a result of the non-conformance of Releases 11.2 and earlier and changes in the standards with regard to the extra byte, a compatibility issue exists between some of the Junos OS versions of MVRP. This issue can result in some versions of MVRP not recognizing PDUs without the extra byte.

To address this compatibility issue, the MVRP versions described in scenarios 2 and 3 include the ability to control whether or not the PDU includes the extra byte. Before using these controls, however, you must understand each scenario that applies to your environment and plan carefully so that you do not inadvertently create an additional compatibility issue between the MVRP versions in scenarios 2 and 3.

[Table 232 on page 2266](#) provides a summary of environments that include the various MVRP scenarios and whether or not a particular environment requires you to take action.

**Table 232: MVRP Environments and Description of Required Actions**

Environment	Action Required?	Action Description
Includes MVRP versions in scenario 1 only	No	—
Includes MVRP versions in scenario 2 only	No	—
Includes MVRP versions in scenario 3 only	No	—

Table 232: MVRP Environments and Description of Required Actions (*continued*)

Environment	Action Required?	Action Description
Includes MVRP versions in scenarios 1 and 2. MVRP version in scenario 2 is in its default state.	Yes	On switches running MVRP version in scenario 2, use the <b>add-attribute-length-in-pdu</b> statement. For more information, see <i>Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure)</i> .
Includes MVRP versions in scenarios 1 and 3. MVRP version in scenario 3 is in its default state.	No	—
Includes MVRP versions in scenarios 2 and 3, and both versions are in their respective default states	Yes	Do one of the following: <ul style="list-style-type: none"> <li>On switches running MVRP version in scenario 2, use the <b>add-attribute-length-in-pdu</b> statement. For more information, see <i>Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure)</i>.</li> <li>On switches running MVRP version in scenario 3, use the <b>no-attribute-length-in-pdu</b> statement. For more information, see “<i>Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure)</i>” on page 2348.</li> </ul>

You can determine whether the switches in your network are running incompatible versions of MVRP by issuing the **show mvrp statistics** command. For more information on diagnosing and correcting this MVRP compatibility situation, see *Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure)* or “*Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure)*” on page 2348.

## Understanding MAC Address Aging

Juniper Networks EX Series Ethernet Switches store MAC addresses in the Ethernet switching table, also called the *MAC table*. When the aging time for a MAC address in the table expires, the address is removed.

If your switch runs Juniper Networks Junos operating system (Junos OS) for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style, you can configure the MAC table aging time on all VLANs on the switch. If your switch runs Junos OS that does not support ELS, you can configure the MAC table aging time on all VLANs on the switch or on specified VLANs, as well as configure aging time to be unlimited, either on all VLANs or on specified VLANs, so that MAC addresses never age out of the table.

To learn MAC addresses, the switch reads all packets that it detects on the LAN or on the local VLAN, looking for MAC addresses of sending nodes. It places these addresses

into its Ethernet switching table, along with two other pieces of information—the interface on which the traffic was received and the time when the address was learned.

When the switch receives traffic on an interface, it searches the Ethernet switching table for the MAC address of the destination. If the MAC address is not found, the traffic is flooded out all of the other interfaces associated with the VLAN. For example, if traffic is received on an interface that is associated with VLAN v-10 and there is no entry in the Ethernet switching table for VLAN v-10 (the Ethernet switching table is organized by VLAN), then the traffic is flooded to all access and trunk interfaces that are members of VLAN v-10.

Flooding allows the switch to learn about destinations that are not yet in its Ethernet switching table. If a particular destination MAC address is not in the Ethernet switching table, the switch floods the traffic to all interfaces except the interface on which it was received. When the destination node receives the flooded traffic, it sends an acknowledgment packet back to the switch, allowing the switch to learn the MAC address of the node and to add the address to its Ethernet switching table.

The switch uses a mechanism called aging to keep the Ethernet switching table current. For each MAC address in the Ethernet switching table, the switch records a timestamp of when the information about the network node was learned. Each time the switch detects traffic from a MAC address that is in its Ethernet switching table, it updates the timestamp of that MAC address. A timer on the switch periodically checks the timestamp, and if the MAC address of a node is older than the value set, the switch removes that MAC address from the Ethernet switching table. This aging process ensures that the switch tracks only active MAC addresses on the network and that it is able to flush out from the Ethernet switching table MAC addresses that are no longer available.

You configure how long MAC addresses remain in the Ethernet switching table by:

- (On switches that run Junos OS with support for the ELS configuration style) Using the **global-mac-table-aging-time** statement in the **[edit protocols l2-learning]** hierarchy.
- (On switches that run Junos OS that does not support ELS) Using the **mac-table-aging-time** statement in either the **[edit ethernet-switching-options]** or the **[edit vlans]** hierarchy, depending on whether you want to configure it for the entire switch or only for specific VLANs.

For example, in a topology with EX switches that run Junos OS that does not support ELS, if you have a printer VLAN, you might choose to configure the aging time for that VLAN to be considerably longer than for other VLANs so that MAC addresses of printers on this VLAN age out less frequently. Because the MAC addresses remain in the table, even if a printer has been idle for some time before traffic arrives for it, the switch still finds the MAC address and does not need to flood the traffic to all other interfaces.

Similarly, in a data center environment where the list of servers connected to the switch is fairly stable, you might choose to increase MAC address aging time, or even set it to unlimited, to increase the efficiency of the utilization of network bandwidth by reducing flooding.

## Q-in-Q Tunneling

- [Understanding Q-in-Q Tunneling on EX Series Switches on page 2269](#)

### Understanding Q-in-Q Tunneling on EX Series Switches

**NOTE:** This topic applies to Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Understanding Q-in-Q Tunneling on EX Series Switches*. For ELS details, see “[Getting Started with Enhanced Layer 2 Software](#)” on page 3.

Q-in-Q tunneling enables service providers on Ethernet access networks to extend a Layer 2 Ethernet connection between two customer sites. Using Q-in-Q tunneling, providers can also segregate or bundle customer traffic into fewer VLANs or different VLANs by adding another layer of 802.1Q tags. Q-in-Q tunneling is useful when customers have overlapping VLAN IDs, because the customer's 802.1Q VLAN tags are prepended by the service-provider VLAN (S-VLAN) tag. The Juniper Networks Junos operating system (Junos OS) implementation of Q-in-Q tunneling supports the IEEE 802.1ad standard.

This topic describes:

- [How Q-in-Q Tunneling Works on page 2269](#)
- [Sending and Receiving Untagged Packets on page 2270](#)
- [Disabling MAC Address Learning on page 2270](#)
- [Mapping C-VLANs to S-VLANs on page 2271](#)
- [Limitations for Q-in-Q Tunneling on page 2272](#)

#### How Q-in-Q Tunneling Works

In Q-in-Q tunneling, as a packet travels from a customer VLAN (C-VLAN) to an S-VLAN, a service-provider-specific 802.1Q tag is added to the packet. This additional tag is used to segregate traffic into S-VLANs. The original customer 802.1Q tag of the packet is retained and is transmitted transparently, passing through the service provider's network. As the packet leaves the S-VLAN in the downstream direction, the additional 802.1Q tag is removed.

When Q-in-Q tunneling is configured on Juniper Networks EX Series Ethernet Switches, trunk interfaces are assumed to be part of the service-provider network and access interfaces are assumed to be part of the customer network. Therefore, this topic also refers to trunk interfaces as S-VLAN interfaces (network-to-network interfaces [NNI]),

and to access interfaces as C-VLAN interfaces (user-network interfaces [UNI]). An access interface can receive both tagged and untagged frames in this case.

An interface can be a member of multiple S-VLANs. You can map one C-VLAN to one S-VLAN (1:1) or many C-VLANs to many S-VLANs (N:N). Customer packets that traverse an S-VLAN are double-tagged for an additional layer of segregating or bundling of C-VLANs. C-VLAN and S-VLAN tags are unique—for instance, you can have both a C-VLAN tag of 101 and an S-VLAN tag of 101. You can limit the set of accepted customer tags to a range of tags or to discrete values. Class-of-service (CoS) values of C-VLANs are unchanged in the downstream direction. You may, optionally, copy ingress priority and CoS settings to the S-VLAN.

C-VLAN and S-VLAN interfaces accept priority-tagged packets without any configuration.

**NOTE:** On an EX4300 switch, you can configure multiple logical interfaces on the same Ethernet port, but each logical interface supports only single-tagged packets and that tag must include a different VLAN ID than those supported by the other logical interfaces. Given this situation, you cannot enable Q-in-Q tunneling on Ethernet ports with multiple logical subinterfaces.

---

### **Sending and Receiving Untagged Packets**

---

To enable a C-VLAN or S-VLAN interface to send and receive untagged packets, you must configure a native VLAN for the interface, then specify a VLAN ID for the native VLAN. After performing this configuration, when a C-VLAN or S-VLAN interface receives an untagged packet, it adds the VLAN ID of the native VLAN to the packet and sends the newly tagged packet to the mapped interface.

To specify a native VLAN ID, use the **native-vlan-id** statement at the **[edit interfaces interface-name]** hierarchy level. When specifying a native VLAN ID on a C-VLAN or S-VLAN physical interface, the value must match the VLAN ID or be included in the VLAN ID list specified on the C-VLAN or S-VLAN logical interface.

For example, on a logical interface for a C-VLAN interface, you specify a C-VLAN ID list of 100-200. Then, on the C-VLAN physical interface, you specify a native VLAN ID of 150. This configuration will work because the native VLAN of 150 is included in the C-VLAN ID list of 100-200.

We recommend configuring a native VLAN when using any of the approaches to map C-VLANs to S-VLANs. If you do not configure a native VLAN on an interface, untagged packets received by the interface are discarded. See the Mapping C-VLANs to S-VLANs section in this topic for information about the methods of mapping C-VLANs to S-VLANs.

---

### **Disabling MAC Address Learning**

---

In a Q-in-Q deployment, customer packets from downstream interfaces are transported without any changes to source and destination MAC addresses. You can disable MAC address learning at the global, interface, and VLAN levels:

At the global level, you disable MAC address learning for the switch.

At the interface level, you disable MAC address learning for all VLANs of which the specified interface is a member.

At the VLAN level, you disable MAC address learning for a specified VLAN. MAC addresses that have already been learned for the VLAN are flushed.

### Mapping C-VLANs to S-VLANs

There are three ways to map C-VLANs to S-VLANs:

- [All-in-One Bundling on page 2271](#)
- [Many-to-Many Bundling on page 2271](#)
- [Mapping a Specific Interface on page 2271](#)

If you configure multiple mapping methods, the switch gives priority to mapping a specific interface, then to many-to-many bundling, and last to all-in-one bundling. However, for a particular mapping method, setting up overlapping rules for the same C-VLAN is not supported.

#### ***All-in-One Bundling***

All-in-one bundling maps all packets from all C-VLAN interfaces to an S-VLAN.

The C-VLAN interface accepts untagged and single-tagged packets. An S-VLAN 802.1Q tag is then added to these packets, and the packets are sent to the S-VLAN interface, which accepts untagged, single-tagged, and double-tagged packets.

**NOTE:** The C-VLAN and S-VLAN interfaces accept untagged packets provided that the `native-vlan-id` statement is configured on these interfaces.

#### ***Many-to-Many Bundling***

Many-to-many bundling is used to specify which C-VLANs are mapped to which S-VLANs.

Many-to-many bundling is used when you want a subset of the C-VLANs on the access switch to be part of multiple S-VLANs. With many-to-many bundling, the C-VLAN interfaces accept untagged and single-tagged packets. An S-VLAN 802.1Q tag is then added to these packets, and the packets are sent to the S-VLAN interfaces, which accept untagged, single-tagged, and double-tagged packets.

**NOTE:** The C-VLAN and S-VLAN interfaces accept untagged packets provided that the `native-vlan-id` statement is configured on these interfaces.

#### ***Mapping a Specific Interface***

Use specific interface mapping when you want to assign an S-VLAN to a specific C-VLAN on an interface. The configuration applies only to the specific interface, not to all access

interfaces as in the cases of the all-in-one bundling and many-to-many bundling approaches.

Specific interface mapping has two suboptions for treatment of traffic: push and swap. When traffic that is mapped to a specific interface is pushed, the packet retains its tag as it moves from the C-VLAN to the S-VLAN, then an additional S-VLAN tag is added to the packet. When traffic that is mapped to a specific interface is swapped, the incoming tag is replaced with a new VLAN tag, which is also referred to as VLAN rewrite.

It might be useful to have S-VLANs that provide service to multiple customers. Each customer typically has its own S-VLAN plus access to one or more S-VLANs that are used by multiple customers. A specific tag on the customer side is mapped to an S-VLAN. Typically, this functionality is used to keep data from different customers separate or to provide individualized treatment of the packets on a certain interface.

When using specific interface mapping, the C-VLAN interfaces accept untagged and single-tagged packets, while the S-VLAN interfaces accept untagged, single-tagged, and double-tagged packets.

**NOTE:** The C-VLAN and S-VLAN interfaces accept untagged packets provided that the `native-vlan-id` statement is configured on these interfaces.

---

### Limitations for Q-in-Q Tunneling

---

Q-in-Q tunneling does not support most access port security features. There is no per-VLAN (customer) policing or per-VLAN (outgoing) shaping and limiting with Q-in-Q tunneling unless you configure these security features by using firewall filters.

## Layer 2 Protocol Tunneling

---

- [Understanding Layer 2 Protocol Tunneling on EX Series Switches on page 2272](#)

### Understanding Layer 2 Protocol Tunneling on EX Series Switches

---

**NOTE:** This topic describes Layer 2 protocol tunneling (L2PT) on Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Understanding Layer 2 Protocol Tunneling on EX Series Switches*. For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 3](#).

---

L2PT enables service providers to send Layer 2 protocol data units (PDUs) across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain. This feature is useful when you want to run

Layer 2 protocols on a network that includes switches located at remote sites that are connected across a service provider network.

This topic includes:

- [Layer 2 Protocols Supported by L2PT on EX Series Switches on page 2273](#)
- [How L2PT Works on page 2274](#)
- [L2PT and Q-in-Q Tunneling on EX Series Switches on page 2275](#)

### Layer 2 Protocols Supported by L2PT on EX Series Switches

L2PT on EX Series switches supports the following Layer 2 protocols:

- 802.3ah Operation, Administration, and Maintenance (OAM) link fault management (LFM)

**NOTE:** If you enable L2PT for untagged OAM LFM packets, do not configure LFM on the corresponding access interface.

- Cisco Discovery Protocol (CDP)
- Ethernet Local Management Interface (E-LMI)
- MVRP VLAN Registration Protocol (MVRP)
- Link Aggregation Control Protocol (LACP)

**NOTE:** If you enable L2PT for untagged LACP packets, do not configure LACP on the corresponding access interface.

- Link Layer Discovery Protocol (LLDP)
- Multiple MAC Registration Protocol (MMRP)
- Multiple VLAN Registration Protocol (MVRP)
- Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), and Multiple Spanning Tree Protocol (MSTP)
- Unidirectional Link Detection (UDLD)
- VLAN Spanning Tree Protocol (VSTP)
- VLAN Trunking Protocol (VTP)

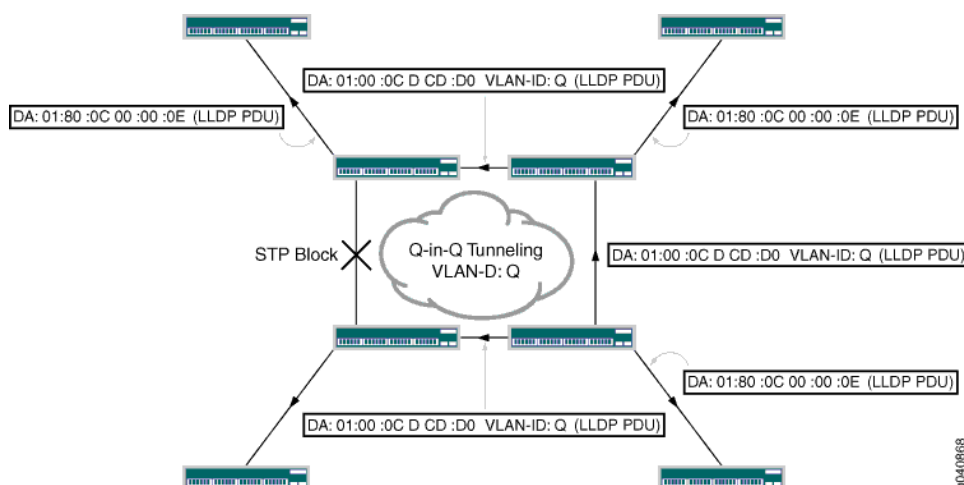

**NOTE:** CDP, UDLD, and VTP cannot be configured on EX Series switches. L2PT does, however, tunnel CDP, UDLD, and VTP PDUs.

## How L2PT Works

L2PT works by encapsulating Layer 2 PDUs, tunneling them across a service provider network, and decapsulating them for delivery to their destination switches. L2PT encapsulates Layer 2 PDUs by enabling the ingress provider edge (PE) device to rewrite the PDUs' destination media access control (MAC) addresses before forwarding them to the service provider network. The devices in the service provider network treat these encapsulated PDUs as multicast Ethernet packets. On receiving these PDUs, the egress PE devices decapsulate them by replacing the destination MAC addresses with the address of the Layer 2 protocol that is being tunneled before forwarding the PDUs to their destination switches. This process is illustrated in [Figure 31 on page 2274](#).

Figure 31: L2PT Example

When a PE device receives a Layer 2 control PDU from any of the customer PE devices, it changes the destination MAC address to 01:00:0C:CD:CD:D0. The modified packet is then sent to the provider network. All devices on the provider network treat these packets as multicast Ethernet packets and deliver them to all PE devices for the customer. The egress PE devices receive all the control PDUs with the same MAC address (01:00:0C:CD:CD:D0). Then they identify the packet type by doing deeper packet inspection and replace the destination MAC address 01:00:0C:CD:CD:D0 with the appropriate destination address. The modified PDUs are sent out to the customer PE devices, thus ensuring the Layer 2 control PDUs are delivered, in their original state, across the provider network. The L2PT protocol is valid for all types of packets (untagged, tagged, and Q-in-Q tagged).

The switch tunnels all Layer 2 PDUs regardless of the speed at which they are received, although the number of packets tunneled per second might be limited by other factors.

L2PT supports tunneling of STP, LLDP, CDP, and VTP control PDUs across the service provider network. The PE device identifies the Layer 2 control protocols by their encapsulated MAC address. The destination MAC address used by different protocols is listed in [Table 233 on page 2275](#):

Table 233: Protocol Destination MAC Addresses

Protocol	Ethernet Encapsulation	MAC Address
802.3ah	Ether-II	01:80:C2:00:00:02
CDP	SNAP	01:00:0C:CC:CC:CC
E-LMI	Ether-II	01:80:C2:00:00:07
MVRP	Ether-II	01:80C2:00:00:21
LACP	Ether-II	01:80:C2:00:00:02
STP, RSTP, and MSTP	SNAP	01:80:C2:00:00:21
LLDP	Ether-II	01:80:0C:00:00:0E
MMRP	Ether-II	01:80:C2:00:00:0E
UDLD	SNAP	01:00:0C:CC:CC:CC
VSTP	SNAP	01:00:0C:CC:CC:CD
VTP	SNAP	01:00:0C:CC:CC:CC

### L2PT and Q-in-Q Tunneling on EX Series Switches

You must enable Q-in-Q tunneling before you can configure L2PT. For information about Q-in-Q tunneling, see [“Understanding Q-in-Q Tunneling on EX Series Switches” on page 2269](#).

### Redundant Trunk Groups

- [Understanding Redundant Trunk Links on page 2276](#)

## Understanding Redundant Trunk Links

In a typical enterprise network composed of distribution and access layers, a redundant trunk link provides a simple solution for network recovery when a trunk port on a switch goes down. In that case, traffic is routed to another trunk port, keeping network convergence time to a minimum.

To configure a redundant trunk link, create a redundant trunk group. The redundant trunk group is configured on the access switch and contains two links: a primary or active link, and a secondary link. If the active link fails, the secondary link automatically starts forwarding data traffic without waiting for normal spanning-tree protocol convergence.

Data traffic is forwarded only on the active link. Data traffic on the secondary link is dropped and shown as dropped packets when you issue the operational mode command **show interfaces *interface-name* extensive**.

While data traffic is blocked on the secondary link, Layer 2 control traffic is still permitted. For example, an LLDP session can be run between two switches on the secondary link.

Rapid Spanning Tree Protocol (RSTP) is enabled by default on the switches to create a loop-free topology, but an interface is not allowed to be in both a redundant trunk group and in a spanning-tree protocol topology at the same time. You must disable RSTP on an interface if a redundant trunk group is configured on that interface. For example, in [Figure 32 on page 2277](#), in addition to disabling RSTP on the Switch 3 interfaces, you must also disable RSTP on the Switch 1 and Switch 2 interfaces connected to Switch 3. Spanning-tree protocols can, however, continue operating on other interfaces on those switches—for example on the link between Switch 1 and Switch 2.

[Figure 32 on page 2277](#) shows three switches in a basic topology for redundant trunk links. Switch 1 and Switch 2 make up the distribution layer, and Switch 3 makes up the access layer. Switch 3 is connected to the distribution layer through trunk ports ge-0/0/9.0 (Link 1) and ge-0/0/10.0 (Link 2). Link 1 and Link 2 are in a redundant trunk group called group1. Link 1 is designated as the primary link. Traffic flows between Switch 3 in the access layer and Switch 1 in the distribution layer through Link 1. While Link 1 is active, Link 2 blocks traffic.

Figure 32: Redundant Trunk Group, Link 1 Active

Figure 33 on page 2277 illustrates how the redundant trunk link topology works when the primary link goes down.

Figure 33: Redundant Trunk Group, Link 2 Active

When Link 1 between Switch 1 and Switch 3 goes down, Link 2 takes over as the active link. Traffic between the access layer and the distribution layer is then automatically switched to Link 2 between Switch 1 and Switch 2.

## Proxy ARP

- [Understanding Proxy ARP on EX Series Switches on page 2278](#)

### Understanding Proxy ARP on EX Series Switches

You can configure proxy Address Resolution Protocol (ARP) on your Juniper Networks EX Series Ethernet Switch to enable the switch to respond to ARP queries for network addresses by offering its own Ethernet media access control (MAC) address. With proxy ARP enabled, the switch captures and routes traffic to the intended destination.

Proxy ARP is useful in situations where hosts are on different physical networks and you do not want to use subnet masking. Because ARP broadcasts are not propagated between hosts on different physical networks, hosts will not receive a response to their ARP request if the destination is on a different subnet. Enabling the switch to act as an ARP proxy allows the hosts to transparently communicate with each other through the switch. Proxy ARP can help hosts on a subnet reach remote subnets without your having to configure routing or a default gateway.

- [What Is ARP? on page 2278](#)
- [Proxy ARP Overview on page 2278](#)
- [Best Practices for Proxy ARP on EX Series Switches on page 2279](#)

---

#### What Is ARP?

Ethernet LANs use ARP to map Ethernet MAC addresses to IP addresses. Each device maintains a cache containing a mapping of MAC addresses to IP addresses. The switch maintains this mapping in a cache that it consults when forwarding packets to network devices. If the ARP cache does not contain an entry for the destination device, the host (the DHCP client) broadcasts an ARP request for that device's address and stores the response in the cache.

---

#### Proxy ARP Overview

When proxy ARP is enabled, if the switch receives an ARP request for which it has a route to the target (destination) IP address, the switch responds by sending a proxy ARP reply packet containing its own MAC address. The host that sent the ARP request then sends its packets to the switch, which forwards them to the intended host.

**NOTE:** For security reasons, the source address in an ARP request must be on the same subnet as the interface on which the ARP request is received.

---

You can configure proxy ARP for each interface. You can also configure proxy ARP for an integrated routing and bridging (IRB) interface named `irb` or a routed VLAN interface (RVI) named `vlan`. (On EX Series switches that use Juniper Networks Junos operating system (Junos OS) with support for the Enhanced Layer 2 Software (ELS) configuration style, the feature is known as an IRB interface. On EX Series switches that use Junos OS that does not support ELS, the feature is known as an RVI.)

EX Series switches support two modes of proxy ARP, restricted and unrestricted. Both modes require that the switch have an active route to the destination address of the ARP request.

- **Restricted**—The switch responds to ARP requests in which the physical networks of the source and target are different and does not respond if the source and target IP addresses are on the same subnet. In this mode, hosts on the same subnet communicate without proxy ARP. We recommend that you use this mode on the switch.
- **Unrestricted**—The switch responds to all ARP requests for which it has a route to the destination. This is the default mode (because it is the default mode in Juniper Networks Junos operating system (Junos OS) configurations other than those on the switch). We recommend using restricted mode on the switch.

### Best Practices for Proxy ARP on EX Series Switches

We recommend these best practices for configuring proxy ARP on the switches:

- Set proxy ARP on the interfaces that you want, including IRB interfaces or RVIs, to restricted mode.
- If you set proxy ARP to unrestricted, disable gratuitous ARP requests on each interface enabled for proxy ARP.

### Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch

---

**NOTE:** This example uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs Junos OS that does not support ELS, see *Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch*. For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 3](#).

---

EX Series switches use bridging and virtual LANs (VLANs) to connect network devices in a LAN—desktop computers or laptops, IP telephones, printers, file servers, wireless access points, and others—and to segment the LAN into smaller broadcast domains.

This example describes how to configure basic bridging and a VLAN on an EX Series switch:

- [Requirements on page 2282](#)
- [Overview and Topology on page 2282](#)
- [Configuration on page 2283](#)
- [Verification on page 2287](#)

---

## Requirements

This example uses the following hardware and software components:

- One EX Series switch
- Junos OS Release 13.2X50-D10 or later for EX Series switches

Before you set up bridging and a VLAN, be sure you have:

- Installed your EX Series switch. See the installation instructions for your switch.
- Performed the initial switch configuration. See *Connecting and Configuring an EX Series Switch (CLI Procedure)*.

---

## Overview and Topology

EX Series switches connect network devices in an office LAN or a data center LAN to provide sharing of common resources such as printers and file servers and to enable wireless devices to connect to the LAN through wireless access points. Without bridging and VLANs, all devices on the Ethernet LAN are in a single broadcast domain, and all the devices detect all the packets on the LAN. Bridging creates separate broadcast domains on the LAN, creating VLANs, which are independent logical networks that group together related devices into separate network segments. The grouping of devices on a VLAN is independent of where the devices are physically located in the LAN.

To use an EX Series switch to connect network devices on a LAN, you must, at a minimum, explicitly configure at least one VLAN, even if your network is simple and you want only one broadcast domain to exist, as is the case with this example. You must also assign all needed interfaces to the VLAN, after which the interfaces function in access mode. After the VLAN is configured, you can plug access devices—such as desktop or laptop computers, IP telephones, file servers, printers, and wireless access points—into the switch, and they are joined immediately into the VLAN, and the LAN is up and running.

The topology used in this example consists of one EX4300-24P switch, which has a total of 24 ports. All ports support Power over Ethernet (PoE), which means they provide both network connectivity and electric power for the device connecting to the port. To these ports, you can plug in devices requiring PoE, such as Avaya VoIP telephones, wireless access points, and some IP cameras. (Avaya phones have a built-in hub that allows you to connect a desktop PC to the phone, so the desktop and phone in a single office require only one port on the switch.) [Table 234 on page 2283](#) details the topology used in this configuration example.

Table 234: Components of the Basic Bridging Configuration Topology

Property	Settings
Switch hardware	EX4300-24P switch, with 24 Gigabit Ethernet ports: in this example, 8 ports are used as PoE ports (ge-0/0/0 through ge-0/0/7 ) and 16 ports used as non-PoE ports (ge-0/0/8 through ge-0/0/23)
VLAN name	employee-vlan
VLAN ID	10
Connection to wireless access point (requires PoE)	ge-0/0/0
Connections to Avaya IP telephone—with integrated hub, to connect phone and desktop PC to a single port (requires PoE)	ge-0/0/1 through ge-0/0/7
Direct connections to desktop PCs and laptops (no PoE required)	ge-0/0/8 through ge-0/0/12
Connections to file servers (no PoE required)	ge-0/0/17 and ge-0/0/18
Connections to integrated printer/fax/copier machines (no PoE required)	ge-0/0/19 through ge-0/0/20
Unused ports (for future expansion)	ge-0/0/13 through ge-0/0/16, and ge-0/0/21 through ge-0/0/23

### Configuration

To set up basic bridging and a VLAN:

#### CLI Quick Configuration

To quickly configure a VLAN, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans employee-vlan vlan-id 10
set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/2 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/3 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/4 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/5 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/6 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/7 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/8 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/9 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/10 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/11 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/12 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/17 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/18 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/19 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces ge-0/0/20 unit 0 family ethernet-switching vlan members employee-vlan
```

You must then plug the wireless access point into PoE-enabled port **ge-0/0/0** and the Avaya IP phones into the PoE-enabled ports **ge-0/0/1** through **ge-0/0/7**. Also, plug the PCs, file servers, and printers into ports **ge-0/0/8** through **ge-0/0/12** and **ge-0/0/17** through **ge-0/0/20**.

#### Step-by-Step Procedure

To set up basic bridging and a VLAN:

1. Create a VLAN named **employee-vlan** and specify the VLAN ID of 10 for it:  

```
[edit vlans]
user@switch# set employee-vlan vlan-id 10
```
2. Assign interfaces **ge-0/0/0** through **ge-0/0/12**, and **ge-0/0/17** through **ge-0/0/20** to the **employee-vlan** VLAN:  

```
[edit interface]
user@switch# set ge-0/0/0 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set ge-0/0/1 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set ge-0/0/2 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set ge-0/0/3 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set ge-0/0/4 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set ge-0/0/5 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set ge-0/0/6 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set ge-0/0/7 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set ge-0/0/8 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set ge-0/0/9 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set ge-0/0/10 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set ge-0/0/11 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set ge-0/0/12 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set ge-0/0/17 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set ge-0/0/18 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set ge-0/0/19 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set ge-0/0/20 unit 0 family ethernet-switching vlan members employee-vlan
```
3. Connect the wireless access point to switch port **ge-0/0/0**.
4. Connect the seven Avaya phones to switch ports **ge-0/0/1** through **ge-0/0/7**.
5. Connect the five PCs to ports **ge-0/0/8** through **ge-0/0/12**.
6. Connect the two file servers to ports **ge-0/0/17** and **ge-0/0/18**.
7. Connect the two printers to ports **ge-0/0/19** and **ge-0/0/20**.

**Results** Check the results of the configuration:

```
user@switch> show configuration
ge-0/0/0 {
  unit 0 {
    family ethernet-switching {
      vlan {
        members employee-vlan;
      }
    }
  }
}
ge-0/0/1 {

      vlan {
        members employee-vlan;
      }
    }
  }
}

```

### Verification

To verify that switching is operational and that **employee-vlan** has been created, perform these tasks:

- [Verifying That the VLAN Has Been Created on page 2287](#)
- [Verifying That Interfaces Are Associated with the Proper VLANs on page 2288](#)

#### *Verifying That the VLAN Has Been Created*

**Purpose** Verify that the VLAN named **employee-vlan** has been created on the switch.

**Action** List all VLANs configured on the switch:

```
user@switch> show vlans
Routing instance      VLAN name      Tag      Interfaces
default-switch        employee-vlan   10
                      ge-0/0/0.0
                      ge-0/0/1.0
                      ge-0/0/2.0
                      ge-0/0/3.0
                      ge-0/0/4.0
                      ge-0/0/5.0
                      ge-0/0/6.0
                      ge-0/0/7.0
                      ge-0/0/8.0
                      ge-0/0/9.0
                      ge-0/0/10.0
                      ge-0/0/11.0
                      ge-0/0/12.0
                      ge-0/0/17.0
                      ge-0/0/18.0
                      ge-0/0/19.0
                      ge-0/0/20.0
...
```

**Meaning** The `show vlans` command lists the VLANs configured on the switch. This output shows that the VLAN `employee-vlan` has been created.

***Verifying That Interfaces Are Associated with the Proper VLANs***

**Purpose** Verify that Ethernet switching is enabled on switch interfaces and that all interfaces are included in the VLAN.

**Action** List all interfaces on which switching is enabled:

```

user@switch> show ethernet-switching interfaces

...

```

**Meaning** The **show ethernet-switching interfaces** command lists all interfaces on which switching is enabled (in the **Logical interface** column), along with the VLANs that are active on the interfaces (in the **VLAN members** column). The output in this example shows all the connected interfaces, ge-0/0/0 through ge-0/0/12 and ge-0/0/17 through ge-0/0/20 and that they are all part of VLAN **employee-vlan**. Notice that the interfaces listed are the logical interfaces, not the physical interfaces. For example, the output shows ge-0/0/0.0 instead of ge-0/0/0. This is because Junos OS creates VLANs on logical interfaces, not directly on physical interfaces.

**Related Documentation**

- [Configuring VLANs for EX Series Switches \(CLI Procedure\) on page 2337](#)
- [Example: Connecting Access Switches to a Distribution Switch on page 2291](#)
- [Understanding Bridging and VLANs on EX Series Switches on page 2245](#)

## Example: Connecting Access Switches to a Distribution Switch

**NOTE:** This example uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Example: Connecting an Access Switch to a Distribution Switch*. For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 3](#).

In large local area networks (LANs), you commonly need to aggregate traffic from a number of access switches into a distribution switch.

This example describes how to connect access switches to a distribution switch:

- [Requirements on page 2292](#)
- [Overview and Topology on page 2292](#)
- [Configuring the Access Switch on page 2294](#)

- [Configuring the Distribution Switch on page 2298](#)
- [Verification on page 2300](#)

## Requirements

---

This example uses the following hardware and software components:

- Three EX Series access switches.
- One EX Series distribution switch.

**NOTE:** In an access switch-distribution switch topology, you can connect EX Series switches that run a version of Junos OS that supports ELS with EX Series switches that do not run a version of Junos OS that supports ELS. However, this example uses switches running ELS only to show how to configure this topology using the ELS CLI.

---

- Junos OS Release 12.3R2 or later that supports ELS for EX Series switches.

Before you connect an access switch to a distribution switch, be sure you have:

- Installed the switches. See the installation instructions for your switch.
- Performed the initial software configuration on both switches. For information about the initial software configuration for all EX Series switches except the EX9200 Series switches, see *Connecting and Configuring an EX Series Switch (CLI Procedure)*. For information about the initial software configuration for the EX9200 Series switches, see *Connecting and Configuring an EX9200 Switch (CLI Procedure)*.

## Overview and Topology

---

In a large office that is spread across several floors or buildings, or in a data center, you commonly aggregate traffic from a number of access switches into a distribution switch. This configuration example shows a simple topology to illustrate how to connect three access switches to a distribution switch.

In the topology, the LAN is segmented into two VLANs, one for the sales department and the second for the support team. One 1-Gigabit Ethernet port on one of the access switch's uplink modules connects to the distribution switch, to one 1-Gigabit Ethernet port on the distribution switch.

[Figure 34 on page 2293](#) shows an EX9200 distribution switch that is connected to three EX4300 access switches.

Figure 34: Sample Access Switch-Distribution Switch Topology

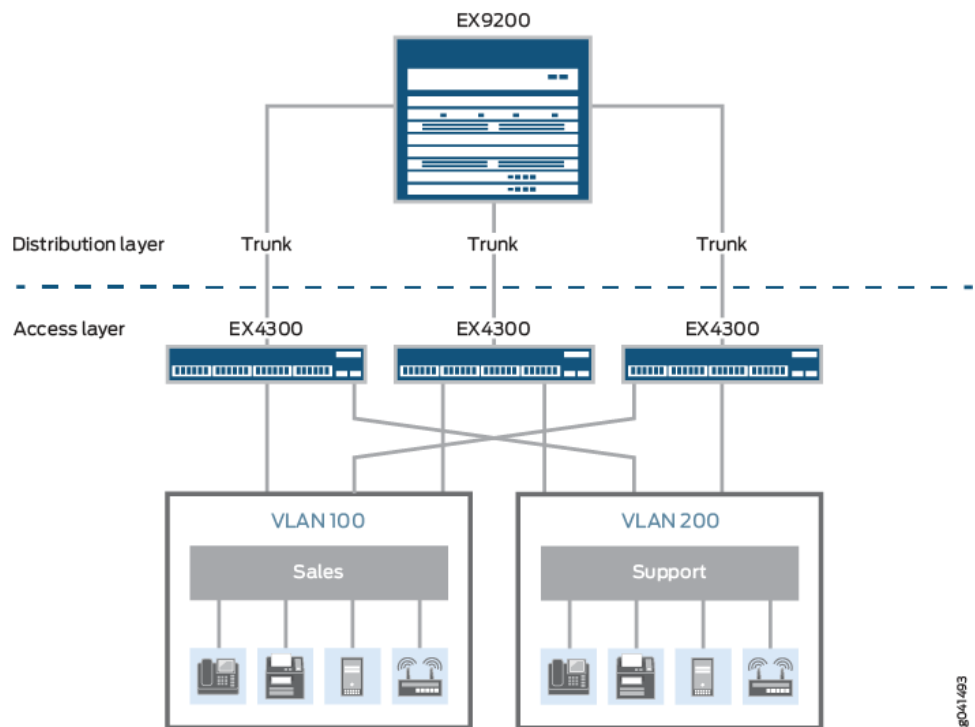

Table 235 on page 2293 describes the components of the example topology. The example shows how to configure one of the three access switches. The other access switches could be configured in the same manner.

**Table 235: Components of the Topology for Connecting an Access Switch to a Distribution Switch**

Property	Settings
Access switch hardware	Three EX4300 switches, each with an uplink module with 1-Gigabit Ethernet ports..
Distribution switch hardware	One EX9208 with up to three EX9200-40T line cards installed, which at full duplex, can provide up to 240 1-Gigabit ports.
VLAN names and tag IDs	<b>sales</b> , tag <b>100</b> <b>support</b> , tag <b>200</b>
VLAN subnets	<b>sales</b> : 192.0.2.0/25 (addresses 192.0.2.1 through 192.0.2.126) <b>support</b> : 192.0.2.128/25 (addresses 192.0.2.129 through 192.0.2.254)
Trunk port interfaces	On the access switch: ge-0/2/0 On the distribution switch: ge-0/0/0
Access port interfaces in VLAN <b>sales</b> (on access switch)	Avaya IP telephones: ge-0/0/3 through ge-0/0/19 Wireless access points: ge-0/0/0 and ge-0/0/1 Printers: ge-0/0/22 and ge-0/0/23 File servers: ge-0/0/20 and ge-0/0/21

Table 235: Components of the Topology for Connecting an Access Switch to a Distribution Switch (*continued*)

Property	Settings
Access port interfaces in VLAN <b>support</b> (on access switch)	Avaya IP telephones: ge-0/0/25 through ge-0/0/43 Wireless access points: ge-0/0/24 Printers: ge-0/0/44 and ge-0/0/45 File servers: ge-0/0/46 and ge-0/0/47

### Configuring the Access Switch

To configure the access switch:

#### CLI Quick Configuration

To quickly configure the access switch, copy the following commands and paste them into the switch terminal window:

```
[edit]
set interfaces ge-0/0/0 unit 0 description "Sales wireless access point port"
set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/3 unit 0 description "Sales phone port"
set interfaces ge-0/0/3 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/22 unit 0 description "Sales printer port"
set interfaces ge-0/0/22 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/20 unit 0 description "Sales file server port"
set interfaces ge-0/0/20 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/24 unit 0 description "Support wireless access point port"
set interfaces ge-0/0/24 unit 0 family ethernet-switching vlan members support
set interfaces ge-0/0/26 unit 0 description "Support phone port"
set interfaces ge-0/0/26 unit 0 family ethernet-switching vlan members support
set interfaces ge-0/0/44 unit 0 description "Support printer port"
set interfaces ge-0/0/44 unit 0 family ethernet-switching vlan members support
set interfaces ge-0/0/46 unit 0 description "Support file server port"
set interfaces ge-0/0/46 unit 0 family ethernet-switching vlan members support
set interfaces ge-0/2/0 unit 0 description "Uplink module port connection to distribution switch"
set interfaces ge-0/2/0 unit 0 family ethernet-switching interface-mode trunk
set interfaces ge-0/2/0 native-vlan-id 1
set interfaces ge-0/2/0 unit 0 family ethernet-switching vlan members [sales support]
set interfaces ge-0/2/0 unit 0 family ethernet-switching vlan members 1
set interfaces irb unit 0 family inet address 192.0.2.1/25
set interfaces irb unit 1 family inet address 192.0.2.129/25
set vlans sales description "Sales VLAN"
set vlans sales l3-interface irb.0
set vlans sales vlan-id 100
set vlans support description "Support VLAN"
set vlans support vlan-id 200
set vlans support l3-interface irb.1
```

#### Step-by-Step Procedure

To configure the access switch:

1. Configure the 1-Gigabit Ethernet interface on the uplink module to be the trunk port that connects to the distribution switch:
 

```
[edit interfaces]
user@access-switch# set ge-0/2/0 unit 0 description "Uplink module port connection to distribution switch"
user@access-switch# set ge-0/2/0 unit 0 family ethernet-switching interface-mode trunk
```
2. Specify the VLANs to be aggregated on the trunk port:

- ```
[edit interfaces]
user@access-switch# set ge-0/2/0 unit 0 family ethernet-switching vlan members [ sales support ]
```
3. To handle untagged packets that are received on the trunk port, create a native VLAN by configuring a VLAN ID and specifying that the trunk port is a member of the native VLAN:
 

```
[edit interfaces]
user@access-switch# set ge-0/2/0 native-vlan-id 1
user@access-switch# set ge-0/2/0 unit 0 family ethernet-switching vlan members 1
```
  4. Configure the sales VLAN:
 

```
[edit vlans]
user@access-switch# set sales description "Sales VLAN"
user@access-switch# set sales vlan-id 100
user@access-switch# set sales l3-interface irb.0
```
  5. Configure the support VLAN:
 

```
[edit vlans]
user@access-switch# set support description "Support VLAN"
user@access-switch# set support vlan-id 200
user@access-switch# set support l3-interface irb.1
```
  6. Create the subnet for the sales VLAN:
 

```
[edit interfaces]
user@access-switch# set irb unit 0 family inet address 192.0.2.1/25
```
  7. Create the subnet for the support VLAN:
 

```
[edit interfaces]
user@access-switch# set irb unit 1 family inet address 192.0.2.129/25
```
  8. Configure the interfaces in the sales VLAN:
 

```
[edit interfaces]
user@access-switch# set ge-0/0/0 unit 0 description "Sales wireless access point port"
user@access-switch# set ge-0/0/0 unit 0 family ethernet-switching vlan members sales
user@access-switch# set ge-0/0/3 unit 0 description "Sales phone port"
user@access-switch# set ge-0/0/3 unit 0 family ethernet-switching vlan members sales
user@access-switch# set ge-0/0/20 unit 0 description "Sales file server port"
user@access-switch# set ge-0/0/20 unit 0 family ethernet-switching vlan members sales
user@access-switch# set ge-0/0/22 unit 0 description "Sales printer port"
user@access-switch# set ge-0/0/22 unit 0 family ethernet-switching vlan members sales
```
  9. Configure the interfaces in the support VLAN:
 

```
[edit interfaces]
user@access-switch# set ge-0/0/24 unit 0 description "Support wireless access point port"
user@access-switch# set ge-0/0/24 unit 0 family ethernet-switching vlan members support
user@access-switch# set ge-0/0/26 unit 0 description "Support phone port"
user@access-switch# set ge-0/0/26 unit 0 family ethernet-switching vlan members support
user@access-switch# set ge-0/0/44 unit 0 description "Support printer port"
user@access-switch# set ge-0/0/44 unit 0 family ethernet-switching vlan members support
user@access-switch# set ge-0/0/46 unit 0 description "Support file server port"
user@access-switch# set ge-0/0/46 unit 0 family ethernet-switching vlan members support
```

**Results** Display the results of the configuration:

```
user@access-switch> show configuration
interfaces {
  ge-0/0/0 {
    unit 0 {
      description "Sales wireless access point port";
      family ethernet-switching {
        vlan {
          members sales;
        }
      }
    }
  }
  ge-0/0/3 {

    vlan-id 200;
    l3-interface irb.1;
  }
}
}

```

**TIP:** To quickly configure the access switch, issue the load merge terminal command, then copy the hierarchy and paste it into the switch terminal window.

## Configuring the Distribution Switch

To configure the distribution switch:

### CLI Quick Configuration

To quickly configure the distribution switch, copy the following commands and paste them into the switch terminal window:

```
set interfaces ge-0/0/0 unit 0 description "Connection to access switch"
set interfaces ge-0/0/0 unit 0 family ethernet-switching interface-mode trunk
set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan members [ sales support ]
set interfaces ge-0/0/0 native-vlan-id 1
set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan members 1
set interfaces irb unit 0 family inet address 192.0.2.2/25
set interfaces irb unit 1 family inet address 192.0.2.130/25
set vlans sales description "Sales VLAN"
set vlans sales vlan-id 100
set vlans sales l3-interface irb.0
set vlans support description "Support VLAN"
set vlans support vlan-id 200
set vlans support l3-interface irb.1
```

### Step-by-Step Procedure

To configure the distribution switch:

1. Configure the interface on the switch to be the trunk port that connects to the access switch:  

```
[edit interfaces]
user@distribution-switch# set ge-0/0/0 unit 0 description "Connection to access switch"
user@distribution-switch# set ge-0/0/0 unit 0 family ethernet-switching interface-mode trunk
```
2. Specify the VLANs to be aggregated on the trunk port:  

```
[edit interfaces]
user@distribution-switch# set ge-0/0/0 unit 0 family ethernet-switching vlan members [ sales support ]
```
3. To handle untagged packets that are received on the trunk port, create a native VLAN by configuring a VLAN ID and specifying that the trunk port is a member of the native VLAN:  

```
[edit interfaces]
user@distribution-switch# set ge-0/0/0 native-vlan-id 1
user@distribution-switch# set ge-0/0/0 unit 0 family ethernet-switching vlan members 1
```
4. Configure the sales VLAN:  

```
[edit vlans]
user@distribution-switch# set sales description "Sales VLAN"
user@distribution-switch# set sales vlan-id 100
user@distribution-switch# set sales l3-interface irb.0
```

The VLAN configuration for the distribution switch includes the **set l3-interface irb.0** command to route traffic between the sales and support VLANs. The VLAN configuration for the access switch does not include this statement because the access switch is not monitoring IP addresses. Instead, the access switch is passing the IP addresses to the distribution switch for interpretation.

5. Configure the support VLAN:

```
[edit vlans]
user@distribution-switch# set support description "Support VLAN"
user@distribution-switch# set support vlan-id 200
user@distribution-switch# set support l3-interface irb.1
```

The VLAN configuration for the distribution switch includes the **set l3-interface irb.1** command to route traffic between the sales and support VLANs. The VLAN configuration for the access switch does not include this statement because the access switch is not monitoring IP addresses. Instead, the access switch is passing the IP addresses to the distribution switch for interpretation.

6. Create the subnet for the sales VLAN:

```
[edit interfaces]
user@distribution-switch# set irb unit 0 family inet address 192.0.2.2/25
```

7. Create the subnet for the support VLAN:

```
[edit interfaces]
user@distribution-switch# set irb unit 1 family inet address 192.0.2.130/25
```

**Results** Display the results of the configuration:

```
user@distribution-switch> show configuration
interfaces {
  ge-0/0/0 {
    native-vlan-id 1;
    unit 0 {
      description "Connection to access switch";
      family ethernet-switching {
        interface-mode trunk;
        vlan {
          members [ 1 sales support ];
        }
      }
    }
  }
  irb {
    unit 0 {
      family inet {
        address 192.0.2.2/25;
      }
    }
    unit 1 {
      family inet {
        address 192.0.2.130/25;
      }
    }
  }
}
vlans {
  sales {
    description "Sales VLAN";
    vlan-id 100;
    l3-interface irb.0;
  }
  support {
    description "Support VLAN";
    vlan-id 200;
    l3-interface irb.1;
  }
}
```

**TIP:** To quickly configure the distribution switch, issue the load merge terminal command, then copy the hierarchy and paste it into the switch terminal window.

---

### Verification

---

To confirm that the configuration is working properly, perform these tasks:

- [Verifying the VLAN Members and Interfaces on the Access Switch on page 2301](#)
- [Verifying the VLAN Members and Interfaces on the Distribution Switch on page 2301](#)

**Verifying the VLAN Members and Interfaces on the Access Switch**

**Purpose** Verify that the **sales** and **support** VLANs have been created on the switch.

**Action** List all VLANs configured on the switch:

```
user@access-switch> show vlans
```

| Routing instance | VLAN name | Tag | Interfaces                                                                |
|------------------|-----------|-----|---------------------------------------------------------------------------|
| default-switch   | sales     | 100 | ge-0/0/20.0<br>ge-0/0/22.0<br>ge-0/0/3.0*<br>ge-0/0/0.0*<br>ge-0/2/0.0*   |
| default-switch   | support   | 200 | ge-0/0/24.0<br>ge-0/0/26.0<br>ge-0/0/44.0*<br>ge-0/0/46.0*<br>ge-0/2/0.0* |

**Meaning** The output shows the **sales** and **support** VLANs and the interfaces that are configured as members of the respective VLANs.

**Verifying the VLAN Members and Interfaces on the Distribution Switch**

**Purpose** Verify that the **sales** and **support** VLANs have been created on the switch.

**Action** List all VLANs configured on the switch:

```
user@distribution-switch> show vlans
```

| Routing instance | VLAN name | Tag | Interfaces  |
|------------------|-----------|-----|-------------|
| default-switch   | sales     | 100 | ge-0/0/0.0* |
| default-switch   | support   | 200 | ge-0/0/0.0* |

**Meaning** The output shows the **sales** and **support** VLANs and the interface (ge-0/0/0.0) that is configured as a member of both VLANs. Interface ge-0/0/0.0 is also the trunk interface connected to the access switch.

- Related Documentation**
- [Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch on page 2281](#)
  - [Configuring VLANs for EX Series Switches \(CLI Procedure\) on page 2337](#)
  - [Understanding Bridging and VLANs on EX Series Switches on page 2245](#)

## Example: Configuring a Private VLAN on a Single Switch

**NOTE:** This example uses Junos OS for switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your EX switch runs software that does not support ELS, see *Example: Configuring a Private VLAN on a Single EX Series Switch*. For ELS details, see “[Getting Started with Enhanced Layer 2 Software](#)” on page 3.

For security reasons, it is often useful to restrict the flow of broadcast and unknown unicast traffic or limit the communication between known hosts. Private VLANs (PVLANS) enable you to split a broadcast domain (primary VLAN) into multiple isolated broadcast subdomains (secondary VLANs), essentially putting a VLAN inside a VLAN.

This example describes how to create a PVLAN on a single switch:

- [Requirements on page 2302](#)
- [Overview and Topology on page 2302](#)
- [Configuration on page 2304](#)
- [Verification on page 2305](#)

### Requirements

This example uses the following hardware and software components:

- One Junos OS switch
- Junos OS Release 14.1X53-D10 or later for EX Series switches  
Junos OS Release 14.1X53-D15 or later for QFX Series switches

### Overview and Topology

You can isolate groups of subscribers for improved security and efficiency. This configuration example uses a simple topology to illustrate how to create a PVLAN with one primary VLAN and three secondary VLANs (one isolated VLAN, and two community VLANs).

[Table 236 on page 2302](#) lists the interfaces of the topology used in the example.

**Table 236: Interfaces of the Topology for Configuring a PVLAN**

| Interface            | Description                         |
|----------------------|-------------------------------------|
| ge-0/0/0             | Promiscuous member ports            |
| ge-1/0/0             |                                     |
| ge-0/0/11, ge-0/0/12 | HR community VLAN member ports      |
| ge-0/0/13, ge-0/0/14 | Finance community VLAN member ports |

Table 236: Interfaces of the Topology for Configuring a PVLAN (*continued*)

| Interface            | Description           |
|----------------------|-----------------------|
| ge-0/0/15, ge-0/0/16 | Isolated member ports |

Table 237 on page 2303 lists the VLAN IDs of the topology used in the example.

Table 237: VLAN IDs in the Topology for Configuring a PVLAN

| VLAN ID | Description            |
|---------|------------------------|
| 100     | Primary VLAN           |
| 200     | HR community VLAN      |
| 300     | Finance community VLAN |
| 400     | Isolated VLAN          |

Figure 35 on page 2303 shows the topology for this example.

Figure 35: Topology of a Private VLAN on a Single EX Series Switch

## Configuration

---

You can use an existing VLAN as the basis for your private PVLAN and create subdomains within it. This example creates a primary VLAN—using the VLAN name **vlan-pri**—as part of the procedure.

To configure a PVLAN, perform these tasks:

**CLI Quick Configuration** To quickly create and configure a PVLAN, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans vlan-pri vlan-id 100
set vlans vlan-iso private-vlan isolated vlan-id 400
set vlans vlan-hr private-vlan community vlan-id 200
set vlans vlan-finance private-vlan community vlan-id 300
set vlans vlan-pri vlan-id 100 isolated-vlan vlan-iso community-vlan vlan-hr community-vlan
vlan-finance
set interface ge-0/0/15 unit 0 family ethernet-switching interface-mode access vlan members
vlan-iso
set interface ge-0/0/16 unit 0 family ethernet-switching interface-mode access vlan members
vlan-iso
set interface ge-0/0/11 unit 0 family ethernet-switching interface-mode access vlan members
vlan-hr
set interface ge-0/0/12 unit 0 family ethernet-switching interface-mode trunk vlan members
vlan-hr
set interface ge-0/0/13 unit 0 family ethernet-switching interface-mode access vlan members
vlan-finance
set interface ge-0/0/14 unit 0 family ethernet-switching interface-mode trunk vlan members
vlan-finance
set interface ge-0/0/0 unit 0 family ethernet-switching interface-mode trunk vlan members
vlan-pri
set interface ge-1/0/0 unit 0 family ethernet-switching interface-mode trunk vlan members
vlan-pri
```

**Step-by-Step Procedure** To configure the PVLAN:

1. Create the primary VLAN (in this example, the name is **vlan-pri**) of the private VLAN:  

```
[edit vlans]
user@switch# set vlan-pri vlan-id 100
```
2. Create an isolated VLAN and assign it a VLAN ID:  

```
[edit vlans]
user@switch# set vlan-iso private-vlan isolated vlan-id 400
```
3. Create the HR community VLAN and assign it a VLAN ID:  

```
[edit vlans]
user@switch# set vlan-hr private-vlan community vlan-id 200
```
4. Create the finance community VLAN and assign it a VLAN ID:  

```
[edit vlans]
user@switch# set vlan-finance private-vlan community vlan-id 300
```
5. Associate the secondary VLANs with the primary VLAN:  

```
[edit vlans]
user@switch# set vlan-pri vlan-id 100 isolated-vlan vlan-iso community-vlan vlan-hr
community-vlan vlan-finance
```
6. Set the interfaces to the appropriate interface modes:

[edit interfaces]

```
user@switch# set ge-0/0/15 unit 0 family ethernet-switching interface-mode access vlan members vlan-iso
```

```
user@switch# set ge-0/0/16 unit 0 family ethernet-switching interface-mode trunk vlan members vlan-iso
```

```
user@switch# set ge-0/0/11 unit 0 family ethernet-switching interface-mode access vlan members vlan-hr
```

```
user@switch# set ge-0/0/12 unit 0 family ethernet-switching interface-mode access vlan members vlan-hr
```

```
user@switch# set ge-0/0/13 unit 0 family ethernet-switching interface-mode access vlan members vlan-finance
```

```
user@switch# set ge-0/0/14 unit 0 family ethernet-switching interface-mode trunk vlan members vlan-finance
```

7. Configure a promiscuous trunk interface of the primary VLAN. This interface is used by the primary VLAN to communicate with the secondary VLANs.

```
user@switch# set ge-0/0/0 unit 0 family ethernet-switching interface-mode trunk vlan members vlan-pri
```

8. Configure another trunk interface (it is also a promiscuous interface) of the primary VLAN, connecting the PVLAN to the router.

```
user@switch# set ge-1/0/0 unit 0 family ethernet-switching interface-mode trunk vlan members vlan-pri
```

### Results

Check the results of the configuration:

```
user@switch> show configuration
```

### Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying That the Private VLAN and Secondary VLANs Were Created on page 2305](#)

#### *Verifying That the Private VLAN and Secondary VLANs Were Created*

**Purpose** Verify that the primary VLAN and secondary VLANs were properly created on the switch.

**Action** Use the `show vlans` command:

```
user@switch> show vlans extensive
```

**Meaning** The output shows that the primary VLAN was created and identifies the interfaces and secondary VLANs associated with it.

#### Related Documentation

## Example: Using Virtual Routing Instances to Route Among VLANs on EX Series Switches

Virtual routing instances enable an EX Series switch to have multiple routing tables. With virtual routing instances, you can segment your network to isolate traffic without setting up additional devices.

In a large office, you might need multiple VLANs to properly manage your traffic. This example describes how to create a virtual routing instance associated with each VLAN for this large office:

- [Requirements on page 2306](#)
- [Overview and Topology on page 2306](#)
- [Configuration on page 2307](#)
- [Verification on page 2309](#)

---

### Requirements

This example uses the following hardware and software components:

- One EX Series switch
- Junos OS Release 9.2 or later for EX Series switches

Before you create the virtual routing instances, make sure you have:

- Configured the necessary VLANs. See *Configuring VLANs for EX Series Switches (CLI Procedure)*, “[Configuring VLANs for EX Series Switches \(CLI Procedure\)](#)” on page 2337, or “[Configuring VLANs for EX Series Switches \(J-Web Procedure\)](#)” on page 2334.

---

### Overview and Topology

This configuration example shows a simple large office topology wherein a LAN is segmented into two VLANs, each of which is associated with an interface and a virtual routing instance.

For example, VLAN 1031 is associated with interface ge-0/0/3.1 and virtual routing instance **r1**. VLAN 1032 is associated with interface ge-0/0/3.2 and virtual routing instance **r2**.

This example also includes interfaces ge-0/0/1.0 and ge-0/0/2.0. Although these interfaces are not part of either VLAN, interface ge-0/0/1.0 is associated with virtual routing instance **r1**, while interface ge-0/0/2.0 is associated with virtual routing instance **r2**.

This example also shows how to use policy statements to import routes from virtual routing instance **r1** to **r2** and from virtual routing instance **r2** to **r1**.

**NOTE:** On EX Series switches, importing directly connected routes from one virtual routing instance to another is not supported. (A directly connected route is a route that is created by specifying an IP address on one of the switch interfaces or for a VLAN.) For more information, including a workaround for this situation, see [KB23027 - Exchanging \(leaking\) directly connected routes across routing instances is not supported](#).

## Configuration

### CLI Quick Configuration

To quickly create and configure virtual routing instances, copy the following commands and paste them into the switch terminal window:

```
[edit]
set interfaces ge-0/0/3 vlan-tagging
set interfaces ge-0/0/3 unit 1 vlan-id 1031 family inet address 10.3.1.1/24
set interfaces ge-0/0/3 unit 2 vlan-id 1032 family inet address 10.4.1.1/24
set interfaces ge-0/0/1 unit 0 family inet address 10.1.1.1/24
set interfaces ge-0/0/2 unit 0 family inet address 10.2.1.1/24
set routing-instances r1 instance-type virtual-router
set routing-instances r1 interface ge-0/0/1.0
set routing-instances r1 interface ge-0/0/3.1
set routing-instances r1 routing-options instance-import import-from-r2
set routing-instances r2 instance-type virtual-router
set routing-instances r2 interface ge-0/0/2.0
set routing-instances r2 interface ge-0/0/3.2
set routing-instances r2 routing-options instance-import import-from-r1
set policy-options policy-statement import-from-r1 term 1 from instance r1
set policy-options policy-statement import-from-r1 term 1 then accept
set policy-options policy-statement import-from-r2 term 1 from instance r2
set policy-options policy-statement import-from-r2 term 1 then accept
```

### Step-by-Step Procedure

To configure virtual routing instances:

1. Create a VLAN-tagged interface:

```
[edit]
user@switch# set interfaces ge-0/0/3 vlan-tagging
```

2. Create one or more logical interfaces on the interfaces to be included in each virtual routing instance:

```
[edit]
user@switch# set interfaces ge-0/0/3 unit 1 vlan-id 1031 family inet address 10.3.1.1/24
user@switch# set interfaces ge-0/0/3 unit 2 vlan-id 1032 family inet address 10.4.1.1/24
user@switch# set interfaces ge-0/0/1 unit 0 family inet address 10.1.1.1/24
user@switch# set interfaces ge-0/0/2 unit 0 family inet address 10.2.1.1/24
```

3. Create two virtual routing instances:

```
[edit]
user@switch# set routing-instances r1 instance-type virtual-router
user@switch# set routing-instances r2 instance-type virtual-router
```

4. Set the interfaces for the virtual routing instances:

```
[edit]
user@switch# set routing-instances r1 interface ge-0/0/1.0
user@switch# set routing-instances r1 interface ge-0/0/3.1
user@switch# set routing-instances r2 interface ge-0/0/2.0
user@switch# set routing-instances r2 interface ge-0/0/3.2
```

5. Apply a policy to routes being imported into each of the virtual routing instances:

```
[edit]
```

```
user@switch# set routing-instances r1 routing-options instance-import import-from-r2
```

```
user@switch# set routing-instances r2 routing-options instance-import import-from-r1
```

6. Create a policy for importing routes from virtual routing instance r1 to r2 and another policy for importing routes from virtual routing instance r2 to r1:

```
[edit]
```

```
user@switch# set policy-options policy-statement import-from-r1 term 1 from instance r1
```

```
user@switch# set policy-options policy-statement import-from-r1 term 1 then accept
```

```
user@switch# set policy-options policy-statement import-from-r2 term 1 from instance r2
```

```
user@switch# set policy-options policy-statement import-from-r2 term 1 then accept
```

**Results** Check the results of the configuration:

```
user@switch> show configuration
```

```
interfaces {
  ge-0/0/1 {
    unit 0 {
      family inet {
        address 10.1.1.1/24;
      }
    }
  }
  ge-0/0/2 {
    unit 0 {
      family inet {
        address 10.2.1.1/24;
      }
    }
  }
  ge-1/0/3 {
    vlan-tagging;
    unit 1 {
      vlan-id 1031;
      family inet {
        address 10.3.1.1/24;
      }
    }
    unit 2 {
      vlan-id 1032;
      family inet {
        address 10.4.1.1/24;
      }
    }
  }
}
policy-options {
  policy-statement import-from-r1 {
    term 1 {
      from instance r1;
      then accept;
    }
  }
  policy-statement import-from-r2 {
    term 1 {
      from instance r2;
      then accept;
    }
  }
}
```

```

    }
  }
  routing-instances {
    r1 {
      instance-type virtual-router;
      interface ge-0/0/1.0;
      interface ge-0/0/3.1;
      routing-options {
        instance-import import-from-r2;
      }
    }
    r2 {
      instance-type virtual-router;
      interface ge-0/0/2.0;
      interface ge-0/0/3.2;
      routing-options {
        instance-import import-from-r1;
      }
    }
  }
}

```

### Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying That the Routing Instances Were Created on page 2309](#)

#### *Verifying That the Routing Instances Were Created*

**Purpose** Verify that the virtual routing instances were properly created on the switch.

**Action** Use the `show route instance` command:

```

user@switch> show route instance
Instance      Primary RIB      Type      Active/holdown/hidden
master
  inet.0      forwarding      6/0/0
  iso.0       1/0/0
  inet6.0     2/0/0
...
r1
  r1.inet.0   virtual-router  7/0/0
r2
  r2.inet.0   virtual-router  7/0/0

```

**Meaning** Each routing instance created is displayed, along with its type, information about whether it is active or not, and its primary routing table.

**Related Documentation**

## Example: Configuring Automatic VLAN Administration Using MVRP on EX Series Switches

---

**NOTE:** This example uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Example: Configuring Automatic VLAN Administration Using MVRP on EX Series Switches*. For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 3](#).

---

As a network expands and the number of clients and VLANs increases, VLAN administration becomes complex and the task of efficiently configuring VLANs on multiple EX Series switches becomes increasingly difficult. However, you can automate VLAN administration by enabling Multiple VLAN Registration Protocol (MVRP) on the network.

MVRP also dynamically creates VLANs, further simplifying the network overhead required to statically configure VLANs.

---

**NOTE:** Only trunk interfaces can be enabled for MVRP.

---

This example describes how to use MVRP to automate administration of VLAN membership changes within your network and how to use MVRP to dynamically create VLANs:

- [Requirements on page 2310](#)
- [Overview and Topology on page 2311](#)
- [Configuring VLANs and MVRP on Access Switch A on page 2313](#)
- [Configuring VLANs and MVRP on Access Switch B on page 2315](#)
- [Configuring VLANs and MVRP on Distribution Switch C on page 2317](#)
- [Verification on page 2318](#)

### Requirements

---

This example uses the following hardware and software components:

- Two EX Series access switches
- One EX Series distribution switch
- Junos OS Release 13.2X50-D10 or later for EX Series switches

Before you configure MVRP on an interface, you must enable one of the following spanning tree protocols on that interface:

- Rapid Spanning-Tree Protocol (RSTP). For more information about RSTP, see [“Understanding RSTP for EX Series Switches” on page 4906](#).
- Multiple Spanning-Tree Protocol (MSTP). For more information about MSTP, see [“Understanding MSTP for EX Series Switches” on page 4904](#).

## Overview and Topology

MVRP is used to manage dynamic VLAN registration in a LAN. It can also be used to dynamically create VLANs.

This example uses MVRP to dynamically create VLANs on the switching network. Alternatively, you can disable dynamic VLAN creation and create VLANs statically. Enabling MVRP on the trunk interface of each switch in your switching network ensures that the active VLAN information for the switches in the network is propagated to each switch through the trunk interfaces, assuming dynamic VLAN creation is enabled for MVRP.

MVRP ensures that the VLAN membership information on the trunk interface is updated as the switch's access interfaces become active or inactive in the configured VLANs in a static or dynamic VLAN creation setup.

You do not need to explicitly bind a VLAN to the trunk interface. When MVRP is enabled, the trunk interface advertises all the VLANs that are active (bound to access interfaces) on that switch. An MVRP-enabled trunk interface does not advertise VLANs that are configured on the switch but are not currently bound to an access interface. Thus, MVRP provides the benefit of reducing network overhead—by limiting the scope of broadcast, unknown unicast, and multicast (BUM) traffic to interested devices only.

When VLAN access interfaces become active or inactive, MVRP ensures that the updated information is advertised on the trunk interface. Thus, in this example, distribution Switch C does not forward traffic to inactive VLANs.

**NOTE:** This example shows a network with three VLANs: **finance**, **sales**, and **lab**. All three VLANs are running the same version of Junos OS. If switches in this network were running a mix of Junos OS releases that included Release 11.3, additional configuration would be necessary—see *Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure)* for details.

Figure 36 on page 2312 shows MVRP configured on two access switches and one distribution switch.

Figure 36: MVRP Configured on Two Access Switches and One Distribution Switch for Automatic VLAN Administration

Table 238 on page 2312 explains the components of the example topology.

### Configuring VLANs and MVRP on Access Switch A

To configure VLANs on the switch, bind access interfaces to the VLANs, and enable MVRP on the trunk interface of access Switch A, perform these tasks:

#### CLI Quick Configuration

To quickly configure access Switch A for MVRP, copy the following commands and paste them into the switch terminal window of Switch A:

```
[edit]
set vlans finance vlan-id 100
set vlans lab vlan-id 200
set vlans sales vlan-id 300
set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan members finance
set interfaces ge-0/0/2 unit 0 family ethernet-switching vlan members lab
set interfaces ge-0/0/3 unit 0 family ethernet-switching vlan members sales
set interfaces xe-0/1/1 unit 0 family ethernet-switching interface-mode trunk
set protocols mvrp interface xe-0/1/1
```

**NOTE:** This example uses default MVRP timers. The default values associated with each MVRP timer are: 200 ms for the join timer, 1000 ms for the leave timer, and 10000 ms (10 seconds) for the leaveall timer. We recommend retaining the use of default timer values as modifying timers to inappropriate values might cause an imbalance in the operation of MVRP. However, if you choose to change the default settings, keep in mind that on an EX Series switch that uses Junos OS with support for ELS, if the timer value set on an interface level is different from the value set on a switch level, then the value on the interface level takes precedence.

**Step-by-Step  
Procedure**

To configure access Switch A for MVRP:

1. Configure the finance VLAN:  

```
[edit]
user@Access-Switch-A# set vlans finance vlan-id 100
```
2. Configure the lab VLAN:  

```
[edit]
user@Access-Switch-A# set vlans lab vlan-id 200
```
3. Configure the sales VLAN:  

```
[edit]
user@Access-Switch-A# set vlans sales vlan-id 300
```
4. Configure an Ethernet interface as a member of the finance VLAN:  

```
[edit]
user@Access-Switch-A# set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan
members finance
```
5. Configure an Ethernet interface as a member of the lab VLAN:  

```
[edit]
user@Access-Switch-A# set interfaces ge-0/0/2 unit 0 family ethernet-switching vlan
members lab
```
6. Configure an Ethernet interface as a member of the sales VLAN:  

```
[edit]
user@Access-Switch-A# set interfaces ge-0/0/3 unit 0 family ethernet-switching vlan
members sales
```
7. Configure a trunk interface:  

```
[edit]
user@Access-Switch-A# set interfaces xe-0/1/1 unit 0 family ethernet-switching
interface-mode trunk
```
8. Enable MVRP on the trunk interface:  

```
[edit]
user@Access-Switch-A# set protocols mvrp interface xe-0/1/1
```

**Results** Check the results of the configuration on Switch A:

```
[edit]
user@Access-Switch-A# show
interfaces {
  ge-0/0/1 {
    unit 0 {
      family ethernet-switching {
        vlan {
          members finance;
        }
      }
    }
  }
  ge-0/0/2 {
    unit 0 {
      family ethernet-switching {
        vlan {
          members lab;
        }
      }
    }
  }
}
```

```

    }
  }
  ge-0/0/3 {
    unit 0 {
      family ethernet-switching {
        vlan {
          members sales;
        }
      }
    }
  }
  xe-0/1/1 {
    unit 0 {
      family ethernet-switching {
        interface-mode trunk;
      }
    }
  }
}
protocols {
  mvrp {
    interface xe-0/1/1;
  }
}
vlangs {
  finance {
    vlan-id 100;
  }
  lab {
    vlan-id 200;
  }
  sales {
    vlan-id 300;
  }
}

```

### Configuring VLANs and MVRP on Access Switch B

To configure three VLANs on the switch, bind access interfaces for PC4 and PC5 to the VLANs, and enable MVRP on the trunk interface of access Switch B, perform these tasks:

#### CLI Quick Configuration

To quickly configure Access Switch B for MVRP, copy the following commands and paste them into the switch terminal window of Switch B:

```

[edit]
set vlans finance vlan-id 100
set vlans lab vlan-id 200
set vlans sales vlan-id 300
set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan members finance
set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan members lab
set interfaces xe-0/1/0 unit 0 family ethernet-switching interface-mode trunk
set protocols mvrp interface xe-0/1/0

```

**Step-by-Step  
Procedure**

To configure access Switch B for MVRP:

1. Configure the finance VLAN:  

```
[edit]  
user@Access-Switch-B# set vlans finance vlan-id 100
```
2. Configure the lab VLAN:  

```
[edit]  
user@Access-Switch-B# set vlans lab vlan-id 200
```
3. Configure the sales VLAN:  

```
[edit]  
user@Access-Switch-B# set vlans sales vlan-id 300
```
4. Configure an Ethernet interface as a member of the finance VLAN:  

```
[edit]  
user@Access-Switch-B# set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan  
members finance
```
5. Configure an Ethernet interface as a member of the lab VLAN:  

```
[edit]  
user@Access-Switch-B# set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan  
members lab
```
6. Configure a trunk interface:  

```
user@Access-Switch-B# set interfaces xe-0/1/0 unit 0 family ethernet-switching  
interface-mode trunk
```
7. Enable MVRP on the trunk interface:  

```
[edit]  
user@Access-Switch-B# set protocols mvrp xe-0/1/0
```

**NOTE:** This example uses default MVRP timers. The default values associated with each MVRP timer are: 200 ms for the join timer, 1000 ms for the leave timer, and 10000 ms (10 seconds) for the leaveall timer. We recommend retaining the use of default timer values as modifying timers to inappropriate values might cause an imbalance in the operation of MVRP. However, if you choose to change the default values, keep in mind that on an EX Series switch that uses Junos OS with support for ELS, if the timer value set on an interface level is different from the value set on a switch level, then the value on the interface level takes precedence.

**Results** Check the results of the configuration for Switch B:

```
[edit]  
user@Access-Switch-B# show  
interfaces {  
  ge-0/0/0 {  
    unit 0 {  
      family ethernet-switching {  
        vlan {  
          members finance;
```

```

    }
  }
}
ge-0/0/1 {
  unit 0 {
    family ethernet-switching {
      vlan {
        members lab;
      }
    }
  }
}
xe-0/1/0 {
  unit 0 {
    family ethernet-switching {
      interface-mode trunk;
    }
  }
}
}
protocols {
  mvrp {
    interface xe-0/1/0;
  }
}
vlands {
  finance {
    vlan-id 100;
  }
  lab {
    vlan-id 200;
  }
  sales {
    vlan-id 300;
  }
}
}

```

### Configuring VLANS and MVRP on Distribution Switch C

**CLI Quick Configuration** To quickly configure distribution Switch C for MVRP, copy the following commands and paste them into the switch terminal window of distribution Switch C:

```

[edit]
set interfaces xe-0/1/1 unit 0 family ethernet-switching interface-mode trunk
set interfaces xe-0/1/0 unit 0 family ethernet-switching interface-mode trunk
set protocols mvrp interface xe-0/1/1
set protocols mvrp interface xe-0/1/0

```

**Step-by-Step  
Procedure**

To configure distribution Switch C for MVRP:

1. Configure the trunk interface to access Switch A:  

```
[edit]
user@Distribution-Switch-C# set interfaces xe-0/1/1 unit 0 family ethernet-switching
interface-mode trunk
```
2. Configure the trunk interface to access Switch B:  

```
[edit]
user@Distribution-Switch-C# set interfaces xe-0/1/0 unit 0 family ethernet-switching
interface-mode trunk
```
3. Enable MVRP on the trunk interface for xe-0/1/1 :  

```
[edit]
user@Distribution-Switch-C# set protocols mvrp interface xe-0/1/1
```
4. Enable MVRP on the trunk interface for xe-0/1/0 :  

```
[edit]
user@Distribution-Switch-C# set protocols mvrp interface xe-0/1/0
```

**Results**

Check the results of the configuration for Switch C:

```
[edit]
user@Distribution Switch-C# show
interfaces {
  xe-0/1/0 {
    unit 0 {
      family ethernet-switching {
        interface-mode trunk;
      }
    }
  }
  xe-0/1/1 {
    unit 0 {
      family ethernet-switching {
        interface-mode trunk;
      }
    }
  }
}
protocols {
  mvrp {
    interface xe-0/1/0;
    interface xe-0/1/1;
  }
}
```

---

**Verification**

To confirm that the configuration is updating VLAN membership, perform these tasks:

- [Verifying That MVRP Is Enabled on Access Switch A on page 2319](#)
- [Verifying That MVRP Is Updating VLAN Membership on Access Switch A on page 2319](#)
- [Verifying That MVRP Is Enabled on Access Switch B on page 2320](#)
- [Verifying That MVRP Is Updating VLAN Membership on Access Switch B on page 2320](#)

- [Verifying That MVRP Is Enabled on Distribution Switch C on page 2321](#)
- [Verifying That MVRP Is Updating VLAN Membership on Distribution Switch C on page 2321](#)

### *Verifying That MVRP Is Enabled on Access Switch A*

**Purpose** Verify that MVRP is enabled on the switch.

**Action** Show the MVRP configuration:

```
user@Access-Switch-A> show mvrp
MVRP configuration for routing instance 'default-switch'
MVRP dynamic VLAN creation : Enabled
MVRP BPDU MAC address      : Customer bridge group (01-80-C2-00-00-21)
MVRP timers (ms)
  Interface   Join   Leave  LeaveAll
  xe-0/1/1    200   1000   10000
```

**Meaning** The results show that MVRP is enabled on the trunk interface of Switch A and that the default timers are used.

### *Verifying That MVRP Is Updating VLAN Membership on Access Switch A*

**Purpose** Verify that MVRP is updating VLAN membership by displaying the Ethernet switching interfaces and associated VLANs that are active on Switch A.

**Action** List Ethernet switching interfaces on the switch:

```
user@Access-Switch-A> show ethernet-switching interface
Routing Instance Name : default-switch
Logical Interface flags (DL - disable learning, AD - packet action drop,
                        LH - MAC limit hit, DN - interface down )
Logical   Vlan   TAG   MAC   STP   Logical   Tagging
interface members limit state interface flags
ge-0/0/1.0
      finance  100
                        65535   Forwarding
Routing Instance Name : default-switch
Logical Interface flags (DL - disable learning, AD - packet action drop,
                        LH - MAC limit hit, DN - interface down )
Logical   Vlan   TAG   MAC   STP   Logical   Tagging
interface members limit state interface flags
ge-0/0/2.0
      lab      200
                        65535   Forwarding
Routing Instance Name : default-switch
Logical Interface flags (DL - disable learning, AD - packet action drop,
                        LH - MAC limit hit, DN - interface down )
Logical   Vlan   TAG   MAC   STP   Logical   Tagging
interface members limit state interface flags
ge-0/0/3.0
      sales    300
                        65535   Forwarding
Routing Instance Name : default-switch
Logical Interface flags (DL - disable learning, AD - packet action drop,
                        LH - MAC limit hit, DN - interface down )
Logical   Vlan   TAG   MAC   STP   Logical   Tagging
interface members limit state interface flags
xe-0/1/1.0
                        65535   tagged
```

|         |     |       |            |
|---------|-----|-------|------------|
| finance | 100 | 65535 | Forwarding |
| lab     | 200 | 65535 | Forwarding |

**Meaning** MVRP has automatically added **finance** and **lab** as VLAN members on the trunk interface because they are being advertised by access Switch B.

#### *Verifying That MVRP Is Enabled on Access Switch B*

**Purpose** Verify that MVRP is enabled on the switch.

**Action** Show the MVRP configuration:

```
user@Access-Switch-B> show mvrp
MVRP configuration for routing instance 'default-switch'
MVRP dynamic VLAN creation : Enabled
MVRP BPDU MAC address      : Customer bridge group (01-80-C2-00-00-21)
MVRP timers (ms)
  Interface    Join    Leave    LeaveAll
  xe-0/1/0     200    1000    10000
```

**Meaning** The results show that MVRP is enabled on the trunk interface of Switch B and that the default timers are used.

#### *Verifying That MVRP Is Updating VLAN Membership on Access Switch B*

**Purpose** Verify that MVRP is updating VLAN membership by displaying the Ethernet switching interfaces and associated VLANs that are active on Switch B.

**Action** List Ethernet switching interfaces on the switch:

```
user@Access-Switch-B> show ethernet-switching interface
Routing Instance Name : default-switch
Logical Interface flags (DL - disable learning, AD - packet action drop,
                        LH - MAC limit hit, DN - interface down )
Logical   Vlan   TAG   MAC   STP   Logical   Tagging
interface members   limit state   interface flags
ge-0/0/0.0
      finance  100
                        65535 Forwarding
Routing Instance Name : default-switch
Logical Interface flags (DL - disable learning, AD - packet action drop,
                        LH - MAC limit hit, DN - interface down )
Logical   Vlan   TAG   MAC   STP   Logical   Tagging
interface members   limit state   interface flags
ge-0/0/1.0
      lab      200
                        65535 Forwarding
Routing Instance Name : default-switch
Logical Interface flags (DL - disable learning, AD - packet action drop,
                        LH - MAC limit hit, DN - interface down )
Logical   Vlan   TAG   MAC   STP   Logical   Tagging
interface members   limit state   interface flags
xe-0/1/0.0
      finance  100
                        65535 Forwarding
      lab      200
```

|       |     |       |            |
|-------|-----|-------|------------|
|       |     | 65535 | Forwarding |
| sales | 300 |       |            |
|       |     | 65535 | Forwarding |

**Meaning** MVRP has automatically added **finance**, **lab**, and **sales** as VLAN members on the trunk interface because they are being advertised by access Switch A.

#### *Verifying That MVRP Is Enabled on Distribution Switch C*

**Purpose** Verify that MVRP is enabled on the switch.

**Action** Show the MVRP configuration:

```
user@Distribution-Switch-C> show mvrp
MVRP configuration for routing instance 'default-switch'
MVRP dynamic VLAN creation : Enabled
MVRP BPDU MAC address      : Customer bridge group (01-80-C2-00-00-21)
MVRP timers (ms)
  Interface    Join    Leave  LeaveAll
  xe-0/1/1     200    1000   10000
  xe-0/1/0     200    1000   10000
```

**Meaning** The results show that MVRP is enabled on the trunk interfaces of Switch C and that the default timers are used.

#### *Verifying That MVRP Is Updating VLAN Membership on Distribution Switch C*

**Purpose** Verify that MVRP is updating VLAN membership on distribution Switch C by displaying the Ethernet switching interfaces and associated VLANs on distribution Switch C.

**Action** List the Ethernet switching interfaces on the switch:

```
user@Distribution-Switch-C> show ethernet-switching interface
Routing Instance Name : default-switch
Logical Interface flags (DL - disable learning, AD - packet action drop,
                        LH - MAC limit hit, DN - interface down )
Logical   Vlan   TAG   MAC   STP   Logical   Tagging
interface members limit state interface flags
xe-0/1/1.0
  mvrp_100
    65535 Forwarding
  mvrp_200
    65535 Forwarding
  mvrp_300
    65535 Forwarding
Routing Instance Name : default-switch
Logical Interface flags (DL - disable learning, AD - packet action drop,
                        LH - MAC limit hit, DN - interface down )
Logical   Vlan   TAG   MAC   STP   Logical   Tagging
interface members limit state interface flags
xe-0/1/0.0
  mvrp_100
    65535 Forwarding
  mvrp_200
    65535 Forwarding
```

List the VLANs that were created dynamically using MVRP on the switch:

```
user@Distribution-Switch-C> show mvrp dynamic-vlan-memberships
```

```
MVRP dynamic vlans for routing instance 'default-switch'
```

```
(s) static vlan, (f) fixed registration
```

| VLAN ID | Interfaces |
|---------|------------|
| 100     | xe-0/1/1.0 |
|         | xe-0/1/0.0 |
| 200     | xe-0/1/1.0 |
|         | xe-0/1/0.0 |
| 300     | xe-0/1/1.0 |

Note that this scenario does not have any fixed registration, which is typical when MVRP is enabled.

**Meaning** Distribution Switch C has two trunk interfaces. Interface **xe-0/1/1.0** connects Distribution Switch C to Access Switch A and is, therefore, updated to show that it is a member of all the VLANs that are active on Switch A. Any traffic for those VLANs will be passed on from Switch C to Switch A, through interface **xe-0/1/1.0**. Interface **xe-0/1/0.0** connects Switch C to Switch B and is updated to show that it is a member of the two VLANs that are active on Switch B. Thus, Switch C sends traffic for **finance** and **lab** to both Switch A and Switch B. But Switch C sends traffic for **sales** only to Switch A.

Switch C also has three dynamic VLANs created using MVRP: **mvrp\_100**, **mvrp\_200**, and **mvrp\_300**. The dynamically created VLANs **mvrp\_100** and **mvrp\_200** are active on interfaces **xe-0/1/1.0** and **xe-0/1/0.0**, and dynamically created VLAN **mvrp\_300** is active on interface **xe-0/1/1.0**.

## Example: Configuring Layer 2 Protocol Tunneling on EX Series Switches

**NOTE:** This topic applies to Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Example: Configuring Layer 2 Protocol Tunneling on EX Series Switches*. For ELS details, see “[Getting Started with Enhanced Layer 2 Software](#)” on page 3.

Layer 2 protocol tunneling (L2PT) allows service providers to send Layer 2 protocol data units (PDUs) across the provider’s cloud and deliver them to EX Series switches that are not part of the local broadcast domain. This feature is useful when you want to run Layer 2 protocols on a network that includes switches located at remote sites that are connected across a service provider network.

This example describes how to configure L2PT on EX Series switches that are running Junos OS with support for ELS:

- [Requirements on page 2323](#)
- [Overview and Topology on page 2323](#)
- [Configuration on page 2325](#)
- [Verification on page 2325](#)

### Requirements

---

This example uses the following hardware and software components:

- Six EX Series switches, with three each at two customer sites, and with one of the switches at each site designated as the provider edge (PE) device
- Junos OS Release 14.1X53-D10 or later for EX Series switches

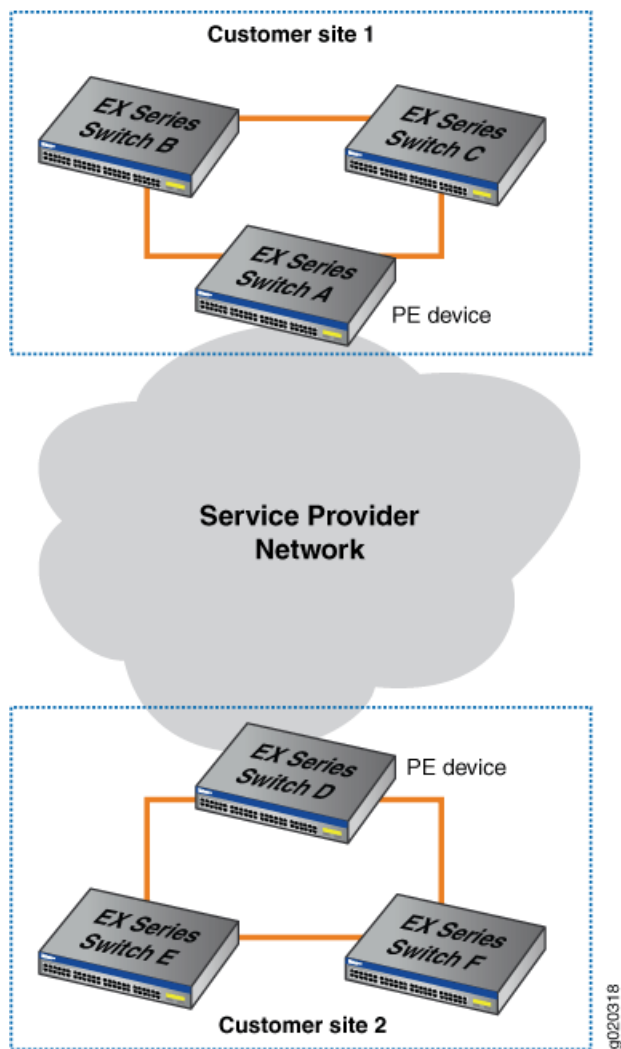

### Overview and Topology

---

L2PT enables you to send Layer 2 PDUs across a service provider network and deliver them to EX Series switches that are not part of the local broadcast domain.

[Figure 37 on page 2324](#) shows a customer network that includes two sites that are connected across a service provider network. Site 1 contains three switches connected in a Layer 2 network, with Switch A designated as a provider edge (PE) device in the service provider network. Site 2 contains a Layer 2 network with a similar topology to that of Site 1, with Switch D designated as a PE device.

Figure 37: L2PT Topology

Q-in-Q tunneling must be enabled before you configure L2PT. L2PT tunneling can be configured *only* on interfaces that have already been configured to support Q-in-Q tunneling.

Q-in-Q tunneling ensures that Switches A, B, C, D, E, and F are part of the same broadcast domain.

This example uses Spanning Tree Protocol (STP) as the Layer 2 protocol being tunneled, but you could substitute any of the supported protocols for STP.

**NOTE:** The implementation of L2PT on EX4300 switches does not support the drop-threshold or the shutdown-threshold configuration statements.

## Configuration

Before you begin, you must configure Q-in-Q tunneling. See [“Configuring Q-in-Q Tunneling \(CLI Procedure\)” on page 2351](#) for a step-by-step procedure for configuring Q-in-Q tunneling.

To configure L2PT, perform these tasks:

**CLI Quick Configuration** To quickly configure L2PT on a Q-in-Q interface, copy the following command and paste it into the switch terminal window of each PE device, and commit the configuration.

```
[edit protocols]
user@switch# set layer2-control mac-rewrite interface ge-0/0/0 protocol STP
```

**Step-by-Step Procedure** To configure L2PT, perform these tasks on each PE device (in [Figure 37 on page 2324](#), Switch A and Switch D are the PE devices):

1. Configure L2PT on a specified Q-in-Q interface by enabling MAC address rewriting for Layer 2 protocol tunneling and selecting the Layer 2 protocol to be tunneled:

**NOTE:** You can select only one layer 2 protocol at a time. If you want an interface to support more than one layer 2 protocol, you must enter the `mac-rewrite` statement multiple times to select the desired protocols.

```
[edit protocols]
user@switch# set layer2-control mac-rewrite interface interface-name protocol STP
```

**Results** Check the results of the configuration:

```
[edit]
user@switch# show
protocols {
  layer2-control {
    mac-rewrite {
      interface ge-0/0/1 {
        protocol {
          stp;
        }
      }
    }
  }
}
```

## Verification

To verify that L2PT is working correctly, perform this task:

- [Verify That L2PT Is Tunneling the Desired Layer 2 Protocol on page 2325](#)

### *Verify That L2PT Is Tunneling the Desired Layer 2 Protocol*

**Purpose** Check to see that L2PT is tunneling the desired protocol on a specified Q-in-Q interface:

**Action** Check to see that L2PT is tunneling STP on an interface:

```
user@switchA> show mac-rewrite interface ge-0/0/0
Interface      Protocols
ge-0/0/0       STP
```

**Meaning** The output shows that STP is being tunneled on the ge-0/0/0 interface.

**Related Documentation**

## Example: Configuring Redundant Trunk Links for Faster Recovery

**NOTE:** This example uses Junos OS for EX Series switches or QFX Series with support for the Enhanced Layer 2 Software (ELS) configuration style. If your EX Series switch runs software that does not support ELS, see *Example: Configuring Redundant Trunk Links for Faster Recovery*. For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 3](#).

You can manage network convergence by configuring both a primary link and a secondary link on a switch; this is called a redundant trunk group (RTG). If the primary link in a redundant trunk group fails, it passes its known MAC address locations to the secondary link, which automatically takes over after one minute.

This example describes how to create a redundant trunk group with a primary and a secondary link:

- [Requirements on page 2326](#)
- [Overview and Topology on page 2327](#)
- [Disabling RSTP on Switches 1 and 2 on page 2329](#)
- [Configuring Redundant Trunk Links on Switch 3 on page 2329](#)
- [Verification on page 2330](#)

### Requirements

---

This example uses the following hardware and software components:

- Two EX Series or QFX Series distribution switches
- One EX Series or QFX Series access switch
- The appropriate software release for your platform:
  - For EX Series switches: Junos OS Release 13.2X50-D10 or later
  - For the QFX Series: Junos OS Release 13.2X50-D15 or later

Before you configure the redundant trunk links network on the access and distribution switches, be sure you have:

- Configured interfaces ge-0/0/9 and ge-0/0/10 on the access switch, Switch 3, as trunk interfaces. .
- Configured one trunk interface on each distribution switch, Switch 1 and Switch 2.
- Connected the three switches as shown in the topology for this example (see [Figure 38 on page 2328](#)).

### Overview and Topology

In a typical enterprise network composed of distribution and access layers, a redundant trunk link provides a simple solution for trunk interface network recovery. When a trunk interface fails, data traffic is routed to another trunk interface after one minute, thereby keeping network convergence time to a minimum.

This example shows the configuration of a redundant trunk group that includes one primary link (and its interface) and one unspecified link (and its interface) that serves as the secondary link.

A second type of redundant trunk group, not illustrated in the example, consists of two unspecified links (and their interfaces); in this case, neither of the links is primary. The software selects an active link by comparing the port numbers of the two links and activating the link with the higher port number. For example, if the two link interfaces use interfaces ge-0/1/0 and ge-0/1/1, the software activates ge-0/1/1. (In the interface names, the final number is the port number.)

The two links in a redundant trunk group generally operate the same way, whether they are configured as primary/unspecified or unspecified/unspecified. Data traffic initially passes through the active link but is blocked on the inactive link. While data traffic is blocked on the secondary link, note that Layer 2 control traffic is still permitted if the link is active. For example, an LLDP session can be run between two switches on the secondary link. If the active link either goes down or is disabled administratively, it broadcasts a list of its known MAC addresses for data traffic; the other link immediately picks up and adds the MAC addresses to its address table, becomes active, and begins forwarding traffic.

The one difference in operation between the two types of redundant trunk groups occurs when a primary link is active, goes down, is replaced by the secondary link, and then reactivates. When a primary link is re-enabled like this while the secondary link is active, the primary link waits 2 minutes (you can change the time interval by using the preempt cutover timer to accommodate your network) and then takes over as the active link. In other words, the primary link has priority and is always activated if it is available. This differs from the behavior of two unspecified links, both of which act as equals. Because the unspecified links are equal, the active link remains active until it either goes down or is disabled administratively; this is the only time that the other unspecified link learns the MAC addresses and immediately becomes active.

The example given here illustrates a primary/unspecified configuration for a redundant trunk group because that configuration gives you more control and is more commonly used.

**NOTE:** Rapid Spanning Tree Protocol (RSTP) is enabled by default on the switches to create a loop-free topology, but an interface is not allowed to be in both a redundant trunk group and in a spanning-tree protocol topology at the same time. You will need to disable RSTP on the two distribution switches in the example, Switch 1 and Switch 2. Spanning-tree protocols can, however, continue operating in other parts of the network—for example, between the distribution switches and also in links between distribution switches and the enterprise core.

Figure 38 on page 2328 displays an example topology containing three switches. Switch 1 and Switch 2 make up the distribution layer, and Switch 3 makes up the access layer. Switch 3 is connected to the distribution layer through trunk interfaces ge-0/0/9.0 (Link 1) and ge-0/0/10.0 (Link 2).

Table 239 on page 2329 lists the components used in this redundant trunk group.

Because RSTP and RTGs cannot operate simultaneously on a switch, you disable RSTP on Switch 1 and Switch 2 in the first configuration task, and you disable RSTP on Switch 3 in the second task.

The second configuration task creates a redundant trunk group called example 1 on Switch 3. The trunk interfaces ge-0/0/9.0 and ge-0/0/10.0 are the two links configured in the second configuration task. You configure the trunk interface ge-0/0/9.0 as the primary link. You configure the trunk interface ge-0/0/10.0 as an unspecified link, which becomes the secondary link by default.

Figure 38: Topology for Configuring the Redundant Trunk Links

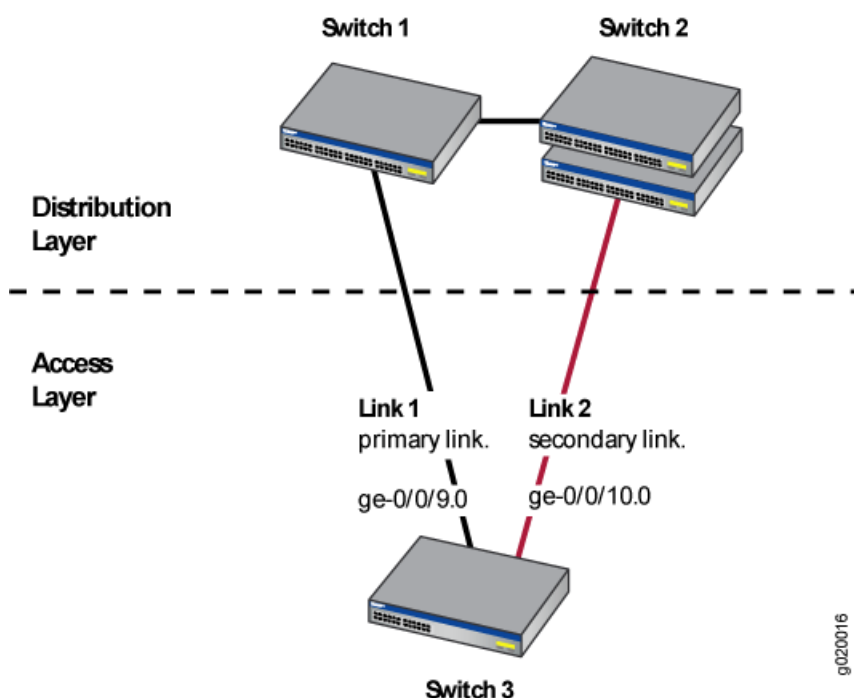

Table 239: Components of the Redundant Trunk Link Topology

| Property              | Settings                                                                                                                                                                                                                           |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Switch hardware       | <ul style="list-style-type: none"> <li>Switch 1–1 EX Series or QFX Series distribution switch</li> <li>Switch 2–1 EX Series or QFX Series distribution switch</li> <li>Switch 3–1 EX Series or QFX Series access switch</li> </ul> |
| Trunk interfaces      | On Switch 3 (access switch): ge-0/0/9.0 and ge-0/0/10.0                                                                                                                                                                            |
| Redundant trunk group | example1                                                                                                                                                                                                                           |

### Disabling RSTP on Switches 1 and 2

To disable RSTP on Switch 1 and Switch 2, perform this task on each switch:

#### CLI Quick Configuration

To quickly disable RSTP on Switch 1 and Switch 2, copy the following command and paste it into each switch terminal window:

```
[edit]
set protocols rstp disable
```

#### Step-by-Step Procedure

To disable RSTP on Switch 1 and Switch 2:

1. Disable RSTP on Switch 1 and Switch 2:

```
[edit]
user@switch# set protocols rstp disable
```

#### Results

Check the results of the configuration:

```
[edit]
user@switch# show
protocols {
  rstp {
    disable;
  }
}
```

### Configuring Redundant Trunk Links on Switch 3

To configure redundant trunk links on Switch 3, perform this task:

#### CLI Quick Configuration

To quickly configure the redundant trunk group example1 on Switch 3, copy the following commands and paste them into the switch terminal window:

```
[edit]
set protocols rstp disable
set switch-options redundant-trunk-group group example1 interface ge-0/0/9.0 primary
set switch-options redundant-trunk-group group example1 interface ge-0/0/10.0
set redundant-trunk-group group example1 preempt-cutover-timer 60
```

#### Step-by-Step Procedure

Configure the redundant trunk group example1 on Switch 3.

1. Turn off RSTP:

```
[edit]
user@switch# set protocols rstp disable
```

2. Name the redundant trunk group example1 while configuring trunk interface ge-0/0/9.0 as the primary link and ge-0/0/10 as an unspecified link to serve as the secondary link:

```
[edit switch-options]
user@switch# set redundant-trunk-group group example1 interface ge-0/0/9.0 primary
user@switch# set redundant-trunk-group group example1 interface ge-0/0/10.0
```

3. (Optional) Change the time interval (from the default 120 seconds) that a re-enabled primary link waits to take over for an active secondary link:

```
[edit switch-options]
user@switch# set redundant-trunk-group group example1 preempt-cutover-timer 60
```

**Results** Check the results of the configuration:

```
[edit]
user@switch# show
switch-options
  redundant-trunk-group {
    group example1 {
      preempt-cutover-timer 60;
      interface ge-0/0/9.0 {
        primary;
      }
      interface ge-0/0/10.0;
    }
  }
protocols {
  rstp {
    disable;
  }
}
```

---

### Verification

To confirm that the configuration is set up correctly, perform this task:

- [Verifying That a Redundant Trunk Group Was Created on page 2330](#)

#### *Verifying That a Redundant Trunk Group Was Created*

**Purpose** Verify that the redundant trunk group example1 has been created on Switch 1 and that trunk interfaces are members of the redundant trunk group.

**Action** List all redundant trunk groups configured on the switch:

```
user@switch> show redundant-trunk-group
```

| Group name | Interface   | State  | Time of last flap | Flap count |
|------------|-------------|--------|-------------------|------------|
| example1   | ge-0/0/9.0  | Up/Pri | Never             | 0          |
|            | ge-0/0/10.0 | Up     | Never             | 0          |

**Meaning** The `show redundant-trunk-group` command lists all redundant trunk groups configured on the switch as well as the interface names and their current states (up or down for an unspecified link, and up or down and primary for a primary link). For this configuration example, the output shows that the redundant trunk group `example1` is configured on the switch. The **Up** beside the interfaces indicates that both link cables are physically connected. The **Pri** beside trunk interface `ge-0/0/9.0` indicates that it is configured as the primary link.

**Related Documentation**

- [Understanding Redundant Trunk Links on page 2276](#)

## Example: Configuring Proxy ARP on an EX Series Switch

You can configure proxy Address Resolution Protocol (ARP) on your EX Series switch to enable the switch to respond to ARP queries for network addresses by offering its own MAC address. With proxy ARP enabled, the switch captures and routes traffic to the intended destination.

This example shows how to configure proxy ARP on an access switch:

- [Requirements on page 2331](#)
- [Overview and Topology on page 2331](#)
- [Configuration on page 2332](#)
- [Verification on page 2332](#)

### Requirements

This example uses the following hardware and software components:

- One EX Series switch
- Junos OS Release 10.0 or later for EX Series switches

### Overview and Topology

This example shows the configuration of proxy ARP on an interface of an EX Series switch using restricted mode. In restricted mode, the switch does not act as a proxy for hosts on the same subnet.

The topology for this example consists of one EX Series switch. When a host wants to communicate with a host that is not already in its ARP table, it broadcasts an ARP request for the MAC address of the destination host:

- When proxy ARP is not enabled, a host that shares the same IP address replies directly to the ARP request, providing its MAC address, and future transmissions are sent directly to the destination host MAC address.
- When proxy ARP is enabled, the switch responds to ARP requests, providing the switch's MAC address—even when the destination IP address is the same as the source IP address. Thus, communications must be sent through the switch and then routed through the switch to the appropriate destination.

## Configuration

---

To configure proxy ARP, perform the following tasks:

**CLI Quick Configuration** To quickly configure proxy ARP on an interface, copy the following command and paste it into the switch terminal window:

```
[edit]
set interfaces ge-0/0/3 unit 0 proxy-arp restricted
```

**Step-by-Step Procedure** You configure proxy ARP on individual interfaces.

1. To configure proxy ARP on an interface:

```
[edit interfaces]
user@switch# set ge-0/0/3 unit 0 proxy-arp restricted
```

**BEST PRACTICE:** We recommend that you configure proxy ARP in restricted mode. In restricted mode, the switch does not act as a proxy if the source and target IP addresses are on the same subnet. If you use unrestricted mode, disable gratuitous ARP requests on the interface to avoid a situation wherein the switch's response to a gratuitous ARP request appears to the host to be an indication of an IP conflict.

```
[edit interfaces]
user@switch# set ge-0/0/3 no-gratuitous-arp-request
```

**Results** Display the results of the configuration:

```
user@switch> show configuration
interfaces {
  ge-0/0/3 {
    unit 0 {
      proxy-arp restricted;
      family ethernet-switching;
    }
  }
}
```

## Verification

---

To verify that the switch is sending proxy ARP messages, perform these tasks:

- [Verifying That the Switch Is Sending Proxy ARP Messages on page 2332](#)

### *Verifying That the Switch Is Sending Proxy ARP Messages*

**Purpose** Verify that the switch is sending proxy ARP messages.

**Action** List the system statistics for ARP messages:

```
user@switch> show system statistics arp
arp:
    90060 datagrams received
    34 ARP requests received
```

```

610 ARP replies received
2 resolution request received
0 unrestricted proxy requests
0 restricted proxy requests
0 received proxy requests
0 unrestricted proxy requests not proxied
0 restricted proxy requests not proxied
0 datagrams with bogus interface
0 datagrams with incorrect length
0 datagrams for non-IP protocol
0 datagrams with unsupported op code
0 datagrams with bad protocol address length
0 datagrams with bad hardware address length
0 datagrams with multicast source address
0 datagrams with multicast target address
0 datagrams with my own hardware address
0 datagrams for an address not on the interface
0 datagrams with a broadcast source address
294 datagrams with source address duplicate to mine
89113 datagrams which were not for me
0 packets discarded waiting for resolution
0 packets sent after waiting for resolution
309 ARP requests sent
35 ARP replies sent
0 requests for memory denied
0 requests dropped on entry
0 requests dropped during retry
0 requests dropped due to interface deletion
0 requests on unnumbered interfaces
0 new requests on unnumbered interfaces
0 replies for from unnumbered interfaces
0 requests on unnumbered interface with non-subnetted donor
0 replies from unnumbered interface with non-subnetted donor

```

**Meaning** The statistics show that two proxy ARP requests were received. The **unrestricted proxy requests not proxied** and **restricted proxy requests not proxied** fields indicate that all the unproxied ARP requests received have been proxied by the switch.

## Configuring VLANs for EX Series Switches (J-Web Procedure)

---

**NOTE:** This topic applies only to the J-Web Application package.

---

You can use the VLAN Configuration page to add a new VLAN or to edit or delete an existing VLAN on an EX Series switch.

To access the VLAN Configuration page:

1. Select **Configure > Switching > VLAN**.

The VLAN Configuration page displays a list of existing VLANs. If you select a specific VLAN, the specific VLAN details are displayed in the Details section.

---

**NOTE:** After you make changes to the configuration on this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See [Using the Commit Options to Commit Configuration Changes](#) for details about all commit options.

---

2. Click one of the following options:

- **Add**—Creates a VLAN.
  - **Edit**—Edits an existing VLAN configuration.
  - **Delete**—Deletes an existing VLAN.
- 

**NOTE:** If you delete a VLAN, the VLAN configuration for all the associated interfaces is also deleted.

---

When you are adding or editing a VLAN, enter information as described in [Table 240 on page 2335](#).

Table 240: VLAN Configuration Details

| Field                                                                                                        | Function                                                                                                                     | Your Action                                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| General tab                                                                                                  |                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                      |
| VLAN Name                                                                                                    | Specifies a unique name for the VLAN.                                                                                        | Enter a name.                                                                                                                                                                                                                                                                                                                                                                                                        |
| VLAN ID/Range/VLAN ID/List<br><br><b>NOTE:</b> EX4300 switches support only VLAN ID/List and not VLAN Range. | Specifies the identifier or range for the VLAN.                                                                              | Select one of the following options: <ul style="list-style-type: none"> <li>• <b>VLAN ID</b>—Type a unique identification number from 1 through <b>4094</b>. If no value is specified, the ID defaults to 0.</li> <li>• <b>VLAN Range/List</b>—Type a number range to create VLANs with IDs corresponding to the numbers in the range. For example, the range 2–3 creates two VLANs with the IDs 2 and 3.</li> </ul> |
| Description                                                                                                  | Describes the VLAN.                                                                                                          | Enter a brief description for the VLAN.                                                                                                                                                                                                                                                                                                                                                                              |
| MAC-Table-Aging-Time<br><br><b>NOTE:</b> This option is not supported on EX4300 switches.                    | Specifies the maximum time that an entry can remain in the forwarding table before it <i>ages out</i> .                      | Type the number of seconds from <b>60</b> through <b>1000000</b> .                                                                                                                                                                                                                                                                                                                                                   |
| Input filter                                                                                                 | Specifies the VLAN firewall filter that is applied to incoming packets.                                                      | To apply an input firewall filter, select the firewall filter from the list.                                                                                                                                                                                                                                                                                                                                         |
| Output filter                                                                                                | Specifies the VLAN firewall filter that is applied to outgoing packets.                                                      | To apply an output firewall filter, select the firewall filter from the list.                                                                                                                                                                                                                                                                                                                                        |
| Ports tab                                                                                                    |                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Ports<br><br><b>NOTE:</b> This option is not supported on EX4300 switches.                                   | Specifies the ports (interfaces) to be associated with this VLAN for data traffic. You can also remove the port association. | Click one of the following options: <ul style="list-style-type: none"> <li>• <b>Add</b>—Select the ports from the available list. For an EX8200 Virtual Chassis configuration, select the member, FPC, and the interface from the list.</li> <li>• <b>Remove</b>—Select the port that you do not want associated with the VLAN.</li> </ul>                                                                           |
| IP address tab                                                                                               |                                                                                                                              |                                                                                                                                                                                                                                                                                                                                                                                                                      |

Table 240: VLAN Configuration Details (*continued*)

| Field        | Function                                                                                                         | Your Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------|------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IPv4 address | Specifies IPv4 address options for the VLAN.                                                                     | <p>Select <b>IPv4 address</b> to enable the IPv4 address options.</p> <p>To configure IPv4:</p> <ol style="list-style-type: none"> <li>1. Enter the IP address.</li> <li>2. Enter the subnet mask—for example, <b>255.255.255.0</b>. You can also specify the address prefix.</li> <li>3. To apply an input firewall filter to an interface, select the firewall filter from the list.</li> <li>4. To apply an output firewall filter to an interface, select the firewall filter from the list.</li> <li>5. Click the <b>ARP/MAC Details</b> button. Enter the static IP address and MAC address in the window that is displayed.</li> </ol> <p><b>NOTE:</b> In EX4300 switches, you also need to select <b>L2 Interface</b> in the window that is displayed.</p> |
| IPv6 address | Specifies IPv6 address options for the VLAN.                                                                     | <p>Select <b>IPv6 address</b> to enable the IPv6 address options.</p> <p>To configure IPv6:</p> <ol style="list-style-type: none"> <li>1. Enter the IP address—for example: <b>2001:ab8:85a3::8a2e:370:7334</b>.</li> <li>2. Specify the subnet mask.</li> </ol>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Voip tab     |                                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Ports        | Specifies the ports to be associated with this VLAN for voice traffic. You can also remove the port association. | <p>Click one of the following options:</p> <ul style="list-style-type: none"> <li>• <b>Add</b>—Select the ports from the list of available ports. For an EX8200 Virtual Chassis configuration, select the member, FPC, and the interface from the list.</li> <li>• <b>Remove</b>—Select the port that you do not want associated with the VLAN.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                         |

## Configuring VLANs for EX Series Switches (CLI Procedure)

**NOTE:** This task uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Configuring VLANs for EX Series Switches (CLI Procedure)*. For ELS details, see “[Getting Started with Enhanced Layer 2 Software](#)” on page 3.

EX Series switches use VLANs to make logical groupings of network nodes with their own broadcast domains. VLANs limit the traffic flowing across the entire LAN and reduce collisions and packet retransmissions.

- [Why Create a VLAN? on page 2337](#)
- [Creating a VLAN Using the Minimum Procedure on page 2337](#)
- [Creating a VLAN Using All of the Options on page 2338](#)
- [Configuration Guidelines for VLANs on page 2339](#)

### Why Create a VLAN?

For switching to begin, you must explicitly configure at least one VLAN, even if your network is simple and you want only one broadcast domain to exist.

Some reasons to create more than one VLAN are:

- A LAN has more than 200 devices.
- A LAN has a large amount of broadcast traffic.
- A group of clients requires that a higher-than-average level of security be applied to traffic entering or exiting the group's devices.
- A group of clients requires that the group's devices receive less broadcast traffic than they are currently receiving, so that data speed across the group is increased.

### Creating a VLAN Using the Minimum Procedure

These steps are required to create a VLAN:

- Uniquely identify the VLAN. You do this by assigning a name and an ID to the VLAN.
- Assign at least one switch port interface to the VLAN for communication. After assigning one or more interfaces to the VLAN, the interfaces function in access mode. All interfaces in a single VLAN are in a single broadcast domain, even if the interfaces are on different switches. You can assign traffic on any switch to a particular VLAN by referencing either the interface sending traffic or the MAC addresses of devices sending traffic.

The following example creates a VLAN using only a few required steps. The VLAN is created with the name **employee-vlan** and the VLAN ID of **100**. Then, three interfaces are

assigned to that VLAN, and these interfaces, which function in access mode, transmit traffic among themselves.

```
[edit] set vlans employee-vlan
edit] set vlans employee-vlan vlan-id 100
[edit] set interfaces ge-0/0/1 unit 0 family ethernet-switching vlan members
employee-vlan
[edit] set interfaces ge-0/0/2 unit 0 family ethernet-switching vlan members
employee-vlan
[edit] set interfaces ge-0/0/3 unit 0 family ethernet-switching vlan members
employee-vlan
```

In the example, all users connected to the interfaces ge-0/0/1, ge-0/0/2, and ge-0/0/3 can communicate with each other, but not with users on other interfaces in this network. To configure communication between VLANs, you must configure an integrated routing and bridging (IRB) interface. See [“Configuring Integrated Routing and Bridging Interfaces \(CLI Procedure\)” on page 2340](#).

---

### Creating a VLAN Using All of the Options

---

To configure a VLAN, follow these steps:

1. Create the VLAN by setting the unique VLAN name:

```
[edit vlans]
user@switch# set vlan-name
```

2. Configure the VLAN ID or a VLAN ID list for the VLAN. Using the VLAN ID list option, you can optionally specify a range of VLAN IDs.

```
[edit vlans]
user@switch# set vlan-name vlan-id vlan-id-number
or
```

```
[edit vlans]
user@switch# set vlan-name vlan-id-list [vlan-ids | vlan-id--vlan-id-]
```

3. Assign at least one interface to the VLAN:

```
[edit interfaces]
user@switch# set interface-name unit logical-unit-number family ethernet-switching vlan
members [all | vlan-names | vlan-ids]
```

**NOTE:** You can also specify that a trunk interface is a member of all VLANs that are configured on this switch. When a new VLAN is configured on the switch, this trunk interface automatically becomes a member of the VLAN.

4. (Optional) Create a subnet for the VLAN because all computers that belong to a subnet are addressed with a common, identical, most-significant-bit group in their IP address. This makes it easy to identify VLAN members by their IP addresses. To create the subnet for the VLAN:

```
[edit interfaces]
user@switch# set vlan unit logical-unit-number family inet address
ip-address/destination-prefix
```

5. (Optional) Specify the description of the VLAN:

```
[edit vlans]
```

```
user@switch# set vlan-name description text-description
```

6. (Optional) For security purposes, specify a VLAN firewall filter to be applied to incoming or outgoing packets:

```
[edit vlans]
```

```
user@switch# set vlan-name filter (input | output) filter-name
```

### Configuration Guidelines for VLANs

To create a VLAN, you must uniquely identify the VLAN and assign at least one switch port interface to the VLAN for communication. After you assign one or more interfaces to the VLAN, the interfaces function in access mode.

After creating a VLAN, all users connected to interfaces that are assigned to the VLAN can communicate with each other but not with users on other interfaces in the network. To configure communication between VLANs, you must configure an IRB interface. For information about creating an IRB interface, see [“Configuring Integrated Routing and Bridging Interfaces \(CLI Procedure\)” on page 2340..](#)

The number of VLANs supported per switch varies. Use the command **set vlans *vlan-name* *vlan-id* ?** to determine the maximum number of VLANs allowed on a switch. You cannot exceed this VLAN limit because each VLAN is assigned an ID number when it is created.

## Configuring Integrated Routing and Bridging Interfaces (CLI Procedure)

Integrated routing and bridging (IRB) interfaces allow an EX Series switch to recognize packets that are being sent to local addresses so that they are bridged (switched) whenever possible and are routed only when necessary. Whenever packets can be switched instead of routed, several layers of processing are eliminated.

An interface named `irb` functions as a logical router on which you can configure a Layer 3 logical interface for each virtual LAN (VLAN). For redundancy, you can combine an IRB interface with implementations of the Virtual Router Redundancy Protocol (VRRP) in both bridging and virtual private LAN service (VPLS) environments.

Jumbo frames of up to 9216 bytes are supported on an IRB interface. To route jumbo data packets on the IRB interface, you must configure the jumbo MTU size on the member physical interfaces of the VLAN that you have associated with the IRB interface, as well as on the IRB interface itself (the interface named `irb`).

**CAUTION:** Setting or deleting the jumbo MTU size on the IRB interface (the interface named `irb`) while the switch is transmitting packets might result in dropped packets.

To configure the IRB interface:

1. Create a Layer 2 VLAN by assigning it a name and a VLAN ID:

```
[edit]
user@switch# set vlans vlan-name vlan-id vlan-id
```

2. Assign an interface to the VLAN by naming the VLAN as a trunk member on the logical interface, thereby making the interface part of the VLAN's broadcast domain:

```
[edit]
user@switch# set interfaces interface-name unit logical-unit-number family ethernet-switching
vlan members vlan-name
```

3. Create a logical Layer 3 IRB interface (its name will be `irb.logical-interface-number`, where the value for *logical-interface-number* is the value you supplied for *vlan-id* in Step 1; in the following command, it is the *logical-unit-number*) on a subnet for the VLAN's broadcast domain:

```
[edit]
user@switch# set interfaces irb unit logical-unit-number family inet address inet-address
```

4. Link the Layer 2 VLAN to the logical Layer 3 IRB interface:

```
[edit]
user@switch# set vlans vlan-name l3-interface irb.logical-interface-number
```

**NOTE:** Layer 3 interfaces on trunk ports allow the interface to transfer traffic between multiple Layer 2 VLANs. Within a VLAN, traffic is switched, while across VLANs, traffic is routed.

## Configuring MAC Table Aging (CLI Procedure)

**NOTE:** This task uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Configuring MAC Table Aging (CLI Procedure)*.

The Ethernet switching table (or MAC table) aging process ensures that the EX Series switch tracks only active MAC addresses on the network and is able to flush out MAC addresses that are no longer used.

You can configure the MAC table aging time, the maximum time that an entry can remain in the Ethernet Switching table before it *ages out*, on all VLANs on the switch. This setting can influence efficiency of network resource use by affecting the amount of traffic that is flooded to all interfaces because when traffic is received for MAC addresses no longer in the Ethernet switching table, the switch floods the traffic to all interfaces.

To configure the MAC table aging time on all VLANs on the switch:

[edit]

```
user@switch# set protocols l2-learning global-mac-table-aging-time seconds
```

## Configuring the Native VLAN Identifier (CLI Procedure)

**NOTE:** This task uses Junos OS for EX Series switches and Junos OS for QFX3500 and QFX3600 switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Configuring the Native VLAN Identifier (CLI Procedure)*. For ELS details, see “Getting Started with Enhanced Layer 2 Software” on page 3.

Switches can receive and forward routed or bridged Ethernet frames with 802.1Q VLAN tags. Typically, trunk ports, which connect switches to each other, accept untagged control packets but do not accept untagged data packets. You can enable a trunk port to accept untagged data packets by configuring a native VLAN ID on the interface on which you want the untagged data packets to be received. The logical interface on which untagged packets are to be received must be configured with the same VLAN ID as the native VLAN ID configured on the physical interface.

To configure the native VLAN ID by using the command-line interface (CLI):

1. On the interface on which you want untagged data packets to be received, set the interface mode to **trunk**, which specifies that the interface is in multiple VLANs and can multiplex traffic between different VLANs.:

```
[edit interfaces]
user@switch# set interface-name unit logical-unit-number family
ethernet-switching interface-mode trunk
```

2. Configure the native VLAN ID:

```
[edit interfaces]
user@switch# set interface-name native-vlan-id vlan-id
```

3. Specify that the logical interface that will receive the untagged data packets is a member of the native VLAN:

```
[edit interfaces]
user@switch# set interface-name unit logical-unit-number family
ethernet-switching vlan members vlan-id
```

## Creating a Private VLAN on a Single Switch (CLI Procedure)

**NOTE:** This task uses Junos OS for switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your EX Series switch runs software that does not support ELS, see *Creating a Private VLAN on a Single EX Series Switch (CLI Procedure)*. For ELS details, see “[Getting Started with Enhanced Layer 2 Software](#)” on page 3.

For security reasons, it is often useful to restrict the flow of broadcast and unknown unicast traffic or limit the communication between known hosts. Private VLANs (PVLANS) enable you to split a broadcast domain (primary VLAN) into multiple isolated broadcast subdomains (secondary VLANs), essentially putting a VLAN inside a VLAN. This procedure describes how to create a PVLAN on a single switch.

**NOTE:** You must specify a VLAN ID for each secondary VLAN even if the PVLAN is configured on a single switch.

You do not need to preconfigure the primary VLAN. This topic shows the primary VLAN being configured as part of this PVLAN configuration procedure.

For a list of guidelines on configuring PVLANS, see “[Understanding Private VLANs](#)” on page 2258.

To configure a private VLAN on a single switch:

1. Set the VLAN ID for the primary VLAN:

[edit vlans]

```
user@switch# set primary-vlan-name vlan-id vlan-id-number
```

2. Configure at least one interface within the primary VLAN so that it communicates with all the subdomains of the PVLAN. This interface functions as a *promiscuous* port. It can be either a trunk port or an access port.

[edit interfaces]

```
user@switch# set interface-name unit 0 family ethernet-switching
```

```
user@switch# set interface-name unit 0 family ethernet-switching vlan members  
primary-vlan-name
```

3. Configure another promiscuous interface of the primary VLAN as a trunk port to connect the PVLAN to the external router or switch:

[edit interfaces]

```
user@switch# set interface-name unit 0 family ethernet-switching interface-mode trunk
```

```
user@switch# set interface-name unit 0 family ethernet-switching vlan members  
primary-vlan-name
```

4. Create an isolated VLAN by selecting the **isolated** option for **private-vlan**, and setting a VLAN ID for the isolated VLAN:

[edit vlans]

```
user@switch# set isolated-vlan-name private-vlan isolated vlan-id isolated-vlan-id
```

**NOTE:** You can create only one isolated VLAN within a private VLAN. Setting the VLAN name for the isolated VLAN is optional. Configuring the VLAN ID is required.

5. Create a community VLAN by selecting the **community** option for **private-vlan**, and setting a VLAN ID for this community VLAN:

[edit vlans]

```
user@switch# set community-vlan-name private-vlan community vlan-id community-vlan-id
```

**NOTE:** To create additional community VLANs, repeat this step and specify a different name for the community VLAN. Setting the VLAN name for the community VLAN is optional. Configuring the VLAN ID is required.

6. Associate the isolated VLAN with the primary VLAN:

[edit vlans]

```
user@switch# set primary-vlan-name vlan-id primary-vlan-id isolated-vlan isolated-vlan-name
```

7. Associate each community VLAN with the primary VLAN:

[edit vlans]

```
user@switch# set primary-vlan-name vlan-id primary-vlan-id  
community-vlan community-vlan-name
```

8. If you have not already done so, configure at least one interface of the isolated VLAN.

[edit interfaces]

```
user@switch# set interface-name unit logical-unit-number family ethernet-switching  
interface-mode access vlan members isolated-vlan-name
```

9. If you have not already done so, configure at least one interface of the community VLAN.

[edit interfaces]

```
user@switch# set interface-name unit logical-unit-number family ethernet-switching  
interface-mode access vlan members community-vlan-name
```

**NOTE:** Repeat the same step on other community VLANs that you want to include in the PVLAN.

#### Related Documentation

- [Understanding Private VLANs on page 2258](#)
- [Creating a Private VLAN Spanning Multiple Switches \(CLI Procedure\) on page 2345](#)

## Creating a Private VLAN Spanning Multiple Switches (CLI Procedure)

**NOTE:** This task uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Creating a Private VLAN Spanning Multiple EX Series Switches (CLI Procedure)*. For ELS details, see “[Getting Started with Enhanced Layer 2 Software](#)” on page 3.

For security reasons, it is often useful to restrict the flow of broadcast and unknown unicast traffic or limit the communication between known hosts. Private VLANs (PVLANS) enable you to split a broadcast domain (primary VLAN) into multiple isolated broadcast subdomains (secondary VLANs), essentially putting a VLAN inside a VLAN. This procedure describes how to configure a PVLAN to span multiple switches.

For a list of guidelines on configuring PVLANS, see “[Understanding Private VLANs](#)” on page 2258.

To configure a PVLAN to span multiple switches, perform the following procedure on all the switches that will participate in the PVLAN::

1. Create the primary VLAN by setting the unique VLAN name and specify an 802.1Q tag for the VLAN:

```
[edit vlans]
user@switch# set primary-vlan-name vlan-id number
```

2. On the switch that will connect to a router, configure a promiscuous interface as a trunk port to connect the PVLAN to the router:

```
[edit interfaces]
user@switch# set interface-name unit 0 family ethernet-switching interface-mode trunk
user@switch# set interface-name unit 0 family ethernet-switching vlan members
primary-vlan-name
```

3. On all the switches, configure a trunk interface as the Inter-Switch Link (ISL) that will be used to connect the switches to each other:

```
[edit interfaces]
user@switch# set interface-name unit 0 family ethernet-switching interface-mode trunk
inter-switch-link
user@switch# set interface-name unit 0 family ethernet-switching vlan members
name-of-private-vlan
```

4. Create an isolated VLAN within the primary VLAN by selecting the **isolated** option for **private-vlan**, and setting a VLAN ID for the isolated VLAN:

```
[edit vlans]
user@switch# set isolated-vlan-name private-vlan isolated-vlan-id isolated-vlan-id
```

**NOTE:** You can create only one isolated VLAN within a private VLAN. The isolated VLAN can contain member interfaces from the multiple switches that compose the PVLAN.

Setting the VLAN name for the isolated VLAN is optional. Configuring the VLAN ID is required.

5. Create a community VLAN within the primary VLAN by selecting the **community** option for **private-vlan**, and setting a VLAN ID for this community VLAN::

[edit vlans]

```
user@switch# set community-vlan-name private-vlan community vlan-id community-vlan-id
```

---

**NOTE:** To create additional community VLANs, repeat this step and specify a different name for the community VLAN. Setting the VLAN name for the community VLAN is optional. Configuring the VLAN ID is required.

---

6. Associate the isolated VLAN with the primary VLAN:

[edit vlans *primary-vlan-name* vlan-id *primary-vlan-id*]

```
user@switch# set isolated-vlan isolated-vlan-name
```

7. Associate each community VLAN with the primary VLAN:

[edit vlans *primary-vlan-name* vlan-id *primary-vlan-id*]

```
user@switch# set community-vlan community-vlan-name
```

8. If you have not already done so, configure at least one access interface to be a member of the isolated VLAN.

[edit interface]

```
user@switch# set interface-name unit logical-unit-number family ethernet-switching  
interface-mode access vlan members isolated-vlan-name
```

9. If you have not already done so, configure at least one access interface to be a member of the community VLAN.

[edit interface]

```
user@switch# set interface-name unit logical-unit-number family ethernet-switching  
interface-mode access vlan members community-vlan-name
```

---

**NOTE:** Repeat this step for the other community VLANs that you are including in the PVLAN.

---

#### Related Documentation

- [Understanding Private VLANs on page 2258](#)
- [Example: Configuring a Private VLAN on a Single Switch on page 2302](#)
- [Creating a Private VLAN on a Single Switch \(CLI Procedure\) on page 2343](#)

## Configuring Virtual Routing Instances (CLI Procedure)

Use virtual routing and forwarding (VRF) to divide an EX Series switch into multiple virtual routing instances. VRF allows you to isolate traffic traversing the network without using multiple devices to segment your network. VRF is supported on all Layer 3 interfaces.

Before you begin, make sure to set up your VLANs. See *Configuring VLANs for EX Series Switches (CLI Procedure)*, “[Configuring VLANs for EX Series Switches \(CLI Procedure\)](#)” on page 2337, or “[Configuring VLANs for EX Series Switches \(J-Web Procedure\)](#)” on page 2334.

To configure virtual routing instances:

1. Create a routing instance:

```
[edit routing-instances]user@switch# set routing-instance-name instance-type virtual-router
```

**NOTE:** EX Series switches only support the virtual-router instance type.

2. Bind each routing instance to the corresponding physical interfaces:

```
[edit routing-instances]user@switch# set routing-instance-name interface
interface-name.logical-unit-number
```

3. Create the logical interfaces that are bound to the routing instance.

- To create a logical interface with an IPv4 address:

```
[edit interfaces]user@switch# set interface-name unit logical-unit-number family inet
address ip-address
```

- To create a logical interface with an IPv6 address:

```
[edit interfaces]user@switch# set interface-name unit logical-unit-number family inet6
address ipv6-address
```

**NOTE:** Do not create a logical interface using the family ethernet-switching option in this step. Binding an interface using the family ethernet-switching option to a routing instance can cause the interface to shutdown.

4. Enable VLAN tagging on each physical interface that was bound to the routing instance:

```
[edit interfaces]user@switch# set interface-name vlan-tagging
```

## Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure)

---

**NOTE:** This task uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs Junos OS that does not support ELS, see *Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure)*. For ELS details, see “[Getting Started with Enhanced Layer 2 Software](#)” on page 3.

---

Multiple VLAN Registration Protocol (MVRP) is used to manage dynamic VLAN registration in a LAN. You can use MVRP on EX Series switches.

MVRP is disabled by default on EX Series switches.

To enable MVRP or set MVRP options, follow these instructions:

- [Enabling MVRP on page 2348](#)
- [Disabling MVRP on page 2348](#)
- [Disabling Dynamic VLANs on page 2348](#)
- [Configuring Timer Values on page 2349](#)
- [Configuring MVRP Registration Mode on page 2350](#)
- [Using MVRP in a Mixed-Release Network on page 2350](#)

---

### Enabling MVRP

MVRP can only be enabled on trunk interfaces.

To enable MVRP on a trunk interface:

```
[edit protocols mvrp]  
user@switch# set interface interface-name
```

---

### Disabling MVRP

MVRP is disabled by default. You only need to perform this procedure if you have previously enabled MVRP.

You can disable MVRP globally only. . To disable MVRP on all trunk interfaces on a switch, use one of the following commands:

```
user@switch# deactivate protocols mvrp  
user@switch# delete protocols mvrp
```

---

### Disabling Dynamic VLANs

By default, dynamic VLANs can be created on interfaces participating in MVRP. Dynamic VLANs are VLANs created on one switch that are propagated to other switches dynamically; in this case, using MVRP.

Dynamic VLAN creation through MVRP cannot be disabled per switch interface. To disable dynamic VLAN creation for interfaces participating in MVRP, you must disable it for all interfaces on the switch.

To disable dynamic VLAN creation:

```
[edit protocols mvrp]
user@switch# set no-dynamic-vlan
```

### Configuring Timer Values

The timers in MVRP define the amount of time all interfaces on a switch or a specific interface wait to join or leave MVRP, or to send or process the MVRP information for the switch after receiving an MVRP PDU. The join timer controls the amount of time the switch waits to accept a registration request, the leave timer controls the period of time that the switch waits in the Leave state before changing to the unregistered state, and the leaveall timer controls the frequency with which the LeaveAll messages are communicated.

The default MVRP timer values are 200 ms for the join timer, 1000 ms for the leave timer, and 10 seconds for the leaveall timer.

**BEST PRACTICE:** Maintain default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values might cause an imbalance in the operation of MVRP.

On an EX Series switch that uses Junos OS with support for ELS, if the timer value set on an interface level is different from the value set on a switch level, then the value on the interface level takes precedence.

To set the join timer for all interfaces on the switch:

```
[edit protocols mvrp]
user@switch# set join-timer milliseconds
```

To set the join timer for a specific interface:

```
[edit protocols mvrp]
user@switch# set interface interface-name join-timer milliseconds
```

To set the leave timer for all interfaces on the switch:

```
[edit protocols mvrp]
user@switch# set leave-timer milliseconds
```

To set the leave timer for a specific interface:

```
[edit protocols mvrp]
user@switch# set interface interface-name leave-timer milliseconds
```

To set the leaveall timer for all interfaces on the switch:

```
[edit protocols mvrp]
user@switch# set leaveall-timer seconds
```

To set the leaveall timer for a specific interface:

```
[edit protocols mvrp]
user@switch# set interface interface-name leaveall-timer seconds
```

### Configuring MVRP Registration Mode

---

The default MVRP registration mode for any interface participating in MVRP is normal. An interface in normal registration mode participates in MVRP when MVRP is enabled on the switch.

You can change the registration mode of a specific interface to **forbidden**. An interface in forbidden registration mode does not participate in MVRP even if MVRP is enabled on the switch.

To set an interface to forbidden registration mode:

```
[edit protocols mvrp]
user@switch# set interface xe-0/0/1.0 registration forbidden
```

To set an interface to normal registration mode:

```
[edit protocols mvrp]
user@switch# set interface xe-0/0/1.0 registration normal
```

### Using MVRP in a Mixed-Release Network

---

Except in Junos OS Releases 11.2 and earlier, MVRP has conformed with IEEE standard 802.1ak and IEEE Draft 802.1Q regarding the inclusion of an extra byte in the protocol data units (PDUs) sent and received by MVRP. As a result of changes in the standards with regard to the extra byte, MVRP in Junos OS Releases 13.2 and later for EX Series switches with support for the Enhanced Layer 2 Software (ELS) includes the extra byte, while MVRP in Junos OS Releases 11.3 and later for EX Series switches that do not support ELS does not include the extra byte. A compatibility issue arises, wherein the ELS version of MVRP does not recognize PDUs without the extra byte sent by the non-ELS version of MVRP.

For more information about this issue, see [“Understanding Multiple VLAN Registration Protocol \(MVRP\) on EX Series Switches” on page 2264](#).

You can recognize an MVRP version compatibility issue by observing the switch running the ELS version of MVRP. Because a switch running the ELS version of MVRP cannot interpret an unmodified PDU from a switch running the non-ELS version of MVRP, the switch will not add VLANs from the non-ELS version of MVRP. When you use the **show mvrp statistics** command in the ELS version of MVRP, the values for **Received Join Empty** and **Received Join In** will incorrectly display zero, even though the value for the **Received MVRP PDUs without error** has been increased. Another indication that MVRP is having a version compatibility issue is that unexpected VLAN activity, such as multiple VLAN creation, takes place on the switch running the ELS version of MVRP.

If your network includes a mix of EX Series switches running ELS and non-ELS versions of MVRP, you can eliminate the compatibility issue by entering the following command on the switches running the ELS version of MVRP:

```
[edit protocols mvrp]
user@switch# set no-attribute-length-in-pdu
```

The `no-attribute-length-in-pdu` statement prevents the ELS version of MVRP from sending PDUs with the extra byte, thereby eliminating the compatibility issue with the non-ELS version of MVRP.

#### Related Documentation

## Configuring Q-in-Q Tunneling (CLI Procedure)

**NOTE:** This task uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Configuring Q-in-Q Tunneling (CLI Procedure)*. For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 3](#).

Q-in-Q tunneling enables service providers on Ethernet access networks to segregate or bundle customer traffic into different VLANs by adding another layer of 802.1Q tags. You can configure Q-in-Q tunneling on EX Series switches.

**NOTE:** You cannot configure 802.1X user authentication on interfaces that have been enabled for Q-in-Q tunneling.

When Q-in-Q tunneling is configured on EX Series switches, trunk interfaces are assumed to be part of the service-provider network and access interfaces are assumed to be part of the customer network. Therefore, this topic also refers to trunk interfaces as service-provider VLAN (S-VLAN) interfaces (network-to-network interfaces [NNI]), and to access interfaces as customer VLAN (C-VLAN) interfaces (user-network interfaces [UNI]).

Before you begin configuring Q-in-Q tunneling, make sure you set up your VLANs. See [“Configuring VLANs for EX Series Switches \(CLI Procedure\)” on page 2337](#) or [“Configuring VLANs for EX Series Switches \(J-Web Procedure\)” on page 2334](#).

Configure Q-in-Q tunneling by using one of the following methods to map C-VLANs to S-VLANs:

- [Configuring All-in-One Bundling on page 2352](#)
- [Configuring Many-to-Many Bundling on page 2353](#)
- [Configuring a Specific Interface Mapping with VLAN Rewrite Option on page 2355](#)

## Configuring All-in-One Bundling

You can configure Q-in-Q tunneling by using the all-in-one bundling method, which maps packets from all C-VLAN interfaces on a switch to an S-VLAN.

To configure the all-in-one bundling method on a C-VLAN interface:

1. Enable the transmission of packets with no or a single 802.1Q VLAN tag:

```
[edit interfaces interface-name]  
user@switch# set flexible-vlan-tagging
```

2. Enable extended VLAN bridge encapsulation:

```
[edit interfaces interface-name]  
user@switch# set encapsulation extended-vlan-bridge
```

3. Map packets from all C-VLANs to a logical interface:

```
[edit interfaces interface-name unit logical-unit-number]  
user@switch# set vlan-id-list vlan-id-numbers
```

4. Enable a C-VLAN interface to send and receive untagged packets:

```
[edit interfaces interface-name]  
user@switch# set native-vlan-id vlan-id
```

When specifying a native VLAN ID on a C-VLAN physical interface, the value must be included in the VLAN ID list specified on the C-VLAN logical interface in step 3.

5. Specify that packets traveling from a C-VLAN interface to an S-VLAN interface are tagged with the VLAN ID of the S-VLAN:

```
[edit interfaces interface-name unit logical-unit-number]  
user@switch# set input-vlan-map push
```

6. Specify that the 802.1Q S-VLAN tag is removed as packets exit an S-VLAN interface.

```
[edit interfaces interface-name unit logical-unit-number]  
user@switch# set output-vlan-map pop
```

7. Configure a name for the S-VLAN, and associate the logical interface configured in step 3 with the S-VLAN:

```
[edit vlans vlan-name]  
user@switch# set interface interface-name.logical-unit-number
```

The following configuration on the C-VLAN interface ge-0/0/1 enables Q-in-Q tunneling and maps packets from C-VLANs 100 through 200 to logical interface 10, which is in turn associated with S-VLAN v10. In this sample configuration, a packet originated in C-VLAN 100 includes a tag with the VLAN ID 100. When this packet travels from the interface ge-0/0/1 to the S-VLAN interface, a tag with VLAN ID 10 is added to it. As the packet exits the S-VLAN interface, the tag with the VLAN ID 10 is removed. .

```
set interfaces ge-0/0/1 flexible-vlan-tagging  
set interfaces ge-0/0/1 encapsulation extended-vlan-bridge  
set interfaces ge-0/0/1 unit 10 vlan-id-list 100-200  
set interfaces ge-0/0/1 native-vlan-id 150  
set interfaces ge-0/0/1 unit 10 input-vlan-map push  
set interfaces ge-0/0/1 unit 10 output-vlan-map pop  
set vlans v10 interface ge-0/0/1.10
```

To configure the all-in-one bundling method on an S-VLAN interface:

1. Enable the transmission of packets with no, one, or two 802.1Q VLAN tags:

```
[edit interfaces interface-name]
user@switch# set flexible-vlan-tagging
```

2. Enable extended VLAN bridge encapsulation:

```
[edit interfaces interface-name]
user@switch# set encapsulation extended-vlan-bridge
```

3. Map packets from the logical interface specified in the C-VLAN interface configuration to the S-VLAN:

```
[edit interfaces interface-name unit logical-unit-number]
user@switch# set vlan-id number
```

4. Enable the S-VLAN interface to send and receive untagged packets:

```
[edit interfaces interface-name]
user@switch# set native-vlan-id vlan-id
```

When specifying a native VLAN ID on an S-VLAN physical interface, the value must match the VLAN ID specified on the S-VLAN logical interface in step 3.

5. Associate the S-VLAN interface with the S-VLAN that was configured in the C-VLAN interface procedure:

```
[edit vlans vlan-name]
user@switch# set interface interface-name.logical-unit-number
```

For example, the following configuration on the S-VLAN interface ge-1/1/1 enables Q-in-Q tunneling and maps packets with a VLAN ID tag of 10 to logical interface 10, which is in turn associated with S-VLAN v10. .

```
set interfaces ge-1/1/1 flexible-vlan-tagging
set interfaces ge-1/1/1 encapsulation extended-vlan-bridge
set interfaces ge-1/1/1 unit 10 vlan-id 10
set interfaces ge-1/1/1 native-vlan-id 10
set vlans v10 interface ge-1/1/1.10
```

### Configuring Many-to-Many Bundling

You can configure Q-in-Q tunneling by using the many-to-many bundling method, which maps packets from multiple C-VLANs to multiple S-VLANs.

To configure the many-to-many bundling method on a C-VLAN interface:

1. Enable the transmission of packets with no or a single 802.1Q VLAN tag:

```
[edit interfaces interface-name]
user@switch# set flexible-vlan-tagging
```

2. Enable extended VLAN bridge encapsulation:

```
[edit interfaces interface-name]
user@switch# set encapsulation extended-vlan-bridge
```

3. Map packets from specified C-VLANs to a logical interface:

```
[edit interfaces interface-name unit logical-unit-number]
user@switch# set vlan-id-list vlan-id-numbers
```

4. Enable a C-VLAN interface to send and receive untagged packets:

```
[edit interfaces interface-name]
user@switch# set native-vlan-id vlan-id
```

When specifying a native VLAN ID on a C-VLAN physical interface, the value must be included in the VLAN ID list specified on the C-VLAN logical interface in step 3.

5. Specify that packets traveling from a C-VLAN interface to an S-VLAN interface are tagged with the VLAN ID of the S-VLAN:

```
[edit interfaces interface-name unit logical-unit-number]
```

```
user@switch# set input-vlan-map push
```

6. Specify that the 802.1Q S-VLAN tag is removed as packets exit an S-VLAN interface:

```
[edit interfaces interface-name unit logical-unit-number]
```

```
user@switch# set output-vlan-map pop
```

7. Configure a name for an S-VLAN, and associate the logical interface configured in step 3 with the S-VLAN:

```
[edit vlans vlan-name]
```

```
user@switch# set interface interface-name.logical-unit-number
```

The following configuration on the C-VLAN interface ge-0/0/1 for customer 1 enables Q-in-Q tunneling and maps packets from C-VLANs 100 through 120 to logical interface 10, which is in turn associated with S-VLAN v10.

The configuration on the C-VLAN interface ge-0/0/2 for customer 2 enables Q-in-Q tunneling and maps packets from C-VLANs 30 through 40, 50 through 60, and 70 through 80 to logical interface 30, which is in turn associated with S-VLAN v30.

In this sample configuration, a packet originated in C-VLAN 100 includes a tag with the VLAN ID 100. When this packet travels from the interface ge-0/0/1 to the S-VLAN interface, a tag with a VLAN ID of 10 is added to it. As the packet exits the S-VLAN interface, the tag with the VLAN ID of 10 is removed.

Customer 1

```
set interfaces ge-0/0/1 flexible-vlan-tagging
set interfaces ge-0/0/1 encapsulation extended-vlan-bridge
set interfaces ge-0/0/1 unit 10 vlan-id-list 100-120
set interfaces ge-0/0/1 native-vlan-id 100
set interfaces ge-0/0/1 unit 10 input-vlan-map push
set interfaces ge-0/0/1 unit 10 output-vlan-map pop
set vlans v10 interface ge-0/0/1.10
```

Customer 2

```
set interfaces ge-0/0/2 flexible-vlan-tagging
set interfaces ge-0/0/2 encapsulation extended-vlan-bridge
set interfaces ge-0/0/2 unit 30 vlan-id-list 30-40
set interfaces ge-0/0/2 unit 30 vlan-id-list 50-60
set interfaces ge-0/0/2 unit 30 vlan-id-list 70-80
set interfaces ge-0/0/2 native-vlan-id 30
set interfaces ge-0/0/2 unit 30 input-vlan-map push
set interfaces ge-0/0/2 unit 30 output-vlan-map pop
set vlans v30 interface ge-0/0/2.30
```

To configure the many-to-many bundling method on an S-VLAN interface:

1. Enable the transmission of packets with no, one, or two 802.1Q VLAN tags:

```
[edit interfaces interface-name]
```

```
user@switch# set flexible-vlan-tagging
```

2. Enable extended VLAN bridge encapsulation:

```
[edit interfaces interface-name]
```

```
user@switch# set encapsulation extended-vlan-bridge
```

3. Map packets from each logical interface specified in the C-VLAN interface configuration to an S-VLAN:

```
[edit interfaces interface-name unit logical-unit-number]
```

```
user@switch# set vlan-id number
```

4. Enable an S-VLAN interface to send and receive untagged packets:

```
[edit interfaces interface-name]
```

```
user@switch# set native-vlan-id vlan-id
```

When specifying a native VLAN ID on an S-VLAN physical interface, the value must match an S-VLAN ID specified on the S-VLAN logical interface in step 3.

5. Associate the S-VLAN interface with the S-VLANs that were configured in the C-VLAN interface procedure:

```
[edit vlans vlan-name]
```

```
user@switch# set interface interface-name.logical-unit-number
```

For example, the following configuration on the S-VLAN interface ge-1/1/1 enables Q-in-Q tunneling and maps incoming C-VLAN packets to logical interfaces 10 and 30, which are in turn associated with S-VLANs v10 and v30, respectively.

```
set interfaces ge-1/1/1 flexible-vlan-tagging
set interfaces ge-1/1/1 encapsulation extended-vlan-bridge
set interfaces ge-1/1/1 unit 10 vlan-id 10
set interfaces ge-1/1/1 unit 30 vlan-id 30
set interfaces ge-1/1/1 native-vlan-id 10
set vlans v10 interface ge-1/1/1.10
set vlans v30 interface ge-1/1/1.30
```

### Configuring a Specific Interface Mapping with VLAN Rewrite Option

You can configure Q-in-Q tunneling by mapping packets from a specified C-VLAN to a specified S-VLAN. In addition, while the packets are transmitted to and from the S-VLAN, you can specify that the 802.1Q C-VLAN tag be removed and replaced with the S-VLAN tag or vice versa.

To configure a specific interface mapping with VLAN rewriting on the C-VLAN interface:

1. Enable the transmission of packets with no or one 802.1Q VLAN tag:

```
[edit interfaces interface-name]
```

```
user@switch# set flexible-vlan-tagging
```

2. Enable extended VLAN bridge encapsulation:

```
[edit interfaces interface-name]
```

```
user@switch# set encapsulation extended-vlan-bridge
```

3. Map packets from a specified C-VLAN to a logical interface:

```
[edit interfaces interface-name unit logical-unit-number]
```

```
user@switch# set vlan-id number
```

4. Enable the C-VLAN interface to send and receive untagged packets:

```
[edit interfaces interface-name]
```

```
user@switch# set native-vlan-id vlan-id
```

When specifying a native VLAN ID on a C-VLAN physical interface, the value must match the VLAN ID specified on the C-VLAN logical interface in step 3.

5. Specify that the existing 802.1Q C-VLAN tag is removed from packets traveling from a C-VLAN interface to an S-VLAN interface and replaced with the 802.1Q S-VLAN tag:

```
[edit interfaces interface-name unit logical-unit-number]
```

```
user@switch# set input-vlan-map swap
```

6. Specify that the existing 802.1Q S-VLAN tag is removed from packets traveling from an S-VLAN interface to a C-VLAN interface and replaced with the 802.1Q C-VLAN tag:

```
[edit interfaces interface-name unit logical-unit-number]
```

```
user@switch# set output-vlan-map swap
```

7. Configure a name for the S-VLAN, and associate the logical interface configured in step 3 with the S-VLAN:

```
[edit vlans vlan-name]
```

```
user@switch# set interface interface-name.logical-unit-number
```

For example, the following configuration on the C-VLAN interface ge-0/0/1 enables Q-in-Q tunneling and maps incoming packets from C-VLAN 150 to logical interface 200, which is in turn associated with VLAN v200. Also, as packets travel from the C-VLAN interface ge-0/0/1 to an S-VLAN interface, the C-VLAN tag 150 is removed and replaced with the S-VLAN tag 200. As packets travel from an S-VLAN interface to C-VLAN interface ge-0/0/1, the S-VLAN tag 200 is removed and replaced with the C-VLAN tag of 150.

```
set interfaces ge-0/0/1 flexible-vlan-tagging
set interfaces ge-0/0/1 encapsulation extended-vlan-bridge
set interfaces ge-0/0/1 unit 200 vlan-id 150
set interfaces ge-0/0/1 native-vlan-id 150
set interfaces ge-0/0/1 unit 200 input-vlan-map swap
set interfaces ge-0/0/1 unit 200 output-vlan-map swap
set vlans v200 interface ge-0/0/1.200
```

To configure a specific interface mapping with VLAN rewriting on the S-VLAN interface:

1. Enable the transmission of packets with no, one, or two 802.1Q VLAN tags:

```
[edit interfaces interface-name]
```

```
user@switch# set flexible-vlan-tagging
```

2. Enable extended VLAN bridge encapsulation:

```
[edit interfaces interface-name]
```

```
user@switch# set encapsulation extended-vlan-bridge
```

3. Map packets from the logical interface specified in the C-VLAN interface configuration to the S-VLAN:

```
[edit interfaces interface-name unit logical-unit-number]
```

```
user@switch# set vlan-id number
```

4. Enable the S-VLAN interface to send and receive untagged packets:

```
[edit interfaces interface-name]
```

```
user@switch# set native-vlan-id vlan-id
```

When specifying a native VLAN ID on an S-VLAN physical interface, the value must match the VLAN ID specified on the S-VLAN logical interface in step 3.

5. Associate the S-VLAN interface with the S-VLAN that was configured in the C-VLAN interface procedure: :

```
[edit vlans vlan-name]
```

```
user@switch# set interface interface-name.logical-unit-number
```

For example, the following configuration on the S-VLAN interface ge-1/1/1 enables Q-in-Q tunneling and maps packets with VLAN ID 200 to logical interface 200, which is in turn associated with S-VLAN v200.

```
set interfaces ge-1/1/1 flexible-vlan-tagging
set interfaces ge-1/1/1 encapsulation extended-vlan-bridge
set interfaces ge-1/1/1 unit 200 vlan-id 200
set interfaces ge-1/1/1 native-vlan-id 200
set vlans v200 interface ge-1/1/1.200
```

**Related  
Documentation**

- [Understanding Q-in-Q Tunneling on EX Series Switches on page 2269](#)

## Configuring Layer 2 Protocol Tunneling on EX Series Switches (CLI Procedure)

**NOTE:** This topic applies to Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Configuring Layer 2 Protocol Tunneling on EX Series Switches (CLI Procedure)*. For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 3](#).

Layer 2 protocol tunneling (L2PT) enables you to send Layer 2 protocol data units (PDUs) across a service provider network and deliver them to EX Series switches at a remote location. This feature is useful when you have a network that includes remote sites that are connected across a service provider network and you want to run Layer 2 protocols on switches connected across the service provider network.

**NOTE:** The implementation of L2PT on EX4300 switches does not support the drop-threshold or the shutdown-threshold configuration statements.

To configure L2PT on an EX Series switch, you must first configure a Q-in-Q interface or group of interfaces. See “[Configuring Q-in-Q Tunneling \(CLI Procedure\)](#)” on page 2351 for information about how to configure Q-in-Q tunneling.

- To configure L2PT on a specified Q-in-Q interface, enable MAC address rewriting for Layer 2 protocol tunneling and select the Layer 2 protocol to be tunneled from the list of options:

**NOTE:** You can select only one layer 2 protocol at a time. If you want an interface to support more than one layer 2 protocol, you must enter the `mac-rewrite` statement multiple times to select the desired protocols.

[edit protocols]

```
user@switch# set layer2-control mac-rewrite interface interface-name protocol (802.3AH | CDP | LACP | LLDP | MVRP | STP | VTP | GVRP | VSTP)
```

## Configuring Redundant Trunk Groups (J-Web Procedure)

**NOTE:** This topic applies only to the J-Web Application package.

A redundant trunk link provides a simple solution for network recovery when a trunk interface goes down. Traffic is routed to another trunk interface, keeping network convergence time to a minimum. You can configure redundant trunk groups (RTGs) with a primary link and a secondary link on trunk interfaces, or configure dynamic selection of the active interface. If the primary link fails, the secondary link automatically takes over without waiting for normal Spanning Tree Protocol (STP) convergence. An RTG can be created only if the following conditions are satisfied:

- A minimum of two trunk interfaces that are not part of any RTG are available.
- All the selected trunk interfaces to be added to the RTG have the same VLAN configuration.
- The selected trunk interfaces are not part of a spanning-tree configuration.

To configure an RTG by using the J-Web interface:

1. Select **Configure > Switching > RTG**.

The RTG Configuration page displays a list of existing RTGs. If you select a specific RTG, the details of the selected RTG are displayed in the Details of group section.

**NOTE:** After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See [Using the Commit Options to Commit Configuration Changes](#) for details about all commit options.

2. Click one of the following options:

- **Add**—Creates an RTG.
- **Edit**—Modifies an RTG.
- **Delete**—Deletes an RTG.

When you are adding or editing an RTG, enter information as described in [Table 241 on page 2359](#).

3. Click **OK** to apply changes to the configuration or click **Cancel** to cancel without saving changes.

**Table 241: RTG Configuration Fields**

| Field                                  | Function                                                                                                                                         | Your Action                                                                                                              |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| Group Name                             | Specifies a unique name for the RTG.                                                                                                             | Enter a name.<br><br><b>NOTE:</b> Only on EX4300 switches, you can select the name from a list.                          |
| Member Interface 1                     | Specifies a logical interface containing multiple trunk interfaces.                                                                              | Select a trunk interface from the list.                                                                                  |
| Member Interface 2                     | Specifies a trunk interface containing multiple VLANs.                                                                                           | Select a trunk interface from the list.                                                                                  |
| Select Primary Interface               | Enables you to specify one of the interfaces in the RTG as the primary link. The interface without this option is the secondary link in the RTG. | <ol style="list-style-type: none"> <li>1. Select the option button.</li> <li>2. Select the primary interface.</li> </ol> |
| Dynamically select my active interface | Specifies that the system dynamically select the active interface.                                                                               | Select the option button.                                                                                                |

## Configuring Proxy ARP (CLI Procedure)

**NOTE:** This task uses Junos OS for EX Series switches and QFX3500 and QFX3600 switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Configuring Proxy ARP (CLI Procedure)* or *Configuring Proxy ARP*. For ELS details, see “[Getting Started with Enhanced Layer 2 Software](#)” on page 3.

You can configure proxy Address Resolution Protocol (ARP) on your switch to enable the switch to respond to ARP queries for network addresses by offering its own media access control (MAC) address. With proxy ARP enabled, the switch captures and routes traffic to the intended destination.

To configure proxy ARP on a single interface:

```
[edit interfaces]
user@switch# set interface-name unit logical-unit-number proxy-arp (restricted |
unrestricted)
```

**BEST PRACTICE:** We recommend that you configure proxy ARP in restricted mode. In restricted mode, the switch does not act as a proxy if the source and target IP addresses are on the same subnet. If you decide to use unrestricted mode, disable gratuitous ARP requests on the interface to avoid a situation wherein the switch's response to a gratuitous ARP request appears to the host to be an indication of an IP conflict.

To configure proxy ARP on an integrated routing and bridging (IRB) interface:

```
[edit interfaces]
user@switch# set irb.logical-unit-number proxy-arp restricted
```

### Related Documentation

- [Example: Configuring Proxy ARP on an EX Series Switch on page 2331](#)
- [Verifying That Proxy ARP Is Working Correctly on page 2439](#)
- [Configuring Integrated Routing and Bridging Interfaces \(CLI Procedure\) on page 2340](#)

## Adding a Static MAC Address Entry to the Ethernet Switching Table (CLI Procedure)

**NOTE:** This task uses Junos OS for EX Series switches and Junos OS for QFX3500 and QFX3600 switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Adding a Static MAC Address Entry to the Ethernet Switching Table (CLI Procedure)*. For ELS details, see “[Getting Started with Enhanced Layer 2 Software](#)” on page 3.

The Ethernet switching table, also known as the forwarding table, specifies the known locations of VLAN nodes and the addresses of devices within those nodes. There are two ways to populate the Ethernet switching table on a switch. The easiest method is to let the switch update the table with MAC addresses.

The second way to populate the Ethernet switching table is to manually insert addresses into the table. You can do this to reduce flooding and speed up the switch's automatic learning process.

Before configuring a static MAC address, be sure that you have:

- Set up the VLAN. See “[Configuring VLANs for EX Series Switches \(CLI Procedure\)](#)” on page 2337.

To configure an interface to have a static MAC address:

```
[edit vlans vlan-name switch-options interface interface-name]  
user@switch# set static-mac mac-address
```

### Related Documentation

## Configuring MAC Limiting (CLI Procedure)

**NOTE:** This task uses Junos OS for EX Series switches and QFX3500 and QFX3600 switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Configuring MAC Limiting (CLI Procedure)*. For ELS details, see “[Getting Started with Enhanced Layer 2 Software](#)” on page 3.

This topic describes various ways of configuring a limitation on MAC addresses in packets that are received and forwarded by the switch.

**NOTE:** On a QFX Series Virtual Chassis, if you include the shutdown option at the [edit vlans *vlan-name* switch-options interface *interface-name* interface-mac-limit packet-action] hierarchy level and issue the commit operation, the system generates a commit error. The system does not generate an error if you include the shutdown option at the [edit switch-options interface *interface-name* interface-mac-limit packet-action] hierarchy level.

The different ways of setting a MAC limit are described in the following sections:

- [Limiting the Number of MAC Addresses Learned by an Interface on page 2362](#)
- [Limiting the Number of MAC Addresses Learned by a VLAN on page 2362](#)

### Limiting the Number of MAC Addresses Learned by an Interface

To secure a port, you can set the maximum number of MAC addresses that can be learned by an interface:

- Set the MAC limit on an interface, and specify an action that the switch takes after the specified limit is exceeded:

```
[edit switch-options]
user@switch# set interface interface-name interface-mac-limit limit packet-action
action
```

After you set a new MAC limit for the interface, the system clears existing entries in the MAC address forwarding table associated with the interface.

### Limiting the Number of MAC Addresses Learned by a VLAN

To limit the number of MAC addresses learned by a VLAN, perform both of the following steps:

1. Set the maximum number of MAC addresses that can be learned by a VLAN, and specify an action that the switch takes after the specified limit is exceeded:

```
[edit vlans]
user@switch# set vlan-name switch-options mac-table-size limit packet-action
action
```

2. Set the maximum number of MAC addresses that can be learned by one or all interfaces in the VLAN, and specify an action that the switch takes after the specified limit is exceeded:

```
[edit vlans]
user@switch# set vlan-name switch-options interface interface-name
interface-mac-limit limit packet-action action
[edit vlans]
user@switch# set vlan-name switch-options interface-mac-limit limit packet-action
action
```

**NOTE:** If you specify a MAC limit and packet action for all interfaces in the VLAN *and* a specific interface in the VLAN, the MAC limit and packet action specified at the specific interface level takes precedence. Also, at the VLAN interface level, only the drop and drop-and-log options are supported.

After you set new MAC limits for a VLAN by using the **mac-table-size** statement or for interfaces associated with a VLAN by using the **interface-mac-limit** statement, the system clears the corresponding existing entries in the MAC address forwarding table.

## Configuring MAC Notification (CLI Procedure)

**NOTE:** This task uses the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Configuring MAC Notification (CLI Procedure)* or *Configuring MAC Notification*. For ELS details, see “[Getting Started with Enhanced Layer 2 Software](#)” on page 3.

When a switch learns or unlearns a MAC address, SNMP notifications can be sent to the network management system at regular intervals to record the addition or removal of the MAC address. This process is known as MAC notification.

The MAC notification interval defines how often Simple Network Management Protocol (SNMP) notifications logging the addition or removal of MAC addresses on the switch are sent to the network management system.

MAC notification is disabled by default. When MAC notification is enabled, the default MAC notification interval is 30 seconds.

To enable or disable MAC notification, or to set the MAC notification interval, perform these tasks:

- [Enabling MAC Notification on page 2363](#)
- [Disabling MAC Notification on page 2364](#)
- [Setting the MAC Notification Interval on page 2364](#)

### Enabling MAC Notification

MAC notification is disabled by default. You need to perform this procedure to enable MAC notification.

To enable MAC notification on the switch with the default MAC notification interval of 30 seconds:

[edit switch-options]

```
user@switch# set mac-notification
```

To enable MAC notification on the switch with any other MAC notification interval (here, the MAC notification interval is set to 60 seconds):

```
[edit switch-options]
user@switch# set mac-notification notification-interval 60
```

---

### Disabling MAC Notification

MAC notification is disabled by default. Perform this procedure only if MAC notification was previously enabled on your switch.

To disable MAC notification on the switch:

```
[edit switch-options]
user@switch# delete mac-notification
```

To disable MAC notification on a specific interface (here, the interface is ge-0/0/3):

```
[edit switch-options]
user@switch# set interface ge-0/0/3 no-mac-notification
```

---

### Setting the MAC Notification Interval

The default MAC notification interval is 30 seconds. The procedure to change the MAC notification interval to a different interval is identical to the procedure to enable MAC notification on the switch with a nondefault value for the MAC notification interval.

To set the MAC notification interval on the switch (here, the MAC notification interval is set to 5 seconds):

```
[edit switch-options]
user@switch# set mac-notification notification-interval 5
```

## [edit switch-options] Configuration Statement Hierarchy on EX Series Switches

This topic lists supported and unsupported configuration statements in the **[edit switch-options]** hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.
- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see *EX Series Switch Software Features Overview*.

This topic lists:

- [Supported Statements in the \[edit switch-options\] Hierarchy Level on page 2367](#)
- [Unsupported Statements in the \[edit switch-options\] Hierarchy Level on page 2368](#)

### Supported Statements in the [edit switch-options] Hierarchy Level

The following hierarchy shows the **[edit switch-options]** configuration statements supported on EX Series switches:

```
switch-options {
  authentication-whitelist mac-address {
    interface interface-name;
    vlan-assignment (vlan-id | vlan-name);
  }
  interface interface-name {
    interface-mac-limit number {
      packet-action action;
    }
    no-mac-learning;
    persistent-learning
  }
  no-mac-learning;
  redundant-trunk-group {
    group name {
      description text;
      interface interface-name {
        primary;
      }
      preempt-cutover-timer seconds
    }
  }
  unknown-unicast-forwarding {
    vlan (all | vlan-name | vlan-tag) {
      interface interface-name;
    }
  }
}
```

```

voip {
  interface (all | [interface-name | access-ports]) {
    forwarding-class (assured-forwarding | best-effort | expedited-forwarding | mcast-af
      | mcast-be | mcast-ef | mcast-nc | network-control);
    vlan vlan-name;
  }
}

```

### Unsupported Statements in the [edit switch-options] Hierarchy Level

All statements in the **[edit switch-options]** hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented with the following exceptions:

**Table 242: Unsupported [edit switch-options] Configuration Statements on EX Series Switches**

| Statement                                                                                  | Hierarchy Level                          |
|--------------------------------------------------------------------------------------------|------------------------------------------|
| NOTE: Variables, such as <i>filename</i> , are not shown in the statements or hierarchies. |                                          |
| port-error-disable                                                                         | [edit switch-options]                    |
| disable-timeout                                                                            | [edit switch-options port-error-disable] |

## [edit vlans] Configuration Statement Hierarchy on EX Series Switches

This topic lists supported and unsupported configuration statements in the **[edit vlans]** hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.
- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see *EX Series Switch Software Features Overview*.

This topic lists:

- [Supported Statements in the \[edit vlans\] Hierarchy Level on page 2370](#)
- [Unsupported Statements in the \[edit vlans\] Hierarchy Level on page 2372](#)

### Supported Statements in the [edit vlans] Hierarchy Level

---

The following hierarchy shows the **[edit vlans]** configuration statements supported on one or more of the EX Series switches:

```
vlans {
  vlan-name {
    description text-description;
    domain-type bridge;
    forwarding-options {
      dhcp-security {
        arp-inspection;
        group group-name {
          interface interface-name {
            static-ip ip-address {
              mac mac-address;
            }
          }
        }
        overrides {
          no-option82;
          trusted;
        }
      }
    }
    ip-source-guard;
    no-dhcp-snooping;
    option-82 {
      circuit-id {
        prefix {
          host-name;
          logical-system-name;
          routing-instance-name;
        }
      }
      use-interface-description (device | logical);
      use-vlan-id;
    }
  }
}
```

```

        remote-id {
            host-name;
            use-interface-description (device | logical);
            use-string string;
        }
        vendor-id {
            use-string string;
        }
    }
}
filter {
    input filter-name;
    output filter-name;
}
flood {
    input filter-name;
}
}
l3-interface irb.logical-unit-number;
multicast-snooping-options {
    flood-groups [group-names];
    forwarding-cache {
        threshold {
            reuse threshold;
            suppress threshold;
        }
    }
}

**Hierarchy Level** [edit interfaces aex]

**Release Information** Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 12.3R2.

**Description** Configure the aggregated Ethernet properties of a specific aggregated Ethernet interface.  
  
The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>         | Specify the physical link-layer encapsulation type. Not all encapsulation types are supported on the switches. See the switch CLI.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Default</b>             | <b>ppp</b> —Use serial PPP encapsulation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>             | <b>atm-ccc-cell-relay</b> —Use ATM cell-relay encapsulation.<br><br><b>atm-pvc</b> —Use ATM PVC encapsulation.<br><br><b>cisco-hdlc</b> —Use Cisco-compatible High-Level Data Link Control (HDLC) framing.<br><br><b>cisco-hdlc-ccc</b> —Use Cisco-compatible HDLC framing on CCC circuits.<br><br><b>cisco-hdlc-tcc</b> —Use Cisco-compatible HDLC framing on TCC circuits for connecting different media.<br><br><b>ethernet-bridge</b> —Use Ethernet bridge encapsulation on Ethernet interfaces that have bridging enabled and that must accept all packets.<br><br><b>ethernet-ccc</b> —Use Ethernet CCC encapsulation on Ethernet interfaces that must accept packets carrying standard Tag Protocol ID (TPID) values. For 8-port, 12-port, and 48-port Fast Ethernet PICs, CCC is not supported.<br><br><b>ethernet-over-atm</b> —For interfaces that carry IPv4 traffic, use Ethernet over ATM encapsulation. When you use this encapsulation type, you cannot configure multipoint interfaces. As defined in RFC 2684, <i>Multiprotocol Encapsulation over ATM Adaptation Layer 5</i> , this encapsulation type allows ATM interfaces to connect to devices that support only bridge protocol data units (BPDUs). Junos OS does not completely support bridging, but accepts BPDU packets as a default gateway. If you use the router as an edge device, then the router acts as a default gateway. It accepts Ethernet LLC/SNAP frames with IP or ARP in the payload, and drops the rest. For packets destined to the Ethernet LAN, a route lookup is done using the destination |

IP address. If the route lookup yields a full address match, the packet is encapsulated with an LLC/SNAP and MAC header, and the packet is forwarded to the ATM interface.

**ethernet-tcc**—For interfaces that carry IPv4 traffic, use Ethernet TCC encapsulation on interfaces that must accept packets carrying standard TPID values. For 8-port, 12-port, and 48-port Fast Ethernet PICs, TCC is not supported.

**ethernet-vpls**—Use Ethernet VPLS encapsulation on Ethernet interfaces that have VPLS enabled and that must accept packets carrying standard TPID values. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.

**ethernet-vpls-fr**—Use in a VPLS setup when a CE device is connected to a PE device over a time division multiplexing (TDM) link. This encapsulation type enables the PE device to terminate the outer Layer 2 Frame Relay connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use the MAC address to forward the packet into a given VPLS instance.

**ethernet-vpls-ppp**—Use in a VPLS setup when a CE device is connected to a PE device over a time division multiplexing (TDM) link. This encapsulation type enables the PE device to terminate the outer Layer 2 PPP connection, use the 802.1p bits inside the inner Ethernet header to classify the packets, look at the MAC address from the Ethernet header, and use it to forward the packet into a given VPLS instance.

**ether-vpls-over-atm-llc**—For ATM intelligent queuing (IQ) interfaces only, use the Ethernet virtual private LAN service (VPLS) over ATM LLC encapsulation to bridge Ethernet interfaces and ATM interfaces over a VPLS routing instance (as described in RFC 2684, *Multiprotocol Encapsulation over ATM Adaptation Layer 5*). Packets from the ATM interfaces are converted to standard ENET2/802.3 encapsulated Ethernet frames with the frame check sequence (FCS) field removed.

**extended-frame-relay-ccc**—Use Frame Relay encapsulation on CCC circuits. This encapsulation type allows you to dedicate DLCIs 1 through 1022 to CCC.

**extended-frame-relay-ether-type-tcc**—Use extended Frame Relay ether type TCC for Cisco-compatible Frame Relay for DLCIs 1 through 1022. This encapsulation type is used for circuits with different media on either side of the connection.

**extended-frame-relay-tcc**—Use Frame Relay encapsulation on TCC circuits to connect different media. This encapsulation type allows you to dedicate DLCIs 1 through 1022 to TCC.

**extended-vlan-bridge**—Use extended VLAN bridge encapsulation on Ethernet interfaces that have IEEE 802.1Q VLAN tagging and bridging enabled and that must accept packets carrying TPID 0x8100 or a user-defined TPID.

**extended-vlan-ccc**—Use extended VLAN encapsulation on CCC circuits with Gigabit Ethernet and 4-port Fast Ethernet interfaces that must accept packets carrying 802.1Q values. For 8-port, 12-port, and 48-port Fast Ethernet PICs, extended VLAN CCC is not supported. For 4-port Gigabit Ethernet PICs, extended VLAN CCC is not supported.

**extended-vlan-tcc**—For interfaces that carry IPv4 traffic, use extended VLAN encapsulation on TCC circuits with Gigabit Ethernet interfaces on which you want to use 802.1Q tagging. For 4-port Gigabit Ethernet PICs, extended VLAN TCC is not supported.

**extended-vlan-vpls**—Use extended VLAN VPLS encapsulation on Ethernet interfaces that have VLAN 802.1Q tagging and VPLS enabled and that must accept packets carrying TPIDs 0x8100, 0x9100, and 0x9901. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.

**NOTE:** The built-in Gigabit Ethernet PIC on an M7i router does not support extended VLAN VPLS encapsulation.

---

**flexible-ethernet-services**—For Gigabit Ethernet IQ interfaces and Gigabit Ethernet PICs with small form-factor pluggable transceivers (SFPs) (except the 10-port Gigabit Ethernet PIC and the built-in Gigabit Ethernet port on the M7i router), use flexible Ethernet services encapsulation when you want to configure multiple per-unit Ethernet encapsulations. Aggregated Ethernet bundles can use this encapsulation type. This encapsulation type allows you to configure any combination of route, TCC, CCC, Layer 2 virtual private networks (VPNs), and VPLS encapsulations on a single physical port. If you configure flexible Ethernet services encapsulation on the physical interface, VLAN IDs from 1 through 511 are no longer reserved for normal VLANs.

**flexible-frame-relay**—For IQ interfaces only, use flexible Frame Relay encapsulation when you want to configure multiple per-unit Frame Relay encapsulations. This encapsulation type allows you to configure any combination of TCC, CCC, and standard Frame Relay encapsulations on a single physical port. Also, each logical interface can have any DLCI value from 1 through 1022.

**frame-relay**—Use Frame Relay encapsulation.

**frame-relay-ccc**—Use Frame Relay encapsulation on CCC circuits.

**frame-relay-ether-type**—Use Frame Relay ether type encapsulation for compatibility with the Cisco Frame Relay.

**frame-relay-ether-type-tcc**—Use Frame Relay ether type TCC for Cisco-compatible Frame Relay on TCC circuits to connect different media.

**frame-relay-port-ccc**—Use Frame Relay port CCC encapsulation to transparently carry all the DLCIs between two customer edge (CE) routers without explicitly configuring each DLCI on the two provider edge (PE) routers with Frame Relay transport. When you use this encapsulation type, you can configure the **ccc** family only.

**frame-relay-tcc**—Use Frame Relay encapsulation on TCC circuits to connect different media.

**generic-services**—Use generic services encapsulation for services with a hierarchical scheduler.

**multilink-frame-relay-uni-nni**—Use MLFR UNI NNI encapsulation. This encapsulation is used on link services, voice services interfaces functioning as FRF.16 bundles, and their constituent T1 or E1 interfaces, and is supported on LSQ and redundant LSQ interfaces.

**ppp**—Use serial PPP encapsulation.

**ppp-ccc**—Use serial PPP encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only.

**ppp-tcc**—Use serial PPP encapsulation on TCC circuits for connecting different media. When you use this encapsulation type, you can configure the **tcc** family only.

**vlan-ccc**—Use Ethernet VLAN encapsulation on CCC circuits.

**vlan-vci-ccc**—Use ATM-to-Ethernet interworking encapsulation on CCC circuits. When you use this encapsulation type, you can configure the **ccc** family only. All logical interfaces configured on the Ethernet interface must also have the encapsulation type set to **vlan-vci-ccc**.

**vlan-vpls**—Use VLAN VPLS encapsulation on Ethernet interfaces with VLAN tagging and VPLS enabled. Interfaces with VLAN VPLS encapsulation accept packets carrying standard TPID values only. On M Series routers, except the M320 router, the 4-port Fast Ethernet TX PIC and the 1-port, 2-port, and 4-port, 4-slot Gigabit Ethernet PICs can use the Ethernet VPLS encapsulation type.

#### NOTE:

- Label-switched interfaces (LSIs) do not support VLAN VPLS encapsulation. Therefore, you can only use VLAN VPLS encapsulation on a PE-router-to-CE-router interface and not a core-facing interface.
- Starting with Junos OS release 13.3, a commit error occurs when you configure **vlan-vpls** encapsulation on a physical interface and configure **family inet** on one of the logical units. Previously, it was possible to commit this invalid configuration.

## ethernet-switch-profile

**Syntax**

```

ethernet-switch-profile {
  ethernet-policer-profile {
    input-priority-map {
      ieee802.1p premium [values];
    }
    output-priority-map {
      classifier {
        premium {
          forwarding-class class-name {
            loss-priority (high | low);
          }
        }
      }
    }
  }
  policer cos-policer-name {
    aggregate {
      bandwidth-limit bps;
      burst-size-limit bytes;
    }
    premium {
      bandwidth-limit bps;
      burst-size-limit bytes;
    }
  }
  tag-protocol-id tpid;
}
mac-learn-enable;

```

**Hierarchy Level** [edit interfaces *interface-name* gigether-options],  
 [edit interfaces *interface-name* aggregated-ether-options],  
 [edit interfaces *interface-name* **aggregated-ether-options**],  
 [edit interfaces *interface-name* ether-options]

**Release Information** Statement introduced before Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.  
 Statement introduced in Junos OS Release 13.2 for the QFX Series.  
 Statement introduced in Junos OS Release 13.2X50-D15 for the EX Series switches.

**Description**

**NOTE:** On QFX Series standalone switches, the **ethernet-policer-profile** CLI hierarchy and the **mac-learn-enable** statement are supported only on the Enhanced Layer 2 Switching CLI.

For Gigabit Ethernet IQ, 10-Gigabit Ethernet IQ2 and IQ2-E, and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC, aggregated Ethernet with Gigabit Ethernet IQ interfaces, the built-in Gigabit Ethernet port on the M7i router); 100-Gigabit Ethernet Type 5 PIC with CFP; and Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit

Ethernet, and aggregated Ethernet interfaces on EX Series switches, configure VLAN tag and MAC address accounting and filtering properties.

The remaining statements are explained separately.

**NOTE:** When you gather interfaces into a bridge domain, the `no-mac-learn-enable` statement at the `[edit interfaces interface-name together-options ethernet-switch-profile]` hierarchy level is not supported. You must use the `no-mac-learning` statement at the `[edit bridge-domains bridge-domain-name bridge-options interface interface-name]` hierarchy level to disable MAC learning on an interface in a bridge domain. For information on disabling MAC learning for a bridge domain, see the *MX Series Layer 2 Configuration Guide*.

| <b>Release Information</b> | <p>Statement introduced in Junos OS Release 8.4.</p> <p>Support for the <b>switch-options</b> statement added in Junos OS Release 9.2.</p> <p>Support for top-level configuration for the <b>virtual-switch</b> type of routing instance added in Junos OS Release 9.2. In Junos OS Release 9.1 and earlier, the routing instances hierarchy supported this statement only for a VPLS instance or a bridge domain configured within a virtual switch.</p> <p>Support for logical systems added in Junos OS Release 9.6.</p> <p>[edit switch-options], [edit switch-options interface <i>interface-name</i>], [edit vlans <i>vlan-name</i> switch-options], and [edit vlans <i>vlan-name</i> switch-options interface <i>interface-name</i>] hierarchy levels introduced in Junos OS Release 12.3R2 for EX Series switches.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>         | <p>(MX Series routers or EX Series switches only) Configure a limit to the number of MAC addresses that can be learned from a bridge domain, VLAN, virtual switch, or set of bridge domains or VLANs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**NOTE:** For multichassis link aggregation (MC-LAG) peers in active-active mode, configuring the `interface-mac-limit` statement or changing the `interface-mac-limit` configuration when traffic is flowing can cause the MAC entries to be out of synchronization between the two MC-LAG peers, which might result in flooding. To avoid flooding, you must either halt traffic forwarding and then configure the `interface-mac-limit` statement or use the `commit at` configuration statement to commit the changes at the same time in both the peer nodes.

Alternatively, if flooding does occur, you can clear the bridge MAC table on both the routers by using the `clear bridge mac-table` command. Running this command ensures that the MAC entries are re-learned and in synchronization between both the peers.

---

**Default** For an access port, the default MAC limit is 1024 MAC addresses. For a trunk port, the default MAC limit is 8192 MAC addresses.

**Options** *limit*—Maximum number of MAC addresses learned from an interface.

**Range:** 1 through 131,071 MAC addresses per interface

The remaining statement is explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| Description              | <p> <b>NOTE:</b> This statement supports the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see <i>port-mode</i>. For ELS details, see <a href="#">“Getting Started with Enhanced Layer 2 Software” on page 3</a>.</p> <p>(QFX Series 3500 and 3600 standalone switches)—Determine whether the logical interface accepts or discards packets based on VLAN tags. Specify the <b>trunk</b> option to accept packets with a VLAN ID that matches the list of VLAN IDs specified in the <b>vlan-id</b> or <b>vlan-id-list</b> statement, then forward the packet within the bridge domain or VLAN configured with the matching VLAN ID. Specify the <b>access</b> option to accept packets with no VLAN ID, then forward the packet within the bridge domain or VLAN configured with the VLAN ID that matches the VLAN ID specified in the <b>vlan-id</b> statement.</p> <p> <b>NOTE:</b> On MX Series routers, if you want IGMP snooping to be functional for a bridge domain, then you should not configure <b>interface-mode</b> and <b>irb</b> for that bridge. Such a configuration commit succeeds, but IGMP snooping is not functional, and a message informing the same is displayed. For more information, see <i>Configuring a Trunk Interface on a Bridge Network</i>.</p> |
| Options                  | <p><b>access</b>—Configure a logical interface to accept untagged packets. Specify the VLAN to which this interface belongs using the <b>vlan-id</b> statement.</p> <p><b>trunk</b>—Configure a single logical interface to accept packets tagged with any VLAN ID specified with the <b>vlan-id</b> or <b>vlan-id-list</b> statement.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Description</b>         | Configure the specified isolated VLAN to be a secondary VLAN of the specified primary VLAN. An isolated VLAN receives packets only from the primary VLAN and forwards frames upstream to the primary VLAN. |

**NOTE:** Before you specify this configuration statement, you must have already configured an isolated VLAN and assigned a VLAN ID to it. See [private-vlan](#).

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.0 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | Associate a Layer 3 interface with the VLAN. Configure Layer 3 interfaces on trunk ports to allow the interface to transfer traffic between multiple VLANs. Within a VLAN, traffic is bridged, while across VLANs, traffic is routed.                                                                                                                                                                                                                                                                                                      |
| <b>Default</b>                  | No Layer 3 (routing) interface is associated with the VLAN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Options</b>                  | <p><b><i>l3-interface-name.logical-interface-number</i></b>—Name of the Layer 3 interface and number of the logical interface defined by using the <b>set interfaces <a href="#">vlan</a> unit</b> command. The name of the Layer 3 interface is <b>irb</b> for an integrated routing and bridging (IRB) interface, and <b>vlan</b> for a routed VLAN interface (RVI). The number of the logical interface is the same number that you configure in the <b>unit</b> statement.</p> <p>The remaining statement is explained separately.</p> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Release Information</b>      | <p>Statement introduced in Junos OS Release 10.0 for EX Series switches.</p> <p>Hierarchy level <code>[edit protocols <a href="#">mvrp</a>]</code> introduced in Junos OS Release 13.2X50-D10 (ELS). (See “<a href="#">Getting Started with Enhanced Layer 2 Software</a>” on page 3 for information about ELS.)</p> <p>Statement introduced in Junos OS Release 13.1 for the QFX Series.</p>                                                                                                                                                                                                                                      |
| <b>Description</b>              | <p>For Multiple VLAN Registration Protocol (MVRP), configure the interval at which the LeaveAll state operates on the interface.</p> <p>Maintain default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values might cause an imbalance in the operation of MVRP. However, if you choose to change the default values, keep in mind that on an EX Series switch that uses Junos OS with support for ELS, if the timer value set on an interface level is different from the value set on a switch level, then the value on the interface level takes precedence.</p> |
| <b>Options</b>                  | <p><b><i>interval</i></b>—Number of seconds or milliseconds between the sending of Leave All messages.</p> <p><b>Default:</b> 10 seconds, or 10,000 milliseconds</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## mac-rewrite

---

**Syntax**    `mac-rewrite {  
              interface interface-name {  
                  enable-all-ifl  
                  protocol (802.1X | 802.3AH | CDP | LACP | LLDP | MVRP | STP | VTP | GVRP | VSTP);  
                  }  
              }  
              }`

**Hierarchy Level**    [edit protocols [layer2-control](#)]

**Release Information**    Statement introduced in Junos OS Release 9.1.  
                              Statement introduced in Junos OS Release 13.2 for QFX series.  
                              Support for PVSTP introduced in Junos OS Release 13.3.  
                              **enable-all-if** statement added in Junos OS Release 13.3.  
                              Support for PVSTP protocol introduced in Junos OS Release 13.3.  
                              Statement introduced in Junos OS Release 14.1X53-D10 for EX Series switches.

**Description**    Enable rewriting of the MAC address for Layer 2 protocol tunneling.

**NOTE:** On EX4300 switches, the `mac-rewrite` statement does not support the 802.1X authentication protocol.

---

The remaining statements are explained separately.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                  interface-control—To add this statement to the configuration.

| <b>Description</b>         | Modify the size of the MAC address table for the bridge domain or VLAN, a set of bridge domains or VLANs associated with a trunk port, or a virtual switch. The default is 5120 MAC addresses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**NOTE:** For multichassis link aggregation (MC-LAG) peers in active-active mode, configuring the **mac-table-size** statement or changing the **mac-table-size** configuration when traffic is flowing can cause the MAC entries to be out of synchronization between the two MC-LAG peers, which might result in flooding. To avoid flooding, you must either halt traffic forwarding and then configure the **mac-table-size** statement or use the **commit at** configuration statement to commit the changes at the same time in both the peer nodes.

Alternatively, if flooding does occur, you can clear the bridge MAC table on both the routers by using the **clear bridge mac-table** command. Running this command ensures that the MAC entries are re-learned and in synchronization between both the peers.

**Options** *limit*—Specify the maximum number of addresses in the MAC address table.

**Range:** 16 through 1,048,575 MAC addresses

**Default:** 5120 MAC addresses There is no default MAC address limit for the **mac-table-size** statement at the **[edit switch-options]** hierarchy level. The number of MAC addresses that can be learned is only limited by the platform, 65,535 MAC addresses for EX Series switches and 1,048,575 MAC addresses for other devices.

The remaining statement is explained separately.

**Required Privilege** routing—To view this statement in the configuration.

**Level** routing-control—To add this statement to the configuration.

## members

|                            |                                                                                                                                                                                                  |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <code>members [(all   <i>names</i>   <i>vlan-ids</i>)];</code>                                                                                                                                   |
| <b>Hierarchy Level</b>     | [edit interfaces <i>interface-name</i> <b>unit</b> <i>logical-unit-number</i> <b>family</b> ethernet-switching <b>vlan</b> ]                                                                     |
| <b>Release Information</b> | Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement updated with enhanced ? (CLI completion feature) functionality in Junos OS Release 9.5 for EX Series switches. |
| <b>Description</b>         | For trunk interfaces, configure the VLANs that can carry traffic.                                                                                                                                |

**TIP:** To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type ? after `vlan` or `vlands` in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range.

**NOTE:** The number of VLANs supported per switch varies for each model. Use the configuration-mode command `set vlans id vlan-id ?` to determine the maximum number of VLANs allowed on a switch. You cannot exceed this VLAN limit because each VLAN is assigned an ID number when it is created. You can, however, exceed the recommended VLAN member maximum.

On an EX Series switch that runs Junos OS that does not support the Enhanced Layer 2 Software (ELS) configuration style, the maximum number of VLAN members allowed on the switch is 8 times the maximum number of VLANs the switch supports (`vmember limit = vlan max * 8`). If the switch configuration exceeds the recommended VLAN member maximum, you see a warning message when you commit the configuration. If you ignore the warning and commit such a configuration, the configuration succeeds but you run the risk of crashing the Ethernet switching process (`eswd`) due to memory allocation failure.

On an EX Series switch that runs Junos OS that supports ELS, the maximum number of VLAN members allowed on the switch is 24 times the maximum number of VLANs the switch supports (`vmember limit = vlan max * 24`). If the configuration of one of these switches exceeds the recommended VLAN member maximum, a warning message appears in the system log (`syslog`).

|                |                                                                                                                                                                                                                                |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Options</b> | <b>all</b> —Specifies that this trunk interface is a member of all the VLANs that are configured on this switch. When a new VLAN is configured on the switch, this trunk interface automatically becomes a member of the VLAN. |
|----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**NOTE:** Since VLAN members are limited, specifying all could cause the number of VLAN members to exceed the limit at some point.

**names**—Name of one or more VLANs. VLAN IDs are applied automatically in this case.

**NOTE:** all cannot be a VLAN name.

**vlan-ids**—Numeric identifier of one or more VLANs. For a series of tagged VLANs, specify a range; for example, 10–20 or 10–20 23 27–30.

**NOTE:** Each configured VLAN must have a specified VLAN ID to successfully commit the configuration; otherwise, the configuration commit fails.

**Required Privilege  
Level**

interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## mvrp

**Syntax**

```
mvrp {
  interface interface-name {
    join-timer milliseconds;
    leave-timer milliseconds;
    leaveall-timer seconds;
    registration (forbidden | normal);
  }
  join-timer milliseconds;
  leave-timer milliseconds;
  leaveall-timer seconds;
  no-attribute-length-in-pdu
  no-dynamic-vlan;
  traceoptions (Spanning Trees) {
    file filename <files number > <size size > <world-readable | no-world-readable>;
    flag <flag> <disable>;
  }
}
```

**Hierarchy Level** [edit protocols]

**Release Information** Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

**Description**

**NOTE:** If your switch command-line interface (CLI) displays different options for the mvrp statement from the options shown in this document, see *mvrp*.

Configure Multiple VLAN Registration Protocol (MVRP) on a trunk interface to ensure that the VLAN membership information on the trunk interface is updated as the switch's access interfaces become active or inactive in the configured VLANs.

**NOTE:** In Junos OS Release 11.3, MVRP was updated to conform to the IEEE standard 802.1ak. This update might result in compatibility issues in mixed release networks. For details, see “[Configuring Multiple VLAN Registration Protocol \(MVRP\) \(CLI Procedure\)](#)” on page 2348.

The remaining statements are explained separately.

**Default** MVRP is disabled by default.

**Required Privilege Level**

| <b>Description</b>              | <p>Configure mixed tagging support for untagged packets on a port for the following:</p> <ul style="list-style-type: none"><li>• M Series routers with Gigabit Ethernet IQ PICs with SFP and Gigabit Ethernet IQ2 PICs with SFP configured for 802.1Q flexible VLAN tagging</li><li>• MX Series routers with Gigabit Ethernet DPCs and MICs, Tri-Rate Ethernet DPCs and MICs, and 10-Gigabit Ethernet DPCs and MICs and MPCs configured for 802.1Q flexible VLAN tagging</li><li>• T4000 routers with 100-Gigabit Ethernet Type 5 PIC with CFP</li><li>• EX Series switches with Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces</li></ul> <p>When the <b>native-vlan-id</b> statement is included with the <a href="#">flexible-vlan-tagging</a> statement, untagged packets are accepted on the same mixed VLAN-tagged port.</p> <p>The logical interface on which untagged packets are received must be configured with the same VLAN ID as the native VLAN ID configured on the physical interface. To configure the logical interface, include the <b>vlan-id</b> statement (matching the <b>native-vlan-id</b> statement on the physical interface) at the [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i>] hierarchy level.</p> <p>When the <b>native-vlan-id</b> statement is included with the <a href="#">interface-mode</a> statement, untagged packets are accepted and forwarded within the bridge domain or VLAN that is configured with the matching VLAN ID.</p> |
| <b>Options</b>                  | <p><b><i>number</i></b>—VLAN ID number.</p> <p><b>Range:</b> (ACX Series routers and EX Series switches) 0 through 4094.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | <p>Include an extra byte in protocol data units (PDUs) sent by the Multiple VLAN Registration Protocol (MVRP). You can disable the extra byte to address a compatibility issue between MVRP in Junos OS Releases 13.2 and later for EX Series switches with support for the Enhanced Layer 2 Software (ELS), which includes the extra byte, and MVRP in Junos OS Releases 11.3 and later for EX Series switches that do not support ELS, which does not include the extra byte. If this compatibility issue arises, the ELS version of MVRP does not recognize PDUs without the extra byte sent by the non-ELS version of MVRP.</p> <p>You can recognize an MVRP version compatibility issue by observing the switch running the ELS version of MVRP. Because a switch running the ELS version of MVRP cannot interpret an unmodified PDU from a switch running the non-ELS version of MVRP, the switch will not add VLANs from the non-ELS version of MVRP. When you execute the command <b>show mvrp statistics</b> in the ELS version of MVRP, the values for <b>Received Join Empty</b> and <b>Received Join In</b> will incorrectly display zero, even though the value for the <b>Received MVRP PDUs without error</b> has been increased. Another indication that MVRP is having a version compatibility issue is that unexpected VLAN activity, such as multiple VLAN creation, takes place on the switch running the ELS version of MVRP.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.0 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | <p>Disable the dynamic creation of VLANs using Multiple VLAN Registration Protocol (MVRP) for interfaces participating in MVRP.</p> <p>Dynamic VLAN configuration can be enabled on an interface independent of MVRP. The MVRP dynamic VLAN configuration setting does not override the interface configuration dynamic VLAN configuration setting. If dynamic VLAN creation is disabled on the interface in the interface configuration, no dynamic VLANs are created on the interface, including dynamic VLANs created using MVRP.</p> <p>This option can be applied globally; it cannot be applied per interface.</p> |
| <b>Default</b>                  | If MVRP is enabled, the dynamic creation of VLANs as a result of MVRP protocol exchange messages is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.0 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>              | Configure the switch not to respond to gratuitous ARP requests. You can disable responses to gratuitous ARP requests on Layer 2 Ethernet switching interfaces, and integrated routing and bridging (IRB) interfaces or routed VLAN interfaces (RVIs). (On EX Series switches that use Junos OS with support for the Enhanced Layer 2 Software (ELS) configuration style, the feature is known as an IRB interface. On EX Series switches that use Junos OS that does not support ELS, the feature is known as an RVI.) |
| <b>Default</b>                  | Gratuitous ARP responses are enabled on all Ethernet switching interfaces, and IRB interfaces or RVIs.                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Release Information</b> | <p>Statement introduced in Junos OS Release 8.4.</p> <p>Support for the <b>switch-options</b> statement added in Junos OS Release 9.2.</p> <p>Support for top-level configuration for the <b>virtual-switch</b> type of routing instance added in Junos OS Release 9.2. In Junos OS Release 9.1 and earlier, the routing instances hierarchy supported this statement only for a VPLS instance or bridge domain configured within a virtual switch.</p> <p>Support for logical systems added in Junos OS Release 9.6.</p> <p>[edit switch-options], [edit switch-options interface <i>interface-name</i>], [edit vlans <i>vlan-name</i> switch-options], and [edit vlans <i>vlan-name</i> switch-options interface <i>interface-name</i>] hierarchy levels introduced in Junos OS Release 12.3 R2 for EX Series switches.</p> <p>Support for EVPNs added in Junos OS Release 13.2 for MX 3D Series routers.</p> <p>Hierarchy levels [edit switch-options interface <i>interface-name</i>] and [edit vlans <i>vlan-name</i> switch-options] introduced in Junos OS Release 13.2X50-D10 for EX Series switches.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>         | <p>For MX Series routers and EX Series switches, disable MAC learning for a virtual switch, for a bridge domain or VLAN, for a specific logical interface in a bridge domain or VLAN, or for a set of bridge domains or VLANs associated with a Layer 2 trunk port. On platforms that support EVPNs, you can disable MAC learning on an EVPN.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**NOTE:** When MAC learning is disabled for a VPLS routing instance, traffic is not load-balanced and only one of the equal-cost next hops is used.

**Release Information** Statement introduced in Junos OS Release 8.4.  
 Support for the **switch-options** statement added in Junos OS Release 9.2.  
 Support for top-level configuration for the **virtual-switch** type of routing instance added in Junos OS Release 9.2. In Junos OS Release 9.1 and earlier, the routing instances hierarchy

supported this statement only for a VPLS instance or a bridge domain configured within a virtual switch.

Support for logical systems added in Junos OS Release 9.6.

[edit switch-options interface *interface-name* interface-mac-limit *limit*], [edit switch-options interface-mac-limit *limit*], [edit switch-options mac-table-size *limit*], [edit vlans *vlan-name* switch-options interface *interface-name* interface-mac-limit *limit*], [edit vlans *vlan-name* switch-options interface-mac-limit *limit*], and [edit vlans *vlan-name* switch-options mac-table-size *limit*] hierarchy levels introduced in Junos OS Release 12.3R2 for EX Series switches.

Support for EVPNs introduced in Junos OS Release 13.2 on MX Series 3D Universal Edge Routers.

Support at the [edit switch-options interface *interface-name* interface-mac-limit *limit*] hierarchy level and hierarchy levels under [edit vlans *vlan-name*] introduced in Junos OS Release 13.2X50-D10 for EX Series switches and Junos OS Release 13.2 for the QFX Series.

**Description** Specify the action taken when packets with new source MAC addresses are received after the MAC address limit is reached. If this statement is not configured, packets with new source MAC addresses are forwarded by default.

**Default**

**NOTE:** On a QFX Series Virtual Chassis, if you include the shutdown option at the [edit vlans *vlan-name* switch-options interface *interface-name* interface-mac-limit packet-action] hierarchy level and issue the commit operation, the system generates a commit error. The system does not generate an error if you include the shutdown option at the [edit switch-options interface *interface-name* interface-mac-limit packet-action] hierarchy level.

Disabled. The default is for packets for new source MAC addresses to be forwarded after the MAC address limit is reached.

**Options**

- drop**—Drop packets with new source MAC addresses, and do not learn the new source MAC addresses.
- drop-and-log**—(EX Series switches and QFX Series only) Drop packets with new source MAC addresses, and generate an alarm, an SNMP trap, or a system log entry.
- log**—(EX Series switches and QFX Series only) Hold packets with new source MAC addresses, and generate an alarm, an SNMP trap, or a system log entry.
- none**—(EX Series switches and QFX Series only) Forward packets with new source MAC addresses, and learn the new source MAC address.
- shutdown**—(EX Series switches and QFX Series only) Disable the specified interface, and generate an alarm, an SNMP trap, or a system log entry.

**Required Privilege Level**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.6 for EX Series switches.<br><b>restricted</b> added in Junos OS Release 10.0 for EX Series switches.<br>Statement introduced in Junos OS Release 12.2 for the QFX Series. |
| <b>Description</b>         | For Ethernet interfaces only, configure the router or switch to respond to any ARP request, as long as the router or switch has an active route to the ARP request's target address.                                                                                       |

**NOTE:** You must configure the IP address and the inet family for the interface when you enable proxy ARP.

| <b>Description</b>              | <p> <b>NOTE:</b> On EX4300 switches, <code>push</code> is not supported at the <code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> output-vlan-map]</code> hierarchy level.</p> <p>Specify the VLAN rewrite operation to add a new VLAN tag to the top of the VLAN stack. An outer VLAN tag is pushed in front of the existing VLAN tag.</p> <p>You can use this statement on Gigabit Ethernet IQ and 10-Gigabit Ethernet IQ2 and IQ2-E interfaces; 10-Gigabit Ethernet LAN/WAN PIC; aggregated Ethernet interfaces using Gigabit Ethernet IQ interfaces; 100-Gigabit Ethernet Type 5 PIC with CFP; and Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces.</p> <p>If you include the <b>push</b> statement in the configuration, you must also include the <a href="#">pop</a> statement at the <code>[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> output-vlan-map]</code> hierarchy level.</p> |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Description</b>              | <p>For Gigabit Ethernet IQ and 10-Gigabit Ethernet IQ2 and IQ2-E interfaces, aggregated Ethernet with Gigabit Ethernet IQ interfaces, and Gigabit Ethernet PICs with SFPs (except the 10-port Gigabit Ethernet PIC, and the built-in Gigabit Ethernet port on the M7i router), define the TPIDs expected to be sent or received on a particular VLAN. For each Gigabit Ethernet port, you can configure up to eight TPIDs using the <b>tag-protocol-id</b> statement; but only the first four TPIDs are supported on IQ2 and IQ2-E interfaces.</p> <p>For 10-Gigabit Ethernet LAN/WAN PIC interfaces on T Series routers only the default TPID value (<b>0x8100</b>) is supported.</p> <p>For Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet, and aggregated Ethernet interfaces on EX Series switches, define the TPIDs expected to be sent or received on a particular VLAN. The default TPID value is <b>0x8100</b>. Other supported values are <b>0x88a8</b>, <b>0x9100</b>, and <b>0x9200</b>.</p> |
| <b>Options</b>                  | <b>tpids</b> —TPIDs to be accepted on the VLAN. Specify TPIDs in hexadecimal.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## vlan-id (VLAN Tagging and Layer 3 Subinterfaces)

---

|                            |                                                                                 |
|----------------------------|---------------------------------------------------------------------------------|
| <b>Syntax</b>              | <code>vlan-id <i>vlan-id-number</i>;</code>                                     |
| <b>Hierarchy Level</b>     | [edit interfaces <i>interface-name</i> <b>unit</b> <i>logical-unit-number</i> ] |
| <b>Release Information</b> | Statement introduced in Junos OS Release 9.2 for EX Series switches.            |
| <b>Description</b>         | Bind an 802.1Q VLAN tag ID to a logical interface.                              |

**NOTE:** The VLAN tag ID cannot be configured on logical interface unit 0. The logical unit number must be 1 or higher.

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

```

Hierarchy Level [edit]

**Release Information** Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Configure VLAN properties on EX Series switches. The following configuration guidelines apply:

- Only private VLAN (PVLAN) firewall filters can be used when the VLAN is enabled for Q-in-Q tunneling.
- An S-VLAN tag is added to the packet if the VLAN is Q-in-Q-tunneled and the packet is arriving from an access interface.
- You cannot use a firewall filter to assign an integrated routing and bridging (IRB) interface or a routed VLAN interface (RVI) to a VLAN.
- VLAN assignments performed using a firewall filter override all other VLAN assignments.

**Options** *vlan-name*—Name of the VLAN. The name can include letters, numbers, hyphens (-), and periods (.) and can contain up to 255 characters long.

The remaining statements are explained separately.

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

- [Operational Commands on page 2440](#)

## Routine Monitoring

---

- [Verifying That Virtual Routing Instances Are Working on page 2435](#)
- [Verifying Integrated Routing and Bridging Interface Status and Statistics on page 2436](#)
- [Verifying That MVRP Is Working Correctly on page 2438](#)
- [Verifying That MAC Notification Is Working Properly on page 2439](#)
- [Verifying That Proxy ARP Is Working Correctly on page 2439](#)

## Verifying That Virtual Routing Instances Are Working

**Purpose** After creating a virtual routing instance, make sure it is set up properly.

**Action** 1. Use the **show route instance** command to list all of the routing instances and their properties:

```
user@switch> show route instance
Instance          Type
Primary RIB
master            forwarding
inet.0            3/0/0
__juniper_private1__ forwarding
__juniper_private1__.inet.0 1/0/3
__juniper_private2__ forwarding
instance1         forwarding
r1                virtual-router
r1.inet.0         1/0/0
r2                virtual-router
r2.inet.0         1/0/0
```

2. Use the **show route forwarding-table** command to view the forwarding table information for each routing instance:

```
user@switch> show route forwarding-table
```

Routing table: r1.inet

Internet:

| Destination        | Type | RtRef | Next hop    | Type | Index | NhRef | Netif      |
|--------------------|------|-------|-------------|------|-------|-------|------------|
| default            | perm | 0     |             | rjct | 539   | 2     |            |
| 0.0.0.0/32         | perm | 0     |             | dscd | 537   | 1     |            |
| 103.1.1.0/24       | ifdn | 0     |             | rslv | 579   | 1     | ge-0/0/3.0 |
| 103.1.1.0/32       | iddn | 0     | 103.1.1.0   | recv | 577   | 1     | ge-0/0/3.0 |
| 103.1.1.1/32       | user | 0     |             | rjct | 539   | 2     |            |
| 103.1.1.1/32       | intf | 0     | 103.1.1.1   | loc1 | 578   | 2     |            |
| 103.1.1.1/32       | iddn | 0     | 103.1.1.1   | loc1 | 578   | 2     |            |
| 103.1.1.255/32     | iddn | 0     | 103.1.1.255 | bcst | 576   | 1     | ge-0/0/3.0 |
| 224.0.0.0/4        | perm | 0     |             | mdsc | 538   | 1     |            |
| 224.0.0.1/32       | perm | 0     | 224.0.0.1   | mcst | 534   | 1     |            |
| 255.255.255.255/32 | perm | 0     |             | bcst | 535   | 1     |            |

**Meaning** The output confirms that the virtual routing instances are created and the links are up and displays the routing table information.

## Verifying Integrated Routing and Bridging Interface Status and Statistics

**Purpose** Determine status information and traffic statistics for integrated routing and bridging (IRB) interfaces.

**Action** Display IRB interfaces and their current states:

```
user@switch> show interfaces irb terse
```

| Interface | Admin | Link | Proto | Local            | Remote |
|-----------|-------|------|-------|------------------|--------|
| irb       | up    | up   |       |                  |        |
| irb.111   | up    | up   | inet  | 111.111.111.1/24 |        |
| ...       |       |      |       |                  |        |

Display Layer 2 VLANs, including any tags assigned to the VLANs and the interfaces associated with the VLANs:

```
user@switch> show vlans
```

| Routing instance | VLAN name | Tag | Interfaces  |
|------------------|-----------|-----|-------------|
| default-switch   | irb       | 101 |             |
| default-switch   | support   | 111 |             |
|                  |           |     | ge-0/0/18.0 |
| ...              |           |     |             |

Display Ethernet switching table entries for the VLAN that is attached to the IRB interface:

```
user@switch> show ethernet-switching table
```

MAC flags (S -static MAC, D -dynamic MAC, L -locally learned  
SE -Statistics enabled, NM -Non configured MAC, R -Remote PE MAC)

```
Routing instance : default-switch
```

| Vlan Name | MAC address | MAC flags | Age | Logical interface |
|-----------|-------------|-----------|-----|-------------------|
|-----------|-------------|-----------|-----|-------------------|

```
support          00:01:02:03:04:05  S          - ge-0/0/18.0
...
```

Display the ingress-counting statistics of an IRB interface with either the **show interfaces irb detail** command or the **show interfaces irb extensive** command. Ingress counting is displayed as **Input bytes** and **Input packets** and egress counting is displayed as **Output bytes** and **Output packets** under **Transit Statistics**.

```
user@switch> show interfaces irb.111 detail
```

```
Logical interface irb.111 (Index 65) (SNMP ifIndex 503) (HW Token 100) (Generation
131)
Flags: SNMP-Traps 0x4000 Encapsulation: ENET2
Bandwidth: 1000mbps
Routing Instance: default-switch Bridging Domain: irb+111
Traffic statistics:
  Input bytes:    17516756
  Output bytes:   411764
  Input packets: 271745
  Output packets: 8256
Local statistics:
  Input bytes:    3240
  Output bytes:   411764
  Input packets:  54
  Output packets: 8256
Transit statistics:
  Input bytes:    17513516  0 bps
  Output bytes:   0        0 bps
  Input packets: 271745    0 pps
  Output packets: 0        0 pps
Protocol inet, MTU: 1514, Generation: 148, Route table: 0
Flags: None
Addresses, Flags: iS-Preferred Is-Primary
  Destination: 50.1.1/24, Local: 50.1.1.1, Broadcast: 50.1.1.255, Generation: 136
```

- Meaning**
- **show interfaces irb terse** displays a list of interfaces, including IRB interfaces, and their current states (up, down).
  - **show vlans** displays a list of VLANs, including any tags assigned to the VLANs and the interfaces associated with the VLANs.
  - **show ethernet-switching table** displays the Ethernet switching table entries, including VLANs attached to the IRB interface.
  - **show interfaces irb detail** displays IRB interface ingress counting as **Input Bytes** and **Input Packets** under **Transit Statistics**.

## Verifying That MVRP Is Working Correctly

### Purpose

**NOTE:** This task uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Verifying That MVRP Is Working Correctly*. For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 3](#).

After configuring your EX Series switch to participate in MVRP, verify that the configuration is properly set and that MVRP messages are being sent and received on your switch.

### Action

1. Confirm that MVRP is enabled on your switch.

```
user@switch> show mvrp
MVRP configuration for routing instance 'default-switch'
MVRP dynamic VLAN creation : Enabled
MVRP BPDU MAC address      : Customer bridge group (01-80-C2-00-00-21)
MVRP timers (ms)
  Interface      Join   Leave  LeaveAll
  xe-0/1/1       200   1000   10000
```

2. Confirm that MVRP messages are being sent and received on your switch.

```
user@switch> show mvrp statistics
MVRP statistics for routing instance 'default-switch'

Interface name           : xe-0/1/1
VLAN IDs registered      : 117
Sent MVRP PDUs           : 118824
Received MVRP PDUs without error: 118848
Received MVRP PDUs with error : 0
Transmitted Join Empty   : 5229
Transmitted Leave All    : 2
Received Join In         : 11884924
Transmitted Join In      : 1835
Transmitted Empty        : 93606408
Transmitted Leave        : 888
Transmitted In           : 13780024
Transmitted New          : 2692
Received Leave All       : 118761
Received Leave           : 97
Received In              : 3869
Received Empty           : 828
Received Join Empty      : 2020152
Received New             : 224
...
```

### Meaning

The output of **show mvrp** shows that interface xe-0/1/1 is enabled for MVRP participation.

The output for **show mvrp statistics** confirms that MVRP messages are being transmitted and received on interface xe-0/1/1.

**NOTE:** You can identify an MVRP compatibility issue by observing the output from this command. If **Received Join Empty** and **Received Join In** incorrectly display zero, even though the value for **Received MVRP PDUs without error** has been increased, you are probably running different versions of Junos OS on the switches in this network. Another indication that MVRP is having a version problem is that unexpected VLAN activity, such as multiple VLAN creation, takes place on the switch running the earlier release version. To remedy these problems, see [“Configuring Multiple VLAN Registration Protocol \(MVRP\) \(CLI Procedure\)”](#) on page 2348.

## Verifying That MAC Notification Is Working Properly

**Purpose** Verify that MAC notification is enabled or disabled, and that the MAC notification interval is set to the specified value.

**Action** Verify that MAC notification is enabled while also verifying the MAC notification interval setting.

```
user@switch> show ethernet-switching mac-notification
Notification Status: Enabled
Notification Interval: 30
```

**Meaning** The output in the **Notification Status** field shows that MAC notification is enabled. The output in the **Notification Status** field would display **Disabled** if MAC notification was disabled.

The **Notification Interval** field output shows that the MAC notification interval is set to 30 seconds.

  - [Configuring MAC Notification \(CLI Procedure\)](#) on page 2363

## Verifying That Proxy ARP Is Working Correctly

**Purpose** Verify that the switch is sending proxy ARP messages.

**Action** List the system statistics for ARP:

```
user@switch> show system statistics arp
arp:
    90060 datagrams received
```

```
34 ARP requests received
610 ARP replies received
2 resolution request received
0 unrestricted proxy requests
0 restricted proxy requests
0 received proxy requests
0 unrestricted proxy requests not proxied
0 restricted proxy requests not proxied
0 datagrams with bogus interface
0 datagrams with incorrect length
0 datagrams for non-IP protocol
0 datagrams with unsupported op code
0 datagrams with bad protocol address length
0 datagrams with bad hardware address length
0 datagrams with multicast source address
0 datagrams with multicast target address
0 datagrams with my own hardware address
0 datagrams for an address not on the interface
0 datagrams with a broadcast source address
294 datagrams with source address duplicate to mine
89113 datagrams which were not for me
0 packets discarded waiting for resolution
0 packets sent after waiting for resolution
309 ARP requests sent
35 ARP replies sent
0 requests for memory denied
0 requests dropped on entry
0 requests dropped during retry
0 requests dropped due to interface deletion
0 requests on unnumbered interfaces
0 new requests on unnumbered interfaces
0 replies for from unnumbered interfaces
0 requests on unnumbered interface with non-subnetted donor
0 replies from unnumbered interface with non-subnetted donor
```

**Meaning** The statistics show that two proxy ARP requests were received. The **unrestricted proxy requests not proxied** and **restricted proxy requests not proxied** fields indicate that all the unproxied ARP requests received have been proxied by the switch.

**Table 245: show ethernet-switching mac-notification Output Fields**

| Field Name                         | Field Description                                                                                                                                                                 |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Notification Status</b>         | MAC notification status: <ul style="list-style-type: none"> <li>• <b>Enabled</b>—MAC notification is enabled.</li> <li>• <b>Disabled</b>—MAC notification is disabled.</li> </ul> |
| <b>Notification Interval</b>       | MAC notification interval in seconds.                                                                                                                                             |
| <b>Notifications Sent</b>          | Number of notifications sent to SNMP when MACs are learned or when MACs age out.                                                                                                  |
| <b>Notifications Table Maxsize</b> | Maximum size of the notification table, which is populated when notifications are sent to the SNMP server.                                                                        |

### Sample Output

#### show ethernet-switching mac-notification (MAC Notification Enabled)

```

user@switch> show ethernet-switching mac-notification
Notification Status           : Enabled
Notification Interval         : 30
Notifications Sent            : 0
Notifications Table Maxsize   : 256

```

### Sample Output

#### show ethernet-switching mac-notification (MAC Notification Disabled)

```

user@switch> show ethernet-switching mac-notification
Notification Status           : Disabled
Notification Interval         : 0

```

Notifications Sent : 0  
Notifications Table Maxsize : 256

## show ethernet-switching table

**Syntax** `show ethernet-switching table`  
`<brief | count | detail | extensive | summary>`  
`<address>`  
`<instance instance-name>`  
`<interface interface-name>`  
`isid isid`  
`<logical-system logical-system-name>`  
`<persistent-learning (interface interface-name | mac mac-address)>`  
`<address>`  
`<vlan-id (all-vlan | vlan-id)>`  
`<vlan-name (all | vlan-name)>`

**Release Information** Command introduced in Junos OS Release 12.3R2.  
 Command introduced in Junos OS Release 12.3R2 for EX Series switches.  
 Options **logical-system**, **persistent-learning**, and **summary** introduced in Junos OS Release 13.2X50-D10 (ELS).

### Description

**NOTE:** If your EX Series switch CLI displays different options for the `show ethernet-switching table` command from the options shown in this document, then see [show ethernet-switching table](#).

(MX Series routers and EX Series switches only) Display Layer 2 MAC address information.

**Options** **none**—Display all learned Layer 2 MAC address information.

**brief | count | detail | extensive | summary**—(Optional) Display the specified level of output.

**address**—(Optional) Display the specified learned Layer 2 MAC address information.

**instance *instance-name***—(Optional) Display learned Layer 2 MAC addresses for the specified routing instance.

**interface *interface-name***—(Optional) Display learned Layer 2 MAC addresses for the specified interface.

**isid *isid***—(Optional) Display learned Layer 2 MAC addresses for the specified ISID.

**logical-system *logical-system-name***—(Optional) Display Ethernet-switching statistics information for the specified logical system.

**persistent-learning (interface *interface-name* | mac *mac-address*)**—(Optional) Display dynamically learned MAC addresses that are retained despite device restarts and interface failures for a specified interface, or information about a specified MAC address.

**vlan-id (all-vlan | *vlan-id*)**—(Optional) Display learned Layer 2 MAC addresses for all VLANs or for the specified VLAN.

**vlan-name (all | *vlan-name*)**—(Optional) Display learned Layer 2 MAC addresses for all VLANs or for the specified VLAN.

**Additional Information** When Layer 2 protocol tunneling is enabled, the tunneling MAC address 01:00:0c:cd:cd:d0 is installed in the MAC table. When the Cisco Discovery Protocol (CDP), Spanning Tree Protocol (STP), or VLAN Trunk Protocol (VTP) is configured for Layer 2 protocol tunneling on an interface, the corresponding protocol MAC address is installed in the MAC table.

**Output Fields** [Table 228 on page 2239](#) describes the output fields for the **show ethernet-switching table** command. Output fields are listed in the approximate order in which they appear.

**Table 246: show ethernet-switching table Output fields**

| Field Name                | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Routing instance</b>   | Name of the routing instance.                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>VLAN name</b>          | Name of the VLAN.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>MAC address</b>        | MAC address or addresses learned on a logical interface.                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>MAC flags</b>          | Status of MAC address learning properties for each interface: <ul style="list-style-type: none"> <li>• <b>S</b>—Static MAC address is configured.</li> <li>• <b>D</b>—Dynamic MAC address is configured.</li> <li>• <b>L</b>—Locally learned MAC address is configured.</li> <li>• <b>SE</b>—MAC accounting is enabled.</li> <li>• <b>NM</b>—Non-configured MAC.</li> <li>• <b>R</b>—Locally learned MAC address is configured.</li> </ul> |
| <b>Age</b>                | This field is not supported.                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Logical interface</b>  | Name of the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>MAC count</b>          | Number of MAC addresses learned on the specific routing instance or interface.                                                                                                                                                                                                                                                                                                                                                             |
| <b>Learning interface</b> | Name of the logical interface on which the MAC address was learned.                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Learning VLAN</b>      | VLAN ID of the routing instance or VLAN in which the MAC address was learned.                                                                                                                                                                                                                                                                                                                                                              |
| <b>Layer 2 flags</b>      | Debugging flags signifying that the MAC address is present in various lists.                                                                                                                                                                                                                                                                                                                                                               |

Table 246: show ethernet-switching table Output fields (*continued*)

| Field Name      | Field Description                                                                                     |
|-----------------|-------------------------------------------------------------------------------------------------------|
| Epoch           | Spanning-tree-protocol epoch number identifying when the MAC address was learned. Used for debugging. |
| Sequence number | Sequence number assigned to this MAC address. Used for debugging.                                     |
| Learning mask   | Mask of the Packet Forwarding Engines where this MAC address was learned. Used for debugging.         |
| IPC generation  | Creation time of the logical interface when this MAC address was learned. Used for debugging.         |

## Sample Output

### show ethernet-switching table

```

user@host> show ethernet-switching table
MAC flags (S - static MAC, D - dynamic MAC, L - locally learned
          SE - statistics enabled, NM - non configured MAC, R - remote PE MAC)

Routing instance : default-switch
  Vlan      MAC      MAC      Age      Logical
  name      address   flags    interface

| <b>Additional Information</b>   | Integrated routing and bridging (IRB) provides simultaneous support for Layer 2 bridging and Layer 3 IP routing on the same interface. IRB enables you to route local packets to another routed interface or to another VLAN that has a Layer 3 protocol configured.                                                                                                                                                                                                                                                                                                                                                |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Field Name                | Field Description                                                                                                                             | Level of Output |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Physical Interface</b> |                                                                                                                                               |                 |
| <b>Physical interface</b> | Name of the physical interface.                                                                                                               | All levels      |
| <b>Enabled</b>            | State of the physical interface. Possible values are described in the “Enabled Field” section under <i>Common Output Fields Description</i> . | All levels      |

Table 247: show interfaces irb Output Fields (*continued*)

| Field Name                     | Field Description                                                                                                                                                                                                                                          | Level of Output                    |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------|
| <b>Proto</b>                   | Protocol configured on the interface.                                                                                                                                                                                                                      | <b>terse</b>                       |
| <b>Interface index</b>         | Physical interface index number, which reflects its initialization sequence.                                                                                                                                                                               | <b>detail extensive none</b>       |
| <b>SNMP ifIndex</b>            | SNMP index number for the physical interface.                                                                                                                                                                                                              | <b>detail extensive none</b>       |
| <b>Type</b>                    | Physical interface type.                                                                                                                                                                                                                                   | <b>detail extensive none</b>       |
| <b>Link-level type</b>         | Encapsulation being used on the physical interface.                                                                                                                                                                                                        | <b>detail extensive brief none</b> |
| <b>MTU</b>                     | MTU size on the physical interface.                                                                                                                                                                                                                        | <b>detail extensive brief none</b> |
| <b>Clocking</b>                | Reference clock source: <b>Internal</b> or <b>External</b> . Always unspecified on IRB interfaces.                                                                                                                                                         | <b>detail extensive brief</b>      |
| <b>Speed</b>                   | Speed at which the interface is running. Always unspecified on IRB interfaces.                                                                                                                                                                             | <b>detail extensive brief</b>      |
| <b>Device flags</b>            | Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .                                                                                                         | <b>detail extensive brief none</b> |
| <b>Interface flags</b>         | Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> .                                                                                                            | <b>detail extensive brief none</b> |
| <b>Link type</b>               | Physical interface link type: <b>full duplex</b> or <b>half duplex</b> .                                                                                                                                                                                   | <b>detail extensive none</b>       |
| <b>Link flags</b>              | Information about the link. Possible values are described in the “Links Flags” section under <i>Common Output Fields Description</i> .                                                                                                                     | <b>detail extensive none</b>       |
| <b>Physical Info</b>           | Physical interface information.                                                                                                                                                                                                                            | All levels                         |
| <b>Hold-times</b>              | Current interface hold-time up and hold-time down, in milliseconds.                                                                                                                                                                                        | <b>detail extensive</b>            |
| <b>Current address</b>         | Configured MAC address.                                                                                                                                                                                                                                    | <b>detail extensive none</b>       |
| <b>Hardware address</b>        | MAC address of the hardware.                                                                                                                                                                                                                               | <b>detail extensive none</b>       |
| <b>Alternate link address</b>  | Backup address of the link.                                                                                                                                                                                                                                | <b>detail extensive</b>            |
| <b>Last flapped</b>            | Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hours:minutes:seconds timezone (hours:minutes:seconds ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> . | <b>detail extensive none</b>       |
| <b>Statistics last cleared</b> | Time when the statistics for the interface were last set to zero.                                                                                                                                                                                          | <b>detail extensive</b>            |

Table 247: show interfaces irb Output Fields (*continued*)

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Level of Output         |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Traffic statistics</b>      | <p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b> |
| <b>IPv6 transit statistics</b> | <p>Number of IPv6 transit bytes and packets received and transmitted on the physical interface if IPv6 statistics tracking is enabled.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>detail extensive</b> |
| <b>Input errors</b>            | <p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Giants</b>—Number of frames received that are larger than the giant threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>           | <b>detail extensive</b> |
| <b>Output errors</b>           | <p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the DPC is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>detail extensive</b> |

#### Logical Interface

Table 247: show interfaces irb Output Fields (*continued*)

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Level of Output                 |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------|
| <b>Logical interface</b>       | Name of the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | All levels                      |
| <b>Index</b>                   | Index number of the logical interface (which reflects its initialization sequence).                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive</b><br>none |
| <b>SNMP ifIndex</b>            | SNMP interface index number of the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <b>detail extensive</b><br>none |
| <b>Generation</b>              | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>detail extensive</b>         |
| <b>Flags</b>                   | Information about the logical interface. Possible values are described in the "Logical Interface Flags" section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                                                                        | <b>detail extensive</b>         |
| <b>Encapsulation</b>           | Encapsulation on the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive</b>         |
| <b>Bandwidth</b>               | Speed at which the interface is running.                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive</b>         |
| <b>Routing Instance</b>        | Routing instance IRB is configured under.                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive</b>         |
| <b>Bridging Domain</b>         | Bridging domain IRB is participating in.                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive</b>         |
| <b>Traffic statistics</b>      | <p>Number and rate of bytes and packets received and transmitted on the logical interface.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>                                             | <b>detail extensive</b>         |
| <b>IPv6 transit statistics</b> | <p>Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul> | <b>detail extensive</b>         |
| <b>Local statistics</b>        | Statistics for traffic received from and transmitted to the Routing Engine.                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>detail extensive</b>         |
| <b>Transit statistics</b>      | Statistics for traffic transiting the router.                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>detail extensive</b>         |
| <b>Protocol</b>                | Protocol family configured on the local interface. Possible values are described in the "Protocol Field" section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                                                                       | <b>detail extensive</b>         |
| <b>MTU</b>                     | Maximum transmission unit size on the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive</b>         |
| <b>Maximum labels</b>          | Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                        | <b>detail extensive</b><br>none |

Table 247: show interfaces irb Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                               | Level of Output         |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Generation</b>       | Unique number for use by Juniper Networks technical support only.                                                                                               | <b>detail extensive</b> |
| <b>Route table</b>      | Routing table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.                                             | <b>detail extensive</b> |
| <b>Addresses, Flags</b> | Information about address flags. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> .                 | <b>detail extensive</b> |
| <b>Policer</b>          | The policer that is to be evaluated when packets are received or transmitted on the interface.                                                                  | <b>detail extensive</b> |
| <b>Flags</b>            | Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> . | <b>detail extensive</b> |

## Sample Output

### show interfaces irb extensive

```

user@host> show interfaces irb extensive
Physical interface: irb, Enabled, Physical link is Up
  Interface index: 129, SNMP ifIndex: 23, Generation: 130
  Type: Ethernet, Link-level type: Ethernet, MTU: 1514, Clocking: Unspecified,
  Speed: Unspecified
  Device flags   : Present Running
  Interface flags: SNMP-Traps

**Table 250: show mvrp dynamic-vlan-memberships Output Fields**

| Field Name | Field Description                                                           |
|------------|-----------------------------------------------------------------------------|
| VLAN Id    | The VLAN ID of the dynamically created VLAN.                                |
| Interfaces | The interface or interfaces that are bound to the dynamically created VLAN. |

### Sample Output

#### show mvrp dynamic-vlan-memberships

```

user@host> show mvrp dynamic-vlan-memberships
MVRP dynamic vlans for routing instance 'default-switch'
(s) static vlan, (f) fixed registration

VLAN Id      Interfaces
  100 (s)    ge-11/3/0
  200 (s)    ge-11/3/0
  300 (s)

```

| <b>Transmitted Empty</b>   | Number of MRP Empty messages sent from the switch.                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Transmitted Leave</b>   | Number of MRP LeaveEmpty messages sent from the switch.                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Transmitted In</b>      | Number of MRP In messages sent from the switch.                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Transmitted New</b>     | Number of New messages transmitted from the switch.                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Received Leave All</b>  | Number of LeaveAll messages received on the switch.                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Received Leave</b>      | Number of MRP Leave messages received on the switch.                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Received In</b>         | Number of MRP In messages received on the switch.                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Received Empty</b>      | Number of MRP Empty messages received on the switch.                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Received Join Empty</b> | Number of MRP JoinEmpty messages received on the switch. Either this value or the value for <b>Received Join In</b> should increase when the value for <b>Received MVRP PDUs without error</b> increases. If this value is not incrementing when it should, you might have a Junos OS release compatibility issue. To resolve the issue, see <a href="#">“Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure)”</a> on page 2348. |
| <b>Received New</b>        | Number of New messages received on the switch.                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Output Fields</b>            | <p><a href="#">Table 253 on page 2470</a> lists the output fields for the <b>show route forwarding-table</b> command. Output fields are listed in the approximate order in which they appear. Field names may</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

be abbreviated (as shown in parentheses) when no level of output is specified, or when the **detail** keyword is used instead of the **extensive** keyword.

Table 253: show route forwarding-table Output Fields

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Level of Output         |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Routing table</b>           | Name of the routing table (for example, <b>inet</b> , <b>inet6</b> , <b>mpls</b> ).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | All levels              |
| <b>Destination</b>             | Destination of the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>detail extensive</b> |
| <b>Route Type (Type)</b>       | How the route was placed into the forwarding table. When the <b>detail</b> keyword is used, the route type might be abbreviated (as shown in parentheses): <ul style="list-style-type: none"> <li>• <b>cloned (clon)</b>—(TCP or multicast only) Cloned route.</li> <li>• <b>destination (dest)</b>—Remote addresses directly reachable through an interface.</li> <li>• <b>destination down (iddn)</b>—Destination route for which the interface is unreachable.</li> <li>• <b>interface cloned (ifcl)</b>—Cloned route for which the interface is unreachable.</li> <li>• <b>route down (ifdn)</b>—Interface route for which the interface is unreachable.</li> <li>• <b>ignore (ignr)</b>—Ignore this route.</li> <li>• <b>interface (intf)</b>—Installed as a result of configuring an interface.</li> <li>• <b>permanent (perm)</b>—Routes installed by the kernel when the routing table is initialized.</li> <li>• <b>user</b>—Routes installed by the routing protocol process or as a result of the configuration.</li> </ul>                                                                                                                           | All levels              |
| <b>Route Reference (RtRef)</b> | Number of routes to reference.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>detail extensive</b> |
| <b>Next hop</b>                | IP address of the next hop to the destination.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>detail extensive</b> |
| <b>Next hop Type (Type)</b>    | Next-hop type. When the <b>detail</b> keyword is used, the next-hop type might be abbreviated (as indicated in parentheses): <ul style="list-style-type: none"> <li>• <b>broadcast (bcst)</b> —Broadcast.</li> <li>• <b>deny</b>—Deny.</li> <li>• <b>hold</b>—Next hop is waiting to be resolved into a unicast or multicast type.</li> <li>• <b>indexed (idxd)</b>—Indexed next hop.</li> <li>• <b>indirect (indr)</b>—Indirect next hop.</li> <li>• <b>local (locl)</b>—Local address on an interface.</li> <li>• <b>routed multicast (mcr)</b>—Regular multicast next hop</li> <li>• <b>multicast (mcst)</b>—Wire multicast next hop (limited to the LAN).</li> <li>• <b>multicast discard (mdsc)</b>—Multicast discard.</li> <li>• <b>multicast group (mgrp)</b> —Multicast group member.</li> <li>• <b>receive (rcv)</b>—Receive.</li> <li>• <b>reject (rjct)</b> Discard. An ICMP unreachable message was sent.</li> <li>• <b>resolve (rslv)</b>—Resolving the next hop.</li> <li>• <b>unicast (ucst)</b>—Unicast.</li> <li>• <b>unilist (ulst)</b>—List of unicast next hops. A packet sent to this next hop goes to any next hop in the list.</li> </ul> | <b>detail extensive</b> |

Table 253: show route forwarding-table Output Fields (*continued*)

| Field Name                        | Field Description                                                                    | Level of Output              |
|-----------------------------------|--------------------------------------------------------------------------------------|------------------------------|
| <b>Index</b>                      | Software index of the next hop that is used to route the traffic for a given prefix. | <b>detail extensive none</b> |
| <b>Reference (NhRef)</b>          | Number of routes that refer to this next hop.                                        | <b>detail extensive none</b> |
| <b>Next-hop interface (Netif)</b> | Interface used to reach the next hop.                                                | <b>detail extensive none</b> |

## Sample Output

### show route forwarding-table

```

user@host> show route forwarding-table

## show system statistics arp

```

user@switch> show system statistics arp
arp:
    90060 datagrams received
    34 ARP requests received
    610 ARP replies received
    0 resolution request received
    0 unrestricted proxy requests
    0 restricted proxy requests
    0 received proxy requests
    0 unrestricted proxy requests not proxied
    0 restricted proxy requests not proxied
    0 datagrams with bogus interface
    0 datagrams with incorrect length
    0 datagrams for non-IP protocol
    0 datagrams with unsupported op code
    0 datagrams with bad protocol address length
    0 datagrams with bad hardware address length
    0 datagrams with multicast source address
    0 datagrams with multicast target address
    0 datagrams with my own hardware address
    0 datagrams for an address not on the interface
    0 datagrams with a broadcast source address
    294 datagrams with source address duplicate to mine
    89113 datagrams which were not for me
    0 packets discarded waiting for resolution
    0 packets sent after waiting for resolution
    309 ARP requests sent
    35 ARP replies sent
    0 requests for memory denied
    0 requests dropped on entry
    0 requests dropped during retry
    0 requests dropped due to interface deletion
    0 requests on unnumbered interfaces
    0 new requests on unnumbered interfaces
    0 replies for from unnumbered interfaces
    0 requests on unnumbered interface with non-subnetted donor
    0 replies from unnumbered interface with non-subnetted donor

```

## show vlans

**Syntax** `show vlans`  
`<brief | detail | extensive>`  
`<instance instance-name>`  
`<logical-system logical-system-name>`  
`<operational>`  
`<vlan-name>`  
`<interface interface-name>`

**Release Information** Command introduced in Junos OS Release 12.3R2.  
 Command introduced in Junos OS Release 12.3R2 for EX Series switches.  
 Option **interface** introduced in Junos OS Release 13.2X50-D10 (ELS).

### Description

**NOTE:** If your EX Series switch CLI displays different options for the `show vlans` command from the options shown in this document, see *show vlans*.

(MX Series routers and EX Series switches only) Display VLAN information.

### Options

**none**—Display information for all VLANs.

**brief | detail | extensive**—(Optional) Display the specified level of output.

**instance *instance-name***—(Optional) Display information for the specified routing instance.

**logical-system *logical-system-name***—(Optional) Display Ethernet-switching statistics information for the specified logical system.

**operational**—(Optional) Display information for the operational routing instances.

***vlan-name***— (Optional) Display information about the specified VLAN.

**interface *interface-name***—(Optional) Display information about the specified interface.

- [VRRP Overview on page 2501](#)

### High Availability Features Overview

---

- [High Availability Features for EX4300 Switches Overview on page 2483](#)

### High Availability Features for EX4300 Switches Overview

*High availability* refers to the hardware and software components that provide redundancy and reliability for network communications. This topic covers the following high availability features of Juniper Networks EX4300 Ethernet Switches:

- [Redundant Routing Engines on page 2483](#)
- [Virtual Chassis on page 2484](#)
- [VRRP on page 2484](#)
- [Graceful Routing Engine Switchover on page 2485](#)
- [Link Aggregation on page 2485](#)
- [Nonstop Active Routing and Nonstop Bridging on page 2485](#)

### Redundant Routing Engines

---

Redundant Routing Engines are two Routing Engines that are installed in a switch or a Virtual Chassis. When a switch has two Routing Engines, one functions as the master, while the other stands by as a backup in case the master Routing Engine fails. When a Virtual Chassis has two Routing Engines, the switch in the master role functions as the master Routing Engine and the switch in the backup role functions as the backup Routing Engine. Redundant Routing Engines are supported on Juniper Networks EX4300 Ethernet Switches configuring into a Virtual Chassis.

The master Routing Engine receives and transmits routing information, builds and maintains routing tables, communicates with interfaces and Packet Forwarding Engine components of the switch, and has full control over the control plane of the switch.

The backup Routing Engine stays in sync with the master Routing Engine in terms of protocol states, forwarding tables, and so forth. If the master becomes unavailable, the backup Routing Engine takes over the functions that the master Routing Engine performs.

Network reconvergence takes place more quickly on switches and on Virtual Chassis with redundant Routing Engines than on switches and on Virtual Chassis with a single Routing Engine.

### Virtual Chassis

---

A Virtual Chassis is multiple switches connected together that operate as a single network entity. The advantages of connecting multiple switches into a Virtual Chassis include better-managed bandwidth at a network layer, simplified configuration and maintenance because multiple devices can be managed as a single device, a simplified Layer 2 network topology that minimizes or eliminates the need for loop prevention protocols such as Spanning Tree Protocol (STP), and improved fault tolerance and high availability. A Virtual Chassis improves high availability for the following reasons:

- **Dual Routing Engine support.** A Virtual Chassis automatically has two Routing Engines—the switches in the master and backup **routing-engine** roles—and, therefore, provides more high availability options than standalone switches. Many high availability features are available for an EX Series Virtual Chassis that are not available on standalone EX Series switches.
- **Increased fault tolerance.** You increase your fault tolerance options when you configure your EX Series switches into a Virtual Chassis. You can, for instance, configure interfaces into a link aggregation group (LAG) with member interfaces on different member switches in the same Virtual Chassis to ensure network traffic is received by a Virtual Chassis even when a switch or physical interface in the Virtual Chassis fails.

You can configure up to ten EX4300 switches into an EX4300 Virtual Chassis. See [“Understanding EX4300 Virtual Chassis” on page 5065](#).

### VRRP

---

You can configure Virtual Router Redundancy Protocol (VRRP) for IP and IPv6 on most switch interfaces, including Gigabit Ethernet interfaces, high-speed uplink interfaces, and logical interfaces. When VRRP is configured, the switches act as virtual routing platforms. VRRP enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts. The VRRP routing platforms share the IP address corresponding to the default route configured on the hosts. At any time, one of the VRRP routing platforms is the master (active) and the others are backups. If the master routing platform fails, one of the backup routing platforms becomes the new master, providing a virtual default routing platform and enabling traffic on the LAN to be routed without relying on a single routing platform. Using VRRP, a backup switch can take over a failed default switch within a few seconds. This is done with minimum loss of VRRP traffic and without any interaction with the hosts.

---

### Graceful Routing Engine Switchover

---

You can configure graceful Routing Engine switchover (GRES) on a switch with redundant Routing Engines or on a Virtual Chassis, allowing control to switch from the master Routing Engine to the backup Routing Engine with minimal interruption to network communications. When you configure GRES, the backup Routing Engine automatically synchronizes with the master Routing Engine to preserve kernel state information and forwarding state. Any updates to the master Routing Engine are replicated to the backup Routing Engine as soon as they occur. If the kernel on the master Routing Engine stops operating, the master Routing Engine experiences a hardware failure, or the administrator initiates a manual switchover, mastership switches to the backup Routing Engine.

When the backup Routing Engine assumes mastership in a redundant failover configuration (that is, when GRES is not enabled), the Packet Forwarding Engines initialize their state to the boot state before they connect to the new master Routing Engine. In contrast, in a GRES configuration, the Packet Forwarding Engines do not reinitialize their state, but resynchronize their state to that of the new master Routing Engine. The interruption to traffic is minimal.

---

### Link Aggregation

---

You can combine multiple physical Ethernet ports to form a logical point-to-point link, known as a link aggregation group (LAG) or bundle. A LAG provides more bandwidth than a single Ethernet link can provide. Additionally, link aggregation provides network redundancy by load-balancing traffic across all available links. If one of the links should fail, the system automatically load-balances traffic across all remaining links. In a Virtual Chassis, LAGs can be used to load-balance network traffic between member switches, which increases high availability by ensuring that network traffic is received by the Virtual Chassis even if a single interface fails for any reason.

The number of Ethernet interfaces you can include in a LAG and the number of LAGs you can configure on a switch depend on the switch model. For information about LAGs, see [“Understanding Aggregated Ethernet Interfaces and LACP” on page 2582](#).

---

### Nonstop Active Routing and Nonstop Bridging

---

Nonstop active routing (NSR) provides high availability in a switch or Virtual Chassis with redundant Routing Engines by enabling transparent switchover of the Routing Engines without requiring restart of supported Layer 3 routing protocols. Both Routing Engines are fully active in processing protocol sessions, and so each can take over for the other. The switchover is transparent to neighbor routing devices, which do not detect that a change has occurred. The neighboring devices and other devices on the network do not, therefore, have to resynchronize their Layer 3 protocol states to respond to the downtime on the switch—a process that adds network overhead and risks disrupting network performance—when a Routing Engine switchover occurs when NSR is enabled.

Nonstop bridging (NSB) provides the same mechanism for Layer 2 protocols. NSB operates by synchronizing all protocol information for NSB-supported Layer 2 protocols between the master and backup Routing Engines. If the switch has a Routing Engine switchover, the NSB-supported Layer 2 protocol sessions remain active because they are already synchronized on the backup Routing Engine. The Routing Engine switchover

is transparent to neighbor devices, which do not detect any changes related to the Layer 2 protocol sessions. The neighboring devices and other devices on the network do not, therefore, have to resynchronize their Layer 2 protocol states to respond to the downtime on the switch—a process that adds network overhead and risks disrupting network performance—when a Routing Engine switchover occurs when NSB is enabled.

To use NSR or NSB, you must also configure GRES.

## Nonstop Active Routing Overview

- [Understanding Nonstop Active Routing on EX Series Switches on page 2486](#)

### Understanding Nonstop Active Routing on EX Series Switches

You can configure nonstop active routing (NSR) on an EX Series switch with redundant Routing Engines or on an EX Series Virtual Chassis to enable the transparent switchover of the Routing Engines in the event that one of the Routing Engines goes down.

Nonstop active routing provides high availability for Routing Engines by enabling transparent switchover of the Routing Engines without requiring restart of supported routing protocols. Both Routing Engines are fully active in processing protocol sessions, and so each can take over for the other. The switchover is transparent to neighbor routing devices, which do not detect that a change has occurred.

Enable nonstop active routing when neighbor routing devices are not configured to support graceful restart of protocols or when you want to ensure graceful restart of protocols for which graceful restart is not supported—such as PIM.

You do not need to start the two Routing Engines simultaneously to synchronize them for nonstop active routing. If both Routing Engines are not present or not up when you issue a **commit synchronize** statement, the candidate configuration is committed in the master Routing Engine and when the backup Routing Engine is inserted or comes online, its configuration is automatically synchronized with that of the master.

Nonstop active routing uses the same infrastructure as graceful Routing Engine switchover (GRES) to preserve interface and kernel information. However, nonstop active routing also saves routing protocol information by running the routing protocol process (**rpd**) on the backup Routing Engine. By saving this additional information, nonstop active routing does not rely on other routing devices to assist in restoring routing protocol information.

**NOTE:** After a graceful Routing Engine switchover, we recommend that you issue the `clear interface statistics (interface-name | all)` command to reset the cumulative values for local statistics on the new master Routing Engine.

If you suspect a problem with the synchronization of Routing Engines when nonstop active routing is enabled, you can gather troubleshooting information using trace options. For example, if certain protocols lose connectivity with neighbors after a graceful Routing Engine switchover with NSR enabled, you can use trace options to help isolate the problem. See [“Tracing Nonstop Active Routing Synchronization Events” on page 2573](#).

**NOTE:** Graceful restart and nonstop active routing are mutually exclusive. You will receive an error message upon commit if both are configured.

**NOTE:** Nonstop active routing provides a transparent switchover mechanism only for Layer 3 protocol sessions. Nonstop bridging (NSB) provides a similar mechanism for Layer 2 protocol sessions. See [“Understanding Nonstop Bridging on EX Series Switches” on page 2487](#).

## Nonstop Bridging Overview

- [Understanding Nonstop Bridging on EX Series Switches on page 2487](#)

### Understanding Nonstop Bridging on EX Series Switches

You can configure nonstop bridging (NSB) to provide resilience for Layer 2 protocol sessions on a Juniper Networks EX Series Ethernet Switch or on an EX Series Virtual Chassis with redundant Routing Engines.

NSB operates by synchronizing all protocol information for NSB-supported Layer 2 protocols between the master and backup Routing Engines. If the switch has a Routing Engine switchover, the NSB-supported Layer 2 protocol sessions remain active because all session information is already synchronized to the backup Routing Engine. Traffic disruption for the NSB-supported Layer 2 protocol is minimal or nonexistent as a result of the switchover. The Routing Engine switchover is transparent to neighbor devices, which do not detect any changes related to the NSB-supported Layer 2 protocol sessions on the switch.

For a list of the EX Series switches and Layer 2 protocols that support NSB, see *EX Series Switch Software Features Overview* and *EX Series Virtual Chassis Software Features Overview*.

**NOTE:** Nonstop bridging provides a transparent switchover mechanism only for Layer 2 protocol sessions. Nonstop active routing (NSR) provides a similar mechanism for Layer 3 protocol sessions. See [“Understanding Nonstop Active Routing on EX Series Switches” on page 2486](#).

## Nonstop Software Upgrade Overview

- [Understanding Nonstop Software Upgrade on EX Series Switches on page 2488](#)

### Understanding Nonstop Software Upgrade on EX Series Switches

Nonstop software upgrade (NSSU) enables you to upgrade the software running on Juniper Networks EX Series Ethernet Switches with redundant Routing Engines and all member switches in EX Series Virtual Chassis by using a single command and with minimal network traffic disruption during the upgrade.

NSSU is supported on the following platforms:

- EX3300 Virtual Chassis
- EX4200 Virtual Chassis
- EX4300 Virtual Chassis
- EX4500 Virtual Chassis
- EX4550 Virtual Chassis
- All mixed Virtual Chassis composed of EX4200, EX4500, and EX4550 switches
- EX6200 switches
- EX8200 switches
- EX8200 Virtual Chassis

Performing an NSSU provides these benefits:

- No disruption to the control plane—An NSSU takes advantage of graceful Routing Engine switchover (GRES) and nonstop active routing (NSR) to ensure no disruption to the control plane. During the upgrade process, interface, kernel, and routing protocol information is preserved.
- Minimal disruption to network traffic—An NSSU minimizes network traffic disruption by:

- Upgrading line cards one at a time in an EX6200 switch, EX8200 switch, or EX8200 Virtual Chassis, permitting traffic to continue to flow through the line cards that are not being upgraded.
- Upgrading member switches one at a time in an EX3300, EX4200, EX4300, EX4500, or mixed Virtual Chassis, permitting traffic to continue to flow through the members that are not being upgraded.

To achieve minimal disruption to traffic, you must configure link aggregation groups (LAGs) such that the member links of each LAG reside on different line cards or Virtual Chassis members. When one member link of a LAG is down, the remaining links are up, and traffic continues to flow through the LAG.

**NOTE:** Because NSSU upgrades the software on each line card or on each Virtual Chassis member one at a time, an upgrade using NSSU can take longer than an upgrade using the `request system software add` command.

For EX6200 switches, EX8200 switches, and EX8200 Virtual Chassis, you can reduce the amount of time an upgrade takes by configuring line-card upgrade groups. The line cards in an upgrade group are upgraded simultaneously, reducing the amount of time it takes to complete an upgrade. See *Configuring Line-Card Upgrade Groups for Nonstop Software Upgrade (CLI Procedure)*.

This topic covers:

- [Requirements for Performing an NSSU on page 2489](#)
- [How an NSSU Works on page 2490](#)
- [NSSU Limitations on page 2493](#)
- [NSSU and Junos OS Release Support on page 2493](#)
- [Overview of NSSU Configuration and Operation on page 2494](#)

### **Requirements for Performing an NSSU**

The following requirements apply to all switches and Virtual Chassis:

- All Virtual Chassis members and all Routing Engines must be running the same Junos OS release.
- Graceful Routing Engine switchover (GRES) must be enabled.
- Nonstop active routing (NSR) must be enabled.

**NOTE:** Although nonstop bridging (NSB) does not have to be enabled to perform an NSSU, we recommend enabling NSB before performing an NSSU. Enabling NSB ensures that all NSB-supported Layer 2 protocols operate seamlessly during the Routing Engine switchover that is part of the NSSU. See *Configuring Nonstop Bridging on EX Series Switches (CLI Procedure)*.

- For minimal traffic disruption, you must define link aggregation groups (LAGs) such that the member links reside on different Virtual Chassis members or on different line cards.

The following are requirements for EX3300, EX4200, EX4300, EX4500, and mixed Virtual Chassis:

- The Virtual Chassis members must be connected in a ring topology so that no member is isolated as a result of another member being rebooted. This topology prevents the Virtual Chassis from splitting during an NSSU.
- The Virtual Chassis master and backup must be adjacent to each other in the ring topology. Adjacency permits the master and backup to always be in sync, even when the switches in linecard roles are rebooting.
- The Virtual Chassis must be preprovisioned so that the linecard role has been explicitly assigned to member switches acting in a linecard role. During an NSSU, the Virtual Chassis members must maintain their roles—the master and backup must maintain their master and backup roles (although mastership will change), and the remaining switches must maintain their linecard roles.
- A two-member Virtual Chassis must have **no-split-detection** configured so that the Virtual Chassis does not split when an NSSU upgrades a member.

**NOTE:** For the EX4300 Virtual Chassis, you should enable the `vcp-no-hold-time` statement at the `[edit virtual-chassis]` hierarchy level before performing a software upgrade using NSSU. If you do not enable the `vcp-no-hold-time` statement, the Virtual Chassis may split during the upgrade. A split Virtual Chassis can cause disruptions to your network, and you may have to manually reconfigure your Virtual Chassis after the NSSU if the split and merge feature was disabled. For more information about a split Virtual Chassis, see [“Understanding Split and Merge in a Virtual Chassis” on page 5087](#)

---

## How an NSSU Works

This section describes what happens when you request an NSSU on these switches and Virtual Chassis:

- [EX3300, EX4200, EX4300, EX4500, and Mixed Virtual Chassis on page 2491](#)
- [EX6200 and EX8200 Switches on page 2491](#)
- [EX8200 Virtual Chassis on page 2492](#)

***EX3300, EX4200, EX4300, EX4500, and Mixed Virtual Chassis***

When you request an NSSU on an EX3300, EX4200, EX4300, EX4500, or mixed Virtual Chassis:

1. The Virtual Chassis master verifies that:
  - The backup is online and running the same software version.
  - Graceful Routing Engine switchover (GRES) and nonstop active routing (NSR) are enabled.
  - The Virtual Chassis has a preprovisioned configuration.
2. The master installs the new software image on the backup and reboots it.
3. The master resynchronizes the backup.
4. The master installs the new software image on member switches that are in the linecard role and reboots them, one at a time. The master waits for each member to become online and active before starting the software upgrade on the next member.
5. When all members that are in the linecard role have been upgraded, the master performs a graceful Routing Engine switchover, and the upgraded backup becomes the master.
6. The software on the original master is upgraded and the original master is automatically rebooted. After the original master has rejoined the Virtual Chassis, you can optionally return control to it by requesting a graceful Routing Engine switchover.

***EX6200 and EX8200 Switches***

When you request an NSSU on a standalone switch with redundant Routing Engines:

1. The switch verifies that:
  - Both Routing Engines are online and running the same software version.
  - Both Routing Engines have sufficient storage space for the new software image.
  - Graceful Routing Engine switchover and nonstop active routing are enabled.
2. The switch installs the new software image on the backup Routing Engine and reboots it.
3. The switch resynchronizes the backup Routing Engine to the master Routing Engine.
4. The line cards in the first upgrade group (or the line card in slot 0, if no upgrade groups are defined) download the new image and then restart. Traffic continues to flow through the line cards in the other upgrade groups during this process.
5. When line cards restarted in Step 4 are online again, the line cards in the next upgrade group download the new image and restart. This process continues until all online line cards have restarted with the new software.

**NOTE:** If you have taken a line card offline with the CLI before you start the NSSU, the line card is not restarted and remains offline.

6. The switch performs a graceful Routing Engine switchover, so that the upgraded backup Routing Engine becomes the master.
7. The switch installs the new software on the original master Routing Engine.

To complete the upgrade process, the original master Routing Engine must be rebooted. You can do so manually or have the switch perform an automatic reboot by including the **reboot** option when you request the NSSU. After the original master has been rebooted, you can optionally return control to it by requesting a graceful Routing Engine switchover.

8. (EX6200 switch only) The original master Routing Engine reboots to complete the software upgrade.

**NOTE:** To complete the upgrade process on an EX8200 switch, you must intervene to reboot the original master Routing Engine. You can reboot the original master Routing Engine manually or have the switch perform an automatic reboot by including the **reboot** option when you request the NSSU.

9. (Optional) After the original master has been rebooted, you can return control to it by requesting a graceful Routing Engine switchover.

The switch can maintain normal operations with either Routing Engine acting as the master Routing Engine after the software upgrade, so you only have to perform this switchover if you want to return Routing Engine control to the original master Routing Engine.

### ***EX8200 Virtual Chassis***

When you request an NSSU on an EX8200 Virtual Chassis:

1. The master external Routing Engine verifies that:
  - It has a backup external Routing Engine that is online.
  - All Virtual Chassis members have redundant Routing Engines and the Routing Engines are online.
  - All Routing Engines are running the same software version.
  - All Routing Engines have sufficient storage space for the new software image.
  - Graceful Routing Engine switchover and nonstop active routing (NSR) are enabled.
2. The master external Routing Engine installs the new software image on the backup external Routing Engine and reboots it.
3. The backup external Routing Engine resynchronizes with the master external Routing Engine.

4. The master external Routing Engine installs the new software on the backup Routing Engines in the member switches and reboots the backup Routing Engines.
5. When the reboot of the backup Routing Engines complete, the line cards in the first upgrade group download the new image and then restart. (If no upgrade groups are defined, the line card in slot 0 of member 0 downloads the new image and restarts.) Traffic continues to flow through the line cards in the other upgrade groups during this process.
6. When line cards restarted in Step 5 are online again, the line cards in the next upgrade group (or the next sequential line card) download the new image and restart. This process continues until all online line cards have restarted with the new software.

**NOTE:** If you have taken a line card offline with the CLI before you start the NSSU, the line card is not restarted and remains offline.

7. The new software image is installed on the master Routing Engines, both external and internal.
8. The member switches perform a graceful Routing Engine switchover, so that the upgraded backup Routing Engines become masters.
9. The master external Routing Engine performs a graceful Routing Engine switchover so that the backup external Routing Engine is now the master.

To complete the upgrade process, the original master Routing Engines, both external and internal, must be rebooted. You can do so manually by establishing a console connection to each Routing Engine or have the reboot performed automatically by including the **reboot** option when you request the NSSU. After the original master external Routing Engine has been rebooted, you can optionally return control to it by requesting a graceful Routing Engine switchover.

### NSSU Limitations

You cannot use an NSSU to downgrade the software—that is, to install an earlier version of the software than is currently running on the switch. To install an earlier software version, use the **request system software add** command.

You cannot roll back to the previous software version after you perform an upgrade using NSSU. If you need to rollback to the previous software version, you can do so by rebooting from the alternate root partition if you have not already copied the new software version into the alternate root partition.

### NSSU and Junos OS Release Support

A Virtual Chassis must be running a Junos OS release that supports NSSU before you can perform an NSSU. If a Virtual Chassis is running a software version that does not support NSSU, use the **request system software add** command.

Table 254 on page 2494 lists the EX Series switches and Virtual Chassis that support NSSU and the Junos OS release at which they began supporting it.

Table 254: Platform and Release Support for NSSU

| Platform                                         | Junos OS Release     |
|--------------------------------------------------|----------------------|
| EX3300 Virtual Chassis                           | 12.2 or later        |
| EX4200 Virtual Chassis                           | 12.1 or later        |
| EX4300 Virtual Chassis                           | 13.2X51-D20 or later |
| EX4500 Virtual Chassis                           | 12.1 or later        |
| EX4550 Virtual Chassis                           | 12.2 or later        |
| Mixed EX4200 and EX4500 Virtual Chassis          | 12.1 or later        |
| Mixed EX4200 and EX4550 Virtual Chassis          | 12.2 or later        |
| Mixed EX4200, EX4500, and EX4550 Virtual Chassis | 12.2 or later        |
| Mixed EX4500 and EX4550 Virtual Chassis          | 12.2 or later        |
| EX6200 switch                                    | 12.2 or later        |
| EX8200 switch                                    | 10.4 or later        |
| EX8200 Virtual Chassis                           | 11.1 or later        |

### Overview of NSSU Configuration and Operation

You must ensure that the configuration of the switch or Virtual Chassis meets the requirements described in [“Requirements for Performing an NSSU” on page 2489](#). NSSU requires no additional configuration.

For EX6200 switches, EX8200 switches, and EX8200 Virtual Chassis, you can optionally configure line-card upgrade groups using the CLI. See *Example: Configuring Line-Card Upgrade Groups for Nonstop Software Upgrade on EX Series Switches*.

You perform an NSSU by executing the [request system software nonstop-upgrade](#) command. For detailed instructions on how to perform an NSSU, see the topics in Related Documentation.

## Power Management Overview

---

- [Understanding Power Management on EX Series Switches on page 2495](#)

### Understanding Power Management on EX Series Switches

The power management feature for Juniper Networks Ethernet Switches helps ensure that normal operation of the system is not disrupted because of insufficient power to the switch. For example:

- Power management ensures that operating line cards continue to receive power if a user installs a new line card in an operating switch when power is insufficient for both the new and existing line cards.
- Power management reserves a certain amount of power to power supply redundancy, so that if a power supply fails, the switch can continue to operate normally. If power management must use some of this reserved power to provide power to switch components, it raises an alarm to indicate that power supply redundancy no longer exists and that normal operations might be disrupted if a power supply fails.
- If power supply failure requires power management to power down some components, it does so gracefully by powering down line cards and PoE ports in the order specified by the user.

Power management manages power to switch components by employing a power budget policy. In its power budget policy, power management:

- Budgets power for each installed switch component that requires power. With the exception of PoE power for line cards that support PoE, the amount that power management budgets for each component is the maximum power that component might consume under worst case operating conditions. For example, for the fan tray, power management budgets the amount of power required to run the fans at their maximum speed setting, even if the current fan speed is much lower.
- Reserves a set amount of power for power supply redundancy. In its default configuration, power management manages the switch for  $N+1$  power redundancy, which ensures uninterrupted system operation if one power supply fails. For example, if a switch has four online 3000 W power supplies, power management reserves 3000 W in its power budget policy for redundancy. It allocates the remaining 9000 W to normal operating power.
- Specifies the rules under which components receive power. These rules are designed to ensure the least disruption to switch operation under conditions of insufficient power.

For example, power management provides power to core system components, such as the Routing Engines, before it provides power to line cards.

You can configure certain aspects of power management's budget policy, specifically:

- The power priority of individual line cards. By assigning different power priorities to the line cards, you can determine which line cards are more likely to receive power in the event of insufficient power.
- The power redundancy configuration. The default power redundancy configuration is  $N+1$ ; you can optionally configure  $N+N$ . For example, if you have deployed two independent AC power feeds to the switch, configure  $N+N$  redundancy. When you configure power management for  $N+N$  redundancy, it reserves the appropriate amount of power in its power budget and reports insufficient power conditions accordingly.

These configurable items are discussed further in:

- [Power Priority of Line Cards on page 2496](#)
- [Power Supply Redundancy on page 2499](#)

---

### Power Priority of Line Cards

---

The power priority of line cards determines:

- The order in which line cards are allocated power
- The order in which line cards that support PoE are allocated power for PoE
- How power is reallocated in cases of changes in power availability or demand in an operating switch

**NOTE:** On EX6200 switches, the four 10-Gigabit Ethernet SFP+ uplink ports on a Switch Fabric and Routing Engine (SRE) module are treated like a line card in the power budget.

---

This section covers:

- [How a Line Card's Power Priority Is Determined on page 2496](#)
- [Line Card Priority and Line Card Power on page 2497](#)
- [Line Card Priority and PoE Power on page 2497](#)
- [Line Card Priority and Changes in the Power Budget on page 2498](#)

#### ***How a Line Card's Power Priority Is Determined***

Using the CLI, you can assign an explicit power priority to a line-card slot. If more than one slot has the same assigned priority, the power priority is determined by slot number, with the lowest-numbered slots receiving power first.

By default, all slots in an EX8200 switch are assigned the lowest priority. Thus if you do not explicitly assign priorities to slots, power priority is determined by slot number, with slot 0 having the highest priority.

In an EX6200 switch, all slots are assigned the lowest priority, except for the slots containing an SRE module. Slots containing an SRE module are automatically assigned the highest priority. This means that the line cards that represent the 10-Gigabit Ethernet SFP+ ports on SRE modules have the highest priority among the line cards.

### ***Line Card Priority and Line Card Power***

When an EX6200 or EX8200 switch is powered on, power management allocates power to components according to its power budget policy. After power management has allocated power to the base chassis components, it allocates the remaining available power to the line cards. It powers on the line cards in priority order until all line cards are powered on or the available power (including reserved power, if necessary) is exhausted. Thus if available power is exhausted before all line cards receive power, higher-priority cards are powered on while lower-priority cards remain powered off.

A lower-priority card might receive power while a higher-priority card does not if the remaining available power is sufficient to power on the lower-priority card but not the higher-priority card. For example, if a line card requiring 450 W is in a higher-priority slot than line card requiring 330 W, the line card requiring 330 W receives the power if there is less than 450 W but more than 330 W remaining in the power budget.

Line cards that have been administratively taken offline are not allocated power.

**NOTE:** Because power management does not allocate power to a line card that has been administratively taken offline, a line card that has been taken offline in an EX6200 or EX8200 switch is not automatically brought online when you commit a configuration. You must explicitly use the `request chassis fpc slot slot-number online` command to bring a line card online that was taken offline previously. This behavior differs from other platforms running Juniper Networks Junos operating system (Junos OS), which automatically bring an offline FPC online when you commit a configuration.

If power management cannot power on a line card because of insufficient power, it raises a major (red) alarm.

### ***Line Card Priority and PoE Power***

After all line cards have been powered on, power management allocates any remaining available power, including reserved power, to the PoE power budgets of line cards that have PoE ports. Power management allocates PoE power to line cards in the order of power priority. If enough power is available, a line card receives its full PoE power budget before power management allocates PoE power to the next highest-priority line card. If not enough power is available, a line card receives partial PoE power and lower-priority line cards receive no PoE power.

If power management is unable to allocate enough power to meet the PoE power budget for a line card, it logs a message to the system log.

The default PoE power budget for a line card is the amount of power needed to supply the maximum supported power to all PoE ports. In cases where powered devices do not require the maximum power or in which some PoE ports are not used for powered devices,

you can configure a smaller PoE power budget for a line card. By configuring a smaller PoE power budget, you make more power available for the PoE power budgets of lower-priority line cards.

You can also configure the power priority of the PoE ports on a line card. If power management is unable to allocate enough power to a line card to meet its PoE power budget, the line card PoE controller will turn off power to PoE ports in reverse priority order as required to meet the reduced power allocation.

See [“Configuring PoE on EX Series Switches \(CLI Procedure\)”](#) on page 4440 for more information on how to configure the PoE power budget for a line card and how to configure PoE port priorities.

### ***Line Card Priority and Changes in the Power Budget***

In an operating switch, power management dynamically reallocates power in response to changes in power availability or demand or changes in line card priority. Power management uses line card priority to determine how to reallocate power in response to the following events:

- A power supply fails, is removed, or is taken offline:
  - If power is insufficient to meet the PoE power allocations of all PoE line cards, power management deallocates PoE power from the line cards in reverse priority order until power is sufficient to meet the remaining PoE power allocations.
  - If power is insufficient to meet the base (non-PoE) power requirements of all the line cards, all PoE power is deallocated. If, after the deallocation of PoE power, power is still not sufficient, power management turns off line cards in reverse priority order until power is sufficient for the remaining line cards.
- A new line card is inserted or a line card is brought online:
  - If the line card supports PoE and there is insufficient power to meet its PoE power budget, PoE power is reallocated from lower-priority line cards. If not enough PoE power can be reallocated from lower-priority line cards, the new line card receives a partial PoE power allocation.
  - If there is insufficient power to power on the new line card, PoE power is removed from PoE line cards in reverse priority order until the new line card can be powered on.
  - If the removal of all PoE power is insufficient to free up enough power to power on the line card, the line card remains powered off and the PoE line cards continue to receive their PoE power allocations. To minimize disruption on an operating switch, lower-priority line cards are not turned off to provide power to the new line card. However, if you restart the switch, power management reruns the current power budget policy and powers line cards on or off based on their priority. As a result, line cards receive power strictly by priority order and previously operating line cards might no longer receive power.
- A new power supply is brought online:

- Any line cards that were powered off because of insufficient power are powered on in priority order.
- After all line cards are powered on, remaining power is allocated to the PoE power budgets of line cards in priority order.
- A line card is removed or taken offline, freeing up power:
  - Any line cards that were powered down because of insufficient power are powered on in priority order.
  - After all line cards are powered on, any remaining power is allocated to the PoE power budgets of line cards in priority order.
- A user changes the assigned power priority of one or more line cards when power is insufficient to meet the power budget:
  - PoE power to the line cards is reallocated based on the new power priorities.
  - Base power allocation to the line cards is not changed—in other words, power management does not power down line cards that had been receiving power because they are now a lower priority. However, if you restart the switch, power management reruns the current power budget policy and powers line cards on or off based on their priority. As a result, line cards receive power strictly by priority order and previously operating line cards might no longer receive power.

If, because of insufficient power, power management reduces or eliminates the PoE power budget for a line card, it logs a message to the system log. If power management must power down a line card because of insufficient power, it raises a major (red) alarm.

### Power Supply Redundancy

By default, power management in EX Series switches is configured to manage the power supplies for  $N+1$  redundancy, in which one power supply is held in reserve for backup if one of the other power supplies is removed or fails.

You can configure power management to manage the power supplies for  $N+N$  redundancy. In  $N+N$  redundancy, power management holds  $N$  power supplies in reserve for backup. For example, if your switch has six power supplies and you configure  $N+N$  redundancy, power management makes three power supplies available for normal operating power and reserves three power supplies for redundancy (3+3). If you have an odd number of power supplies, power management allocates one more power supply to normal operating power than to redundant power. For example, if you have five power supplies, the  $N+N$  configuration is 3+2.

Given the same number of power supplies, an  $N+N$  configuration usually provides less normal operating power than an  $N+1$  configuration because the  $N+N$  configuration holds more power in reserve for backup. [Table 255 on page 2500](#) shows the effect on normal operating power in  $N+1$  and  $N+N$  configurations.

**Table 255: Available Operating Power in N+1 and N+N Redundancy Configurations**

| Number of Power Supplies at $n$ W Each | Normal Operating Power in $N+1$ Configuration | Normal Operating Power in $N+N$ Configuration |
|----------------------------------------|-----------------------------------------------|-----------------------------------------------|
| 2                                      | 1 x ( $n$ W)                                  | 1 x ( $n$ W)                                  |
| 3                                      | 2 x ( $n$ W)                                  | 2 x ( $n$ W)                                  |
| 4                                      | 3 x ( $n$ W)                                  | 2 x ( $n$ W)                                  |
| 5 (EX8200 switches only)               | 4 x ( $n$ W)                                  | 3 x ( $n$ W)                                  |
| 6 (EX8200 switches only)               | 5 x ( $n$ W)                                  | 3 x ( $n$ W)                                  |

To compensate for the reduced normal operating power, power management on EX8200 switches allocates less power to the chassis in an  $N+N$  configuration than in an  $N+1$  configuration. This reduction in allocated chassis power allows a switch in an  $N+N$  configuration to power more line cards than it could without the reduction. For the EX8208 switch, the power allocated for the chassis is reduced to 1200 W from 1600 W; for the EX8216 switch, it is reduced to 1800 W from 2400 W.

**NOTE:** To achieve the reduction in allocated chassis power in an EX8200 switch, power management reduces the maximum fan speed to 60 percent in an  $N+N$  configuration from 80 percent in an  $N+1$  configuration. Because the maximum fan speed is reduced, it is possible that a line card that overheats would be shut down sooner in an  $N+N$  configuration than in an  $N+1$  configuration.

On EX6200 switches, the same amount of power is allocated for the chassis in  $N+N$  configurations as in  $N+1$  configurations.

Power management automatically recalculates the reserved power and normal operating power as power supplies go online or offline. For example, if you have an  $N+N$  configuration with three online 2000 W power supplies, power management allocates 2000 W to reserved power. If you bring a fourth 2000 W power supply online, power management then allocates 4000 W to reserved power. If a power supply goes offline again, power management once again allocates 2000 W to reserved power.

When power is insufficient to meet the budgeted power requirements, power management raises alarms as follows:

- A minor (yellow) alarm is raised when insufficient power exists to maintain the configured  $N+1$  or  $N+N$  power reserves, but all line cards are still receiving their base and PoE power allocations. If this condition persists for 5 minutes, the alarm becomes a major (red) alarm. Even though operation of the switch is unaffected in this condition, you should remedy it as quickly as possible because a power supply failure might cause a disruption in switch operation.

- A major (red) alarm is raised when insufficient power exists to provide all the line cards with their base and PoE power allocations. One or more PoE ports might be down or one or more line cards might be down.

Power management clears all alarms when sufficient power is available to meet normal operating and reserved power requirements.

## VRRP Overview

- [Understanding VRRP on EX Series Switches on page 2501](#)

### Understanding VRRP on EX Series Switches

Juniper Networks EX Series Ethernet Switches support the Virtual Router Redundancy Protocol (VRRP) and VRRP for IPv6. This topic covers:

- [Overview of VRRP on EX Series Switches on page 2501](#)
- [Examples of VRRP Topologies on page 2502](#)

#### Overview of VRRP on EX Series Switches

You can configure the Virtual Router Redundancy Protocol (VRRP) or VRRP for IPv6 on Gigabit Ethernet interfaces, 10-Gigabit Ethernet interfaces, and logical interfaces on EX Series switches. When VRRP is configured, the switches act as virtual routing platforms. VRRP enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts. The VRRP routing platforms share the IP address corresponding to the default route configured on the hosts. At any time, one of the VRRP routing platforms is the master (active) and the others are backups. If the master routing platform fails, one of the backup routing platforms becomes the new master, providing a virtual default routing platform and enabling traffic on the LAN to be routed without relying on a single routing platform. Using VRRP, a backup EX Series switch can take over a failed default switch within a few seconds. This is done with minimum loss of VRRP traffic and without any interaction with the hosts. Virtual Router Redundancy Protocol is not supported on management interfaces.

VRRP for IPv6 provides a much faster switchover to an alternate default routing platform than IPv6 Neighbor Discovery (ND) procedures. VRRP for IPv6 does not support the **authentication-type** or **authentication-key** statements.

**NOTE:** Do not confuse the VRRP master and backup routing platforms with the master and backup member switches of a Virtual Chassis configuration. The master and backup members of a Virtual Chassis configuration compose a single host. In a VRRP topology, one host operates as the master routing platform and another operates as the backup routing platform, as shown in [Figure 40 on page 2503](#).

Switches running VRRP dynamically elect master and backup routing platforms. You can also force assignment of master and backup routing platforms using priorities from 1 through 255, with 255 being the highest priority. In VRRP operation, the default master routing platform sends advertisements to backup routing platforms at regular intervals. The default interval is 1 second. If the backup routing platforms do not receive an advertisement for a set period, the backup routing platform with the highest priority takes over as master and begins forwarding packets.

**NOTE:** Priority 255 cannot be set for routed VLAN interfaces (RVIs).

VRRP is defined in RFC 3768, *Virtual Router Redundancy Protocol*.

### Examples of VRRP Topologies

[Figure 39 on page 2502](#) illustrates a basic VRRP topology with EX Series switches. In this example, Switches A, B, and C are running VRRP and together they make up a virtual routing platform. The IP address of this virtual routing platform is 10.10.0.1 (the same address as the physical interface of Switch A).

**Figure 39: Basic VRRP on EX Series Switches**

[Figure 40 on page 2503](#) illustrates a basic VRRP topology using Virtual Chassis configurations. Switch A, Switch B, and Switch C are each composed of multiple interconnected Juniper Networks EX4200 Ethernet Switches. Each Virtual Chassis configuration operates as a single switch, which is running VRRP, and together they make

up a virtual routing platform. The IP address of this virtual routing platform is **10.10.0.1** (the same address as the physical interface of Switch A).

**Figure 40: VRRP on Virtual Chassis Switches**

Because the virtual routing platform uses the IP address of the physical interface of Switch A, Switch A is the master VRRP routing platform, while Switch B and Switch C function as backup VRRP routing platforms. Clients 1 through 3 are configured with the default gateway IP address of **10.10.0.1** as the master router. Switch A, forwards packets sent to its IP address. If the master routing platform fails, the switch configured with the higher priority becomes the master virtual routing platform and provides uninterrupted service for the LAN hosts. When Switch A recovers, it becomes the master virtual routing platform again.

## Configuring Nonstop Active Routing on Switches

Nonstop active routing (NSR) provides a mechanism for transparent switchover of the Routing Engines without necessitating restart of supported routing protocols. Both Routing Engines are fully active in processing protocol sessions, and so each can take over for the other. The switchover is transparent to neighbors.

You can configure NSR on an on a Juniper Networks EX Series switch with multiple Routing Engines or an EX Series or QFX Series switch in a Virtual Chassis or Virtual Chassis Fabric configuration.

To configure nonstop active routing:

1. Enable graceful Routing Engine switchover (GRES):  

```
[edit chassis redundancy]  
user@switch# set graceful-switchover
```
2. Enable nonstop active routing (by default, nonstop active routing is disabled):  

```
[edit routing-options]  
user@switch# set nonstop-routing
```
3. Synchronize configuration changes between the Routing Engines:  

```
[edit system]  
user@switch# set commit synchronize
```

If you try to commit the nonstop active routing configuration without including the **commit synchronize** statement, the commit fails.

**NOTE:** There is no requirement to start the two Routing Engines simultaneously. If the backup Routing Engine is not up when you issue the **commit synchronize** command, the candidate configuration is committed in the master Routing Engine. When the backup Routing Engine is inserted or comes online, its configuration is automatically synchronized with that of the master.

**BEST PRACTICE:** After a graceful Routing Engine switchover, we recommend that you issue the clear interface statistics (*interface-name* | all) command to reset the cumulative values for local statistics on the new master Routing Engine.

To disable nonstop active routing:

```
[edit routing-options]  
user@switch# delete nonstop-routing
```

## Configuring Nonstop Bridging on Switches (CLI Procedure)

**NOTE:** This task uses switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Configuring Nonstop Bridging on EX Series Switches (CLI Procedure)*. For ELS details, see “[Getting Started with Enhanced Layer 2 Software](#)” on page 3.

You can configure nonstop bridging (NSB) to provide resilience for Layer 2 protocol sessions on a Juniper Networks EX Series switch with multiple Routing Engines or an EX Series or QFX Series switch in a Virtual Chassis or Virtual Chassis Fabric configuration. Limited support for NSB is also provided on QFX5100 and EX4600 standalone switches, but NSB is enabled *only* during an ISSU.

NSB operates by synchronizing all protocol information for NSB-supported Layer 2 protocols between the master and backup Routing Engines. If the switch has a Routing Engine switchover, the NSB-supported Layer 2 protocol sessions remain active because they are already synchronized on the backup Routing Engine. The Routing Engine switchover is transparent to neighbor devices, which do not detect any changes related to the Layer 2 protocol sessions. The neighboring devices and other devices on the network do not, therefore, have to resynchronize their Layer 2 protocol states to respond to the downtime on the switch—a process that adds network overhead and risks disrupting network performance—when a Routing Engine switchover occurs when NSB is enabled.

**NOTE:** If you are using a QFX5100 or EX4600 standalone switch and you want to use ISSU, configure Graceful Routing Engine switchover (GRES), NSB and nonstop active routing (NSR). You must configure NSB, GRES, and NSR in order to run ISSU. However, GRES, NSB and NSR are enabled *only* during the upgrade. During an ISSU, the Junos OS runs in two separate virtual machines (VMs)—one VM is in the master role acting as the master Routing Engine, and the other VM is in the backup role acting as the backup Routing Engine. The Junos OS is upgraded on the backup VM. After a successful software upgrade, the backup VM then becomes the master VM, and the original master VM is no longer needed and is shut down.

To configure NSB:

1. Enable graceful Routing Engine switchover (GRES):

```
[edit chassis redundancy]
user@switch# set graceful-switchover
```

2. Enable NSB:

```
[edit protocols layer2-control]
user@switch# set nonstop-bridging
```

3. Synchronize configuration changes between the Routing Engines:

```
[edit system]
user@switch# set commit synchronize
```

If you try to commit a configuration that includes NSB without including the **commit synchronize** statement, the commit fails.

**NOTE:** There is no requirement to start the two Routing Engines simultaneously. If the backup Routing Engine is not up when you use the **commit synchronize** statement, the candidate configuration is committed in the master Routing Engine. When the backup Routing Engine comes online, its configuration is automatically synchronized with that of the master.

**BEST PRACTICE:** After a graceful Routing Engine switchover, we recommend that you issue the clear interface statistics (*interface-name | all*) command to reset the cumulative values for local statistics on the new master Routing Engine.

### Upgrading Software on an EX3300, EX4200, EX4300, EX4500 and EX4550 Virtual Chassis, and Mixed Virtual Chassis Using Nonstop Software Upgrade (CLI Procedure)

You can use nonstop software upgrade (NSSU) to upgrade the software running on all member switches in most EX Series Virtual Chassis with minimal traffic disruption during the upgrade.

NSSU is supported on the following Virtual Chassis platforms:

- EX3300 Virtual Chassis
- EX4200 Virtual Chassis
- EX4300 Virtual Chassis
- EX4500 Virtual Chassis
- EX4550 Virtual Chassis
- All mixed Virtual Chassis composed of EX4200, EX4500, and EX4550 switches
- EX8200 Virtual Chassis

This topic covers:

- [Preparing the Switch for Software Installation on page 2509](#)
- [Upgrading the Software Using NSSU on page 2510](#)

## Preparing the Switch for Software Installation

Before you begin software installation using NSSU:

- Ensure that the Virtual Chassis is configured correctly to support NSSU. Verify that:
  - The Virtual Chassis members are connected in a ring topology. A ring topology prevents the Virtual Chassis from splitting during an NSSU.
  - The Virtual Chassis master and backup are adjacent to each other in the ring topology. Adjacency permits the master and backup to always be in sync, even when the switches in linecard roles are rebooting.
  - The Virtual Chassis is preprovisioned so that the linecard role has been explicitly assigned to member switches acting in the linecard role. During an NSSU, the Virtual Chassis members must maintain their roles—the master and backup must maintain their master and backup roles (although mastership will change), and the other member switches must maintain their linecard roles.

For information on configuring a preprovisioned Virtual Chassis, see *Configuring an EX3300 Virtual Chassis (CLI Procedure)*, *Configuring an EX4200, EX4500, or EX4550 Virtual Chassis (CLI Procedure)*, and *Configuring an EX8200 Virtual Chassis (CLI Procedure)*.

- A two-member Virtual Chassis has **no-split-detection** configured so that the Virtual Chassis does not split when an NSSU upgrades a member.
- Verify that the members are running the same version of the software:

```
user@switch> show version
```

If the Virtual Chassis members are not running the same version of the software, use the **request system software add** command to upgrade the software on the inconsistent members.

- Ensure that nonstop active routing (NSR) and graceful Routing Engine switchover (GRES) are enabled. To verify that they are enabled, you need to check only the state of nonstop active routing—if nonstop active routing is enabled, then graceful Routing Engine switchover is enabled.

To verify that nonstop active routing is enabled:

```
user@switch> show task replication
```

```
Stateful Replication: Enabled
RE mode: Master
```

| Protocol | Synchronization Status |
|----------|------------------------|
| OSPF     | Complete               |
| BGP      | Complete               |
| PIM      | Complete               |

If nonstop active routing is not enabled (**Stateful Replication is Disabled**), see [“Configuring Nonstop Active Routing on Switches” on page 2505](#) for information on how to enable it.

- For the EX4300 Virtual Chassis, you should enable the **vcp-no-hold-time** statement at the **[edit virtual-chassis]** hierarchy level before performing a software upgrade using

NSSU. If you do not enable the **vcp-no-hold-time** statement, the Virtual Chassis may split during the upgrade. A split Virtual Chassis can cause disruptions to your network, and you may have to manually reconfigure your Virtual Chassis after the NSSU if the split and merge feature was disabled. For more information about a split Virtual Chassis, see [“Understanding Split and Merge in a Virtual Chassis” on page 5087](#)

- (Optional) Enable nonstop bridging (NSB). Enabling NSB ensures that all NSB-supported Layer 2 protocols operate seamlessly during the Routing Engine switchover that is part of the NSSU.
- (Optional) Back up the system software—Junos OS, the active configuration, and log files—on each member to an external storage device with the [request system snapshot](#) command.

### Upgrading the Software Using NSSU

---

This procedure describes how to upgrade the software running on all Virtual Chassis members using NSSU. When the upgrade completes, all members are running the new version of the software. Because a graceful Routing Engine switchover occurs during the upgrade, the original Virtual Chassis backup is the new master.

To upgrade all members using NSSU:

1. Download the software package by following the procedure in *Downloading Software Packages from Juniper Networks*. If you are upgrading the software running on a mixed Virtual Chassis, download the software packages for both switch types.
2. Copy the software package or packages to the Virtual Chassis. We recommend that you copy the file to the **/var/tmp** directory on the master.
3. Log in to the Virtual Chassis using the console connection or the virtual management Ethernet (VME) interface. Using a console connection allows you to monitor the progress of the master switch reboot.
4. Start the NSSU:
  - On an EX3300 Virtual Chassis, EX4200 Virtual Chassis, EX4300 Virtual Chassis, EX4500 Virtual Chassis, or EX4550 Virtual Chassis, enter:

```
user@switch> request system software nonstop-upgrade  
/var/tmp/package-name.tgz
```

where **package-name.tgz** is, for example, **jinstall-ex4200-12.1R2.5-domestic-signed.tgz**.

- On a mixed Virtual Chassis, enter:

```
user@switch> request system software nonstop-upgrade set  
[/var/tmp/package-name.tgz /var/tmp/package-name.tgz]
```

where **[/var/tmp/package-name.tgz /var/tmp/package-name.tgz]** specifies the EX4200 and EX4500 software packages.

The switch displays status messages similar to the following messages as the upgrade executes:

```
Chassis ISSU Check Done
```

```

ISSU: Validating Image

WARNING: Use the 'request system reboot' command immediately
relinquish mastership
ISSU: IDLE

*** FINAL System shutdown message from user@switch ***

System going down IMMEDIATELY

Shutdown NOW!
[pid 9336]

```

5. Log in after the reboot of the original master switch completes. To verify that the software on all Routing Engines in the Virtual Chassis members has been upgraded, enter the following command:

```
user@switch> show version
```

6. To ensure that the resilient dual-root partitions feature operates correctly, copy the new Junos OS image into the alternate root partitions of all members:

```
user@switch> request system snapshot slice alternate all-members
```

Resilient dual-root partitions allow the switch to boot transparently from the alternate root partition if the system fails to boot from the primary root partition.

## Configuring Power Supply Redundancy (CLI Procedure)

By default, the power management feature in EX Series switches is configured to manage the power supplies for  $N+1$  redundancy, in which one power supply is held in reserve for backup if any one of the other power supplies is removed or fails.

You can configure power management to manage the power supplies for  $N+N$  redundancy. For example, to set up your AC power supplies for dual power feed,  $N+N$  redundancy is required. In  $N+N$  redundancy, power management allocates half of the online power supplies to normal operating power and half to redundant power. If you have an odd number of online power supplies, power management allocates one more power supply to normal operating power than to redundant power.

This topic describes how to configure power management for  $N+N$  redundancy and how to revert back to  $N+1$  redundancy if your deployment needs change.

Before you configure power management for  $N+N$  redundancy, ensure that you have sufficient power supplies to meet the power requirements of an  $N+N$  configuration. Use the [show chassis power-budget-statistics](#) command to display your current power budget.

**NOTE:** To allow more power to be available to line cards in an EX8200 switch, power management compensates for the reduced normal operating power in an  $N+N$  configuration by allocating less power to the chassis than it does in an  $N+1$  configuration. For the EX8208 switch, the power allocated to the chassis is reduced to 1200 W from 1600 W. For the EX8216 switch, it is reduced to 1800 W from 2400 W. In determining whether you have enough power for an  $N+N$  configuration, take this reduction of allocated chassis power into account.

The reduction in allocated chassis power is achieved by reducing the maximum fan speed to 60 percent in an  $N+N$  configuration from 80 percent in an  $N+1$  configuration. Because the maximum fan speed is reduced, it is possible that a line card that overheats would be shut down sooner in an  $N+N$  configuration than in an  $N+1$  configuration.

On EX6200 switches, the same amount of power is allocated for the chassis in  $N+N$  configurations as in  $N+1$  configurations.

To configure *N+N* redundancy:

```
[edit chassis]
user@switch# set psu redundancy n-plus-n
```

To revert back to *N+1* redundancy:

```
[edit chassis]
user@switch# delete chassis psu redundancy n-plus-n
```

## Configuring VRRP for IPv6 (CLI Procedure)

By configuring the Virtual Router Redundancy Protocol (VRRP) on EX Series switches, you can enable hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts. You can configure VRRP for IPv6 on Gigabit Ethernet, 10-Gigabit Ethernet, and logical interfaces.

To configure VRRP for IPv6:

1. Configure VRRP group support on interfaces:

```
[edit interfaces interface-name unit logical-unit-number family inet6 address address]
user@switch# set vrrp-inet6-group group-id priority number virtual-inet6-address address
virtual-link-local-address ipv6-address
```

You must explicitly define a virtual link local address for each VRRP for IPv6 group. Otherwise, when you attempt to commit the configuration, the commit request fails. The virtual link local address must be on the same subnet as the physical interface address.

2. If you want to configure the priority order in which this switch functioning as a backup router becomes the master router if the master router becomes nonoperational, configure a priority for this switch:

```
[edit interfaces interface-name unit logical-unit-number family inet6 address address vrrp-inet6-group group-id]
user@switch# set priority number
```

3. Specify the interval in milliseconds in which the master router sends advertisement packets to the members of the VRRP group:

```
[edit interfaces interface-name unit logical-unit-number family inet6 address address vrrp-inet6-group group-id]
user@switch# set inet6-advertise-interval milliseconds
```

4. By default, a higher-priority backup router preempts a lower-priority master router.

- To explicitly enable the master router to be preempted:

```
[edit interfaces interface-name unit logical-unit-number family inet6 address address vrrp-inet6-group group-id]
user@switch# set preempt
```

- To prohibit a higher-priority backup router from preempting a lower priority master router:

```
[edit interfaces interface-name unit logical-unit-number family inet6 address  
address vrrp-inet6-group group-id]  
user@switch# set no-preempt
```

## Configuration Examples

- [Example: Configuring Nonstop Active Routing on Switches on page 2514](#)

### Example: Configuring Nonstop Active Routing on Switches

Nonstop active routing (NSR) provides high availability for Routing Engines by enabling transparent switchover of the Routing Engines without necessitating restart of supported routing protocols. Both Routing Engines are fully active in processing protocol sessions, and so each can take over for the other. The switchover is transparent to neighbors.

This example describes how to configure nonstop active routing on switches with multiple Routing Engines or on an EX Series or a QFX series switch in a Virtual Chassis or Virtual Chassis Fabric configuration.

- [Requirements on page 2514](#)
- [Overview and Topology on page 2514](#)
- [Configuration on page 2515](#)
- [Verification on page 2516](#)
- [Troubleshooting on page 2516](#)

---

#### Requirements

This example uses the following hardware and software components:

- An EX Series with multiple Routing Engines or on an EX Series or a QFX series switch in a Virtual Chassis or Virtual Chassis Fabric configuration
- Junos OS Release 10.4 or later for EX Series switches
- Junos OS Release 13.2X51-D20 or later for QFX Series switches

---

#### Overview and Topology

Configure nonstop active routing on any EX Series with multiple Routing Engines or on an EX Series or a QFX series switch in a Virtual Chassis or Virtual Chassis Fabric configuration. Nonstop active routing is advantageous in networks where neighbor routing devices do not support graceful restart protocol extensions.

The topology used in this example consists of an EX8200 switch with redundant Routing Engines connected to neighbor routing devices that are not configured to support graceful restart of protocols.

### Configuration

#### CLI Quick Configuration

To quickly configure nonstop active routing, copy the following commands and paste them into the switch terminal window:

```
[edit]
set chassis redundancy graceful-switchover
set routing-options nonstop-routing
set system commit synchronize
```

#### Step-by-Step Procedure

To configure nonstop active routing on a switch:

1. Enable graceful Routing Engine switchover (GRES):

```
[edit chassis redundancy]
user@switch# set graceful-switchover
```

2. Enable nonstop active routing (by default, nonstop active routing is disabled):

```
[edit routing-options]
user@switch# set nonstop-routing
```

3. Synchronize configuration changes between the Routing Engines:

```
[edit system]
user@switch# set commit synchronize
```

If you try to commit the nonstop active routing configuration without including the **commit synchronize** statement, the commit fails.

**NOTE:** If the backup Routing Engine is down when you issue the commit, a warning is displayed and the candidate configuration is committed in the master Routing Engine. When the backup Routing Engine comes up, its configuration is automatically synchronized with that of the master. If you subsequently insert or bring up a backup Routing Engine, it automatically synchronizes its configuration with the master Routing Engine configuration.

### Results

Check the results of the configuration:

```
[edit]
user@switch# show
chassis {
  redundancy {
    graceful-switchover;
  }
}
routing-options {
  nonstop-routing;
}
system {
  commit synchronize;
```

```
}
```

## Verification

---

To confirm that the configuration is working properly, perform these tasks:

- [Verifying That Nonstop Active Routing Is Working Correctly on the Switch on page 2516](#)

### *Verifying That Nonstop Active Routing Is Working Correctly on the Switch*

**Purpose** Verify that nonstop active routing is enabled.

**Action** Issue the [show task replication](#) command:

```
user@switch# show task replication
Stateful Replication: Enabled
RE mode: Master
```

| Protocol | Synchronization Status |
|----------|------------------------|
| OSPF     | Complete               |
| RIP      | Complete               |
| PIM      | Complete               |
| RSVP     | Complete               |

**Meaning** This output shows that nonstop active routing (Stateful Replication) is enabled on master routing engine. If nonstop routing is not enabled, instead of the output shown above:

- On the backup routing engine the following error message is displayed: “**error: the routing subsystem is not running.**”
- On the master routing engine, the following output is displayed if nonstop routing is not enabled:

```
Stateful Replication: Disabled
RE mode: Master
```

## Troubleshooting

---

To troubleshoot nonstop active routing, perform these tasks:

- [Investigating Problems with Synchronization of Routing Engines When NSR Is Enabled on page 2516](#)

### *Investigating Problems with Synchronization of Routing Engines When NSR Is Enabled*

**Problem** A protocol loses connectivity with neighbors after a graceful Routing Engine switchover (GRES) occurs with nonstop active routing (NSR) enabled.

**Solution** Use trace options to help isolate the problem and gather troubleshooting information. Using the information gathered from trace options, you can confirm or eliminate the synchronization of the Routing Engines as the cause of the loss of connectivity for the protocol. See “[Tracing Nonstop Active Routing Synchronization Events](#)” on page 2573.

### [edit chassis] Configuration Statement Hierarchy on EX Series Switches

This topic lists supported and unsupported configuration statements in the **[edit chassis]** hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.

- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see [Feature Explorer](#).

This topic lists:

- [Supported Statements in the \[edit chassis\] Hierarchy Level on page 2518](#)

### [Supported Statements in the \[edit chassis\] Hierarchy Level](#)

---

The following hierarchy shows the **[edit chassis]** configuration statements supported on EX Series switches:

```
chassis {
  aggregated-devices {
    ethernet {
      device-count number;
      lacp {
        link-protection non-revertive;
        system-priority system-priority-number
      }
    }
  }
  alarm {
    ethernet {

| <b>Release Information</b> | Statement introduced in Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 10.4 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>         | For devices with multiple Routing Engines only. Configure the <b>commit</b> command to automatically perform a <b>commit synchronize</b> action between dual Routing Engines within the same chassis. The Routing Engine on which you execute the <b>commit</b> command (the requesting Routing Engine) copies and loads its candidate configuration to the other (the responding) Routing Engine. Each Routing Engine then performs a syntax check on the candidate configuration file being committed. If no errors are found, the configuration is activated and becomes the current operational configuration on both Routing Engines. |

**NOTE:** When you configure nonstop active routing (NSR), you must configure the **commit synchronize** statement. Otherwise, the commit operation fails.

---

On the TX Matrix router, synchronization only occurs between the Routing Engines within the same chassis. When synchronization is complete, the new configuration is then distributed to the Routing Engines on the T640 routers. That is, the master Routing Engine on the TX Matrix router distributes the configuration to the master Routing Engine on each T640 router. Likewise, the backup Routing Engine on the TX Matrix router distributes the configuration to the backup Routing Engine on each T640 router.

On the TX Matrix Plus router, synchronization only occurs between the Routing Engines within the switch-fabric chassis and when synchronization is complete, the new configuration is then distributed to the Routing Engines on the line-card chassis (LCC). That is, the master Routing Engine on the TX Matrix Plus router distributes the configuration to the master Routing Engine on each LCC. Likewise, the backup Routing Engine on the TX Matrix Plus router distributes the configuration to the backup Routing Engine on each LCC.

In EX Series Virtual Chassis configurations:

- On EX4200 switches in Virtual Chassis, synchronization occurs between the switch in the master role and the switch in the backup role.
- On EX8200 switches in a Virtual Chassis, synchronization occurs only between the master and backup XRE200 External Routing Engines.

## failover (Chassis)

**Syntax**

```
failover {
  on-disk-failure;
  on-loss-of-keepalives;
}
```

**Hierarchy Level** [edit chassis [redundancy](#)]

**Release Information** Statement introduced in Junos OS Release 9.2 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Specify conditions on the master Routing Engine that cause the backup router to take mastership.

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## fpc

---

**Syntax** `fpc slot {  
 pic pic-number {  
 sfpplus {  
 pic-mode mode;  
 }  
 tunnel-port port-number tunnel-services;  
 }  
 power (off | on);  
 power-budget-priority priority;  
}`

**Hierarchy Level** [edit [chassis](#)]

**Release Information** Statement introduced in Junos OS Release 9.4 for EX Series switches.  
Statement introduced in Junos OS Release 13.2 for the QFX Series.

**Description** Specify the port of the SFP+ uplink module for which you want to configure the operating mode, or specify the line card slot for which you want to assign a power priority.

**NOTE:** On an EX6200 switch, you cannot change the power priority of a slot containing a Switch Fabric and Routing Engine (SRE) module. Although the CLI allows you to set a power priority for the slot, your change does not take effect, and the power priority remains 0. A message is sent to the system log to inform you that changing the power priority of the slot is unsupported.

For generic routing encapsulation (GRE) tunneling, use the **fpc** statement along with the **tunnel-port** statement to specify the port on the switch that you want to convert to a GRE tunnel port.

**Options** *slot*—Number of the slot:

- 0—EX3200 and standalone EX4200, EX4500, and EX4550 switches. The FPC value refers to the switch itself.
- 0–9—EX4200, EX4500, or EX4550 switch in a Virtual Chassis configuration. The value corresponds to the switch's member ID.
- 0–3 and 6–9—EX6210 switch. The slot is a line card slot.  
4–5—The slot is a line card slot or an SRE module slot.
- 0–7—EX8208 switch. The slot is a line card slot.
- 0–15—EX8216 switch. The slot is a line card slot.

The remaining statements are explained separately.

| <b>Description</b>         | <p>Define tracing operations that track all routing protocol functionality in the routing device.</p> <p>To specify more than one tracing operation, include multiple <b>flag</b> statements.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Default</b>             | If you do not include this statement, no global tracing operations are performed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>             | <p><b>Values:</b></p> <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. We recommend that you place global routing protocol tracing output in the file <b>routing-log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and</p>                                                                                                                                                                                                 |

so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

**Range:** 2 through 1000 files

**Default:** 10 files

**flag flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. These are the global routing protocol tracing options:

- **all**—All tracing operations
- **condition-manager**—Condition-manager events
- **config-internal**—Configuration internals
- **general**—All normal operations and routing table changes (a combination of the **normal** and **route** trace operations)
- **graceful-restart**—Graceful restart operations
- **normal**—All normal operations
- **nsr-packet**—Detailed trace information for BFD nonstop active routing only
- **nsr-synchronization**—Tracing operations for nonstop active routing
- **nsr-synchronization-detail**—(MPLS only) Tracing operations for nonstop active routing in detail
- **parse**—Configuration parsing
- **policy**—Routing policy operations and actions
- **regex-parse**—Regular-expression parsing
- **route**—Routing table changes
- **state**—State transitions
- **task**—Interface transactions and processing
- **timer**—Timer usage

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 128 KB

**world-readable**—(Optional) Allow any user to read the log file.

**Required Privilege Level** routing and trace—To view this statement in the configuration.  
routing-control and trace-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.<br>Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>              | <p>Disable the Virtual Chassis port (VCP) holddown timer for all VCPs in the Virtual Chassis or Virtual Chassis Fabric (VCF).</p> <p>The VCP holddown timer is an internal mechanism that delays a Virtual Chassis reconvergence for several seconds when a VCP becomes inactive. The purpose of this delay is to provide the VCP time to return online without having to reconverge the Virtual Chassis to adjust to the inactive VCP. All traffic to the VCP is dropped while the VCP is inactive. If the VCP remains down for a time that exceeds the VCP holddown timer, a Virtual Chassis reconvergence occurs.</p> <p>When this statement is enabled, the VCP holddown timer is disabled and the Virtual Chassis reconvergence occurs when a VCP becomes inactive. The period of time where traffic is dropped waiting for the VCP to return online is avoided.</p> <p>We recommend enabling this statement after a Virtual Chassis is operational. We recommend disabling this statement when you are adding or removing member switches from your Virtual Chassis.</p> <p>The VCP holddown timer cannot be viewed and is not user-configurable. You can only control whether the VCP holddown timer is enabled or disabled by configuring this statement.</p> <div> <b>NOTE:</b> For the EX4300 Virtual Chassis, you should enable the <code>vcp-no-hold-time</code> statement before performing a software upgrade using NSSU. If you do not enable the <code>vcp-no-hold-time</code> statement, the Virtual Chassis may split during the upgrade. A split Virtual Chassis can cause disruptions to your network, and you may have to manually reconfigure your Virtual Chassis after the NSSU if the split and merge feature was disabled. For more information about a split Virtual Chassis, see <a href="#">“Understanding Split and Merge in a Virtual Chassis”</a> on page 5087</div> |
| <b>Default</b>                  | The VCP holddown timer is enabled by default on all devices that support this statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Release Information</b> | Statement introduced in Junos OS Release 10.0 for EX Series switches.                                                                              |
| <b>Description</b>         | Configure the addresses of the virtual routers in a Virtual Router Redundancy Protocol (VRRP) IPv6 group. You can configure up to eight addresses. |

**NOTE:** The address of an aggregated Ethernet interface (a LAG) or a routed VLAN interface (RVI) cannot be assigned as the virtual router address in a VRRP IPv6 group.

|                                 |                                                                                                                                                                                                                            |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Options</b>                  | <b>addresses</b> —Addresses of one or more virtual routers. Do not include a prefix length. If the address is the same as the interface's physical address, the interface becomes the master virtual router for the group. |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                    |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.0 for EX Series switches.                                                                                                                                                                                                                                                 |
| <b>Description</b>              | Configure a virtual link local address for a Virtual Router Redundancy Protocol (VRRP) IPv6 group. You must explicitly define a virtual link local address for each VRRP IPv6 group. The virtual link local address must be in the same subnet as the physical interface address.                                     |
| <b>Options</b>                  | <i>ipv6-address</i> —Virtual link local IPv6 address for VRRP for an IPv6 group.                                                                                                                                                                                                                                      |
| <b>Required Privilege Level</b> | <code>interface</code> —To view this statement in the configuration.<br><code>interface-control</code> —To add this statement to the configuration.                                                                                                                                                                   |

## Verification Tasks

---

- [Verifying Power Configuration and Use on page 2545](#)

### Verifying Power Configuration and Use

**Purpose** Verify on an EX Series switch:

- The power redundancy and line card priority settings
- The PoE power budgets for line cards that support PoE
- Whether the  $N+1$  or  $N+N$  power requirements are being met
- Whether the switch has sufficient power for a new line card or an  $N+N$  configuration

**Action** Enter the following command:

```
user@switch> show chassis power-budget-statistics
```

Example output for an EX6200 switch:

```

PSU 0      (EX6200-PWR-AC2500)      :   2500 W   Online
PSU 1      (EX6200-PWR-AC2500)      :   2500 W   Online
PSU 2      (EX6200-PWR-AC2500)      :   2500 W   Online
PSU 3      (EX6200-PWR-AC2500)      :   2500 W   Online
Total Power supplied by all Online PSUs : 10000 W
Power Redundancy Configuration         :   N+1
Power Reserved for the Chassis         :    500 W

Fan Tray Statistics
FTC 0      Base power   Power Used
          :    300 W    43.04 W

FPC Statistics
          Base power   Power Used   PoE power   Priority
FPC 1    (EX6200-48P)   :    220 W    49.47 W    1440 W     1
FPC 2    (EX6200-48P)   :    220 W    47.20 W     800 W     2
FPC 3    (EX6200-48P)   :    220 W   1493.57 W    1440 W     0
FPC 4    (EX6200-SRE64-4XS) :    100 W    51.38 W     0 W       0
FPC 5    (EX6200-SRE64-4XS) :    100 W    50.28 W     0 W       0
FPC 6    (EX6200-48P)   :    220 W    49.38 W     800 W     6
FPC 8    (EX6200-48P)   :    220 W    61.41 W    1440 W     9

```

```

FPC 9 (EX6200-48T) : 150 W 12.49 W 0 W 9

Total (non-PoE) Power allocated : 1750 W
Total Power allocated for PoE : 5920 W
Power Available (Redundant case) : 5750 W
Total Power Available : 2515 W

```

Example output for an EX8200 switch:

```

PSU 0 (EX8200-AC2K) : 1200 W Online
PSU 1 (EX8200-AC2K) : 1200 W Online
PSU 2 (EX8200-AC2K) : 1200 W Online
PSU 3 (EX8200-AC2K) : 1200 W Online
Total Power supplied by all Online PSUs : 4800 W
Power Redundancy Configuration : N+1
Power Reserved for the Chassis : 1600 W

FPC Statistics Base power PoE power Priority
FPC 0 (EX8200-48T) : 350 W 0 W 2
FPC 1 (EX8200-2XS-40P) : 387 W 300 W 0
FPC 2 (EX8200-48PL) : 267 W 350 W 15
FPC 4 (EX8200-2XS-40P) : 387 W 300 W 1
FPC 5 (EX8200-48TL) : 230 W 0 W 15
FPC 6 (EX8200-48TL) : 230 W 0 W 15

Total (non-PoE) Power allocated : 3451 W
Total Power allocated for PoE : 950 W
Power Available (Redundant case) : 149 W
Total Power Available : 510 W

```

- Meaning**
- Example output for an EX6200 switch —The online power supplies can supply a total of 10,000 W to the switch. The switch is configured for *N+1* redundancy, which means 7500 W of redundant power can be supplied. The **Power Available (Redundant case)** field shows that the switch is meeting the *N+1* power requirements, with an additional 5750 W available. This value is calculated by subtracting all power allocations except PoE power allocations from redundant power (7500 W).

The total amount of power available on the switch is 2515 W. This value is calculated by subtracting all power allocations, including PoE power allocations, from the total power (10,000 W). On a switch with PoE line cards, if **Total Power Available** is 0, some or all of the PoE line cards might not be allocated their configured PoE power budgets, which means power to some or all PoE ports might be disabled.

The power priority order of the line cards, from highest priority line card to the lowest priority line card, is 4, 5, 3, 1, 2, 6, 8, 9. Slots 4 and 5, which contain the Switch Fabric and Routing Engine (SRE) modules, always have highest priority, even if a lower-numbered slot, such as slot 3 in this example, has a priority of 0. Should two or more 2500 W power supplies fail, power management will remove or reduce the PoE power allocations from the PoE line cards in the following order to balance the power budget: 8, 6, 2, 1, and 3.

The **Power Used** values for the fan tray and line cards shows the actual power being consumed for these components at the time the command was executed. These values are for your information only; power management uses allocated power, which is based on the maximum power the component might consume, and not actual power consumed, in determining its power budget.

- Example output for an EX8200 switch—The online power supplies can supply a total of 4800 W to the switch. The switch is configured for  $N+1$  redundancy, which means 3600 W of redundant power can be supplied. The **Power Available (Redundant case)** field shows that the switch is meeting the  $N+1$  power requirements, with an additional 149 W available. This value is calculated by subtracting all power allocations except PoE power allocations from redundant power (3600 W). Because 149 W is insufficient power for a line card, another line card cannot be added to the switch while maintaining  $N+1$  redundancy.

The total amount of power available on the switch is 510 W. This value is calculated by subtracting all power allocations, including PoE power allocations, from the total power (4800 W). On a switch with PoE line cards, if **Total Power Available** is 0, some or all of the PoE line cards might not be allocated their configured PoE power budgets, which means power to some or all PoE ports might be disabled.

The power priority order of the line cards, from highest priority line card to the lowest priority line card, is 1, 4, 0, 2, 5, 6. Should one or more 1200 W power supplies fail, power management will remove or reduce the PoE power allocations from the PoE line cards in the following order to balance the power budget: 2, 4, and 1.

| <b>Release Information</b> | Command introduced in Junos OS Release 10.4 for EX Series switches.<br>Option <b>set [<i>package-name</i> <i>package-name</i>]</b> added in Junos OS Release 12.1 for EX Series switches.<br>Command introduced in Junos OS Release 13.2X50-D20 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>         | <p>Perform a nonstop software upgrade (NSSU) on a switch with redundant Routing Engines or on a Virtual Chassis. The behavior of this command depends on which switch or Virtual Chassis it is executed on:</p> <ul style="list-style-type: none"><li>• When you execute this command on an EX3300, EX4200, EX4300, EX4500, or EX4550 Virtual Chassis or QFX3500 and QFX3600 Virtual Chassis, a fixed configuration of switches in a Virtual Chassis Fabric (QFX3500/QFX3600 and QFX5100 switches) or for a mixed Virtual Chassis Fabric composed of any combination of QFX3500/QFX3600, QFX5100, and EX4300 switches, or a mixed Virtual Chassis composed of any combination of EX4200, EX4500, and EX4550 switches, all members are upgraded. The original Virtual Chassis backup becomes the master. The original master is automatically upgraded and rebooted and rejoins the Virtual Chassis as the backup after the upgrade completes.</li><li>• When you execute this command on an EX6200 or EX8200 switch, both the backup and master Routing Engines are upgraded, with the original backup Routing Engine becoming the new master at the end of the upgrade.<br/><br/>The original master Routing Engine is automatically rebooted on an EX6200 switch.<br/><br/>The original master Routing Engine is not automatically rebooted on an EX8200 switch unless you specify the <b>reboot</b> option.</li><li>• When you execute this command on an EX8200 Virtual Chassis, all master and backup Routing Engines are upgraded in the Virtual Chassis, including the external Routing Engines. The original backup Routing Engines become the new master Routing Engines. The original master Routing Engines are not automatically rebooted, unless you specify the <b>reboot</b> option.</li></ul> <p>This command has the following requirements:</p> <ul style="list-style-type: none"><li>• All Virtual Chassis members and all Routing Engines must be running the same Junos OS release.</li><li>• Graceful Routing Engine switchover (GRES) must be enabled.</li><li>• Nonstop active routing (NSR) must be enabled.</li></ul> |

**NOTE:** Although nonstop bridging (NSB) does not have to be enabled for you to use this command, we recommend that you enable NSB. Enabling NSB ensures that all NSB-supported Layer 2 protocols operate seamlessly during the Routing Engine switchover that is part of the NSSU. See *Configuring Nonstop Bridging on EX Series Switches (CLI Procedure)*.

- The command must be executed from the master Routing Engine on a standalone switch or from the master on a Virtual Chassis.
- For minimal traffic disruption, you must define link aggregation groups (LAGs) such that the member links reside on different Virtual Chassis members (for EX3300, EX4200, EX4300, EX4500, EX4550, QFX3500 and QFX3600 Virtual Chassis, and mixed Virtual Chassis, and Virtual Chassis Fabric) or on different line cards (for EX6200 and EX8200 switches, and for EX8200 Virtual Chassis).
- For EX3300, EX4200, EX4300, EX4500, EX4550, QFX3500 and QFX3600 Virtual Chassis, and mixed Virtual Chassis:
  - The Virtual Chassis members must be connected in a ring topology. A ring topology prevents the Virtual Chassis from splitting during an NSSU.
  - The Virtual Chassis master and backup must be adjacent to each other in the ring topology. Adjacency permits the master and backup to always be in sync, even when the switches in linecard roles are rebooting.
  - The Virtual Chassis must be preprovisioned so that the linecard role has been explicitly assigned to member switches acting in a linecard role. During an NSSU, the Virtual Chassis members must maintain their roles—the master and backup must maintain their Routing Engine roles (although mastership will change), and the remaining switches must maintain their linecard roles.
  - A two-member Virtual Chassis must have **no-split-detection** configured so that the Virtual Chassis does not split when an NSSU upgrades a member.
- For Virtual Chassis Fabric:
  - Only two pre-provisioned members in the routing engine role are supported. If more than two routing engines are configured, a warning will be issued, and NSSU will stop.
  - The Virtual Chassis Fabric members are connected in a spine and leaf topology. A spine and leaf topology prevents the Virtual Chassis Fabric from splitting during an NSSU. Each leaf device must be connected to both spine devices.
  - The Virtual Chassis Fabric must be preprovisioned so that the line card role has been explicitly assigned to member switches acting in a line card role, and that the routing engine role has been explicitly assigned to member switches acting in a routing engine role. During an NSSU, the Virtual Chassis Fabric members must maintain their roles—the master and backup must maintain their master and backup roles (although

mastership will change), the member switches must remain their routing engine roles, and the remaining switches must maintain their linecard roles.

- A two-member Virtual Chassis Fabric must have **no-split-detection** configured so that the Virtual Chassis Fabric does not split when an NSSU upgrades a member.

**Options** *package-name*—Location from which the software package or bundle is to be installed. For example:

- */var/tmp/package-name*—For a software package or bundle that is being installed from a local directory on the switch.
- *protocol://hostname/pathname/package-name*—For a software package or bundle that is to be downloaded and installed from a remote location. Replace **protocol** with one of the following:
  - **ftp**—File Transfer Protocol.  
Use *ftp://hostname/pathname/package-name*. To specify authentication credentials, use *ftp://<username>:<password>@hostname/pathname/package-name*. To have the system prompt you for the password, specify **prompt** in place of the password. If a password is required, and you do not specify the password or **prompt**, an error message is displayed.
  - **http**—Hypertext Transfer Protocol.  
Use *http://hostname/pathname/package-name*. To specify authentication credentials, use *http://<username>:<password>@hostname/pathname/package-name*. If a password is required and you omit it, you are prompted for it.
  - **scp**—Secure copy (available only for Canada and U.S. version).  
Use *scp://hostname/pathname/package-name*. To specify authentication credentials, use *scp://<username>:<password>@hostname/pathname/package-name*.

**NOTE:** The *pathname* in the protocol is the relative path to the user home directory on the remote system and not the root directory.

---

**set** [*package-name package-name*]—(Mixed Virtual Chassis only) Locations of the EX4200 and the EX4500 installation packages. These packages must be for the same Junos OS release. See the description of the *package-name* option for information about how to specify the location of the installation packages.

**no-copy**—(Optional) Install a software package or bundle, but do not save copies of package or bundle files.

**no-old-master-upgrade**—(Optional) (EX8200 switches only) Upgrade the backup Routing Engine only. After the upgrade completes, the original master Routing Engine becomes the backup Routing Engine and continues running the previous software version.

**reboot**—(Optional) (EX8200 switches and EX8200 Virtual Chassis only) When the **reboot** option is included, the original master (new backup) Routing Engines are automatically rebooted after being upgraded to the new software. When the **reboot** option is not included, you must manually reboot the original master (new backup) Routing Engines using the [request system reboot](#) command.

**NOTE:** If you do not use the **reboot** option on an EX8200 Virtual Chassis, you must establish a connection to the console port on the Switch Fabric and Routing Engine (SRE) module or Routing Engine (RE) module to perform the manual reboot of the backup Routing Engines.

**unlink**—(Optional) Remove the software package after a successful upgrade is completed.

**Required Privilege Level** maintenance

| Fan Tray Statistics               | <p>(EX6200 switch only) Information about the fan tray:</p> <ul style="list-style-type: none"> <li>• <b>Base power</b>—Power allocated to the fan tray in the power budget. This allocation is included in <b>Power Reserved for the Chassis</b>.</li> <li>• <b>Power Used</b>—Actual power being used by the fan tray. This value is for informational purposes only: the power budget for the switch is based on allocated power (the theoretical maximum the fan tray might use) rather than used power.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| FPC <i>n</i> ( <i>card type</i> ) | <p>Information about the line card installed in slot <i>n</i>. For EX6200 switches, information about the SRE modules in slot 4 and slot 5 is also shown.</p> <ul style="list-style-type: none"> <li>• <b>Base power</b>—For line cards without PoE ports, the total power allocated to the line card.<br/>For line cards with PoE ports, the power allocated to the line card before the PoE power budget is allocated. The base power includes 37 W of PoE power that is always allocated to line cards that support PoE.</li> <li>• <b>Power Used</b>—(EX6200 switch only) The actual power being consumed by the line card or SRE module, including PoE power. This value is for informational purposes only: the power budget for the switch is based on allocated power (the theoretical maximum the line card might use) rather than used power.</li> <li>• <b>PoE power</b>—For line cards with PoE ports, the PoE power budget allocated to the line card. This value includes the 37 W of PoE power that is always part of the base power allocation for line cards that support PoE.<br/>For line cards without PoE ports, the value is always 0 W.</li> <li>• The power priority assigned to the line card slot.</li> </ul> |
| Total (non-PoE) Power allocated   | Power budgeted for all the components in the switch, excluding the PoE power budget allocated to line cards. This value is equal to the power reserved for the chassis plus the base power allocations of all online line cards.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Total Power allocated for PoE     | The total of the PoE power budgets allocated to the line cards in the switch. This figure includes the 37 W of PoE power always included in the base allocation for each line card that supports PoE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Total PoE power consumed          | The amount of power that has been consumed by PoE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Total PoE power remaining         | The amount of available power remaining that can be used for PoE.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Power Available (Redundant case)  | Unused power available to the switch in the power budget, not including the power reserved for redundancy. If power is insufficient to meet the <i>N</i> +1 or <i>N</i> + <i>N</i> redundancy requirements, this value is 0. PoE power allocations are not included in the calculation of this value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Field Name                   | Field Description                                                                                                                                                                                                                                               |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Total Power Available</b> | Unused power available to the switch in the power budget. This value is derived by subtracting all power allocations, including PoE power allocations, from the total power available on the switch (the <b>Total Power supplied by all Online PSUs</b> value). |

Table 257: show vrrp Output Fields (*continued*)

| Field Name                  | Field Description                                                                                                                                                                                                                                                                                              | Level of Output   |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| Master router               | IP address of the interface that is acting as the master. If the VRRP interface is down, the output is <b>N/A</b> .                                                                                                                                                                                            | detail, extensive |
| Virtual router uptime       | Time that the virtual router has been up.                                                                                                                                                                                                                                                                      | detail, extensive |
| Master router uptime        | Time that the master router has been up.                                                                                                                                                                                                                                                                       | detail, extensive |
| Virtual MAC                 | MAC address associated with the virtual IP address.                                                                                                                                                                                                                                                            | detail, extensive |
| Tracking                    | Whether tracking is <b>enabled</b> or <b>disabled</b> .                                                                                                                                                                                                                                                        | detail, extensive |
| Current priority            | Current operational priority for being the VRRP master.                                                                                                                                                                                                                                                        | detail, extensive |
| Configured priority         | Configured base priority for being the VRRP master.                                                                                                                                                                                                                                                            | detail, extensive |
| Priority hold-time          | Minimum time interval, in seconds, between successive changes to the current priority. <b>Disabled</b> indicates no minimum interval.                                                                                                                                                                          | detail, extensive |
| Remaining-time              | ( <b>track</b> option only) Displays the time remaining in the priority hold-time interval.                                                                                                                                                                                                                    | detail            |
| Interface tracking          | Whether interface tracking is enabled or disabled. When enabled, the output also displays the number of tracked interfaces.                                                                                                                                                                                    | detail extensive  |
| Interface/Tracked interface | Name of the tracked interface.                                                                                                                                                                                                                                                                                 | detail extensive  |
| Int state/Interface state   | Current operational state of the tracked interface: <b>up</b> or <b>down</b> .                                                                                                                                                                                                                                 | detail, extensive |
| Int speed/Speed             | Current operational speed, in bits per second, of the tracked interface.                                                                                                                                                                                                                                       | detail, extensive |
| Incurred priority cost      | Operational priority cost incurred due to the state and speed of this tracked interface. This cost is applied to the configured priority to obtain the current priority.                                                                                                                                       | detail, extensive |
| Threshold                   | Speed below which the corresponding priority cost is incurred. In other words, when the speed of the interface drops below the threshold speed, the corresponding priority cost is incurred.<br><br>An entry of <b>down</b> means that the corresponding priority cost is incurred when the interface is down. | detail, extensive |
| Route tracking              | Whether route tracking is enabled or disabled. When enabled, the output also displays the number of tracked routes.                                                                                                                                                                                            | detail, extensive |
| Route count                 | The number of routes being tracked.                                                                                                                                                                                                                                                                            | detail, extensive |

Table 257: show vrrp Output Fields (*continued*)

| Field Name                               | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Level of Output          |

# Troubleshooting Procedures

- [Tracing Nonstop Active Routing Synchronization Events on page 2573](#)

## Tracing Nonstop Active Routing Synchronization Events

---

To track the progress of nonstop active routing synchronization between Routing Engines, you can configure nonstop active routing trace options flags for each supported protocol and for BFD sessions and record these operations to a log file.

To configure nonstop active routing trace options for supported routing protocols, include the **nsr-synchronization** statement at the **[edit protocols protocol-name traceoptions flag]** hierarchy level and optionally specify one or more of the **detail**, **disable**, **receive**, and **send** options:

```
[edit protocols]
bgp {
  traceoptions {
    flag nsr-synchronization <detail> <disable> <receive> <send>;
  }
}
isis {
  traceoptions {
    flag nsr-synchronization <detail> <disable> <receive> <send>;
  }
}
ldp {
  traceoptions {
    flag nsr-synchronization <detail> <disable> <receive> <send>;
  }
}
mpls {
  traceoptions {
    flag nsr-synchronization;
    flag nsr-synchronization-detail;
  }
}
msdp {
  traceoptions {
    flag nsr-synchronization <detail> <disable> <receive> <send>;
  }
}
(ospf | ospf3) {
```

```
traceoptions {  
    flag nsr-synchronization <detail> <disable> <receive> <send>;  
}  
}  
rip {  
    traceoptions {  
        flag nsr-synchronization <detail> <disable> <receive> <send>;  
    }  
}  
ripng {  
    traceoptions {  
        flag nsr-synchronization <detail> <disable> <receive> <send>;  
    }  
}  
pim {  
    traceoptions {  
        flag nsr-synchronization <detail> <disable> <receive> <send>;  
    }  
}
```

To configure nonstop active routing trace options for BFD sessions, include the **nsr-synchronization** and **nsr-packet** statements at the **[edit protocols bfd traceoptions flag]** hierarchy level.

```
[edit protocols]  
bfd {  
    traceoptions {  
        flag nsr-synchronization;  
        flag nsr-packet;  
    }  
}
```

To trace the Layer 2 VPN signaling state replicated from routes advertised by BGP, include the **nsr-synchronization** statement at the **[edit routing-options traceoptions flag]** hierarchy level. This flag also traces the label and logical interface association that VPLS receives from the kernel replication state.

```
[edit routing-options]  
traceoptions {  
    flag nsr-synchronization;  
}
```

## EX Series Switches Interfaces Overview

Juniper Networks EX Series Ethernet Switches have two types of interfaces: network interfaces and special interfaces. This topic provides brief information about these interfaces. For additional information, see the *[Junos OS Interfaces Fundamentals Configuration Guide](#)*.

For information about interface-naming conventions on EX Series switches, see “[Understanding Interface Naming Conventions on EX Series Switches](#)” on page 2580.

This topic describes:

- [Network Interfaces on page 2578](#)
- [Special Interfaces on page 2578](#)

## Network Interfaces

Network interfaces connect to the network and carry network traffic. [Table 258 on page 2578](#) lists the types of network interfaces supported on EX Series switches.

**Table 258: Network Interface Types and Purposes**

| Type                                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                          |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Aggregated Ethernet interfaces       | All EX Series switches allow you to group Ethernet interfaces at the physical layer to form a single link layer interface, also known as a <i>link aggregation group (LAG)</i> or <i>bundle</i> . These aggregated Ethernet interfaces help to balance traffic and increase the uplink bandwidth.                                                                                                |
| LAN access interfaces                | Use these EX Series switch interfaces to connect a personal computer, laptop, file server, or printer to the network. When you power on an EX Series switch and use the factory-default configuration, the software automatically configures interfaces in access mode for each of the network ports. The default configuration also enables autonegotiation for both speed and link mode.       |
| Power over Ethernet (PoE) interfaces | EX Series switches provide PoE network ports with various switch models. These ports can be used to connect voice over IP (VoIP) telephones, wireless access points, video cameras, and point-of-sale devices to safely receive power from the same access ports that are used to connect personal computers to the network. PoE interfaces are enabled by default in the factory configuration. |
| Trunk interfaces                     | EX Series access switches can be connected to a distribution switch or customer-edge (CE) switches or routers. To use a port for this type of connection, you must explicitly configure the network interface for trunk mode. The interfaces from the distribution switch or CE switch to the access switches must also be configured for trunk mode.                                            |

## Special Interfaces

[Table 259 on page 2578](#) lists the types of special interfaces supported on EX Series switches.

**Table 259: Special Interface Types and Purposes**

| Type                 | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Console port         | Each EX Series switch has a serial port, labeled <b>CON</b> or <b>CONSOLE</b> , for connecting tty-type terminals to the switch using standard PC-type tty cables. The console port does not have a physical address or IP address associated with it. However, it is an interface in the sense that it provides access to the switch. On an EX3300 Virtual Chassis, an EX4200 Virtual Chassis, or an EX4500 Virtual Chassis, you can access the master and configure all members of the Virtual Chassis through any member's console port. For more information about the console port in a Virtual Chassis, see <a href="#">"Understanding Global Management of a Virtual Chassis" on page 5080</a> . |
| Loopback             | All EX Series switches have this software-only virtual interface that is always up. The loopback interface provides a stable and consistent interface and IP address on the switch.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Management interface | The Juniper Networks Junos operating system (Junos OS) for EX Series switches automatically creates the switch's management Ethernet interface, <b>me0</b> . The management Ethernet interface provides an out-of-band method for connecting to the switch. To use <b>me0</b> as a management port, you must configure its logical port, <b>me0.0</b> , with a valid IP address. You can connect to the management interface over the network using utilities such as SSH or Telnet. SNMP can use the management interface to gather statistics from the switch. (The management interface <b>me0</b> is analogous to the <b>fxp0</b> interfaces on routers running Junos OS.)                          |

Table 259: Special Interface Types and Purposes (*continued*)

| Type                                                                           | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|--------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Integrated Routing and Bridging (IRB) Interface or Routed VLAN Interface (RVI) | <p>EX Series switches use an integrated routing and bridging (IRB) interface or Routed VLAN Interface (RVI) to route traffic from one broadcast domain to another and to perform other Layer 3 functions such as traffic engineering. These functions are typically performed by a router interface in a traditional network.</p> <p>The IRB interface or RVI functions as a logical router, eliminating the need for having both a switch and a router. These interfaces must be configured as part of a broadcast domain or virtual private LAN service (VPLS) routing instance for Layer 3 traffic to be routed from.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Virtual Chassis port (VCP) interfaces                                          | <p>Virtual Chassis ports (VCPs) are used to interconnect switches in a Virtual Chassis:</p> <ul style="list-style-type: none"> <li>EX3300 switches—Port 2 and port 3 of the SFP+ uplink ports are preconfigured as VCPs and can be used to interconnect up to six EX3300 switches in an EX3300 Virtual Chassis. See <a href="#">“Setting an Uplink Port on an EX Series Switch as a Virtual Chassis Port (CLI Procedure)”</a> on page 5109.</li> <li>EX4200 and EX4500 switches—Each EX4200 switch or each EX4500 switch with a Virtual Chassis module installed has two dedicated VCPs on its rear panel. These ports can be used to interconnect up to ten EX4200 switches in an EX4200 Virtual Chassis, up to ten EX4500 switches in an EX4500 Virtual Chassis, and up to ten switches in a mixed EX4200 and EX4500 Virtual Chassis. When you power on switches that are interconnected in this manner, the software automatically configures the VCP interfaces for the dedicated ports that have been interconnected. These VCP interfaces are not configurable or modifiable. See <i>Understanding the High-Speed Interconnection of the Dedicated Virtual Chassis Ports Connecting EX4200, EX4500, and EX4550 Member Switches</i>.</li> </ul> <p>You can also interconnect EX4200 and EX4500 switches by using uplink module ports. Using uplink ports allows you to connect switches over longer distances than you can by using the dedicated VCPs. To use the uplink ports as VCPs, you must explicitly configure the uplink module ports on the members you want to connect as VCPs. See <a href="#">“Setting an Uplink Port on an EX Series Switch as a Virtual Chassis Port (CLI Procedure)”</a> on page 5109 or <a href="#">Setting an Uplink Port as a Virtual Chassis Port on an EX4500 or EX4550 Switch (CLI Procedure)</a>.</p> <ul style="list-style-type: none"> <li>EX4300 switches—All QSFP+ ports are configured as VCPs, by default. See <a href="#">“Understanding EX4300 Virtual Chassis”</a> on page 5065.</li> </ul> <p>You can also interconnect EX4300 switches into a Virtual Chassis by using SFP+ uplink module ports as VCPs. Using uplink ports as VCPs allows you to connect switches over longer distances than you can by using the QSFP+ ports as VCPs. To use the uplink ports as VCPs, you must explicitly configure the uplink module ports on the members you want to connect as VCPs. See <a href="#">“Setting an Uplink Port on an EX Series Switch as a Virtual Chassis Port (CLI Procedure)”</a> on page 5109.</p> <ul style="list-style-type: none"> <li>EX8200 switches—EX8200 switches can be connected to an XRE200 External Routing Engine to create an EX8200 Virtual Chassis. The XRE200 External Routing Engine has dedicated VCPs that connect to ports on the internal Routing Engines of the EX8200 switches and can connect to another XRE200 External Routing Engine for redundancy. These ports require no configuration.</li> </ul> <p>You can also connect two members of an EX8200 Virtual Chassis so that they can exchange Virtual Chassis Control Protocol (VCCP) traffic. To do so, you explicitly configure network ports on the EX8200 switches as VCPs. See <i>Understanding Virtual Chassis Ports in an EX8200 Virtual Chassis</i>.</p> |
| Virtual management Ethernet (VME) interface                                    | <p>EX3300, EX4200, EX4300, and EX4500 switches have a VME interface. This is a logical interface that is used for Virtual Chassis configurations and allows you to manage all the members of the Virtual Chassis through the master. For more information about the VME interface, see <a href="#">“Understanding Global Management of a Virtual Chassis”</a> on page 5080.</p> <p>EX8200 switches do not use a VME interface. An EX8200 Virtual Chassis is managed through the management Ethernet (<b>me0</b>) interface on the XRE200 External Routing Engine.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## Understanding Interface Naming Conventions on EX Series Switches

Juniper Networks EX Series Ethernet Switches use a naming convention for defining the interfaces that is similar to that of other platforms running under Juniper Networks Junos operating system (Junos OS). This topic provides brief information about the naming conventions used for interfaces on EX Series switches. For additional information, see the [Junos OS Network Interfaces Configuration Guide](#).

This topic describes:

- [Physical Part of an Interface Name on page 2580](#)
- [Logical Part of an Interface Name on page 2582](#)
- [Wildcard Characters in Interface Names on page 2582](#)

### Physical Part of an Interface Name

Network interfaces in Junos OS are specified as follows:

*type-fpc / pic / port*

EX Series switches apply this convention as follows:

- *type*—EX Series interfaces use the following media types:
  - **ge**—Gigabit Ethernet interface
  - **xe**—10 Gigabit Ethernet interface
  - **et**—40 Gigabit Ethernet interface
- *fpc*—Flexible PIC Concentrator. EX Series interfaces use the following convention for the FPC number in interface names:

- On an EX2200 switch, an EX3200 switch, a standalone EX3300 switch, a standalone EX4200 switch, a standalone EX4300 switch, a standalone EX4500, and a standalone EX4550 switch, FPC refers to the switch itself. The FPC number is **0** by default on these switches.
- On an EX3300 Virtual Chassis, an EX4200 Virtual Chassis, an EX4300 Virtual Chassis, an EX4500 Virtual Chassis, an EX4550 Virtual Chassis, or a mixed Virtual Chassis, the FPC number indicates the member ID of the switch in the Virtual Chassis.
- On an EX6200 switch and a standalone EX8200 switch, the FPC number indicates the slot number of the line card that contains the physical interface. On an EX6200 switch, the FPC number also indicates the slot number of the Switch Fabric and Routing Engine (SRE) module that contains the uplink port.
- On an EX8200 Virtual Chassis, the FPC number indicates the slot number of the line card on the Virtual Chassis. The line card slots on Virtual Chassis member 0 are numbered 0 through 15; on member 1, they are numbered 16 through 31, and so on.
- *pic*—EX Series interfaces use the following convention for the PIC (Physical Interface Card) number in interface names:
  - On EX2200, EX3200, EX3300, EX4200, EX4500 switch, and EX4550 switches, the PIC number is **0** for all built-in interfaces (interfaces that are not uplink ports).
  - On EX2200, EX3200, EX3300, and EX4200 switches, the PIC number is **1** for uplink ports.
  - On EX4300 switches, the PIC number is **0** for built-in network ports, **1** for built-in QSFP+ ports (located on the rear panel of the switch), and **2** for uplink module ports.
  - On EX4500 switches, the PIC number is **1** for ports on the left-hand uplink module and **2** for ports on the right-hand uplink module.
  - On EX4550 switches, the PIC number is **1** for ports in the expansion module or Virtual Chassis module installed in the module slot on the front panel of the switch and **2** for those in the expansion module or Virtual Chassis module installed in the module slot on the rear panel of the switch.
  - On EX6200 and EX8200 switches, the PIC number is always **0**.
- *port*—EX Series interfaces use the following convention for port numbers:
  - On EX2200, EX3200, EX3300, EX4200, EX4300, EX4500, and EX4550 switches, built-in network ports are numbered from left to right. On models that have two rows of ports, the ports on the top row start with **0** followed by the remaining even-numbered ports, and the ports on the bottom row start with **1** followed by the remaining odd-numbered ports.
  - Uplink ports in EX2200, EX3200, EX3300, EX4200, EX4300, EX4500, and EX4550 switches are labeled from left to right, starting with **0**.
  - On EX6200 and EX8200 switches, the network ports are numbered from left to right on each line card. On line cards that have two rows of ports, the ports on the top row

start with **0** followed by the remaining even-numbered ports, and the ports on the bottom row start with **1** followed by the remaining odd-numbered ports.

- Uplink ports on an SRE module in an EX6200 switch are labeled from left to right, starting with **0**.

---

### Logical Part of an Interface Name

The logical unit part of the interface name corresponds to the logical unit number, which can be a number from 0 through 16384. In the virtual part of the name, a period (.) separates the port and logical unit numbers: *type-fpc/pic/port.logical-unit-number*. For example, if you issue the **show ethernet-switching interfaces** command on a system with a default VLAN, the resulting display shows the logical interfaces associated with the VLAN:

| Interface   | State | VLAN members    | Blocking  |
|-------------|-------|-----------------|-----------|
| ge-0/0/0.0  | down  | remote-analyzer | unblocked |
| ge-0/0/1.0  | down  | default         | unblocked |
| ge-0/0/10.0 | down  | default         | unblocked |

### Wildcard Characters in Interface Names

In the **show interfaces** and **clear interfaces** commands, you can use wildcard characters in the *interface-name* option to specify groups of interface names without having to type each name individually. You must enclose all wildcard characters except the asterisk (\*) in quotation marks (" ").

## Understanding Aggregated Ethernet Interfaces and LACP

IEEE 802.3ad link aggregation enables you to group Ethernet interfaces to form a single link layer interface, also known as a *link aggregation group (LAG)* or *bundle*.

Aggregating multiple links between physical interfaces creates a single logical point-to-point trunk link or a LAG. The LAG balances traffic across the member links within an aggregated Ethernet bundle and effectively increases the uplink bandwidth. Another advantage of link aggregation is increased availability, because the LAG is composed of multiple member links. If one member link fails, the LAG continues to carry traffic over the remaining links.

Link Aggregation Control Protocol (LACP), a component of IEEE 802.3ad, provides additional functionality for LAGs.

This topic describes:

- [Link Aggregation Group \(LAG\) on page 2583](#)
- [Link Aggregation Control Protocol \(LACP\) on page 2584](#)

### Link Aggregation Group (LAG)

You configure a LAG by specifying the link number as a physical device and then associating a set of interfaces (ports) with the link. All the interfaces must have the same speed and be in full-duplex mode. Juniper Networks Junos operating system (Junos OS) for EX Series Ethernet Switches assigns a unique ID and port priority to each interface. The ID and priority are not configurable.

The number of interfaces that can be grouped into a LAG and the total number of LAGs supported on a switch varies according to switch model. [Table 260 on page 2583](#) lists the EX Series switches and the maximum number of interfaces per LAG and the maximum number of LAGs they support. MX Series devices can support up to 64 LAGs.

**Table 260: Maximum Interfaces per LAG and Maximum LAGs per Switch**

| Switch                                                             | Maximum Interfaces per LAG | Maximum LAGs |
|--------------------------------------------------------------------|----------------------------|--------------|
| EX2200                                                             | 8                          | 32           |
| EX3200                                                             | 8                          | 32           |
| EX3300 and EX3300 Virtual Chassis                                  | 8                          | 111          |
| EX4200 and EX4200 Virtual Chassis                                  | 8                          | 111          |
| EX4300 and EX4300 Virtual Chassis                                  | 16                         | 112          |
| EX4500, EX4500 Virtual Chassis, EX4550, and EX4550 Virtual Chassis | 8                          | 111          |
| EX6200                                                             | 8                          | 111          |
| EX8200                                                             | 12                         | 255          |
| EX8200 Virtual Chassis                                             | 12                         | 239          |

When configuring LAGs, consider the following guidelines:

- You must configure the LAG on both sides of the link.
- You must set the interfaces on either side of the link to the same speed.
- You can configure and apply firewall filters on a LAG.
- You can optionally configure LACP for link negotiation.
- You can optionally configure LACP for link protection.

You can combine physical Ethernet ports belonging to different member switches of a Virtual Chassis configuration to form a LAG. See [“Understanding EX Series Virtual Chassis Port Link Aggregation” on page 5083](#) and [Understanding Link Aggregation in an EX8200 Virtual Chassis](#).

**NOTE:** The interfaces that are included within a LAG are sometimes referred to as *member interfaces*. Do not confuse this term with *member switches*, which refers to switches that are interconnected as a Virtual Chassis. It is possible to create a LAG that is composed of member interfaces that are located in different member switches of a Virtual Chassis.

A LAG hashing algorithm determines how traffic entering a LAG is placed onto the bundle's member links. The LAG hashing algorithm tries to manage bandwidth by evenly load-balancing all incoming traffic across the member links in the bundle. You can configure the fields used by the LAG hashing algorithm on some EX series switches. See [“Configuring the Fields in the Algorithm Used To Hash LAG Bundle and ECMP Traffic \(CLI Procedure\)” on page 2686](#).

A LAG creates a single logical point-to-point connection. A typical deployment for a LAG would be to aggregate trunk links between an access switch and a distribution switch or customer edge (CE) router.

### Link Aggregation Control Protocol (LACP)

---

When LACP is configured, it detects misconfigurations on the local end or the remote end of the link. Thus, LACP can help prevent communication failure:

- When LACP is not enabled, a local LAG might attempt to transmit packets to a remote single interface, which causes the communication to fail.
- When LACP is enabled, a local LAG cannot transmit packets unless a LAG with LACP is also configured on the remote end of the link.

By default, Ethernet links do not exchange LACP protocol data units (PDUs), which contain information about the state of the link. You can configure Ethernet links to actively transmit LACP PDUs, or you can configure the links to passively transmit them, sending out LACP PDUs only when the Ethernet link receives them from the remote end. The transmitting link is known as the *actor* and the receiving link is known as the *partner*.

In a scenario where a dual-homed server is deployed with a switch, the network interface cards form a LAG with the switch. During a server upgrade, the server might not be able to exchange LACP PDUs. In such a situation, you can configure an interface to be in the **up** state even if no PDUs are exchanged. Use the **force-up** statement to configure an interface when the peer has limited LACP capability. The interface selects the associated LAG by default, whether the switch and peer are both in active or passive mode. When PDUs are not received, the partner is considered to be working in the passive mode. Therefore, LACP PDU transmissions are controlled by the transmitting link.

If the remote end of the LAG link is a security device, LACP might not be supported because security devices require a deterministic configuration. In such a scenario, do not

configure LACP. All links in the LAG are permanently operational unless the switch detects a link failure within the Ethernet physical layer or data link layers.

## Understanding the Algorithm Used to Hash LAG Bundle and Egress Next-Hop ECMP Traffic

Juniper Networks EX Series and QFX Series use a hashing algorithm to determine how to forward traffic over a link aggregation group (LAG) bundle or to the next-hop device when equal-cost multipath (ECMP) is enabled.

The hashing algorithm makes hashing decisions based on values in various packet fields, as well as on some internal values like source port ID and source device ID. You can configure some of the fields that are used by the hashing algorithm.

This topic contains the following sections:

- [Understanding the Hashing Algorithm on page 2585](#)
- [IP \(IPv4 and IPv6\) on page 2586](#)
- [MPLS on page 2587](#)
- [MAC-in-MAC Packet Hashing on page 2588](#)
- [Layer 2 Header Hashing on page 2589](#)

### Understanding the Hashing Algorithm

The hashing algorithm is used to make traffic-forwarding decisions for traffic entering a LAG bundle or for traffic exiting a switch when ECMP is enabled.

For LAG bundles, the hashing algorithm determines how traffic entering a LAG bundle is placed onto the bundle's member links. The hashing algorithm tries to manage bandwidth by evenly load-balancing all incoming traffic across the member links in the bundle.

For ECMP, the hashing algorithm determines how incoming traffic is forwarded to the next-hop device.

The hashing algorithm makes hashing decisions based on values in various packet fields, as well as on some internal values like source port ID and source device ID. The packet fields used by the hashing algorithm varies by the packet's EtherType and, in some instances, by the configuration on the switch. The hashing algorithm recognizes the following EtherTypes:

- IP (IPv4 and IPv6)
- MPLS
- MAC-in-MAC

Traffic that is not recognized as belonging to any of these EtherTypes is hashed based on the Layer 2 header. IP and MPLS traffic are also hashed based on the Layer 2 header when a user configures the hash mode as Layer 2 header.

You can configure some fields that are used by the hashing algorithm to make traffic forwarding decisions. You cannot, however, configure how certain values within a header are used by the hashing algorithm.

Note the following points regarding the hashing algorithm:

- The fields selected for hashing are based on the packet type only. The fields are not based on any other parameters, including forwarding decision (bridged or routed) or egress LAG bundle configuration (Layer 2 or Layer 3).
- The same fields are used for hashing unicast and multicast packets. Unicast and multicast packets are, however, hashed differently.
- The same fields are used by the hashing algorithm to hash ECMP and LAG traffic, but the hashing algorithm hashes ECMP and LAG traffic differently. The different hashing ensures that traffic is not polarized when a LAG bundle is part of the ECMP next-hop path.
- The same fields are used for hashing regardless of whether the switch is or is not participating in a mixed or non-mixed Virtual Chassis or Virtual Chassis Fabric (VCF).

The fields used for hashing by each EtherType as well as the fields used by the Layer 2 header are discussed in the following sections.

### IP (IPv4 and IPv6)

---

Payload fields in IPv4 and IPv6 packets are used by the hashing algorithm when IPv4 or IPv6 packets need to be placed onto a member link in a LAG bundle or sent to the next-hop device when ECMP is enabled.

The hash mode is set to Layer 2 payload field, by default. IPv4 and IPv6 payload fields are used for hashing when the hash mode is set to Layer 2 payload.

If the hash mode is configured to Layer 2 header, IPv4, IPv6, and MPLS packets are hashed using the Layer 2 header fields. If you want incoming IPv4, IPv6, and MPLS packets hashed by the source MAC address, destination MAC address, or EtherType fields, you must set the hash mode to Layer 2 header.

[Table 261 on page 2587](#) displays the IPv4 and IPv6 payload fields that are used by the hashing algorithm, by default.

- ✓—Field is used by the hashing algorithm, by default.
- X—Field is not used by the hashing algorithm, by default.
- (configurable)—Field can be configured to be used or not used by the hashing algorithm.

Table 261: IPv4 and IPv6 Hashing Fields

| Fields                      | EX4300              |                     | QFX5100             |                     |
|-----------------------------|---------------------|---------------------|---------------------|---------------------|
|                             | LAG                 | ECMP                | LAG                 | ECMP                |
| Source MAC                  | X                   | X                   | X                   | X                   |
| Destination MAC             | X                   | X                   | X                   | X                   |
| EtherType                   | X                   | X                   | X                   | X                   |
| VLAN ID                     | X<br>(configurable) | X<br>(configurable) | X<br>(configurable) | X<br>(configurable) |
| Source IP or IPv6           | ✓<br>(configurable) | ✓<br>(configurable) | ✓<br>(configurable) | ✓<br>(configurable) |

| Protocol (IPv4 only)        | ✓<br>(configurable) | ✓<br>(configurable) | ✓<br>(configurable) | ✓<br>(configurable) |
| Next header (IPv6 only)     | ✓<br>(configurable) | ✓<br>(configurable) | ✓<br>(configurable) | ✓<br>(configurable) |
| Layer 4 Source Port         | ✓<br>(configurable) | ✓<br>(configurable) | ✓<br>(configurable) | ✓<br>(configurable) |
| Layer 4 Destination Port    | ✓<br>(configurable) | ✓<br>(configurable) | ✓<br>(configurable) | ✓<br>(configurable) |
| IPv6 Flow label (IPv6 only) | X                   | X                   | X                   | X                   |

## MPLS

The hashing algorithm hashes MPLS packets using the source IP, destination IP, MPLS label 0, MPLS label 1, and MPLS label 2 fields.

Table 262 on page 2588 displays the MPLS payload fields that are used by the hashing algorithm, by default:

- ✓—Field is used by the hashing algorithm, by default.
- X—Field is not used by the hashing algorithm, by default.

The fields used by the hashing algorithm for MPLS packet hashing are not user-configurable.

The source IP and destination IP fields are not always used for hashing. For non-terminated MPLS packets, the payload is checked if the bottom of stack (BoS) flag is seen in the packet. If the payload is IPv4 or IPv6, then the IP source address and IP destination address fields are used for hashing along with the MPLS labels. If the BoS flag is not seen in the packet, only the MPLS labels are used for hashing.

**Table 262: MPLS Hashing Fields**

| Field                          | EX4300 | QFX5100 |
|--------------------------------|--------|---------|
| Source MAC                     | X      | X       |
| Destination MAC                | X      | X       |
| EtherType                      | X      | X       |
| VLAN ID                        | X      | X       |
| Source IP                      | ✓      | ✓       |
| Destination IP                 | ✓      | ✓       |
| Protocol (for IPv4 packets)    | X      | X       |
| Next header (for IPv6 packets) | X      | X       |
| Layer 4 Source Port            | X      | X       |
| Layer 4 Destination Port       | X      | X       |
| IPv6 Flow lab                  | X      | X       |
| MPLS label 0                   | ✓      | ✓       |
| MPLS label 1                   | ✓      | ✓       |
| MPLS label 2                   | ✓      | ✓       |

### MAC-in-MAC Packet Hashing

Packets using the MAC-in-MAC EtherType are hashed by the hashing algorithm using the Layer 2 payload source MAC, Layer 2 payload destination MAC, and Layer 2 payload EtherType fields. See [Table 263 on page 2589](#).

Hashing using the fields in the MAC-in-MAC EtherType packet is first supported on EX4300 switches in Release 13.2X51-D20. Hashing using the fields in the MAC-in-MAC EtherType is not supported on earlier releases.

The fields used by the hashing algorithm for MAC-in-MAC hashing are not user-configurable.

- ✓—Field is used by the hashing algorithm, by default.
- X—Field is not used by the hashing algorithm, by default.

**Table 263: MAC-in-MAC Hashing Fields**

| Field                           | EX4300 | QFX5100 |
|---------------------------------|--------|---------|
| Layer 2 Payload Source MAC      | ✓      | ✓       |
| Layer 2 Payload Destination MAC | ✓      | ✓       |
| Layer 2 Payload EtherType       | ✓      | ✓       |
| Layer 2 Payload Outer VLAN      | X      | X       |

#### Layer 2 Header Hashing

Layer 2 header fields are used by the hashing algorithm when a packet's EtherType is not recognized as IP (IPv4 or IPv6), MPLS, or MAC-in-MAC. The Layer 2 header fields are also used for hashing IPv4, IPv6, and MPLS traffic instead of the payload fields when the hash mode is set to Layer 2 header.

- ✓—Field is used by the hashing algorithm, by default.
- X—Field is not used by the hashing algorithm, by default.
- (configurable)—Field can be configured to be used or not used by the hashing algorithm.

**Table 264: Layer 2 Header Hashing Fields**

| Field           | EX4300              | QFX5100             |
|-----------------|---------------------|---------------------|
| Source MAC      | ✓<br>(configurable) | ✓<br>(configurable) |
| Destination MAC | ✓<br>(configurable) | ✓<br>(configurable) |
| EtherType       | ✓<br>(configurable) | ✓<br>(configurable) |
| VLAN ID         | X<br>(configurable) | X<br>(configurable) |

## Understanding How Energy Efficient Ethernet Reduces Power Consumption on Interfaces

Energy Efficient Ethernet (EEE), an Institute of Electrical and Electronics Engineers (IEEE) 802.3az standard, reduces the power consumption of physical layer devices (PHYs) during periods of low link utilization. EEE saves energy by putting part of the transmission circuit into low power mode when the link is idle.

An Ethernet link consumes power even when a link is idle. EEE provides a method to utilize power in such a way that Ethernet links use power only during data transmission. EEE specifies a signaling protocol, Low Power Idle (LPI) for achieving the power saving during the idle time of Ethernet links. EEE allows PHYs to exchange LPI indications to signal the transition to low power mode when there is no traffic. LPI indicates when a link can go idle and when the link needs to resume after a predefined delay without impacting data transmission.

The following copper PHYs are standardized by IEEE 802.3az:

- 100BASE-T
- 1000BASE-T
- 10GBASE-T

## Understanding Local Link Bias

Local link bias conserves bandwidth on Virtual Chassis ports (VCPs) by using local links to forward unicast traffic exiting a Virtual Chassis or Virtual Chassis Fabric (VCF) that has a Link Aggregation group (LAG) bundle composed of member links on different member switches in the same Virtual Chassis or VCF. A local link is a member link in the LAG bundle that is on the member switch that received the traffic. Because traffic is received and forwarded on the same member switch when local link bias is enabled, no VCP bandwidth is consumed by traffic traversing the VCPs to exit the Virtual Chassis or VCF using a different member link in the LAG bundle. The traffic flow of traffic exiting a Virtual Chassis or VCF over a LAG bundle when local link bias is enabled is illustrated in [Figure 41 on page 2590](#).

Figure 41: Egress Traffic Flow with Local Link Bias

When local link bias is disabled, egress traffic exiting a Virtual Chassis or VCF on a LAG bundle can be forwarded out of any member link in the LAG bundle. Traffic forwarding decisions are made by an internal algorithm that attempts to load-balance traffic between the member links in the bundle. VCP bandwidth is frequently consumed by egress traffic when local link bias is disabled because the egress traffic traverses the VCPs to reach the destination egress member link in the LAG bundle. The traffic flow of traffic exiting a Virtual Chassis or VCF over a LAG bundle when local link bias is disabled is illustrated in Figure 42 on page 2591.

Figure 42: Egress Traffic Flow without Local Link Bias

Local link bias is configured in a LAG bundle. A Virtual Chassis or VCF that has multiple LAG bundles can contain bundles that have and have not enabled local link bias. Local link bias only impacts the forwarding of unicast traffic exiting a Virtual Chassis or VCF; ingress traffic handling is not impacted by the local link bias setting. Egress multicast, unknown unicast, and broadcast traffic exiting a Virtual Chassis or VCF over a LAG bundle is not impacted by the local link bias setting and is always load-balanced among the member links. Local link bias is disabled, by default.

You should enable local link bias if you want to conserve VCP bandwidth by always forwarding egress unicast traffic on a LAG bundle out of a local link. You should not enable local link bias if you want egress traffic load-balanced across the member links in the LAG bundle as it exits the Virtual Chassis or VCF.

## Understanding Layer 3 Subinterfaces

A Layer 3 subinterface is a logical division of a physical interface that operates at the network level and therefore can receive and forward 802.1Q VLAN tags. You can use Layer 3 subinterfaces to route traffic among multiple VLANs along a single trunk line that connects a Juniper Networks EX Series Ethernet Switch to a Layer 2 switch. Only one physical connection is required between the switches. This topology is often called a *router on a stick* or a *one-armed router* when the Layer 3 device is a router.

To create Layer 3 subinterfaces on an EX Series switch, you enable VLAN tagging, partition the physical interface into logical partitions, and bind the VLAN ID to the logical interface.

You can partition one physical interface into up to 4094 different subinterfaces, one for each VLAN. We recommend that you use the VLAN ID as the subinterface number when you configure the subinterface. Juniper Networks Junos operating system (Junos OS) reserves VLAN IDs 0 and 4095.

VLAN tagging places the VLAN ID in the frame header, allowing each physical interface to handle multiple VLANs. When you configure multiple VLANs on an interface, you must also enable tagging on that interface. Junos OS on EX Series switches supports a subset of the 802.1Q standard for receiving and forwarding routed or bridged Ethernet frames with single VLAN tags and running Virtual Router Redundancy Protocol (VRRP) over 802.1Q-tagged interfaces. Double-tagging is not supported.

## Understanding Unicast RPF

Unicast reverse-path forwarding (RPF) helps protect the switch against denial-of-service (DoS) and distributed denial-of-service (DDoS) attacks by verifying the unicast source address of each packet that arrives on an ingress interface where unicast RPF is enabled. It also helps ensure that traffic arriving on ingress interfaces comes from a network source that the receiving interface can reach.

When you enable unicast RPF, the switch forwards a packet only if the receiving interface is the best return path to the packet's unicast source address. This is known as strict mode unicast RPF.

**NOTE:** On Juniper Networks EX3200, EX4200, and EX4300 Ethernet Switches, the switch applies unicast RPF *globally* to all interfaces when unicast RPF is configured on any interface. For additional information, see [“Limitations of the Unicast RPF Implementation on EX3200, EX4200, and EX4300 Switches” on page 2595](#).

This topic covers:

- [Unicast RPF for Switches Overview on page 2593](#)
- [Unicast RPF Implementation on page 2593](#)
- [When to Enable Unicast RPF on page 2594](#)
- [When Not to Enable Unicast RPF on page 2595](#)
- [Limitations of the Unicast RPF Implementation on EX3200, EX4200, and EX4300 Switches on page 2595](#)

---

## Unicast RPF for Switches Overview

---

Unicast RPF functions as an ingress filter that reduces the forwarding of IP packets that might be spoofing an address. By default, unicast RPF is disabled on the switch interfaces.

The type of unicast RPF provided on the switches—that is, strict mode unicast RPF is especially useful on untrusted interfaces. An untrusted interface is an interface where untrusted users or processes can place packets on the network segment.

The switch supports only the active paths method of determining the best return path back to a unicast source address. The active paths method looks up the best reverse path entry in the forwarding table. It does not consider alternate routes specified using routing-protocol-specific methods when determining the best return path.

If the forwarding table lists the receiving interface as the interface to use to forward the packet back to its unicast source, it is the best return path interface.

Use strict mode unicast RPF only on symmetrically routed interfaces. (For information about symmetrically routed interfaces, see [“When to Enable Unicast RPF” on page 2594.](#))

For more information about strict unicast RPF, see RFC 3704, *Ingress Filtering for Multihomed Networks* at <http://www.ietf.org/rfc/rfc3704.txt>.

---

## Unicast RPF Implementation

---

This section includes:

- [Unicast RPF Packet Filtering on page 2593](#)
- [Bootstrap Protocol \(BOOTP\) and DHCP Requests on page 2593](#)
- [Default Route Handling on page 2594](#)

### ***Unicast RPF Packet Filtering***

When you enable unicast RPF on the switch, the switch handles traffic in the following manner:

- If the switch receives a packet on the interface that is the best return path to the unicast source address of that packet, the switch forwards the packet.
- If the best return path from the switch to the packet's unicast source address is not the receiving interface, the switch discards the packet.
- If the switch receives a packet that has a source IP address that does not have a routing entry in the forwarding table, the switch discards the packet.

### ***Bootstrap Protocol (BOOTP) and DHCP Requests***

Bootstrap protocol (BOOTP) and DHCP request packets are sent with a broadcast MAC address and therefore the switch does not perform unicast RPF checks on them. The switch forwards all BOOTP packets and DHCP request packets without performing unicast RPF checks.

### Default Route Handling

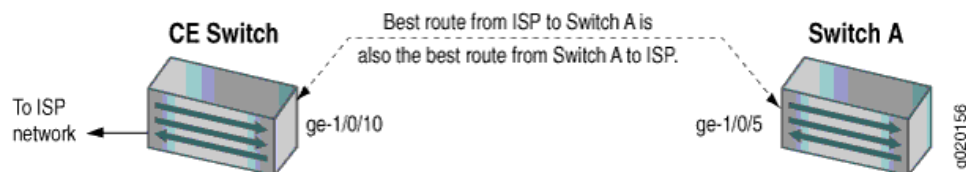

If the best return path to the source is the default route (0.0.0.0) and the default route points to **reject**, the switch discards the packets. If the default route points to a valid network interface, the switch performs a normal unicast RPF check on the packets.

### When to Enable Unicast RPF

Enable unicast RPF when you want to ensure that traffic arriving on a network interface comes from a source that resides on a network that that interface can reach. You can enable unicast RPF on untrusted interfaces to filter spoofed packets. For example, a common application for unicast RPF is to help defend an enterprise network from DoS/DDoS attacks coming from the Internet.

Enable unicast RPF only on symmetrically routed interfaces. A symmetrically routed interface uses the same route in both directions between the source and the destination, as shown in [Figure 43 on page 2594](#). Symmetrical routing means that if an interface receives a packet, the switch uses the same interface to send a reply to the packet source (the receiving interface matches the forwarding-table entry for the best return path to the source).

Figure 43: Symmetrically Routed Interfaces

Enabling unicast RPF on asymmetrically routed interfaces (where different interfaces receive a packet and reply to its source) results in packets from legitimate sources being filtered (discarded) because the best return path is not the same interface that received the packet.

The following switch interfaces are most likely to be symmetrically routed and thus are candidates for unicast RPF enabling:

- The service provider edge to a customer
- The customer edge to a service provider
- A single access point out of the network (usually on the network perimeter)
- A terminal network that has only one link

**NOTE:** Because unicast RPF is enabled globally on EX3200, EX4200, and EX4300 switches, ensure that *all* interfaces are symmetrically routed before you enable unicast RPF on these switches. Enabling unicast RPF on asymmetrically routed interfaces results in packets from legitimate sources being filtered.

**TIP:** Enabling unicast RPF as close as possible to the traffic source stops spoofed traffic before it can proliferate or reach interfaces that do not have unicast RPF enabled.

### When Not to Enable Unicast RPF

Typically, you will not enable unicast RPF if:

- Switch interfaces are multihomed.
- Switch interfaces are trusted interfaces.
- BGP is carrying prefixes and some of those prefixes are not advertised or are not accepted by the ISP under its policy. (The effect in this case is the same as filtering an interface by using an incomplete access list.)
- Switch interfaces face the network core. Core-facing interfaces are usually asymmetrically routed.

An asymmetrically routed interface uses different paths to send and receive packets between the source and the destination, as shown in [Figure 44 on page 2595](#). This means that if an interface receives a packet, that interface does not match the forwarding table entry as the best return path back to the source. If the receiving interface is not the best return path to the source of a packet, unicast RPF causes the switch to discard the packet even though it comes from a valid source.

**Figure 44: Asymmetrically Routed Interfaces**

**NOTE:** Do not enable unicast RPF on EX3200, EX4200, and EX4300 switches if any switch interfaces are asymmetrically routed, because unicast RPF is enabled globally on all interfaces of these switches. All switch interfaces must be symmetrically routed for you to enable unicast RPF without the risk of the switch discarding traffic that you want to forward.

### Limitations of the Unicast RPF Implementation on EX3200, EX4200, and EX4300 Switches

On EX3200, EX4200, and EX4300 switches, the switch implements unicast RPF on a global basis. You cannot enable unicast RPF on a per-interface basis. Unicast RPF is globally disabled by default.

- When you enable unicast RPF on any interface, it is automatically enabled on all switch interfaces, including link aggregation groups (LAGs), integrated routing and bridging (IRB) interfaces, and routed VLAN interfaces (RVIs).
- When you disable unicast RPF on the interface (or interfaces) on which you enabled unicast RPF, it is automatically disabled on all switch interfaces.

**NOTE:** You must explicitly disable unicast RPF on every interface on which it was explicitly enabled or unicast RPF remains enabled on all switch interfaces.

QFX switches and EX3200 and EX4200 switches do not perform unicast RPF filtering on equal-cost multipath (ECMP) traffic. The unicast RPF check examines only one best return path to the packet source, but ECMP traffic employs an address block consisting of multiple paths. Using unicast RPF to filter ECMP traffic on these switches can result in the switch discarding packets that you want to forward because the unicast RPF filter does not examine the entire ECMP address block.

## Understanding IP Directed Broadcast for EX Series Switches

IP directed broadcast helps you implement remote administration tasks such as backups and wake-on-LAN (WOL) application tasks by sending broadcast packets targeted at the hosts in a specified destination subnet. IP directed broadcast packets traverse the network in the same way as unicast IP packets until they reach the destination subnet. When they reach the destination subnet and IP directed broadcast is enabled on the receiving switch, the switch translates (*explodes*) the IP directed broadcast packet into a broadcast that floods the packet on the target subnet. All hosts on the target subnet receive the IP directed broadcast packet.

This topic covers:

- [IP Directed Broadcast for EX Series Switches Overview on page 2596](#)
- [IP Directed Broadcast Implementation for EX Series Switches on page 2597](#)
- [When to Enable IP Directed Broadcast on page 2597](#)
- [When Not to Enable IP Directed Broadcast on page 2597](#)

### IP Directed Broadcast for EX Series Switches Overview

---

IP directed broadcast packets have a destination IP address that is a valid broadcast address for the subnet that is the target of the directed broadcast (the target subnet). The intent of an IP directed broadcast is to flood the target subnet with the broadcast packets without broadcasting to the entire network. IP directed broadcast packets cannot originate from the target subnet.

When you send an IP directed broadcast packet, as it travels to the target subnet, the network forwards it in the same way as it forwards a unicast packet. When the packet reaches a switch that is directly connected to the target subnet, the switch checks to see whether IP directed broadcast is enabled on the interface that is directly connected to the target subnet:

- If IP directed broadcast is enabled on that interface, the switch broadcasts the packet on that subnet by rewriting the destination IP address as the configured broadcast IP address for the subnet. The switch converts the packet to a link-layer broadcast packet that every host on the network processes.
- If IP directed broadcast is disabled on the interface that is directly connected to the target subnet, the switch drops the packet.

### IP Directed Broadcast Implementation for EX Series Switches

---

You configure IP directed broadcast on a per-subnet basis by enabling IP directed broadcast on the Layer 3 interface of the subnet's VLAN. When the switch that is connected to that subnet receives a packet that has the subnet's broadcast IP address as the destination address, the switch broadcasts the packet to all hosts on the subnet.

By default, IP directed broadcast is disabled.

### When to Enable IP Directed Broadcast

---

IP directed broadcast is disabled by default. Enable IP directed broadcast when you want to perform remote management or administration services such as backups or WOL tasks on hosts in a subnet that does not have a direct connection to the Internet.

Enabling IP directed broadcast on a subnet affects only the hosts within that subnet. Only packets received on the subnet's Layer 3 interface that have the subnet's broadcast IP address as the destination address are flooded on the subnet.

### When Not to Enable IP Directed Broadcast

---

Typically, you do not enable IP directed broadcast on subnets that have direct connections to the Internet. Disabling IP directed broadcast on a subnet's Layer 3 interface affects only that subnet. If you disable IP directed broadcast on a subnet and a packet that has the broadcast IP address of that subnet arrives at the switch, the switch drops the broadcast packet.

If a subnet has a direct connection to the Internet, enabling IP directed broadcast on it increases the network's susceptibility to denial-of-service (DoS) attacks.

For example, a malicious attacker can spoof a source IP address (use a source IP address that is not the actual source of the transmission to deceive a network into identifying the attacker as a legitimate source) and send IP directed broadcasts containing Internet Control Message Protocol (ICMP) echo (ping) packets. When the hosts on the network with IP directed broadcast enabled receive the ICMP echo packets, they all send replies to the victim that has the spoofed source IP address. This creates a flood of ping replies in a DoS attack that can overwhelm the spoofed source address; this is known as a *smurf* attack. Another common DoS attack on exposed networks with IP directed broadcast

enabled is a *fraggle* attack, which is similar to a smurf attack except that the malicious packet is a User Datagram Protocol (UDP) echo packet instead of an ICMP echo packet.

## Understanding Interface Ranges on EX Series Switches

**NOTE:** This concept uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Understanding Interface Ranges on EX Series Switches*. For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 3](#).

You can use the interface ranges to group interfaces of the same type that share a common configuration profile. This helps reduce the time and effort in configuring interfaces on Juniper Networks EX Series Ethernet Switches. The configurations common to all the interfaces can be included in the interface range definition.

The interface range definition contains the name of the interface range defined, the names of the individual member interfaces that do not fall in a series of interfaces, a range of interfaces defined in the member range, and the configuration statements common to all the interfaces. An interface range defined with member ranges and individual members but without any common configurations, is also a valid definition.

**NOTE:** The interface range definition is supported only for Gigabit, 10-Gigabit, 40-Gigabit, and Fast Ethernet interfaces.

The common configurations defined in the interface range will be overridden by the local configuration.

The defined interface ranges can be used at places where the **interface** node is used in the following configuration hierarchies:

- **forwarding-options analyzer *name* input egress interface**
- **forwarding-options analyzer *name* input ingress interface**
- **poe interface**
- **protocols dot1x authenticator interface**
- **protocols igmp interface**
- **protocols isis interface**
- **protocols layer2-control bpdu-block interface**

- `protocols link-management peer name lmp-control-channel`
- `protocols link-management te-link name interface`
- `protocols lldp interface`
- `protocols lldp-med interface`
- `protocols mstp interface`
- `protocols oam ethernet link-fault-management interface`
- `protocols ospf area area-id interface`
- `protocols pim interface`
- `protocols router-advertisement interface`
- `protocols router-discovery interface`
- `protocols rsvp interface`
- `protocols sflow interfaces`
- `protocols vstp vlan vlan-id interface`
- `switch-options redundant-trunk-group group-name interface`
- `switch-options voip interface`

## Understanding Multichassis Link Aggregation

Layer 2 networks are increasing in scale mainly because of technologies such as virtualization. Protocol and control mechanisms that limit the disastrous effects of a topology loop in the network have become necessary. Spanning Tree Protocol (STP) is the primary solution to this problem because it provides a loop-free Layer 2 environment. STP has gone through a number of enhancements and extensions, and although it scales to very large network environments, it still provides only one active path from one device to another, regardless of the number of actual connections that might exist in the network. Although STP is a robust and scalable solution to redundancy in a Layer 2 network, the single logical link creates two problems: At least half of the available system bandwidth is off-limits to data traffic, and network topology changes occur. Rapid Spanning Tree Protocol (RSTP) reduces the overhead of the rediscovery process and allows a Layer 2 network to reconverge faster, but the delay is still high.

Link aggregation (IEEE 802.3ad) solves some of these problems by enabling users to use more than one link connection between switches. All physical connections are considered one logical connection. The problem with standard link aggregation is that the connections are point to point.

Multichassis link aggregation groups (MC-LAGs) enable a client device to form a logical LAG interface between two MC-LAG peers (for example, EX9200 switches). An MC-LAG provides redundancy and load balancing between the two MC-LAG peers, multihoming support, and a loop-free Layer 2 network without running STP.

On one end of an MC-LAG, there is an MC-LAG client device, such as a server, that has one or more physical links in a link aggregation group (LAG). This client device does not need to have an MC-LAG configured. On the other side of the MC-LAG, there are two MC-LAG peers. Each of the MC-LAG peers has one or more physical links connected to a single client device.

---

### MC-LAG Configuration Guidelines and Functional Behavior

---

When you configure MC-LAGs, we recommend that you follow certain guidelines to ensure that you obtain optimum benefit from the MC-LAG feature.

[Table 265 on page 2601](#) provides best practice configuration guidelines for MC-LAGs and [Table 266 on page 2602](#) describes important functional behavior for MC-LAGs.

Table 265: MC-LAG Configuration Guidelines

- We recommend that you use separate ports and choose different FPCs for the interchassis link (ICL) and Inter-Chassis Control Protocol (ICCP) interfaces.
- We recommend that you configure the backup liveness detection feature to implement faster failover of data traffic during an MC-LAG peer reboot. Configure the **backup-liveness-detection** statement on the management interface (fxp0) only.

**NOTE:** On EX9200 switches, the **backup-liveness-detection** statement was added in Junos OS Release 13.2R1.

- The following two methods can be used to enable Layer 3 functionality across an MC-LAG. We recommend that you use the Virtual Router Redundancy Protocol (VRRP) over integrated routing and bridging (IRB) interfaces method. Use media access control (MAC) address synchronization only when you cannot configure VRRP over IRB.
  1. Configure different IP addresses on IRB interfaces and run VRRP over the IRB interfaces. The virtual IP address is the gateway IP address for the MC-LAG clients.
  2. Configure the MAC address synchronization feature using the **set vlans *vlan-name* mcae-mac-synchronize** command and configure the same IP address on each of the IRBs on the MC-LAG peers. This IP address will be the gateway IP address for the MC-LAG clients.
- If you are using the VRRP over IRB method to enable Layer 3 functionality, you must configure static ARP entries for the IRB interface of the remote MC-LAG peer to allow routing protocols to run over the IRB interfaces.
- You must configure the ICL interface as a router-facing interface (by configuring the **multicast-router-interface** statement) for multicast forwarding to work in an MC-LAG environment.
- You must configure the **multichassis-lag-replicate-state** statement for Internet Group Management Protocol (IGMP) snooping to work properly in an MC-LAG environment.
- You must enable Protocol Independent Multicast (PIM) on the IRB interface to avoid multicast duplication.
- If you are using Layer 3 multicast, configure the IP address on the active MC-LAG peer with a high IP address or a high designated router priority.

**NOTE:** Use this configuration guideline only if you can ensure that the ICCP will not go down unless the router or switch is down.

- You can configure the **prefer-status-control-active** statement with the **mc-ae status-control standby** configuration to prevent the LACP MC-LAG system ID from reverting to the default Link Aggregation Control Protocol (LACP) system ID on ICCP failure. You must also configure the **hold-time down** value (at the **[edit interfaces *interface-name*]** hierarchy level) for the ICL with the **mc-ae status-control standby** configuration to be higher than the ICCP Bidirectional Forwarding Detection (BFD) timeout. This configuration prevents data traffic loss by ensuring that when the router or switch with the **mc-ae status-control active** configuration goes down, the router or switch with the **mc-ae status-control standby** configuration does not go into standby mode.

To make the **prefer-status-control-active** configuration work with the **mc-ae status-control standby** configuration when an ICL logical interface is configured on an aggregated Ethernet interface, you must either configure the **lACP periodic interval** statement at the **[edit interfaces *interface-name* aggregated-ether-options]** hierarchy level as slow or configure the **detection-time threshold** statement at the **[edit protocols iccp peer *liveness-detection*]** hierarchy level as less than 3 seconds.

**NOTE:** On EX9200 switches, the **prefer-status-control-active** statement was added in Junos OS Release 13.2R1.

We recommend that you configure the ICCP liveness-detection interval to be at least 8 seconds, to allow GRES to work seamlessly. By default, ICCP liveness detection uses multihop BFD, which runs in centralized mode. If you have configured ICCP connectivity through a dedicated physical interface rather than through an IRB interface, then you can configure single-hop BFD, and the restriction on the liveness-detection interval does not apply.

Table 265: MC-LAG Configuration Guidelines (*continued*)

We recommend that you configure only one redundancy group between MC-LAG nodes. The redundancy group represents the domain of high availability between the MC-LAG nodes. One redundancy group is sufficient between a pair of MC-LAG nodes.

Table 266: MC-LAG Functional Behavior

- STP is not supported on the ICL or MC-LAG interfaces.
- Load-balancing of network traffic between MC-LAG peers is 100 percent local bias.
- Load-balancing of network traffic between multiple LAG members in a local MC-LAG node is achieved through a standard LAG hashing algorithm.
- MAC learning is disabled on the ICL. Consequently, source MAC addresses cannot be learned locally on the ICL. However, MAC addresses from a remote MC-LAG node can be installed on the ICL interface. For example, the MAC address for a single-homed client on a remote MC-LAG node can be installed on the ICL interface of the local MC-LAG node.
- Dynamic Address Resolution Protocol (ARP) resolution over the ICL interface is not supported. Consequently, incoming ARP replies on the ICL are discarded. However, ARP entries can be populated on the ICL interface through ICCP exchanges from a remote MC-LAG peer.
- For EX9200 switches, ARP entries that were learned remotely will be purged and then learned again during graceful Routing Engine switchover (GRES).
- Usually, a VRRP backup node does not forward incoming packets. However, when VRRP over IRB is configured in an MC-LAG active-active environment, both the VRRP master and the VRRP backup forward Layer 3 traffic arriving on the MC-AE interface.
- If you are using the MAC address synchronization method (by configuring the **set vlans *vlan-name* mcae-mac-synchronize** command) to enable Layer 3 functionality, running routing protocols over the IRB interface is not supported and gratuitous ARP requests are not sent when the MAC address on the IRB interface changes.
- Access port security features (for example, DHCP snooping, dynamic ARP inspection (DAI), and IP source guard) are not supported on the ICL or MC-LAG interfaces.

### Active-Active and Active-Standby Mode

In active-active mode, all member links are active on the MC-LAG. In this mode, media access control (MAC) addresses learned on one MC-LAG peer are propagated to the other MC-LAG peer.

In active-standby mode, only one of the MC-LAG peers is active at any given time. The other MC-LAG peer is in backup (standby) mode. The active MC-LAG peer uses Link Aggregation Control Protocol (LACP) to advertise to client devices that its child link is available for forwarding data traffic.

### ICCP and ICL

The MC-LAG peers use Inter-Chassis Control Protocol (ICCP) to exchange control information and coordinate with each other to ensure that data traffic is forwarded properly. ICCP replicates control traffic and forwarding states across the MC-LAG peers and communicates the operational state of the MC-LAG members. Because ICCP uses TCP/IP to communicate between the peers, the two peers must be connected to each

other. ICCP messages exchange MC-LAG configuration parameters and ensure that both peers use the correct LACP parameters.

The interchassis link (ICL), also known as the interchassis link-protection link (ICL-PL), is used to forward data traffic across the MC-LAG peers. This link provides redundancy when a link failure (for example, an MC-LAG trunk failure) occurs on one of the active links. The ICL can be a single physical Ethernet interface or an aggregated Ethernet interface. You can configure only one ICL between the two MC-LAG peers, although you can configure multiple MC-LAGs between them.

## LACP

LACP is a subcomponent of the IEEE 802.3ad standard. LACP is used to discover multiple links from a client device connected to an MC-LAG peer. LACP must be configured on all member links for an MC-LAG to work correctly.

## Data Traffic Forwarding Rules

In active-active MC-LAG topologies, network interfaces are categorized into three interface types, as follows:

- S-Links—Single-homed link (S-Link) terminating on an MC-LAG peer device.
- MC-Links—MC-LAG links.
- ICL—Interchassis data link.

Depending on the incoming and outgoing interface types, some constraints are added to the Layer 2 forwarding rules for MC-LAG configurations. The following data traffic forwarding rules apply:

**NOTE:** If only one MC-LAG member link is in the up state, it is considered an S-Link.

- When an MC-LAG network receives a packet from a local MC-Link or S-Link, the packet is forwarded to other local interfaces, including S-Links and MC-Links based on the normal Layer 2 forwarding rules and on the configuration of the **mesh-group** and **no-local-switching** statements. If MC-Links and S-Links are in the same mesh group and their **no-local-switching** statements are enabled, the received packets are only forwarded upstream and not sent to MC-Links and S-Links.
- The following circumstances determine whether or not an ICL receives a packet from a local MC-Link or S-Link:
  - If the peer MC-LAG network device has S-Links or MC-LAGs that do not reside on the local MC-LAG network device.
  - Whether or not interfaces on two peering MC-LAG network devices are allowed to talk to each other.

- When an MC-LAG network receives a packet from the ICL, the packet is forwarded to all local S-Links and active MC-LAGs that do not exist in the MC-LAG network from which the packet was sent.

### Multichassis Link Protection

Multichassis link protection provides link protection between the two MC-LAG peers that host an MC-LAG. If the ICCP connection is up and the ICL comes up, the peer configured as standby brings up the multichassis aggregated Ethernet (MC-AE) interfaces shared with the peer. Multichassis protection must be configured on each MC-LAG peer that is hosting an MC-LAG.

### Failure Handling During a Split-Brain State

Configuring ICCP adjacency over aggregated links with child links on multiple FPCs mitigates the possibility of a split-brain state. A split-brain occurs when ICCP adjacency is lost between the MC-LAG peers. To work around this problem, enable backup liveness detection. With backup liveness detection enabled, the MC-LAG peers establish an out-of-band channel through the management network in addition to the ICCP channel.

During a split-brain state, both active and standby peers change LACP system IDs. Because both MC-LAG peers change the LACP system ID, the CE device accepts the LACP system ID of the first link that comes up and brings down other links carrying different LACP system IDs. When the ICCP connection is active, both of the MC-LAG peers use the configured LACP system ID. If the LACP system ID is changed during failures, the server that is connected over the MC-LAG removes these links from the aggregated Ethernet bundle.

When the ICL is operationally down and the ICCP connection is active, the LACP state of the links with status control configured as standby is set to the standby state. When the LACP state of the links is changed to standby, the server that is connected over the MC-LAG makes these links inactive and does not use them for sending data.

Table 267 on page 2604 describes the different ICCP failure scenarios. The dash means that the item is not applicable.

**Table 267: MC-LAG Failure Scenarios**

| ICCP Connection Status | ICL Status | Backup Liveness Peer Status | Action on Multichassis Aggregated Ethernet (MC-AE) Interface with Status Set to Standby |
|------------------------|------------|-----------------------------|-----------------------------------------------------------------------------------------|
| Down                   | Down or Up | Not configured              | LACP system ID is changed to default value.                                             |
| Down                   | Down or Up | Active                      | LACP system ID is changed to default value.                                             |
| Down                   | Down or Up | Inactive                    | No change in LACP system ID.                                                            |
| Up                     | Down       | —                           | LACP state is set to standby. MUX state moves to waiting state.                         |

Recovery from the split-brain state occurs automatically when the ICCP adjacency comes up between the MC-LAG peers.

If only one physical link is available for ICCP, then ICCP might go down due to link failure or FPC failure, while the node is still up—a split-brain state results. If you do not set a special configuration to avoid this situation, the mc-ae interfaces change the LACP system ID to their local defaults, thus ensuring that only one link (the first) comes up from the downstream device. A convergence delay results from the mc-ae LACP state changes on both active and standby nodes.

To avoid this problem of the split-brain state and resultant convergence delays, configure *one* of the following two options:

- Enable backup liveness detection on the management (fxp0) interface:

For example:

```
[edit ]
user@switch# set protocols iccp peer 3.3.3.1 backup-liveness-detection backup-peer-ip
10.207.64.233
```

When you configure **backup-liveness-detection**, an out-of-band channel is established between the nodes, through the management network, to test the liveness of the Routing Engine. When both ICCP and backup liveness detection fail, the remote node is considered down, so the LACP system ID is not changed on the local node.

- Configure **prefer-status-control-active** on the active node:

For example:

```
[edit ]
user@switch# set interfaces ae1 aggregated-ether-options mc-ae chassis-id 1 events
iccp-peer-down prefer-status-control-active
```

When you configure **prefer-status-control-active**, if ICCP goes down and backup liveness detection is up, the LACP system ID is not changed. Thus if ICCP alone fails, the LACP system ID is not changed on the active node but it is changed on the standby node.

**NOTE:** Configure the **master-only** statement on the IP address of the fxp0 interface for backup liveness detection, on both the master and backup Routing Engines, to ensure that the connection is not reset during GRES in the remote peer

For example, on the master Routing Engine:

```
user@switch-re1 > show configuration interfaces fxp0 | display inheritance no-comments
unit 0 {
  family inet {
    address 10.8.2.31/24;
    address 10.8.2.33/24 {
      master-only;
    }
  }
}
```

```
}
```

For example, on the backup Routing Engine:

```
user@switch1-re1 > show configuration interfaces fxp0 | display inheritance no-comments
unit 0 {
  family inet {
    address 10.8.2.32/24;
    address 10.8.2.33/24 {
      master-only;
    }
  }
}
```

The master Routing Engine services both 10.8.2.31 and 10.8.2.33. Configure 10.8.2.33 in a backup-liveness-detection configuration on the peer node.

For example, on the backup Routing Engine:

```
user@switch2 > show configuration protocols iccp
local-ip-addr 2.2.2.2;
peer 1.1.1.1 {
  session-establishment-hold-time 50;
  redundancy-group-id-list 1;
  backup-liveness-detection {
    backup-peer-ip 10.8.2.33;
  }
  liveness-detection {
    minimum-interval 500;
    multiplier 3;
    single-hop;
  }
}
```

---

## Load-Balancing

Load-balancing of network traffic between MC-LAG peers is 100 percent local bias. Load-balancing of network traffic between multiple LAG members in a local MC-LAG node is achieved through a standard LAG hashing algorithm.

---

## Layer 2 Unicast Features Supported

The following Layer 2 unicast features are supported:

- Layer 2 unicast: learning and aging
  - Learned MAC addresses are propagated across MC-LAG peers for all of the VLANs that are spawned across the peers.
  - Aging of MAC addresses occurs when the MAC address is not seen on both of the peers.

- MAC addresses learned on single-homed links are propagated across all of the VLANs that have MC-LAG links as members.

**NOTE:** MAC learning is disabled on the ICL. Consequently, source MAC addresses cannot be learned locally on the ICL. However, MAC addresses from a remote MC-LAG node can be installed on the ICL interface. For example, the MAC address for a single-homed client on a remote MC-LAG node can be installed on the ICL interface of the local MC-LAG node.

### Layer 2 Multicast Features Supported

The following Layer 2 multicast features are supported:

- Layer 2 multicast: unknown unicast and IGMP snooping
  - Flooding happens on all links across peers if both peers have virtual LAN membership. Only one of the peers forwards traffic on a given MC-LAG link.
  - Known and unknown multicast packets are forwarded across the peers by adding the ICL port as a multicast router port.
  - IGMP membership learned on MC-LAG links is propagated across peers.
  - During an MC-LAG peer reboot, known multicast traffic is flooded until the IGMP snooping state is synced with the peer.

### IGMP Snooping on an Active-Active MC-LAG

IGMP snooping controls multicast traffic in a switched network. When IGMP snooping is not enabled, the Layer 2 device broadcasts multicast traffic out of all of its ports, even if the hosts on the network do not want the multicast traffic. With IGMP snooping enabled, a Layer 2 device monitors the IGMP join and leave messages sent from each connected host to a multicast router. This enables the Layer 2 device to keep track of the multicast groups and associated member ports. The Layer 2 device uses this information to make intelligent decisions and to forward multicast traffic to only the intended destination hosts. IGMP uses Protocol Independent Multicast (PIM) to route the multicast traffic. PIM uses distribution trees to determine which traffic is forwarded.

In an active-active MC-LAG configuration, IGMP snooping replicates the Layer 2 multicast routes so that each MC-LAG peer has the same routes. If a device is connected to an MC-LAG peer by way of a single-homed interface, IGMP snooping replicates join message to its IGMP snooping peer. If a multicast source is connected to an MC-LAG by way of a Layer 3 device, the Layer 3 device passes this information to the IRB that is configured on the MC-LAG. The first hop designated router is responsible for sending the register and register-stop messages for the multicast group. The last hop designated router is responsible for sending PIM join and leave messages toward the rendezvous point and source for the multicast group. The routing device with the smallest preference metric forwards traffic on transit LANs.

You must configure the ICL interface as a router-facing interface (by configuring the **multicast-router-interface** statement) for multicast forwarding to work in an MC-LAG environment. For the scenario in which traffic arrives by way of a Layer 3 interface, PIM and IGMP must be enabled on the IRB interface configured on the MC-LAG peers. You must enable PIM on the IRB interface to avoid multicast duplication.

### Layer 3 Unicast Features Supported

---

To provide Layer 3 routing functions to downstream clients, the MC-LAG network peers must be configured to provide the same gateway address to the downstream clients. To the upstream routers, the MC-LAG network peers could be viewed as either equal-cost multi path (ECMP) or two routes with different preference values.

The following two methods can be used to enable Layer 3 functionality across an MC-LAG. We recommend that you use the VRRP over IRB method. Use MAC address synchronization only when you cannot configure VRRP over IRB.

1. Configure different IP addresses on IRB interfaces and run Virtual Router Redundancy Protocol (VRRP) over the IRB interfaces. The virtual IP address is the gateway IP address for the MC-LAG clients.
2. Configure the MAC address synchronization feature using the **mcae-mac-synchronize** statement and configure the same IP address on each of the IRBs on the MC-LAG peers. This IP address will be the gateway IP address for the MC-LAG clients.

Layer 3 unicast feature support includes the following:

- Address Resolution Protocol (ARP) synchronization enables ARP resolution on both of the MC-LAG peers.
- DHCP Relay with option 82 enables option 82 on the MC-LAG peers. Option 82 provides information about the network location of DHCP clients. The DHCP server uses this information to implement IP addresses or other parameters for the client.

### VRRP Active-Standby Support

---

Juniper Networks Junos operating system (Junos OS) supports active-active MC-LAGs by using VRRP in active-standby mode. VRRP in active-standby mode enables Layer 3 routing over the multichassis aggregated Ethernet (MC-AE) interfaces on the MC-LAG peers. In this mode, the MC-LAG peers act as virtual routers. The peers share the virtual IP address that corresponds to the default route configured on the host or server connected to the MC-LAG. This virtual IP address (of the IRB interface) maps to either of the VRRP MAC addresses or to the logical interfaces of the MC-LAG peers. The host or server uses the VRRP MAC address to send any Layer 3 upstream packets. At any time, one of the VRRP devices is the master (active), and the other is a backup (standby). Usually, a VRRP backup node does not forward incoming packets. However, when VRRP over IRB is configured in an MC-LAG active-active environment, both the VRRP master and the VRRP backup forward Layer 3 traffic arriving on the MC-AE interface. If the master fails, all the traffic shifts to the MC-AE link on the backup.

**NOTE:** You must configure VRRP on both MC-LAG peers for both the active and standby members to accept and route packets. Additionally, you must configure the VRRP backup device to send and receive ARP requests.

Routing protocols run on the primary IP address of the IRB interface, and both of the MC-LAG peers run routing protocols independently. The routing protocols use the primary IP address of the IRB interface and the IRB MAC address to communicate with the MC-LAG peers. The IRB MAC address of each MC-LAG peer is replicated on the other MC-LAG peer and is installed as a MAC address that has been learned on the ICL.

**NOTE:** If you are using the VRRP over IRB method to enable Layer 3 functionality, you must configure static ARP entries for the IRB interface of the remote MC-LAG peer to allow routing protocols to run over the IRB interfaces.

### MAC Address Management

If an MC-LAG is configured to be active-active, upstream and downstream traffic could go through different MC-LAG peer devices. Because the MAC address is learned only on one of the MC-LAG peers, traffic in the reverse direction could be going through the other MC-LAG peer and flooding the network unnecessarily. Also, a single-homed client's MAC address is learned only on the MC-LAG peer that it is attached to. If a client attached to the peer MC-LAG network device needs to communicate with that single-homed client, then traffic would be flooded on the peer MC-LAG network device. To avoid unnecessary flooding, whenever a MAC address is learned on one of the MC-LAG peers, the address is replicated to the other MC-LAG peer. The following conditions are applied when MAC address replication is performed:

- MAC addresses learned on an MC-LAG of one MC-LAG peer must be replicated as learned on the same MC-LAG of the other MC-LAG peer.
- MAC addresses learned on single-homed customer edge (CE) clients of one MC-LAG peer must be replicated as learned on the ICL interface of the other MC-LAG peer.
- MAC address learning on an ICL is disabled from the data path. It depends on software to install MAC addresses replicated through ICCP.

### MAC Aging

MAC aging support in Junos OS extends aggregated Ethernet logic for a specified MC-LAG. A MAC address in software is not deleted until all Packet Forwarding Engines have deleted the MAC address.

### MAC Address Synchronization

MAC address synchronization enables MC-LAG peers to forward Layer 3 packets arriving on MC-AE interfaces with either its own IRB MAC address or its peer's IRB MAC address. Each MC-LAG peer installs its own IRB MAC address as well as the peer's IRB MAC address in the hardware. Each MC-LAG peer treats the packet as if it were its own packet. If MAC

address synchronization is not enabled, the IRB MAC address is installed on the MC-LAG peer as if it was learned on the ICL.

**NOTE:** If you are using the MAC address synchronization to enable Layer 3 functionality, running routing protocols over the IRB interface is not supported. If you need routing capability, configure both VRRP and routing protocols on each MC-LAG peer.

Control packets destined for a particular MC-LAG peer that arrive on an MC-AE interface of its MC-LAG peer are not forwarded on the ICL interface. Additionally, using the gateway IP address as a source address when you issue either a ping, traceroute, telnet, or FTP request is not supported.

**NOTE:** Gratuitous ARP requests are not sent when the MAC address on the IRB interface changes.

To enable the MAC address synchronization feature, issue the **set vlan *vlan-name* mcae-mac-synchronize** command on each MC-LAG peer. Configure the same IP address on both MC-LAG peers. This IP address is used as the default gateway for the MC-LAG servers or hosts.

### Address Resolution Protocol Active-Active MC-LAG Support Methodology

ARP maps IP addresses to MAC addresses. Junos OS uses ARP response packet snooping to support active-active MC-LAGs, providing easy synchronization without the need to maintain any specific state. Without synchronization, if one MC-LAG peer sends an ARP request, and the other MC-LAG peer receives the response, ARP resolution is not successful. With synchronization, the MC-LAG peers synchronize the ARP resolutions by sniffing the packet at the MC-LAG peer receiving the ARP response and replicating this to the other MC-LAG peer. This ensures that the entries in ARP tables on the MC-LAG peers are consistent.

When one of the MC-LAG peers restarts, the ARP destinations on its MC-LAG peer are synchronized. Because the ARP destinations are already resolved, its MC-LAG peer can forward Layer 3 packets out of the MC-AE interface.

**NOTE:** In some cases, ARP messages received by one MC-LAG peer are replicated to the other MC-LAG peer through ICCP. This optimization feature is applicable only for ARP replies, not ARP requests, received by the MC-LAG peers.

**NOTE:** Dynamic ARP resolution over the ICL interface is not supported. Consequently, incoming ARP replies on the ICL are discarded. However, ARP entries can be populated on the ICL interface through ICCP exchanges from a remote MC-LAG peer.

**NOTE:** During Graceful Routing Engine Switchover (GRES), ARP entries that were learned remotely will be purged and then learned again.

### DHCP Relay with Option 82

**NOTE:** DHCP relay is not supported with MAC address synchronization. If DHCP relay is required, configure VRRP over IRB for Layer 3 functionality.

DHCP relay with option 82 provides information about the network location of DHCP clients. The DHCP server uses this information to implement IP addresses or other parameters for the client. With DHCP relay enabled, DHCP request packets might take the path to the DHCP server through either of the MC-LAG peers. Because the MC-LAG peers have different host names, chassis MAC addresses, and interface names, you need to observe these requirements when you configure DHCP relay with option 82:

- Use the interface description instead of the interface name.
- Do not use the hostname as part of the circuit ID or remote ID strings.
- Do not use the chassis MAC address as part of the remote ID string.
- Do not enable the vendor ID.
- If the ICL interface receives DHCP request packets, the packets are dropped to avoid duplicate packets in the network.

A counter called *Due to received on ICL interface* has been added to the **show helper statistics** command, which tracks the packets that the ICL interface drops.

An example of the CLI output follows:

```
user@switch> show helper statistics
BOOTP:
  Received packets: 6
  Forwarded packets: 0
  Dropped packets: 6
    Due to no interface in DHCP Relay database: 0
    Due to no matching routing instance: 0
    Due to an error during packet read: 0
    Due to an error during packet send: 0
    Due to invalid server address: 0
    Due to no valid local address: 0
    Due to no route to server/client: 0
    Due to received on ICL interface: 6
```

The output shows that six packets received on the ICL interface have been dropped.

## Layer 3 Multicast

---

- [PIM Operation with Normal Mode Designated Router Election on page 2612](#)
- [PIM Operation with Dual DR Mode on page 2612](#)

Protocol Independent Multicast (PIM) and Internet Group Management Protocol (IGMP) provide support for Layer 3 multicast. In addition to the standard mode of PIM operation, there is a special mode called PIM dual DR (designated router). PIM dual DR minimizes multicast traffic loss in case of failures.

### ***PIM Operation with Normal Mode Designated Router Election***

In normal mode designated router election, the IRB interfaces on both of the MC-LAG peers are configured with PIM enabled. In this mode, one of the MC-LAG peers becomes the designated router through the PIM designated router election mechanism. The elected designated router maintains the rendezvous-point tree (RPT) and shortest-path tree (SPT) so it can receive data from the source device. The elected designated router participates in periodic PIM join and prune activities toward the rendezvous point (RP) or the source.

The trigger for initiating these join and prune activities is the IGMP membership reports that are received from interested receivers. IGMP reports received over MC-AE interfaces (potentially hashing on either of the MC-LAG peers) and single-homed links are synchronized to the MC-LAG peer through ICCP.

Both MC-LAG peers receive traffic on their incoming interface (IIF). The non-designated router receives traffic by way of the ICL interface, which acts as a multicast router (mrouter) interface.

If the designated router fails, the non-designated router has to build the entire forwarding tree (RPT and SPT), which can cause multicast traffic loss.

### ***PIM Operation with Dual DR Mode***

In this mode, both of the MC-LAG peers act as designated routers (active and backup) and send periodic join and prune messages upstream towards the RP, or source, and eventually join the RPT or SPT.

The primary MC-LAG peer forwards the multicast traffic to the receiver devices even if the standby MC-LAG peer has a smaller preference metric.

The standby MC-LAG peer also joins the forwarding tree and receives the multicast data. The standby MC-LAG peer drops the data because it has an empty outgoing interface list (OIL). When the standby MC-LAG peer detects the primary MC-LAG peer failure, it adds the receiver VLAN to the OIL, and starts to forward the multicast traffic.

To enable a multicast dual DR, issue the **set protocols pim interface interface-name dual-dr** command on the VLAN interfaces of each MC-LAG peer.

## MC-LAG Upgrade Guidelines

Upgrade the MC-LAG peers according to the following guidelines.

**NOTE:** After a reboot, the MC-AE interfaces come up immediately and might start receiving packets from the server. If routing protocols are enabled, and the routing adjacencies have not been formed, packets might be dropped.

To prevent this scenario, issue the `set interfaces interface-name aggregated-ether-options mc-ae init-delay-time time` to set a time by which the routing adjacencies are formed.

1. Make sure that both of the MC-LAG peers (node1 and node2) are in the active-active state using the following command on any one of the MC-LAG peers:

```
user@switch> show interfaces mc-ae id 1
Member Link           : ae0
Current State Machine's State: mcae active state
Local Status          : active<<<<<<<
Local State           : up
Peer Status           : active<<<<<<<
Peer State            : up
  Logical Interface    : ae0.0
  Topology Type        : bridge
  Local State          : up
  Peer State           : up
  Peer Ip/MCP/State    : 20.1.1.2 ae2.0 up
```

2. Upgrade node1 of the MC-LAG.

When node1 is upgraded it is rebooted, and all traffic is sent across the available LAG interfaces of node2, which is still up. The amount of traffic lost depends on how quickly the neighbor devices detect the link loss and rehash the flows of the LAG.

3. Verify that node1 is running the software you just installed. Issue the `show version` command.
4. Make sure that both nodes of the MC-LAG (node1 and node2) are in the active-active state after the reboot of node1.
5. Upgrade node2 of the MC-LAG.

Repeat step 1 through step 3 to upgrade node2.

## 802.1Q VLANs Overview

For Ethernet, Fast Ethernet, Tri-Rate Ethernet copper, Gigabit Ethernet, 10-Gigabit Ethernet, and aggregated Ethernet interfaces supporting VPLS, the Junos OS supports a subset of the IEEE 802.1Q standard for channelizing an Ethernet interface into multiple logical interfaces, allowing many hosts to be connected to the same Gigabit Ethernet switch, but preventing them from being in the same routing or bridging domain.

## Configuring Gigabit Ethernet Interfaces (CLI Procedure)

---

**NOTE:** This task uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see [Configuring Gigabit Ethernet Interfaces \(CLI Procedure\)](#). For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 3](#).

---

An Ethernet interface must be configured for optimal performance in a high-traffic network. EX Series switches include a factory default configuration that:

- Enables all the network interfaces on the switch
- Sets a default interface mode (access)
- Sets default link settings
- Specifies a logical unit (**unit 0**) and assigns it to **family ethernet-switching** (except on EX8200 switches and Virtual Chassis)
- Specifies Rapid Spanning Tree Protocol (RSTP) and Link Layer Discovery Protocol (LLDP)

This topic describes:

- [Configuring VLAN Options and Interface Mode on page 2617](#)
- [Configuring the Link Settings on page 2617](#)
- [Configuring the IP Options on page 2618](#)

### Configuring VLAN Options and Interface Mode

By default, when you boot a switch and use the factory default configuration, or when you boot the switch and do not explicitly configure a port mode, all interfaces on the switch are in access mode and accept only untagged packets from the VLAN named **default**. You can optionally configure another VLAN and use that instead of **default**. You can also configure a port to accept untagged packets from the user-configured VLAN. For details on this concept (native VLAN), see [“Understanding Bridging and VLANs on EX Series Switches” on page 2245](#)

If you are connecting either a desktop phone, wireless access point or a security camera to a Power over Ethernet (PoE) port, you can configure some parameters for the PoE interface. PoE interfaces are enabled by default. For detailed information about PoE settings, see [“Configuring PoE on EX Series Switches \(CLI Procedure\)” on page 4440](#).

If you are connecting a device to other switches and to routers on the LAN, you need to assign the interface to a logical port and configure the logical port as a trunk port. See [“Port Role Configuration with the J-Web Interface \(with CLI References\)” on page 2625](#) for more information about port configuration.

If you are connecting to a server that contains virtual machines and a VEPA for packet aggregation from those virtual machines, configure the port as a tagged-access port. See [“Understanding Bridging and VLANs on EX Series Switches” on page 2245](#) for more information about tagged access.

To configure a 1-Gigabit, 10-Gigabit, or 40-Gigabit Ethernet interface for trunk port mode:

```
[edit]
user@switch# set interfaces interface-name unit logical-unit-number family ethernet-switching
interface-mode trunk
```

### Configuring the Link Settings

EX Series switches include a factory default configuration that enables interfaces with the link settings provided in [Table 268 on page 2617](#).

**Table 268: Factory Default Configuration Link Settings for EX Series Switches**

| Ethernet Interface                        | Autonegotiation | Flow Control | Link Mode                                       | Link Speed                                        |
|-------------------------------------------|-----------------|--------------|-------------------------------------------------|---------------------------------------------------|
| 1 gigabit                                 | Enabled         | Enabled      | Autonegotiation<br>(full duplex or half duplex) | Autonegotiation<br>(10 Mbps, 100 Mbps, or 1 Gbps) |
| 10 gigabit<br>(using a DAC cable)         | Enabled         | Enabled      | Full duplex                                     | 10 Gbps                                           |
| 10 gigabit<br>(using a fiber-optic cable) | Disabled        | Enabled      | Full duplex                                     | 10 Gbps                                           |
| 40 gigabit<br>(using a DAC cable)         | Enabled         | Enabled      | Full duplex                                     | 40 Gbps                                           |

Table 268: Factory Default Configuration Link Settings for EX Series Switches (*continued*)

| Ethernet Interface                        | Autonegotiation | Flow Control | Link Mode   | Link Speed |
|-------------------------------------------|-----------------|--------------|-------------|------------|
| 40 gigabit<br>(using a fiber-optic cable) | Disabled        | Enabled      | Full duplex | 40 Gbps    |

**NOTE:** On EX4300 switches, the interfaces operate in full duplex mode only.

To configure the link mode and speed settings for a 1-Gigabit, 10-Gigabit, or 40-Gigabit Ethernet interface:

```
[edit]
user@switch# set interfaces interface-name
```

To configure additional link settings for a 1-Gigabit, 10-Gigabit, or 40-Gigabit Ethernet interface:

```
[edit]
user@switch# set interfaces interface-name ether-options
```

For detailed information about the FPC, PIC, and port numbers used for EX Series switches, see [“Understanding Interface Naming Conventions on EX Series Switches” on page 2580](#).

Configurable link settings include:

- **802.3ad**—Specify an aggregated Ethernet bundle. See [“Configuring Aggregated Ethernet Links \(CLI Procedure\)” on page 2667](#).
- **auto-negotiation**—Enable or disable autonegotiation of flow control, link mode, and speed.
- **flow-control**—Enable or disable flow control.
- **link-mode**—Specify full duplex, half duplex, or autonegotiation. On EX4300 switches, the interfaces operate in full duplex mode only.
- **loopback**—Enable or disable loopback mode.
- **speed**—Specify 10 Mbps, 100 Mbps, 1 Gbps, or autonegotiation.

### Configuring the IP Options

To specify an IP address for the logical unit using IPv4:

```
[edit]
user@switch# set interfaces interface-name unit logical-unit-number family inet address ip-address
```

To specify an IP address for the logical unit using IPv6:

```
[edit]
user@switch# set interfaces interface-name unit logical-unit-number family inet6 address ip-address
```

**NOTE:** Access interfaces on EX4300 switches are set to family ethernet-switching by default. You might have to delete this or any other user-configured family setting before changing the setting to family inet or family inet6.

## Configuring Gigabit Ethernet Interfaces (J-Web Procedure)

You can configure specific properties on your Ethernet interface to ensure optimal performance of your network in a high-traffic environment.

To configure properties on a Gigabit Ethernet interface, a 10-Gigabit Ethernet interface, and a 40-Gigabit Ethernet interface on an EX Series switch:

1. Select **Interfaces > Ports**.

The page that is displayed lists Gigabit Ethernet, 10-Gigabit Ethernet interfaces, and 40-Gigabit Ethernet interfaces, and their link statuses.

**NOTE:** After you make changes to the configuration on this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See “[Using the Commit Options to Commit Configuration Changes \(J-Web Procedure\)](#)” on page 628 for details about all commit options.

2. Select the interface you want to configure. For an EX8200 Virtual Chassis configuration, select the member and the FPC slot if the interface you want to configure is not listed under **Ports** in the top table on the page.

Details for the selected interface, such as administrative status, link status, speed, duplex, and flow control, are displayed in the **Details of port** table on the page.

**NOTE:** You can select multiple interfaces and modify their settings at the same time. However, while doing this, you cannot modify the IP address or enable or disable the administrative status of the selected interfaces.

**NOTE:** In the J-Web interface, you cannot configure interface ranges and interface groups.

3. Click **Edit** and select the set of options you want to configure first:

- Port Role—Enables you to assign a profile for the selected interface.

**NOTE:** When you select a particular port role, preconfigured port security parameters are set for the VLAN that the interface belongs to. For example, if you select the port role **Desktop**, the port security options **examine-dhcp** and **arp-inspection** are enabled on the VLAN that the interface belongs to. If there are interfaces in the VLAN that have static IP addresses, those interfaces might lose connectivity because those static IP addresses might not be present in the DHCP pool. Therefore, when you select a port role, ensure that the corresponding port security settings for the VLAN are applicable to the interface.

For basic information about port security features such as DHCP snooping (CLI option **examine-dhcp**) or dynamic ARP inspection (DAI) (CLI option **arp-inspection**), see “[Configuring Port Security \(J-Web Procedure\)](#)” on page 4541. For detailed descriptions of port security features, see the Port Security topics in the EX Series documentation at <http://www.juniper.net/techpubs/>.

Click **Details** to view the configuration parameters for the selected port role.

- VLAN—Enables you to configure VLAN options for the selected interface.
  - Link—Enables you to modify the following link options for the selected interface:
    - Speed
    - MTU
    - Autonegotiation
    - Flow Control
    - Duplex
    - Media Type
  - IP—Enables you to configure an IP address for the interface.
4. Configure the interface by configuring options in the selected option set. See [Table 269 on page 2621](#) for details of the options.
5. Repeat Steps 3 and 4 for the remaining option sets that you want to configure for the interface.

**NOTE:** To enable or disable the administrative status of a selected interface, click **Enable Port** or **Disable Port**.

Table 269: Port Edit Options

| Field                 | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Your Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Port Mode               | Specifies the mode of operation for the interface: trunk or access.                                                                                                                                | <p>If you select <b>Trunk</b>, you can:</p> <ol style="list-style-type: none"> <li>1. Click <b>Add</b> to add a VLAN member.</li> <li>2. Select the VLAN and click <b>OK</b>.</li> <li>3. (Optional) Associate a native VLAN with the interface.</li> <li>4. Click <b>OK</b>.</li> </ol> <p>If you select <b>Access</b>, you can:</p> <ol style="list-style-type: none"> <li>1. Select the VLAN member to be associated with the interface.</li> <li>2. (Optional) Associate a VoIP VLAN with the interface. Only a VLAN with a VLAN ID can be associated as a VoIP VLAN.</li> </ol> <p><b>NOTE:</b> VoIP is not supported on EX8200 switches.</p> <ol style="list-style-type: none"> <li>3. Click <b>OK</b>.</li> </ol> |
| Link Options            |                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| MTU (bytes)             | Specifies the maximum transmission unit size (MTU) for the interface.                                                                                                                              | Type a value from <b>256</b> through <b>9216</b> . The default MTU size for Gigabit Ethernet interfaces is <b>1514</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Speed                   | Specifies the speed for the mode.                                                                                                                                                                  | <p>Select one of the following values: <b>10 Mbps</b>, <b>100 Mbps</b>, <b>1000 Mbps</b>, or <b>Auto-Negotiation</b>.</p> <p><b>NOTE:</b> EX4300 switches supports <b>Auto-Negotiation 10M-100M</b> apart from the values mentioned above.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Duplex                  | Specifies the link mode.                                                                                                                                                                           | <p>Select one: <b>automatic</b>, <b>half</b>, or <b>full</b>.</p> <p><b>NOTE:</b> Link mode <b>half</b> is not supported on EX4300 switches.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Description             | <p>Describes the link.</p> <p><b>NOTE:</b> If the interface is part of a link aggregation group (LAG), only the <b>Description</b> option is enabled. Other Port Edit options are unavailable.</p> | Enter a brief description for the link.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Enable Auto Negotiation | Enables or disables autonegotiation.                                                                                                                                                               | Select the check box to enable autonegotiation, or clear the check box to disable it. By default, autonegotiation is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Enable Flow Control     | Enables or disables flow control.                                                                                                                                                                  | Select the check box to enable flow control to regulate the amount of traffic sent out of the interface, or clear the check box to disable flow control and permit unrestricted traffic. Flow control is enabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

Table 269: Port Edit Options (*continued*)

| Field        | Function                                                                                                                                                          | Your Action                                                                                                                                                                                                                                                                                                                                                                   |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Media Type   | Specifies the media type selected.                                                                                                                                | Select the check box to enable the media type. Then select <b>Copper</b> or <b>Fiber</b> .                                                                                                                                                                                                                                                                                    |
| IP Options   |                                                                                                                                                                   |                                                                                                                                                                                                                                                                                                                                                                               |
| IPv4 Address | Specifies an IPv4 address for the interface.<br><br><i>NOTE:</i> If the IPv4 Address check box is cleared, the interface still belongs to the <b>inet</b> family. | <ol style="list-style-type: none"> <li>1. Select the <b>IPv4 address</b> check box to specify an IPv4 address.</li> <li>2. Type an IP address—for example: <b>10.10.10.10</b>.</li> <li>3. Enter the subnet mask or address prefix. For example, 24 bits represents <b>255.255.255.0</b>.</li> <li>4. Click <b>OK</b>.</li> </ol>                                             |
| IPv6 Address | Specifies an IPv6 address for the interface.<br><br><i>NOTE:</i> If the IPv6 Address check box is cleared, the interface still belongs to the <b>inet</b> family. | <ol style="list-style-type: none"> <li>1. Select the <b>IPv6 address</b> check box to specify an IPv6 address.</li> <li>2. Type an IP address—for example: <b>2001:ab8:85a3::8a2e:370:7334</b>.</li> <li>3. Enter the subnet mask or address prefix.</li> <li>4. Click <b>OK</b>.</li> </ol> <p><i>NOTE:</i> IPv6 address is not supported on EX2200 and EX4500 switches.</p> |

Table 270: Recommended CoS Settings for Port Roles

| CoS Parameter         | Recommended Settings                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Forwarding Classes    | <p>There are four forwarding classes:</p> <ul style="list-style-type: none"> <li>• <b>voice</b>—Queue number is set to 7.</li> <li>• <b>expedited-forwarding</b>—Queue number is set to 5.</li> <li>• <b>assured-forwarding</b>—Queue number is set to 1.</li> <li>• <b>best-effort</b>—Queue number is set to 0.</li> </ul>                                                                                                                                                                                                                                                     |
| Schedulers            | <p>The schedulers and their settings are:</p> <ul style="list-style-type: none"> <li>• Strict-priority—Transmission rate is set to 10 percent and buffer size to 5 percent.</li> <li>• Expedited-scheduler—Transmission rate is set to 30 percent, buffer size to 30 percent, and priority to <b>low</b>.</li> <li>• Assured-scheduler—Transmission rate is set to 25 percent, buffer size to 25 percent, and priority to <b>low</b>.</li> <li>• Best-effort scheduler—Transmission rate is set to 35 percent, buffer size to 40 percent, and priority to <b>low</b>.</li> </ul> |
| Scheduler maps        | When a desktop and phone, routed uplink, or Layer 2 uplink role is applied on an interface, the forwarding classes and schedulers are mapped using the scheduler map.                                                                                                                                                                                                                                                                                                                                                                                                            |
| ieee-802.1 classifier | Imports the default <b>ieee-802.1</b> classifier configuration and sets the loss priority to <b>low</b> for the code point 101 for the <b>voice</b> forwarding class.                                                                                                                                                                                                                                                                                                                                                                                                            |

Table 270: Recommended CoS Settings for Port Roles (*continued*)

| CoS Parameter                | Recommended Settings                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

### Port Role Configuration with the J-Web Interface (with CLI References)

When you configure Gigabit Ethernet interface properties with the J-Web interface (Configure > Interfaces) you can optionally select pre-configured port roles for those interfaces. When you select a role from the **Port Role** field and apply it to a port, the J-Web interface modifies the switch configuration using CLI commands. [Table 271 on page 2625](#) lists the CLI commands applied for each port role.

**NOTE:** If there is an existing port role configuration, it is cleared before the new port role configuration is applied.

Table 271: Port Role Configuration Summary

| Configuration Description                                 | CLI Commands                                                                          |
|-----------------------------------------------------------|---------------------------------------------------------------------------------------|
| Default Port Role                                         |                                                                                       |
| Set the port role to <b>Default</b> .                     | <code>set interfaces <i>interface</i> apply-macro juniper-port-profile Default</code> |
| Set port family to <b>ethernet-switching</b> .            | <code>set interfaces <i>interface</i> unit 0 family ethernet-switching</code>         |
| Set port mode to <b>access</b> .                          | <code>port-mode access</code>                                                         |
| Enable RSTP if redundant trunk groups are not configured. | <code>delete protocols rstp interface <i>interface</i> disable</code>                 |
| Disable RSTP if redundant trunk groups are configured.    | <code>set protocols rstp interface <i>interface</i> disable</code>                    |
| Desktop Port Role                                         |                                                                                       |
| Set the port role to desktop.                             | <code>set interfaces <i>interface</i> apply-macro juniper-port-profile Desktop</code> |

## Adding a Logical Unit Description to the Configuration

You can include a text description of each logical unit in the configuration file. Any descriptive text you include is displayed in the output of the **show interfaces** commands, and is also exposed in the **ifAlias** Management Information Base (MIB) object. It has no impact on the interface's configuration. To add a text description, include the **description** statement:

```
description text;
```

You can include this statement at the following hierarchy levels:

- **[edit interfaces *interface-name* unit *logical-unit-number*]**
- **[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]**

The description can be a single line of text. If the text contains spaces, enclose it in quotation marks.

**NOTE:** You can configure the extended DHCP relay to include the interface description in the option 82 Agent Circuit ID suboption. See [“Using DHCP Relay Agent Option 82 Information” on page 1464](#) in the *Junos OS Subscriber Management and Services Library*.

For information about describing physical interfaces, see *Configuring Interface Description*.

## Disabling a Physical Interface

You can disable a physical interface, marking it as being down, without removing the interface configuration statements from the configuration. To do this, include the **disable** statement at the **[edit interfaces *interface-name*]** hierarchy level:

```
[edit interfaces interface-name]  
disable;
```

**CAUTION:** Dynamic subscribers and logical interfaces use physical interfaces for connection to the network. The Junos OS allows you to set the interface to disable and commit the change while dynamic subscribers and logical interfaces are still active. This action results in the loss of all subscriber connections on the interface. Use care when disabling interfaces.

**NOTE:** On the router, when you use the **disable** statement at the **edit interfaces** hierarchy level, depending on the PIC type, the interface might or might not turn off the laser. Older PIC transceivers do not support turning off the laser, but newer Gigabit Ethernet PICs with SFP and XFP transceivers do support it and the laser will be turned off when the interface is disabled.

Table 273: Effect of set interfaces disable <interface\_name> on T series PICs

| PIC Model Number  | PIC Description                                                               | Type of PIC | Behaviour             |
|-------------------|-------------------------------------------------------------------------------|-------------|-----------------------|
| PF-12XGE-SFPP     | 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (T4000 Router)                      | 5           | Tx laser disabled     |
| PF-24XGE-SFPP     | 10-Gigabit Ethernet LAN/WAN PIC with Oversubscription and SFP+ (T4000 Router) | 5           | Tx laser disabled     |
| PF-1CGE-CFP       | 100-Gigabit Ethernet PIC with CFP (T4000 Router)                              | 5           | Tx laser disabled     |
| PD-4XGE-XFP       | 10-Gigabit Ethernet, 4-port LAN/WAN XFP                                       | 4           | Tx laser disabled     |
| PD-5-10XGE-SFPP   | 10-Gigabit LAN/WAN with SFP+                                                  | 4           | Tx laser disabled     |
| PD-1XLE-CFP       | 40-Gigabit with CFP                                                           | 4           | Tx laser disabled     |
| PD-1CE-CFP-FPC4   | 100-Gigabit with CFP                                                          | 4           | Tx laser disabled     |
| PD-TUNNEL         | 40-Gigabit Tunnel Services                                                    | 4           | NA                    |
| PD-4OC192-SON-XFP | OC192/STM64, 4-port XFP                                                       | 4           | Tx laser not disabled |
| PD-1OC768-SON-SR  | OC768c/STM256, 1-port                                                         | 4           | Tx laser not disabled |

**WARNING:** Do not stare into the laser beam or view it directly with optical instruments even if the interface has been disabled.

### Example: Disabling a Physical Interface

Sample interface configuration:

```
[edit interfaces]
user@host# show
ge-0/3/2 {
  unit 0 {
    description CE2-to-PE1;
    family inet {
      address 20.1.1.6/24;
    }
  }
}
```

Disabling the interface:

```
[edit interfaces]
user@host# set ge-0/3/2 disable
```

Verifying the interface configuration:

```
[edit interfaces]
user@host# show
ge-0/3/2 {
  disable; # Interface is marked as disabled.
  unit 0 {
    description CE2-to-PE1;
    family inet {
      address 20.1.1.6/24;
    }
  }
}
```

### Disabling a Logical Interface

You can unconfigure a logical interface, effectively disabling that interface, without removing the logical interface configuration statements from the configuration. To do this, include the **disable** statement:

```
disable;
```

You can include this statement at the following hierarchy levels:

- **[edit interfaces *interface-name* unit *logical-unit-number*]**
- **[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]**

When an interface is disabled, a route (pointing to the reserved target “**REJECT**”) with the IP address of the interface and a 32-bit subnet mask is installed in the routing table. See *Routing Protocols*.

## Configuring Flow Control

By default, the router or switch imposes flow control to regulate the amount of traffic sent out on a Fast Ethernet, Tri-Rate Ethernet copper, Gigabit Ethernet, and 10-Gigabit Ethernet interface. Flow control is not supported on the 4-port Fast Ethernet PIC. This is useful if the remote side of the connection is a Fast Ethernet or Gigabit Ethernet switch.

You can disable flow control if you want the router or switch to permit unrestricted traffic. To disable flow control, include the **no-flow-control** statement:

```
no-flow-control;
```

To explicitly reinstate flow control, include the **flow-control** statement:

```
flow-control;
```

You can include these statements at the following hierarchy levels:

- [edit interfaces *interface-name* aggregated-ether-options]
- [edit interfaces *interface-name* ether-options]
- [edit interfaces *interface-name* fastether-options]
- [edit interfaces *interface-name* ggether-options]

**NOTE:** On the Type 5 FPC, to prioritize control packets in case of ingress oversubscription, you must ensure that the neighboring peers support MAC flow control. If the peers do not support MAC flow control, then you must disable flow control.

## Configuring the Interface Address

You assign an address to an interface by specifying the address when configuring the protocol family. For the **inet** or **inet6** family, configure the interface IP address. For the **iso** family, configure one or more addresses for the loopback interface. For the **ccc**, **ethernet-switching**, **tcc**, **mpls**, **tnp**, and **vpls** families, you never configure an address.

**NOTE:** The point-to-point (PPP) address is taken from the loopback interface address that has the primary attribute. When the loopback interface is configured as an unnumbered interface, it takes the primary address from the donor interface.

To assign an address to an interface, include the **address** statement:

```
address address {
  broadcast address;
  destination address;
  destination-profile name;
  eui-64;
  preferred;
  primary;
}
```

You can include these statements at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* family *family*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family *family*]

In the **address** statement, specify the network address of the interface.

For each address, you can optionally configure one or more of the following:

- Broadcast address for the interface subnet—Specify this in the **broadcast** statement; this applies only to Ethernet interfaces, such as the management interface **fxp0**, **em0**, or **me0** the Fast Ethernet interface, and the Gigabit Ethernet interface.
- Address of the remote side of the connection (for point-to-point interfaces only)—Specify this in the **destination** statement.
- PPP properties to the remote end—Specify this in the **destination-profile** statement. You define the profile at the [edit access group-profile *name* ppp] hierarchy level (for point-to-point interfaces only).
- Whether the router or switch automatically generates the host number portion of interface addresses—The **eui-64** statement applies only to interfaces that carry IPv6 traffic, in which the prefix length of the address is 64 bits or less, and the low-order 64 bits of the address are zero. This option does not apply to the loopback interface (**lo0**) because IPv6 addresses configured on the loopback interface must have a 128-bit prefix length.
- Whether this address is the preferred address—Each subnet on an interface has a preferred local address. If you configure more than one address on the same subnet, the preferred local address is chosen by default as the source address when you originate packets to destinations on the subnet.

By default, the preferred address is the lowest-numbered address on the subnet. To override the default and explicitly configure the preferred address, include the **preferred** statement when configuring the address.

- Whether this address is the primary address—Each interface has a primary local address. If an interface has more than one address, the primary local address is used by default as the source address when you send packets from an interface where the destination provides no information about the subnet (for example, some **ping** commands).

By default, the primary address on an interface is the lowest-numbered non-127 (in other words, non-loopback) preferred address on the interface. To override the default and explicitly configure the preferred address, include the **primary** statement when configuring the address.

**NOTE:** If you configure a duplicate IP address on an interface, even when the earlier interface with that IP address is disabled, a **Warning** message is added to the syslog and not displayed on the screen. Do not configure the same IP address of a disabled interface on another interface.

---

### Configuring Interface IPv4 Addresses

---

You can configure router or switch interfaces with a 32-bit IP version 4 (IPv4) address and optionally with a destination prefix, sometimes called a *subnet mask*. An IPv4 address utilizes a 4-octet dotted decimal address syntax (for example, **192.16.1.1**). An IPv4 address with destination prefix utilizes a 4-octet dotted decimal address syntax with a destination prefix appended (for example, **192.16.1.1/30**).

To configure an IPv4 address on routers and switches running Junos OS, use the **edit interface *interface-name* unit *number* family inet address *a.b.c.d/nn*** statement at the **[edit interfaces]** hierarchy level.

**NOTE:** Juniper Networks routers and switches support /31 destination prefixes when used in point-to-point Ethernet configurations; however, they are not supported by many other devices, such as hosts, hubs, routers, or switches. You must determine if the peer system also supports /31 destination prefixes before configuration.

---

### *Operational Behavior of Interfaces when the Same IPv4 Address is Assigned to Them*

You can configure the same IPv4 address on multiple physical interfaces. When you assign the same IPv4 address to multiple physical interfaces, the operational behavior of those interfaces differs, depending on whether they are implicitly or explicitly point-to-point.

**NOTE:** By default, all interfaces are assumed to be point-to-point (PPP) interfaces. For all interfaces except aggregated Ethernet, Fast Ethernet, and Gigabit Ethernet, you can explicitly configure an interface to be a point-to-point connection.

**NOTE:** If you configure the same address on multiple interfaces in the same routing instance, Junos OS uses only the first configuration, the remaining address configurations are ignored and can leave interfaces without an address. Interfaces that do not have an assigned address cannot be used as a donor interface for an unnumbered Ethernet interface.

For example, in the following configuration the address configuration of interface xe-0/0/1.0 is ignored:

```
interfaces {
  xe-0/0/0 {
    unit 0 {
      family inet {
        address 192.168.1.1/24;
      }
    }
  }
  xe-0/0/1 {
    unit 0 {
      family inet {
        address 192.168.1.1/24;
      }
    }
  }
}
```

The following examples show the sample configuration of assigning the same IPv4 address to implicitly and explicitly point-to-point interfaces, and their corresponding **show interfaces terse** command outputs to see their operational status.

#### Configuring same IPv4 address on implicitly PPP interfaces:

```
[edit]
user@host# show
ge-0/1/0 {
  unit 0 {
    family inet {
      address 200.1.1.1/24;
    }
  }
}
ge-3/0/1 {
  unit 0 {
    family inet {
      address 200.1.1.1/24;
    }
  }
}
```

The sample output shown below for the above configuration reveals that only **ge-0/1/0.0** was assigned the same IPv4 address **200.1.1.1/24** and its **link** state was **up**, while **ge-3/0/1.0** was not assigned the IPv4 address, though its **link** state was **up**, which means that it will be operational only when it gets a unique IPv4 address other than **200.1.1.1/24**.

```
user@host> show interfaces terse ge*
Interface           Admin Link Proto  Local          Remote
ge-0/1/0            up    up    up
ge-0/1/0.0          up    up    inet    200.1.1.1/24
                    multiservice
ge-0/1/1            up    down
ge-3/0/0            up    down
ge-3/0/1            up    up
ge-3/0/1.0          up    up    inet
                    multiservice
```

#### Configuring same IPv4 address on explicitly PPP interfaces:

```
[edit]
user@host# show
so-0/0/0 {
  unit 0 {
    family inet {
      address 200.1.1.1/24;
    }
  }
}
so-0/0/3 {
  unit 0 {
    family inet {
      address 200.1.1.1/24;
    }
  }
}
```

The sample output shown below for the above configuration reveals that both **so-0/0/0.0** and **so-0/0/3.0** were assigned the same IPv4 address **200.1.1.1/24** and that their **link** states were **down**, which means that to make them operational at least one of them will have to be configured with a unique IPv4 address other than **200.1.1.1/24**.

```
user@host> show interfaces terse so*
Interface           Admin Link Proto  Local          Remote
so-0/0/0            up    up
so-0/0/0.0          up    down inet    200.1.1.1/24
so-0/0/1            up    up
so-0/0/2            up    down
so-0/0/3            up    up
so-0/0/3.0          up    down inet    200.1.1.1/24
so-1/1/0            up    down
so-1/1/1            up    down
so-1/1/2            up    up
so-1/1/3            up    up
so-2/0/0            up    up
so-2/0/1            up    up
so-2/0/2            up    up
so-2/0/3            up    down
```

## Configuring Interface IPv6 Addresses

**NOTE:** IPv6 is not currently supported for the QFX Series.

You represent IP version 6 (IPv6) addresses in hexadecimal notation using a colon-separated list of 16-bit values.

You assign a 128-bit IPv6 address to an interface by including the **address** statement:

```
address aaaa:bbbb:...:zzzz/nn;
```

**NOTE:** You cannot configure a subnet zero IPv6 address because RFC 2461 reserves the subnet-zero address for anycast addresses, and Junos OS complies with the RFC.

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* family inet6]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family inet6]

The double colon (::) represents all bits set to 0, as shown in the following example:

```
interfaces fe-0/0/1 {
  unit 0 {
    family inet6 {
      address fec0:1:1::2/64;
    }
  }
}
```

**NOTE:** You must manually configure the router or switch advertisement and advertise the default prefix for autoconfiguration to work on a specific interface.

## Configuring the Interface Bandwidth

By default, the Junos OS uses the physical interface's speed for the MIB-II object, **ifSpeed**. You can configure the logical unit to populate the **ifSpeed** variable by configuring a bandwidth value for the logical interface. The **bandwidth** statement sets an informational-only parameter; you cannot adjust the actual bandwidth of an interface with this statement.

**NOTE:** We recommend that you be careful when setting this value. Any interface bandwidth value that you configure using the **bandwidth** statement affects how the interface cost is calculated for a dynamic routing protocol, such as OSPF. By default, the interface cost for a dynamic routing protocol is calculated using the following formula:

$$\text{cost} = \text{reference-bandwidth} / \text{bandwidth},$$

where bandwidth is the physical interface speed. However, if you specify a value for bandwidth using the **bandwidth** statement, that value is used to calculate the interface cost, rather than the actual physical interface bandwidth.

To configure the bandwidth value for a logical interface, include the **bandwidth** statement:

**bandwidth** *rate*;

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]

**rate** is the peak rate, in bps or cps. You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation **k** (1000), **m** (1,000,000), or **g** (1,000,000,000). You can also specify a value in cells per second by entering a decimal number followed by the abbreviation **c**; values expressed in cells per second are converted to bits per second using the formula 1 cps = 384 bps. The value can be any positive integer. The **bandwidth** statement is valid for all logical interfaces, except multilink interfaces.

## Configuring the Media MTU

The media maximum transmission unit (MTU) is the largest data unit that can be forwarded without fragmentation.

This topic contains the following sections:

---

### Media MTU Overview

The default media MTU size used on a physical interface depends on the encapsulation used on that interface. In some cases, the default IP Protocol MTU depends on whether the protocol used is IP version 4 (IPv4) or International Organization for Standardization (ISO).

The default media MTU is calculated as follows:

**Default media MTU = Default IP MTU + encapsulation overhead**

When you are configuring point-to-point connections, the MTU sizes on both sides of the connections must be the same. Also, when you are configuring point-to-multipoint connections, all interfaces in the subnet must use the same MTU size. For details about encapsulation overhead, see [“Encapsulation Overhead by Encapsulation Type” on page 2641](#).

**NOTE:** The actual frames transmitted also contain cyclic redundancy check (CRC) bits, which are not part of the media MTU. For example, the media MTU for a Gigabit Ethernet Version 2 interface is specified as 1514 bytes, but the largest possible frame size is actually 1518 bytes; you need to consider the extra bits in calculations of MTUs for interoperability.

The physical MTU for Ethernet interfaces does not include the 4-byte frame check sequence (FCS) field of the Ethernet frame.

A SONET/SDH interface operating in concatenated mode has a “c” added to the rate descriptor. For example, a concatenated OC48 interface is referred to as OC48c.

If you do not configure an MPLS MTU, the Junos OS derives the MPLS MTU from the physical interface MTU. From this value, the software subtracts the encapsulation-specific overhead and space for the maximum number of labels that might be pushed in the Packet Forwarding Engine. Currently, the software provides for three labels of four bytes each, for a total of 12 bytes.

In other words, the formula used to determine the MPLS MTU is the following:

$$\text{MPLS MTU} = \text{physical interface MTU} - \text{encapsulation overhead} - 12$$

If you configure an MTU value by including the `mtu` statement at the `[edit interfaces interface-name unit logical-unit-number family mpls]` hierarchy level, the configured value is used.

---

### How to Configure the Media MTU

---

To modify the default media MTU size for a physical interface, include the `mtu` statement at the `[edit interfaces interface-name]` hierarchy level:

```
[edit interfaces interface-name]  
  mtu bytes;
```

If you change the size of the media MTU, you must ensure that the size is equal to or greater than the sum of the protocol MTU and the encapsulation overhead.

**NOTE:** Changing the media MTU or protocol MTU causes an interface to be deleted and added again.

You configure the protocol MTU by including the `mtu` statement at the following hierarchy levels:

- `[edit interfaces interface-name unit logical-unit-number family family]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family]`

Because tunnel services interfaces are considered logical interfaces, you cannot configure the MTU setting for the physical interface. This means you cannot include the **mtu** statement at the **[edit interfaces *interface-name*]** hierarchy level for the following interface types: generic routing encapsulation (**gr-**), IP-IP (**ip-**), loopback (**lo-**), link services (**ls-**), multilink services (**ml-**), and multicast (**pe-**, **pd-**). You can, however, configure the protocol MTU on tunnel interfaces, as described in [“Setting the Protocol MTU” on page 2651](#).

### Encapsulation Overhead by Encapsulation Type

**Table 274: Encapsulation Overhead by Encapsulation Type**

| Interface Encapsulation                                                     | Encapsulation Overhead (Bytes) |
|-----------------------------------------------------------------------------|--------------------------------|
| 802.1Q/Ethernet 802.3                                                       | 21                             |
| 802.1Q/Ethernet Subnetwork Access Protocol (SNAP)                           | 26                             |
| 802.1Q/Ethernet version 2                                                   | 18                             |
| ATM Cell Relay                                                              | 4                              |
| ATM permanent virtual connection (PVC)                                      | 12                             |
| Cisco HDLC                                                                  | 4                              |
| Ethernet 802.3                                                              | 17                             |
| Ethernet circuit cross-connect (CCC) and virtual private LAN service (VPLS) | 4                              |
| Ethernet over ATM                                                           | 32                             |
| Ethernet SNAP                                                               | 22                             |
| Ethernet translational cross-connect (TCC)                                  | 18                             |
| Ethernet version 2                                                          | 14                             |
| Extended virtual local area network (VLAN) CCC and VPLS                     | 4                              |
| Extended VLAN TCC                                                           | 22                             |
| Frame Relay                                                                 | 4                              |
| PPP                                                                         | 4                              |
| VLAN CCC                                                                    | 4                              |

| 4-port ISDN BRI PIM                                      | 1504                      | 4092                | 1500                            |
| T3 (DS3) or E3 PIM                                       | 4474                      | 9192                | 4470                            |

**Media MTU Sizes by Interface Type for J4350 and J6350 Platforms****Table 284: Media MTU Sizes by Interface Type for J4350 and J6350 Platforms**

| Interface Type                                           | Default Media MTU (Bytes) | Maximum MTU (Bytes) | Default IP Protocol MTU (Bytes) |
|----------------------------------------------------------|---------------------------|---------------------|---------------------------------|
| 4-port ISDN BRI PIM                                      | 1504                      | 4092                | 1500                            |
| ADSL2+ PIM                                               | 4482                      | 9150                | 4470                            |
| Dual-port Fast Ethernet (10/100) PIM                     | 1514                      | 9192                | 1500                            |
| Dual-port Serial PIM                                     | 1504                      | 9150                | 1500                            |
| Dual-port T1 or E1 PIM                                   | 1504                      | 9150                | 1500                            |
| Dual-port Channelized T1/E1 PIM (channelized to DS0s)    | 1504                      | 4500                | 1500                            |
| Dual-port Channelized T1/E1 PIM (clear channel T1 or E1) | 1504                      | 9150                | 1500                            |
| 4-port Fast Ethernet (10/100) ePIM                       | 1518                      | 1518                | 1500                            |

**Table 284: Media MTU Sizes by Interface Type for J4350 and J6350 Platforms** (*continued*)

| Interface Type                                                           | Default Media MTU (Bytes) | Maximum MTU (Bytes) | Default IP Protocol MTU (Bytes) |
|--------------------------------------------------------------------------|---------------------------|---------------------|---------------------------------|
| Gigabit Ethernet (10/100/1000) built-in interface                        | 1514                      | 9018                | 1500                            |
| Gigabit Ethernet (10/100/1000) Enhanced Physical Interface Module (ePIM) | 1514                      | 9018                | 1500                            |
| Gigabit Ethernet (10/100/1000) SFP ePIM                                  | 1514                      | 9018                | 1500                            |
| G.SHDSL PIM                                                              | 4482                      | 9150                | 4470                            |
| T3 (DS3) or E3 PIM                                                       | 4474                      | 9192                | 4470                            |

**NOTE:** On Gigabit Ethernet ePIMs in J4350 and J6350 Services Routers, you can configure a maximum transmission unit (MTU) size of only 9018 bytes even though the CLI indicates that you can configure an MTU of up to 9192 bytes. If you configure an MTU greater than 9018 bytes, the router does not accept the configuration and generates a system log error message similar to the following:

```
/kernel: ge-0/0/0: Illegal media change. MTU invalid: 9192. Max MTU supported on this PIC: 9018
```

On 4-port Fast Ethernet ePIMs in J4350 and J6350 Services Routers, you can configure a maximum transmission unit (MTU) size of only 1518 bytes even though the CLI indicates that you can configure an MTU of up to 9192 bytes. If you configure an MTU greater than 1518 bytes, the router does not accept the configuration and generates a system log error message similar to the following:

```
/kernel: fe-3/0/1: Illegal media change. MTU invalid: 9192. Max MTU supported on this PIC: 1518
```

## Media MTU Sizes by Interface Type for EX Series Switches and ACX Series Routers

Table 285: Media MTU Sizes by Interface Type for EX Series Switches and ACX Series Routers

| Interface Type      | Default Media MTU (Bytes) | Maximum MTU (Bytes) | Default IP Protocol MTU (Bytes) |
|---------------------|---------------------------|---------------------|---------------------------------|
| Gigabit Ethernet    | 1514                      | 9192                | 1500 (IPv4),<br>1497 (ISO)      |
| 10-Gigabit Ethernet | 1514                      | 9192                | 1500 (IPv4),<br>1497 (ISO)      |

**NOTE:** On ACX Series routers, you can configure the protocol MTU by including the `mtu` statement at the `[edit interfaces interface-name unit logical-unit-number family inet]` or `[edit interfaces interface-name unit logical-unit-number family inet6]` hierarchy level.

- If you configure the protocol MTU at any of these hierarchy levels, the configured value is applied to all families that are configured on the logical interface.
- If you are configuring the protocol MTU for both `inet` and `inet6` families on the same logical interface, you must configure the same value for both the families. It is not recommended to configure different MTU size values for `inet` and `inet6` families that are configured on the same logical interface.

## Media MTU Sizes by Interface Type for PTX Series Packet Transport Routers

Table 286: Media MTU Sizes by Interface Type for PTX Series Packet Transport Routers

| Interface Type       | Default Media MTU (Bytes) | Maximum MTU (Bytes) | Default IP Protocol MTU (Bytes)            |
|----------------------|---------------------------|---------------------|--------------------------------------------|
| 10-Gigabit Ethernet  | 1514                      | 9500                | 1500 (IPv4),<br>1488 (MPLS),<br>1497 (ISO) |
| 40-Gigabit Ethernet  | 1514                      | 9500                | 1500 (IPv4),<br>1488 (MPLS),<br>1497 (ISO) |
| 100-Gigabit Ethernet | 1514                      | 9500                | 1500 (IPv4),<br>1488 (MPLS),<br>1497 (ISO) |

- [Setting the Protocol MTU on page 2651](#)

## Setting the Protocol MTU

When you initially configure an interface, the protocol maximum transmission unit (MTU) is calculated automatically. If you subsequently change the media MTU, the protocol MTU on existing address families automatically changes.

For a list of default protocol MTU values, see [“Configuring the Media MTU” on page 2638](#).

To modify the MTU for a particular protocol family, include the **mtu** statement:

**mtu** *bytes*;

You can include this statement at the following hierarchy levels:

- **[edit interfaces *interface-name* unit *logical-unit-number* family *family*]**
- **[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family *family*]**

If you increase the size of the protocol MTU, you must ensure that the size of the media MTU is equal to or greater than the sum of the protocol MTU and the encapsulation overhead. For a list of encapsulation overhead values, see [Table 274 on page 2641](#). If you reduce the media MTU size, but there are already one or more address families configured and active on the interface, you must also reduce the protocol MTU size. (You configure the media MTU by including the **mtu** statement at the **[edit interfaces *interface-name*]** hierarchy level, as discussed in [“Configuring the Media MTU” on page 2638](#).)

**NOTE:** Changing the media MTU or protocol MTU causes an interface to be deleted and added again.

The maximum number of data-link connection identifiers (DLCIs) is determined by the MTU on the interface. If you have keepalives enabled, the maximum number of DLCIs is 1000, with the MTU set to 5012.

The actual frames transmitted also contain cyclic redundancy check (CRC) bits, which are not part of the MTU. For example, the default protocol MTU for a Gigabit Ethernet interface is 1500 bytes, but the largest possible frame size is actually 1504 bytes; you need to consider the extra bits in calculations of MTUs for interoperability.

## Interface Ranges

**NOTE:** This task uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see [Interface Ranges](#). For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 3](#).

Junos OS allows you to group a range of identical interfaces into an *interface range*. You first specify the group of identical interfaces in the interface range. Then you can apply a common configuration to the specified interface range, reducing the number of configuration statements required and saving time while producing a compact configuration.

- [Configuration Expansion Where Interface Range Is Used on page 2659](#)

---

### Configuring Interface Ranges

---

To configure an interface range, include the **interface-range** statement at the **[edit interfaces]** hierarchy level.

The **interface-range** statement accepts only physical networking interface names in its definition.

Interfaces can be grouped either as a range of interfaces or using a number range under the **interface-range** statement definition.

Interfaces in an **interface-range** definition can be added as part of a member range or as individual members or multiple members using a number range.

To specify a member range, use the **member-range** statement at the **[edit interfaces interface-range *name*]** hierarchy level.

To specify interfaces in lexical order, use the **member-range start-range to end-range** statement.

A range for a member statement must contain the following:

- **\***—All, specifies sequential interfaces from 0 through 47.

**CAUTION:** The wildcard **\*** in a member statement does not take into account the interface numbers supported by a specific interface type. Irrespective of the interface type, **\*** includes interface numbers ranging from 0 through 47 to the interface group. Therefore, use **\*** in a member statement with caution.

- **num**—Number; specifies one specific interface by its number.
- **[low-high]**—Numbers between low to high; specifies a range of sequential interfaces.
- **[num1, num2, num3]**—Numbers **num1**, **num2**, and **num3** specify multiple specific interfaces.

**Example: Specifying an  
Interface Range  
Member Range**

```
member-range ge-0/0/0 to ge-4/0/40;
```

To specify one or multiple members, use the **member** statement at the **[edit interfaces interface-range *name*]** hierarchy level.

To specify the list of interface range members individually or for multiple interfaces using regex, use the **member *list of interface names*** statement.

**Example: Specifying an  
Interface Range  
Member**

```
member ge-0/0/0;  
member ge-0/*/*  
member ge-0/[1-10]/0;  
member ge-0/[1,2,3]/3;
```

Regex or wildcards are not supported for interface-type prefixes. For example, prefixes **ge**, **fe**, and **xe** must be mentioned explicitly.

An **interface-range** definition can contain both **member** and **member-range** statements within it. There is no maximum limit on the number of **member** or **member-range** statements within an interface-range. However, at least one **member** or **member-range** statement must exist within an **interface-range** definition.

**Example: Interface  
Range Common  
Configuration**

Configuration common to an interface range can be added as a part of the **interface-range** definition, as follows:

```
[edit]  
interfaces {  
  + interface-range foo {  
    + member-range ge-1/0/0 to ge-4/0/40;  
    + member ge-0/1/1;  
    + member ge-5/[1-10]/*;  
    /*Common configuration is added as part of interface-range definition*/  
    mtu 256;  
    hold-time up 10;  
    ether-options {  
      flow-control;  
      speed {  
        100m;  
      }  
      802.3ad primary;  
    }  
  }  
}
```

An **interface-range** definition having just **member** or **member-range** statements and no common configurations statements is valid.

These defined interface ranges can be used in other configuration hierarchies, in places where an **interface** node exists.

**Example:  
Interface-Range foo  
Used Under the  
Protocols Hierarchy**

```
protocols {  
  dot1x {  
    authenticator {  
      interface foo{  
        retries 1;
```

```
    }  
  }  
}
```

**foo** should be an **interface-range** defined at the **[interfaces]** hierarchy level. In the above example, the **interface** node can accept both individual interfaces and interface ranges.

**TIP:** To view an interface range in expanded configuration, use the **(show | display inheritance)** command. For more information, see the *CLI User Guide*.

The defined interface ranges can be used at places where the **interface** node is used in the following configuration hierarchies:

- forwarding-options analyzer *name* input egress interface
- forwarding-options analyzer *name* input ingress interface
- poe interface
- protocols dot1x authenticator interface
- protocols igmp interface
- protocols isis interface
- protocols layer2-control bpdu-block interface
- protocols link-management peer *name* lmp-control-channel
- protocols link-management te-link *name* interface
- protocols lldp interface
- protocols lldp-med interface
- protocols mstp interface
- protocols oam ethernet link-fault-management interface
- protocols ospf area *area-id* interface
- protocols pim interface
- protocols router-advertisement interface
- protocols router-discovery interface
- protocols rsvp interface
- protocols sflow interfaces
- protocols vstp vlan *vlan-id* interface
- switch-options redundant-trunk-group group-name interface
- switch-options voip interface

### Expanding Interface Range Member and Member Range Statements

All **member** and **member-range** statements in an interface range definition are expanded to generate the final list of interface names for the specified interface range.

#### Example: Expanding Interface Range Member and Member Range Statements

```
[edit]
interfaces {
  interface-range range-1 {
    member-range ge-0/0/0 to ge-4/0/20;
    member ge-10/1/1;
    member ge-5/[0-5]/*;
    /*Common configuration is added part of the interface-range definition*/
    mtu 256;
    hold-time up 10;
    ether-options {
      flow-control;
      speed {
        100m;
      }
      802.3ad primary;
    }
  }
}
```

For the **member-range** statement, all possible interfaces between **start-range** and **end-range** are considered in expanding the members. For example, the following **member-range** statement:

**member-range ge-0/0/0 to ge-4/0/20**

expands to:

```
[ge-0/0/0, ge-0/0/1 ... ge-0/0/max_ports
ge-0/1/0 ge-0/1/1 ... ge-0/1/max_ports
ge-0/2/0 ge-0/2/1 ... ge-0/2/max_ports
.
.
ge-0/MAX_PICS/0 ... ge-0/max_pics/max_ports
ge-1/0/0 ge-1/0/1 ... ge-1/0/max_ports
.
ge-1/MAX_PICS/0 ... ge-1/max_pics/max_ports
.
.
ge-4/0/0 ge-4/0/1 ... ge-4/0/max_ports]
```

The following **member** statement:

**ge-5/[0-5]/\***

expands to:

```
ge-5/0/0 ... ge-5/0/max_ports
ge-5/1/0 ... ge-5/0/max_ports
.
.
ge-5/5/0 ... ge-5/5/max_ports
```

The following **member** statement:

```
ge-5/1/[2,3,6,10]
```

expands to:

```
ge-5/1/2
ge-5/1/3
ge-5/1/6
ge-5/1/10
```

### Configuration Inheritance for Member Interfaces

---

When the Junos OS expands the **member** and **member-range** statements present in an **interface-range**, it creates *interface objects* if they are not explicitly defined in the configuration. The common configuration is copied to all its member interfaces in the **interface-range**.

**Example:** Foreground interface configuration takes priority compared to configuration inherited by the interface through the **interface-range**.

#### Configuration Priorities

```
interfaces {
  interface-range range-1 {
    member-range ge-1/0/0/ to ge-10/0/47;
    mtu 256;
  }
  ge-1/0/1 {
    mtu 1024;
  }
}
```

In the preceding example, interface **ge-1/0/1** will have an MTU value of 1024.

This can be verified with output of the **show interfaces | display inheritance** command, as follows:

```
user@host: # show interfaces | display inheritance
## 'ge-1/0/0' was expanded from interface-range 'range-1'
##
ge-1/0/0 {
  ##
  ## '256' was expanded from interface-range 'range-1'
  ##
  mtu 256;
}
ge-1/0/1 {
  mtu 1024;
}
##
## 'ge-1/0/2' was expanded from interface-range 'range-1'
##
ge-1/0/2 {
  ##
  ## '256' was expanded from interface-range 'range-1'
  ##
  mtu 256;
}
.....
.....
##
## 'ge-10/0/47' was expanded from interface-range 'range-1'
##
```

```

ge-10/0/47 {
  ##
  ## '256' was expanded from interface-range 'range-1'
  ##
  mtu 256;
}

```

### Member Interfaces Inheriting Configuration from Configuration Groups

Interface range member interfaces inherit the config-groups configuration like any other foreground configuration. **interface-range** is similar to any other foreground configuration statement. The only difference is that the **interface-range** goes through a member interfaces expansion before Junos OS reads this configuration.

```

groups {
  global {
    interfaces {
      <*> {
        hold-time up 10;
      }
    }
  }
  apply-groups [global];
  interfaces {
    interface-range range-1 {
      member-range ge-1/0/0 to ge-10/0/47;
      mtu 256;
    }
  }
}

```

The **hold-time** configuration is applied to all members of **interface-range range-1**.

This can be verified with **show interfaces | display inheritance** as follows:

```

user@host# show interfaces | display inheritance
ge-1/0/0 {
  ##
  ## '256' was expanded from interface-range 'range-1'
  ##
  mtu 256;
  ##
  ## 'hold-time' was inherited from group 'global'
  ## '10' was inherited from group 'global'
  ##
  hold-time up 10;
}
ge-1/0/1 {
  ##
  ## '256' was expanded from interface-range 'range-1'
  ##
  mtu 256;
  ##
  ## 'hold-time' was inherited from group 'global'
  ## '10' was inherited from group 'global'
  ##
  hold-time up 10;
}
ge-10/0/47 {

```

```
##
## '256' was expanded from interface-range 'range-1'
##
mtu 256;
##
## 'hold-time' was inherited from group 'global'
## '10' was inherited from group 'global'
##
hold-time up 10;
}
```

---

### Interfaces Inheriting Common Configuration

If an interface is a member of several interface ranges, that interface will inherit the common configuration from all of those interface ranges.

```
[edit]
interfaces {
  interface-range range-1 {
    member-range ge-1/0/0 to ge-10/0/47;
    mtu 256;
  }
}
interfaces {
  interface-range range-1 {
    member-range ge-10/0/0 to ge-10/0/47;
    hold-time up 10;
  }
}
```

In this example, interfaces **ge-10/0/0** through **ge-10/0/47** will have both **hold-time** and **mtu**.

---

### Configuring Inheritance Range Priorities

The interface ranges are defined in the order of inheritance priority, with the first interface range configuration data taking priority over subsequent interface ranges.

```
[edit]
interfaces {
  interface-range int-grp-one {
    member-range ge-0/0/0 to ge-4/0/40;
    member ge-1/1/1;
    /*Common config is added part of the interface-range definition*/
    mtu 256;
    hold-time up 10;
  }
}
interfaces {
  interface-range int-grp-two {
    member-range ge-5/0/0 to ge-10/0/40;
    member ge-1/1/1;
    mtu 1024;
  }
}
```

Interface **ge-1/1/1** exists in both **interface-range int-grp-one** and **interface-range int-grp-two**. This interface inherits **mtu 256** from **interface-range int-grp-one** because it was defined first.

### Configuration Expansion Where Interface Range Is Used

In this example, **interface-range range-1** is used under the **protocols** hierarchy:

```
[edit]
interfaces {
  interface-range range-1 {
    member ge-10/1/1;
    member ge-5/5/1;
    mtu 256;
    hold-time up 10;
    ether-options {
      flow-control;
      speed {
        100m;
      }
      802.3ad primary;
    }
  }
}
protocols {
  dot1x {
    authenticator {
      interface range-1 {
        retries 1;
      }
    }
  }
}
```

The **interface** node present under **authenticator** is expanded into member interfaces of the **interface-range range-1** as follows:

```
protocols {
  dot1x {
    authenticator {
      interface ge-10/1/1 {
        retries 1;
      }
      interface ge-5/5/1 {
        retries 1;
      }
    }
  }
}
```

The **interface range-1** statement is expanded into two interfaces, **ge-10/1/1** and **ge-5/5/1**, and configuration **retries 1** is copied under those two interfaces.

This configuration can be verified using the **show protocols dot1x | display inheritance** command.

## Configuring Accounting for the Physical Interface

Juniper Networks routers and switches can collect various kinds of data about traffic passing through the router and switch. You can set up one or more *accounting profiles* that specify some common characteristics of this data, including the following:

- The fields used in the accounting records
- The number of files that the router or switch retains before discarding, and the number of bytes per file
- The polling period that the system uses to record the data

You configure the profiles and define a unique name for each profile using statements at the **[edit accounting-options]** hierarchy level. There are two types of accounting profiles: interface profiles and filter profiles. You configure interface profiles by including the **interface-profile** statement at the **[edit accounting-options]** hierarchy level. You configure filter profiles by including the **filter-profile** statement at the **[edit accounting-options]** hierarchy level. For more information, see the *Network Management Administration Guide for Routing Devices*.

You apply filter profiles by including the **accounting-profile** statement at the **[edit firewall filter *filter-name*]** and **[edit firewall family *family* filter *filter-name*]** hierarchy levels. For more information, see the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices*.

### Applying an Accounting Profile to the Physical Interface

---

To enable accounting on an interface, include the **accounting-profile** statement at the **[edit interfaces *interface-name*]** hierarchy level:

```
[edit interfaces interface-name]  
  accounting-profile name;
```

You can also reference profiles by logical unit; for more information, see “[Configuring Accounting for the Logical Interface](#)” on page 2661.

#### *Example: Applying an Accounting Profile to the Physical Interface*

Configure an accounting profile for an interface and apply it to a physical interface:

```
[edit]  
accounting-options {  
  file if_stats {  
    size 4m files 10 transfer-interval 15;  
    archive-sites {  
      "ftp://login:password@host/path";  
    }  
  }  
  interface-profile if_profile {  
    interval 15;  
    file if_stats {  
      fields {  
        input-bytes;  
        output-bytes;  
      }  
    }  
  }  
}
```

```

        input-packets;
        output-packets;
        input-errors;
        output-errors;
    }
}
}
[edit interfaces ge-1/0/1]
accounting-profile if_profile;

```

## Configuring Accounting for the Logical Interface

Juniper Networks routers or switches can collect various kinds of data about traffic passing through the router or switch. You can set up one or more *accounting profiles* that specify some common characteristics of this data, including the following:

- The fields used in the accounting records
- The number of files that the router or switch retains before discarding, and the number of bytes per file
- The period that the system uses to record the data

You configure the profiles and define a unique name for each profile using statements at the **[edit accounting-options]** hierarchy level. There are two types of accounting profiles: interface profiles and filter profiles. You configure interface profiles by including the **interface-profile** statement at the **[edit accounting-options]** hierarchy level. You configure filter profiles by including the **filter-profile** statement at the **[edit accounting-options]** hierarchy level. For more information, see the *Network Management Administration Guide for Routing Devices*.

You apply filter profiles by including the **accounting-profile** statement at the **[edit firewall filter *filter-name*]** and **[edit firewall family *family* filter *filter-name*]** hierarchy levels. For more information, see the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices*.

### Applying an Accounting Profile to the Logical Interface

To enable accounting on a logical interface, include the **accounting-profile** statement:

```
accounting-profile name;
```

You can include this statement at the following hierarchy level:

- **[edit interfaces *interface-name* unit *logical-unit-number*]**

You can also reference profiles for the physical interface; for more information, see [“Configuring Accounting for the Physical Interface” on page 2660](#).

#### *Example: Applying an Accounting Profile to the Logical Interface*

Configure an accounting profile for an interface and apply it to a logical interface:

```

[edit]
accounting-options {

```

```
file if_stats {
  size 4m files 10 transfer-interval 15;
  archive-sites {
    "ftp://login:password@host/path";
  }
}
interface-profile if_profile {
  interval 15;
  file if_stats {
    fields {
      input-bytes;
      output-bytes;
      input-packets;
      output-packets;
      input-errors;
      output-errors;
    }
  }
}
[edit interfaces ge-1/0/1 unit 1]
accounting-profile if_profile;
```

To reference profiles by physical interface, see [“Applying an Accounting Profile to the Physical Interface” on page 2660](#). For information about configuring a firewall filter accounting profile, see the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices*.

## Configuring Ethernet Loopback Capability

By default, local aggregated Ethernet, Fast Ethernet, Tri-Rate Ethernet copper, Gigabit Ethernet, and 10-Gigabit Ethernet interfaces connect to a remote system. To place an interface in loopback mode, include the **loopback** statement:

**loopback;**

**NOTE:** If you configure a local loopback on a 1-port 10-Gigabit IQ2 and IQ2-E PIC using the loopback statement at the [edit interfaces *interface-name* *gigether-options*] hierarchy level, the transmit-path stops working, causing the remote end to detect a link down.

To return to the default—that is, to disable loopback mode—delete the **loopback** statement from the configuration:

```
[edit]
user@host# delete interfaces fe-fpc/pic/port fastether-options loopback
```

To explicitly disable loopback mode, include the **no-loopback** statement:

**no-loopback;**

You can include the **loopback** and **no-loopback** statements at the following hierarchy levels:

- [edit interfaces *interface-name* aggregated-ether-options]
- [edit interfaces *interface-name* ether-options]
- [edit interfaces *interface-name* fastether-options]
- [edit interfaces *interface-name* gigether-options]

#### Related Documentation

## Configuring Gratuitous ARP

Gratuitous Address Resolution Protocol (ARP) requests provide duplicate IP address detection. A gratuitous ARP request is a broadcast request for a router's own IP address. If a router or switch sends an ARP request for its own IP address and no ARP replies are received, the router- or switch-assigned IP address is not being used by other nodes. If a router or switch sends an ARP request for its own IP address and an ARP reply is received, the router- or switch-assigned IP address is already being used by another node.

By default, the router or switch responds to gratuitous ARP requests. On Ethernet interfaces, you can disable responses to gratuitous ARP requests. To disable responses to gratuitous ARP requests, include the **no-gratuitous-arp-request** statement at the [edit interfaces *interface-name*] hierarchy level:

```
[edit interfaces interface-name]
no-gratuitous-arp-request;
```

To return to the default—that is, to respond to gratuitous ARP requests—delete the **no-gratuitous-arp-request** statement from the configuration:

```
[edit]
user@host# delete interfaces interface-name no-gratuitous-arp-request
```

Gratuitous ARP replies are reply packets sent to the broadcast MAC address with the target IP address set to be the same as the sender's IP address. When the router or switch receives a gratuitous ARP reply, the router or switch can insert an entry for that reply in the ARP cache.

By default, updating the ARP cache on gratuitous ARP replies is disabled on the router or switch. On Ethernet interfaces, you can enable handling of gratuitous ARP replies on a specific interface by including the **gratuitous-arp-reply** statement at the [edit interfaces *interface-name*] hierarchy level:

```
[edit interfaces interface-name]
gratuitous-arp-reply;
```

To restore the default behavior, include the **no-gratuitous-arp-reply** statement at the **[edit interfaces *interface-name*]** hierarchy level:

```
[edit interfaces interface-name]  
no-gratuitous-arp-reply;
```

## Configuring Static ARP Table Entries

To configure static ARP table entries, include the **arp** statement:

```
arp ip-address (mac | multicast-mac) mac-address <publish>;
```

You can include this statement at the following hierarchy levels:

- **[edit interfaces *interface-name* unit *logical-unit-number* family inet address *address*]**
- **[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family inet address *address*]**

The IP address that you specify must be part of the subnet defined in the enclosing **address** statement.

To associate a multicast MAC address with a unicast IP address, include the **multicast-mac** statement.

Specify the MAC address as six hexadecimal bytes in one of the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn*; for example, 0011.2233.4455 or 00:11:22:33:44:55.

For unicast MAC addresses only, if you include the **publish** option, the router or switch replies to proxy ARP requests.

**NOTE:** By default, an ARP policer is installed that is shared among all the Ethernet interfaces on which you have configured the **family inet** statement. By including the **arp** statement at the **[edit interfaces *interface-name* unit *logical-unit-number* family inet policer]** hierarchy level, you can apply a specific ARP-packet policer to an interface. This feature is not available on EX Series switches.

When you need to conserve IP addresses, you can configure an Ethernet interface to be unnumbered by including the **unnumbered-address** statement at the **[edit interfaces *interface-name* unit *logical-unit-number* family inet]** hierarchy level.

---

**NOTE:** The Junos OS supports the IPv6 static neighbor discovery cache entries, similar to the static ARP entries in IPv4.

### Example: Configuring Static ARP Table Entries

Configure two static ARP table entries on the router or switch's management interface:

```
[edit interfaces]
fxp0 {
  unit 0 {
    family inet {
      address 10.10.0.11/24 {
        arp 10.10.0.99 mac 0001.0002.0003;
        arp 10.10.0.101 mac 00:11:22:33:44:55 publish;
      }
    }
  }
}
```

### Disabling the Transmission of Redirect Messages on an Interface

By default, the interface sends protocol redirect messages. To disable the sending of these messages on an interface, include the **no-redirects** statement:

```
no-redirects;
```

You can include this statement at the following hierarchy levels:

- `[edit interfaces interface-name unit logical-unit-number family family]`
- `[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family]`

To disable the sending of protocol redirect messages for the entire router or switch, include the **no-redirects** statement at the `[edit system]` hierarchy level.

#### Related Documentation

- [no-redirects on page 2817](#)

### Configuring Restricted and Unrestricted Proxy ARP

To configure restricted or unrestricted proxy ARP, include the **proxy-arp** statement:

```
proxy-arp (restricted |unrestricted);
```

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* ]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]

To return to the default—that is, to disable restricted or unrestricted proxy ARP—delete the **proxy-arp** statement from the configuration:

```
[edit]
user@host# delete interfaces interface-name unit logical-unit-number proxy-arp
```

You can track the number of restricted or unrestricted proxy ARP requests processed by the router or switch by issuing the **show system statistics arp** operational mode command.

**NOTE:** When proxy ARP is enabled as default or unrestricted, the router or switch responds to any ARP request as long as the device has an active route to the target address of the ARP request. This gratuitous ARP behavior can result in an error when the receiving interface and target response interface are the same and the end device (for example, a client) performs a duplicate address check. To prevent this error, configure the router or switch interface with the **no-gratuitous-arp-reply** statement. See [“Configuring Gratuitous ARP” on page 2663](#) for information about how to disable responses to gratuitous ARP requests.

## Enabling or Disabling SNMP Notifications on Logical Interfaces

By default, Simple Network Management Protocol (SNMP) notifications are sent when the state of an interface or a connection changes. To explicitly enable these notifications on the logical interface, include the **traps** statement; to disable these notifications on the logical interface, include the **no-traps** statement:

```
(traps | no-traps);
```

You can include these statements at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]

**NOTE:** Gigabit Ethernet interfaces on J Series routers do not support SNMP.

## Configuring Aggregated Ethernet Links (CLI Procedure)

Use the link aggregation feature to aggregate one or more links to form a virtual link or link aggregation group (LAG). The MAC client can treat this virtual link as if it were a single link to increase bandwidth, provide graceful degradation as failure occurs, and increase availability.

**NOTE:** An interface with an already configured IP address cannot form part of the aggregation group.

To configure aggregated Ethernet interfaces, using the CLI:

1. Specify the number of aggregated Ethernet interfaces to be created:

```
[edit chassis]
user@switch# set aggregated-devices ethernet device-count number
```

2. Specify the minimum number of links for the aggregated Ethernet interface (aex), that is, the defined bundle, to be labeled *up*:

**NOTE:** By default, only one link must be up for the bundle to be labeled *up*.

```
[edit interfaces]
user@switch# set ae0 aggregated-ether-options minimum-links number
```

3. Specify the link speed for the aggregated Ethernet bundle:

```
[edit interfaces]
user@switch# set ae0 aggregated-ether-options link-speed speed
```

4. Specify the members to be included within the aggregated Ethernet bundle:

```
[edit interfaces]
user@switch# set xe-fpc/pic/port ether-options 802.3ad ae0
user@switch# set xe-fpc/pic/port ether-options 802.3ad ae0
```

5. Specify an interface family for the aggregated Ethernet bundle:

```
[edit interfaces]
user@switch# set ae0 unit 0 family inet address address
```

For information about adding LACP to a LAG, see “Configuring Aggregated Ethernet LACP (CLI Procedure)” on page 2671.

## Configuring Aggregated Ethernet Interfaces (J-Web Procedure)

---

**NOTE:** This topic applies only to the J-Web Application package.

---

Use the link aggregation feature to aggregate one or more Ethernet interfaces to form a virtual link or link aggregation group (LAG) on an EX Series switch. The MAC client can treat this virtual link as if it were a single link. Link aggregation increases bandwidth, provides graceful degradation as failure occurs, and increases availability. You can use the J-Web interface to configure aggregated Ethernet interfaces, or a LAG, on the switch.

---

**NOTE:** Interfaces that are already configured with MTU, duplex, flow control, or logical interfaces are listed but are not available for aggregation.

---

To configure an aggregated Ethernet interface (also referred to as a LAG):

1. Select **Configure > Interfaces > Link Aggregation**.

The list of aggregated interfaces is displayed.

---

**NOTE:** After you make changes to the configuration on this page, you must commit the changes immediately for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See [Using the Commit Options to Commit Configuration Changes](#) for details about all commit options.

---

2. Click one of the following:

- **Add**—Creates an aggregated Ethernet interface, or LAG. Enter information as specified in [Table 287 on page 2669](#).
- **Edit**—Modifies a selected LAG.
  - **Aggregation**—Modifies settings for the selected LAG. Enter information as specified in [Table 287 on page 2669](#).
  - **VLAN**—Specifies VLAN options for the selected LAG. Enter information as specified in [Table 288 on page 2670](#).
  - **IP Option**—Specifies IP options for the selected LAG. Enter information as specified in [Table 289 on page 2670](#).
- **Delete**—Deletes the selected LAG.

- **Disable Port** or **Enable Port**—Disables or enables the administrative status on the selected interface.
- **Device Count**—Configures the number of aggregated logical devices available to the switch. Select the number and click **OK**.

Table 287: Aggregated Ethernet Interface Options

| Field                | Function                                                                                                                                                                                                                                                                                                                                                                                      | Your Action                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Aggregated Interface | Specifies the name of the aggregated interface.                                                                                                                                                                                                                                                                                                                                               | None. The name is supplied by the software.                                                                                                                                                                                                                                                                                                                                                                       |
| LACP Mode            | <p>Specifies the mode in which LACP packets are exchanged between the interfaces. The modes are:</p> <ul style="list-style-type: none"> <li>• <b>None</b>—Indicates that no mode is applicable.</li> <li>• <b>Active</b>—Indicates that the interface initiates transmission of LACP packets</li> <li>• <b>Passive</b>—Indicates that the interface responds only to LACP packets.</li> </ul> | Select from the list.                                                                                                                                                                                                                                                                                                                                                                                             |
| Description          | Specifies a description for the LAG.                                                                                                                                                                                                                                                                                                                                                          | Enter a description.                                                                                                                                                                                                                                                                                                                                                                                              |
| Interface            | Specifies the interfaces in the LAG.                                                                                                                                                                                                                                                                                                                                                          | <p>To add interfaces to the LAG, select the interfaces and click <b>Add</b>. For an EX8200 Virtual Chassis configuration, select the member, FPC, and the interface from the list. Click <b>OK</b>.</p> <p>To remove an interface from the LAG, select the interface and click <b>Remove</b>.</p> <p><b>NOTE:</b> Only interfaces that are configured with the same speed can be selected together for a LAG.</p> |
| Enable Log           | Specifies whether to enable generation of log entries for the LAG.                                                                                                                                                                                                                                                                                                                            | Select the check box to enable log generation, or clear the check box to disable log generation.                                                                                                                                                                                                                                                                                                                  |

Table 288: VLAN Options

| Field     | Function                                                       | Your Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------|----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port Mode | Specifies the mode of operation for the port: trunk or access. | <p>If you select <b>Trunk</b>, you can:</p> <ol style="list-style-type: none"> <li>1. Click <b>Add</b> to add a VLAN member.</li> <li>2. Select the VLAN and click <b>OK</b>.</li> <li>3. (Optional) Associate a native VLAN ID with the port.</li> </ol> <p>If you select <b>Access</b>, you can:</p> <ol style="list-style-type: none"> <li>1. Select the VLAN member to be associated with the port.</li> <li>2. (Optional) Associate a VoIP VLAN with the interface. Only a VLAN with a VLAN ID can be associated as a VoIP VLAN.</li> </ol> <p>Click <b>OK</b>.</p> |

Table 289: IP Options

| Field        | Function                                        | Your Action                                                                                                                                                                                                                                                                                            |
|--------------|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IPv4 Address | Specifies an IPv4 address for the selected LAG. | <ol style="list-style-type: none"> <li>1. Select the check box <b>IPv4 address</b>.</li> <li>2. Type an IP address—for example, <b>10.10.10.10</b>.</li> <li>3. Enter the subnet mask or address prefix. For example, 24 bits represents <b>255.255.255.0</b>.</li> <li>4. Click <b>OK</b>.</li> </ol> |
| IPv6 Address | Specifies an IPv6 address for the selected LAG. | <ol style="list-style-type: none"> <li>1. Select the check box <b>IPv6 address</b>.</li> <li>2. Type an IP address—for example, <b>2001:ab8:85a3::8a2e:370:7334</b>.</li> <li>3. Enter the subnet mask or address prefix.</li> <li>4. Click <b>OK</b>.</li> </ol>                                      |

## Configuring Aggregated Ethernet LACP (CLI Procedure)

For aggregated Ethernet interfaces on EX Series switches, you can configure the Link Aggregation Control Protocol (LACP). LACP is one method of bundling several physical interfaces to form one logical interface. You can configure aggregated Ethernet interfaces with or without LACP enabled.

LACP was designed to achieve the following:

- Automatic addition and deletion of individual links to the bundle without user intervention
- Link monitoring to check whether both ends of the bundle are connected to the correct group

**NOTE:** You can also configure LACP link protection on aggregated Ethernet interfaces. For information, see [“Configuring LACP Link Protection of Aggregated Ethernet Interfaces \(CLI Procedure\)” on page 2672](#).

The Junos OS implementation of LACP provides link monitoring but not automatic addition and deletion of links.

Before you configure LACP, be sure you have:

- Configured the aggregated Ethernet bundles—also known as link aggregation groups (LAGs). See [“Configuring Aggregated Ethernet Links \(CLI Procedure\)” on page 2667](#)

When LACP is enabled, the local and remote sides of the aggregated Ethernet links exchange protocol data units (PDUs), which contain information about the state of the link. You can configure Ethernet links to actively transmit PDUs, or you can configure the links to passively transmit them (sending out LACP PDUs only when they receive them from another link). One side of the link must be configured as **active** for the link to be up.

**NOTE:** Do not add LACP to a LAG if the remote end of the LAG link is a security device, unless the security device supports LACP. Security devices often do not support LACP because they require a deterministic configuration.

To configure LACP:

1. Configure at least one side of the aggregated Ethernet link as active:

```
[edit interfaces]
user@switch# set aeX aggregated-ether-options lacp active
```

2. Specify the interval at which the interfaces send LACP packets:

```
[edit interfaces]
user@switch# set aeX aggregated-ether-options lacp periodic interval
```

**NOTE:** The LACP process exists in the system only if you configure the system in either active or passive LACP mode.

## Configuring LACP Link Protection of Aggregated Ethernet Interfaces (CLI Procedure)

You can configure LACP link protection and system priority at the global level on the switch or for a specific aggregated Ethernet interface. When using LACP link protection to protect a single link in the aggregated ethernet bundle, you configure only two member links for an aggregated Ethernet interface: one active and one standby. LACP link protection ensures that only one link—the link with the higher priority—is used for traffic. The other link is forced to stay in a *waiting* state.

When using LACP link protection to protect multiple links in an aggregated ethernet bundle, you configure links into primary and backup subgroups. A link protection subgroup is a collection of ethernet links within the aggregated ethernet bundle. When you use link protection subgroups, you configure a primary subgroup and a backup subgroup. The configuration process includes assigning member links to each subgroup. When the configuration process is complete, the primary subgroup is used to forward traffic until a switchover event, such as a link failure, occurs and causes the backup subgroup to assume control of traffic that was travelling on the links in the primary subgroup within the bundle.

By default LACP link protection reverts to a higher-priority (lower-numbered) link when the higher-priority link becomes operational or when a higher-priority link is added to the aggregated Ethernet bundle. For priority purposes, LACP link protection treats subgroups like links. You can suppress link calculation by adding the **non-revertive** statement to the link protection configuration. In nonrevertive mode, when a link is active in sending and receiving LACP packets, adding a higher-priority link to the bundle does not change the status of the currently active link. It remains active.

If LACP link configuration is specified to be nonrevertive at the global **[edit chassis]** hierarchy level, you can specify the **revertive** statement in the LACP link protection configuration at the aggregated Ethernet interface level to override the nonrevertive setting for the interface. In revertive mode, adding a higher-priority link to the aggregated

Ethernet bundle results in LACP recalculating the priority and switching the status from the currently active link to the newly added, higher-priority link.

**NOTE:** When LACP link protection is enabled on both local and remote sides of the link, both sides must use the same mode (either revertive or nonrevertive).

Configuring LACP link configuration at the aggregated Ethernet level results in only the configured interfaces using the defined configuration. LACP interface configuration also enables you to override global (chassis) LACP settings.

Before you configure LACP link protection, be sure you have:

- Configured the aggregated Ethernet bundles—also known as link aggregation groups (LAGs). See [“Configuring Aggregated Ethernet Links \(CLI Procedure\)” on page 2667](#).
- Configured LACP for the interface. See [“Configuring Aggregated Ethernet LACP \(CLI Procedure\)” on page 2671](#).

You can configure LACP link protection for all aggregated Ethernet interfaces on the switch by enabling it at the global level on the switch or configure it for a specific aggregated Ethernet interface by enabling it on that interface.

- [Configuring LACP Link Protection for a Single Link at the Global Level on page 2674](#)
- [Configuring LACP Link Protection for a Single Link at the Aggregated Interface Level on page 2674](#)
- [Configuring Subgroup Bundles to Provide LACP Link Protection to Multiple Links in an Aggregated Ethernet Interface on page 2675](#)

### Configuring LACP Link Protection for a Single Link at the Global Level

---

To configure LACP link protection for aggregated Ethernet interfaces at the global level:

1. Enable LACP link protection on the switch:

```
[edit chassis aggregated-devices ethernet lacp]
user@switch# set link-protection
```

2. (Optional) Configure the LACP link protection for the aggregated Ethernet interfaces to be in nonrevertive mode:

**NOTE:** LACP link protection is in revertive mode by default.

```
[edit chassis aggregated-devices ethernet lacp link-protection]
user@switch# set non-revertive
```

3. (Optional) To configure LACP system priority for the aggregated Ethernet interfaces:

```
[edit chassis aggregated-devices ethernet lacp]
user@switch# set system-priority
```

### Configuring LACP Link Protection for a Single Link at the Aggregated Interface Level

---

To enable LACP link protection for a specific aggregated Ethernet interface:

1. Enable LACP link protection for the interface:

```
[edit interfaces aeX aggregated-ether-options lacp]
user@switch# set link-protection
```

2. (Optional) Configure the LACP link protection for the aggregated Ethernet interface to be in revertive or nonrevertive mode:

- To specify revertive mode:

```
[edit interfaces aeX aggregated-ether-options lacp link-protection]
user@switch# set revertive
```

- To specify nonrevertive mode:

```
[edit interfaces aeX aggregated-ether-options lacp link-protection]
user@switch# set non-revertive
```

3. (Optional) To configure LACP system priority for an aggregated Ethernet interface:

```
[edit interfaces aeX aggregated-ether-options lacp link-protection]
user@switch# set system-priority
```

4. (Optional) To configure LACP port priority for an aggregated Ethernet interface:

```
[edit interfaces ge-fpc/pic/port ether-options 802.3ad lacp]
user@switch# set port-priority
```

## Configuring Subgroup Bundles to Provide LACP Link Protection to Multiple Links in an Aggregated Ethernet Interface

You can configure link protection subgroup bundles to provide link protection for multiple links in an aggregated ethernet bundle.

Link protection subgroups allow you to provide link protection to a collection of Ethernet links within a LAG bundle, instead of providing protection to a single link in the aggregated ethernet bundle only. You can, for instance, configure a primary subgroup with three member links and a backup subgroup with three different member links and use the backup subgroup to provide link protection for the primary subgroup.

To configure link protection using subgroups:

1. Configure the primary link protection subgroup in the aggregated ethernet interface:

```
[edit interfaces aeX aggregated-ether-options]
user@switch# set link-protection-sub-group group-name primary
```

For instance, to create a primary link protection subgroup named **subgroup-primary** for interface **ae0**:

```
[edit interfaces ae0 aggregated-ether-options]
user@switch# set link-protection-sub-group subgroup-primary primary
```

2. Configure the backup link protection subgroup in the aggregated ethernet interface:

```
[edit interfaces aeX aggregated-ether-options]
user@switch# set link-protection-sub-group group-name backup
```

For instance, to create a backup link protection subgroup named **subgroup-backup** for interface **ae0**:

```
[edit interfaces ae0 aggregated-ether-options]
user@switch# set link-protection-sub-group subgroup-backup backup
```

**NOTE:** You can create one primary and one backup link protection subgroup per aggregated ethernet interface.

3. Attach interfaces to the link protection subgroups:

```
[edit interfaces interface-name ether-options 802.3ad]
user@switch# set link-protection-sub-group group-name
```

**NOTE:** The primary and backup link protection subgroups must contain the same number of interfaces. For instance, if the primary link protection subgroup contains three interfaces, the backup link protection subgroup must also contain three interfaces.

For instance, to configure interfaces **ge-0/0/0** and **ge-0/0/1** into link protection subgroup **subgroup-primary** and interfaces **ge-0/0/2** and **ge-0/0/3** into link protection subgroup **subgroup-backup**:

```
[edit interfaces ge-0/0/0 ether-options 802.3ad]
user@switch# set link-protection-sub-group subgroup-primary
[edit interfaces ge-0/0/1 ether-options 802.3ad]
```

```
user@switch# set link-protection-sub-group subgroup-primary
[edit interfaces ge-0/0/2 ether-options 802.3ad]
user@switch# set link-protection-sub-group subgroup-backup
[edit interfaces ge-0/0/3 ether-options 802.3ad]
user@switch# set link-protection-sub-group subgroup-backup
```

4. (Optional) Configure the port priority for link protection:

```
[edit interfaces interface-name ether-options 802.3ad]
user@switch# set port-priority priority
```

The port priority is used to select the active link.

5. Enable link protection

To enable link protection at the LAG level:

```
[edit interfaces aeX aggregated-ether-options]
user@switch# set link-protection
```

To enable link protection at the LACP level:

```
[edit interfaces aeX aggregated-ether-options lacp]
user@switch# set link-protection
```

For instance, to enable link protection on **ae0** at the LAG level:

```
[edit interfaces ae0 aggregated-ether-options]
user@switch# set link-protection
```

For instance, to enable link protection on **ae0** at the LACP level:

```
[edit interfaces ae0 aggregated-ether-options lacp]
user@switch# set link-protection
```

## Configuring Aggregated Ethernet Link Protection

You can configure link protection for aggregated Ethernet interfaces to provide QoS on the links during operation.

On aggregated Ethernet interfaces, you designate a primary and backup link to support link protection. Egress traffic passes only through the designated primary link. This includes transit traffic and locally generated traffic on the router or switch. When the primary link fails, traffic is routed through the backup link. Because some traffic loss is unavoidable, egress traffic is not automatically routed back to the primary link when the primary link is reestablished. Instead, you manually control when traffic should be diverted back to the primary link from the designated backup link.

**NOTE:** Link protection is not supported on MX80.

- [Configuring Primary and Backup Links for Link Aggregated Ethernet Interfaces on page 2677](#)

- [Reverting Traffic to a Primary Link When Traffic is Passing Through a Backup Link on page 2677](#)
- [Disabling Link Protection for Aggregated Ethernet Interfaces on page 2677](#)

### Configuring Link Protection for Aggregated Ethernet Interfaces

Aggregated Ethernet interfaces support link protection to ensure QoS on the interface.

To configure link protection:

1. Specify that you want to configure the options for an aggregated Ethernet interface.

```
user@host# edit interfaces aex aggregated-ether-options
```

2. Configure the link protection mode.

```
[edit interfaces aex aggregated-ether-options]
user@host# set link-protection
```

### Configuring Primary and Backup Links for Link Aggregated Ethernet Interfaces

To configure link protection, you must specify a primary and a secondary, or backup, link.

To configure a primary link and a backup link:

1. Configure the primary logical interface.

```
[edit interfaces interface-name]
user@host# set (fastether-options | gigether-options) 802.3ad aex primary
```

2. Configure the backup logical interface.

```
[edit interfaces interface-name]
user@host# set (fastether-options | gigether-options) 802.3ad aex backup
```

### Reverting Traffic to a Primary Link When Traffic is Passing Through a Backup Link

On aggregated Ethernet interfaces, you designate a primary and backup link to support link protection. Egress traffic passes only through the designated primary link. This includes transit traffic and locally generated traffic on the router or switch. When the primary link fails, traffic is routed through the backup link. Because some traffic loss is unavoidable, egress traffic is not automatically routed back to the primary link when the primary link is reestablished. Instead, you manually control when traffic should be diverted back to the primary link from the designated backup link.

To manually control when traffic should be diverted back to the primary link from the designated backup link, enter the following operational command:

```
user@host> request interface revert aex
```

### Disabling Link Protection for Aggregated Ethernet Interfaces

To disable link protection, issue the **delete interface revert aex** configuration command.

```
user@host# delete interfaces aex aggregated-ether-options link-protection
```

## Configuring Aggregated Ethernet Link Speed

On aggregated Ethernet interfaces, you can set the required link speed for all interfaces included in the bundle. Generally, all interfaces that make up a bundle must have the same speed. If you include in the aggregated Ethernet interface an individual link that has a speed different from the speed that you specify in the **link-speed** parameter, an error message is logged. However, starting with Junos OS Release 13.2, aggregated Ethernet supports the following mixed rates and mixed modes on T640, T1600, T4000, and TX Matrix Plus routers:

- Member links of different modes (WAN and LAN) for 10-Gigabit Ethernet links.
- Member links of different rates: 10-Gigabit Ethernet, 40-Gigabit Ethernet, 50-Gigabit Ethernet, 100-Gigabit Ethernet, and OC192 (10-Gigabit Ethernet WAN mode)

---

### NOTE:

- Member links of 50-Gigabit Ethernet can only be configured using the 50-Gigabit Ethernet interfaces of 100-Gigabit Ethernet PIC with CFP (PD-1CE-CFP-FPC4).
  - Starting with Junos OS Release 13.2, 100-Gigabit Ethernet member links can be configured using the two 50-Gigabit Ethernet interfaces of 100-Gigabit Ethernet PIC with CFP. This 100-Gigabit Ethernet member link can be included in an aggregated Ethernet link that includes member links of other interfaces as well. In releases before Junos OS Release 13.2, the 100-Gigabit Ethernet member link configured using the two 50-Gigabit Ethernet interfaces of 100-Gigabit Ethernet PIC with CFP cannot be included in an aggregated Ethernet link that includes member links of other interfaces.
- 

To configure member links of mixed rates and mixed modes on T640, T1600, T4000, and TX Matrix Plus routers, you need to configure the **mixed** option for the **[edit interfaces aex aggregated-ether-options link-speed]** statement.

To set the required link speed:

1. Specify that you want to configure the aggregated Ethernet options.

```
user@host# edit interfaces interface-name aggregated-ether-options
```

2. Configure the link speed.

```
[edit interfaces interface-name aggregated-ether-options ]  
user@host# set link-speed speed
```

**speed** can be in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation **k** (1000), **m** (1,000,000), or **g** (1,000,000,000).

Aggregated Ethernet interfaces on the M120 router can have one of the following speeds:

- **100m**—Links are 100 Mbps.
- **10g**—Links are 10 Gbps.
- **1g**—Links are 1 Gbps.
- **oc192**—Links are OC192 or STM64c.

Aggregated Ethernet links on EX Series switches can be configured to operate at one of the following speeds:

- **10m**—Links are 10 Mbps.
- **100m**—Links are 100 Mbps.
- **1g**—Links are 1 Gbps.
- **10g**—Links are 10 Gbps.
- **50g**—Links are 50 Gbps.

Aggregated Ethernet links on T Series routers can be configured to operate at one of the following speeds:

- **100g**—Links are 100 Gbps.
- **100m**—Links are 100 Mbps.
- **10g**—Links are 10 Gbps.
- **1g**—Links are 1 Gbps.
- **40g**—Links are 40 Gbps.
- **50g**—Links are 50 Gbps.
- **80g**—Links are 80 Gbps.
- **8g**—Links are 8 Gbps.
- **mixed**—Links are of various speeds.
- **oc192**—Links are OC192.

## Configuring Aggregated Ethernet Minimum Links

On aggregated Ethernet interfaces, you can configure the minimum number of links that must be up for the bundle as a whole to be labeled **up**. By default, only one link must be up for the bundle to be labeled **up**.

To configure the minimum number of links:

1. Specify that you want to configure the aggregated Ethernet options.

```
user@host# edit interfaces interface-name aggregated-ether-options
```

2. Configure the minimum number of links.

```
[edit interfaces interface-name aggregated-ether-options]
```

```
user@host# set minimum-links number
```

On M120, M320, MX Series, T Series, and TX Matrix routers with Ethernet interfaces, and EX 9200 switches, the valid range for **minimum-links *number*** is 1 through 16. When the maximum value (16) is specified, all configured links of a bundle must be up for the bundle to be labeled **up**.

On all other routers and on EX Series switches, other than EX8200 switches, the range of valid values for **minimum-links *number*** is 1 through 8. When the maximum value (8) is specified, all configured links of a bundle must be up for the bundle to be labeled **up**.

On EX8200 switches, the range of valid values for **minimum-links *number*** is 1 through 12. When the maximum value (12) is specified, all configured links of a bundle must be up for the bundle to be labeled **up**.

If the number of links configured in an aggregated Ethernet interface is less than the minimum link value configured under the **aggregated-ether-options** statement, the configuration commit fails and an error message is displayed.

## Configuring Multichassis Link Aggregation

Multichassis link aggregation groups (MC-LAGs) enable a client device to form a logical LAG interface between two MC-LAG peers (for example, EX9200 switches). An MC-LAG provides redundancy and load balancing between the two MC-LAG peers, multihoming support, and a loop-free Layer 2 network without running the Spanning Tree Protocol (STP).

On one end of an MC-LAG, there is an MC-LAG client device, such as a server, that has one or more physical links in a link aggregation group (LAG). This client device does not need to have an MC-LAG configured. On the other side of MC-LAG, there are two MC-LAG peers. Each of the MC-LAG peers has one or more physical links connected to a single client device.

The MC-LAG peers use Interchassis Control Protocol (ICCP) to exchange control information and coordinate with each other to ensure that data traffic is forwarded properly.

**NOTE:** An interface with an already configured IP address cannot form part of the aggregated Ethernet interface or multichassis aggregated Ethernet interface group.

For information about MC-LAG functional behaviors, see the “MC-LAG Configuration Guidelines and Functional Behavior” section in the topic [“Understanding Multichassis Link Aggregation” on page 2599](#). For a list of best practice MC-LAG configuration guidelines, see the “MC-LAG Configuration Guidelines and Functional Behavior” section in the topic [“Understanding Multichassis Link Aggregation” on page 2599](#).

Perform the following steps on each switch that hosts an MC-LAG:

1. Specify the same multichassis aggregated Ethernet identification number for the MC-LAG that the aggregated Ethernet interface belongs to on each switch.

```
[edit interfaces]
user@switch# set aex aggregated-ether-options mc-ae mc-ae-id number
```

For example:

```
[edit interfaces]
user@switch# set ael aggregated-ether-options mc-ae mc-ae-id 3
```

2. Specify a unique chassis ID for the MC-LAG that the aggregated Ethernet interface belongs to on each switch.

```
[edit interfaces]
user@switch# set aex aggregated-ether-options mc-ae chassis-id number
```

For example:

```
[edit interfaces]
user@switch# set ael aggregated-ether-options mc-ae chassis-id 0
```

3. Specify the mode of the MC-LAG the aggregated Ethernet interface belongs to.

```
[edit interfaces]
user@switch# set aex aggregated-ether-options mc-ae mode mode
```

For example:

```
[edit interfaces]
user@switch# set ael aggregated-ether-options mc-ae mode active-active
```

4. Specify whether the aggregated Ethernet interface participating in the MC-LAG is primary or secondary. Primary is **active**, and secondary is **standby**.

**NOTE:** You must configure status control on both switches that host the MC-LAG. If one switch is in active mode, the other must be in standby mode.

```
[edit interfaces]
user@switch# set aex aggregated-ether-options mc-ae status-control (active | standby)
```

For example:

```
[edit interfaces]
user@switch# set ael aggregated-ether-options mc-ae status-control active
```

**NOTE:** You can configure the `prefer-status-control-active` statement with the `mc-ae status-control standby` configuration to prevent the LACP MC-LAG system ID from reverting to the default LACP system ID on ICCP failure. Use this configuration only if you can ensure that ICCP will not go down unless the router or switch is down. You must also configure the `hold-time down` value (at the `[edit interfaces interface-name]` hierarchy level) for the ICL with the `mc-ae status-control standby` configuration to be higher than the ICCP BFD timeout. This configuration prevents data traffic loss by ensuring that when the router or switch with the `mc-ae status-control active` configuration goes down, the router or switch with the `mc-ae status-control standby` configuration does not go into standby mode.

To make the `prefer-status-control-active` configuration work with the `mc-ae status-control standby` configuration when an ICL logical interface is configured on an aggregated Ethernet interface, you must either configure the `lACP periodic interval` statement at the `[edit interfaces interface-name aggregated-ether-options]` hierarchy level as `slow` or configure the `detection-time threshold` statement at the `[edit protocols iccp peer liveness-detection]` hierarchy level as less than 3 seconds.

On EX9200 switches, the `prefer-status-control-active` statement was added in Junos OS Release 13.2R1.

5. Specify the same LACP system ID on each switch.

```
[edit interfaces]
user@switch# set aex aggregated-ether-options lACP system-id mac-address
```

For example:

```
[edit interfaces]
user@switch# set ael aggregated-ether-options lACP system-id 00:01:02:03:04:05
```

6. Specify the same LACP administration key on each switch.

```
[edit interfaces]
user@switch# set aex aggregated-ether-options lACP admin-key number
```

For example:

```
[edit interfaces]
user@switch# set aex aggregated-ether-options lACP admin-key 3
```

7. Configure ICCP by performing the following steps on each switch that hosts the MC-LAG:

- a. Configure the local IP address to be used by the switches that host the MC-LAG.

```
[edit protocols]
user@switch# set iccp local-ip-addr local-ip-address
```

For example:

```
[edit protocols]
user@switch# set iccp local-ip-addr 3.3.3.1
```

- b. (Optional) Configure the IP address of the switch and the time during which an ICCP connection must be established between the switches that host the MC-LAG.

Configured session establishment hold time results in faster ICCP connection establishment. The recommended value is 50 seconds.

```
[edit protocols]
user@switch# set iccp peer peer-ip-address session-establishment-hold-time seconds
```

For example:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 session-establishment-hold-time 50
```

- c. (Optional) We recommend that you configure the backup liveness detection feature to implement faster failover of data traffic during an MC-LAG peer reboot. Configure the **backup-liveness-detection** statement on the management interface (fxp0) only.

**NOTE:** On EX9200 switches, the **backup-liveness-detection** statement was added in Junos OS Release 13.2R1.

```
[edit protocols]
user@switch# set iccp peer peer-ip-address backup-liveness-detection backup-peer-ip ip-address
```

For example:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 backup-liveness-detection backup-peer-ip 10.207.64.232
```

- d. Configure the minimum interval at which the switch must receive a reply from the other switch with which it has established a Bidirectional Forwarding Detection (BFD) session.

**NOTE:** Configuring the minimum receive interval is required to enable BFD. We recommend a minimum receive interval value of 6 seconds.

```
[edit protocols]
user@switch# set iccp peer peer-ip-address liveness-detection minimum-receive-interval
seconds
```

For example:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 liveness-detection minimum-receive-interval 60
```

- e. Configure the minimum transmit interval during which a switch must receive a reply from a switch with which it has established a BFD session.

```
[edit protocols]
user@switch# set iccp peer peer-ip-address liveness-detection transmit-interval
minimum-interval seconds
```

For example:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 liveness-detection transmit-interval minimum-interval
60
```

8. Configure a multichassis protection link between the switches.

```
[edit]
user@switch# set multi-chassis multi-chassis-protection peer-ip-address interface
interface-name
```

For example:

```
[edit protocols]
user@switch# set multi-chassis multi-chassis-protection 3.3.3.1 interface ae0
```

9. Disable Rapid Spanning Tree Protocol (RSTP) on the ICL interfaces on both switches.

**NOTE:** STP is not supported on the ICL or MC-LAG interfaces.

```
[edit]
user@switch# set protocols rstp interface interface-name disable
```

For example:

```
[edit]
user@switch# set protocols rstp interface ae0.0 disable
```

## Configuring Energy Efficient Ethernet on Interfaces (CLI Procedure)

Energy Efficient Ethernet (EEE), an Institute of Electrical and Electronics Engineers (IEEE) 802.3az standard, reduces the power consumption of physical layer devices (PHYs) during periods of low link utilization. EEE saves energy by putting part of the transmission circuit into low power mode when a link is idle.

**NOTE:** Configure EEE only on EEE-capable Base-T copper Ethernet ports. If you configure EEE on unsupported ports, the console displays the message: “EEE not supported”.

This topic describes:

- [Enabling EEE on an EEE-Capable Base-T Copper Ethernet Port on page 2685](#)
- [Disabling EEE on a Base-T Copper Ethernet Port on page 2685](#)

### [Enabling EEE on an EEE-Capable Base-T Copper Ethernet Port](#)

To enable EEE on an EEE-capable Base-T copper Ethernet interface:

[edit]

```
user@switch# set interfaces interface-name ether-options ieee-802-3az-eee
```

You can view the EEE status by using the `show interfaces interface-name detail` command.

### [Disabling EEE on a Base-T Copper Ethernet Port](#)

To disable EEE on a Base-T copper Ethernet interface:

[edit]

```
user@switch# delete interfaces interface-name ether-options ieee-802-3az-eee
```

By default, EEE is disabled on EEE-capable ports.

## Configuring Local Link Bias (CLI Procedure)

Local link bias is used to conserve bandwidth on Virtual Chassis ports (VCPs) by using local links to forward unicast traffic exiting a Virtual Chassis or Virtual Chassis Fabric (VCF) that has a Link Aggregation group (LAG) bundle composed of member links on different member switches in the same Virtual Chassis or VCF. A local link is a member link in the LAG bundle that is on the member switch that received the traffic. Because traffic is received and forwarded on the same member switch when local link bias is enabled, no VCP bandwidth is consumed by traffic traversing the VCPs to exit the Virtual Chassis or VCF on a different member link in the LAG bundle.

You should enable local link bias if you want to conserve VCP bandwidth by always forwarding egress unicast traffic on a LAG out of a local link. You should not enable local link bias if you want egress traffic load-balanced as it exits the Virtual Chassis or VCF.

To enable local link bias on a LAG bundle:

```
[edit]
user@switch# set interface aex aggregated-ether-options local-bias
where aex is the name of the aggregated Ethernet link bundle.
```

For instance, to enable local link bias on aggregated Ethernet interface ae0:

```
[edit]
user@switch# set interface ae0 aggregated-ether-options local-bias
```

## Configuring the Fields in the Algorithm Used To Hash LAG Bundle and ECMP Traffic (CLI Procedure)

Juniper Networks EX Series and QFX Series switches use a hashing algorithm to determine how to forward traffic over a Link Aggregation group (LAG) bundle or to the next-hop device when equal-cost multipath (ECMP) is enabled.

The hashing algorithm makes hashing decisions based on values in various packet fields, as well as on some internal values like source port ID and source device ID. You can configure some of the fields that are used by the hashing algorithm.

Configuring the fields used by the hashing algorithm is useful in scenarios where most of the traffic entering the bundle is similar and the traffic needs to be managed in the LAG bundle. For instance, if the only difference in the IP packets for all incoming traffic is the source and destination IP address, you can tune the hashing algorithm to make hashing decisions more efficiently by configuring the algorithm to make hashing decisions using only those fields.

- [Configuring the Hashing Algorithm to Use Fields in the Layer 2 Header for Hashing on page 2687](#)
- [Configuring the Hashing Algorithm to Use Fields in the IP Payload for Hashing on page 2687](#)
- [Configuring the Hashing Algorithm to Use Fields in the IPv6 Payload for Hashing on page 2687](#)

### Configuring the Hashing Algorithm to Use Fields in the Layer 2 Header for Hashing

To configure the hashing algorithm to use fields in the Layer 2 header for hashing:

1. Configure the hash mode to Layer 2 header:

```
[edit forwarding-options enhanced-hash-key]
user@switch# set hash-mode layer2-header
```

The default hash mode is Layer 2 payload. Therefore, this step must be performed if you have not previously configured the hash mode.

2. Configure the fields in the Layer 2 header that the hashing algorithm uses for hashing:

```
[edit forwarding-options enhanced-hash-key]
user@switch# set layer2 {no-destination-mac-address | no-ether-type |
no-source-mac-address | vlan-id}
```

By default, the hashing algorithm uses the values in the destination MAC address, Ethertype, and source MAC address fields in the header to hash traffic on the LAG. You can configure the hashing algorithm to not use the values in these fields by configuring **no-destination-mac-address**, **no-ether-type**, or **no-source-mac-address**.

You can also configure the hashing algorithm to include the VLAN ID field in the header by configuring the **vlan-id** option.

If you want the hashing algorithm to not use the Ethertype field for hashing:

```
[edit forwarding-options enhanced-hash-key]
user@switch# set layer2 no-ether-type
```

### Configuring the Hashing Algorithm to Use Fields in the IP Payload for Hashing

To configure the hashing algorithm to use fields in the IP payload for hashing:

1. Configure the hash mode to Layer 2 payload:

```
[edit forwarding-options enhanced-hash-key]
user@switch# set hash-mode layer2-payload
```

The IP payload is not checked by the hashing algorithm unless the hash mode is set to Layer 2 payload. The default hash mode is Layer 2 payload.

2. Configure the fields in the IP payload that the hashing algorithm uses for hashing:

```
[edit forwarding-options enhanced-hash-key]
user@switch# set inet {no-ipv4-destination-address | no-ipv4-source-address |
no-l4-destination-port | no-l4-source-port | no-protocol | vlan-id}
```

For instance, if you want the hashing algorithm to ignore the Layer 4 destination port, Layer 4 source port, and protocol fields and instead hash traffic based only on the IPv4 source and destination addresses:

```
[edit forwarding-options enhanced-hash-key]
user@switch# set inet no-l4-destination-port no-l4-source-port no-protocol
```

### Configuring the Hashing Algorithm to Use Fields in the IPv6 Payload for Hashing

To configure the hashing algorithm to use fields in the IPv6 payload for hashing:

1. Configure the hash mode to Layer 2 payload:

```
[edit forwarding-options enhanced-hash-key]
```

```
user@switch# set hash-mode layer2-payload
```

The IPv6 payload is not checked by the hashing algorithm unless the hash mode is set to Layer 2 payload. The default hash mode is Layer 2 payload.

2. Configure the fields in the IPv6 payload that the hashing algorithm uses for hashing:

```
[edit forwarding-options enhanced-hash-key]
```

```
user@switch# set inet6 {no-ipv6-destination-address | no-ipv6-source-address |  
no-l4-destination-port | no-l4-source-port | no-next-header | vlan-id}
```

For instance, if you want the hashing algorithm to ignore the Layer 4 destination port, Layer 4 source port, and the Next Header fields and instead hash traffic based only on the IPv6 source and IPv6 destination address fields only:

```
[edit forwarding-options enhanced-hash-key]
```

```
user@switch# set inet6 no-l4-destination-port no-l4-source-port no-next-header
```

## Configuring Tagged Aggregated Ethernet Interfaces

To specify aggregated Ethernet interfaces, include the **vlan-tagging** statement at the **[edit interfaces aex]** hierarchy level:

```
[edit interfaces aex]  
vlan-tagging;
```

You must also include the **vlan-id** statement:

```
vlan-id number;
```

You can include this statement at the following hierarchy levels:

- **[edit interfaces *interface-name* unit *logical-unit-number*]**
- **[edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*]**

For more information about the **vlan-tagging** and **vlan-id** statements, see [“802.1Q VLANs Overview” on page 2614](#).

- Related Documentation**
- [vlan-id](#)
  - [vlan-tagging on page 2834](#)

## Configuring a Layer 3 Subinterface (CLI Procedure)

EX Series switches use Layer 3 subinterfaces to divide a physical interface into multiple logical interfaces, each corresponding to a VLAN. The switch uses the Layer 3 subinterfaces to route traffic between subnets.

To configure Layer 3 subinterfaces, you enable VLAN tagging and partition one or more physical ports into multiple logical interfaces, each corresponding to a VLAN ID.

Before you begin, make sure you set up your VLANs. See *Configuring VLANs for EX Series Switches (CLI Procedure)* or “[Configuring VLANs for EX Series Switches \(J-Web Procedure\)](#)” on page 2334.

To configure Layer 3 subinterfaces:

1. Enable VLAN tagging:

```
[edit interfaces interface-name]
user@switch# set vlan-tagging
```

2. Bind each VLAN ID to a logical interface:

```
[edit interfaces interface-name]
user@switch# set unit logical-unit-number vlan-id (VLAN Tagging and Layer 3 Subinterfaces)
vlan-id-number
```

### Related Documentation

## Configuring Unicast RPF (CLI Procedure)

Unicast reverse-path forwarding (RPF) can help protect your LAN from denial-of-service (DoS) and distributed denial-of-service (DDoS) attacks on untrusted interfaces. Enabling unicast RPF on the switch interfaces filters traffic with source addresses that do not use the incoming interface as the best return path back to the source. When a packet comes into an interface, if that interface is not the best return path to the source, the switch discards the packet. If the incoming interface is the best return path to the source, the switch forwards the packet.

**NOTE:** On EX3200, EX4200, and EX4300 switches, you can enable unicast RPF only globally—that is, on all switch interfaces. You cannot enable unicast RPF on a per-interface basis.

Before you begin:

- On an EX8200, EX6200, or QFX Series switch, ensure that the selected switch interface is symmetrically routed before you enable unicast RPF. A symmetrically routed interface is an interface that uses the same route in both directions between the source and the destination. Do not enable unicast RPF on asymmetrically routed interfaces. An

asymmetrically routed interface uses different paths to send and receive packets between the source and the destination.

- On an EX3200, EX4200, or EX4300 switch, ensure that *all* switch interfaces are symmetrically routed before you enable unicast RPF on an interface. When you enable unicast RPF on any interface, it is enabled globally on all switch interfaces. Do not enable unicast RPF on asymmetrically routed interfaces. An asymmetrically routed interface uses different paths to send and receive packets between the source and the destination.

To enable unicast RPF, configure it explicitly on a selected customer-edge interface:

[edit interfaces]

user@switch# **set ge-1/0/10 unit 0 family inet *rpf-check***

**BEST PRACTICE:** On EX3200, EX4200, and EX4300 switches, unicast RPF is enabled globally on *all* switch interfaces, regardless of whether you configure it explicitly on only one interface or only on some interfaces.

On EX3200, EX4200, and EX4300 switches, we recommend that you enable unicast RPF explicitly on either all interfaces or only one interface. To avoid possible confusion, do not enable it on only some interfaces:

- Enabling unicast RPF explicitly on only one interface makes it easier if you choose to disable it in the future because you must explicitly disable unicast RPF on every interface on which you explicitly enabled it. If you explicitly enable unicast RPF on two interfaces and you disable it on only one interface, unicast RPF is still implicitly enabled globally on the switch. The drawback of this approach is that the switch displays the flag that indicates that unicast RPF is enabled only on interfaces on which unicast RPF is explicitly enabled, so even though unicast RPF is enabled on all interfaces, this status is not displayed.
- Enabling unicast RPF explicitly on all interfaces makes it easier to know whether unicast RPF is enabled on the switch because every interface shows the correct status. (Only interfaces on which you explicitly enable unicast RPF display the flag that indicates that unicast RPF is enabled.) The drawback of this approach is that if you want to disable unicast RPF, you must explicitly disable it on every interface. If unicast RPF is enabled on any interface, it is implicitly enabled on all interfaces.

---

**Related  
Documentation**

- *Example: Configuring Unicast RPF on an EX Series Switch*
- [Verifying Unicast RPF Status on page 2841](#)
- [Disabling Unicast RPF \(CLI Procedure\) on page 2691](#)
- [Troubleshooting Unicast RPF on page 2933](#)
- [Understanding Unicast RPF on page 2592](#)

## Disabling Unicast RPF (CLI Procedure)

Unicast reverse-path forwarding (RPF) can help protect your LAN from denial-of-service (DoS) and distributed denial-of-service (DDoS) attacks on untrusted interfaces. Unicast RPF filters traffic with source addresses that do not use the incoming interface as the best return path back to the source. If the network configuration changes so that an interface that has unicast RPF enabled becomes a trusted interface or becomes asymmetrically routed (the interface that receives a packet is not the best return path to the packet's source), disable unicast RPF.

To disable unicast RPF on an EX3200, EX4200, or EX4300 switch, you must delete it from every interface on which you explicitly configured it. If you do not disable unicast RPF on every interface on which you explicitly enabled it, it remains implicitly enabled on all interfaces. If you attempt to delete unicast RPF from an interface on which it was not explicitly enabled, the **warning: statement not found** message appears. If you do not disable unicast RPF on every interface on which you explicitly enabled it, unicast RPF remains implicitly enabled on all interfaces of the EX3200, EX4200, or EX4300 switch.

On EX8200, EX6200, and QFX Series switches, the switch does not apply unicast RPF to an interface unless you explicitly enable that interface for unicast RPF.

To disable unicast RPF, delete its configuration from the interface:

[edit interfaces]

user@switch# **delete** ge-1/0/10 unit 0 family inet **rpf-check**

**NOTE:** On EX3200, EX4200, and EX4300 switches, if you do not disable unicast RPF on every interface on which you explicitly enabled it, unicast RPF remains implicitly enabled on all interfaces.

### Related Documentation

- [Example: Configuring Unicast RPF on an EX Series Switch](#)

## Configuring IP Directed Broadcast (CLI Procedure)

**NOTE:** This task uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Configuring IP Directed Broadcast (CLI Procedure)*. For ELS details, see “[Getting Started with Enhanced Layer 2 Software](#)” on page 3.

You can use IP directed broadcast on an EX Series switch to facilitate remote network management by sending broadcast packets to hosts on a specified subnet without broadcasting to the entire network. IP directed broadcast packets are broadcast on only the target subnet. The rest of the network treats IP directed broadcast packets as unicast packets and forwards them accordingly.

Before you begin to configure IP directed broadcast:

- Ensure that the subnet on which you want broadcast packets using IP direct broadcast is not directly connected to the Internet.
- Configure an integrated routing and bridging (IRB) interface or routed VLAN interface (RVI) for the subnet that will be enabled for IP direct broadcast. See [“Configuring Integrated Routing and Bridging Interfaces \(CLI Procedure\)” on page 2340](#), [Configuring Routed VLAN Interfaces \(CLI Procedure\)](#) , or [“Configuring VLANs for EX Series Switches \(J-Web Procedure\)” on page 2334](#).

**NOTE:** We recommend that you do not enable IP directed broadcast on subnets that have a direct connection to the Internet because of increased exposure to denial-of-service (DoS) attacks.

To enable IP directed broadcast for a specified subnet:

1. Add the target subnet’s logical interfaces to the VLAN:  

```
[edit interfaces]
user@switch# set ge-0/0/0.0 family ethernet-switching vlan members v1
user@switch# set ge-0/0/1.0 family ethernet-switching vlan members v1
```
2. Configure the Layer 3 interface on the VLAN that is the target of the IP directed broadcast packets:  

```
[edit interfaces]
user@switch# set irb.1 family inet address 10.1.2.1/24
```
3. Associate a Layer 3 interface with the VLAN:  

```
[edit vlans]
user@switch# set vl l3-interface (VLANs) irb.1
```
4. Enable the Layer 3 interface for the VLAN to receive IP directed broadcasts:  

```
[edit interfaces]
user@switch# set irb.1 family inet targeted-broadcast
```

**Related  
Documentation**

- [Example: Configuring IP Directed Broadcast on an EX Series Switch](#)
- [Understanding IP Directed Broadcast for EX Series Switches on page 2596](#)

## Tracing Operations of an Individual Router or Switch Interface

To trace the operations of individual router or switch interfaces, include the **traceoptions** statement at the **[edit interfaces *interface-name*]** hierarchy level:

```
[edit interfaces interface-name]
traceoptions {
  flag flag;
```

```
}
```

You can specify the following interface tracing flags:

- **all**—Trace all interface operations.
- **event**—Trace all interface events.
- **ipc**—Trace all interface interprocess communication (IPC) messages.
- **media**—Trace all interface media changes.

The interfaces **traceoptions** statement does not support a trace file. The logging is done by the kernel, so the tracing information is placed in the system **syslog** files.

#### Related Documentation

- *Tracing Operations of the Interface Process*
- *Tracing Interface Operations Overview*

## Tracing Operations of the Interface Process

To trace the operations of the router or switch interface process, dcd, include the **traceoptions** statement at the **[edit interfaces]** hierarchy level:

```
[edit interfaces]
traceoptions {
  file <filename> <files number> <match regular-expression> <size size> <world-readable |
    no-world-readable>;
  flag <flag> <disable>;
  no-remote-trace;
}
```

By default, interface process operations are placed in the file named dcd and three 1-MB files of tracing information are maintained.

You can specify the following flags in the **interfaces traceoptions** statement:

- **change-events**—Log changes that produce configuration events.
- **config-states**—Log the configuration state machine changes.
- **kernel**—Log configuration IPC messages to kernel.
- **kernel-detail**—Log details of configuration messages to kernel.

For general information about tracing, see the tracing and logging information in the *Junos OS Administration Library for Routing Devices*.

## **[edit chassis] Configuration Statement Hierarchy on EX Series Switches**

This topic lists supported and unsupported configuration statements in the **[edit chassis]** hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.
- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see [Feature Explorer](#).

This topic lists:

- [Supported Statements in the \[edit chassis\] Hierarchy Level](#) on page 2696

---

### **Supported Statements in the [edit chassis] Hierarchy Level**

The following hierarchy shows the **[edit chassis]** configuration statements supported on EX Series switches:

```
chassis {  
  aggregated-devices {  
    ethernet {
```

```

    device-count number;
    lACP {
        link-protection non-revertive;
        system-priority system-priority-number
    }
}
alarm {
    ethernet {
        link-down (ignore | red | yellow);
    }
    management-ethernet {
        link-down (ignore | red | yellow);
    }
}
container-devices {
    device-count device-count-number;
}
disk-partition {
    /config {
        level (full | high) {
            free-space (free-space-threshold-value | mb | percent);
        }
    }
    /var {
        level (full | high) {
            free-space (free-space-threshold-value | mb | percent);
        }
    }
}
}
fpc slot-number {
    pic pic-number {
        no-multi-rate;
        q-pic-large-buffer (large-scale | small-scale);
    }
}
}
maximum-ecmp maximum-ecmp-routes;
lcd-menu {
    fpc slot-number {
        menu-item menu-name);
        disable;
    }
}
pseudowire-service {
    device-count device-count-number;
}
psu {
    redundancy {
        n-plus-n;
    }
}
redundancy {
    graceful-switchover;
}
slow-pfe-alarm;
}

```

## [edit interfaces ae] Configuration Statement Hierarchy on EX Series Switches

This topic lists supported and unsupported configuration statements in the **[edit interfaces ae]** hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.
- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see [Feature Explorer](#).

This topic lists:

- [Supported Statements in the \[edit interfaces ae\] Hierarchy Level on page 2700](#)
- [Unsupported Statements in the \[edit interfaces ae\] Hierarchy Level on page 2704](#)

### Supported Statements in the [edit interfaces ae] Hierarchy Level

---

The following hierarchy shows the **[edit interfaces ae]** configuration statements supported on EX Series switches.

```
interfaces {
  aeX {
    accounting-profile name;
    aggregated-ether-options {
      ethernet-switch-profile {
        tag-protocol-id identifiers;
      }
      (flow-control | no-flow-control);
      lcp {
        (active | passive);
        link-protection {
          disable;
          (revertive | non-revertive);
        }
        periodic interval;
        system-priority number;
      }
      (link-protection | no-link-protection);
      link-speed speed;
      local-bias;
      (loopback | no-loopback);
      mc-ae {
        chassis-id chassis-id;
        events {
          iccp-peer-down {
            force-icl-down;
            prefer-status-control-active;
          }
        }
      }
    }
  }
}
```

```

    }
  }
  init-delay-time seconds;
  mc-ae-id mc-ae-id;

## [edit interfaces ge] Configuration Statement Hierarchy on EX Series Switches

This topic lists supported and unsupported configuration statements in the **[edit interfaces ge]** hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.
- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see [Feature Explorer](#).

This topic lists:

- [Supported Statements in the \[edit interfaces ge\] Hierarchy Level on page 2711](#)
- [Unsupported Statements in the \[edit interfaces ge\] Hierarchy Level on page 2715](#)

### Supported Statements in the [edit interfaces ge] Hierarchy Level

The following hierarchy shows the **[edit interfaces ge]** configuration statements supported on EX Series switches.

```

interfaces {
  ge-fpc/pic/port {
    accounting-profile name;
    description text;
    disable;
    encapsulation type;
    ether-options {
      802.3ad {
        aex;
        (backup | primary);
        lacp {
          force-up;
          port-priority number;
        }
      }
    }
    (auto-negotiation | no-auto-negotiation);
    ethernet-switch-profile {
      tag-protocol-id [tpids];
    }
    (flow-control | no-flow-control);
  }
}

```

```
ieee-802-3az-eee;  
(loopback | no-loopback);  
no-auto-mdix;  
}  
flexible-vlan-tagging;  
(gratuitous-arp-reply | no-gratuitous-arp-reply);  
hold-time up milliseconds down milliseconds;  
link-mode {  
    full-duplex;  
}  
mtu bytes;
