## ipv6-source-guard

|                            |                                                                                                                                                                                                                                                                       |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | ipv6-source-guard;                                                                                                                                                                                                                                                    |
| <b>Hierarchy Level</b>     | [edit vlans <i>vlan-name</i> forwarding-options <b>dhcp-security</b> ];<br>[edit ethernet-switching-options secure-access-port vlan (all   <i>vlan-name</i> )]                                                                                                        |
| <b>Release Information</b> | Statement introduced in Junos OS Release 13.2X51-D20 for EX Series switches.<br>Support at the [edit ethernet-switching-options secure-access-port vlan (all   <i>vlan-name</i> )] hierarchy level introduced in Junos OS Release 14.1X53-D10 for EX Series switches. |
| <b>Description</b>         | Perform IPv6 source guard checking on packets sent from access interfaces. Validate source IP addresses and source MAC addresses on all VLANs or on the specified VLAN. Forward packets with valid addresses and drop those with invalid addresses.                   |

**NOTE:** If you configure the `ipv6-source-guard` statement at the [edit vlans *vlan-name* forwarding-options **dhcp-security**] hierarchy level, DHCPv6 snooping is automatically enabled for the specified VLAN.

If you configure the `ipv6-source-guard` statement at the [edit ethernet-switching-options secure-access-port vlan *vlan-name*] hierarchy level, you must also enable DHCPv6 snooping for the specified VLAN.

| <b>Description</b>              | <p>Specifies the static security key to exchange to enable MACsec using static secure association key (SAK) security mode.</p> <p>The key string is a 32-digit hexadecimal number. The key string and the security association must match on both sides of an Ethernet connection to secure traffic using MACsec when enabling MACsec using SAK security mode.</p> <p>You must configure at least two security associations with unique security association numbers and key strings to enable MACsec using static SAK security mode. MACsec initially establishes a secure connection when a security association number and key match on both ends of an Ethernet link. After a certain number of Ethernet frames are securely transmitted across the Ethernet link, MACsec automatically rotates to a new security association with a new security association number and key to maintain the secured Ethernet link. This rotation continues each time a certain number of Ethernet frames are securely transmitted across the secured Ethernet link, so you must always configure MACsec to have at least two security associations.</p> |
| <b>Default</b>                  | This statement does not have a default value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Options</b>                  | <b>key-string</b> —Specifies the key to exchange with the other end of the link on the secure channel. The <i>key-string</i> is a 32-digit hexadecimal string that is created by the user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.2X50-D15 for EX Series switches.<br>Statement introduced in Junos OS Release 14.1X53-D15 for QFX Series switches.                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | <p>Specifies the key server priority used by the MACsec Key Agreement (MKA) protocol to select the key server when MACsec is enabled using static connectivity association key (CAK) security mode.</p> <p>The switch with the lower <i>priority-number</i> is selected as the key server.</p> <p>If the <i>priority-number</i> is identical on both sides of a point-to-point link, the MKA protocol selects the device with the lower MAC address as the key server.</p> |
| <b>Default</b>                  | The default key server priority number is 16.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Options</b>                  | <p><i>priority-number</i>—Specifies the MKA server election priority number.</p> <p>The <i>priority-number</i> can be any number between 0 and 255. The lower the number, the higher the priority.</p>                                                                                                                                                                                                                                                                     |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.2X50-D15 for EX Series switches.<br>Statement introduced in Junos OS Release 14.1X53-D15 for QFX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | <p>Specify a MAC address to enable MACsec using static secure association key (SAK) security mode. The <b>mac-address</b> variables must match on the sending and receiving ends of a link to enable MACsec using static SAK security mode.</p> <p>If you are configuring a MAC address on a secure channel in the outbound direction, you should specify the MAC address of the interface as the <b>mac-address</b>.</p> <p>If you are configuring a MAC address on a secure channel in the inbound direction, you should specify the MAC address of the interface at the other end of the link as the <b>mac-address</b>.</p> <p>You only use this configuration option when you are configuring MACsec using static SAK security mode. This option does not need to be specified when you are enabling MACsec using static connectivity association key (CAK) security mode.</p> |
| <b>Default</b>                  | No MAC address is specified in the secure channel, by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Options</b>                  | <b>mac-address</b> —The MAC address, in six groups of two hexadecimal digits.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Release Information</b> | Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Hierarchy level [edit vlans <i>vlan-name</i> switch-options] introduced in Junos OS Release 13.2X50-D10. (See <a href="#">“Getting Started with Enhanced Layer 2 Software” on page 3</a> for information about ELS.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Description</b>         | Specify the number of times a MAC address can move to a new interface (port) in one second and the action to be taken by the switch if the MAC address move limit is exceeded.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Default</b>             | If you do not specify <b>mac-move-limit</b> , the default MAC address move limit is unlimited.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Options</b>             | <p><b>limit</b> <i>limit</i>—Maximum number of moves to a new interface per second.</p> <ul style="list-style-type: none"><li>• <b>action</b> <i>action</i>—(Optional) (Available <i>only</i> under the hierarchy level [edit ethernet-switching-options secure-access-port vlan (all   <i>vlan-name</i>) mac-move-limit]) Action to take when the MAC address move limit is reached:<ul style="list-style-type: none"><li>• <b>drop</b>—Drop the packet and generate a system log entry. This is the default.</li><li>• <b>log</b>—Do not drop the packet but generate a system log entry.</li><li>• <b>none</b>—No action.</li><li>• <b>shutdown</b>—Disable the interface and generate a system log entry. If you have configured the switch with the <b>port-error-disable</b> statement, the disabled interfaces recover automatically upon expiration of the specified disable timeout. If you have not configured the switch for autorecovery from port error disabled conditions, you can bring up the disabled interfaces by running the <b>clear ethernet-switching port-error</b> command.</li></ul></li><li>• <b>packet-action</b> <i>action</i>—(Optional) (Available <i>only</i> under the hierarchy level, [edit vlans <i>vlan-name</i> switch-options mac-move-limit]) Action to take when the MAC address move limit is reached:</li></ul> |

**NOTE:** There is no default action.

---

- **drop**—Drop the packet and do not generate an alarm.

- **drop and log**—Drop the packet and generate an alarm, an SNMP trap, or system log entry.
- **log**— Do not drop the packet, but generate an alarm, an SNMP trap, or a system log entry.
- **none**—No action.
- **shutdown**—Disable the interface and generate an alarm or an SNMP trap. If you have configured the interface with the [recovery-timeout](#) statement, the disabled interface recovers automatically upon expiration of the specified timeout. If you have not configured the interface for a recovery timeout, you can bring up the disabled interface by running the operational command [clear ethernet-switching recovery-timeout](#).

**Required Privilege Level** system—To view this statement in the configuration.  
system—control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.1X53-D10.<br>Statement introduced in Junos OS Release 14.1X53-D15 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | <p>Specifies that all traffic travelling on the MACsec-secured link must be MACsec-secured to be forwarded onward.</p> <p>When the <b>must-secure</b> option is enabled, all traffic that is not MACsec-secured that is received on the interface is dropped.</p> <p>When the <b>must-secure</b> option is disabled, all traffic from devices that support MACsec is MACsec-secured while traffic received from devices that do not support MACsec is forwarded through the network.</p> <p>The <b>must-secure</b> option is particularly useful in scenarios where multiple devices, such as a phone and a PC, are accessing the network through the same Ethernet interface. If one of the devices supports MACsec while the other device does not support MACsec, the device that doesn't support MACsec can continue to send and receive traffic over the network—provided the <b>must-secure</b> option is disabled—while traffic to and from the device that supports MACsec is MACsec-secured. In this scenario, traffic to the device that is not MACsec-secured must be VLAN-tagged.</p> |
| <b>Default</b>                  | The <b>must-secure</b> option is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Description</b>              | <p>Disables MACsec encryption for a connectivity association that is configured to enable MACsec using static connectivity association key (CAK) or dynamic security mode.</p> <p>You can enable MACsec without enabling encryption. If a connectivity association that has not enabled MACsec encryption is associated with an interface, traffic is forwarded across the Ethernet link in clear text. You are, therefore, able to view this unencrypted traffic when you are monitoring the link. The MACsec header is still applied to the packet, however, and all MACsec data integrity checks are run on both ends of the link to ensure the traffic does not represent a security threat.</p> <p>This command is used to disable encryption when MACsec is configured using static CAK or dynamic security mode only. When MACsec is configuring using static secure association key (SAK) security mode, the encryption setting is managed in the secure channel using the <b>encryption</b> configuration statement.</p> |
| <b>Default</b>                  | MACsec encryption is enabled if MACsec is enabled using static CAK or dynamic security mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

## offset

---

**Syntax**    offset (0 | 30 | 50);

**Hierarchy Level**    [edit security **macsec connectivity-association** *connectivity-association-name*]  
[edit security **macsec connectivity-association** *connectivity-association-name* **secure-channel** *secure-channel-name*]

**Release Information**    Statement introduced in Junos OS Release 13.2X50-D15 for EX Series switches.  
Statement introduced in Junos OS Release 14.1X53-D15 for QFX Series switches.

**Description**    Specifies the number of octets in an Ethernet frame that are sent in unencrypted plain-text when encryption is enabled for MACsec.

Setting the offset to 30 allows a feature to see the IPv4 header and the TCP/UDP header while encrypting the remaining traffic. Setting the offset to 50 allows a feature to see the IPv6 header and the TCP/UDP header while encrypting the remaining traffic.

You would typically forward traffic with the first 30 or 50 octets unencrypted if a feature needed to see the data in the octets to perform a function, but you otherwise prefer to encrypt the remaining data in the frames traversing the link. Load balancing features, in particular, typically need to see the IP and TCP/UDP headers in the first 30 or 50 octets to properly load balance traffic.

You configure the **offset** in the [edit security **macsec connectivity-association** *connectivity-association-name*] hierarchy when you are enabling MACsec using static connectivity association key (CAK) or dynamic security mode.

You configure the **offset** in the [edit security **macsec connectivity-association** *connectivity-association-name* **secure-channel** *secure-channel-name*] hierarchy when you are enabling MACsec using static secure association key (SAK) security mode.

**Default**    0

**Options**    **0**—Specifies that no octets are unencrypted. When you set the offset to 0, all traffic on the interface where the connectivity association or secure channel is applied is encrypted.

**30**—Specifies that the first 30 octets of each Ethernet frame are unencrypted.

**NOTE:** In IPv4 traffic, setting the offset to 30 allows a feature to see the IPv4 header and the TCP/UDP header while encrypting the rest of the traffic. An offset of 30, therefore, is typically used when a feature needs this information to perform a task on IPv4 traffic.

---

**50**—Specified that the first 50 octets of each Ethernet frame are unencrypted.

**NOTE:** In IPv6 traffic, setting the offset to 50 allows a feature to see the IPv6 header and the TCP/UDP header while encrypting the rest of the traffic. An offset of 50, therefore, is typically used when a feature needs this information to perform a task on IPv6 traffic.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

## option-16 (DHCPv6 Snooping)

**Syntax**

```
option-16 {
    use-string string;
}
```

**Hierarchy Level** [edit vlans *vlan-name* forwarding-options [dhcp-security dhcpv6-options](#)]

**Release Information** Statement introduced in Junos OS Release 14.1X53-D10 for EX Series switches.

**Description** Configure the DHCPv6 Vendor ID option (option 16) to be included in DHCPv6 requests from clients before forwarding them to a DHCPv6 server. Option 16 provides the server with information about the vendor that manufactured the hardware on which the DHCP client is running. When configured, the switch will overwrite any existing option 16 information sent by clients in the DHCPv6 packets.

Option 16 is the DHCPv6 equivalent of the [vendor-id](#) sub-option of DHCP option 82.

**Options** **use-string *string***—Define a custom string to be used as the DHCPv6 vendor identifier.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## option-18 (DHCPv6 Snooping)

**Syntax**

```
option-18 {
  prefix {
    host-name;
    logical-system-name;
    routing-instance-name;
    vlan-id;
    vlan-name;
  }
  use-interface-index (device | logical);
  use-interface-description (device | logical);
  use-interface-mac;
  use-interface-name (device | logical);
  use-string string;
}
```

**Hierarchy Level** [edit vlans *vlan-name* forwarding-options [dhcp-security dhcpv6-options](#)]

**Release Information** Statement introduced in Junos OS Release 14.1X53-D10 for EX Series switches.

**Description** Configure the DHCPv6 Relay Agent Interface ID option (option 18) to insert information in DHCPv6 requests from clients before forwarding them to a DHCPv6 server. Option 18 provides information about the port on which the request was received, which the server can use to assign IP addresses, prefixes, and other configuration parameters for the client.

When option 18 is configured, a unique interface ID is inserted into the DHCPv6 packet headers. Suboptions can be configured to include a prefix with the interface ID or to change the type of information used to identify the interface. The default fields included in option 18 are the Juniper Enterprise ID, VLAN, and MAC address of the interface.

Option 18 is the DHCPv6 equivalent of the [circuit-id](#) sub-option of DHCP option 82.

**NOTE:** DHCPv6 packets that already contain option 18 information when received from a client are dropped by the switch.

**Options**

**use-interface-mac**—Use the MAC address of the interface in the DHCPv6 interface ID.

**use-string *string***—Use a custom string in the DHCPv6 interface ID.

The remaining statements are explained separately.

**Required Privilege Level**

interface—To view this statement in the configuration.

interface-control—To add this statement to the configuration.

**Related Documentation**

## option-37 (DHCPv6 Snooping)

```
Syntax  option-37 {
        prefix {
            host-name;
            logical-system-name;
            routing-instance-name;
            vlan-id;
            vlan-name;
        }
        use-interface-index (device | logical);
        use-interface-description (device | logical);
        use-interface-mac;
        use-interface-name (device | logical);
        use-string string;
    }
```

**Hierarchy Level** [edit vlans *vlan-name* forwarding-options [dhcp-security dhcpv6-options](#)]

**Release Information** Statement introduced in Junos OS Release 14.1X53-D10 for EX Series switches.

**Description** Configure the DHCPv6 Relay Agent Remote ID option (option 37) to insert information in DHCPv6 requests from clients before forwarding them to a DHCPv6 server. Option 37 provides information about the remote host, which the server can use to assign IP addresses, prefixes, and other configuration parameters for the client.

When option 37 is configured, a unique remote ID is inserted into the DHCPv6 packet headers. Suboptions can be configured to include a prefix with the remote ID or to change the interface portion of the ID. The default fields included in option 37 are the Juniper Enterprise ID, VLAN, and MAC address of the interface.

Option 37 is the DHCPv6 equivalent of the [remote-id](#) sub-option of DHCP option 82.

**NOTE:** DHCPv6 packets that already contain option 37 information when received from a client are dropped by the switch.

**Options** **use-interface-mac**—Use the MAC address of the interface in the DHCPv6 remote ID.  
**use-string *string***—Use a custom string in the DHCPv6 remote ID.

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Release Information** Statement introduced in Junos OS Release 8.4.  
 Support for the **switch-options** statement added in Junos OS Release 9.2.  
 Support for top-level configuration for the **virtual-switch** type of routing instance added in Junos OS Release 9.2. In Junos OS Release 9.1 and earlier, the routing instances hierarchy

supported this statement only for a VPLS instance or a bridge domain configured within a virtual switch.

Support for logical systems added in Junos OS Release 9.6.

[edit switch-options interface *interface-name* interface-mac-limit *limit*], [edit switch-options interface-mac-limit *limit*], [edit switch-options mac-table-size *limit*], [edit vlans *vlan-name* switch-options interface *interface-name* interface-mac-limit *limit*], [edit vlans *vlan-name* switch-options interface-mac-limit *limit*], and [edit vlans *vlan-name* switch-options mac-table-size *limit*] hierarchy levels introduced in Junos OS Release 12.3R2 for EX Series switches.

Support for EVPNs introduced in Junos OS Release 13.2 on MX Series 3D Universal Edge Routers.

Support at the [edit switch-options interface *interface-name* interface-mac-limit *limit*] hierarchy level and hierarchy levels under [edit vlans *vlan-name*] introduced in Junos OS Release 13.2X50-D10 for EX Series switches and Junos OS Release 13.2 for the QFX Series.

**Description** Specify the action taken when packets with new source MAC addresses are received after the MAC address limit is reached. If this statement is not configured, packets with new source MAC addresses are forwarded by default.

**Default**

**NOTE:** On a QFX Series Virtual Chassis, if you include the shutdown option at the [edit vlans *vlan-name* switch-options interface *interface-name* interface-mac-limit packet-action] hierarchy level and issue the commit operation, the system generates a commit error. The system does not generate an error if you include the shutdown option at the [edit switch-options interface *interface-name* interface-mac-limit packet-action] hierarchy level.

Disabled. The default is for packets for new source MAC addresses to be forwarded after the MAC address limit is reached.

- Options**
- drop**—Drop packets with new source MAC addresses, and do not learn the new source MAC addresses.
  - drop-and-log**—(EX Series switches and QFX Series only) Drop packets with new source MAC addresses, and generate an alarm, an SNMP trap, or a system log entry.
  - log**—(EX Series switches and QFX Series only) Hold packets with new source MAC addresses, and generate an alarm, an SNMP trap, or a system log entry.
  - none**—(EX Series switches and QFX Series only) Forward packets with new source MAC addresses, and learn the new source MAC address.
  - shutdown**—(EX Series switches and QFX Series only) Disable the specified interface, and generate an alarm, an SNMP trap, or a system log entry.

**Required Privilege Level**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.2X50-D15 for EX Series switches.<br>Statement introduced in Junos OS Release 14.1X53-D15 for QFX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b>              | <p>Specify a port ID in a secure channel when enabling MACsec using static secure association key (SAK) security mode. The port IDs must match on a sending and receiving secure channel on each side of a link to enable MACsec.</p> <p>Once the port numbers match, MACsec is enabled for all traffic on the connection.</p> <p>You only use this configuration option when you are configuring MACsec using static SAK security mode. This option does not need to be specified when you are enabling MACsec using static connectivity association key (CAK) security mode.</p> |
| <b>Default</b>                  | No port ID is specified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>                  | <i>port-id-number</i> —The port ID number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.2X50-D15 for EX Series switches.<br>Statement introduced in Junos OS Release 14.1X53-D15 for QFX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>              | <p>Specifies the pre-shared key used to enable MACsec using static connectivity association key (CAK) security mode.</p> <p>A pre-shared key includes a connectivity association key name (CKN) and a connectivity association key (CAK). A pre-shared key is exchanged between two devices at each end of a point-to-point link to enable MACsec using static CAK security mode. The MACsec Key Agreement (MKA) protocol is enabled after the pre-shared keys are successfully verified and exchanged. The pre-shared key—the CKN and CAK—must match on both ends of a link.</p> |
| <b>Default</b>                  | No pre-shared keys exist, by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                  | The remaining statements are explained separately.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.1X53-D10 for EX Series switches.                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | Configure a prefix for DHCPv6 option 18 (Interface ID) or option 37 (Remote ID). When configured, the prefix is inserted into DHCPv6 packets during the DHCPv6 snooping process.                                                                                                                                                                                                       |
| <b>Default</b>                  | If the <b>prefix</b> statement is not explicitly specified, no prefix is inserted in DHCPv6 packets.                                                                                                                                                                                                                                                                                   |
| <b>Options</b>                  | <p><b>host-name</b>—Add the host name of the switch to DHCPv6 options.</p> <p><b>logical-system-name</b>—Add the logical system name to the DHCPv6 options.</p> <p><b>routing-instance-name</b>—Add the routing instance name to the DHCPv6 options.</p> <p><b>vlan-id</b>—Add the VLAN ID to the DHCPv6 options.</p> <p><b>vlan-name</b>—Add the VLAN name to the DHCPv6 options.</p> |

| <b>Description</b>                                | <p>Disable rather than block an interface when enforcing MAC limiting, MAC move limiting, or rate-limiting configuration options for shutting down the interface, and allow the interface to recover automatically from the error condition after the specified period of time:</p> <ul style="list-style-type: none"> <li>• If you have enabled MAC limiting with the <b>shutdown</b> option and you enable <b>recovery-timeout</b>, the switch disables (rather than shuts down) the interface when the MAC address limit is reached.</li> <li>• If you have enabled MAC move limiting (not supported on EX9200) with the <b>shutdown</b> option and you enable <b>recovery-timeout</b>, the switch disables (rather than shuts down) the interface when the maximum number of moves to a new interface is reached.</li> <li>• If you have enabled storm control with the <b>action-shutdown</b> option and you enable <b>recovery-timeout</b>, the switch disables (rather than shuts down) the interface when applicable traffic exceeds the specified levels. Depending upon the configuration, applicable traffic could include broadcast, unknown unicast, and multicast traffic.</li> </ul> |
|                                                   | <p> <b>NOTE:</b> The <b>recovery-timeout</b> configuration does not apply to pre-existing error conditions. It impacts only error conditions that are detected after the <b>recovery-timeout</b> statement has been enabled and committed. To clear a pre-existing error condition and restore the interface to service, use the operational mode command <b>clear ethernet-switching recovery-timeout</b> for EX Series and QFX Series and <b>clear bridge recovery-timeout</b> for MX Series routers.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Description</b>         | <p>Insert the <b>remote-id</b> suboption of DHCP option 82 (also known as the DHCP relay agent information option) in DHCP request packet headers before forwarding or relaying requests to a DHCP server. This suboption provides a trusted identifier for the host system that has forwarded or relayed requests to the server.</p> <p>The remaining statements are explained separately, and their availability depends on the hierarchy level at which the <b>remote-id</b> suboption is specified, as follows:</p> <ul style="list-style-type: none"> <li>The statement <b>prefix</b>, is <i>not</i> supported at the [edit vlans <i>vlan-name</i> forwarding-options <b>dhcp-security option-82</b>] hierarchy level.</li> <li>The statement <b>host-name</b> is supported <i>only</i> at the [edit vlans <i>vlan-name</i> forwarding-options <b>dhcp-security option-82</b>] hierarchy level.</li> </ul> |
| <b>Default</b>             | <p>If the <b>remote-id</b> statement is not explicitly set, no remote ID value is inserted in the DHCP request packet header.</p> <p>If the <b>remote-id</b> statement is explicitly set, but is not qualified by a keyword, the following are true:</p> <ul style="list-style-type: none"> <li>At the [edit vlans <i>vlan-name</i> forwarding-options <b>dhcp-security</b>] hierarchy level, the default keyword value is <i>interface-name</i>.</li> <li>At all other hierarchy levels, the default value of the <b>remote-id</b> keyword is the MAC address of the switch.</li> </ul>                                                                                                                                                                                                                                                                                                                        |

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b>              | <p>Specifies the size of the replay protection window.</p> <p>This statement has to be configured to enable replay protection.</p> <p>When MACsec is enabled on an Ethernet link, an ID number is assigned to each packet entering the link. The ID number of the packet is checked by the receiving interface after the packet has traversed the MACsec-enabled link.</p> <p>When replay protection is enabled, the sequence of the ID number of received packets are checked. If the packet arrives out of sequence and the difference between the packet numbers exceeds the replay protection window size, the packet is dropped by the receiving interface. For instance, if the replay protection window size is set to five and a packet assigned the ID of 1006 arrives on the receiving link immediately after the packet assigned the ID of 1000, the packet that is assigned the ID of 1006 is dropped because it falls outside the parameters of the replay protection window.</p> <p>Replay protection is especially useful for fighting man-in-the-middle attacks. A packet that is replayed by a man-in-the-middle attacker on the Ethernet link will arrive on the receiving link out of sequence, so replay protection helps ensure the replayed packet is dropped instead of forwarded through the network.</p> <p>Replay protection should not be enabled in cases where packets are expected to arrive out of order.</p> |
| <b>Default</b>                  | Replay protection is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Description</b>              | <p>Create and configure a secure channel to enable and configure MACsec when MACsec is enabled using static secure association key (SAK) security mode.</p> <p>You do not need to use this option to enable MACsec using static connectivity association key (CAK) security mode. All configuration for MACsec using static CAK security mode is done inside of the connectivity association but outside of the secure channel. When MACsec is enabled using static CAK security mode, an inbound and an outbound secure channel—neither of which is user-configurable—is automatically created within the connectivity association.</p> |
| <b>Options</b>                  | The remaining statements are explained separately.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Description</b>              | <p>Specifies the number of one of the security associations in the secure channel when MACsec is enabled using static secure association key (SAK) security mode. Because SAKs are created by the key server when MACsec is enabled using static connectivity association key (CAK) security mode, the <b>security-association</b> statement is not used when enabling MACsec using static CAK security mode.</p> <p>You must configure at least two security associations to enable MACsec using static SAK security mode. MACsec initially establishes a secure connection when a security association number and key match on both ends of an Ethernet link. After a certain number of Ethernet frames are securely transmitted across the Ethernet link, MACsec automatically rotates to a new security association with a new security association number and key to maintain the secured Ethernet link. This rotation continues each time a certain number of Ethernet frames are securely transmitted across the secured Ethernet link, so you must always configure MACsec to have at least two security associations.</p> |
| <b>Default</b>                  | No security keys are configured, by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>                  | <p><b><i>security-association-number</i></b>—Specifies the security association number and creates the SAK.</p> <p>The security association number is a whole number between 0 and 3. You can configure two security associations in a secure channel when enabling MACsec using static security keys.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b>              | Configure the MACsec security mode for the connectivity association.<br><br>We recommend enabling MACsec on switch-to-switch Ethernet links using static connectivity association key (CAK) security mode. Static CAK security mode ensures security by frequently refreshing to a new random secure association key (SAK) and by only sharing the SAK between the two devices on the MACsec-secured point-to-point link. Additionally, some optional MACsec features—replay protection, SCI tagging, and the ability to exclude traffic from MACsec—are only available when you enable MACsec using static CAK security mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>                  | <p><b><i>security-mode</i></b>—Specifies the MACsec security mode. Options include:</p> <ul style="list-style-type: none"> <li>• <b>dynamic</b>—Dynamic mode.<br/><br/>Dynamic security mode is used to enable MACsec on switch-to-host Ethernet links. In dynamic mode, a master key is retrieved from a RADIUS server by a switch and a host as part of the AAA handshake in separate transactions. The MKA protocol is enabled when the master key is exchanged between the switch and the host.</li> <li>• <b>static-cak</b>—Static connectivity association key (CAK) mode.<br/><br/>Static CAK security mode is used to enable MACsec on switch-to-switch Ethernet links. In <b>static-cak</b> mode, the switch at one end of the point-to-point link acts as the key server and regularly transmits a randomized key using a process that does not transmit any traffic outside of the MACsec-secured point-to-point link.</li> <li>• <b>static-sak</b>—Static secure association key (SAK) mode.<br/><br/>Static SAK security mode is used to enable MACsec on switch-to-switch Ethernet links. In <b>static-sak</b> mode, one of two user-configured security keys is used to secure the point-to-point link. The two security keys are regularly rotated.</li> </ul> |

| <b>Description</b>         | <p>Define global tracing operations for extended DHCP local server and extended DHCP relay agent processes.</p> <p>Replaces deprecated <b>traceoptions</b> statements at the <b>[edit forwarding-options dhcp-relay]</b> and <b>[edit system services dhcp-local-server]</b> hierarchy levels.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>             | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files to create before overwriting the oldest one. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements:</p> <ul style="list-style-type: none"><li>• <b>all</b>—Trace all events.</li><li>• <b>auth</b>—Trace authentication events.</li><li>• <b>database</b>—Trace database events.</li><li>• <b>fwd</b>—Trace firewall process events.</li><li>• <b>general</b>—Trace miscellaneous events.</li><li>• <b>ha</b>—Trace high availability-related events.</li><li>• <b>interface</b>—Trace interface operations.</li><li>• <b>io</b>—Trace I/O operations.</li><li>• <b>liveness-detection</b>—Trace liveness detection operations.</li><li>• <b>packet</b>—Trace packet and option decoding operations.</li><li>• <b>performance</b>—Trace performance measurement operations.</li><li>• <b>profile</b>—Trace profile operations.</li></ul> |

- **rpd**—Trace routing protocol process events.
- **rtsock**—Trace routing socket operations.
- **security-persistence**—Trace security persistence events.
- **session-db**—Trace session database events.
- **state**—Trace changes in state.
- **statistics**—Trace baseline statistics.
- **ui**—Trace user interface operations.

**level**—Level of tracing to perform; also known as severity level. The option you configure enables tracing of events at that level and all higher (more restrictive) levels. You can specify any of the following levels:

- **all**—Match messages of all levels.
- **error**—Match error messages.
- **info**—Match informational messages.
- **notice**—Match notice messages about conditions requiring special handling.
- **verbose**—Match verbose messages. This is the lowest (least restrictive) severity level; when you configure **verbose**, messages at all higher levels are traced. Therefore, the result is the same as when you configure **all**.
- **warning**—Match warning messages.

**Default:** error

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—Disable remote tracing.

**no-world-readable**—(Optional) Disable unrestricted file access, allowing only the user **root** and users who have the Junos OS **maintenance** permission to access the trace files.

**size *maximum-file-size***—(Optional) Maximum size of each trace file. By default, the number entered is treated as bytes. Alternatively, you can include a suffix to the number to indicate kilobytes (***maximum-file-sizek***), megabytes (***maximum-file-sizem***), or gigabytes (***maximum-file-sizeg***). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Range:** 10,240 through 1,073,741,824

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

|                           |                                                           |
|---------------------------|-----------------------------------------------------------|
| <b>Required Privilege</b> | trace—To view this statement in the configuration.        |
| <b>Level</b>              | trace-control—To add this statement to the configuration. |

| <b>Description</b>              | <p>Specifies the transmit interval for MACsec Key Agreement (MKA) protocol data units (PDUs).</p> <p>The MKA transmit interval setting sets the frequency for how often the MKA PDU is sent to the directly connected device to maintain MACsec on a point-to-point Ethernet link. A lower <i>interval</i> increases bandwidth overhead on the link; a higher <i>interval</i> optimizes the MKA protocol data unit exchange process.</p> <p>The transmit interval settings must be identical on both ends of the link when MACsec using static connectivity association key (CAK) security mode is enabled.</p> <p>We recommend increasing the interval to 6000 ms in high-traffic load environments.</p> |
| <b>Default</b>                  | The default transmit interval is 2000 milliseconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>                  | <i>interval</i> —Specifies the transmit interval, in milliseconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Output Fields</b>            | When you enter this command, you are provided feedback on the status of your request.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## Sample Output

### clear arp

```
user@host> clear arp
192.168.71.254    deleted
192.168.65.46    deleted
192.168.64.10    deleted
10.0.12.14       deleted
10.0.17.14       deleted
```

### clear arp logical-system ls1

```
user@host> clear arp logical-system ls1
192.168.71.254    deleted
192.168.65.46    deleted
192.168.64.10    deleted
10.0.12.14       deleted
10.0.17.14       deleted
```

### Sample Output

#### clear dhcp-security ipv6 binding

```
user@switch> clear dhcp-security ipv6 binding
```

## clear dot1x

---

**Syntax** `clear dot1x (firewall <counter-name> | interface <[interface-name]> | mac-address [mac-addresses] | statistics <interface interface-name>)`

**Release Information** Command introduced in Junos OS Release 9.0 for EX Series switches.  
**firewall** option added in Junos OS Release 9.5 for EX Series switches.

**Description** Reset the authentication state of an interface or delete 802.1X statistics from the switch. When you reset an interface using the **interface** or **mac-address** options, reauthentication on the interface is also triggered. The switch sends out a multicast message on the interface to restart the authentication of all connected supplicants. If a MAC address is reset, then the switch sends out a unicast message to that specific MAC address to restart authentication.

If a supplicant is sending traffic when the **clear dot1x interface** command is issued, the authenticator immediately initiates reauthentication. This process happens quickly, and it might seem that reauthentication did not occur. To verify that reauthentication has happened, issue the **show dot1x interface detail** command. The values for **Reauthentication due** and **Reauthentication interval** will be about the same.

**CAUTION:** When you clear the learned MAC addresses from an interface using the **clear dot1x interface** command, all MAC addresses are cleared, including those in static MAC bypass list.

If you have enabled Media Access Control Security (MACsec) using static secure association key (SAK) security mode on an EX Series switch, the SAKs are rotated when the **clear dot1x** command is entered. The **clear dot1x** command has no impact on MACsec when MACsec is enabled using static connectivity association keys (CAK) or any other security mode.

**Options** **firewall <counter-name>**—Clear 802.1X firewall counter statistics. If the *counter-name* option is specified, clear 802.1X firewall statistics for that counter.

**interface <[interface-name]>**—Reset the authentication state of all the supplicants (also, clears all the authentication bypassed clients) connected to the specified interface (when the interface is an authenticator) or reset the authentication state for the interface itself (when the interface is a supplicant).

**mac-address [mac-addresses]**—Reset the authentication state of the specified MAC addresses.

**statistics <interface interface-name>**—Clear 802.1X statistics on all 802.1X-enabled interfaces. If the **interface** option is specified, clear 802.1X firewall statistics for that interface or interfaces.

**Required Privilege Level** view

**Related Documentation**

**List of Sample Output**

[clear dot1x firewall c1 on page 4663](#)  
[clear dot1x interface ge-1/0/0 ge-2/0/0 ge-2/0/0 ge5/0/0 on page 4663](#)  
[clear dot1x mac-address 00:04:ae:cd:23:5f on page 4663](#)  
[clear dot1x statistics interface ge-1/0/1 on page 4663](#)

## Sample Output

`clear dot1x firewall c1`

```
user@switch> clear dot1x firewall c1
```

`clear dot1x interface ge-1/0/0 ge-2/0/0 ge-2/0/0 ge5/0/0`

```
user@switch> clear dot1x interface ge-1/0/0 ge-2/0/0 ge-2/0/0 ge5/0/0
```

`clear dot1x mac-address 00:04:ae:cd:23:5f`

```
user@switch> clear dot1x mac-address 00:04:ae:cd:23:5f
```

`clear dot1x statistics interface ge-1/0/1`

```
user@switch> clear dot1x statistics interface ge-1/0/1
```

## clear ethernet-switching recovery-timeout

**Table 502: show dhcp-security binding Output Fields**

| Field Name  | Field Description                                           | Level of Output |
|-------------|-------------------------------------------------------------|-----------------|
| IP Address  | IP address of the network device; bound to the MAC address. | All levels      |
| MAC address | MAC address of the network device; bound to the IP address. | All levels      |
| VLAN        | VLAN name of the network device whose MAC address is shown. | All levels      |

Table 502: show dhcp-security binding Output Fields (*continued*)

| Field Name       | Field Description                                                                                                                                                                                                         | Level of Output |
|------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Expires</b>   | The time, in seconds, remaining before the lease of the IP address to the MAC address expires.                                                                                                                            | All levels      |
| <b>State</b>     | Specifies whether the IP address is: <ul style="list-style-type: none"> <li>• <b>BOUND</b>: Leased to the MAC address for a limited period of time.</li> <li>• <b>STATIC</b>: Attached to a fixed MAC address.</li> </ul> | All levels      |
| <b>Interface</b> | Interface address (port).                                                                                                                                                                                                 | All levels      |

## Sample Output

### show dhcp-security binding

```
user@device> show dhcp-security binding
```

| IP address | MAC address       | Vlan   | Expires | State  | Interface  |
|------------|-------------------|--------|---------|--------|------------|
| 30.1.1.10  | 00:10:00:20:00:01 | vlan20 | 0       | STATIC | ge-0/0/4.0 |
| 30.1.1.18  | 00:10:94:00:00:34 | vlan20 | 86287   | BOUND  | ge-0/0/6.0 |
| 30.1.1.15  | 00:10:94:00:00:55 | vlan20 | 86265   | BOUND  | ge-0/0/4.0 |
| 30.1.1.16  | 00:10:94:00:00:56 | vlan20 | 86265   | BOUND  | ge-0/0/4.0 |
| 30.1.1.19  | 00:10:94:00:00:5b | vlan20 | 86287   | BOUND  | ge-0/0/6.0 |
| 30.1.1.20  | 00:10:94:00:00:5c | vlan20 | 86287   | BOUND  | ge-0/0/6.0 |
| 30.1.1.21  | 00:10:94:00:00:5d | vlan20 | 86287   | BOUND  | ge-0/0/6.0 |
| 30.1.1.17  | 00:10:94:00:00:68 | vlan20 | 86265   | BOUND  | ge-0/0/4.0 |

### show dhcp-security binding interface

```
user@device> show dhcp-security binding interface ge-0/0/6
```

| IP address | MAC address       | Vlan   | Expires | State | Interface  |
|------------|-------------------|--------|---------|-------|------------|
| 30.1.1.18  | 00:10:94:00:00:34 | vlan20 | 86282   | BOUND | ge-0/0/6.0 |
| 30.1.1.19  | 00:10:94:00:00:5b | vlan20 | 86282   | BOUND | ge-0/0/6.0 |
| 30.1.1.20  | 00:10:94:00:00:5c | vlan20 | 86282   | BOUND | ge-0/0/6.0 |
| 30.1.1.21  | 00:10:94:00:00:5d | vlan20 | 86282   | BOUND | ge-0/0/6.0 |

### show dhcp-security binding ip-address

```
user@device> show dhcp-security binding ip-address
```

| IP address | MAC address       | Vlan   | Expires | State | Interface  |
|------------|-------------------|--------|---------|-------|------------|
| 30.1.1.18  | 00:10:94:00:00:34 | vlan20 | 86282   | BOUND | ge-0/0/6.0 |

### show dhcp-security binding vlan

```
user@device> show dhcp-security binding vlan vlan20
```

| IIP address | MAC address       | Vlan   | Expires | State | Interface  |
|-------------|-------------------|--------|---------|-------|------------|
| 30.1.1.18   | 00:10:94:00:00:34 | vlan20 | 86282   | BOUND | ge-0/0/6.0 |

## show dhcp-security binding ip-source-guard

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Output Fields</b>            | <p><a href="#">Table 503 on page 4671</a> lists the output fields for the <b>show dhcp-security ipv6 binding</b> command. Output fields are listed in the approximate order in which they appear.</p> <p>The DHCPv6 binding table shows the untrusted access interfaces in VLANs that have been enabled for DHCPv6 snooping. The entries include the IPv6 addresses and MAC addresses that are bound to one another.</p> |

**Table 504: show dhcp-security ipv6 binding Output Fields**

| Field Name   | Field Description                                                                                                                                                                                                                                                                                                               | Level of Output |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| IPv6 address | IPv6 addresses of the network device; bound to the MAC address. There are two entries added for each client: one with the link-local IPv6 address, which is used by the client for DHCP transactions, and another with the IPv6 address assigned by the server. The link-local address always has the prefix <b>fe80::/10</b> . | All levels      |
| MAC address  | MAC address of the network device; bound to the IPv6 address.                                                                                                                                                                                                                                                                   | All levels      |
| VLAN         | VLAN name of the network device whose MAC address is shown.                                                                                                                                                                                                                                                                     | All levels      |

Table 504: show dhcp-security ipv6 binding Output Fields (*continued*)

| Field Name       | Field Description                                                                                                                                                                                                                       | Level of Output |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Expires</b>   | The time, in seconds, remaining before the lease of the IPv6 address to the MAC address expires.                                                                                                                                        | All levels      |
| <b>State</b>     | Specifies whether the IPv6 address is: <ul style="list-style-type: none"> <li>• <b>BOUND</b>: Temporarily leased to the MAC address for a limited period of time.</li> <li>• <b>STATIC</b>: Attached to a fixed MAC address.</li> </ul> | All levels      |
| <b>Interface</b> | Interface address (port).                                                                                                                                                                                                               | All levels      |

| DHCPv6 messages | <p>Number of DHCPv6 messages exchanged.</p> <ul style="list-style-type: none"> <li>• <b>Total</b>—Total number of DHCPv6 messages exchanged.</li> <li>• <b>Solicit</b>—Number of DHCPv6 messages of type Solicit. A client sends a Solicit message to locate servers.</li> <li>• <b>Advertise</b>—Number of DHCPv6 messages of type Advertise. A server sends an Advertise message, in response to a Solicit message, to indicate that it is available for DHCPv6 service.</li> <li>• <b>Request</b>—Number of DHCPv6 messages of type Request. A client sends a Request message to request configuration parameters from a server.</li> <li>• <b>Reply</b>—Number of DHCPv6 messages of type Reply. A server sends a Reply message in response to a Solicit, Request, Renew, Rebind, Confirm, Information Request, Release, or Decline message.</li> <li>• <b>Confirm</b>—Number of DHCPv6 messages of type Confirm. A client sends a Confirm message to any available server to determine whether the addresses it was assigned are still appropriate for the link to which the client is connected.</li> <li>• <b>Decline</b>—Number of DHCPv6 messages of type Decline. A client sends a Decline message to a server to indicate that one or more of the addresses assigned by the server are already in use on the link to which the client is connected.</li> <li>• <b>Release</b>—Number of DHCPv6 messages of type Release. A client sends a Release message to the server to indicate that the client will no longer use one or more of the assigned addresses.</li> <li>• <b>Renew</b>—Number of DHCPv6 messages of type Renew. A client sends a Renew message to the server to extend the lifetimes on the addresses assigned to the client by that server and to update other configuration parameters received by that server.</li> <li>• <b>Rebind</b>—Number of DHCPv6 messages of type Rebind. A client sends a Rebind message to any available server after receiving no reply to a Renew message.</li> <li>• <b>Relay-forward</b>—Number of DHCPv6 messages of type Relay-forward. A relay agent sends a Relay-forward message to relay messages to servers, either directly or through another relay agent. The received message is encapsulated in an option in the Relay-forward message.</li> <li>• <b>Relay-reply</b>—Number of DHCPv6 messages of type Relay-reply. A server sends a Relay-reply message to a relay agent containing a message that the relay agent delivers to a client.</li> <li>• <b>Information-request</b>—Number of DHCPv6 messages of type Information-request. A client sends an Information-request message to a server to request configuration parameters without the assignment of any IP addresses to the client.</li> <li>• <b>Reconfigure</b>—Number of DHCPv6 messages of type Reconfigure. A server sends a Reconfigure message to a client to inform the client that the server has new or updated configuration parameters, and that the client needs to initiate a Renew/Reply or Information-request/Reply transaction with the server in order to receive the updated information.</li> </ul> |
| Packets dropped | <p>Number of packets not considered for DHCPv6 snooping because of errors.</p> <ul style="list-style-type: none"> <li>• <b>Total</b>—Total number of packets discarded by DHCPv6 snooping.</li> <li>• <b>No configuration</b>—Number of packets discarded because they did not have a valid configuration.</li> <li>• <b>No VLAN</b>—Number of packets discarded because they did not belong to a valid VLAN.</li> <li>• <b>No interface</b>—Number of packets discarded because they did not belong to a valid interface.</li> <li>• <b>Request on trusted port</b>—Number of packets discarded because a Request message was received on a trusted port.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

## Sample Output

### show dhcp-security ipv6 statistics

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                             |

Table 506: show dhcp-security nd inspection statistics Output Fields

| Field Name                | Field Description                                                     | Level of Output |
|---------------------------|-----------------------------------------------------------------------|-----------------|
| <b>Interface</b>          | Interface on which Neighbor Discovery inspection has been applied.    | All levels      |
| <b>Packets received</b>   | Total number of packets that underwent Neighbor Discovery inspection. | All levels      |
| <b>ND inspection pass</b> | Total number of packets that passed Neighbor Discovery inspection.    | All levels      |
| <b>ND inspection fail</b> | Total number of packets that failed Neighbor Discovery inspection.    | All levels      |

## Sample Output

### show dhcp-security nd inspection statistics

```

user@switch> show dhcp-security nd inspection statistics
Interface      ND Packets received  ND inspection pass  ND inspection failed
ge-0/0/1.0      7                    5                    2
ge-0/0/2.0      10                   10                   0
ge-0/0/3.0      12                   12                   0

```

## Sample Output

`show dhcp-security nd inspection statistics interface ge-0/0/1.0`

```
user@switch> show dhcp-security nd inspection statistics interface ge-0/0/1.0
Interface      ND Packets received  ND inspection pass  ND inspection failed
ge-0/0/1.0          7                   5                   2
```

| <b>Cipher suite</b>         | Name of the cipher suite used for encryption.                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Encryption</b>           | Encryption setting. Encryption is enabled when this output is <b>on</b> and disabled when this output is <b>off</b> .<br><br>The encryption setting is set using the <b>no-encryption</b> statement in the connectivity association when using static connectivity association key (CAK) security mode and is set using the <b>encryption</b> statement in the secure channel when using static secure association key (SAK) or dynamic security mode. |
| <b>Key server offset</b>    | Offset setting.<br><br>The offset is set using the <b>offset</b> statement when configuring the connectivity association when using static connectivity association key (CAK) or dynamic security mode or the secure channel when using static secure association key (SAK) security mode.                                                                                                                                                             |

Table 507: show security macsec connections Output Fields (*continued*)

| Field Name            | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Include SCI</b>    | <p>SCI tagging. The SCI tag is included on packets in a secure channel when this output is <b>yes</b>, and not included on packets in a secure channel when this output is <b>no</b>.</p> <p>SCI tagging is automatically enabled on EX4300 switch interfaces that have enabled MACsec using static connectivity association key (CAK) or dynamic security mode. You can enable SCI tagging using the <b>include-sci</b> statement in the connectivity association.</p> |
| <b>Replay protect</b> | <p>Replay protection setting. Replay protection is enabled when this output is <b>on</b> and disabled when this output is <b>off</b>.</p> <p>You can enable replay protection using the <b>replay-protect</b> statement in the connectivity association.</p>                                                                                                                                                                                                            |
| <b>Replay window</b>  | <p>Replay protection window setting. This output is set to <b>0</b> when replay protection is disabled, and is the size of the replay window, in number of packets, when replay protection is enabled.</p> <p>The size of the replay window is configured using the <b>replay-window-size</b> statement in the connectivity association.</p>                                                                                                                            |

## Sample Output

### show security macsec connections

```

user@host> show security macsec connections
Interface name: xe-0/1/0
  CA name: CA1
  Cipher suite: GCM-AES-128   Encryption: on
  Key server offset: 0        Include SCI: no
  Replay protect: off         Replay window: 0

```

## show security macsec statistics

**Syntax** show security macsec statistics  
<brief | detail>  
<interface *interface-name*>

**Release Information** Command introduced in Junos OS Release 13.2X50-D15 for EX Series switches.  
Command introduced in Junos OS Release 14.1X53-D15 for QFX Series switches.

**Description** Display Media Access Control Security (MACsec) statistics.

**Options** **none**—Display MACsec statistics in brief form for all interfaces on the switch.

**brief | detail**—(Optional) Display the specified level of output. Using the **brief** option is equivalent to entering the command with no options (the default). The **detail** option displays additional fields that are not visible in the **brief** output.

**NOTE:** The field names that only appear in this command output when you enter the **detail** option are mostly useful for debugging purposes by Juniper Networks support personnel.

**interface *interface-name***—(Optional) Display MACsec statistics for the specified interface only.

**Required Privilege Level** view

**Related Documentation** • [show security macsec connections on page 4680](#)

**List of Sample Output** [show security macsec statistics interface xe-0/1/0 detail on page 4684](#)

**Output Fields** [Table 508 on page 4682](#) lists the output fields for the **show security macsec statistics** command. Output fields are listed in the approximate order in which they appear.

The field names that appear in this command output only when you enter the **detail** option are mostly useful for debugging purposes by Juniper Networks support personnel. Those field names are, therefore, not included in this table.

**Table 508: show security macsec statistics Output Fields**

| Field Name                                   | Field Description      | Level of Output |
|----------------------------------------------|------------------------|-----------------|
| <b>Interface name</b>                        | Name of the interface. | All levels      |
| <b>Fields for Secure Channel transmitted</b> |                        |                 |

## Security Features for EX Series Switches Overview

Juniper Networks Junos operating system (Junos OS) is a network operating system that has been hardened through the separation of control forwarding and services planes, with each function running in protected memory. The control-plane CPU is protected by rate limiting, routing policy, and firewall filters to ensure switch uptime even under severe attack. Access port security features such as dynamic Address Resolution Protocol (ARP) inspection, DHCP snooping, and MAC limiting are controlled through a single Junos OS CLI command.

Juniper Networks EX Series Ethernet Switches provide the following hardware and software security features:

**Console Port**—Allows use of the console port to connect to the Routing Engine through an RJ-45 cable. You then use the command-line interface (CLI) to configure the switch.

**Out-of-Band Management**—A dedicated management Ethernet port on the rear panel allows out-of-band management.

**Software Images**—All Junos OS images are signed by Juniper Networks certificate authority (CA) with public key infrastructure (PKI).

**User Authentication, Authorization, and Accounting (AAA)**—Features include:

- User and group accounts with password encryption and authentication.
- Access privilege levels configurable for login classes and user templates.
- RADIUS authentication, TACACS+ authentication, or both, for authenticating users who attempt to access the switch.
- Auditing of configuration changes through system logging or RADIUS/TACACS+.

**802.1X Authentication**—Provides network access control. Supplicants (hosts) are authenticated when they initially connect to a LAN. Authenticating supplicants before they receive an IP address from a DHCP server prevents unauthorized supplicants from gaining access to the LAN. EX Series switches support Extensible Authentication Protocol (EAP) methods, including EAP-MD5, EAP-TLS, EAP-TTLS, and EAP-PEAP.

**Port Security**—Access port security features include:

- **DHCP snooping**—Filters and blocks ingress DHCP server messages on untrusted ports; builds and maintains an IP-address/MAC-address binding database (called the DHCP snooping database).
- **Dynamic ARP inspection (DAI)**—Prevents ARP spoofing attacks. ARP requests and replies are compared against entries in the DHCP snooping database, and filtering decisions are made based on the results of those comparisons.
- **MAC limiting**—Protects against flooding of the Ethernet switching table.
- **MAC move limiting**—Detects MAC movement and MAC spoofing on access ports.
- **Trusted DHCP server**—With a DHCP server on a trusted port, protects against rogue DHCP servers sending leases.
- **IP source guard**—Mitigates the effects of IP address spoofing attacks on the Ethernet LAN. The source IP address in the packet sent from an untrusted access interface is validated against the source MAC address in the DHCP snooping database. The packet is allowed for further processing if the source IP address to source MAC address binding is valid; if the binding is not valid, the packet is discarded.
- **DHCP option 82**—Also known as the DHCP relay agent information option. Helps protect the EX Series switch against attacks such as spoofing (forging) of IP addresses and MAC addresses and DHCP IP address starvation. Option 82 provides information about the network location of a DHCP client, and the DHCP server uses this information to implement IP addresses or other parameters for the client.
- **Unrestricted proxy ARP**—The switch responds to all ARP messages with its own MAC address. Hosts that are connected to the switch's interfaces cannot communicate directly with other hosts. Instead, all communications between hosts go through the switch.
- **Restricted proxy ARP**—The switch does not respond to an ARP request if the physical networks of the source and target of the ARP request are the same. It does not matter whether the destination host has the same IP address as the incoming interface or a different (remote) IP address. An ARP request for a broadcast address elicits no reply.

**Device Security**—Storm control permits the switch to monitor unknown unicast and broadcast traffic and drop packets, or shut down, or temporarily disable the interface when a specified traffic level is exceeded, thus preventing packets from proliferating and degrading the LAN. You can enable storm control on access interfaces or trunk interfaces.

**Firewall Filters**—Allow auditing of various types of security violations, including attempts to access the switch from unauthorized locations. Firewall filters can detect such attempts and create audit log entries when they occur. The filters can also restrict access by limiting

traffic to source and destination MAC addresses, specific protocols, or, in combination with policers, to specified data rates to prevent denial of service (DoS) attacks.

**Policers**—Provide rate-limiting capability to control the amount of traffic that enters an interface, which acts to counter DoS attacks.

**Encryption Standards**—Supported standards include:

- 128-, 192-, and 256-bit Advanced Encryption Standard (AES)
- 56-bit Data Encryption Standard (DES) and 168-bit 3DES

## Firewall Filters for EX Series Switches Overview

Firewall filters provide rules that define whether to permit, deny, or forward packets that are transiting an interface on a Juniper Networks EX Series Ethernet Switch from a source address to a destination address. You configure firewall filters to determine whether to permit, deny, or forward traffic before it enters or exits a port, VLAN, or Layer 3 (routed) interface to which the firewall filter is applied. To apply a firewall filter, you must first configure the filter and then apply it to an port, VLAN, or Layer 3 interface.

You can apply firewall filters to network interfaces, aggregated Ethernet interfaces (also known as link aggregation groups (LAGs)), loopback interfaces, management interfaces, virtual management Ethernet interfaces (VMEs), and routed VLAN interfaces (RVIs). For information on EX Series switches that support a firewall filter on these interfaces, see *EX Series Switch Software Features Overview*.

An *ingress* firewall filter is a filter that is applied to packets that are entering a network. An *egress* firewall filter is a filter that is applied to packets that are exiting a network. You can configure firewall filters to subject packets to filtering, class-of-service (CoS) marking (grouping similar types of traffic together, and treating each type of traffic as a class with its own level of service priority), and traffic policing (controlling the maximum rate of traffic sent or received on an interface).

This topic describes:

- [Firewall Filter Types on page 4696](#)
- [Firewall Filter Components on page 4697](#)
- [Firewall Filter Processing on page 4698](#)

---

### Firewall Filter Types

The following firewall filter types are supported for EX Series switches:

- **Port (Layer 2) firewall filter**—Port firewall filters apply to Layer 2 switch ports. You can apply port firewall filters in both ingress and egress directions on a physical port.
- **VLAN firewall filter**—VLAN firewall filters provide access control for packets that enter a VLAN, are bridged within a VLAN, or leave a VLAN. You can apply VLAN firewall filters in both ingress and egress directions on a VLAN. VLAN firewall filters are applied to all packets that are forwarded to or forwarded from the VLAN.
- **Router (Layer 3) firewall filter**—You can apply a router firewall filter in both ingress and egress directions on Layer 3 (routed) interfaces and routed VLAN interfaces (RVIs). You can apply a router firewall filter in the ingress direction on the loopback interface (**lo0**) also. Firewall filters configured on loopback interfaces are applied only to packets that are sent to the Routing Engine CPU for further processing.

You can apply port, VLAN, or router firewall filters to *both* IPv4 and IPv6 traffic on these switches:

- EX2200 switch
- EX3300 switch

- EX3200 switch
- EX4200 switch
- EX4300 switch
- EX4500 switch
- EX6200 switch
- EX8200 switch

For information on firewall filters supported on different switches, see [“Platform Support for Firewall Filter Match Conditions, Actions, and Action Modifiers on EX Series Switches”](#) on page 4718.

### Firewall Filter Components

In a firewall filter, you first define the family address type (**ethernet-switching**, **inet**, or **inet6**), and then you define one or more terms that specify the filtering criteria (specified as terms with match conditions) and the action (specified as actions or action modifiers) to take if a match occurs.

The maximum number of terms allowed per firewall filter for EX Series switches is:

- 512 for EX2200 switches
- 1436 for EX3300 switches

**NOTE:** On EX3300 switches, if you add and delete filters with a large number of terms (on the order of 1000 or more) in the same commit operation, not all the filters are installed. You must add filters in one commit operation, and delete filters in a separate commit operation.

- 7,042 for EX3200 and EX4200 switches—as allocated by the dynamic allocation of ternary content addressable memory (TCAM) for firewall filters.
- On EX4300 switches, the following maximum number of terms are supported for ingress and egress traffic, for firewall filters configured on a port, VLAN and Layer 3 interface:
  - For ingress traffic:
    - 3500 terms for firewall filters configured on a port
    - 3500 terms for firewall filters configured on a VLAN
    - 7000 terms for firewall filters configured on Layer 3 interfaces for IPv4 traffic
    - 3500 terms for firewall filters configured on Layer 3 interfaces for IPv6 traffic
  - For egress traffic:
    - 512 terms for firewall filters configured on a port
    - 256 terms for firewall filters configured on a VLAN

- 512 terms for firewall filters configured on Layer 3 interfaces for IPv4 traffic
- 512 terms for firewall filters configured on Layer 3 interfaces for IPv6 traffic

**NOTE:** You can configure the maximum number of terms only when you configure one type of firewall filter (port, VLAN, or router (Layer 3) firewall filter) on the switch, and when storm control is not enabled on any interface in the switch.

- 1200 for EX4500 and EX4550 switches
- 1400 for EX6200 switches
- 32,768 for EX8200 switches

**NOTE:** The on-demand dynamic allocation of the shared space TCAM in EX8200 switches is achieved by assigning free space blocks to firewall filters. Firewall filters are categorized into two different pools. Port and VLAN filters are pooled together (the memory threshold for this pool is 22K) while router firewall filters are pooled separately (the threshold for this pool is 32K). The assignment happens based on the filter pool type. Free space blocks can be shared only among the firewall filters belonging to the same filter pool type. An error message is generated when you try to configure a firewall filter beyond the TCAM threshold.

Each term consists of the following components:

- Match conditions—Specify the values or fields that the packet must contain. You can define various match conditions, including the IP source address field, IP destination address field, Transmission Control Protocol (TCP) or User Datagram Protocol (UDP) source port field, IP protocol field, Internet Control Message Protocol (ICMP) packet type, TCP flags, and interfaces.
- Action—Specifies what to do if a packet matches the match conditions. Possible actions are to accept or discard the packet or to send the packet to a specific virtual routing interface. In addition, packets can be counted to collect statistical information. If no action is specified for a term, the default action is to accept the packet.
- Action modifier—Specifies one or more actions for the switch if a packet matches the match conditions. You can specify action modifiers such as count, mirror, rate limit, and classify packets.

---

### Firewall Filter Processing

The order of the terms within a firewall filter configuration is important. Packets are tested against each term in the order in which the terms are listed in the firewall filter configuration. For information on how firewall filters process packets, see [“Understanding How Firewall Filters Are Evaluated” on page 4760](#).

## Understanding Planning of Firewall Filters

Before you create a firewall filter and apply it to an interface, determine what you want the firewall filter to accomplish and how to use its match conditions and actions to achieve your goals. You must understand how packets are matched to match conditions, the default and configured actions of the firewall filter, and proper placement of the firewall filter.

You can configure and apply no more than one firewall filter per port, VLAN, or router interface, per direction. The following limits apply for the number of firewall filter terms allowed per filter on various switch models:

- On EX2200 switches, the number of terms per filter cannot exceed 512.
- On EX3300 switches, the number of terms per filter cannot exceed 1436.
- On EX3200 and EX4200 switches, the number of terms per filter cannot exceed 7042.
- On EX4300 switches, the following maximum number of terms are supported for ingress and egress traffic, for firewall filters configured on a port, VLAN and Layer 3 interface:
  - For ingress traffic:
    - 3500 terms for firewall filters configured on a port
    - 3500 terms for firewall filters configured on a VLAN
    - 7000 terms for firewall filters configured on Layer 3 interfaces for IPv4 traffic
    - 3500 terms for firewall filters configured on Layer 3 interfaces for IPv6 traffic
  - For egress traffic:
    - 512 terms for firewall filters configured on a port
    - 256 terms for firewall filters configured on a VLAN

- 512 terms for firewall filters configured on Layer 3 interfaces for IPv4 traffic
- 512 terms for firewall filters configured on Layer 3 interfaces for IPv6 traffic

**NOTE:** You can configure the maximum number of terms only when you configure one type of firewall filter (port, VLAN, or router (Layer 3) firewall filter) on the switch, and when storm control is not enabled on any interface in the switch.

- On EX4500 and EX4550 switches, the number of terms per filter cannot exceed 1200.
- On EX6200 switches, the number of terms per filter cannot exceed 1400.
- On EX8200 switches, the number of terms per filter cannot exceed 32,768.

In addition, try to be conservative in the number of terms (rules) that you include in each firewall filter because a large number of terms requires longer processing time during a commit and also can make firewall filter testing and troubleshooting more difficult. Similarly, applying firewall filters across many switch and router interfaces can make testing and troubleshooting the rules of those filters difficult.

Before you configure and apply firewall filters, answer the following questions for each of those firewall filters:

1. What is the purpose of the firewall filter?

For example, you can use a firewall filter to limit traffic to source and destination MAC addresses, specific protocols, or certain data rates or to prevent denial of service (DoS) attacks.

2. What are the appropriate match conditions?

- a. Determine the packet header fields that the packet must contain for a match.  
Possible fields include:

- Layer 2 header fields—Source and destination MAC addresses, dot1q tag, Ethernet type, and VLAN
- Layer 3 header fields—Source and destination IP addresses, protocols, and IP options (IP precedence, IP fragmentation flags, TTL type)
- TCP header fields—Source and destination ports and flags
- ICMP header fields—Packet type and code

- b. Determine the port, VLAN, or router interface on which the packet was received.

3. What are the appropriate actions to take if a match occurs?

Possible actions to take if a match occurs are accept, discard, and forward to a routing instance.

4. What additional action modifiers might be required?

Determine whether additional actions are required if a packet matches a match condition; for example, you can specify an action modifier to count, analyze, or police packets.

5. On what interface should the firewall filter be applied?

Start with the following basic guidelines:

- If all the packets entering a port need to be exposed to filtering, then use port firewall filters.
- If all the packets that are bridged need filtering, then use VLAN firewall filters.
- If all the packets that are routed need filtering, then use router firewall filters.

Before you choose the interface on which to apply a firewall filter, understand how that placement can impact traffic flow to other interfaces. In general, apply a firewall filter that filters on source and destination IP addresses, IP protocols, or protocol information—such as ICMP message types, and TCP and UDP port numbers—nearest to the source devices. However, typically apply a firewall filter that filters only on a source IP address nearest to the destination devices. When applied too close to the source device, a firewall filter that filters only on a source IP address could potentially prevent that source device from accessing other services that are available on the network.

**NOTE:** Egress firewall filters do not affect the flow of locally generated control packets from the Routing Engine.

6. In which direction should the firewall filter be applied?

You can apply firewall filters to ports on the switch to filter packets that are entering a port. You can apply firewall filters to VLANs, and Layer 3 (routed) interfaces to filter packets that are entering or exiting a VLAN or routed interface. Typically, you configure different sets of actions for traffic entering an interface than you configure for traffic exiting an interface.

## Understanding Firewall Filter Processing Points for Bridged and Routed Packets on EX Series Switches

Juniper Networks EX Series Ethernet Switches are multilayered switches that provide Layer 2 switching and Layer 3 routing. You apply firewall filters at multiple processing points in the packet forwarding path on EX Series switches. At each processing point, the action to be taken on a packet is determined based on the results of the lookup in the switch's forwarding table. A table lookup determines which exit port on the switch to use to forward the packet.

For both bridged unicast packets and routed unicast packets, firewall filters are evaluated and applied hierarchically. First, a packet is checked against the port firewall filter, if present. If the packet is permitted, it is then checked against the VLAN firewall filter, if present. If the packet is permitted, it is then checked against the router firewall filter, if present. The packet must be permitted by the router firewall filter before it is processed.

Figure 66 on page 4702 shows the various firewall filter processing points in the packet forwarding path in a multilayered switching platform.

Figure 66: Firewall Filter Processing Points in the Packet Forwarding Path

For a multicast packet that results in replications, an egress firewall filter is applied to each copy of the packet based on its corresponding egress VLAN.

For Layer 2 (bridged) unicast packets, the following firewall filter processing points apply:

- Ingress port firewall filter
- Ingress VLAN firewall filter
- Egress port firewall filter
- Egress VLAN firewall filter

For Layer 3 (routed and multilayer-switched) unicast packets, the following firewall filter processing points apply:

- Ingress port firewall filter
- Ingress VLAN firewall filter (Layer 2 CoS)
- Ingress router firewall filter (Layer 3 CoS)
- Egress router firewall filter
- Egress VLAN firewall filter

## Understanding How Firewall Filters Control Packet Flows

Juniper Networks EX Series Ethernet Switches support firewall filters that allow you to control flows of data packets and local packets. *Data packets* are chunks of data that transit the switch as they are forwarded from a source to a destination. *Local packets* are chunks of data that are destined for or sent by the switch. Local packets usually contain routing protocol data, data for IP services such as Telnet or SSH, and data for administrative protocols such as the Internet Control Message Protocol (ICMP).

You create firewall filters to protect your switch from excessive traffic transiting the switch to a network destination or destined for the Routing Engine on the switch. Firewall filters that control local packets can also protect your switch from external incidents such as denial-of-service (DoS) attacks.

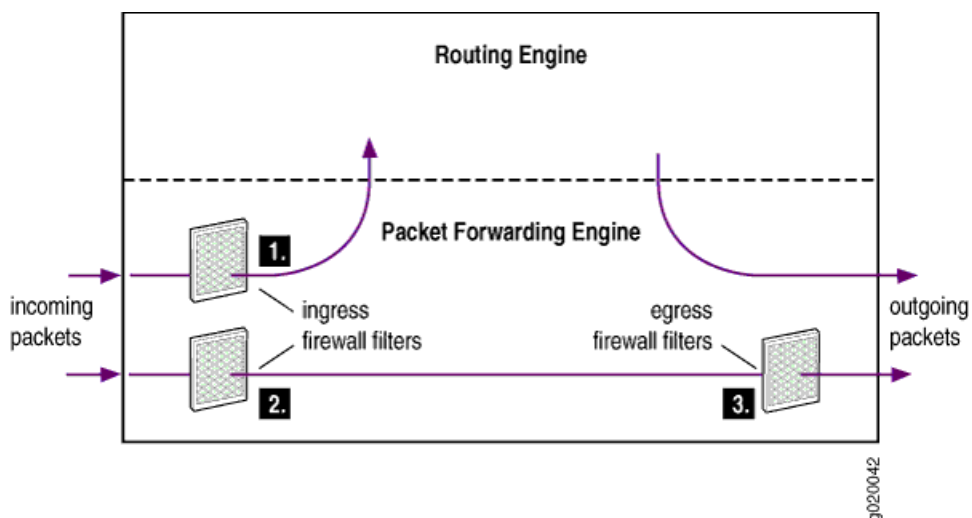

Firewall filters affect packet flows entering in to or exiting from the switch's interfaces:

- Ingress firewall filters affect the flow of data packets that are received by the switch's interfaces. The Packet Forwarding Engine handles this flow. When a switch receives a data packet on an interface, the switch determines where to forward the packet by looking in the forwarding table for the best route (Layer 2 switching, Layer 3 routing) to a destination. Data packets are forwarded to their destination through an outgoing interface. Locally destined packets are forwarded to the Routing Engine.

- Egress firewall filters affect the flow of data packets that are transmitted from the switch's interfaces but do not affect the flow of locally generated control packets from the Routing Engine. The Packet Forwarding Engine handles the flow of data packets that are transmitted from the switch, and egress firewall filters are applied here. The Packet Forwarding Engine also handles the flow of control packets from the Routing Engine.

Figure 67 on page 4704 illustrates the application of ingress and egress firewall filters to control the flow of packets through the switch.

Figure 67: Application of Firewall Filters to Control Packet Flow

- Ingress firewall filter applied to control locally destined packets that are received on the switch's interfaces and are destined for the Routing Engine.
- Ingress firewall filter applied to control incoming packets on the switch's interfaces.
- Egress firewall filter applied to control packets that are transiting the switch's interfaces.

## Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series Switches

When you define a firewall filter for an EX Series switch, you define filtering criteria (*terms*, with *match conditions*) for the packets and an *action* (and, optionally, an *action modifier*) for the switch to take if the packets match the filtering criteria. You can define a firewall filter to monitor IPv4, IPv6, or non-IP traffic.

This topic describes in detail the various match conditions, actions, and action modifiers that you can define in a firewall filter. For information about support for match conditions

on various EX Series switches, see [“Platform Support for Firewall Filter Match Conditions, Actions, and Action Modifiers on EX Series Switches”](#) on page 4718.

This topic describes:

- [Firewall Filter Elements on page 4705](#)
- [Match Conditions Supported on Switches on page 4705](#)
- [Actions for Firewall Filters on page 4712](#)
- [Action Modifiers for Firewall Filters on page 4713](#)

### Firewall Filter Elements

A firewall filter configuration contains a term, a match condition, an action, and, optionally, an action modifier. [Table 511 on page 4705](#) describes each element in a firewall filter configuration.

**Table 511: Elements of a Firewall Filter Configuration**

| Element Name    | Description                                                                                                                                                                                                                                                                                                                                                                             |
|-----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Term            | Defines the filtering criteria for the packets. Each term in the firewall filter consists of match conditions and an action. You can define a single term or multiple terms in the firewall filter. If you define multiple terms, each term must have a unique name.                                                                                                                    |
| Match condition | Consists of a string (called a <i>match statement</i> ) that defines the match condition. Match conditions are the values or fields that a packet must contain. You can define a single match condition or multiple match conditions for a term. You can also opt not to define a match condition. If no match conditions are specified for a term, all packets are matched by default. |
| Action          | Specifies the action that the switch takes if a packet matches all the criteria specified in the match conditions.                                                                                                                                                                                                                                                                      |
| Action modifier | Specifies one or more actions that the switch takes if a packet matches the match conditions for the specific term.                                                                                                                                                                                                                                                                     |

### Match Conditions Supported on Switches

Based on the type of traffic that you want to monitor, you can configure a firewall filter to monitor IPv4, IPv6, or non-IP traffic. When you configure a firewall filter to monitor a particular type of traffic, ensure that you specify match conditions that are supported for that type of traffic. For information about match conditions supported for a specific type of traffic and switches on which they are supported, see [“Platform Support for Firewall Filter Match Conditions, Actions, and Action Modifiers on EX Series Switches”](#) on page 4718.

[Table 512 on page 4705](#) describes all the match conditions that are supported for firewall filters on EX Series Switches.

**Table 512: Firewall Filter Match Conditions Supported on EX Series Switches**

| Match Condition                             | Description                                                                       |
|---------------------------------------------|-----------------------------------------------------------------------------------|
| <code>destination-address ip-address</code> | IP destination address field, which is the address of the final destination node. |

Table 512: Firewall Filter Match Conditions Supported on EX Series Switches (*continued*)

| Match Condition                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>user-vlan-1p-priority <i>number</i></b> | <p>User-priority field of the tagged Ethernet packet. User-priority values can range from 0 through 7.</p> <p>For <i>number</i>, you can specify one of the following text synonyms (the field values are also listed):</p> <ul style="list-style-type: none"> <li>• <b>background (1)</b>—Background</li> <li>• <b>best-effort (0)</b>—Best effort</li> <li>• <b>controlled-load (4)</b>—Controlled load</li> <li>• <b>excellent-load (3)</b>—Excellent load</li> <li>• <b>network-control (7)</b>—Network control reserved traffic</li> <li>• <b>standard (2)</b>—Standard or spare</li> <li>• <b>video (5)</b>—Video</li> <li>• <b>voice (6)</b>—Voice</li> </ul>                                                                                                                                                                                                   |
| <b>dscp <i>number</i></b>                  | <p>Specifies the Differentiated Services code point (DSCP). The DiffServ protocol uses the type-of-service (ToS) byte in the IP header. The most significant six bits of this byte form the DSCP.</p> <p>You can specify DSCP in hexadecimal, binary, or decimal form.</p> <p>For <i>number</i>, you can specify one of the following text synonyms (the field values are also listed):</p> <ul style="list-style-type: none"> <li>• <b>ef (46)</b>—as defined in <a href="#">RFC 2598</a>, <i>An Expedited Forwarding PHB</i>.</li> <li>• <b>af11 (10), af12 (12), af13 (14), af21 (18), af22 (20), af23 (22), af31 (26), af32 (28), af33 (30), af41 (34), af42 (36), af43 (38)</b></li> </ul> <p>These four classes, with three drop precedences in each class, are defined for 12 code points in <a href="#">RFC 2597</a>, <i>Assured Forwarding PHB Group</i>.</p> |

Table 512: Firewall Filter Match Conditions Supported on EX Series Switches (*continued*)

| Match Condition                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|---------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ether-type</b> <i>value</i>              | <p>Ethernet type field of a packet. The <i>value</i> specifies what protocol is being transported in the Ethernet frame. For <i>value</i>, you can specify one of the following text synonyms:</p> <ul style="list-style-type: none"> <li><b>aarp</b>—EtherType value AARP (0x80F3)</li> <li><b>appletalk</b>—EtherType value AppleTalk (0x809B)</li> <li><b>arp</b>—EtherType value ARP (0x0806)</li> <li><b>ipv4</b>—EtherType value IPv4 (0x0800)</li> <li><b>ipv6</b>—EtherType value IPv6 (0x08DD)</li> <li><b>mpls multicast</b>—EtherType value MPLS multicast (0x8848)</li> <li><b>mpls unicast</b>—EtherType value MPLS unicast (0x8847)</li> <li><b>oam</b>—EtherType value OAM (0x88A8)</li> <li><b>ppp</b>—EtherType value PPP (0x880B)</li> <li><b>pppoe-discovery</b>—EtherType value PPPoE Discovery Stage (0x8863)</li> <li><b>pppoe-session</b>—EtherType value PPPoE Session Stage (0x8864)</li> <li><b>sna</b>—EtherType value SNA (0x80D5)</li> </ul> <p><b>NOTE:</b> The following match conditions are not supported when <b>ether-type</b> is set to <b>ipv6</b>:</p> <ul style="list-style-type: none"> <li><b>dscp</b></li> <li><b>fragment-flags</b></li> <li><b>is-fragment</b></li> <li><b>precedence</b> or <b>ip-precedence</b></li> <li><b>protocol</b> or <b>ip-protocol</b></li> </ul> |
| <b>fragment-flags</b> <i>fragment-flags</i> | <p>IP fragmentation flags, specified in symbolic or hexadecimal formats. You can specify one of the following options:</p> <ul style="list-style-type: none"> <li><b>dont-fragment</b> (0x4000)</li> <li><b>more-fragments</b> (0x2000)</li> <li><b>reserved</b> (0x8000)</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

Table 512: Firewall Filter Match Conditions Supported on EX Series Switches (*continued*)

| Match Condition                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>icmp-code</b> <i>number</i>         | <p>ICMP code field. This value or option provides more specific information than <b>icmp-type</b>. Because the value's meaning depends upon the associated <b>icmp-type</b>, you must specify <b>icmp-type</b> along with <b>icmp-code</b>. For <i>number</i>, you can specify one of the following text synonyms (the field values are also listed). The options are grouped by the ICMP type with which they are associated:</p> <ul style="list-style-type: none"> <li>• <b>parameter-problem</b>—<b>ip-header-bad</b> (0), <b>required-option-missing</b> (1)</li> <li>• <b>redirect</b>—<b>redirect-for-host</b> (1), <b>redirect-for-network</b> (0), <b>redirect-for-tos-and-host</b> (3), <b>redirect-for-tos-and-net</b> (2)</li> <li>• <b>time-exceeded</b>—<b>ttl-eq-zero-during-reassembly</b> (1), <b>ttl-eq-zero-during-transit</b> (0)</li> <li>• <b>unreachable</b>—<b>communication-prohibited-by-filtering</b> (13), <b>destination-host-prohibited</b> (10), <b>destination-host-unknown</b> (7), <b>destination-network-prohibited</b> (9), <b>destination-network-unknown</b> (6), <b>fragmentation-needed</b> (4), <b>host-precedence-violation</b> (14), <b>host-unreachable</b> (1), <b>host-unreachable-for-TOS</b> (12), <b>network-unreachable</b> (0), <b>network-unreachable-for-TOS</b> (11), <b>port-unreachable</b> (3), <b>precedence-cutoff-in-effect</b> (15), <b>protocol-unreachable</b> (2), <b>source-host-isolated</b> (8), <b>source-route-failed</b> (5)</li> </ul> |
| <b>icmp-type</b> <i>number</i>         | <p>ICMP packet type field. Typically, you specify this match condition in conjunction with the <b>protocol</b> or <b>ip-protocol</b> match condition to determine which protocol is being used on the port. For <i>number</i>, you can specify one of the following text synonyms (the field values are also listed):</p> <p><b>echo-reply</b> (0), <b>echo-request</b> (8), <b>info-reply</b> (16), <b>info-request</b> (15), <b>mask-request</b> (17), <b>mask-reply</b> (18), <b>parameter-problem</b> (12), <b>redirect</b> (5), <b>router-advertisement</b> (9), <b>router-solicit</b> (10), <b>source-quench</b> (4), <b>time-exceeded</b> (11), <b>timestamp</b> (13), <b>timestamp-reply</b> (14), <b>unreachable</b> (3)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>interface</b> <i>interface-name</i> | <p>Interface on which the packet is received. You can specify the wildcard character (*) as part of an interface name.</p> <p><b>NOTE:</b> The <b>interface</b> match condition is not supported for egress traffic on an EX8200 Virtual Chassis.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>ip-options</b>                      | Presence of the options field in the IP header.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

Table 512: Firewall Filter Match Conditions Supported on EX Series Switches (*continued*)

| Match Condition                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ip-version</b> <i>version match_condition(s)</i> | <p>Version of the IP protocol for port and VLAN firewall filters. The value for <i>version</i> can be <b>ipv4</b> or <b>ipv6</b>.</p> <p>For <i>match_condition(s)</i>, you can specify one or more of the following match conditions:</p> <ul style="list-style-type: none"> <li>• <b>destination-address</b>, <b>ip-destination-address</b>, or <b>ip6-destination-address</b></li> <li>• <b>destination-port</b></li> <li>• <b>destination-prefix-list</b></li> <li>• <b>dscp</b></li> <li>• <b>fragment-flags</b></li> <li>• <b>icmp-code</b></li> <li>• <b>icmp-type</b></li> <li>• <b>is-fragment</b></li> <li>• <b>precedence</b> or <b>ip-precedence</b></li> <li>• <b>protocol</b> or <b>ip-protocol</b></li> <li>• <b>source-address</b> or <b>ip-source-address</b></li> <li>• <b>source-port</b></li> <li>• <b>source-prefix-list</b></li> <li>• <b>tcp-established</b></li> <li>• <b>tcp-flags</b></li> <li>• <b>tcp-initial</b></li> </ul> |
| <b>is-fragment</b>                                  | <p>If the packet is a trailing fragment, this match condition does not match the first fragment of a fragmented packet. Use two terms to match both first and trailing fragments.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>l2-encap-type llc-non-snap</b>                   | <p>Match on logical link control (LLC) layer packets for non-Subnet Access Protocol (SNAP) Ethernet Encapsulation type.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>next-header bytes</b>                            | <p>8-bit protocol field that identifies the type of header immediately following the IPv6 header. In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed):</p> <p><b>ah (51), dstops (60), egp (8), esp (50), fragment (44), gre (47), hop-by-hop (0), icmp (1), icmp6 (1), igmp (2), ipip (4), ipv6 (41), no-next-header (59), ospf (89), pim (103), routing (43), rsvp (46), sctp (132), tcp (6), udp (17), vrrp (112)</b></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>packet-length bytes</b>                          | <p>Length of the received packet, in bytes.</p> <p>The length refers only to the IP packet, including the packet header, and does not include any Layer 2 encapsulation overhead.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>precedence precedence</b>                        | <p>IP precedence. For <i>precedence</i>, you can specify one of the following text synonyms (the field values are also listed):</p> <p><b>critical-ecp (5), flash (3), flash-override (4), immediate (2), internet-control (6), net-control (7), priority (1), routine (0)</b></p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Table 512: Firewall Filter Match Conditions Supported on EX Series Switches (*continued*)

| Match Condition                                                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>ip-precedence</b> <i>precedence</i>                              | <p>IP precedence. For <i>precedence</i>, you can specify one of the following text synonyms (the field values are also listed):</p> <p><b>critical-ecp (5), flash (3), flash-override (4), immediate (2), internet-control (6), net-control (7), priority (1), routine (0)</b></p>                                                                                                                                                           |
| <b>protocol</b> <i>list of protocol</i>                             | <p>IPv4 protocol value. For <i>protocols</i>, you can specify one of the following text synonyms:</p> <p><b>egp (8), esp (50), gre (47), icmp (1), igmp (2), ipip (4), ospf (89), pim (103), rsvp (46), tcp (6), udp (17)</b></p>                                                                                                                                                                                                            |
| <b>ip-protocol</b> <i>list of protocol</i>                          | <p>IPv4 protocol value. For <i>protocols</i>, you can specify one of the following text synonyms:</p> <p><b>egp (8), esp (50), gre (47), icmp (1), igmp (2), ipip (4), ospf (89), pim (103), rsvp (46), tcp (6), udp (17)</b></p>                                                                                                                                                                                                            |
| <b>source-address</b> <i>ip-address</i>                             | <p>IP source address field, which is the address of the source node sending the packet. For IPv6, the source-address field is 128 bits in length. The filter description syntax supports the text representations for IPv6 addresses that are described in <a href="#">RFC 2373</a>, <i>IP Version 6 Addressing Architecture</i>.</p>                                                                                                        |
| <b>ip-source-address</b> ( <i>ip-address</i>   <i>ip6-address</i> ) | <p>IP source address field, which is the address of the source node sending the packet. You can specify either an IPv4 address (<b>ip-address</b>) or an IPv6 address (<b>ip6-address</b>). For IPv6, the ip-source-address field is 128 bits in length. The filter description syntax supports the text representations for IPv6 addresses that are described in <a href="#">RFC 2373</a>, <i>IP Version 6 Addressing Architecture</i>.</p> |
| <b>source-mac-address</b> <i>mac-address</i>                        | <p>Source MAC address.</p> <p>You can define a source MAC address with a prefix, such as <b>source-mac-address 00:01:02:03:04:05/24</b>. If no prefix is specified, the default value 48 is used.</p>                                                                                                                                                                                                                                        |
| <b>source-port</b> <i>number</i>                                    | <p>TCP or UDP <b>source-port</b> field. Typically, you specify this match in conjunction with the <b>protocol</b> or <b>ip-protocol</b> match condition to determine which protocol is being used on the port. For <i>number</i>, you can specify one of the text synonyms listed under <b>destination-port</b>.</p>                                                                                                                         |
| <b>source-prefix-list</b> <i>prefix-list</i>                        | <p>IP source prefix list field.</p> <p>You can define a list of IP address prefixes under a prefix-list alias for frequent use. You define this match condition at the <b>[edit policy-options]</b> hierarchy level.</p>                                                                                                                                                                                                                     |
| <b>tcp-established</b>                                              | <p>TCP packets of an established TCP connection. This condition matches packets other than the first packet of a connection. <b>tcp-established</b> is a synonym for the bit names "(ack   rst)".</p> <p><b>tcp-established</b> does not implicitly check whether the protocol is TCP. To do so, specify the <b>next-header tcp</b> match condition.</p>                                                                                     |

Table 512: Firewall Filter Match Conditions Supported on EX Series Switches (*continued*)

| Match Condition                                            | Description                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>tcp-flags</b> ( <i>flags tcp-initial</i> )              | <p>One or more TCP flags:</p> <ul style="list-style-type: none"> <li>bit-name—<b>fin</b>, <b>syn</b>, <b>rst</b>, <b>push</b>, <b>ack</b>, <b>urgent</b></li> <li>logical operators—<b>&amp;</b> (logical AND), <b> </b> (logical OR), <b>!</b> (negation)</li> <li>numerical value—0x01 through 0x20</li> <li>text synonym—<b>tcp-initial</b></li> </ul> <p>To specify multiple flags, use logical operators.</p> |
| <b>tcp-initial</b>                                         | <p>Matches the first TCP packet of a connection. <b>tcp-initial</b> is a synonym for the bit names "<b>syn&amp;!ack</b>".</p> <p><b>tcp-initial</b> does not implicitly check whether the protocol is TCP. To do so, specify the <b>protocol tcp</b> or <b>ip-protocol tcp</b> match condition.</p>                                                                                                                |
| <b>traffic-class</b> <i>number</i>                         | Specifies the DSCP code point for a packet.                                                                                                                                                                                                                                                                                                                                                                        |
| <b>ttl</b> <i>value</i>                                    | TTL type to match. The value ranges from 1 through 255.                                                                                                                                                                                                                                                                                                                                                            |
| <b>vlan</b> ( <i>vlan-name</i>   <i>vlan-id</i> )          | The VLAN that is associated with the packet. For <i>vlan-id</i> , you can specify either the VLAN ID or a VLAN range. The <b>vlan</b> match condition and the <b>dot1q-tag</b> match condition are mutually exclusive.                                                                                                                                                                                             |
| <b>learn-vlan-id</b> ( <i>vlan-name</i>   <i>vlan-id</i> ) | The VLAN that is associated with the packet. For <i>vlan-id</i> , you can specify either the VLAN ID or a VLAN range. The <b>vlan</b> match condition and the <b>user-vlan-id</b> match condition are mutually exclusive.                                                                                                                                                                                          |

### Actions for Firewall Filters

You can define an action for the switch to take if a packet matches the filtering criteria defined in a match condition. [Table 513 on page 4712](#) describes the actions supported in a firewall filter configuration.

Table 513: Actions for Firewall Filters

| Action         | Description                                                                                    |
|----------------|------------------------------------------------------------------------------------------------|
| <b>accept</b>  | Accept a packet.                                                                               |
| <b>discard</b> | Discard a packet silently without sending an Internet Control Message Protocol (ICMP) message. |

Table 513: Actions for Firewall Filters (*continued*)

| Action                                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>reject message-type</code>                    | <p>Discard a packet, and send the ICMPv4 message (type 3) <b>destination unreachable</b>. You can log the rejected packets if you configure the <b>syslog</b> action modifier.</p> <p>You can specify one of the following message codes: <b>administratively-prohibited (default)</b>, <b>bad-host-tos</b>, <b>bad-network-tos</b>, <b>host-prohibited</b>, <b>host-unknown</b>, <b>host-unreachable</b>, <b>network-prohibited</b>, <b>network-unknown</b>, <b>network-unreachable</b>, <b>port-unreachable</b>, <b>precedence-cutoff</b>, <b>precedence-violation</b>, <b>protocol-unreachable</b>, <b>source-host-isolated</b>, <b>source-route-failed</b>, <b>tcp-reset</b>.</p> <p>If you specify <b>tcp-reset</b>, a TCP reset is returned if the packet is a TCP packet. Otherwise nothing is returned.</p> <p>If you do not specify a message type, the ICMP notification <b>destination unreachable</b> is sent with the default message <b>communication administratively filtered</b>.</p> |
| <code>routing-instance routing-instance-name</code> | <p>Forward matched packets to a virtual routing instance.</p> <p><b>NOTE:</b> EX4200 switches do not support firewall-filter-based redirection to the default routing instance.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <code>vlan vlan-name</code>                         | <p>Forward matched packets to a specific VLAN. Ensure that you specify the VLAN name or VLAN ID and not a VLAN range, because the <b>vlan</b> action does not support the <b>vlan-range</b> option.</p> <p><b>NOTE:</b> If you have defined a VLAN that is enabled for dot1q tunneling, then that particular VLAN is not supported as an action (using the <b>vlan vlan-name</b> action) for an ingress VLAN firewall filter.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### Action Modifiers for Firewall Filters

In addition to the actions described in [Table 513 on page 4712](#), you can define action modifiers in a firewall filter configuration for a switch if packets match the filtering criteria defined in the match condition. [Table 514 on page 4713](#) describes the action modifiers supported in a firewall filter configuration.

Table 514: Action Modifiers for Firewall Filters

| Action Modifier                     | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>analyzer analyzer-name</code> | <p>Mirror port traffic to a specified destination port or VLAN that is connected to a protocol analyzer application. Mirroring copies all packets seen on one switch port to a network monitoring connection on another switch port. The analyzer name must be configured under <b>[edit ethernet-switching-options analyzer]</b>.</p> <p><b>NOTE:</b> <b>analyzer</b> is not a supported action modifier for a management interface.</p> <p><b>NOTE:</b> On EX4500 switches, you can configure only one analyzer and include it in a firewall filter. If you configure multiple analyzers, you cannot include any one of those analyzers in a firewall filter.</p> |

Table 514: Action Modifiers for Firewall Filters (*continued*)

| Action Modifier                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>dscp</b> <i>number</i>              | <p>Change the DSCP value for matched packets to the DSCP value specified with this action modifier. <i>number</i> specifies the Differentiated Services code point (DSCP). The DiffServ protocol uses the type-of-service (ToS) byte in the IP header. The most significant six bits of this byte form the DSCP.</p> <p>You can specify DSCP in hexadecimal, binary, or decimal form.</p> <p>For <i>number</i>, you can specify one of the following text synonyms (the field values are also listed):</p> <ul style="list-style-type: none"> <li>• <b>ef</b> (46)—as defined in <a href="#">RFC 2598</a>, <i>An Expedited Forwarding PHB</i>.</li> <li>• <b>af11</b> (10), <b>af12</b> (12), <b>af13</b> (14), <b>af21</b> (18), <b>af22</b> (20), <b>af23</b> (22), <b>af31</b> (26), <b>af32</b> (28), <b>af33</b> (30), <b>af41</b> (34), <b>af42</b> (36), <b>af43</b> (38)</li> </ul> <p>These four classes, with three drop precedences in each class, are defined for 12 code points in <a href="#">RFC 2597</a>, <i>Assured Forwarding PHB Group</i>.</p> |
| <b>count</b> <i>counter-name</i>       | <p>Count the number of packets that pass this filter, term, or policer. A policer enables you to specify rate limits on traffic that enters an interface on a switch.</p> <p><b>NOTE:</b> On EX4300 switches, you can configure the same number of counters and policers as the number of terms in the ternary content addressable memory (TCAM).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>forwarding-class</b> <i>class</i>   | <p>Classify the packet in one of the following forwarding classes:</p> <ul style="list-style-type: none"> <li>• <b>assured-forwarding</b></li> <li>• <b>best-effort</b></li> <li>• <b>expedited-forwarding</b></li> <li>• <b>network-control</b></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>interface</b> <i>interface-name</i> | Forward the traffic to the specified interface bypassing the switching lookup.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>log</b>                             | <p>Log the packet's header information in the Routing Engine. To view this information, issue the <b>show firewall log</b> command in the CLI.</p> <p><b>NOTE:</b> If the <b>log</b> or the <b>syslog</b> action modifier is configured along with a <b>vlan</b> action or an <b>interface</b> action modifier, the events might not be logged. However, the redirect interface functionality works as expected.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>loss-priority</b> (high   low)      | Set the packet loss priority (PLP).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>policer</b> <i>policer-name</i>     | <p>Apply rate limits to the traffic.</p> <p>You can specify a policer in a firewall filter only for ingress traffic on a port, VLAN, and router.</p> <p><b>NOTE:</b> A counter for a policer is not supported on EX8200 switches.</p> <p><b>NOTE:</b> On EX4300 switches, you can configure the same number of counters and policers as the number of terms in the TCAM.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>port-mirror</b>                     | Mirror packets to the interface defined in the <b>[edit forwarding-options analyzer]</b> hierarchy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Table 514: Action Modifiers for Firewall Filters (*continued*)

| Action Modifier                                        | Description                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <code>port-mirror-instance</code> <i>instance-name</i> | Mirror packets to the instance defined in the <code>[edit forwarding-options analyzer]</code> hierarchy.                                                                                                                                                                                                                                                                                           |
| <code>syslog</code>                                    | Log an alert for this packet. You can specify that the log be sent to a server for storage and analysis.<br><br><b>NOTE:</b> If the <code>log</code> or the <code>syslog</code> action modifier is configured along with a <code>vlan</code> action or an <code>interface</code> action modifier, the events might not be logged. However, the redirect interface functionality works as expected. |
| <code>three-color-policer</code>                       | Apply a three-color policer.                                                                                                                                                                                                                                                                                                                                                                       |

## Support for Match Conditions and Actions for Loopback Firewall Filters on Switches

On EX Series Ethernet switches, a loopback interface is a gateway for all the control traffic that enters the Routing Engine of the switch. If you want to monitor this control traffic, you must configure a firewall filter on the loopback interface (lo0). Loopback firewall filters are applied only to packets that are sent to the Routing Engine CPU for further processing. Therefore, you can apply a firewall filter only in the ingress direction on the loopback interface.

Each term in a firewall filter consists of *match conditions* and an *action*. Match conditions are the values or fields that a packet must contain. You can define multiple, single, or no match conditions. If no match conditions are specified for the term, all packets are matched by default. The string that defines a match condition is called a *match statement*. The action is the action that the switch takes if a packet matches the match conditions for the specific term. Action modifiers are optional and specify one or more actions that the switch takes if a packet matches the match conditions for the specific term.

The following tables list match conditions, actions, and action modifiers that are supported for a firewall filter configured on a loopback interface on a switch:

- [Table 515 on page 4716](#)
- [Table 516 on page 4717](#)

- [Table 517 on page 4718](#)

For information on match conditions, actions, and action modifiers supported for a firewall filter configured on a network interface, see [“Platform Support for Firewall Filter Match Conditions, Actions, and Action Modifiers on EX Series Switches” on page 4718](#).

**Table 517: Action Modifiers for Firewall Filters on Loopback Interfaces for IPv4 and IPv6 Traffic—Support per Switch**

| Action                             | EX2200 | EX3200,<br>EX4200 | EX3300 | EX4500 | EX6200 | EX8200 |
|------------------------------------|--------|-------------------|--------|--------|--------|--------|
| Action modifiers for IPv4 traffic: |        |                   |        |        |        |        |
| count                              | –      | ✓                 | –      | ✓      | ✓      | –      |
| forwarding-class                   | ✓      | ✓                 | ✓      | ✓      | –      | ✓      |
| loss-priority                      | ✓      | ✓                 | ✓      | ✓      | –      | ✓      |
| Action modifiers for IPv6 traffic: |        |                   |        |        |        |        |
| count                              | –      | ✓                 | –      | ✓      | –      | –      |
| forwarding-class                   | ✓      | ✓                 | ✓      | ✓      | –      | ✓      |
| loss-priority                      | ✓      | ✓                 | ✓      | ✓      | –      | ✓      |

**NOTE:** On EX8200 switches, if an implicit or explicit discard action is configured on a loopback interface for IPv4 traffic, next hop resolve packets are accepted and allowed to pass through the switch. However, for IPv6 traffic, you must explicitly configure a rule to allow the neighbor discovery IPv6 resolve packets to pass through the switch.

## Platform Support for Firewall Filter Match Conditions, Actions, and Action Modifiers on EX Series Switches

After you define a firewall filter on an EX Series switch, you must associate the filter to a bind point so that the filter can filter the packets that enter or exit the bind point. Port firewall filters, VLAN firewall filters, and Layer 3 (or router) firewall filters are the different types of firewall filters you can apply on a switch, depending on the bind points the filters are associated with. While a port firewall filter applies to Layer 2 interfaces, a VLAN

firewall filter applies to packets that enter or leave a VLAN and also to packets that are bridged within a VLAN. A Layer 3 firewall filter applies to Layer 3 (routed) interfaces and routed VLAN interfaces (RVIs).

**NOTE:** If you want to control the traffic that enters the Routing Engine of the switch, you must configure a firewall filter on the loopback interface (lo0) of the switch. For information about match conditions, actions, and action modifiers supported on the loopback interface of a switch, see [“Support for Match Conditions and Actions for Loopback Firewall Filters on Switches”](#) on page 4715.

This topic describes the supported switches and bind points for match conditions, actions, and action modifiers for firewall filters supported on EX Series switches. For descriptions of the match conditions, actions, and action modifiers, see [“Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series Switches”](#) on page 4704.

### Firewall Filter Types and Their Bind Points

You can apply a firewall filter at specific bind points to filter IPv4, IPv6, or non-IP traffic. See the remaining sections in this topic for information about support on individual switches for different traffic types.

[Table 518 on page 4719](#) lists the firewall filter types and their associated bind points that are supported on the switches.

**Table 518: Bind Points Associated with Firewall Filter Types**

| Bind Points                                                                       | Firewall Filter Type   |
|-----------------------------------------------------------------------------------|------------------------|
| Ports (Layer 2 interfaces)                                                        | Port firewall filter   |
| VLANs                                                                             | VLAN firewall filter   |
| Layer 3 interfaces (Layer 3 (routed) interfaces or routed VLAN interfaces (RVIs)) | Router firewall filter |

### Support for IPv4 and IPv6 Firewall Filters on Switches

On EX2200, EX3200/EX4200, EX3300, EX4500, and EX6200 switches port and VLAN filters on IPv6 traffic can match only layer 2 header fields. On an EX8200 switch, port and VLAN traffic can match on layer 3 and layer 4 header fields, in addition to layer 2 header fields, of IPv6 traffic. On an EX4300 switch, port and VLAN filters on IPv6 traffic can match layer 3 and layer 4 header fields

[Table 519 on page 4720](#) briefly summarizes the support for IPv4 and IPv6 firewall filters on different switches. The support for port, VLAN, and router firewall filters on different switches is further discussed in the subsequent sections in this topic.

**Table 519: Support for IPv4 and IPv6 Firewall Filters on Switches**

| Switch            | Support for IPv4 Firewall Filter | Support for IPv6 Firewall Filter |
|-------------------|----------------------------------|----------------------------------|
| EX2200            | Yes                              | Yes                              |
| EX3200 and EX4200 | Yes                              | Yes                              |
| EX3300            | Yes                              | Yes                              |
| EX4300            | Yes                              | Yes                              |
| EX4500            | Yes                              | Yes                              |
| EX6200            | Yes                              | Yes                              |
| EX8200            | Yes                              | Yes                              |

### Platform Support for Match Conditions for IPv4 Traffic

You can define port, VLAN, and router firewall filters for ingress and egress IPv4 traffic on all EX Series switches. [Table 520 on page 4721](#) summarizes the support for match conditions on different bind points for ingress and egress IPv4 traffic on different switches.

Table 520: Firewall Filter Match Conditions Supported for IPv4 Traffic on Switches

| Match Condition                                      | Switch            | Supported Bind Points                |                                      |
|------------------------------------------------------|-------------------|--------------------------------------|--------------------------------------|
|                                                      |                   | Ingress                              | Egress                               |
| <b>destination-address</b><br><i>ip-address</i>      | EX2200            | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |
|                                                      | EX3200 and EX4200 | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |
|                                                      | EX3300            | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |
|                                                      | EX4300            | Layer 3 interfaces                   | Layer 3 interfaces                   |
|                                                      | EX4500            | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |
|                                                      | EX6200            | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |
|                                                      | EX8200            | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |
| <b>ip-destination-address</b>                        | EX4300            | Ports and VLANs                      | Not Supported                        |
| <b>destination-mac-address</b><br><i>mac-address</i> | EX2200            | Ports and VLANs                      | Ports and VLANs                      |
|                                                      | EX3200 and EX4200 | Ports and VLANs                      | Ports and VLANs                      |
|                                                      | EX3300            | Ports and VLANs                      | Ports and VLANs                      |
|                                                      | EX4300            | Ports and VLANs                      | Ports and VLANs                      |
|                                                      | EX4500            | Ports and VLANs                      | Ports and VLANs                      |
|                                                      | EX6200            | Ports and VLANs                      | Ports and VLANs                      |
|                                                      | EX8200            | Ports and VLANs                      | Ports and VLANs                      |

Table 520: Firewall Filter Match Conditions Supported for IPv4 Traffic on Switches (*continued*)

| Match Condition                                       | Switch            | Supported Bind Points                |                                      |
|-------------------------------------------------------|-------------------|--------------------------------------|--------------------------------------|

| <b>learn-vlan-id vlan-id</b>      | EX4300            | Ports and VLANs       | Ports and VLANs |

#### Platform Support for Match Conditions for IPv6 Traffic

Table 521 on page 4734 summarizes support for match conditions on different bind points for ingress and egress IPv6 traffic on different switches.

Table 521: Firewall Filter Match Conditions Supported for IPv6 Traffic on Switches

| Match Condition                                                                                          | Switch            | Supported Bind Points                |                                      |
|----------------------------------------------------------------------------------------------------------|-------------------|--------------------------------------|--------------------------------------|
|                                                                                                          |                   | Ingress                              | Egress                               |
| <b>destination-address</b><br><b>ip-addressor</b><br><b>ip6-destination-address</b><br><b>ip-address</b> | EX2200            | Layer 3 interfaces                   | Layer 3 interfaces                   |
|                                                                                                          | EX3200 and EX4200 | Layer 3 interfaces                   | Layer 3 (routed) interfaces only     |
|                                                                                                          | EX3300            | Layer 3 interfaces                   | Layer 3 interfaces                   |
|                                                                                                          | EX4300            | Layer 3 interfaces                   | Layer 3 (routed) interfaces only     |
|                                                                                                          | EX4500            | Layer 3 interfaces                   | Layer 3 interfaces                   |
|                                                                                                          | EX6200            | Layer 3 interfaces                   | Layer 3 interfaces                   |
|                                                                                                          | EX8200            | Ports, VLANs, and Layer 3 interfaces | Layer 3 interfaces                   |

|                                                 | EX6200            | Ports and VLANs                      | Ports and VLANs                      |
|                                                 | EX8200            | Ports and VLANs                      | Not supported                        |

### Platform Support for Match Conditions for Non-IP Traffic

You can define port, VLAN, and router firewall filters for ingress and egress non-IP traffic on all EX Series switches. [Table 522 on page 4742](#) summarizes support for match conditions on different bind points for ingress and egress non-IP traffic on different switches.

**Table 522: Firewall Filter Match Condition Supported for Non-IP Traffic on Switches**

| Match Condition            | Switch            | Supported Bind Points |                 |
|----------------------------|-------------------|-----------------------|-----------------|
|                            |                   | Ingress               | Egress          |
| l2-encap-type llc-non-snap | EX2200            | Ports and VLANs       | Ports and VLANs |
|                            | EX3200 and EX4200 | Ports and VLANs       | Ports and VLANs |
|                            | EX3300            | Ports and VLANs       | Ports and VLANs |
|                            | EX4300            | Ports and VLANs       | Ports and VLANs |
|                            | EX4500            | Ports and VLANs       | Ports and VLANs |
|                            | EX6200            | Ports and VLANs       | Ports and VLANs |
|                            | EX8200            | Ports and VLANs       | Ports and VLANs |

### Platform Support for Actions for IPv4 Traffic

[Table 523 on page 4743](#) summarizes the support for actions on different bind points for ingress and egress IPv4 traffic on different switches.

Table 523: Firewall Filter Actions Supported for IPv4 Traffic on Switches

| Action         | Switch            | Supported Bind Points                |                                      |
|----------------|-------------------|--------------------------------------|--------------------------------------|
|                |                   | Ingress                              | Egress                               |
| <b>accept</b>  | EX2200            | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |
|                | EX3200 and EX4200 | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |
|                | EX3300            | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |
|                | EX4300            | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |
|                | EX4500            | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |
|                | EX6200            | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |
|                | EX8200            | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |
| <b>discard</b> | EX2200            | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |
|                | EX3200 and EX4200 | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |
|                | EX3300            | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |
|                | EX4300            | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |
|                | EX4500            | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |
|                | EX6200            | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |
|                | EX8200            | Ports, VLANs, and Layer 3 interfaces | Ports, VLANs, and Layer 3 interfaces |

Table 523: Firewall Filter Actions Supported for IPv4 Traffic on Switches (*continued*)

| Action                                                  | Switch            | Supported Bind Points |               |
|---------------------------------------------------------|-------------------|-----------------------|---------------|
|                                                         |                   | Ingress               | Egress        |
| <b>reject</b> <i>message-type</i>                       | EX2200            | Layer 3 interfaces    | Not supported |
|                                                         | EX3200 and EX4200 | Layer 3 interfaces    | Not supported |
|                                                         | EX3300            | Layer 3 interfaces    | Not supported |
|                                                         | EX4300            | Layer 3 interfaces    | Not supported |
|                                                         | EX4500            | Layer 3 interfaces    | Not supported |
|                                                         | EX6200            | Layer 3 interfaces    | Not supported |
|                                                         | EX8200            | Layer 3 interfaces    | Not supported |

|                                                                                                                                                                                       | EX4300            | Ports and VLANs       | Not supported |
|                                                                                                                                                                                       | EX4500            | Ports and VLANs       | Not supported |
|                                                                                                                                                                                       | EX6200            | Ports and VLANs       | Not supported |
|                                                                                                                                                                                       | EX8200            | Ports and VLANs       | Not supported |
| <p><b>NOTE:</b> Supported only when used in conjunction with the <b>interface</b> action modifier. On EX8200 Virtual Chassis, the <b>vlan</b> action is supported only for VLANs.</p> |                   |                       |               |

#### Platform Support for Action Modifiers for IPv4 Traffic

Table 525 on page 4749 summarizes support for action modifiers on different bind points for ingress and egress IPv4 traffic on different switches.

Table 525: Firewall Filter Action Modifiers Supported for IPv4 Traffic on Switches

| Action Modifier | Switch            | Supported Bind Points                |                    |
|-----------------|-------------------|--------------------------------------|--------------------|
|                 |                   | Ingress                              | Egress             |
| <b>analyzer</b> | EX2200            | Ports, VLANs, and Layer 3 interfaces | Not supported      |
|                 | EX3200 and EX4200 | Ports, VLANs, and Layer 3 interfaces | Not supported      |
|                 | EX3300            | Ports, VLANs, and Layer 3 interfaces | Not supported      |
|                 | EX4300            | Not supported                        | Not supported      |
|                 | EX4500            | Ports, VLANs, and Layer 3 interfaces | Layer 3 interfaces |
|                 | EX6200            | Ports, VLANs, and Layer 3 interfaces | Not supported      |
|                 | EX8200            | Ports, VLANs, and Layer 3 interfaces | Not supported      |
| <b>dscp</b>     | EX2200            | Not supported                        | Not supported      |
|                 | EX3200 and EX4200 | Not supported                        | Not supported      |
|                 | EX3300            | Not supported                        | Not supported      |
|                 | EX4300            | Not supported                        | Not supported      |
|                 | EX4500            | Not supported                        | Not supported      |
|                 | EX6200            | Not supported                        | Not supported      |
|                 | EX8200            | Layer 3 interfaces                   | Not supported      |

## Understanding How Firewall Filters Are Evaluated

A firewall filter consists of one or more terms, and the order of the terms within a firewall filter is important. Before you configure firewall filters, you should understand how Juniper Networks EX Series Ethernet Switches evaluate the terms within a firewall filter and how packets are evaluated against the terms.

When a firewall filter consists of a single term, the filter is evaluated as follows:

- If the packet matches all the conditions, the action in the **then** statement is taken.
- If the packet matches all the conditions, and no action is specified in the **then** statement, the default action **accept** is taken.

When a firewall filter consists of more than one term, the firewall filter is evaluated sequentially:

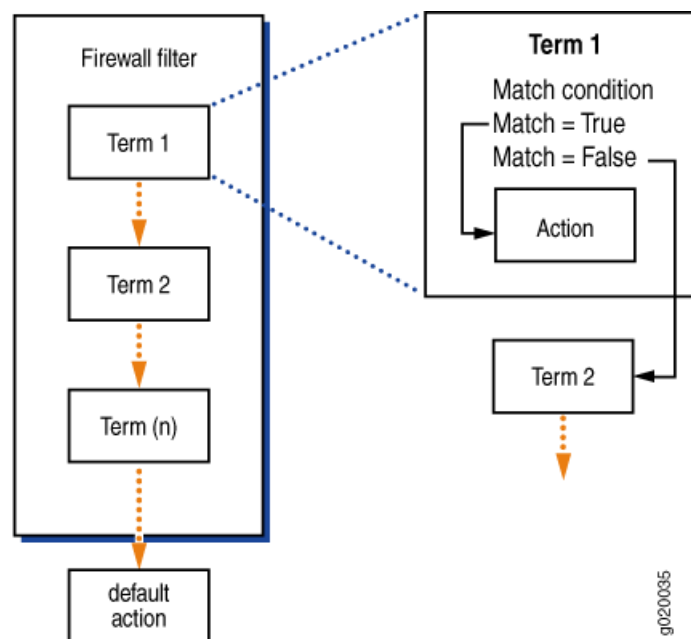

1. The packet is evaluated against the conditions in the **from** statement in the first term.
2. If the packet matches all the conditions in the term, the action in the **then** statement is taken and the evaluation ends. Subsequent terms in the filter are not evaluated.
3. If the packet does not match all the conditions in the term, the packet is evaluated against the conditions in the **from** statement in the second term.

This process continues until either the packet matches the conditions in the **from** statement in one of the subsequent terms or there are no more terms in the filter.

4. If a packet passes through all the terms in the filter without a match, the packet is discarded.

Figure 68 on page 4761 shows how an EX Series switch evaluates the terms within a firewall filter.

Figure 68: Evaluation of Terms Within a Firewall Filter

If a term does not contain a **from** statement, the packet is considered to match and the action in the **then** statement of the term is taken.

If a term does not contain a **then** statement, or if an action has not been configured in the **then** statement, and the packet matches the conditions in the **from** statement of the term, the packet is accepted.

Every firewall filter contains an implicit **deny** statement at the end of the filter, which is equivalent to the following explicit filter term:

```
term implicit-rule {
  then discard;
```

}

Consequently, if a packet passes through all the terms in a filter without matching any conditions, the packet is discarded. If you configure a firewall filter that has no terms, all packets that pass through the filter are discarded.

## Understanding Firewall Filter Match Conditions

Before you define terms for firewall filters, you must understand how the match conditions that you specify in a term are handled and how to specify various types of match conditions to achieve the desired filtering results. A match condition consists of a string (called a match statement) that defines the match condition. Match conditions are the values or fields that a packet must contain.

This topic describes:

- [Filter Match Conditions on page 4762](#)
- [Numeric Filter Match Conditions on page 4763](#)
- [Interface Filter Match Conditions on page 4763](#)
- [IP Address Filter Match Conditions on page 4764](#)
- [MAC Address Filter Match Conditions on page 4764](#)
- [Bit-Field Filter Match Conditions on page 4765](#)

### Filter Match Conditions

---

In the **from** statement of a firewall filter term, you specify the packet conditions that trigger the action in one of the **then** statements: **then** with various options, **then interface** or **then vlan**. All conditions in the **from** statement must match for the action to be taken. The order in which you specify match conditions is not important, because a packet must match all the conditions in a term for a match to occur.

If you specify no match conditions in a term, that term matches all packets.

An individual condition in a **from** statement cannot contain a list of values. For example, you cannot specify numeric ranges or multiple source or destination addresses.

Individual conditions in a **from** statement cannot be negated. A negated condition is an explicit mismatch.

## Numeric Filter Match Conditions

Numeric filter conditions match packet fields that are identified by a numeric value, such as port and protocol numbers. For numeric filter match conditions, you specify a keyword that identifies the condition and a single value that a field in a packet must match.

You can specify the numeric value in one of the following ways:

- Single number—A match occurs if the value of the field matches the number. For example:  

```
source-port 25;
```
- Text synonym for a single number— A match occurs if the value of the field matches the number that corresponds to the synonym. For example:  

```
source-port http;
```

To specify more than one value in a filter term, you enter each value in its own match statement, which is a string that defines a match condition. For example, a match occurs in the following term if the value of **vlan** is 10 or 30.

```
[edit firewall family family-name filter filter-name term term-name from]
vlan 10;
vlan 30;
```

The following restrictions apply to numeric filter match conditions:

- You cannot specify a range of values.
- You cannot specify a list of comma-separated values.
- You cannot exclude a specific value in a numeric filter match condition. For example, you cannot specify a condition that would match only if the match condition was not equal to a given value.

## Interface Filter Match Conditions

Interface filter match conditions can match interface name values in a packet. For interface filter match conditions, you specify the name of the interface, for example:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set interface ge-0/0/1
```

Port and VLAN interfaces do not use logical unit numbers. However, a firewall filter that is applied to a router interface can specify the logical unit number in the interface filter match condition, for example:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set interface ge-0/1/0.0
```

You can include the **\*** wildcard as part of the interface name, for example:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set interface ge-0/*/1
user@switch# set interface ge-0/1/*
user@switch# set interface ge-*
```

### IP Address Filter Match Conditions

---

Address filter match conditions can match prefix values in a packet, such as IP source and destination prefixes. For address filter match conditions, you specify a keyword that identifies the field and one prefix of that type that a packet must match.

You specify the address as a single prefix. A match occurs if the value of the field matches the prefix. For example:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set destination-address 10.2.1.0/28;
```

Each prefix contains an implicit 0/0 except statement, which means that any prefix that does not match the prefix that is specified is explicitly considered not to match.

To specify the address prefix, use the notation prefix/prefix-length. If you omit prefix-length, it defaults to /32. For example:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set destination-address 10
[edit firewall family family-name filter filter-name term term-name from]
user@switch# show destination-address
10.0.0.0/32;
```

To specify more than one IP address in a filter term, you enter each address in its own match statement. For example, a match occurs in the following term if the value of the **source-address** field matches either of the following source-address prefixes:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set source-address 10.0.0.0/8
user@switch# set source-address 10.1.0.0/16
```

### MAC Address Filter Match Conditions

---

MAC address filter match conditions can match source and destination MAC address values in a packet. For MAC address filter match conditions, you specify a keyword that identifies the field and one value of that type that a packet must match.

You can specify the MAC address as six hexadecimal bytes in the following formats:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set destination-mac-address 0011.2233.4455
```

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set destination-mac-address 00:11:22:33:44:55
```

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set destination-mac-address 001122334455
```

To specify more than one MAC address in a filter term, you enter each MAC address in its own match statement. For example, a match occurs in the following term if the value of the **source-mac-address** field matches either of the following addresses.

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set source-mac-address 00:11:22:33:44:55
user@switch# set source-mac-address 00:11:22:33:20:15
```

### Bit-Field Filter Match Conditions

Bit-field filter conditions match packet fields if particular bits in those fields are or are not set. You can match the IP options, TCP flags, and IP fragmentation fields. For bit-field filter match conditions, you specify a keyword that identifies the field and tests to determine that the option is present in the field.

To specify the bit-field value to match, enclose the value in double quotation marks. For example, a match occurs if the **RST** bit in the TCP flags field is set:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set tcp-flags "rst"
```

Typically, you specify the bits to be tested by using keywords. Bit-field match keywords always map to a single bit value. You also can specify bit fields as hexadecimal or decimal numbers.

To match multiple bit-field values, use the logical operators, which are described in [Table 527 on page 4765](#). The operators are listed in order from highest precedence to lowest precedence. Operations are left-associative.

**Table 527: Logical Operators for Matching Multiple Bit-Field Operators**

| Logical Operators | Description  |
|-------------------|--------------|
| !                 | Negation.    |
| &                 | Logical AND. |
|                   | Logical OR.  |

To negate a match, precede the value with an exclamation point. For example, a match occurs only if the RST bit in the TCP flags field is not set:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set tcp-flags "!rst"
```

In the following example of a logical AND operation, a match occurs if the packet is the initial packet on a TCP session:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set tcp-flags "syn&!ack"
```

In the following example of a logical OR operation, a match occurs if the packet is not the initial packet on a TCP session:

```
[edit firewall family family-name filter filter-name term term-name from]
user@switch# set tcp-flags "syn|ack"
```

For a logical OR operation, you can specify a maximum of two match conditions in a single term. If you need to match more than two bit-field values in a logical OR operation, configure the same match condition in consecutive terms with additional bit-field values. In the following example, the two terms configured match the SYN, ACK, FIN, or RST bit in the TCP flags field:

```
[edit firewall family family-name filter filter-name term term-name1 from]
user@switch# set tcp-flags "syn|ack"
[edit firewall family family-name filter filter-name term term-name2 from]
```

```
user@switch# set tcp-flags "fin|rst"
```

You can use text synonyms to specify some common bit-field matches. You specify these matches as a single keyword. In the following example of a text synonym, a match occurs if the packet is the initial packet on a TCP session:

```
[edit firewall family family-name filter filter-name term term-name from]  
user@switch# set tcp-flags tcp-initial
```

## Understanding How Firewall Filters Test a Packet's Protocol

When examining match conditions, Juniper Networks Junos operating system (Junos OS) for Juniper Networks EX Series Ethernet Switches tests only the field that is specified. The software does not implicitly test the IP header to determine whether a packet is an IP packet. Therefore, in some cases, you must specify **protocol** field match conditions in conjunction with other match conditions to ensure that the filters are performing the expected matches.

If you specify a protocol match condition or a match of the ICMP type or TCP flags field, there is no implied protocol match. For the following match conditions, you must explicitly specify the protocol match condition in the same term:

- **destination-port**—Specify the match **protocol tcp** or **protocol udp**.
- **source-port**—Specify the match **protocol tcp** or **protocol udp**.

If you do not specify the protocol when using the preceding fields, design your filters carefully to ensure that they perform the expected matches. For example, if you specify a match of **destination-port ssh**, the switch deterministically matches any packets that have a value of **22** in the two-byte field that is two bytes beyond the end of the IP header without ever checking the IP protocol field.

## Understanding the Use of Policers in Firewall Filters

Policing, or rate limiting, is an important component of firewall filters that lets you control the amount of traffic that enters an interface on Juniper Networks EX Series Ethernet Switches. You can achieve policing by including policers in firewall filter configurations.

This topic describes:

- [Policers Overview on page 4767](#)
- [Policer Types on page 4767](#)
- [Policer Actions on page 4768](#)
- [Policer Levels on page 4769](#)
- [Color Modes on page 4769](#)
- [Naming Conventions for Policers on page 4770](#)

### Policers Overview

---

You can use policers to specify rate limits on traffic. A firewall filter configured with a policer permits only traffic within a specified set of rate limits, thereby providing protection from denial-of-service (DoS) attacks. Traffic that exceeds the rate limits specified by the policer is either discarded immediately or is marked as lower priority than traffic that is within the rate limits. The switch discards the lower-priority traffic when there is traffic congestion.

A policer applies two types of rate limits on traffic:

- **Bandwidth**—The number of bits per second permitted, on average.
- **Maximum burst size**—The maximum size permitted for bursts of data that exceed the given bandwidth limit.

Policing uses an algorithm to enforce a limit on average bandwidth while allowing bursts up to a specified maximum value. You can define specific classes of traffic on an interface and apply a set of rate limits to each class. After you name and configure a policer, it is stored as a template. You can then use the policer in a firewall filter configuration.

On all EX Series switches except Juniper Networks EX8200 Ethernet Switches, each policer that you configure includes an implicit counter that counts the number of packets that exceed the rate limit specified for the policer. Each EX8200 switch contains three global management counters. You must assign ingress policers to these global management counters to obtain policer statistics. You can assign any number of ingress policers to each global management counter. The policer statistics for each global management counter are the aggregate of the policer statistics for all policers associated with that global management counter.

To get filter-specific packet counts, you must configure a different policer for each firewall filter. Policers give term-specific counts by default.

### Policer Types

---

Switches support three types of policers:

- **Single-rate two-color**—A two-color policer (sometimes called simply “policer”) meters the traffic stream and classifies packets into two categories of packet loss priority (PLP) according to a configured bandwidth and burst-size limit. You can mark packets that exceed the bandwidth and burst-size limit or simply discard them. A two-color policer is most useful for metering traffic at the port (physical interface) level.
- **Single-rate three-color**—This type of policer is defined in RFC 2697, *A Single Rate Three Color Marker*, as part of an assured forwarding (AF) per-hop-behavior (PHB) classification system for a Differentiated Services (DiffServ) environment. This type of policer meters traffic based on the configured committed information rate (CIR), committed burst size (CBS), and the excess burst size (EBS). Traffic is marked as belonging to one of three categories (green, yellow, or red) based on whether the packets are arriving at rates that are below the CBS (green), exceed the CBS but not the EBS (yellow), or exceed the EBS (red). A single-rate three-color policer is most useful when a service is structured according to packet size and not according to peak arrival rate.
- **Two-rate three-color**—This type of policer is defined in RFC 2698, *A Two Rate Three Color Marker*, as part of an assured forwarding (AF) per-hop-behavior (PHB) classification system for a Differentiated Services (DiffServ) environment. This type of policer meters traffic based on the configured CIR and the peak information rate (PIR), along with their associated burst sizes; the CBS, and the peak burst size (PBS). Traffic is marked as belonging to one of three categories (green, yellow, or red) based on packets are arriving at rates that are below the CIR (green), exceed the CIR but not the PIR (yellow), or exceed the PIR (red). A two-rate three-color policer is most useful when a service is structured according to arrival rates and not to packet size.

### Policer Actions

Policer actions can be implicit or explicit and vary by policer type. The term implicit means that Junos OS assigns a loss-priority value automatically; explicit means that you configure the action. [Table 528 on page 4768](#) lists policer actions.

**Table 528: Policer Actions**

| Policer               | Marking             | Implicit Action          | Configurable Action                                                     |
|-----------------------|---------------------|--------------------------|-------------------------------------------------------------------------|
| Single-rate two-color | Green (Conforming)  | Assign low loss priority | None                                                                    |
|                       | Red (Nonconforming) | None                     | Assign low or high loss priority, assign a forwarding class, or discard |
|                       | Yellow              | Not supported            | Not supported                                                           |

Table 528: Policer Actions (*continued*)

| Policer                 | Marking                                  | Implicit Action                                                           | Configurable Action                                   |
|-------------------------|------------------------------------------|---------------------------------------------------------------------------|-------------------------------------------------------|
| Single-rate three-color | Green (Conforming)                       | Assign low loss priority                                                  | None                                                  |
|                         | Red (Above the EBS)                      | Assign low loss priority                                                  | Discard                                               |
|                         | Yellow (Exceeds the CBS but not the EBS) | Assign low loss priority<br><i>NOTE:</i> Not supported on EX8200 switches | None<br><i>NOTE:</i> Not supported on EX8200 switches |
| Two-rate three-color    | Green (Conforming)                       | Assign low loss priority                                                  | None                                                  |
|                         | Red (Above the PIR)                      | Assign low loss priority                                                  | Discard                                               |
|                         | Yellow (Exceeds the CIR but not the PIR) | Assign low loss priority<br><i>NOTE:</i> Not supported on EX8200 switches | None<br><i>NOTE:</i> Not supported on EX8200 switches |

### Policer Levels

You can configure policers at the queue level, logical interface level, or Layer 2 (MAC) level. Only a single policer is applied to a packet at the egress queue. The search for policers occurs in this order:

- Queue level
- Logical interface level
- Layer 2 (MAC) level

### Color Modes

Tricolor marking (TCM) policers are not bound by a green-yellow-red coloring convention. Packets are marked with low or high PLP bit configurations based on color. Therefore, both three-color policer types (single-rate and two-rate) extend the functionality of class-of-service (CoS) traffic policing by providing three levels of drop precedence (loss priority) instead of the two normally available in policers. Both single-rate and two-rate three-color policer types can operate in two modes:

- Color-blind—In color-blind mode, the three-color policer operates without reference to whether the examined packets have been previously marked or metered. In other words, the three-color policer is *blind* to any previous coloring a packet might have had.
- Color-aware—In color-aware mode, the three-color policer operates with reference to any previous marking or metering of the examined packets. In other words, the three-color policer is *aware* of the previous coloring a packet might have had. In color-aware mode, the three-color policer can increase the PLP of a packet but can never decrease it. For example, if a color-aware three-color policer meters a packet

with a low PLP marking, it can raise the PLP level to high. But it cannot reduce a high PLP level to low.

### Naming Conventions for Policers

---

We recommend you use the naming convention *rate-TCMnumber-color*type when configuring three-color policers. TCM stands for tricolor marking. Because policers can be numerous and must be applied correctly to work, observing a simple naming convention makes it easier to apply the policers properly.

For example, if you configure a single-rate, three-color, color-aware policer, name it srTCM1-ca. If you configure a two-rate, three-color, color-blind policer, name it trTCM2-cb.

## Understanding Filter-Based Forwarding for EX Series Switches

Administrators of Juniper Networks EX Series Ethernet Switches can use firewall filters in conjunction with virtual routing instances to specify different routes for packets to travel in their networks. To set up this feature, which is called filter-based forwarding, you specify a filter and match criteria and then specify the virtual routing instance to send packets to.

You might want to use filter-based forwarding to route specific types of traffic through a firewall or security device before the traffic continues on its path. You can also use filter-based forwarding to give certain types of traffic preferential treatment or to improve load balancing of switch traffic.

## Understanding Tricolor Marking Architecture

Tricolor marking (TCM) policers provide two functions: metering and marking. A policer meters each packet and passes the packet and the metering result to the marker.

The meter operates in two modes. In the color-blind mode, the meter treats the packet stream as uncolored. Any preset loss priorities are ignored. In the color-aware mode, the meter inspects the packet loss priority (PLP) field, which has been set by an upstream device as high or low; in other words, the PLP field has already been set by a behavior

aggregate (BA) or multifield (MF) classifier. The marker changes the PLP of each incoming IP packet according to the results of the meter.

Single-rate TCM is so called because traffic is policed according to one rate—the committed burst rate (CBR)—and two burst sizes: the committed burst size (CBS) and the excess burst size (EBS). The configured information rate (CIR) specifies the average rate at which bits are admitted to the network. The CBS specifies the usual burst size in bytes and the EBS specifies the maximum burst size in bytes for packets that are admitted to the network. The EBS is greater than or equal to the CBS, and neither can be 0. As each packet enters the network, its bytes are counted. Packets that do not exceed the CBS are marked low PLP. Packets that exceed the peak information rate (PIR) are marked high PLP.

Two-rate TCM is so called because traffic is policed according to two rates: the CIR and the PIR. The PIR is greater than or equal to the CIR. The CIR specifies the average rate at which bits are admitted to the network, and the PIR specifies the maximum rate at which bits are admitted to the network. As each packet enters the network, its bits are counted. Bits in packets that do not exceed the CIR have their packets marked low PLP. Bits in packets that exceed the PIR have their packets marked high PLP.

## Requirements

This example uses the following software and hardware components:

- Junos OS Release 9.0 or later for EX Series switches.
- Two Juniper Networks EX3200-48T switches: one to be used as an access switch, the other to be used as a distribution switch
- One Juniper Networks EX-UM-4SFP uplink module
- One Juniper Networks J-series router

Before you configure and apply the firewall filters in this example, be sure you have:

- An understanding of firewall filter concepts, policers, and CoS
- Installed the uplink module in the distribution switch. See *Installing an Uplink Module in an EX3200 Switch*.

## Overview

This configuration example show how to configure and apply firewall filters to provide rules to evaluate the contents of packets and determine when to discard, forward, classify, count, and analyze packets that are destined for or originating from the EX Series switches that handle all **voice-vlan**, **employee-vlan**, and **guest-vlan** traffic. [Table 529 on page 4774](#) shows the firewall filters that are configured for the EX Series switches in this example.

**Table 529: Configuration Components: Firewall Filters**

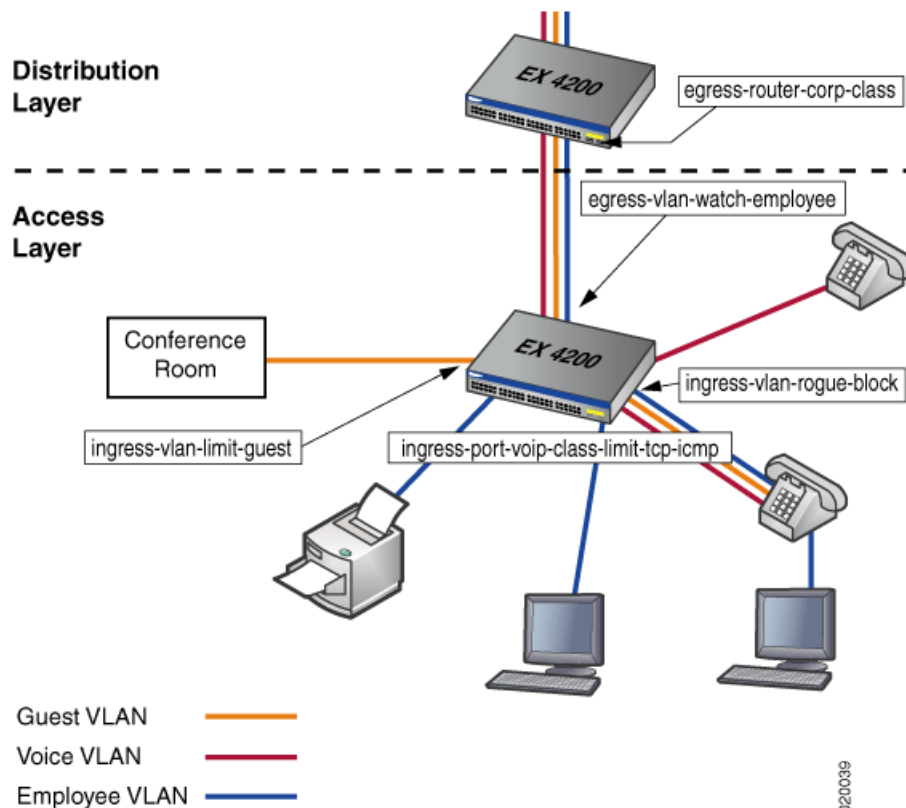

| Component                                                              | Purpose/Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port firewall filter,<br><b>ingress-port-voip-class-limit-tcp-icmp</b> | <p>This firewall filter performs two functions:</p> <ul style="list-style-type: none"> <li>• Assigns priority queueing to packets with a source MAC address that matches the phone MAC addresses. The forwarding class <b>expedited-forwarding</b> provides low loss, low delay, low jitter, assured bandwidth, and end-to-end service for all <b>voice-vlan</b> traffic.</li> <li>• Performs rate limiting on packets that enter the ports for <b>employee-vlan</b>. The traffic rate for TCP and ICMP packets is limited to 1 Mbps with a burst size up to 30,000 bytes.</li> </ul> <p>This firewall filter is applied to port interfaces on the access switch.</p> |
| VLAN firewall filter,<br><b>ingress-vlan-rogue-block</b>               | <p>Prevents rogue devices from using HTTP sessions to mimic the gatekeeper device that manages call registration, admission, and call status for VoIP calls. Only TCP or UDP ports should be used; and only the gatekeeper uses HTTP. That is, all <b>voice-vlan</b> traffic on TCP ports should be destined for the gatekeeper device. This firewall filter applies to all phones on <b>voice-vlan</b>, including communication between any two phones on the VLAN and all communication between the gatekeeper device and VLAN phones.</p> <p>This firewall filter is applied to VLAN interfaces on the access switch.</p>                                          |

Table 529: Configuration Components: Firewall Filters (*continued*)

| Component                                                  | Purpose/Description                                                                                                                                                                                                                                                                                           |
|------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VLAN firewall filter,<br><b>egress-vlan-watch-employee</b> | Accepts <b>employee-vlan</b> traffic destined for the corporate subnet, but does not monitor this traffic. Employee traffic destined for the Web is counted and analyzed.<br><br>This firewall filter is applied to vlan interfaces on the access switch.                                                     |
| VLAN firewall filter,<br><b>ingress-vlan-limit-guest</b>   | Prevents guests (non-employees) from talking with employees or employee hosts on <b>employee-vlan</b> . Also prevents guests from using peer-to-peer applications on <b>guest-vlan</b> , but allows guests to access the Web.<br><br>This firewall filter is applied to VLAN interfaces on the access switch. |
| Router firewall filter,<br><b>egress-router-corp-class</b> | Prioritizes <b>employee-vlan</b> traffic, giving highest forwarding-class priority to employee traffic destined for the corporate subnet.<br><br>This firewall filter is applied to a routed port (Layer 3 uplink module) on the distribution switch.                                                         |

Figure 69 on page 4775 shows the application of port, VLAN, and Layer 3 routed firewall filters on the switch.

Figure 69: Application of Port, VLAN, and Layer 3 Routed Firewall Filters

**Network Topology**

The topology for this configuration example consists of one EX-3200-48T switch at the access layer, and one EX-3200-48T switch at the distribution layer. The distribution switch's uplink module is configured to support a Layer 3 connection to a J-series router.

The EX Series switches are configured to support VLAN membership.

[Table 530 on page 4776](#) shows the VLAN configuration components for the VLANs.

**Table 530: Configuration Components: VLANs**

| VLAN Name     | VLAN ID | VLAN Subnet and Available IP Addresses                                                    | VLAN Description                                                                                                                                                                                                                                                                                   |
|---------------|---------|-------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| voice-vlan    | 10      | 192.0.2.0/28 192.0.2.1 through 192.0.2.14<br><br>192.0.2.15 is subnet's broadcast address | Voice VLAN used for employee VoIP traffic                                                                                                                                                                                                                                                          |
| employee-vlan | 20      | 192.0.2.16/28 192.0.2.17 through 192.0.2.30 192.0.2.31 is subnet's broadcast address      | VLAN standalone PCs, PCs connected to the network through the hub in VoIP telephones, wireless access points, and printers. This VLAN completely includes the voice VLAN. Two VLANs ( <b>voice-vlan</b> and <b>employee-vlan</b> ) must be configured on the ports that connect to the telephones. |
| guest-vlan    | 30      | 192.0.2.32/28 192.0.2.33 through 192.0.2.46 192.0.2.47 is subnet's broadcast address      | VLAN for guests' data devices (PCs). The scenario assumes that the corporation has an area open to visitors, either in the lobby or in a conference room, that has a hub to which visitors can plug in their PCs to connect to the Web and to their company's VPN.                                 |
| camera-vlan   | 40      | 192.0.2.48/28 192.0.2.49 through 192.0.2.62 192.0.2.63 is subnet's broadcast address      | VLAN for the corporate security cameras.                                                                                                                                                                                                                                                           |

Ports on the EX Series switches support Power over Ethernet (PoE) to provide both network connectivity and power for VoIP telephones connecting to the ports.

[Table 531 on page 4777](#) shows the switch ports that are assigned to the VLANs and the IP and MAC addresses for devices connected to the switch ports:

Table 531: Configuration Components: Switch Ports on a 48-Port All-PoE Switch

| Switch and Port Number | VLAN Membership           | IP and MAC Addresses                                                                                       | Port Devices                                                                                                                         |
|------------------------|---------------------------|------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| ge-0/0/0, ge-0/0/1     | voice-vlan, employee-vlan | IP addresses: 192.0.2.1 through 192.0.2.2<br><br>MAC addresses:<br>00.05.85.00.00.01,<br>00.05.85.00–00.02 | Two VoIP telephones, each connected to one PC.                                                                                       |
| ge-0/0/2, ge-0/0/3     | employee-vlan             | 192.0.2.17 through 192.0.2.18                                                                              | Printer, wireless access points                                                                                                      |
| ge-0/0/4, ge-0/0/5     | guest-vlan                | 192.0.2.34 through 192.0.2.35                                                                              | Two hubs into which visitors can plug in their PCs. Hubs are located in an area open to visitors, such as a lobby or conference room |
| ge-0/0/6, ge-0/0/7     | camera-vlan               | 192.0.2.49 through 192.0.2.50                                                                              | Two security cameras                                                                                                                 |
| ge-0/0/9               | voice-vlan                | IP address: 192.0.2.14<br><br>MAC address: 00.05.85.00.00.0E                                               | Gatekeeper device. The gatekeeper manages call registration, admission, and call status for VoIP phones.                             |
| ge-0/1/0               |                           | IP address: 192.0.2.65                                                                                     | Layer 3 connection to a router; note that this is a port on the switch's uplink module                                               |

### Configuring an Ingress Port Firewall Filter to Prioritize Voice Traffic and Rate-Limit TCP and ICMP Traffic

To configure and apply firewall filters for port, VLAN, and router interfaces, perform these tasks:

#### CLI Quick Configuration

To quickly configure and apply a port firewall filter to prioritize voice traffic and rate-limit packets that are destined for the **employee-vlan** subnet, copy the following commands and paste them into the switch terminal window:

```
[edit]
set firewall policer tcp-connection-policer if-exceeding burst-size-limit 30k bandwidth-limit 1m
set firewall policer tcp-connection-policer then discard
set firewall policer icmp-connection-policer if-exceeding burst-size-limit 30k bandwidth-limit 1m
set firewall policer icmp-connection-policer then discard
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term voip-high
from source-mac-address 00.05.85.00.00.01
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term voip-high
from source-mac-address 00.05.85.00.00.02
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term voip-high
from protocol udp
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term voip-high
then forwarding-class expedited-forwarding
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term voip-high
then loss-priority low
```

```
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term
network-control from precedence net-control
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term
network-control then forwarding-class network-control
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term
network-control then loss-priority low
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term
tcp-connection from destination-address 192.0.2.16/28
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term
tcp-connection from protocol tcp
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term
tcp-connection then policer tcp-connection-policer
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term
tcp-connection then count tcp-counter
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term
tcp-connection then forwarding-class best-effort
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term
tcp-connection then loss-priority high
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term
icmp-connection from destination-address 192.0.2.16/28
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term
icmp-connection from protocol icmp
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term
icmp-connection then policer icmp-connection-policer
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term
icmp-connection then count icmp-counter
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term
icmp-connection then forwarding-class best-effort
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term
icmp-connection then loss-priority high
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term best-effort
then forwarding-class best-effort
set firewall family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp term best-effort
then loss-priority high
set interfaces ge-0/0/0 description "voice priority and tcp and icmp traffic rate-limiting filter at
ingress port"
set interfaces ge-0/0/0 unit 0 family ethernet-switching filter input
ingress-port-voip-class-limit-tcp-icmp
set interfaces ge-0/0/1 description "voice priority and tcp and icmp traffic rate-limiting filter at
ingress port"
set interfaces ge-0/0/1 unit 0 family ethernet-switching filter input
ingress-port-voip-class-limit-tcp-icmp
set class-of-service schedulers voice-high buffer-size percent 15
set class-of-service schedulers voice-high priority high
set class-of-service schedulers net-control buffer-size percent 10
set class-of-service schedulers net-control priority high
set class-of-service schedulers best-effort buffer-size percent 75
set class-of-service schedulers best-effort priority low
set class-of-service scheduler-maps ethernet-diffsrv-cos-map forwarding-class
expedited-forwarding scheduler voice-high
set class-of-service scheduler-maps ethernet-diffsrv-cos-map forwarding-class network-control
scheduler net-control
set class-of-service scheduler-maps ethernet-diffsrv-cos-map forwarding-class best-effort
scheduler best-effort
```

**Step-by-Step Procedure** To configure and apply a port firewall filter to prioritize voice traffic and rate-limit packets that are destined for the **employee-vlan** subnet:

1. Define the policers **tcp-connection-policer** and **icmp-connection-policer**:
 

```
[edit]
user@switch# set firewall policer tcp-connection-policer if-exceeding burst-size-limit 30k
bandwidth-limit 1m
user@switch# set firewall policer tcp-connection-policer then discard
user@switch# set firewall policer icmp-connection-policer if-exceeding burst-size-limit
30k bandwidth-limit 1m
user@switch# set firewall policer icmp-connection-policer then discard
```
2. Define the firewall filter **ingress-port-voip-class-limit-tcp-icmp**:
 

```
[edit firewall]
user@switch# set family ethernet-switching filter ingress-port-voip-class-limit-tcp-icmp
```
3. Define the term **voip-high**:
 

```
[edit firewall family ethernet-switching filter
ingress-port-voip-class-limit-tcp-icmp ]
user@switch# set term voip-high from source-mac-address 00.05.85.00.00.01
user@switch# set term voip-high from source-mac-address 00.05.85.00.00.02
user@switch# set term voip-high from protocol udp
user@switch# set term voip-high then forwarding-class expedited-forwarding
user@switch# set term voip-high then loss-priority low
```
4. Define the term **network-control**:
 

```
[edit firewall family ethernet-switching filter
ingress-port-voip-class-limit-tcp-icmp ]
user@switch# set term network-control from precedence net-control
user@switch# set term network-control then forwarding-class network-control
user@switch# set term network-control then loss-priority low
```
5. Define the term **tcp-connection** to configure rate limits for TCP traffic:
 

```
[edit firewall family ethernet-switching filter
ingress-port-voip-class-limit-tcp-icmp]
user@switch# set term tcp-connection from destination-address 192.0.2.16/28
user@switch# set term tcp-connection from protocol tcp
user@switch# set term tcp-connection then policer tcp-connection-policer
user@switch# set term tcp-connection then count tcp-counter
user@switch# set term tcp-connection then forwarding-class best-effort
user@switch# set term tcp-connection then loss-priority high
```
6. Define the term **icmp-connection** to configure rate limits for ICMP traffic:
 

```
[edit firewall family ethernet-switching filter
ingress-port-voip-class-limit-tcp-icmp]
user@switch# set term icmp-connection from destination-address 192.0.2.16/28
user@switch# set term icmp-connection from protocol icmp
user@switch# set term icmp-connection then policer icmp-policer
user@switch# set term icmp-connection then count icmp-counter
user@switch# set term icmp-connection then forwarding-class best-effort
user@switch# set term icmp-connection then loss-priority high
```
7. Define the term **best-effort** with no match conditions for an implicit match on all packets that did not match any other term in the firewall filter:
 

```
[edit firewall family ethernet-switching filter
ingress-port-voip-class-limit-tcp-icmp]
user@switch# set term best-effort then forwarding-class best-effort
user@switch# set term best-effort then loss-priority high
```

8. Apply the firewall filter **ingress-port-voip-class-limit-tcp-icmp** as an input filter to the port interfaces for **employee-vlan** :

```
[edit interfaces]
user@switch# set ge-0/0/0 description "voice priority and tcp and icmp traffic rate-limiting
filter at ingress port"
user@switch# set ge-0/0/0 unit 0 family ethernet-switching filter input
ingress-port-voip-class-limit-tcp-icmp
user@switch# set ge-0/0/1 description "voice priority and tcp and icmp traffic rate-limiting
filter at ingress port"
user@switch# set ge-0/0/1 unit 0 family ethernet-switching filter input
ingress-port-voip-class-limit-tcp-icmp
```

9. Configure the parameters that are desired for the different schedulers.

**NOTE:** When you configure parameters for the schedulers, define the numbers to match your network traffic patterns.

```
[edit class-of-service]
user@switch# set schedulers voice-high buffer-size percent 15
user@switch# set schedulers voice-high priority high
user@switch# set schedulers network-control buffer-size percent 10
user@switch# set schedulers network-control priority high
user@switch# set schedulers best-effort buffer-size percent 75
user@switch# set schedulers best-effort priority low
```

10. Assign the forwarding classes to schedulers with a scheduler map:

```
[edit class-of-service]
user@switch# set scheduler-maps ethernet-diffsrv-cos-map
user@switch# set scheduler-maps ethernet-diffsrv-cos-map forwarding-class
expedited-forwarding scheduler voice-high
user@switch# set scheduler-maps ethernet-diffsrv-cos-map forwarding-class
network-control scheduler net-control
user@switch# set scheduler-maps ethernet-diffsrv-cos-map forwarding-class best-effort
scheduler best-effort
```

11. Associate the scheduler map with the outgoing interface:

```
[edit class-of-service]
user@switch# set interfaces ge-0/1/0 scheduler-map ethernet-diffsrv-cos-map
```

**Results** Display the results of the configuration:

```

---

### Configuring a VLAN Ingress Firewall Filter to Prevent Rogue Devices from Disrupting VoIP Traffic

---

To configure and apply firewall filters for port, VLAN, and router interfaces, perform these tasks:

#### CLI Quick Configuration

To quickly configure a VLAN firewall filter on **voice-vlan** to prevent rogue devices from using HTTP sessions to mimic the gatekeeper device that manages VoIP traffic, copy the following commands and paste them into the switch terminal window:

```
[edit]
set firewall family ethernet-switching filter ingress-vlan-rogue-block term to-gatekeeper from
destination-address 192.0.2.14
set firewall family ethernet-switching filter ingress-vlan-rogue-block term to-gatekeeper from
destination-port 80
set firewall family ethernet-switching filter ingress-vlan-rogue-block term to-gatekeeper then
accept
```

```

set firewall family ethernet-switching filter ingress-vlan-rogue-block term from-gatekeeper from
source-address 192.0.2.14
set firewall family ethernet-switching filter ingress-vlan-rogue-block term from-gatekeeper from
source-port 80
set firewall family ethernet-switching filter ingress-vlan-rogue-block term from-gatekeeper then
accept
set firewall family ethernet-switching filter ingress-vlan-rogue-block term not-gatekeeper from
destination-port 80
set firewall family ethernet-switching filter ingress-vlan-rogue-block term not-gatekeeper then
count rogue-counter
set firewall family ethernet-switching filter ingress-vlan-rogue-block term not-gatekeeper then
discard
set vlans voice-vlan description "block rogue devices on voice-vlan"
set vlans voice-vlan filter input ingress-vlan-rogue-block

```

**Step-by-Step Procedure** To configure and apply a VLAN firewall filter on **voice-vlan** to prevent rogue devices from using HTTP to mimic the gatekeeper device that manages VoIP traffic:

1. Define the firewall filter **ingress-vlan-rogue-block** to specify filter matching on the traffic you want to permit and restrict:  

```

[edit firewall]
user@switch# set family ethernet-switching filter ingress-vlan-rogue-block

```
2. Define the term **to-gatekeeper** to accept packets that match the destination IP address of the gatekeeper:  

```

[edit firewall family ethernet-switching filter ingress-vlan-rogue-block]
user@switch# set term to-gatekeeper from destination-address 192.0.2.14
user@switch# set term to-gatekeeper from destination-port 80
user@switch# set term to-gatekeeper then accept

```
3. Define the term **from-gatekeeper** to accept packets that match the source IP address of the gatekeeper:  

```

[edit firewall family ethernet-switching filter ingress-vlan-rogue-block]
user@switch# set term from-gatekeeper from source-address 192.0.2.14
user@switch# set term from-gatekeeper from source-port 80
user@switch# set term from-gatekeeper then accept

```
4. Define the term **not-gatekeeper** to ensure all **voice-vlan** traffic on TCP ports is destined for the gatekeeper device:  

```

[edit firewall family ethernet-switching filter ingress-vlan-rogue-block]
user@switch# set term not-gatekeeper from destination-port 80
user@switch# set term not-gatekeeper then count rogue-counter
user@switch# set term not-gatekeeper then discard

```
5. Apply the firewall filter **ingress-vlan-rogue-block** as an input filter to the VLAN interface for the VoIP telephones:  

```

[edit]
user@switch# set vlans voice-vlan description "block rogue devices on voice-vlan"
user@switch# set vlans voice-vlan filter input ingress-vlan-rogue-block

```

**Results** Display the results of the configuration:

```

user@switch# show
firewall {
  family ethernet-switching {
    filter ingress-vlan-rogue-block {
      term to-gatekeeper {
        from {

```

```
        destination-address 192.0.2.14/32
        destination-port 80;
    }
    then {
        accept;
    }
}
term from-gatekeeper {
    from {
        source-address 192.0.2.14/32
        source-port 80;
    }
    then {
        accept;
    }
}
term not-gatekeeper {
    from {
        destination-port 80;
    }
    then {
        count rogue-counter;
        discard;
    }
}
}
vlands {
    voice-vlan {
        description "block rogue devices on voice-vlan";
        filter {
            input ingress-vlan-rogue-block;
        }
    }
}
```

### Configuring a VLAN Firewall Filter to Count, Monitor, and Analyze Egress Traffic on the Employee VLAN

---

To configure and apply firewall filters for port, VLAN, and router interfaces, perform these tasks:

#### CLI Quick Configuration

A firewall filter is configured and applied to VLAN interfaces to filter **employee-vlan** egress traffic. Employee traffic destined for the corporate subnet is accepted but not monitored. Employee traffic destined for the Web is counted and analyzed.

To quickly configure and apply a VLAN firewall filter, copy the following commands and paste them into the switch terminal window:

```
[edit]
set firewall family ethernet-switching filter egress-vlan-watch-employee term employee-to-corp
from destination-address 192.0.2.16/28
set firewall family ethernet-switching filter egress-vlan-watch-employee term employee-to-corp
then accept
set firewall family ethernet-switching filter egress-vlan-watch-employee term employee-to-web
from destination-port 80
```

```

set firewall family ethernet-switching filter egress-vlan-watch-employee term employee-to-web
then count employee-web-counter
set firewall family ethernet-switching filter egress-vlan-watch-employee term employee-to-web
then analyzer employee-monitor
set vlans employee-vlan description "filter at egress VLAN to count and analyze employee to
Web traffic"
set vlans employee-vlan filter output egress-vlan-watch-employee

```

**Step-by-Step Procedure** To configure and apply an egress port firewall filter to count and analyze **employee-vlan** traffic that is destined for the Web:

1. Define the firewall filter **egress-vlan-watch-employee**:  

```

[edit firewall]
user@switch# set family ethernet-switching filter egress-vlan-watch-employee

```
2. Define the term **employee-to-corp** to accept but not monitor all **employee-vlan** traffic destined for the corporate subnet:  

```

[edit firewall family ethernet-switching filter egress-vlan-watch-employee]
user@switch# set term employee-to-corp from destination-address 192.0.2.16/28
user@switch# set term employee-to-corp then accept

```
3. Define the term **employee-to-web** to count and monitor all **employee-vlan** traffic destined for the Web:  

```

[edit firewall family ethernet-switching filter egress-vlan-watch-employee]
user@switch# set term employee-to-web from destination-port 80
user@switch# set term employee-to-web then count employee-web-counter
user@switch# set term employee-to-web then analyzer employee-monitor

```

**NOTE:** See *Example: Configuring Port Mirroring for Local Monitoring of Employee Resource Use on EX Series Switches* for information about configuring the **employee-monitor** analyzer.

4. Apply the firewall filter **egress-vlan-watch-employee** as an output filter to the port interfaces for the VoIP telephones:  

```

[edit]
user@switch# set vlans employee-vlan description "filter at egress VLAN to count and
analyze employee to Web traffic"
user@switch# set vlans employee-vlan filter output egress-vlan-watch-employee

```

**Results** Display the results of the configuration:

```

user@switch# show
firewall {
  family ethernet-switching {
    filter egress-vlan-watch-employee {
      term employee-to-corp {
        from {
          destination-address 192.0.2.16/28
        }
        then {
          accept;
        }
      }
    }
  }
}

```

```
term employee-to-web {
  from {
    destination-port 80;
  }
  then {
    count employee-web-counter;
    analyzer employee-monitor;
  }
}
}
}
}
vlands {
  employee-vlan {
    description "filter at egress VLAN to count and analyze employee to Web traffic";
    filter {
      output egress-vlan-watch-employee;
    }
  }
}
```

### Configuring a VLAN Firewall Filter to Restrict Guest-to-Employee Traffic and Peer-to-Peer Applications on the Guest VLAN

---

To configure and apply firewall filters for port, VLAN, and router interfaces, perform these tasks:

#### CLI Quick Configuration

In the following example, the first filter term permits guests to talk with other guests but not employees on **employee-vlan**. The second filter term allows guests Web access but prevents them from using peer-to-peer applications on **guest-vlan**.

To quickly configure a VLAN firewall filter to restrict guest-to-employee traffic, blocking guests from talking with employees or employee hosts on **employee-vlan** or attempting to use peer-to-peer applications on **guest-vlan**, copy the following commands and paste them into the switch terminal window:

```
[edit]
set firewall family ethernet-switching filter ingress-vlan-limit-guest term guest-to-guest from
destination-address 192.0.2.33/28
set firewall family ethernet-switching filter ingress-vlan-limit-guest term guest-to-guest then
accept
set firewall family ethernet-switching filter ingress-vlan-limit-guest term
no-guest-employee-no-peer-to-peer from destination-mac-address 00.05.85.00.00.DF
set firewall family ethernet-switching filter ingress-vlan-limit-guest term
no-guest-employee-no-peer-to-peer then accept
set vlans guest-vlan description "restrict guest-to-employee traffic and peer-to-peer applications
on guest VLAN"
set vlans guest-vlan filter input ingress-vlan-limit-guest
```

**Step-by-Step Procedure** To configure and apply a VLAN firewall filter to restrict guest-to-employee traffic and peer-to-peer applications on **guest-vlan**:

1. Define the firewall filter **ingress-vlan-limit-guest**:  

```
[edit firewall]
set firewall family ethernet-switching filter ingress-vlan-limit-guest
```
2. Define the term **guest-to-guest** to permit guests on the **guest-vlan** to talk with other guests but not employees on the **employee-vlan**:  

```
[edit firewall family ethernet-switching filter ingress-vlan-limit-guest]
user@switch# set term guest-to-guest from destination-address 192.0.2.33/28
user@switch# set term guest-to-guest then accept
```
3. Define the term **no-guest-employee-no-peer-to-peer** to allow guests on **guest-vlan** Web access but prevent them from using peer-to-peer applications on the **guest-vlan**.

**NOTE:** The destination-mac-address is the default gateway, which for any host in a VLAN is the next-hop router.

- ```
[edit firewall family ethernet-switching filter ingress-vlan-limit-guest]
user@switch# set term no-guest-employee-no-peer-to-peer from destination-mac-address 00.05.85.00.00.DF
user@switch# set term no-guest-employee-no-peer-to-peer then accept
```
4. Apply the firewall filter **ingress-vlan-limit-guest** as an input filter to the interface for **guest-vlan** :  

```
[edit]
user@switch# set vlans guest-vlan description "restrict guest-to-employee traffic and peer-to-peer applications on guest VLAN"
user@switch# set vlans guest-vlan filter input ingress-vlan-limit-guest
```

**Results** Display the results of the configuration:

```
user@switch# show
firewall {
  family ethernet-switching {
    filter ingress-vlan-limit-guest {
      term guest-to-guest {
        from {
          destination-address 192.0.2.33/28;
        }
        then {
          accept;
        }
      }
      term no-guest-employee-no-peer-to-peer {
        from {
          destination-mac-address 00.05.85.00.00.DF;
        }
        then {
          accept;
        }
      }
    }
  }
}
```

```

    }
  }
}
vlands {
  guest-vlan {
    description "restrict guest-to-employee traffic and peer-to-peer applications on
    guest VLAN";
    filter {
      input ingress-vlan-limit-guest;
    }
  }
}
}

```

### Configuring a Router Firewall Filter to Give Priority to Egress Traffic Destined for the Corporate Subnet

To configure and apply firewall filters for port, VLAN, and router interfaces, perform these tasks:

#### CLI Quick Configuration

To quickly configure a firewall filter for a routed port (Layer 3 uplink module) to filter **employee-vlan** traffic, giving highest forwarding-class priority to traffic destined for the corporate subnet, copy the following commands and paste them into the switch terminal window:

```

[edit]
set firewall family inet filter egress-router-corp-class term corp-expedite from destination-address
192.0.2.16/28
set firewall family inet filter egress-router-corp-class term corp-expedite then forwarding-class
expedited-forwarding
set firewall family inet filter egress-router-corp-class term corp-expedite then loss-priority low
set firewall family inet filter egress-router-corp-class term not-to-corp then accept
set interfaces ge-0/1/0 description "filter at egress router to expedite destined for corporate
network"
set ge-0/1/0 unit 0 family inet address 103.104.105.1
set interfaces ge-0/1/0 unit 0 family inet filter output egress-router-corp-class

```

#### Step-by-Step Procedure

To configure and apply a firewall filter to a routed port (Layer 3 uplink module) to give highest priority to **employee-vlan** traffic destined for the corporate subnet:

1. Define the firewall filter **egress-router-corp-class**:

```

[edit]
user@switch# set firewall family inet filter egress-router-corp-class

```

2. Define the term **corp-expedite**:

```

[edit firewall]
user@switch# set family inet filter egress-router-corp-class term corp-expedite from
destination-address 192.0.2.16/28
user@switch# set family inet filter egress-router-corp-class term corp-expedite then
forwarding-class expedited-forwarding
user@switch# set family inet filter egress-router-corp-class term corp-expedite then
loss-priority low

```

3. Define the term **not-to-corp**:

```

[edit firewall]
user@switch# set family inet filter egress-router-corp-class term not-to-corp then accept

```

4. Apply the firewall filter **egress-router-corp-class** as an output filter for the port on the switch's uplink module, which provides a Layer 3 connection to a router:

```
[edit interfaces]
user@switch# set ge-0/1/0 description "filter at egress router to expedite employee traffic
destined for corporate network"
user@switch# set ge-0/1/0 unit 0 family inet address 103.104.105.1
user@switch# set ge-0/1/0 unit 0 family inet filter output egress-router-corp-class
```

**Results** Display the results of the configuration:

```
user@switch# show
firewall {
  family inet {
    filter egress-router-corp-class {
      term corp-expedite {
        from {
          destination-address 192.0.2.16/28;
        }
        then {
          forwarding-class expedited-forwarding;
          loss-priority low;
        }
      }
      term not-to-corp {
        then {
          accept;
        }
      }
    }
  }
}
interfaces {
  ge-0/1/0 {
    unit 0 {
      description "filter at egress router interface to expedite employee traffic destined
for corporate network";
      family inet {
        source-address 103.104.105.1
        filter {
          output egress-router-corp-class;
        }
      }
    }
  }
}
```

## Verification

To confirm that the firewall filters are working properly, perform the following tasks:

- [Verifying that Firewall Filters and Policers are Operational on page 4789](#)
- [Verifying that Schedulers and Scheduler-Maps are Operational on page 4790](#)

### *Verifying that Firewall Filters and Policers are Operational*

**Purpose** Verify the operational state of the firewall filters and policers that are configured on the switch.

**Action** Use the operational mode command:

```
user@switch> show firewall
Filter: ingress-port-voip-class-limit-tcp-icmp
Counters:
Name                                     Packets
icmp-counter                             0
tcp-counter                              0
Policers:
Name                                     Packets
icmp-connection-policer                  0
tcp-connection-policer                    0

Filter: ingress-vlan-rogue-block

Filter: egress-vlan-watch-employee
Counters:
Name                                     Packets
employee-web-counter                       0
```

**Meaning** The **show firewall** command displays the names of the firewall filters, policers, and counters that are configured on the switch. The output fields show byte and packet counts for all configured counters and the packet count for all policers.

#### *Verifying that Schedulers and Scheduler-Maps are Operational*

**Purpose** Verify that schedulers and scheduler-maps are operational on the switch.

**Action** Use the operational mode command:

```
user@switch> show class-of-service scheduler-map

Scheduler map: default, Index: 2

Scheduler: default-be, Forwarding class: best-effort, Index: 20
  Transmit rate: 95 percent, Rate Limit: none, Buffer size: 95 percent,
  Priority: low
  Drop profiles:
    Loss priority  Protocol  Index  Name
    Low            non-TCP   1      default-drop-profile
    Low            TCP       1      default-drop-profile
    High           non-TCP   1      default-drop-profile
    High            TCP       1      default-drop-profile

Scheduler: default-nc, Forwarding class: network-control, Index: 22
  Transmit rate: 5 percent, Rate Limit: none, Buffer size: 5 percent,
  Priority: low
  Drop profiles:
    Loss priority  Protocol  Index  Name
    Low            non-TCP   1      default-drop-profile
    Low            TCP       1      default-drop-profile
    High           non-TCP   1      default-drop-profile
    High            TCP       1      default-drop-profile
Scheduler map: ethernet-diffsrv-cos-map, Index: 21657

Scheduler: best-effort, Forwarding class: best-effort, Index: 61257
  Transmit rate: remainder, Rate Limit: none, Buffer size: 75 percent,
  Priority: low
  Drop profiles:
```

Loss priority	Protocol	Index	Name
Low	non-TCP	1	<default-drop-profile>
Low	TCP	1	<default-drop-profile>
High	non-TCP	1	<default-drop-profile>
High	TCP	1	<default-drop-profile>

Scheduler: voice-high, Forwarding class: expedited-forwarding, Index: 3123  
 Transmit rate: remainder, Rate Limit: none, Buffer size: 15 percent,  
 Priority: high

Drop profiles:

Loss priority	Protocol	Index	Name
Low	non-TCP	1	<default-drop-profile>
Low	TCP	1	<default-drop-profile>
High	non-TCP	1	<default-drop-profile>
High	TCP	1	<default-drop-profile>

Scheduler: net-control, Forwarding class: network-control, Index: 2451  
 Transmit rate: remainder, Rate Limit: none, Buffer size: 10 percent,  
 Priority: high

Drop profiles:

Loss priority	Protocol	Index	Name
Low	non-TCP	1	<default-drop-profile>
Low	TCP	1	<default-drop-profile>
High	non-TCP	1	<default-drop-profile>
High	TCP	1	<default-drop-profile>

**Meaning** Displays statistics about the configured schedulers and schedulers-maps.

## Example: Configuring a Firewall Filter on a Management Interface on an EX Series Switch

You can configure a firewall filter on a management interface on an EX Series switch to filter ingress or egress traffic on the management interface on the switch. You can use utilities such as SSH or Telnet to connect to the management interface over the network and then use management protocols such as SNMP to gather statistical data from the switch.

This example discusses how to configure a firewall filter on a management interface to filter SSH packets egressing from an EX Series switch:

- [Requirements on page 4792](#)
- [Overview and Topology on page 4792](#)

- [Configuration on page 4792](#)
- [Verification on page 4794](#)

## Requirements

This example uses the following hardware and software components:

- One EX Series switch and one management PC
- Junos OS Release 10.4 or later for EX Series switches

## Overview and Topology

In this example, a management PC establishes an SSH connection with the management interface on a switch to remotely manage the switch. The IP address configured for the management interface is 10.204.33.103/20. A firewall filter is configured on the management interface to count the number of packets egressing from a source SSH port on the management interface. When the management PC establishes the SSH session with the management interface, the management interface returns SSH packets to the management PC to confirm that the session is established. These SSH packets are filtered based on the match condition specified in the firewall filter before they are forwarded to the management PC. As these packets are generated from the source SSH port on the management interface, they fulfill the match condition specified for the management interface. The number of matched SSH packets provides a count of the number of packets that have traversed the management interface. A system administrator can use this information to monitor the management traffic and take any action if required.

[Figure 70 on page 4792](#) shows the topology for this example in which a management PC establishes an SSH connection with the switch.

**Figure 70: SSH Connection From a Management PC to an EX Series Switch**

## Configuration

To configure a firewall filter on a management interface, perform these tasks:

### CLI Quick Configuration

To quickly create and configure a firewall filter on the management interface to filter SSH packets egressing from the management interface, copy the following commands and paste them into the switch terminal window:

```
[edit]
set firewall family inet filter mgmt_fil1 term t1 from source-port ssh
set firewall family inet filter mgmt_fil1 term t1 then count c1
set firewall family inet filter mgmt_fil1 term t2 then accept
set interfaces me0 unit 0 family inet filter output mgmt_fil1
```

**Step-by-Step Procedure** To configure a firewall filter on the management interface to filter SSH packets:

1. Configure the firewall filter that matches SSH packets from the source port:

```
[edit]
user@switch# set firewall family inet filter (Firewall Filters) mgmt_fil1 term t1 from
source-port ssh
user@switch# set firewall family inet filter mgmt_fil1 term t1 then count c1
user@switch# set firewall family inet filter mgmt_fil1 term t2 then accept
```

These statements set a counter `c1` to count the number of SSH packets that egress from the source SSH interface on the management interface.

2. Set the firewall filter for the management interface:

```
[edit]
user@switch# set interfaces me0 unit 0 family inet filter output mgmt_fil1
```

**NOTE:** You can also set the firewall filter for a VME interface.

**Results** Check the results of the configuration:

```
[edit]
user@switch# show
interfaces {
  me0 {
    unit 0 {
      family inet {
        filter {
          output mgmt_fil1;
        }
        address 10.93.54.6/24;
      }
    }
  }
}

firewall {
  family inet {
    filter mgmt_fil1 {
      term t1 {
        from {
          source-port ssh;
        }
        then count c1;
      }
      term t2 {
        then accept;
      }
    }
  }
}
```

## Verification

---

To confirm that the configuration is working properly, perform these tasks:

- [Verifying That the Firewall Filter Is Configured on a Management Interface on page 4794](#)

### *Verifying That the Firewall Filter Is Configured on a Management Interface*

**Purpose** Verify that the firewall filter has been enabled on the management interface on the switch.

**Action** 1. Verify that the firewall filter is applied to the management interface:

```
[edit]
user@switch# show interfaces me0
unit 0 {
    family inet {
        filter {
            output mgmt_fil1;
        }
        address 10.204.33.103/20;
    }
}
```

2. Check the counter value that is associated with the firewall filter:

```
user@switch> show firewall
Filter: mgmt_fil1
Counters:
Name                               Bytes          Packets
c1                                 0              0
```

3. From the management PC, establish a secure shell session with the switch:

```
[user@management-pc ~]$ ssh user@10.204.33.103
```

4. Check counter values after SSH packets are generated from the switch in response to the secure shell session request by the management PC:

```
user@switch> show firewall
Filter: mgmt_fil1
Counters:
Name                               Bytes          Packets
c1                                 3533           23
```

**Meaning** The output indicates that the firewall filter has been applied to the management interface and the counter value indicates that 23 SSH packets were generated from the switch.

**Related Documentation**

- [Configuring Firewall Filters \(CLI Procedure\) on page 4804](#)
- [Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on EX Series Switches on page 4773](#)

## Example: Using Filter-Based Forwarding to Route Application Traffic to a Security Device on EX Series Switches

Administrators can configure filter-based forwarding on an EX Series switch by using a firewall filter to forward matched traffic to a specific virtual routing instance.

This example describes how to set up filter-based forwarding:

- [Requirements on page 4795](#)
- [Overview and Topology on page 4795](#)
- [Configuration on page 4795](#)
- [Verification on page 4797](#)

### Requirements

This example uses the following software and hardware components:

- One EX Series switch
- Junos OS Release 9.4 or later for EX Series switches

### Overview and Topology

In this example, traffic from one application server that is destined for a different application server is matched by a firewall filter based on the IP address. Any matching packets are routed to a particular virtual routing instance that first sends all traffic to a security device, then forwards it to the designated destination address.

### Configuration

To configure filter-based forwarding:

#### CLI Quick Configuration

To quickly create and configure filter-based forwarding, copy the following commands and paste them into the switch terminal window:

```
[edit]
set interfaces ge-0/0/0 unit 0 family inet address 10.1.0.1/24
set interfaces ge-0/0/3 unit 0 family inet address 10.1.3.1/24
set firewall family inet filter fil term t1 from source-address 1.1.1.1/32
set firewall family inet filter fil term t1 from protocol tcp
set interfaces ge-0/0/0 unit 0 family inet filter input fil
set routing-instances vrf01 instance-type virtual-router
set routing-instances vrf01 interface ge-0/0/1.0
set routing-instances vrf01 interface ge-0/0/3.0
set routing-instances vrf01 routing-options static route 12.34.56.0/24 next-hop 10.1.3.254
set firewall family inet filter fil term t1 then routing-instance vrf01
```

#### Step-by-Step Procedure

To configure filter-based forwarding:

1. Create interfaces to the application servers:

```
[edit]
user@switch# set interfaces ge-0/0/0 unit 0 family inet address 10.1.0.1/24
user@switch# set interfaces ge-0/0/3 unit 0 family inet address 10.1.3.1/24
```

2. Create a firewall filter that matches the correct source address:

- ```
[edit]
user@switch# set firewall family inet filter fil term t1 from source-address 1.1.1.1/32
user@switch# set firewall family inet filter fil term t1 from protocol tcp
```
3. Associate the filter with the source application server's interface:
- ```
[edit]
user@switch# set interfaces ge-0/0/0 unit 0 family inet filter input fil
```
4. Create a virtual router:
- ```
[edit]
user@switch# set routing-instances vrf01 instance-type virtual-router
```
5. Associate the interfaces with the virtual router:
- ```
[edit]
user@switch# set routing-instances vrf01 interface ge-0/0/1.0
user@switch# set routing-instances vrf01 interface ge-0/0/3.0
```
6. Configure the routing information for the virtual routing instance:
- ```
[edit]
user@switch# set routing-instances vrf01 routing-options static route 12.34.56.0/24
next-hop 10.1.3.254
```
7. Set the filter to forward packets to the virtual router you created:
- ```
[edit]
user@switch# set firewall family inet filter fil term t1 then routing-instance vrf01
```

### Results

Check the results of the configuration:

```
user@switch> show configuration
interfaces {
  ge-0/0/0 {
    unit 0 {
      family inet {
        filter {
          input fil;
        }
        address 10.1.0.1/24;
      }
    }
  }
  ge-0/0/3 {
    unit 0 {
      family inet {
        address 10.1.3.1/24;
      }
    }
  }
}
firewall {
  family inet {
    filter fil {
      term t1 {
        from {
          source-address {
            1.1.1.1/32;
          }
        }
        protocol tcp;
      }
    }
  }
}
```

```

    }
    then {
        routing-instance vrf01;
    }
}
}
}
}
}
routing-instances {
    vrf01 {
        instance-type virtual-router;
        interface ge-0/0/1.0;
        interface ge-0/0/3.0;
        routing-options {
            static {
                route 12.34.56.0/24 next-hop 10.1.3.254;
            }
        }
    }
}
}
}

```

### Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying That Filter-Based Forwarding Was Configured on page 4797](#)

#### *Verifying That Filter-Based Forwarding Was Configured*

**Purpose** Verify that filter-based forwarding was properly enabled on the switch.

**Action** 1. Use the **show interfaces filters** command:

```

user@switch> show interfaces filters ge-0/0/0.0
Interface      Admin Link Proto Input Filter      Output Filter
ge-0/0/0.0     up    down inet  fil

```

2. Use the **show route forwarding-table** command:

```

user@switch> show route forwarding-table

```

Routing table: default.inet

Internet:

Destination	Type	RtRef	Next hop	Type	Index	NhRef	Netif
default	user	1	0:12:f2:21:cf:0	ucst	331	4	me0.0

  - [Configuring Static Routing \(CLI Procedure\) on page 3422](#)
  - [Configuring Static Routing \(J-Web Procedure\) on page 3422](#)
  - [Understanding Filter-Based Forwarding for EX Series Switches on page 4770](#)

## Example: Applying Firewall Filters to Multiple Supplicants on Interfaces Enabled for 802.1X or MAC RADIUS Authentication

On EX Series switches, firewall filters that you apply to interfaces enabled for 802.1X or MAC RADIUS authentication are dynamically combined with the per-user policies sent to the switch from the RADIUS server. The switch uses internal logic to dynamically combine the interface firewall filter with the user policies from the RADIUS server and create an individualized policy for each of the multiple users or nonresponsive hosts that are authenticated on the interface.

This example describes how dynamic firewall filters are created for multiple supplicants on an 802.1X-enabled interface (the same principles shown in this example apply to interfaces enabled for MAC RADIUS authentication):

- [Requirements on page 4799](#)
- [Overview and Topology on page 4799](#)

- [Configuration on page 4801](#)
- [Verification on page 4803](#)

---

## Requirements

This example uses the following hardware and software components:

- Junos OS Release 9.5 or later for EX Series switches
- One EX Series switch
- One RADIUS authentication server. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you apply firewall filters to an interface for use with multiple supplicants, be sure you have:

- Set up a connection between the switch and the RADIUS server. See [“Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch” on page 1843](#).
- Configured 802.1X authentication on the switch, with the authentication mode for interface **ge-0/0/2** set to **multiple**. See [“Configuring 802.1X Interface Settings \(CLI Procedure\)” on page 1908](#) and [“Example: Setting Up 802.1X for Single Supplicant or Multiple Supplicant Configurations on an EX Series Switch” on page 1852](#).
- Configured users on the RADIUS authentication server.

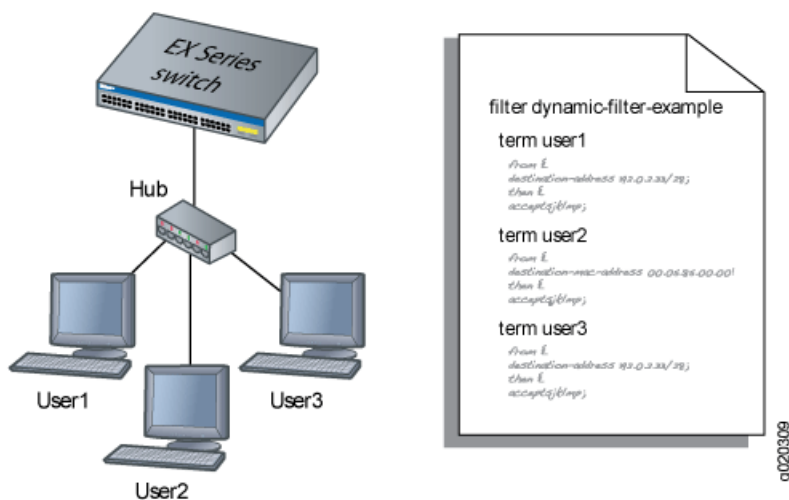

---

## Overview and Topology

When the 802.1X configuration on an interface is set to multiple supplicant mode, the system dynamically combines interface firewall filter with the user policies sent to the switch from the RADIUS server during authentication and creates separate terms for each user. Because there are separate terms for each user authenticated on the interface, you can, as shown in this example, use counters to view the activities of individual users that are authenticated on the same interface.

When a new user (or a nonresponsive host) is authenticated on an interface, the system adds a term to the firewall filter associated with the interface, and the term (policy) for each user is associated with the MAC address of the user. The term for each user is based on the user-specific filters set on the RADIUS server and the filters configured on the interface. For example, as shown in [Figure 18 on page 1895](#), when User1 is authenticated by the EX Series switch, the system creates the firewall filter **dynamic-filter-example**. When User2 is authenticated, another term is added to the firewall filter, and so on.

Figure 71: Conceptual Model: Dynamic Filter Updated for Each New User

This is a conceptual model of the internal process—you cannot access or view the dynamic filter.

**NOTE:** If the firewall filter on the interface is modified after the user (or nonresponsive host) is authenticated, the modifications are not reflected in the dynamic filter unless the user is reauthenticated.

In this example, you configure a firewall filter to count the requests made by each endpoint authenticated on interface **ge-0/0/2** to the file server, which is located on subnet **192.0.2.16/28**, and set policer definitions to rate limit the traffic. [Figure 19 on page 1896](#) shows the network topology for this example.

Figure 72: Multiple Supplicants on an 802.1X-Enabled Interface Connecting to a File Server

g020308

### Configuration

To configure firewall filters for multiple supplicants on 802.1X-enabled interfaces:

- [Configuring Firewall Filters on Interfaces with Multiple Supplicants on page 4801](#)

#### Configuring Firewall Filters on Interfaces with Multiple Supplicants

#### CLI Quick Configuration

To quickly configure firewall filters for multiple supplicants on an 802.1X-enabled interface copy the following commands and paste them into the switch terminal window:

```
[edit]
set protocols dot1x authenticator interface ge-0/0/2 supplicant multiple
set firewall family ethernet-switching filter filter1 term term1 from destination-address 192.0.2.16/28
set firewall policer p1 if-exceeding bandwidth-limit 1m
set firewall policer p1 if-exceeding burst-size-limit 1k
set firewall family ethernet-switching filter filter1 term term1 then count counter1
set firewall family ethernet-switching filter filter1 term term2 then policer p1
```

#### Step-by-Step Procedure

To configure firewall filters on an interface enabled for multiple supplicants:

1. Configure interface **ge-0/0/2** for multiple supplicant mode authentication:
 

```
[edit protocols dot1x]
user@switch# set authenticator interface ge-0/0/2 supplicant multiple
```
2. Set policer definition:

```
user@switch# show policer p1 |display set
set firewall policer p1 if-exceeding bandwidth-limit 1m
set firewall policer p1 if-exceeding burst-size-limit 1k
set firewall policer p1 then discard
```

3. Configure a firewall filter to count packets from each user and a policer that limits the traffic rate. As each new user is authenticated on the multiple supplicant interface, this filter term will be included in the dynamically created term for the user:

```
[edit firewall family ethernet-switching]
user@switch# set filter filter1 term term1 from destination-address 192.0.2.16/28
user@switch# set filter filter1 term term1 then count counter1
user@switch# set filter filter1 term term2 then policer p1
```

**Results** Check the results of the configuration:

```
user@switch> show configuration
```

```
firewall {
  family ethernet-switching {
    filter filter1 {
      term term1 {
        from {
          destination-address {
            192.0.2.16/28;
          }
        }
        then count counter1;
      }
      term term2 {
        from {
          destination-address {
            192.0.2.16/28;
          }
        }
        then policer p1;
      }
    }
  }
}
policer p1 {
  if-exceeding {
    bandwidth-limit 1m;
    burst-size-limit 1k;
  }
  then discard;
}
protocols {
  dot1x {
    authenticator
    interface ge-0/0/2 {
      supplicant multiple;
    }
  }
}
```

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying Firewall Filters on Interfaces with Multiple Supplicants on page 4803](#)

### *Verifying Firewall Filters on Interfaces with Multiple Supplicants*

**Purpose** Verify that firewall filters are functioning on the interface with multiple supplicants.

- Action**
1. Check the results with one user authenticated on the interface. In this case, the user is authenticated on **ge-0/0/2**:  
  

```
user@switch> show dot1x firewall
Filter: dot1x_ge-0/0/2
Counters
counter1_dot1x_ge-0/0/2_user1 100
```
  2. When a second user, User2, is authenticated on the same interface, **ge-0/0/2**, you can verify that the filter includes the results for both of the users authenticated on the interface:  
  

```
user@switch> show dot1x firewall
Filter: dot1x-filter-ge-0/0/0
Counters
counter1_dot1x_ge-0/0/2_user1 100
counter1_dot1x_ge-0/0/2_user2 400
```

**Meaning** The results displayed by the **show dot1x firewall** command output reflect the dynamic filter created with the authentication of each new user. User1 accessed the file server located at the specified destination address 100 times, while User2 accessed the same file server 400 times.

## Configuring Firewall Filters (CLI Procedure)

You configure firewall filters on EX Series switches to control traffic that enters ports on the switch or enters and exits VLANs on the network and Layer 3 (routed) interfaces. To configure a firewall filter you must configure the filter and then apply it to a port, VLAN, or Layer 3 interface.

This topic describes:

- [Configuring a Firewall Filter on page 4804](#)
- [Configuring a Term Specifically for IPv4 or IPv6 Traffic on page 4808](#)
- [Applying a Firewall Filter to a Port on a Switch on page 4809](#)
- [Applying a Firewall Filter to a Management Interface on a Switch on page 4810](#)
- [Applying a Firewall Filter to a VLAN on a Network on page 4811](#)
- [Applying a Firewall Filter to a Layer 3 \(Routed\) Interface on page 4812](#)

### Configuring a Firewall Filter

---

Before you can apply a firewall filter to a port, VLAN, or Layer 3 interface, you must configure a firewall filter with the required details, such as type of family for the firewall filter, firewall filter name, and match conditions. A match condition in the firewall filter configuration can contain multiple terms that define the criteria for the match condition. For each term, you must specify an action to be performed if a packet matches the conditions in the term. For information on different match conditions and actions, see [“Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series Switches” on page 4704](#).

To configure a firewall filter:

1. Configure the family address type for the firewall filter:

- For a firewall filter that is applied to a port or VLAN, specify the family address type **ethernet-switching** to filter Layer 2 (Ethernet) packets and Layer 3 (IP) packets, for example:

```
[edit firewall]
user@switch# set family ethernet-switching
```

- For a firewall filter that is applied to a Layer 3 (routed) interface:

- To filter IPv4 packets, specify the family address type **inet**, for example:

```
[edit firewall]
user@switch# set family inet
```

- To filter IPv6 packets, specify the family address type **inet6**, for example:

```
[edit firewall]
user@switch# set family inet6
```

**NOTE:** You can configure firewall filters for both IPv4 and IPv6 traffic on the same Layer 3 interface.

2. Specify the filter name:

```
[edit firewall family ethernet-switching]
user@switch# set filter ingress-port-filter
```

The filter name can contain letters, numbers, and hyphens (-) and can have a maximum of 64 characters. Each filter name must be unique.

3. If you want to apply a firewall filter to multiple interfaces and name individual firewall counters specific to each interface, configure the **interface-specific** option:

```
[edit firewall family ethernet-switching filter ingress-port-filter]
user@switch# set interface-specific
```

4. Specify a term name:

```
[edit firewall family ethernet-switching filter ingress-port-filter]
user@switch# set term term-one
```

The term name can contain letters, numbers, and hyphens (-) and can have a maximum of 64 characters.

A firewall filter can contain one or more terms. Each term name must be unique within a filter.

**NOTE:**

The maximum number of terms allowed per firewall filter for EX Series switches is:

- 512 for EX2200 switches
- 1,436 for EX3300 switches

**NOTE:** On EX3300 switches, if you add and delete filters with a large number of terms (on the order of 1000 or more) in the same commit operation, not all the filters are installed. You must add filters in one commit operation, and delete filters in a separate commit operation.

- 7,168 for EX3200 and EX4200 switches
- On EX4300 switches, following are the number of terms supported for ingress and egress traffic, for firewall filters configured on a port, VLAN and Layer 3 interface:
  - For ingress traffic:
    - 3,500 terms for firewall filters configured on a port
    - 3,500 terms for firewall filters configured on a VLAN
    - 7,000 terms for firewall filters configured on Layer 3 interfaces for IPv4 traffic
    - 3,500 terms for firewall filters configured on Layer 3 interfaces for IPv6 traffic
  - For egress traffic:
    - 512 terms for firewall filters configured on a port
    - 256 terms for firewall filters configured on a VLAN
    - 512 terms for firewall filters configured on Layer 3 interfaces for IPv4 traffic
    - 512 terms for firewall filters configured on Layer 3 interfaces for IPv6 traffic

**NOTE:** You can configure these maximum number of terms only when you configure one type of firewall filter (Port, VLAN, or Router (Layer 3) firewall filter) on the switch, and when storm control is not enabled on all interfaces in the switch.

- 1,200 for EX4500 and EX4550 switches

- 1,400 for EX6200 switches
- 32,768 for EX8200 switches

If you attempt to configure a firewall filter that exceeds these limits, the switch returns an error message when you commit the configuration.

5. In each firewall filter term, specify the match conditions to use to match components of a packet.

To specify match conditions to match on packets that contain a specific source address and source port—for example:

```
[edit firewall family ethernet-switching filter ingress-port-filter term
term-one]
user@switch# set from source-address 192.0.2.14
user@switch# set from source-port 80
```

You can specify one or more match conditions in a single **from** statement. For a match to occur, the packet must match all the conditions in the term.

The **from** statement is optional, but if included in a term, the **from** statement cannot be empty. If you omit the **from** statement, all packets are considered to match.

6. In each firewall filter term, specify the action to take if the packet matches all the conditions in that term.

You can specify an action and/or action modifiers:

- To specify a filter action, for example, to discard packets that match the conditions of the filter term:

```
[edit firewall family ethernet-switching filter ingress-port-filter term
term-one]
user@switch# set then discard
```

You can specify no more than one action per filter term.

- To specify an action modifier, for example, to count and classify packets in a forwarding class:

```
[edit firewall family ethernet-switching filter ingress-port-filter term
term-one]
user@switch# set then count counter-one
user@switch# set then forwarding-class expedited-forwarding
```

In a **then** statement, you can specify the following action modifiers:

- **analyzer analyzer-name**—Mirror port traffic to a specified destination port or VLAN that is connected to a protocol analyzer application. An **analyzer** must be configured under the **ethernet-switching** family address type. See *Configuring Port Mirroring to Analyze Traffic (CLI Procedure)*.
- **count counter-name**—Count the number of packets that pass this filter term.

**NOTE:** We recommend that you configure a counter for each term in a firewall filter, so that you can monitor the number of packets that match the conditions specified in each filter term.

- **forwarding-class *class***—Classify packets in a forwarding class.
- **loss-priority *priority***—Set the priority for dropping a packet.
- **policer *policer-name***—Apply rate limiting to the traffic.
- **interface *interface-name***—Forward the traffic to the specified interface, bypassing the switching lookup.
- **log**—Log the packet's header information in the Routing Engine.

If you omit the **then** statement or do not specify an action, packets that match all the conditions in the **from** statement are accepted. However, you must always explicitly configure an action and/or action modifier in the **then** statement. You can include no more than one action, but you can use any combination of action modifiers. For an action or action modifier to take effect, all conditions in the **from** statement must match.

**NOTE:** Implicit discard is also applicable to a firewall filter applied to the loopback interface, lo0.

On Juniper Networks EX8200 Ethernet Switches, if an implicit or explicit discard action is configured on a loopback interface for IPv4 traffic, next hop resolve packets are accepted and allowed to pass through the switch. However, for IPv6 traffic, you must explicitly configure a rule to allow the next hop IPv6 resolve packets to pass through the switch.

---

### Configuring a Term Specifically for IPv4 or IPv6 Traffic

---

To configure a term in a firewall filter configuration specifically for IPv4 traffic:

1. Verify that neither **ether-type ipv6** nor **ip-version ipv6** is specified in the term in the configuration. By default, a configuration that does not contain either **ether-type ipv6** or **ip-version ipv6** in a term applies to IPv4 traffic.
2. (Optional) Perform one of these tasks:
  - Define **ether-type ipv4** in a term in the configuration.
  - Define **ip-version ipv4** in a term in the configuration.
  - Define both **ether-type ipv4** and **ip-version ipv4** in a term in the configuration.
3. Verify that neither **ether-type ipv6** nor **ip-version ipv6** is specified in a term in the configuration—by default, a configuration that does not contain either **ether-type ipv6** or **ip-version ipv6** in a term applies to IPv4 traffic if it does not contain **ether-type ipv6** or **ip-version ipv6**.

3. Ensure that other match conditions in the term are valid for IPv4 traffic.

To configure a term in a firewall filter configuration specifically for IPv6 traffic:

1. Perform one of these tasks:
  - Define **ether-type ipv6** in a term in the configuration.
  - Define **ip-version ipv6** in a term in the configuration.
  - Define both **ether-type ipv6** and **ip-version ipv4** in a term in the configuration.

**NOTE:** By default, a configuration that does not contain either **ether-type ipv6** or **ip-version ipv6** in a term applies to IPv4 traffic.

2. Ensure that other match conditions in the term are valid for IPv6 traffic.

**NOTE:** If the term contains either of the match conditions **ether-type ipv6** or **ip-version ipv6**, with no other IPv6 match condition specified, all IPv6 traffic is matched.

**NOTE:** To configure a firewall filter for both IPv4 and IPv6 traffic, you must include two separate terms, one for IPv4 traffic and the other for IPv6 traffic.

### Applying a Firewall Filter to a Port on a Switch

You can apply a firewall filter to a port on a switch to filter ingress or egress traffic on the switch. When you configure the firewall filter, you can specify any match condition, action, and action modifiers specified in “[Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series Switches](#)” on page 4704. The action specified in the match condition indicates the action for the matched packets in the ingress or egress traffic.

To apply a firewall filter to a port to filter ingress or egress traffic:

**NOTE:** For applying a firewall filter to a management interface, see “[Applying a Firewall Filter to a Management Interface on a Switch](#)” on page 4810

1. Specify the interface name and provide a meaningful description of the firewall filter and the interface to which the filter is applied:

```
[edit interfaces]
user@switch# set ge-0/0/1 description "filter to limit tcp traffic filter at trunk port for
employee-vlan and voice-vlan applied on the interface"
```

**NOTE:** Providing the description is optional.

2. Specify the unit number and family address type for the interface:

```
[edit interfaces]
user@switch# set ge-0/0/1 unit 0 family ethernet-switching
```

For firewall filters that are applied to ports, the family address type must be **ethernet-switching**.

3. To apply a firewall filter to filter packets that are entering a port:

```
[edit interfaces]
user@switch# set ge-0/0/1 unit 0 family ethernet-switching filter input ingress-port-filter
```

To apply a firewall filter to filter packets that are exiting a port:

```
[edit interfaces]
user@switch# set ge-0/0/1 unit 0 family ethernet-switching filter output egress-port-filter
```

**NOTE:** You can apply no more than one firewall filter per port, per direction.

---

### Applying a Firewall Filter to a Management Interface on a Switch

You can configure and apply a firewall filter to a management interface to control traffic that is entering or exiting the interface on a switch. You can use utilities such as SSH or Telnet to connect to the management interface over the network and then use management protocols such as SNMP to gather statistical data from the switch. Similar to configuring a firewall filter on other types of interfaces, you can configure a firewall filter on a management interface using any match condition, action, and action modifier specified in [“Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series Switches”](#) on page 4704 except for the following action modifiers:

- **loss-priority**
- **forwarding-class**

You can apply a firewall filter to the management Ethernet interface on any EX Series switch. You can also apply a firewall filter to the virtual management Ethernet (VME) interface on the EX4200 switch. For more information on the management Ethernet interface and the VME interface, see [“EX Series Switches Interfaces Overview”](#) on page 2577.

To apply a firewall filter on the management interface to filter ingress or egress traffic:

1. Specify the interface name and provide a meaningful description of the firewall filter and the interface to which the filter is applied:

```
[edit interfaces]
user@switch# set me0 description "filter to limit tcp traffic filter at management interface"
```

**NOTE:** Providing the description is optional.

2. Specify the unit number and family address type for the management interface:

```
[edit interfaces]
user@switch# set me0 unit 0 family inet
```

**NOTE:** For firewall filters that are applied to management interfaces, the family address type can be either `inet` or `inet6`.

3. To apply a firewall filter to filter packets that are entering a management interface:

```
[edit interfaces]
user@switch# set me0 unit 0 family inet filter input ingress-port-filter
```

To apply a firewall filter to filter packets that are exiting a management interface:

```
[edit interfaces]
user@switch# set me0 unit 0 family inet filter output egress-port-filter
```

**NOTE:** You can apply no more than one firewall filter per management interface, per direction.

### Applying a Firewall Filter to a VLAN on a Network

You can apply a firewall filter to a VLAN on a network to filter ingress or egress traffic on the network. To apply a firewall filter to a VLAN, specify the VLAN name and ID, and then apply the firewall filter to the VLAN. When you configure the firewall filter, you can specify any match condition, action, and action modifiers specified in [“Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series Switches” on page 4704](#). The action specified in the match condition indicates the action for the matched packets in the ingress or egress traffic.

To apply a firewall filter to a VLAN:

1. Specify the VLAN name and VLAN ID and provide a meaningful description of the firewall filter and the VLAN to which the filter is applied:

```
[edit vlans]
user@switch# set employee-vlan vlan-id (802.1Q Tagging) 20 vlan-description "filter to rate limit traffic applied on employee-vlan"
```

**NOTE:** Providing the description is optional.

2. Apply firewall filters to filter packets that are entering or exiting the VLAN:

- To apply a firewall filter to filter packets that are entering the VLAN:

```
[edit vlans]
user@switch# set employee-vlan vlan-id 20 filter input ingress-vlan-filter
```

(On EX4300 switches) To apply a firewall filter to filter packets that are entering the VLAN:

```
[edit vlans]
user@switch# set employee-vlan vlan-id 20 forwarding-options input ingress-vlan-filter
```

- To apply a firewall filter to filter packets that are exiting the VLAN:

```
[edit vlans]
user@switch# set employee-vlan vlan-id 20 filter output egress-vlan-filter
```

(On EX4300 switches) To apply a firewall filter to filter packets that are exiting the VLAN:

```
[edit vlans]
user@switch# set employee-vlan vlan-id 20 forwarding-options output egress-vlan-filter
```

**NOTE:** You can apply no more than one firewall filter per VLAN, per direction.

---

### Applying a Firewall Filter to a Layer 3 (Routed) Interface

You can apply a firewall filter to a Layer 3 (routed) interface to filter ingress or egress traffic on the switch. When you configure the firewall filter, you can specify any match condition, action, and action modifiers specified in [“Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series Switches” on page 4704](#). The action specified in the match condition indicates the action for the matched packets in the ingress or egress traffic.

To apply a firewall filter to a Layer 3 interface on a switch:

1. Specify the interface name and provide a meaningful description of the firewall filter and the interface to which the filter is applied:

```
[edit interfaces]
user@switch# set ge-0/1/0 description "filter to count and monitor employee-vlan traffic
applied on layer 3 interface"
```

**NOTE:** Providing the description is optional.

2. Specify the unit number, family address type, and address for the interface:

```
[edit interfaces]
user@switch# set ge-0/1/0 unit 0 family inet address 10.10.10.1/24
```

For firewall filters applied to Layer 3 interfaces, the family address type must be **inet** (for IPv4 traffic) or **inet6** (for IPv6 traffic).

3. You can apply firewall filters to filter packets that are entering or exiting a Layer 3 (routed) interface:

- To apply a firewall filter to filter packets that are entering a Layer 3 interface:

```
[edit interfaces]
user@switch# set ge-0/1/0 unit 0 family inet address 10.10.10.1/24 filter input
ingress-router-filter
```

- To apply a firewall filter to filter packets that are exiting a Layer 3 interface:

```
[edit interfaces]
user@switch# set ge-0/1/0 unit 0 family inet address 10.10.10.1/24 filter output
egress-router-filter
```

**NOTE:** You can apply no more than one firewall filter per Layer 3 interface, per direction.

## Configuring Firewall Filters (J-Web Procedure)

**NOTE:** This topic applies only to the J-Web Application package.

You configure firewall filters on EX Series switches to control traffic that enters ports on the switch or enters and exits VLANs on the network and Layer 3 (routed) interfaces. To configure a firewall filter, you must configure the filter and then apply it to a port, VLAN, or Layer 3 interface.

To configure firewall filter settings by using the J-Web interface:

1. Select **Configure > Security > Filters**.

The Firewall Filter Configuration page displays a list of all configured ports or VLANs or router filters and the ports or VLANs associated with a particular filter.

**NOTE:** After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See [Using the Commit Options to Commit Configuration Changes](#) for details about all commit options.

2. Click one of the following options:

- **Add**—Select this option to create a new filter. Enter information as specified in [Table 532 on page 4814](#).
- **Edit**—Select this option to edit an existing filter. Enter information as specified in [Table 532 on page 4814](#).

- **Delete**—Select this option to delete a filter.
- **Term Up**—Select this option to move a term up in the filter term list.
- **Term Down**—Select this option to move a term down in the filter term list.

**Table 532: Create a New Filter**

Field	Function	Your Action
Filter tab		
Filter type	Specifies the filter type: port or VLAN firewall filter or router firewall filter.	Select the filter type.
Filter name	Specifies the name for the filter.	Enter a name.
Select terms to be part of the filter	Specifies the terms to be associated with the filter. Add new terms or edit existing terms.	Click <b>Add</b> to add new terms. Enter information as specified in <a href="#">Table 533 on page 4814</a> and <a href="#">Table 534 on page 4815</a> .
Association tab		
Port Associations	Specifies the ports with which the filter is associated.  <b>NOTE:</b> For a port or VLAN filter type, only Ingress direction is supported for port association.	<ol style="list-style-type: none"> <li>1. Click <b>Add</b>.</li> <li>2. Select the direction: Ingress or Egress.</li> <li>3. Select the ports. For an EX8200 Virtual Chassis configuration, select the member, FPC, and the available ports from the list.</li> <li>4. Click <b>OK</b>.</li> </ol>
VLAN Associations	Specifies the VLANs with which the filter is associated.  <b>NOTE:</b> Because router firewall filters can be associated with ports only, this section is not displayed for a router firewall filter.	<ol style="list-style-type: none"> <li>1. Click <b>Add</b>.</li> <li>2. Select the direction: Ingress or Egress.</li> <li>3. Select the VLANs.</li> <li>4. Click <b>OK</b>.</li> </ol>

**Table 533: Create a New Term**

Field	Function	Your Action
Term Name	Specifies the name of the term.	Enter a name.
Protocols	Specifies the protocols to be associated with the term.	<ol style="list-style-type: none"> <li>1. Click <b>Add</b>.</li> <li>2. Select the protocols.</li> <li>3. Click <b>OK</b>.</li> </ol>

Table 533: Create a New Term (*continued*)

Field	Function	Your Action
Source	Specifies the source IP address, MAC address, and available ports.  <b>NOTE:</b> MAC address is specified only for port or VLAN filters.	To specify the IP address, click <b>Add &gt; IP</b> and enter the IP address.  To specify the MAC address, click <b>Add &gt; MAC</b> and enter the MAC address.  To specify the ports (interfaces), click <b>Add &gt; Ports</b> and enter the port number.  To delete the IP address, MAC address, or port details, select it and click <b>Remove</b> .
Destination	Specifies the destination IP address, MAC address, and available ports.  <b>NOTE:</b> MAC address is specified only for port or VLAN filters.	To specify the IP address, click <b>Add &gt; IP</b> and enter the IP address.  To specify the MAC address, click <b>Add &gt; MAC</b> and enter the MAC address.  To specify the ports (interfaces), click <b>Add &gt; Ports</b> and enter the port number.  To delete the IP address, MAC address, or port details, select it and click <b>Remove</b> .
Action	Specifies the packet action for the term.	Select one of the following options: <ul style="list-style-type: none"> <li>• Accept</li> <li>• Discard</li> </ul>
More	Specifies advanced configuration options for the filter.	Select the match conditions as specified in <a href="#">Table 534 on page 4815</a> .  Select the packet action for the term as specified in <a href="#">Table 534 on page 4815</a> .

Table 534: Advanced Options for Terms

Table	Function	Your Action
ICMP Type	Specifies the ICMP packet type field. Typically, you specify this match condition in conjunction with the protocol match condition to determine which protocol is being used on the port.	Select the option from the list.
ICMP Code	Specifies more specific information than the ICMP type. Because the value's meaning depends upon the associated ICMP type, you must specify <b>icmp-type</b> along with <b>icmp-code</b> . The keywords are grouped by the ICMP type with which they are associated.	Select a value from the list.
DSCP	Specifies the Differentiated Services code point (DSCP). The DiffServ protocol uses the type-of-service (ToS) byte in the IP header. The most significant six bits of this byte form the DSCP.	Select the DSCP number from the list.

Table 534: Advanced Options for Terms (*continued*)

Table	Function	Your Action
Precedence	Specifies the IP precedence.  <b>NOTE:</b> The IP precedence and the DSCP number cannot be specified together for the same term.	Select the option from the list.
IP Options	Specifies the presence of the options field in the IP header.	Select the option from the list.
Interface	Specifies the interface on which the packet is received.	Select the interface from the list.
Ether type  <b>NOTE:</b> This option is not supported on EX4300 switches.	Specifies the Ethernet type field of a packet.  <b>NOTE:</b> This option is not applicable for a routing filter.	Select a value from the list.
Dot 1q user priority  <b>NOTE:</b> This option is not supported on EX4300 switches.	Specifies the user-priority field of the tagged Ethernet packet. User-priority values can be 0–7.  In place of the numeric value, you can specify one of the following text synonyms (the field values are also listed) :  <ul style="list-style-type: none"> <li>background (1)—Background</li> <li>best-effort (0)—Best effort</li> <li>controlled-load (4)—Controlled load</li> <li>excellent-load (3)—Excellent load</li> <li>network-control (7)—Network control reserved traffic</li> <li>standard (2)—Standard or spare</li> <li>video (5)—Video</li> <li>voice (6)—Voice</li> </ul> <b>NOTE:</b> This option is not applicable for a routing filter.	Select a value from the list.
VLAN  <b>NOTE:</b> This option is not supported on EX4300 switches.	Specifies the VLAN to be associated with the packet.  <b>NOTE:</b> This option is not applicable for a routing filter.	Select the VLAN from the list.
TCP Flags	Specifies one or more TCP flags.  <b>NOTE:</b> TCP flags are supported on ingress ports, VLANs, and router interfaces.	Select the option <b>TCP Initial</b> or enter a combination of TCP flags.
Fragmentation Flags	Specifies the IP fragmentation flags.  <b>NOTE:</b> Fragmentation flags are supported on ingress ports, VLANs, and router interfaces.	Select either the option <b>is-fragment</b> or enter a combination of fragment action flags.

Table 534: Advanced Options for Terms (*continued*)

Table	Function	Your Action
Dot1q tag <b>NOTE:</b> This option is not supported on EX4300 switches.	Specifies the value for the tag field in the Ethernet header. The value can be from 1 through 4095. <b>NOTE:</b> This option is not applicable for a routing filter.	Enter the value.
User Vlan Id <b>NOTE:</b> This option is supported only on EX4300 switches.	Specifies the value of the VLAN ID. The value can be from 0 through 4095 or a range of values.	Enter a value.
User Vlan IP Priority <b>NOTE:</b> This option is supported only on EX4300 switches.	Specifies the priority value. The values can be from 0 through 7.	Enter a value.
Learn Vlan Id <b>NOTE:</b> This option is supported only on EX4300 switches.	Specifies the value of the learnt VLAN ID. The value can be from 0 through 4095 or a range of values.	Enter a value.
Action		
Counter name	Specifies the count of the number of packets that pass this filter, term, or policer.	Enter a value.
Forwarding class	Classifies the packet into one of the following forwarding classes: <ul style="list-style-type: none"> <li>assured-forwarding</li> <li>best-effort</li> <li>expedited-forwarding</li> <li>network-control</li> <li>None</li> </ul>	Select the option from the list.
Loss priority	Specifies the packet loss priority. <b>NOTE:</b> Forwarding class and loss priority must be specified together for the same term.	Enter the value.
Analyzer <b>NOTE:</b> This option is not supported on EX4300 switches.	Specifies whether to perform port mirroring on packets. Port mirroring copies all packets entering one switch port to a network- monitoring connection on another switch port.	Select the analyzer (port mirroring configuration) from the list.

Table 534: Advanced Options for Terms (*continued*)

Table	Function	Your Action
Port Mirror Instance  <b>NOTE:</b> This option is supported only on EX4300 switches.	Specifies whether to perform port mirroring on packets. Port mirroring copies all packets entering one switch port to a network- monitoring connection on another switch port.	Select the port mirroring instance from the list. <b>Default</b> is selected by default.

## Configuring Policers to Control Traffic Rates (CLI Procedure)

You can configure policers to rate limit traffic on EX Series switches. After you configure a policer, you can include it in an ingress firewall filter configuration.

When you configure a firewall filter, you can specify a policer action for any term or terms within the filter. All traffic that matches a term that contains a policer action goes through the policer that the term references. Each policer that you configure includes an implicit counter. To get term-specific packet counts, you must configure a separate policer for each filter term that requires policing.

**NOTE:** On all EX Series switches except EX8200 switches, each policer that you configure includes an implicit counter. To ensure term-specific packet counts, configure a policer for each term in the filter that requires policing. For EX8200 switches, configure a policer and associate it with a global management counter using the *counter* option.

The following policer limits apply on a switch:

- A maximum of 512 policers can be configured for port firewall filters.
- A maximum of 512 policers can be configured for VLAN and Layer 3 firewall filters.

If the number of policers in the firewall filter configuration exceeds these limits, the switch returns the following message when you commit the configuration:

```
Cannot assign policers: Max policer limit reached
```

This topic includes these tasks:

1. [Configuring Policers on page 4819](#)
2. [Specifying Policers in a Firewall Filter Configuration on page 4820](#)
3. [Applying a Firewall Filter That Is Configured with a Policer on page 4820](#)

## Configuring Policers

To configure a policer:

1. Specify the name of the policer:

```
[edit firewall]
user@switch# set policer policer-one
```

The policer name can include letters, numbers, and hyphens (-) and can contain up to 64 characters.

2. Specify the **filter-specific** statement to configure a policer to act as a filter-specific policer; else proceed to step 3:

```
[edit firewall]
user@switch# set policer policer-one filter-specific
```

If you do not specify the **filter-specific** statement, the policer acts as a term-specific policer by default.

3. Configure rate limiting for the policer:

- a. Specify the bandwidth limit in bits per second (bps) to control the traffic rate on an interface:

```
[edit firewall policer policer-one]
user@switch# set if-exceeding bandwidth-limit 300k
```

The range for the bandwidth limit is 1k through 102.3g bps.

- b. Specify the burst-size limit (the maximum allowed burst size in bytes) to control the amount of traffic bursting:

```
[edit firewall policer policer-one]
user@switch# set if-exceeding burst-size-limit 500k
```

To determine the value for the burst-size limit, multiply the bandwidth of the interface on which the filter is applied by the amount of time to allow a burst of traffic at that bandwidth to occur:

$$\text{burst size} = (\text{bandwidth}) * (\text{allowable time for burst traffic})$$

The range for the burst-size limit is 1 through 2,147,450,880 bytes.

4. Specify the policer action **discard** to discard packets that exceed the rate limits:

```
[edit firewall policer]
user@switch# set policer-one then (Policer Action) discard
```

Discard is the only supported policer action.

5. On EX8200 switches, you must assign a global management counter to the policer to obtain policer statistics:

```
[edit firewall policer]
user@switch# set policer-one counter counter-id 0
```

In this sample statement, the global management counter ID is **0**. You can assign any number of policers to the global management counter. The policer statistics displayed for each counter are the collective statistics of all policers assigned to that counter.

### [Specifying Policers in a Firewall Filter Configuration](#)

---

To reference a policer for a single firewall, configure a filter term that includes the policer action:

```
[edit firewall family ethernet-switching]
user@switch# set filter limit-hosts term term-one from source-address 192.0.2.16/28
users@witch# set filter limit-hosts term term-one then policer policer-one
```

### [Applying a Firewall Filter That Is Configured with a Policer](#)

---

A firewall filter that is configured with one or more policer actions, like any other firewall filter, must be applied to a port, VLAN, or Layer 3 interface. For information about applying firewall filters, see the sections on applying firewall filters in [“Configuring Firewall Filters \(CLI Procedure\)”](#) on page 4804.

## Assigning Multifield Classifiers in Firewall Filters to Specify Packet-Forwarding Behavior (CLI Procedure)

You can configure firewall filters with multifield classifiers to classify packets transiting a port, VLAN, or Layer 3 interface on an EX Series switch.

You specify multifield classifiers in a firewall filter configuration to set the forwarding class and packet loss priority (PLP) for incoming or outgoing packets. By default, the data traffic that is not classified is assigned to the **best-effort** class associated with queue 0.

You can specify any of the following default forwarding classes:

Forwarding class	Queue
best-effort	0
assured-forwarding	1
expedited-forwarding	5
network-control	7

To assign multifield classifiers in firewall filters:

1. Configure the family name and filter name for the filter at the **[edit firewall]** hierarchy level, for example:

```
[edit firewall]
user@switch# set family ethernet-switching
user@switch# set family ethernet-switching filter ingress-filter
```

2. Configure the terms of the filter, including the **forwarding-class** and **loss-priority** action modifiers as appropriate. When you specify a forwarding class you must also specify the packet loss priority. For example, each of the following terms examines different packet header fields and assigns an appropriate classifier and the packet loss priority:

- The term **voice-traffic** matches packets on the **voice-vlan** and assigns the forwarding class **expedited-forwarding** and packet loss priority **low**:

```
[edit firewall family ethernet-switching filter ingress-filter]
user@switch# set term voice-traffic from vlan-id voice-vlan
user@switch# set term voice-traffic then forwarding-class expedited-forwarding
user@switch# set term voice-traffic then loss-priority low
```

- The term **data-traffic** matches packets on **employee-vlan** and assigns the forwarding class **assured-forwarding** and packet loss priority **low**:

```
[edit firewall family ethernet-switching filter ingress-filter]
user@switch# set term data-traffic from vlan-id employee-vlan
user@switch# set term data-traffic then forwarding-class assured-forwarding
user@switch# set term data-traffic then loss-priority low
```

- Because loss of network-generated packets can jeopardize proper network operation, delay is preferable to discard of packets. The following term,

**network-traffic**, assigns the forwarding class **network-control** and packet loss priority **low**:

```
[edit firewall family ethernet-switching filter ingress-filter]
user@switch# set term network-traffic from precedence net-control
user@switch# set term network-traffic then forwarding-class network
user@switch# set term network-traffic then loss-priority low
```

- The last term **accept-traffic** matches any packets that did not match on any of the preceding terms and assigns the forwarding class **best-effort** and packet loss priority **low**:

```
[edit firewall family ethernet-switching filter ingress-filter]
user@switch# set term accept-traffic from precedence net-control
user@switch# set term accept-traffic then forwarding-class best-effort
user@switch# set term accept-traffic then loss-priority low
```

3. Apply the filter **ingress-filter** to a port, VLAN or Layer 3 interface. For information about applying the filter, see [“Configuring Firewall Filters \(CLI Procedure\)” on page 4804](#).

## Configuring Routing Policies (J-Web Procedure)

**NOTE:** This topic applies only to the J-Web Application package.

All routing protocols use the Junos OS routing table to store the routes that they learn and to determine which routes are advertised in the protocol packets. Routing policy allows you to control which routes the routing protocols store in and retrieve from the routing table on the routing device.

To configure routing policies for an EX Series switch using the J-Web interface:

1. Select **Configure > Routing > Policies**.

**NOTE:** After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See [Using the Commit Options to Commit Configuration Changes](#) for details about all commit options.

2. Click one of the following options:

- **Global Options**—Configures global options for policies. Enter information into the configuration page as described in [Table 535 on page 4823](#).
- **Add**—Configures a new policy. Select **New** and specify a policy name. To add terms, enter information into the configuration page as described in [Table 536 on page 4824](#). Select **Clone** to create a copy of an existing policy.
- **Edit**—Edits an existing policy. To modify an existing term, enter information into the configuration page as described in [Table 536 on page 4824](#).
- **Term Up**—Moves a term up in the list.
- **Term Down**—Moves a term down in the list.
- **Delete**—Deletes the selected policy.
- **Test Policy**—Tests the policy. Use this option to check whether the policy produces the results that you expect.

**Table 535: Policies Global Configuration Parameters**

Field	Function	Your Action
Prefix List	Specifies a list of IPv4 address prefixes for use in a routing policy statement.	<p>To add a prefix list:</p> <ol style="list-style-type: none"> <li>1. Click <b>Add</b>.</li> <li>2. Enter a name for the prefix list.</li> <li>3. To add an IP address, click <b>Add</b>.</li> <li>4. Enter the IP address and the subnet mask and click <b>OK</b>.</li> <li>5. Click <b>OK</b>.</li> </ol> <p>To edit a prefix list, click <b>Edit</b>. Edit the settings and click <b>OK</b>.</p> <p>To delete a prefix list, select it and click <b>Delete</b>.</p>
BGP Community	Specifies a BGP community.	<p>To add a BGP community:</p> <ol style="list-style-type: none"> <li>1. Click <b>Add</b>.</li> <li>2. Enter a name for the community.</li> <li>3. To add a community, click <b>Add</b>.</li> <li>4. Enter the community ID and click <b>OK</b>.</li> <li>5. Click <b>OK</b>.</li> </ol> <p>To edit a BGP community, click <b>Edit</b>. Edit the settings and click <b>OK</b>.</p> <p>To delete a BGP community, select it and click <b>Delete</b>.</p>

Table 535: Policies Global Configuration Parameters (*continued*)

Field	Function	Your Action
AS Path	Specifies an AS path. This is applicable to BGP only.	<p>To add an AS path:</p> <ol style="list-style-type: none"> <li>1. Click <b>Add</b>.</li> <li>2. Enter the AS path name.</li> <li>3. Enter the regular expression and click <b>OK</b>.</li> <li>4. Click <b>OK</b>.</li> </ol> <p>To edit an AS path, click <b>Edit</b>. Edit the settings and click <b>OK</b>.</p> <p>To delete an AS path, select it and click <b>Delete</b>.</p>

Table 536: Terms Configuration Parameters

Field	Function	Your Action
Term Name	Specifies a term name.	Type or select and edit the name.
<b>Source tab</b>		
Family	Specifies an address family protocol.	Select a value from the list.
Routing Instance	Specifies a routing instance.	Select a value from the list.
RIB	Specifies the name of a routing table.	Select a value from the list
Preference	Specifies the individual preference value for the route.	Type or select and edit the value.
Metric	Specifies a metric value. You can specify up to four metric values.	Type or select and edit the value.
Interface	Specifies a name or IP address of one or more routing device interfaces. Do not use this qualifier with protocols that are not interface-specific, such as internal BGP (IBGP).	<p>To add an interface, select <b>Add &gt; Interface</b>. Select the interface from the list. For an EX8200 Virtual Chassis configuration, select the member, FPC, and the interface from the list.</p> <p>To add an address, select <b>Add &gt; Address</b>. Select the address from the list.</p> <p>To remove an interface, select it and click <b>Remove</b>.</p>
Prefix List	Specifies a named list of IP addresses. You can specify an exact match with incoming routes.	<p>Click <b>Add</b>. Select the prefix list from the list and click <b>OK</b>.</p> <p>To remove a prefix list, select it and click <b>Remove</b>.</p>
Protocol	Specifies the name of the protocol from which the route was learned or to which the route is being advertised.	<p>Click <b>Add</b> and select the protocol from the list.</p> <p>To remove a protocol, select it and click <b>Remove</b>.</p>

Table 536: Terms Configuration Parameters (*continued*)

Field	Function	Your Action
Policy	Specifies the name of a policy to evaluate as a subroutine.	Click <b>Add</b> . Select the policy from the list.  To remove a policy, select it and click <b>Remove</b> .
More	Specifies advanced configuration options for policies.	Click <b>More</b> for advanced configuration.
OSPF Area ID	Specifies the area identifier.	Type the IP address.
BGP Origin	Specifies the origin of the AS path information.	Select a value from the list.
Local Preference	Specifies the BGP local preference.	Type a value.
Route	Specifies the type of route.	Select <b>External</b> .  Select the OSPF type from the list.
AS Path	Specifies the name of an AS path regular expression.	Click <b>Add</b> . Select the AS path from the list.
Community	Specifies the name of one or more communities.	Click <b>Add</b> . Select the community from the list.
<b>Destination tab</b>		
Family	Specifies an address family protocol.	Select a value from the list.
Routing Instance	Specifies a routing instance.	Select a value from the list.
RIB	Specifies the name of a routing table.	Select a value from the list.
Preference	Specifies the individual preference value for the route.	Type a value.
Metric	Specifies a metric value.	Type a value.
Interface	Specifies a name or IP address of one or more routing device interfaces. Do not use this qualifier with protocols that are not interface-specific, such as internal BGP (IBGP).	To add an interface, select <b>Add &gt; Interface</b> . Select the interface from the list. For an EX8200 Virtual Chassis configuration, select the member, FPC, and the interface from the list.  To add an address, select <b>Add &gt; Address</b> . Select the address from the list.  To delete an interface, select it and click <b>Remove</b> .
Protocol	Specifies the name of the protocol from which the route was learned or to which the route is being advertised.	Click <b>Add</b> and select the protocol from the list.  To delete a protocol, select it and click <b>Remove</b> .

Table 536: Terms Configuration Parameters (*continued*)

Field	Function	Your Action
<b>Action tab</b>		
Action	Specifies the action to take if the conditions match.	Select a value from the list.
Default Action	Specifies that any action that is intrinsic to the protocol is overridden. This action is also nonterminating, so that various policy terms can be evaluated before the policy is terminated.	Select a value from the list.
Next	Specifies the default control action if a match occurs, and there are no further terms in the current routing policy.	Select a value from the list.
Priority	Specifies a priority for prefixes included in an OSPF import policy. Prefixes learned through OSPF are installed in the routing table based on the priority assigned to the prefixes.	Select a value from the list.
BGP Origin	Specifies the BGP origin attribute.	Select a value from the list.
AS Path Prepend	Affixes an AS number at the beginning of the AS path. The AS numbers are added after the local AS number has been added to the path. This action adds an AS number to AS sequences only, not to AS sets. If the existing AS path begins with a confederation sequence or set, the affixed AS number is placed within a confederation sequence. Otherwise, the affixed AS number is placed with a nonconfederation sequence.	Enter a value.
AS Path Expand	Extracts the last AS number in the existing AS path and affixes that AS number to the beginning of the AS path $n$ times, where $n$ is a number from 1 through 32. The AS number is added before the local AS number has been added to the path. This action adds AS numbers to AS sequences only, not to AS sets. If the existing AS path begins with a confederation sequence or set, the affixed AS numbers are placed within a confederation sequence. Otherwise, the affixed AS numbers are placed within a nonconfederation sequence. This option is typically used in non-IBGP export policies.	Select the type and type a value.
Load Balance Per Packet	Specifies that all next-hop addresses in the forwarding table must be installed and have the forwarding table perform per-packet load balancing. This policy action allows you to optimize VPLS traffic flows across multiple paths.	Select the check box to enable the option.
Tag	Specifies the tag value. The tag action sets the 32-bit tag field in OSPF external link-state advertisement (LSA) packets.	Select the action and type a value.
Metric	Changes the metric (MED) value by the specified negative or positive offset. This action is useful only in an external BGP (EBGP) export policy.	Select the action and type a value.
Route	Specifies whether the route is external.	Select the <b>External</b> check box to enable the option, and select the OSPF type.

Table 536: Terms Configuration Parameters (*continued*)

Field	Function	Your Action
Preference	Specifies the preference value.	Select the preference action and type a value.
Local Preference	Specifies the BGP local preference attribute.	Select the action and type a value.
Class of Service	Specifies and applies the class-of-service parameters to routes installed into the routing table. <ul style="list-style-type: none"> <li>Source class The value entered here maintains the packet counts for a route passing through your network, based on the source address.</li> <li>Destination class The value entered here maintains packet counts for a route passing through your network, based on the destination address in the packet.</li> <li>Forwarding class</li> </ul>	Type the source class. Type the destination class. Type the forwarding class.

## Configuring Tricolor Marking Policers

You can rate-limit traffic on EX Series switches by configuring a policer and specifying it as an action modifier for a term in a firewall filter. By default, if you specify the same policer in multiple terms, Junos OS creates a separate policer instance for each term and applies rate limiting separately for each instance. For example, if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms, each policer instance enforces a 1-Gbps limit. In this case, the total bandwidth allowed by the filter is 3 Gbps.

You can also configure a policer to be filter-specific, which means that Junos OS creates only one policer instance regardless of how many times the policer is referenced. When you do this, rate limiting is applied in aggregate, so if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms, the total bandwidth allowed by the filter is 1 Gbps.

This topic describes how to configure single-rate and two-rate tricolor marking (TCM) policers, also known as single-rate and two-rate three-color policers. If you want to

configure a single-rate two-color policer (also known just as a "policer"), see ["Configuring Policers to Control Traffic Rates \(CLI Procedure\)" on page 4818](#).

This topic includes:

- [Configuring a Tricolor Marking Policer on page 4828](#)
- [Applying Tricolor Marking Policers to Firewall Filters on page 4828](#)

---

### Configuring a Tricolor Marking Policer

A tricolor marking policer polices traffic on the basis of metering rates, including the configured information rate (CIR), the peak information rate (PIR), their associated burst sizes, and any policing actions configured for the traffic. With tri-color marking, you can configure traffic policing according to two separate modes—color-blind and color-aware. In color-blind mode, the current packet loss priority (PLP) value is ignored. In color-aware mode, the current PLP values are considered by the policer, and the policer can increase those values but cannot decrease them.

To configure a tricolor marking (TCM) policer:

1. Specify the name of the policer and (optionally) whether to automatically discard packets with high loss priority (PLP):

```
[edit firewall]
user@switch# set three-color-policer policer-name
user@switch# set three-color-policer policer-name action loss-priority high then discard
```

2. Specify the policer as either single-rate or two-rate and as color-aware or color-blind:

```
[edit firewall three-color-policer policer-name]
user@switch# set rate mode
```

For example:

```
[edit firewall three-color-policer srTCm1a]
user@switch# set single-rate color-aware
[edit firewall three-color-policer trTCM2-cb]
user@switch# set two-rate color-blind
```

3. For a single-rate TCM policer, configure the CIR, committed burst size (CBS), and excess burst size (EBS):

```
[edit firewall three-color-policer policer-name single-rate]
user@switch# set committed-information-rate bps
user@switch# set committed-burst-size bytes
user@switch# set excess-burst-size bytes
```

4. For a two-rate TCM policer, configure the CIR, CBS, PIR, and peak burst size (PBS):

```
[edit firewall three-color-policer policer-name single-rate]
user@switch# set committed-information-rate bps
user@switch# set committed-burst-size bytes
user@switch# set peak-information-rate bps
user@switch# set peak-burst-size bytes
```

---

### Applying Tricolor Marking Policers to Firewall Filters

To rate-limit traffic by applying a tricolor marking (TCM) policer to a firewall filter:

```
[edit firewall family family filter filter-name term term-name then]
user@switch# set three-color-policer rate stTCM1-ca
```

For example:

```
[edit firewall family inet filter test1 term term1 then]
user@switch# set three-color-policer single-rate policer1
```

You must include either the **single-rate** statement or the **two-rate** statement in the reference to the policer in the firewall filter configuration, and this statement must match the configured TCM policer. Otherwise, an error message appears in the configuration listing.

For example, if you configure **srTCM1-ca** as a single-rate TCM policer and try to apply it as a two-rate policer, the following message appears:

```
[edit firewall]
user@switch# show three-color-policer srTCM1-ca
single-rate {
  color-aware;
  ...
}
user@switch# show filter TESTER
term A {
  then {
    three-color-policer {
      ##
      ## Warning: Referenced two-rate policer does not exist
      ##
      two-rate srTCM;
    }
  }
}
```

## **[edit firewall]** Configuration Statement Hierarchy on EX Series Switches

This topic lists supported and unsupported configuration statements in the **[edit firewall]** hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.
- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see [Feature Explorer](#).

This topic lists:

- [Supported Statements in the \[edit firewall\] Hierarchy Level on page 4831](#)
- [Unsupported Statements in the \[edit firewall\] Hierarchy Level on page 4832](#)

### Supported Statements in the [edit firewall] Hierarchy Level

The following hierarchy shows the **[edit firewall]** configuration statements supported on EX Series switches:

```

firewall {
  family family-name {
    filter filter-name {
      interface-specific;
      term term-name {
        from {
          match-conditions;
        }
        then {
          action;
          action-modifiers;
        }
      }
    }
  }
  policer policer-name {
    filter-specific;
    if-exceeding {
      bandwidth-limit bps;
      burst-size-limit bytes;
    }
    then {
      policer-action;
    }
  }
  three-color-policer policer-name {
    action {
      loss-priority high then discard;
    }
    filter-specific;
    single-rate {
      (color-aware | color-blind);
      committed-burst-size bytes;
      committed-information-rate bps;
      excess-burst-size bytes;
    }
    two-rate {
      (color-aware | color-blind);
      committed-burst-size bytes;
      committed-information-rate bps;
      peak-information-rate bps;
      peak-burst-size bytes;
    }
  }
}

```

### Unsupported Statements in the [edit firewall] Hierarchy Level

All statements in the [edit firewall] hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented.

## Firewall Filter Configuration Statements Supported by Junos OS for EX Series Switches

You configure firewall filters to filter packets based on their components and to perform an action on packets that match the filter.

[Table 537 on page 4832](#) lists the options that are supported for the firewall statement in Junos OS for EX Series switches.

**Table 537: Supported Options for Firewall Filter Statements**

Statement and Option	Description
<code>family <i>family-name</i> {</code> <code>}</code>	<p>The <b><i>family-name</i></b> option specifies the version or type of addressing protocol:</p> <ul style="list-style-type: none"> <li>• <b>any</b>—Filter packets based on protocol-independent match conditions.</li> <li>• <b>ethernet-switching</b>—Filter Layer 2 (Ethernet) packets and Layer 3 (IP) packets</li> <li>• <b>inet</b>—Filter IPv4 packets</li> <li>• <b>inet6</b>—Filter IPv6 packets</li> </ul>
<code>filter <i>filter-name</i> {</code> <code>}</code>	<p>The <b><i>filter-name</i></b> option identifies the filter. The name can contain letters, numbers, and hyphens (-) and can be up to 64 characters long. To include spaces in the name, enclose the name in quotation marks (" ").</p>
<code>interface-specific</code>	<p>The <b>interface-specific</b> statement configures unique names for individual firewall counters specific to each interface.</p>
<code>term <i>term-name</i> {</code> <code>}</code>	<p>The <b><i>term-name</i></b> option identifies the term. The name can contain letters, numbers, and hyphens (-) and can be up to 64 characters long. To include spaces in the name, enclose the entire name in quotation marks (" "). Each term name must be unique within a filter.</p>

Table 537: Supported Options for Firewall Filter Statements (*continued*)

Statement and Option	Description
<pre> from {   match-conditions; } </pre>	<p>The <b>from</b> statement is optional. If you omit it, all packets are considered to match.</p>
<pre> then {   action;   action-modifiers; } </pre>	<p>For information about the <b>action</b> and <b>action-modifiers</b> options, see <a href="#">“Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series Switches”</a> on page 4704.</p>
<pre> policer policer-name { } </pre>	<p>The <b>policer-name</b> option identifies the policer. The name can contain letters, numbers, and hyphens (-) and can be up to 64 characters long. To include spaces in the name, enclose the name in quotation marks (" ").</p>
filter-specific	<p>The <b>filter-specific</b> statement configures policers and counters for a specific filter name.</p>
<pre> if-exceeding {   bandwidth-limit bps   burst-size-limit bytes } </pre>	<p>The <b>bandwidth-limit bps</b> option specifies the traffic rate in bits per second (bps).</p> <p>You can specify <b>bps</b> as a decimal value or as a decimal number followed by one of the following abbreviations:</p> <ul style="list-style-type: none"> <li>• k (thousand)</li> <li>• m (million)</li> <li>• g (billion, which is also called a thousand million)</li> </ul> <p><b>Range:</b> 1000 (1k) through 102,300,000,000 (102.3g) bps</p> <p>The <b>burst-size-limit bytes</b> option specifies the maximum allowed burst size to control the amount of traffic bursting. To determine the value for the burst-size limit, you can multiply the bandwidth of the interface on which the filter is applied by the amount of time (in seconds) to allow a burst of traffic at that bandwidth to occur:</p> <p>burst size = bandwidth * allowable time for burst traffic</p> <p>You can specify a decimal value or a decimal number followed by k (thousand) or m (million).</p> <p><b>Range:</b> 1 through 2,147,450,880 bytes</p>
<pre> then {   policer-action } </pre>	<p>Use the <b>policer-action</b> option to specify <b>discard</b> to discard traffic that exceeds the rate limits.</p>

Junos OS for EX Series switches does not support some of the firewall filter statements that are supported by other Junos OS packages. [Table 538 on page 4834](#) shows the firewall filter statements that are not supported by Junos OS for EX Series switches.

Table 538: Firewall Filter Statements That Are Not Supported by Junos OS for EX Series Switches

Statements Not Supported	Statement Hierarchy Level
<ul style="list-style-type: none"> <li>• <code>interface-set <i>interface-set-name</i> {</code>     <code>}</code></li> <li>• <code>load-balance-group <i>group-name</i> {</code>     <code>}</code></li> <li>• <code>three-color-policer <i>name</i> {</code>     <code>}</code></li> <li>• <code>logical-interface-policer;</code></li> <li>• <code>single-rate {</code>     <code>}</code></li> <li>• <code>two-rate {</code>     <code>}</code></li> </ul>	[edit firewall]
<ul style="list-style-type: none"> <li>• <code>prefix-action <i>name</i> {</code>     <code>}</code></li> <li>• <code>prefix-policer {</code>     <code>}</code></li> <li>• <code>service-filter <i>filter-name</i> {</code>     <code>}</code></li> <li>• <code>simple-filter <i>simple-filter-name</i> {</code>     <code>}</code></li> </ul>	[edit firewall family <i>family-name</i> ]

## action (TCM Policers)

---

<b>Syntax</b>	action { loss-priority high then discard; }
<b>Hierarchy Level</b>	[edit firewall three-color-policer <i>name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2 for EX Series switches.
<b>Description</b>	Discard traffic on a logical interface using tricolor marking policing.  The remaining statement is explained separately.
<b>Required Privilege Level</b>	firewall—To view this statement in the configuration. firewall-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Tricolor Marking Policers on page 4827</a></li> </ul>

## apply-path

---

<b>Syntax</b>	apply-path <i>path</i> ;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> policy-options <i>prefix-list name</i> ], [edit policy-options <i>prefix-list name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Expand a prefix list to include all prefixes pointed to by a defined path.
<b>Options</b>	<i>path</i> —String of elements composed of identifiers or configuration keywords that points to a set of prefixes. You can include wildcards (enclosed in angle brackets) to match more than one identifier. You cannot add a path element, including wildcards, after a leaf statement. Path elements, including wildcards, can only be used after a container statement.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Prefix Lists</a></li> <li>• <a href="#">Example: Configuring Routing Policy Prefix Lists</a></li> <li>• <a href="#">Example: Configuring a Filter to Limit TCP Access to a Port Based On a Prefix List</a></li> </ul>

## as-path (Policy Options)

---

<b>Syntax</b>	<code>as-path name regular-expression;</code>
<b>Hierarchy Level</b>	[edit dynamic policy-options], [edit logical-systems <i>logical-system-name</i> policy-options], [edit policy-options]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Support for configuration in the dynamic database introduced in Junos OS Release 9.5. Support for configuration in the dynamic database introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	Define an autonomous system (AS) path regular expression for use in a routing policy match condition.
<b>Options</b>	<b>name</b> —Name that identifies the regular expression. The name can contain letters, numbers, and hyphens (-) and can be up to 65,536 characters long. To include spaces in the name, enclose it in quotation marks (" ").  <b>regular-expression</b> —One or more regular expressions used to match the AS path.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Understanding AS Path Regular Expressions for Use as Routing Policy Match Conditions</i></li><li>• <i>Example: Using AS Path Regular Expressions</i></li><li>• <a href="#">dynamic-db on page 4848</a></li></ul>

## as-path-group

---

<b>Syntax</b>	<code>as-path-group <i>group-name</i> {     as-path <i>name</i> <i>regular-expression</i>; }</code>
<b>Hierarchy Level</b>	[edit dynamic policy-options], [edit logical-systems <i>logical-system-name</i> policy-options], [edit policy-options]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Support for dynamic database configuration introduced in Junos OS Release 9.5. Support for dynamic database configuration introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	Define a group containing multiple AS path regular expressions for use in a routing policy match condition.
<b>Options</b>	<p><b><i>group-name</i></b>—Name that identifies the AS path group. One or more AS path regular expressions must be listed below the <b>as-path-group</b> hierarchy.</p> <p><b><i>name</i></b>—Name that identifies the regular expression. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (" ").</p> <p><b><i>regular-expression</i></b>—One or more regular expressions used to match the AS path.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Understanding AS Path Regular Expressions for Use as Routing Policy Match Conditions</i></li> <li>• <a href="#">dynamic-db on page 4848</a></li> </ul>

## bandwidth-limit

---

<b>Syntax</b>	<code>bandwidth-limit <i>bps</i>;</code>
<b>Hierarchy Level</b>	[edit <a href="#">firewall policer <i>policer-name</i> if-exceeding</a> ] [edit logical-systems <i>logical-system-name</i> firewall policer <i>policer-name</i> if-exceeding]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Logical systems support introduced in Junos OS Release 9.3.
<b>Description</b>	Specify the traffic rate in bits per second.
<b>Options</b>	<p><b><i>bps</i></b> —Traffic rate to be specified in bits per second. Specify <b><i>bps</i></b> as a decimal value or as a decimal number followed by one of the following abbreviations:</p> <ul style="list-style-type: none"><li>• k (thousand)</li><li>• m (million)</li><li>• g (billion, which is also called a thousand million)</li></ul> <p><b>Range:</b></p> <ul style="list-style-type: none"><li>• 1000 (1k) through 102,300,000,000 (102.3g) bps (EX Series switches)</li><li>• 8000 (8k) through 40,000,000,000 (40g) bps (routers)</li></ul>
<b>Required Privilege Level</b>	firewall—To view this statement in the configuration. firewall-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on EX Series Switches on page 4773</a></li><li>• <a href="#">Configuring Policers to Control Traffic Rates (CLI Procedure) on page 4818</a></li><li>• <a href="#">Understanding the Use of Policers in Firewall Filters on page 4767</a></li><li>• <i>Basic Single-Rate Two-Color Policers</i></li></ul>

## burst-size-limit

---

<b>Syntax</b>	<code>burst-size-limit bytes;</code>
<b>Hierarchy Level</b>	[edit <code>firewall policer policer-name if-exceeding</code> ] [edit logical-systems <i>logical-system-name</i> firewall policer <i>policer-name</i> if-exceeding]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Logical systems support introduced in Junos OS Release 9.3.
<b>Description</b>	Specify the maximum allowed burst size to control the amount of traffic bursting.
<b>Options</b>	<b>bytes</b> —Decimal value or a decimal number followed by k (thousand) or m (million). <b>Range:</b> <ul style="list-style-type: none"> <li>1 through 2,147,450,880 bytes (EX Series switches)</li> <li>1500 through 1,00,000,000,000 bytes (routers)</li> </ul>
<b>Required Privilege Level</b>	firewall—To view this statement in the configuration. firewall-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on EX Series Switches on page 4773</a></li> <li>• <a href="#">Configuring Policers to Control Traffic Rates (CLI Procedure) on page 4818</a></li> <li>• <a href="#">Understanding the Use of Policers in Firewall Filters on page 4767</a></li> <li>• <i>Basic Single-Rate Two-Color Policers</i></li> </ul>

## color-aware

---

<b>Syntax</b>	color-aware;
<b>Hierarchy Level</b>	[edit <a href="#">firewall three-color-policer</a> <i>policer-name</i> single-rate] [edit <a href="#">firewall three-color-policer</a> <i>policer-name</i> two-rate]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2 for EX Series switches.
<b>Description</b>	Configure the way preclassified packets are metered. In color-aware mode, the local switch can assign a higher packet loss priority but cannot assign a lower packet loss priority.
<b>Default</b>	If you omit the <b>color-aware</b> statement, the default behavior is color-aware mode.
<b>Required Privilege Level</b>	firewall—To view this statement in the configuration. firewall-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Tricolor Marking Policers on page 4827</a></li></ul>

## color-blind

---

<b>Syntax</b>	color-blind;
<b>Hierarchy Level</b>	[edit <a href="#">firewall three-color-policer</a> <i>policer-name</i> single-rate] [edit <a href="#">firewall three-color-policer</a> <i>policer-name</i> two-rate]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2 for EX Series switches.
<b>Description</b>	Configure the way preclassified packets are metered. In color-blind mode, the local switch ignores the preclassification of packets and can assign a higher or lower packet loss priority.
<b>Default</b>	If you omit the <b>color-blind</b> statement, the default behavior is color-aware mode.
<b>Required Privilege Level</b>	firewall—To view this statement in the configuration. firewall-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Tricolor Marking Policers on page 4827</a></li></ul>

## committed-burst-size

<b>Syntax</b>	<code>committed-burst-size <i>bytes</i>;</code>
<b>Hierarchy Level</b>	[edit <code>firewall three-color-policer <i>policer-name</i> single-rate</code> ], [edit <code>firewall three-color-policer <i>policer-name</i> two-rate</code> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2 for EX Series switches.
<b>Description</b>	Configure the maximum number of bytes allowed for incoming packets to burst above the committed information rate (CIR) and still be marked with low packet loss priority (green).
<div>  <p><b>NOTE:</b> When you include the <code>committed-burst-size</code> statement in the configuration, you must also include the <code>committed-information-rate</code> statement at the same hierarchy level.</p> </div>	
<b>Options</b>	<p><b>bytes</b>—Number of bytes. You can specify a value in bytes either as a complete decimal number or as a decimal number followed by the abbreviation <b>k</b> (1000), <b>m</b> (1,000,000), or <b>g</b> (1,000,000,000).</p> <p><b>Range:</b> 1500 through 100,000,000,000 bytes</p>
<b>Required Privilege Level</b>	<p><code>firewall</code>—To view this statement in the configuration.</p> <p><code>firewall-control</code>—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Tricolor Marking Policers on page 4827</a></li> </ul>

## committed-information-rate

---

<b>Syntax</b>	<code>committed-information-rate <i>bps</i>;</code>
<b>Hierarchy Level</b>	[edit <a href="#">firewall three-color-policer</a> <i>policer-name</i> single-rate], [edit <a href="#">firewall three-color-policer</a> <i>policer-name</i> two-rate]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2 for EX Series switches.
<b>Description</b>	Configure the guaranteed bandwidth under normal line conditions and the average rate up to which packets are marked with low packet loss priority (green).
<div> <b>NOTE:</b> When you include the <code>committed-information-rate</code> statement in the configuration, you must also include the <code>committed-burst-size</code> statement at the same hierarchy level.</div>	
<b>Options</b>	<b><i>bps</i></b> —Number of bits per second. You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation <b>k</b> (1000), <b>m</b> (1,000,000), or <b>g</b> (1,000,000,000). <b>Range:</b> 32,000 through 40,000,000,000 bps
<b>Required Privilege Level</b>	<b>firewall</b> —To view this statement in the configuration. <b>firewall-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Tricolor Marking Policers on page 4827</a></li></ul>

## community (Policy Options)

<b>Syntax</b>	<pre>community <i>name</i> {     invert-match;     members [ <i>community-ids</i> ]; }</pre>
<b>Hierarchy Level</b>	[edit dynamic policy-options], [edit logical-systems <i>logical-system-name</i> policy-options], [edit policy-options]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Support for configuration in the dynamic database introduced in Junos OS Release 9.5. Support for configuration in the dynamic database introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	Define a community or extended community for use in a routing policy match condition.
<b>Options</b>	<p><b><i>name</i></b>—Name that identifies the regular expression. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters. To include spaces in the name, enclose it in quotation marks (" ").</p> <p><b><i>invert-match</i></b>—Invert the results of the community expression matching. The <b>community</b> match condition defines a regular expression and if it matches the community attribute of the received prefix, Junos OS returns a TRUE result. If not, Junos OS returns a FALSE result. The <b><i>invert-match</i></b> statement makes Junos OS behave to the contrary. If there is a match, Junos OS returns a FALSE result. If there is no match, Junos OS returns a TRUE result.</p> <p><b><i>members community-ids</i></b>—One or more community members. If you specify more than one member, you must enclose all members in brackets.</p> <p>The format for <b><i>community-ids</i></b> is:</p> <p style="padding-left: 40px;"><b><i>as-number:community-value</i></b></p> <p><b><i>as-number</i></b> is the AS number and can be a value in the range from 0 through 65,535.  <b><i>community-value</i></b> is the community identifier and can be a number in the range from 0 through 65,535.</p> <p>You also can specify <b><i>community-ids</i></b> for communities as one of the following well-known community names, which are defined in RFC 1997, <i>BGP Communities Attribute</i>:</p> <ul style="list-style-type: none"> <li>• <b><i>no-export</i></b>—Routes containing this community name are not advertised outside a BGP confederation boundary.</li> <li>• <b><i>no-advertise</i></b>—Routes containing this community name are not advertised to other BGP peers.</li> <li>• <b><i>no-export-subconfed</i></b>—Routes containing this community name are not advertised to external BGP peers, including peers in other members' ASs inside a BGP confederation.</li> </ul>

You can explicitly exclude BGP community information with a static route using the **none** option. Include **none** when configuring an individual route in the **route** portion of the **static** statement to override a **community** option specified in the **defaults** portion of the statement.

The format for extended **community-ids** is the following:

*type:administrator:assigned-number*

**type** is the type of extended community and can be either a **bandwidth**, **target**, **origin**, **domain-id**, **src-as**, or **rt-import** community or a 16-bit number that identifies a specific BGP extended community. The **target** community identifies the destination to which the route is going. The **origin** community identifies where the route originated. The **domain-id** community identifies the OSPF domain from which the route originated. The **src-as** community identifies the autonomous system from which the route originated. The **rt-import** community identifies the route to install in the routing table.

**NOTE:** For **src-as**, you can specify only an AS number and not an IP address. For **rt-import**, you can specify only an IP address and not an AS number.

**administrator** is the administrator. It is either an AS number or an IPv4 address prefix, depending on the type of extended community.

**assigned-number** identifies the local provider.

The format for linking a bandwidth with an AS number is:

*bandwidth:as-number:bandwidth*

**as-number** specifies the AS number and **bandwidth** specifies the bandwidth in bytes per second.

**NOTE:** In Junos OS Release 9.1 and later, you can specify 4-byte AS numbers as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*, as well as the 2-byte AS numbers that are supported in earlier releases of the Junos OS. In plain-number format, you can configure a value in the range from 1 through 4,294,967,295. To configure a **target** or **origin** extended community that includes a 4-byte AS number in the plain-number format, append the letter “L” to the end of number. For example, a target community with the 4-byte AS number 334,324 and an assigned number of 132 is represented as **target:334324L:132**.

In Junos OS Release 9.2 and later, you can also use AS-dot notation when defining a 4-byte AS number for the **target** and **origin** extended communities. Specify two integers joined by a period: *16-bit high-order value in decimal.16-bit low-order value in decimal*. For example, the 4-byte AS number represented in plain-number format as 65546 is represented in AS-dot notation as 1.10.

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Understanding BGP Communities and Extended Communities as Routing Policy Match Conditions</i></li><li>• <i>Understanding How to Define BGP Communities and Extended Communities</i></li><li>• <a href="#">dynamic-db on page 4848</a></li></ul>

## condition

---

<b>Syntax</b>	<pre>condition <i>condition-name</i> {     <b>dynamic-db</b>;     if-route-exists{         <i>address</i>;         address-family {             inet {                 <i>address</i>;                 table <i>table-name</i>;             }             ccc {                 <i>interface-name</i>;                 standby;                 peer-unit <i>unit-number</i>;                 table <i>table-name</i>;             }         }         table <i>table-name</i>;     } }</pre>
<b>Hierarchy Level</b>	[edit dynamic policy-options], [edit logical-systems <i>logical-system-name</i> policy-options], [edit policy-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0. Statement introduced in Junos OS Release 9.0 for EX Series switches. Support for configuration in the dynamic database introduced in Junos OS Release 9.5. Support for configuration in the dynamic database introduced in Junos OS Release 9.5 for EX Series switches. Support for the address families introduced in Junos OS Release 13.2.
<b>Description</b>	Define a policy condition based on the existence of routes in specific tables for use in BGP export policies.
<b>Options</b>	<b><i>condition-name</i></b> —Name of the condition.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Understanding Conditional Installation of Prefixes in a Routing Table</i></li><li>• <i>Example: Configuring Pseudowire Redundancy for Mobile Backhaul Scenarios</i></li><li>• <a href="#">dynamic-db on page 4848</a></li></ul>

## damping (Policy Options)

<b>Syntax</b>	<pre>damping <i>name</i> {   disable;   half-life <i>minutes</i>;   max-suppress <i>minutes</i>;   reuse <i>number</i>;   suppress <i>number</i>; }</pre>
<b>Hierarchy Level</b>	<pre>[edit logical-systems <i>logical-system-name</i> policy-options], [edit policy-options]</pre>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
<b>Description</b>	Define route flap damping properties to set on BGP routes.
<b>Options</b>	<p><b>disable</b>—Disable damping on a per-prefix basis. Any damping state that is present in the routing table for a prefix is deleted if damping is disabled.</p> <p><b>half-life <i>minutes</i></b>—Decay half-life. <i>minutes</i> is the interval after which the accumulated figure-of-merit value is reduced by half if the route remains stable.</p> <p><b>Range:</b> 1 through 45</p> <p><b>Default:</b> 15 minutes</p> <hr/> <p> <b>NOTE:</b> For the half-life, configure a value that is less than the max-suppress. If you do not, the configuration is rejected.</p> <hr/> <p><b>max-suppress <i>minutes</i></b>—Maximum hold-down time. <i>minutes</i> is the maximum time that a route can be suppressed no matter how unstable it has been.</p> <p><b>Range:</b> 1 through 720</p> <p><b>Default:</b> 60 minutes</p> <hr/> <p> <b>NOTE:</b> For the max-suppress, configure a value that is greater than the half-life. If you do not, the configuration is rejected.</p> <hr/> <p><b><i>name</i></b>—Name that identifies the set of damping parameters. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (" ").</p> <p><b>reuse <i>number</i></b>—Reuse threshold. <i>number</i> is the figure-of-merit value below which a suppressed route can be used again.</p> <p><b>Range:</b> 1 through 20,000</p> <p><b>Default:</b> 750 (unitless)</p>

**suppress *number***—Cutoff (suppression) threshold. *number* is the figure-of-merit value above which a route is suppressed for use or inclusion in advertisements.

**Range:** 1 through 20,000

**Default:** 3000 (unitless)

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## excess-burst-size

<b>Syntax</b>	<code>excess-burst-size bytes;</code>
<b>Hierarchy Level</b>	[edit <a href="#">firewall three-color-policer</a> <i>policer-name</i> single-rate]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2 for EX Series switches.
<b>Description</b>	Configure the maximum number of bytes allowed for incoming packets to burst above the committed information rate and still be marked with medium-high packet loss priority (yellow). Packets that exceed the excess burst size (EBS) are marked with high packet loss priority (red).
<div>  <p><b>NOTE:</b> When you include the <code>excess-burst-size</code> statement in the configuration, you must also include the <code>committed-burst-size</code> and <code>committed-information-rate</code> statements at the same hierarchy level.</p> </div>	
<b>Options</b>	<p><b>bytes</b>—Number of bytes. You can specify a value in bytes either as a complete decimal number or as a decimal number followed by the abbreviation <b>k</b> (1000), <b>m</b> (1,000,000), or <b>g</b> (1,000,000,000).</p> <p><b>Range:</b> 1500 through 100,000,000,000 bytes</p>
<b>Required Privilege Level</b>	<p><code>firewall</code>—To view this statement in the configuration.</p> <p><code>firewall-control</code>—To add this statement to the configuration.</p>

## family (Firewall Filter)

---

**Syntax**    family *family-name* {  
              filter *filter-name* {  
                  interface-specific;  
                  term *term-name* {  
                      from {  
                        match-conditions;  
                      }  
                      then {  
                        action;  
                        action-modifiers;  
                      }  
                  }  
              }  
          }

**Hierarchy Level**    [edit [firewall](#)]

**Release Information**    Statement introduced in Junos OS Release 9.0 for EX Series switches.  
                              Option [interface-specific](#) introduced in Junos OS Release 9.5 for EX Series switches.

**Description**    Configure a firewall filter for IP version 4 or IP version 6.

**Options**    *family-name*—Version or type of addressing protocol:

- **any**—Filter packets based on protocol-independent match conditions.
- **ethernet-switching**—Filter Layer 2 (Ethernet) packets and Layer 3 (IP) packets.
- **inet**—Filter IPv4 packets.
- **inet6**—Filter IPv6 packets.

The remaining statements are explained separately.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                  interface-control—To add this statement to the configuration.

## filter (Firewall Filters)

<b>Syntax</b>	<pre>filter <i>filter-name</i> {     <i>interface-specific</i>;     term <i>term-name</i> {         from {             <i>match-conditions</i>;         }         then {             <i>action</i>;             <i>action-modifiers</i>;         }     } }</pre>
<b>Hierarchy Level</b>	[edit <a href="#">firewall family</a> <i>family-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches. Option <a href="#">interface-specific</a> introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	Configure firewall filters.
<b>Options</b>	<p><b><i>filter-name</i></b>—Name that identifies the filter. The name can contain letters, numbers, and hyphens (-), and can be up to 64 characters long. To include spaces in the name, enclose it in quotation marks.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>firewall—To view this statement in the configuration.</p> <p>firewall-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series Switches on page 4704</a></li> <li>• <a href="#">Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on EX Series Switches on page 4773</a></li> <li>• <a href="#">Configuring Firewall Filters (CLI Procedure) on page 4804</a></li> <li>• <a href="#">Configuring Firewall Filters (J-Web Procedure) on page 4813</a></li> <li>• <a href="#">Firewall Filters for EX Series Switches Overview on page 4696</a></li> </ul>

## filter (VLANs)

---

<b>Syntax</b>	<code>filter (input   output) <i>filter-name</i>;</code>
<b>Hierarchy Level</b>	[edit <b>vlan</b> <i>vlan-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Apply a firewall filter to traffic coming into or exiting from the VLAN.
<b>Default</b>	All incoming traffic is accepted unmodified to the VLAN, and all outgoing traffic is sent unmodified from the VLAN.
<b>Options</b>	<p><b><i>filter-name</i></b> —Name of a firewall filter defined in a <b>filter</b> statement.</p> <ul style="list-style-type: none"><li>• <b>input</b>—Apply a firewall filter to VLAN ingress traffic.</li><li>• <b>output</b>—Apply a firewall filter to VLAN egress traffic.</li></ul>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on EX Series Switches on page 4773</a></li><li>• <a href="#">Configuring Firewall Filters (CLI Procedure) on page 4804</a></li><li>• <a href="#">Configuring Firewall Filters (J-Web Procedure) on page 4813</a></li><li>• <a href="#">Firewall Filters for EX Series Switches Overview on page 4696</a></li><li>• <a href="#">Configuring VLANs for EX Series Switches (CLI Procedure) on page 2337</a></li></ul>

---

## filter-specific

---

<b>Syntax</b>	filter-specific;
<b>Hierarchy Level</b>	[edit <a href="#">firewall policer</a> <i>policer-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	Configure a policer to act as a filter-specific policer. If you do not specify the <b>filter-specific</b> statement, the policer acts as a term-specific policer by default.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on EX Series Switches on page 4773</a></li><li>• <a href="#">Configuring Policers to Control Traffic Rates (CLI Procedure) on page 4818</a></li><li>• <a href="#">Understanding the Use of Policers in Firewall Filters on page 4767</a></li></ul>

## firewall

---

```
Syntax  firewall {
        family family-name {
            filter filter-name {
                interface-specific;
                term term-name {
                    from {
                        match-conditions;
                    }
                    then {
                        action;
                        action-modifiers;
                    }
                }
            }
        }
        policer policer-name {
            filter-specific;
            if-exceeding {
                bandwidth-limit bps;
                burst-size-limit bytes;
            }
            then {
                policer-action;
            }
        }
    }
    three-color-policer policer-name {
        action {
            loss-priority high then discard;
        }
        single-rate {
            (color-aware | color-blind);
            committed-information-rate bps;

            excess-burst-size bytes;
        }
        two-rate {
            (color-aware | color-blind);
            committed-information-rate bps;
            committed-burst-size bytes;
            peak-information-rate bps;
            peak-burst-size bytes;
        }
    }
```

Hierarchy Level [edit]

**Release Information** Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Options **interface-specific** and **filter-specific** introduced in Junos OS Release 9.5 for EX Series switches.

<b>Description</b>	Configure firewall filters and policers.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	firewall—To view this statement in the configuration. firewall-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series Switches on page 4704</a></li> <li>• <a href="#">Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on EX Series Switches on page 4773</a></li> <li>• <a href="#">Configuring Firewall Filters (CLI Procedure) on page 4804</a></li> <li>• <a href="#">Configuring Policers to Control Traffic Rates (CLI Procedure) on page 4818</a></li> <li>• <a href="#">Firewall Filters for EX Series Switches Overview on page 4696</a></li> </ul>

---

## from

---

<b>Syntax</b>	from { <i>match-conditions</i> ; }
<b>Hierarchy Level</b>	[edit <b>firewall</b> <i>family family-name filter filter-name term term-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Match packet fields to values specified in a match condition. If the <b>from</b> statement is not included in a firewall filter configuration, all packets are considered to match and the actions and action modifiers in the <b>then</b> statement are taken.
<b>Options</b>	<b>match-conditions</b> —Conditions that define the values or fields that the incoming or outgoing packets must contain for a match. You can specify one or more match conditions. If you specify more than one, they all must match for a match to occur and for the action in the <b>then</b> statement to be taken.
<b>Required Privilege Level</b>	firewall—To view this statement in the configuration. firewall-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series Switches on page 4704</a></li> <li>• <a href="#">Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on EX Series Switches on page 4773</a></li> <li>• <a href="#">Configuring Firewall Filters (CLI Procedure) on page 4804</a></li> <li>• <a href="#">Configuring Firewall Filters (J-Web Procedure) on page 4813</a></li> <li>• <a href="#">Understanding Firewall Filter Match Conditions on page 4762</a></li> </ul>

## if-exceeding

---

<b>Syntax</b>	<pre>if-exceeding {     bandwidth-limit <i>bps</i>;     bandwidth-percent <i>percent</i>     burst-size-limit <i>bytes</i>; }</pre>
<b>Hierarchy Level</b>	[edit <b>firewall</b> <b>policer</b> <i>policer-name</i> ] [edit logical-systems logical-system-name firewall policer policer-name]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Logical systems support introduced in Junos OS Release 9.3.
<b>Description</b>	Configure policer rate limits.  The <b>bandwidth-percent</b> statement is supported on routers only.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	firewall—To view this statement in the configuration. firewall-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on EX Series Switches on page 4773</a></li><li>• <a href="#">Configuring Policers to Control Traffic Rates (CLI Procedure) on page 4818</a></li><li>• <a href="#">Understanding the Use of Policers in Firewall Filters on page 4767</a></li><li>• <i>Basic Single-Rate Two-Color Policers</i></li></ul>

## interface-specific

<b>Syntax</b>	interface-specific;
<b>Hierarchy Level</b>	[edit <b>firewall family</b> <i>family-name</i> <b>filter</b> <i>filter-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	Configure firewall counters that are interface-specific. You can configure an interface-specific firewall filter only on a port or a Layer 3 interface as an interface-specific firewall filter is not supported for a VLAN.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series Switches on page 4704</a></li> <li>• <a href="#">Configuring Firewall Filters (CLI Procedure) on page 4804</a></li> <li>• <a href="#">Configuring Firewall Filters (J-Web Procedure) on page 4813</a></li> <li>• <a href="#">Firewall Filters for EX Series Switches Overview on page 4696</a></li> </ul>

## loss-priority high then discard (Three-Color Policer)

<b>Syntax</b>	loss-priority high then discard;
<b>Hierarchy Level</b>	[edit <b>firewall three-color-policer</b> <i>policer-name</i> <b>action</b> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2 for EX Series switches.
<b>Description</b>	<p>For packets with high loss priority, discard the packets. The loss priority setting is implicit and cannot be configured. Include this statement if you do not want the local switch to forward packets that have high packet loss priority.</p> <p>For single-rate three-color policers, Junos OS assigns high loss priority to packets that exceed the committed information rate and the excess burst size.</p> <p>For two-rate three-color policers, Junos OS assigns high loss priority to packets that exceed the peak information rate and the peak burst size.</p>
<b>Required Privilege Level</b>	firewall—To view this statement in the configuration. firewall-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Tricolor Marking Policers on page 4827</a></li> </ul>

## peak-burst-size

---

<b>Syntax</b>	<code>peak-burst-size bytes;</code>
<b>Hierarchy Level</b>	[edit <a href="#">firewall three-color-policer</a> <i>policer-name</i> two-rate]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2 for EX Series switches.
<b>Description</b>	Configure the maximum number of bytes allowed for incoming packets to burst above the peak information rate (PIR) and still be marked with medium-high packet loss priority (yellow). Packets that exceed the peak burst size (PBS) are marked with high packet loss priority (red).
<div> <b>NOTE:</b> When you include the <code>peak-burst-size</code> statement in the configuration, you must also include the <code>committed-burst-size</code> and <code>peak-information-rate</code> statements at the same hierarchy level.</div>	
<b>Options</b>	<b>bytes</b> —Number of bytes. You can specify a value in bytes either as a complete decimal number or as a decimal number followed by the abbreviation <b>k</b> (1000), <b>m</b> (1,000,000), or <b>g</b> (1,000,000,000). <b>Range:</b> 1500 through 100,000,000,000 bytes
<b>Required Privilege Level</b>	<code>firewall</code> —To view this statement in the configuration. <code>firewall-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Tricolor Marking Policers on page 4827</a></li></ul>

## policer

<b>Syntax</b>	<pre> policer <i>policer-name</i> {   counter {     counter-id <i>counter-index</i>;   }   filter-specific;   if-exceeding {     bandwidth-limit <i>bps</i>;     bandwidth-percent <i>percent</i>     burst-size-limit <i>bytes</i>;   }   then {     <i>policer-action</i>;   } } </pre>
<b>Hierarchy Level</b>	<p>[edit <a href="#">firewall</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> firewall]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Logical systems support introduced in Junos OS Release 9.3.</p>
<b>Description</b>	<p>Configure policer rate limits and actions. To activate a policer, you must include the <b>policer</b> action modifier in the <b>then</b> statement in a firewall filter term. Except for EX8200 switches, each policer that you configure includes an implicit counter. To obtain term-specific packet counts, configure a policer for each term in the filter that requires policing. For EX8200 switches, configure a policer and associate it with a global management counter using the <i>counter</i> option.</p>
<b>Options</b>	<p><b><i>policer-name</i></b>—Name that identifies the policer. The name can include letters, numbers, hyphens (-), and can contain up to 64 characters.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>firewall—To view this statement in the configuration.</p> <p>firewall-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on EX Series Switches on page 4773</a></li> <li>• <a href="#">Example: Configuring CoS on EX Series Switches on page 2075</a></li> <li>• <a href="#">Configuring Policers to Control Traffic Rates (CLI Procedure) on page 4818</a></li> <li>• <a href="#">Configuring MPLS on Provider Edge Switches Using Circuit Cross-Connect (CLI Procedure)</a></li> <li>• <a href="#">Configuring MPLS on Provider Edge Switches Using IP Over MPLS (CLI Procedure)</a></li> <li>• <a href="#">Understanding the Use of Policers in Firewall Filters on page 4767</a></li> <li>• <a href="#">Basic Single-Rate Two-Color Policers</a></li> </ul>

## policy-options

---

### Syntax

**Hierarchy Level**    [\[edit\]](#)

**Release Information**    Statement introduced in Junos OS Release 12.1 for the EX Series.

**Description**    Configure options such as application maps for DCBX application protocol exchange and policy statements.

**Required Privilege Level**    storage—To view this statement in the configuration.  
storage-control—To add this statement to the configuration.

**Related Documentation**

- *Example: Configuring DCBX to Support an iSCSI Application*

## policy-statement

<b>Syntax</b>	<pre> policy-statement <i>policy-name</i> {   term <i>term-name</i> {     from {       family <i>family-name</i>;       match-conditions;       policy <i>subroutine-policy-name</i>;       prefix-list <i>prefix-list-name</i>;       prefix-list-filter <i>prefix-list-name</i> match-type &lt;actions&gt;;       route-filter <i>destination-prefix</i> match-type &lt;actions&gt;;       source-address-filter <i>source-prefix</i> match-type &lt;actions&gt;;     }     to {       match-conditions;       policy <i>subroutine-policy-name</i>;     }     then <i>actions</i>;   } } </pre>
<b>Hierarchy Level</b>	<p>[edit dynamic policy-options],</p> <p>[edit logical-systems <i>logical-system-name</i> policy-options],</p> <p>[edit policy-options]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for configuration in the dynamic database introduced in Junos OS Release 9.5.</p> <p>Support for configuration in the dynamic database introduced in Junos OS Release 9.5 for EX Series switches.</p> <p><b>inet-mdt</b> option introduced in Junos OS Release 10.0R2.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p> <p><b>route-target</b> option introduced in Junos OS Release 12.2.</p>
<b>Description</b>	<p>Define a routing policy, including subroutine policies.</p> <p>A <i>term</i> is a named structure in which match conditions and actions are defined. Routing policies are made up of one or more terms. Each routing policy term is identified by a term name. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose the entire name in double quotation marks.</p> <p>Each term contains a set of match conditions and a set of actions:</p> <ul style="list-style-type: none"> <li>Match conditions are criteria that a route must match before the actions can be applied. If a route matches all criteria, one or more actions are applied to the route.</li> <li>Actions specify whether to accept or reject the route, control how a series of policies are evaluated, and manipulate the characteristics associated with a route.</li> </ul> <p>Generally, a router compares a route against the match conditions of each term in a routing policy, starting with the first and moving through the terms in the order in which they are defined, until a match is made and an explicitly configured or default action of</p>

**accept** or **reject** is taken. If none of the terms in the policy match the route, the router compares the route against the next policy, and so on, until either an action is taken or the default policy is evaluated.

If none of the match conditions of each term evaluates to true, the final action is executed. The final action is defined in an unnamed term. Additionally, you can define a default action (either **accept** or **reject**) that overrides any action intrinsic to the protocol.

The order of match conditions in a term is not relevant, because a route must match all match conditions in a term for an action to be taken.

To list the routing policies under the **[edit policy-options]** hierarchy level by **policy-statement *policy-name*** in alphabetical order, enter the **show policy-options** configuration command.

**Options** *actions*—(Optional) One or more actions to take if the conditions match. The actions are described in *Configuring Flow Control Actions*.

**family** *family-name*—(Optional) Specify an address family protocol. Specify **inet** for IPv4. Specify **inet6** for 128-bit IPv6, and to enable interpretation of IPv6 router filter addresses. For IS-IS traffic, specify **iso**. For IPv4 multicast VPN traffic, specify **inet-mvpn**. For IPv6 multicast VPN traffic, specify **inet6-mvpn**. For multicast-distribution-tree (MDT) IPv4 traffic, specify **inet-mdt**. For BGP route target VPN traffic, specify **route-target**.

**NOTE:** When *family* is not specified, the routing device or routing instance uses the address family or families carried by BGP. If multiprotocol BGP (MP-BGP) is enabled, the policy defaults to the protocol family or families carried in the network layer reachability information (NLRI) as configured in the *family* statement for BGP. If MP-BGP is not enabled, the policy uses the default BGP address family unicast IPv4.

**from**—(Optional) Match a route based on its source address.

**match-conditions**—(Optional in **from** statement; required in **to** statement) One or more conditions to use to make a match. The qualifiers are described in *Routing Policy Match Conditions*.

**policy** *subroutine-policy-name*—Use another policy as a match condition within this policy. The name identifying the subroutine policy can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (" "). Policy names cannot take the form **\_\_.\*-internal\_\_**, as this form is reserved. For information about how to configure subroutines, see *Understanding Policy Subroutines in Routing Policy Match Conditions*.

**policy-name**—Name that identifies the policy. The name can contain letters, numbers, and hyphens (-) and can be up to 255 characters long. To include spaces in the name, enclose it in quotation marks (" ").

**prefix-list** *prefix-list-name*—Name of a list of IPv4 or IPv6 prefixes.

**prefix-list-filter** *prefix-list-name*—Name of a prefix list to evaluate using qualifiers; *match-type* is the type of match (see *Configuring Prefix List Filters*), and *actions* is the action to take if the prefixes match.

**route-filter** *destination-prefix match-type <actions>*—(Optional) List of routes on which to perform an immediate match; *destination-prefix* is the IPv4 or IPv6 route prefix to match, *match-type* is the type of match (see *Configuring Route Lists*), and *actions* is the action to take if the *destination-prefix* matches.

**source-address-filter** *source-prefix match-type <actions>*—(Optional) Unicast source addresses in multiprotocol BGP (MBGP) and Multicast Source Discovery Protocol (MSDP) environments on which to perform an immediate match. *source-prefix* is

the IPv4 or IPv6 route prefix to match, **match-type** is the type of match (see *Configuring Route Lists*), and **actions** is the action to take if the **source-prefix** matches.

**term term-name**—Name that identifies the term. The term name must be unique in the policy. It can contain letters, numbers, and hyphens (-) and can be up to 64 characters long. To include spaces in the name, enclose the entire name in quotation marks (" "). A policy statement can include multiple terms. We recommend that you name all terms. However, you do have the option to include an unnamed term which must be the final term in the policy. To configure an unnamed term, omit the **term** statement when defining match conditions and actions.

**to**—(Optional) Match a route based on its destination address or the protocols into which the route is being advertised.

**then**—(Optional) Actions to take on matching routes. The actions are described in *Configuring Flow Control Actions* and *Configuring Actions That Manipulate Route Characteristics*.

<b>Required Privilege</b>	routing—To view this statement in the configuration.
<b>Level</b>	routing-control—To add this statement to the configuration.

## prefix-list

<b>Syntax</b>	<pre>prefix-list <i>name</i> {     <i>ip-addresses</i>;     apply-path <i>path</i>; }</pre>
<b>Hierarchy Level</b>	[edit dynamic policy-options], [edit logical-systems <i>logical-system-name</i> policy-options], [edit policy-options]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Support for configuration in the dynamic database introduced in Junos OS Release 9.5.</p> <p>Support for configuration in the dynamic database introduced in Junos OS Release 9.5 for EX Series switches.</p> <p>Support for the <b>vpls</b> protocol family introduced in Junos OS Release 10.2.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	<p>Define a list of IPv4 or IPv6 address prefixes for use in a routing policy statement or firewall filter statement.</p> <p>You can configure up to 85,325 prefixes in each prefix list. To configure more than 85,325 prefixes, configure multiple prefix lists and apply them to multiple firewall filter terms.</p>
<b>Options</b>	<p><b><i>name</i></b>—Name that identifies the list of IPv4 or IPv6 address prefixes.</p> <p><b><i>ip-addresses</i></b>—List of IPv4 or IPv6 address prefixes, one IP address per line in the configuration.</p> <p>The remaining statement is explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Understanding Prefix Lists for Use in Routing Policy Match Conditions</i></li> <li>• <i>Firewall Filter Match Conditions Based on Address Fields</i></li> <li>• <i>Example: Configuring Routing Policy Prefix Lists</i></li> <li>• <i>Example: Configuring a Filter to Limit TCP Access to a Port Based On a Prefix List</i></li> </ul>

## routing-instance

---

<b>Syntax</b>	<code>routing-instance <i>routing-instance-name</i>;</code>
<b>Hierarchy Level</b>	[edit <code>firewall</code> family inet <code>filter filter-name</code> <code>term term-name</code> <code>then</code> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.4 for EX Series switches.
<b>Description</b>	Specify a specific virtual routing instance to which the switch sends matched packets.
<b>Options</b>	<i>routing-instance-name</i> —Name of a virtual routing instance.
<b>Required Privilege Level</b>	<code>firewall</code> —To view this statement in the configuration. <code>firewall-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Using Filter-Based Forwarding to Route Application Traffic to a Security Device on EX Series Switches on page 4795</a></li><li>• <a href="#">Configuring Virtual Routing Instances (CLI Procedure) on page 2347</a></li><li>• <a href="#">Understanding Filter-Based Forwarding for EX Series Switches on page 4770</a></li></ul>

## single-rate

<b>Syntax</b>	<pre>single-rate {   (color-aware   color-blind);   committed-burst-size bytes;   committed-information-rate bps;   excess-burst-size bytes; }</pre>
<b>Hierarchy Level</b>	[edit <a href="#">firewall three-color-policer</a> <i>policer-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2 for EX Series switches.
<b>Description</b>	<p>Configure a single-rate three-color policer in which marking is based on the committed information rate (CIR), committed burst size (CBS), and excess burst size (EBS).</p> <p>Packets that conform to the CIR or the CBS are assigned low loss priority (green). Packets that exceed the CIR and the CBS but do not exceed the EBS are assigned medium-high loss priority (yellow). Packets that exceed the EBS are assigned high loss priority (red).</p> <p>Green and yellow packets are always forwarded; this action is not configurable. You can configure red packets to be discarded. By default, red packets are forwarded.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	firewall—To view this statement in the configuration. firewall-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Tricolor Marking Policers on page 4827</a></li> </ul>

## term

---

<b>Syntax</b>	<pre>term <i>term-name</i> {     from {         <i>match-conditions</i>;     }     then {         <i>action</i>;         <i>action-modifiers</i>;     } }</pre>
<b>Hierarchy Level</b>	[edit <b>firewall family</b> <i>family-name</i> <b>filter</b> <i>filter-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Define a firewall filter term.
<b>Options</b>	<p><b><i>term-name</i></b>—Name that identifies the term. The name can contain letters, numbers, and hyphens (-), and can be up to 64 characters long. To include spaces in the name, enclose it in quotation marks.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>firewall—To view this statement in the configuration.</p> <p>firewall-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series Switches on page 4704</a></li><li>• <a href="#">Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on EX Series Switches on page 4773</a></li><li>• <a href="#">Configuring Firewall Filters (CLI Procedure) on page 4804</a></li><li>• <a href="#">Configuring Firewall Filters (J-Web Procedure) on page 4813</a></li><li>• <a href="#">Firewall Filters for EX Series Switches Overview on page 4696</a></li></ul>

## then (Firewall Filters)

---

<b>Syntax</b>	<pre>then {     action;     action-modifiers; }</pre>
<b>Hierarchy Level</b>	[edit <b>firewall family</b> <i>family-name</i> <b>filter</b> <i>filter-name</i> <b>term</b> <i>term-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure a filter action.
<b>Options</b>	<p><b>action</b>—Action to accept, discard, or forward packets that match all match conditions specified in a filter term.</p> <p><b>action-modifiers</b>—Additional actions to analyze, classify, count, or police packets that match all conditions specified in a filter term.</p>
<b>Required Privilege Level</b>	<p>firewall—To view this statement in the configuration.</p> <p>firewall-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Firewall Filter Match Conditions, Actions, and Action Modifiers for EX Series Switches on page 4704</a></li> <li>• <a href="#">Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on EX Series Switches on page 4773</a></li> <li>• <a href="#">Example: Using Filter-Based Forwarding to Route Application Traffic to a Security Device on EX Series Switches on page 4795</a></li> <li>• <a href="#">Configuring Firewall Filters (CLI Procedure) on page 4804</a></li> <li>• <a href="#">Configuring Firewall Filters (J-Web Procedure) on page 4813</a></li> <li>• <a href="#">Understanding Firewall Filter Match Conditions on page 4762</a></li> </ul>

## then (Policer Action)

---

<b>Syntax</b>	<pre>then {     <i>policer-action</i>; }</pre>
<b>Hierarchy Level</b>	[edit <a href="#">firewall policer <i>policer-name</i></a> ] [edit logical-systems <i>logical-system-name</i> firewall policer <i>policer-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure a policer action.
<b>Options</b>	<p><i>policer-action</i>—Actions to take are:</p> <ul style="list-style-type: none"><li>• <b>discard</b>—Discard traffic that exceeds the rate limits defined by the policer.</li><li>• <b>forwarding-class <i>class-name</i></b>—For routers only, classify traffic that exceeds the rate limits defined by the policer.</li><li>• <b>loss-priority</b>—Set the loss priority for traffic that exceeds the rate limits defined by the policer.</li></ul>
<b>Required Privilege Level</b>	firewall—To view this statement in the configuration. firewall -control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on EX Series Switches on page 4773</a></li><li>• <a href="#">Configuring Policers to Control Traffic Rates (CLI Procedure) on page 4818</a></li><li>• <a href="#">Configuring Firewall Filters (CLI Procedure) on page 4804</a></li><li>• <a href="#">Configuring Firewall Filters (J-Web Procedure) on page 4813</a></li><li>• <a href="#">Understanding the Use of Policers in Firewall Filters on page 4767</a></li><li>• <a href="#">Example: Configuring CoS for a PBB Network on MX Series Routers</a></li><li>• <a href="#">Basic Single-Rate Two-Color Policers</a></li></ul>

## three-color-policer (Configuring)

```
Syntax  three-color-policer policer-name {
        action {
            loss-priority high then discard;
        }
        single-rate {
            (color-aware | color-blind);
            committed-burst-size bytes;
            committed-information-rate bps;
            excess-burst-size bytes;
        }
        two-rate {
            (color-aware | color-blind);
            committed-burst-size bytes;
            committed-information-rate bps;
            peak-burst-size bytes;
            peak-information-rate bps;
        }
    }
```

**Hierarchy Level** [edit [firewall](#)]

**Release Information** Statement introduced in Junos OS Release 11.2 for EX Series switches.

**Description** Configure a three-color policer.

**Options** *policer-name*—Name of the three-color policer. Reference this name when you apply the policer to an interface.

The remaining statements are explained separately.

**Required Privilege Level** firewall—To view this statement in the configuration.  
firewall-control—To add this statement to the configuration.

**Related Documentation**

# Administration

- [Routine Monitoring on page 4873](#)
- [Operational Commands on page 4876](#)

## Routine Monitoring

---

- [Verifying That Firewall Filters Are Operational on page 4873](#)
- [Verifying That Policers Are Operational on page 4874](#)
- [Monitoring Firewall Filter Traffic on page 4875](#)

### Verifying That Firewall Filters Are Operational

**Purpose** After you configure and apply firewall filters to ports, VLANs, or Layer 3 interfaces, you can perform the following task to verify that the firewall filters configured on EX Series switches are working properly.

**Action** Use the operational mode command to verify that the firewall filters on the switch are working properly:

```
user@switch> show firewall
Filter: egress-vlan-watch-employee
Counters:
Name                               Bytes          Packets
counter-employee-web                0              0
Filter: ingress-port-voip-class-limit-tcp-icmp
Counters:
Name                               Bytes          Packets
icmp-counter                        0              0
Policers:
Name                               Packets
icmp-connection-policer            0
tcp-connection-policer             0
Filter: ingress-vlan-rogue-block
Filter: ingress-vlan-limit-guest
```

**Meaning** The **show firewall** command displays the names of all firewall filters, policers, and counters that are configured on the switch. For each counter that is specified in a filter configuration, the output field shows the byte count and packet count for the term in which the counter is specified. For each policer that is specified in a filter configuration, the output field shows the packet count for packets that exceed the specified rate limits.

  - [Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on EX Series Switches on page 4773](#)
  - [Monitoring Firewall Filter Traffic on page 4875](#)

## Verifying That Policers Are Operational

**Purpose** After you configure policers and include them in firewall filter configurations, you can perform the following tasks to verify that the policers configured on EX Series switches are working properly.

**Action** Use the operational mode command to verify that the policers on the switch are working properly:

```
user@switch> show policer
Filter: egress-vlan-watch-employee
Filter: ingress-port-filter
Filter: ingress-port-voip-class-limit-tcp-icmp
Policies:
Name                                     Packets
icmp-connection-policer                  0
tcp-connection-policer                  0
Filter: ingress-vlan-rogue-block
Filter: ingress-vlan-limit-guest
```

**Meaning** The **show policer** command displays the names of all firewall filters and policers that are configured on the switch. For each policer that is specified in a filter configuration, the output field shows the current packet count for all packets that exceed the specified rate limits.

- Related Documentation**
- [Configuring Policers to Control Traffic Rates \(CLI Procedure\) on page 4818](#)
  - [Configuring Firewall Filters \(CLI Procedure\) on page 4804](#)

  - [Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on EX Series Switches on page 4773](#)
  - [Monitoring Firewall Filter Traffic on page 4875](#)

## Monitoring Firewall Filter Traffic

You can monitor firewall filter traffic on EX Series switches.

- [Monitoring Traffic for All Firewall Filters and Policers That Are Configured on the Switch on page 4875](#)
- [Monitoring Traffic for a Specific Firewall Filter on page 4875](#)
- [Monitoring Traffic for a Specific Policar on page 4876](#)

### Monitoring Traffic for All Firewall Filters and Policers That Are Configured on the Switch

**Purpose** Perform the following task to monitor the number of packets and bytes that matched the firewall filters and monitor the number of packets that exceeded policer rate limits:

**Action** Use the operational mode command:

```
user@switch> show firewall
Filter: egress-vlan-watch-employee
Counters:
Name                               Bytes          Packets
counter-employee-web               3348            27
Filter: ingress-port-voip-class-limit-tcp-icmp
Counters:
Name                               Bytes          Packets
icmp-counter                       4100            49
Policers:
Name                               Packets
icmp-connection-policer           0
tcp-connection-policer            0
Filter: ingress-vlan-rogue-block
Filter: ingress-vlan-limit-guest
```

**Meaning** The **show firewall** command displays the names of all firewall filters, policers, and counters that are configured on the switch. The output fields show byte and packet counts for counters and packet count for policers.

### Monitoring Traffic for a Specific Firewall Filter

**Purpose** Perform the following task to monitor the number of packets and bytes that matched a firewall filter and monitor the number of packets that exceeded the policer rate limits.

**Action** Use the operational mode command:

```
user@switch> show firewall filter ingress-vlan-rogue-block
Filter: ingress-vlan-rogue-block
Counters:
Name                               Bytes          Packets
rogue-counter                       2308            20
```

**Meaning** The **show firewall filter *filter-name*** command displays the name of the firewall filter, the packet and byte count for all counters configured with the filter, and the packet count for all policers configured with the filter.

### Monitoring Traffic for a Specific Policer

---

**Purpose** Perform the following task to monitor the number of packets that exceeded policer rate limits:

**Action** Use the operational mode command:

```
user@switch> show policer tcp-connection-policer
Filter: ingress-port-voip-class-limit-tcp-icmp
Policers:
Name                                     Packets
tcp-connection-policer                  0
```

**Meaning** The **show policer *policer-name*** command displays the name of the firewall filter that specifies the policer-action and displays the number of packets that exceeded rate limits for the specified filter.

## clear firewall

<b>List of Syntax</b>	<a href="#">Syntax on page 4877</a> <a href="#">Syntax (EX Series Switches) on page 4877</a>
<b>Syntax</b>	clear firewall (all   counter <i>counter-name</i>   filter <i>filter-name</i>   log (all   <i>logical-system-name</i> )   logical-system <i>logical-system-name</i> )
<b>Syntax (EX Series Switches)</b>	clear firewall (all   counter <i>counter-name</i>   filter <i>filter-name</i>   log (all   <i>logical-system-name</i> )   policer counter (all   counter-id <i>counter-index</i> ))
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>logical-system</b> option introduced in Junos OS Release 9.3.</p> <p><b>log</b> option introduced before Junos OS Release 11.4.</p>
<b>Description</b>	<p>Clear statistics about configured firewall filters.</p> <p>When you clear the counters of a filter, this impacts not only the counters shown by the CLI, but also the ones tracked by SNMP2.</p> <p>Subscriber management uses firewall filters to capture and report the volume-based service accounting counters that are used for subscriber billing. The <b>clear firewall</b> command also clears the service accounting counters that are reported to the RADIUS accounting server. For this reason, you must be cautious in specifying which firewall statistics you want to clear.</p>
<div>  <p><b>NOTE:</b> The <b>clear firewall</b> command cannot be used to clear the Routing Engine filter counters on a backup Routing Engine that is enabled for graceful Routing Engine switchover (GRES).</p> </div>	
<p>If you clear statistics for firewall filters that are applied to Trio-based DPCs and that also use the <b>prefix-action</b> action on matched packets, wait at least 5 seconds before you enter the <b>show firewall prefix-action-stats</b> command. A 5-second pause between issuing the <b>clear firewall</b> and <b>show firewall prefix-action-stats</b> commands avoids a possible timeout of the <b>show firewall prefix-action-stats</b> command.</p>	
<b>Options</b>	<p><b>all</b>—Clear the packet and byte counts for all filters. On EX Series switches, this option also clears the packet counts for all policer counters.</p> <p><b>counter <i>counter-name</i></b>—Clear the packet and byte counts for a filter counter that has been configured with the counter firewall filter action.</p> <p><b>filter <i>filter-name</i></b>—Clear the packet and byte counts for the specified firewall filter.</p> <p><b>log (all   <i>logical-system-name</i>)</b>—Clear log entries for IPv4 firewall filters that have <b>then log</b> as an action. Use <b>log all</b> to clear all log entries or <b>log <i>logical-system-name</i></b> to clear log entries for the specified logical system.</p>

**logical-system** *logical-system-name*—Clear the packet and byte counts for the specified logical system.

**policer counter** (**all** | **counter-id** *counter-index*)—(EX8200 switches only) Clear all policer counters using the **policer counter all** command, or clear a specific policer counter using the **policer counter counter-id** *counter-index* command. The value of *counter-index* can be 0, 1, or 2.

**Required Privilege Level**

**Output Fields** Table 539 on page 4880 lists the output fields for the **show firewall** command. Output fields are listed in the approximate order in which they appear.

**Table 539: show firewall Output Fields**

Field Name	Field Description
<b>Filter</b>	<p>Name of a filter that has been configured with the <b>filter</b> statement at the <b>[edit firewall]</b> hierarchy level.</p> <p>Except on EX Series switches:</p> <ul style="list-style-type: none"> <li>• When an interface-specific filter is displayed, the name of the filter is followed by the full interface name and by either <b>-i</b> for an input filter or <b>-o</b> for an output filter.</li> <li>• When dynamic filters are displayed, the name of the filter is followed by the full interface name and by either <b>-in</b> for an input filter or <b>-out</b> for an output filter. When a logical system-specific filter is displayed, the name of the filter is prefixed with two underscore (__) characters and the name of the logical system (for example, __ls1/filter1).</li> <li>• When a service filter is displayed that uses a service set, the separator between the service-set name and the service-filter name is a semicolon (;).</li> </ul> <p><b>NOTE:</b> For <b>bridge family filter</b>, the <b>ip-protocol</b> match criteria is supported only for IPv4 and not for IPv6. This is applicable for line cards that support the Junos Trio chipset, such as the MX 3D MPC line cards.</p>

Table 539: show firewall Output Fields (*continued*)

Field Name	Field Description
<b>Counters</b>	<p>Display filter counter information:</p> <ul style="list-style-type: none"> <li>• <b>Name</b>—Name of a filter counter that has been configured with the <b>counter</b> firewall filter action.</li> <li>• <b>Bytes</b>—Number of bytes that match the filter term under which the <b>counter</b> action is specified.</li> <li>• <b>Packets</b>—Number of packets that matched the filter term under which the <b>counter</b> action is specified.</li> </ul> <p><b>NOTE:</b> On M and T series routers, firewall filters cannot count <b>ip-options</b> packets on a per option type and per interface basis. A limited work around is to use the <b>show pfe statistics ip options</b> command to see <b>ip-options</b> statistics on a per Packet Forwarding Engine (PFE) basis. See <i>show pfe statistics ip</i> for sample output.</p>
<b>Policers</b>	<p>Display policer information:</p> <ul style="list-style-type: none"> <li>• <b>Name</b>—Name of policer.</li> <li>• <b>Bytes</b>—(For two-color policers on MX Series routers and EX Series switches, and for hierarchical policers on MS-DPC, MIC, and MPC interfaces on MX Series routers) Number of bytes that match the filter term under which the policer action is specified. This is only the number out-of-specification (out-of-spec) byte counts, not all the bytes in all packets policed by the policer. For other combinations of policer type, device, and line card type, this field is blank.</li> <li>• <b>Packets</b>—Number of packets that matched the filter term under which the policer action is specified. This is only the number of out-of-specification (out-of-spec) packet counts, not all packets policed by the policer.</li> </ul>
<b>Policer Counter Index</b>	(EX8200 switch only) Global management counter ID. The counter ID value ( <i>counter-index</i> ) can be 0, 1, or 2.
<b>Green</b>	(EX8200 switch only) Number of packets within the limits. The number of packets is smaller than the committed information rate (CIR).
<b>Yellow</b>	(EX8200 switch only) Number of packets partially within the limits. The number of packets is greater than the CIR, but the burst size is within the excess burst size (EBS) limit.
<b>Discard</b>	(EX8200 switch only) Number of discarded packets.
<b>Bytes</b>	(EX8200 switch only) Number of green, yellow, red, or discarded packets in bytes.
<b>Packets</b>	(EX8200 switch only) Number of green, yellow, red, or discarded packets.
<b>Filter name</b>	(EX8200 switch only) Name of the filter with a term associated to a policer.
<b>Term name</b>	(EX8200 switch only) Name of the term associated with a policer.
<b>Policer name</b>	(EX8200 switch only) Name of the policer that is associated with a global management counter.

Table 539: show firewall Output Fields (*continued*)

Field Name	Field Description
PI-t1	<ul style="list-style-type: none"><li>• OOS packet statistics for packets that are marked out-of-specification (out-of-spec) by the policer. Changes to all packets that have out-of-spec actions, such as discard, color marking, or forwarding-class, are included in this counter.</li><li>• Offered packet statistics for traffic subjected to policing.</li><li>• Transmitted packet statistics for traffic that is not discarded by the policer. When the policer action is discard, the statistics are the same as the in-spec statistics; when the policer action is non-discard (loss-priority or forwarding-class), the statistics are included in this counter.</li></ul>

---

## Sample Output

### show firewall filter (MX Series Router and EX Series Switch)

```

user@host> show firewall filter test
Filter: test
Counters:
Name                               Bytes          Packets
Counter-1                         0              0
Counter-2                         0              0
Policers:
Name                               Bytes          Packets
Policer-1                        2770           70

```

### show firewall filter (non MX Series Router and EX Series Switch)

```

user@host> show firewall filter test
Filter: test
Counters:
Name                               Bytes          Packets
Counter-1                         0              0
Counter-2                         0              0
Policers:
Name                               Bytes          Packets
Policer-1                        70

```

### show firewall filter (Dynamic Input Filter)

```

user@host> show firewall filter dfwd-ge-5/0/0.1-in
Filter: dfwd-ge-5/0/0.1-in
Counters:
Name                               Bytes          Packets
c1-ge-5/0/0.1-in                  0              0

```

### show firewall (Logical Systems)

```

user@host> show firewall

Filter: __lr1/test
Counters:
Name                               Bytes          Packets

**Table 543: show policy conditions Output Fields**

Field Name	Field Description	Level of Output
<b>Condition</b>	Name of configured condition.	All levels
<b>event</b>	Condition type. If the <b>if-route-exists</b> option is configured, the event type is: <b>Existence of a route in a specific routing table.</b>	All levels
<b>Dependent routes</b>	List of routes dependent on the condition, along with the latest generation number.	<b>detail</b>
<b>Condition tables</b>	List of routing tables associated with the condition, along with the latest generation number and number of dependencies.	All levels

Table 543: show policy conditions Output Fields (*continued*)

Field Name	Field Description	Level of Output
If-route-exists conditions	List of conditions configured to look for a route in the specified table.	All levels

## Sample Output

### show policy conditions detail

```
user@host> show policy conditions detail
Configured conditions:
Condition primary (static), event: Existence of a route in a specific routing
table
Dependent routes:
  8.41.0.0/24, generation 18

Condition standby (static), event: Existence of a route in a specific routing
table
Dependent routes:
  8.41.0.0/24, generation 18

Condition tables:
Table mpls.0, generation 0, dependencies 0, If-route-exists conditions: primary
(static) standby (static)
Table l3vpn.inet.0, generation 633, dependencies 2
```

## test policy

<b>Syntax</b>	<code>test policy <i>policy-name</i> <i>prefix</i></code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Test a policy configuration to determine which prefixes match routes in the routing table.
<div>  <p><b>NOTE:</b> If you are using the <code>test policy</code> command on a logical system, you must first set the CLI to the logical system context. For example, if you want to test a routing policy that is configured on logical system R2, first run the <code>set cli logical-system R2</code> command.</p> </div>	
<b>Options</b>	<p><i>policy-name</i>—Name of a policy.</p> <p><i>prefix</i>—Destination prefix to match.</p>
<b>Additional Information</b>	All prefixes in the default unicast routing table (inet.0) that match prefixes that are the same as or longer than the specific prefix are processed by the <b>from</b> clause in the specified policy. All prefixes accepted by the policy are displayed. The <b>test policy</b> command evaluates a policy differently from the BGP import process. When testing a policy that contains an <b>interface</b> match condition in the <b>from</b> clause, the <b>test policy</b> command uses the match condition. In contrast, BGP does not use the <b>interface</b> match condition when evaluating the policy against routes learned from internal BGP (IBGP) or external BGP (EGBP) multihop peers.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Understanding Routing Policy Tests</i></li> <li>• <i>Example: Testing a Routing Policy with Complex Regular Expressions</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">test policy on page 4895</a>
<b>Output Fields</b>	For information about output fields, see the output field tables for the <a href="#">show route</a> command, the <a href="#">show route detail</a> command, the <a href="#">show route extensive</a> command, or the <a href="#">show route terse</a> command.

## Sample Output

### test policy

```
user@host> test policy test-statics 3.0.0.1/8
inet.0: 44 destinations, 44 routes (44 active, 0 holddown, 0 hidden)
Prefixes passing policy:
```

```
3.0.0.0/8      *[BGP/170] 16:22:46, localpref 100, from 10.255.255.41
               AS Path: 50888 I
               > to 10.11.4.32 via en0.2, label-switched-path 12
3.3.3.1/32     *[IS-IS/18] 2d 00:21:46, metric 0, tag 2
               > to 10.0.4.7 via fxp0.0
3.3.3.2/32     *[IS-IS/18] 2d 00:21:46, metric 0, tag 2
               > to 10.0.4.7 via fxp0.0
3.3.3.3/32     *[IS-IS/18] 2d 00:21:46, metric 0, tag 2
               > to 10.0.4.7 via fxp0.0
3.3.3.4/32     *[IS-IS/18] 2d 00:21:46, metric 0, tag 2
               > to 10.0.4.7 via fxp0.0
Policy test-statics: 5 prefixes accepted, 0 prefixes rejected
```

# Troubleshooting Procedures

## Troubleshooting Firewall Filters

---

Troubleshooting issues with firewall filters on EX Series switches:

1. [A Firewall Filter Configuration Returns a “No Space Available in TCAM” Message on page 4897](#)

### A Firewall Filter Configuration Returns a “No Space Available in TCAM” Message

**Problem**    **Description:** When a firewall filter configuration exceeds the amount of available ternary content addressable memory (TCAM) space, the switch returns the following system log (**syslogd**) message:

```
No space available in tcam.  
Rules for filter filter-name will not be installed.
```

The switch returns this error message during the commit operation in the following instances:

- If the firewall filter that you have applied to a port, VLAN, or Layer 3 interface requires more than the amount of available TCAM space.
- If you delete and add large firewall filters in the same commit operation. In this case, the large firewall filter might not be deleted from the TCAM space, because of which there will be no TCAM space freed up for the new firewall filter to be added to it. In addition to the **syslogd** message, the following error message is displayed in the CLI:

```
fpc<device-id> dfw_grph_merge_dfw_bind: rules for filter filter-name will not  
be installed
```

However, in both these instances, the commit operation for the firewall filter configuration is completed in the CLI.

**Solution**    When a firewall filter configuration exceeds the amount of available TCAM table space, you must configure a new firewall filter with fewer filter terms or, if you had deleted and created a firewall filter with a large number of terms (on the order of 1000 or more), you must delete and add the large firewall filters in separate commit operations.

The first procedure (set of steps) in this Solution section tells you how to delete a firewall filter and its bind point and associate a new firewall filter with that existing bind point.

The second procedure in this Solution section tells you how to create a new firewall filter with fewer terms (without deleting the bind point) and bind the new firewall filter with the existing bind point, when you want to create a firewall filter with fewer terms. Do not use the second procedure if you need to replace one large firewall filter with another large firewall filter—you must delete the original large firewall filter and commit that delete operation, and then add the new large firewall filter.

To delete the firewall filter and its bind point and apply a new firewall filter to the same bind point:

1. Delete the firewall filter configuration and its bind points to ports, VLANs, or Layer 3 interfaces—for example:

```
[edit]
user@switch# delete firewall family ethernet-switching filter mini-filter-ingress-vlan
user@switch# delete vlans voice-vlan description "filter to block rogue devices on voice-vlan"
user@switch# delete vlans voice-vlan filter input mini-filter-ingress-vlan
```

2. Commit the operation:

```
[edit]
user@switch# commit
```

**NOTE:** Use separate commit operations for deleting and adding large firewall filters.

3. Configure a firewall filter with fewer terms (if the error message appeared when you tried to create a new filter) or configure a large filter (if the error message appeared when you tried to delete and add large firewall filters)—for example:

```
[edit]
user@switch# set firewall family ethernet-switching filter new-filter-ingress-vlan ...
```

**NOTE:** See [“Firewall Filters for EX Series Switches Overview”](#) on page 4696 to ascertain the maximum number of terms allowed for various firewall filters on EX Series switches.

4. Apply (bind) the new firewall filter to a port, VLAN, or Layer 3 interface—for example:

```
[edit]
user@switch# set vlans voice-vlan description "filter to block rogue devices on voice-vlan"
user@switch# set vlans voice-vlan filter input new-filter-ingress-vlan
```

5. Commit the operation:

```
[edit]
user@switch# commit
```

To create a new firewall filter and attach it to the existing bind point:

1. Configure a firewall filter with fewer terms than the original filter:

```
[edit]
user@switch# set firewall family ethernet-switching filter new-filter-ingress-vlan...
```

2. Apply the firewall filter to the port, VLAN, or Layer 3 interfaces to overwrite the bind points of the original filter—for example:

```
[edit]
user@switch# set vlans voice-vlan description "smaller filter to block rogue devices on voice-vlan"
user@switch# set vlans voice-vlan filter input new-filter-ingress-vlan
```

As a bind point can be attached to only one firewall filter, this configuration detaches the bind point from the previous firewall filter that contained many terms and attaches the bind point to the new firewall filter.

3. Commit the operation:

```
[edit]
user@switch# commit
```

## Understanding MSTP for EX Series Switches

Ethernet networks are susceptible to broadcast storms if loops are introduced. However, an Ethernet network should always include loops because they provide redundant paths in case of a link failure. Spanning-tree protocols address both of these issues because they provide link redundancy while simultaneously preventing undesirable loops.

Spanning-tree protocols intelligently avoid loops in a network by creating a tree topology (spanning-tree) of the entire bridged network with only one available path between the tree root and a leaf. All other paths are forced into a standby state. The tree *root* is a switch within the network elected by the STA (spanning-tree algorithm) to use when computing the best path between bridges throughout the network and the root bridge. Frames travel through the network to their destination—a *leaf* such as Configuring BPDU Protection on Edge Interfaces to Prevent STP Miscalculations on EX Series Switches an end-user PC—along branches. A tree *branch* is a network segment, or link, between bridges. Switches that forward frames through an STP spanning-tree are called *designated bridges*.

Juniper Networks EX Series Ethernet Switches provide Layer 2 loop prevention through Spanning-Tree Protocol (STP), Rapid Spanning-Tree Protocol (RSTP), Multiple Spanning-Tree Protocol (MSTP), and VLAN Spanning-Tree Protocol (VSTP). This topic explains MSTP.

---

### MSTP Maps Multiple VLANs

MSTP is an extension of RSTP that maps multiple independent spanning-tree instances onto one physical topology. Each spanning-tree instance (STI) includes one or more VLANs. Unlike in STP and RSTP configurations, a port may belong to multiple VLANs and be dynamically blocked in one spanning-tree instance but forwarding in another. This behavior significantly improves network resource utilization by load-balancing across the network and maintaining switch CPU loads at moderate levels. MSTP also leverages the fast re-convergence time of RSTP when a network, switch, or port failure occurs within a spanning-tree instance.

MSTP creates a Common and Internal Spanning-Tree (CIST) to interconnect and manage all MSTP regions and even individual devices that run RSTP or STP, which are recognized as distinct spanning-tree regions by MSTP. The CIST views each MSTP region as a virtual bridge, regardless of the actual number of devices participating in the MSTP region, and enables MSTIs to link to other regions. The CIST is a single topology that connects all switches (STP, RSTP, and MSTP devices) through an active topology, ensuring connectivity between LANs and devices within a bridged network. This functionality provided by MSTP enables you to better utilize network resources while remaining backward-compatible with older network devices.

### Configuring MSTP Regions

When enabling MSTP, you define one or more MSTP regions. An MSTP region defines a logical domain where MSTIs can be administered independently of MSTIs in other regions, setting the boundary for Bridge Protocol Data Units (BPDUs) sent by one MSTI. An MSTP region is a group of switches that is defined by three parameters:

- Region name—User-defined alphanumeric name for the region.
- Revision level—User-defined value that identifies the region.
- Mapping table—Numerical digest of VLAN-to-instance mappings.

An MSTP region can support up to 64 MST instances, and each MSTI can support from 1 to 4094 VLANs. When you define a region, MSTP automatically creates an internal spanning-tree instance (IST instance 0) that provides the root switch for the region and includes all currently configured VLANs that are not specifically assigned to a user-defined Multiple Spanning-Tree Instance (MSTI). An MSTI includes all static VLANs that you specifically add to it. The switch places any dynamically created VLANs in the IST instance by default, unless you explicitly map them to another MSTI. Once you assign a VLAN to a user-defined MSTI, the switch removes the VLAN from the IST instance.

### Selecting a Spanning-Tree Protocol

The default factory configuration for EX Series switches is RSTP, a faster version of STP. To determine which spanning-tree protocol is best for your situation, see [Table 544 on page 4905](#) below.

**Table 544: Selecting a Spanning-Tree Protocol**

Protocol	Advantages	Disadvantages
RSTP	<ul style="list-style-type: none"> <li>• Rapid Spanning-Tree Protocol is the default switch configuration and is recommended for most network configurations because it converges more quickly than STP after a failure.</li> <li>• Voice and video work better with RSTP than they do with STP.</li> <li>• RSTP is backward compatible with STP so switches do not all have to run RSTP.</li> </ul>	<ul style="list-style-type: none"> <li>• RSTP does not work with 802.1D 1998 bridges.</li> <li>• RSTP is not recommended for multiple VLAN networks because it is not VLAN-aware—as a result, all VLANs within a LAN share the same spanning-tree. This limits the number of forwarding paths for data traffic.</li> </ul>
STP	<ul style="list-style-type: none"> <li>• Spanning-Tree Protocol works with 802.1D 1998 bridges.</li> <li>• RSTP is backward compatible with STP so switches do not all have to run STP.</li> </ul>	<ul style="list-style-type: none"> <li>• STP is slower than RSTP.</li> <li>• STP is not recommended for multiple VLAN networks because it is not VLAN-aware—as a result, all VLANs within a LAN share the same spanning-tree. This limits the number of forwarding paths for data traffic.</li> </ul>
MSTP	<ul style="list-style-type: none"> <li>• Multiple Spanning-Tree Protocol works with most VLANs.</li> <li>• RSTP and STP are recognized as distinct spanning-tree regions by MSTP.</li> </ul>	<ul style="list-style-type: none"> <li>• Some protocols require compatibility that is not provided by MSTP. In this case, use VSTP.</li> <li>• MSTP uses more CPU than RSTP and does not converge as fast as RSTP.</li> </ul>

Table 544: Selecting a Spanning-Tree Protocol (*continued*)

Protocol	Advantages	Disadvantages
VSTP	<ul style="list-style-type: none"> <li>VLAN Spanning-Tree Protocol works with VLANs that require device compatibility.</li> <li>VSTP and RSTP are the only spanning-tree protocols that can be configured concurrently on a switch.</li> </ul>	<ul style="list-style-type: none"> <li>With VSTP there can be only STP instance per VLAN, whereas MSTP lets you combine multiple VLANs in one instance.</li> <li>VSTP supports a limited number of ports compared to RSTP.</li> <li>VSTP uses more CPU than RSTP and does not converge as fast as RSTP.</li> <li>Having a large number of VSTP and RSTP instances can cause continuous changes in the topology. Ensure to check the scale limits before configuring large number of VSTP instances.</li> </ul>

## Understanding RSTP for EX Series Switches

Ethernet networks are susceptible to broadcast storms if loops are introduced. However, an Ethernet network should always include loops because they provide redundant paths in case of a link failure. Spanning tree protocols address both of these issues because they provide link redundancy while simultaneously preventing undesirable loops. Rapid Spanning-Tree Protocol (RSTP) is the default spanning-tree protocol for preventing loops on Ethernet networks.

This topic describes:

### Spanning-Tree Protocols Help Prevent Broadcast Storms

Spanning tree protocols intelligently avoid loops in a network by creating a tree topology (spanning-tree) of the entire bridged network with only one available path between the

tree root and a leaf. All other paths are forced into a standby state. The tree *root* is a switch within the network elected by the STA (spanning-tree algorithm) to use when computing the best path between bridges throughout the network and the root bridge. Frames travel through the network to their destination—a *leaf* such as an end-user PC—along branches. A tree *branch* is a network segment, or link, between bridges. Switches that forward frames through an STP spanning-tree are called *designated bridges*.

Juniper Networks EX Series Ethernet Switches provide Layer 2 loop prevention through Spanning-Tree Protocol (STP), Rapid Spanning-Tree Protocol (RSTP), Multiple Spanning-Tree Protocol (MSTP), and VLAN Spanning-Tree Protocol (VSTP). This topic explains the spanning-tree default RSTP.

### RSTP is an Enhancement of the Original STP

RSTP evolved from the original STP IEEE 802.1D protocol to provide faster spanning-tree re-convergence after a switch port, switch, or LAN failure. Where STP took up to 50 seconds to respond to topology changes, RSTP responds to changes within the timeframe of three hello BPDUs (bridge protocol data units), or 6 seconds. This is the primary reason that RSTP is the default configuration on EX Series switches. In addition, note that EX Series switches configured to use STP actually run RSTP force version 0, which is compatible with STP.

### Port Roles Determine Participation in The Spanning-Tree

Each port has both a state and a role. A port's *role* determines how it participates in the spanning-tree. The five port roles used in RSTP are:

- Root port—The port closest to the root bridge (has the lowest path cost from a bridge). This is the only port that receives frames from and forwards frames to the root bridge.
- Designated port—The port that forwards traffic away from the root bridge toward a leaf. A designated bridge has one designated port for every link connection it serves. A root bridge forwards frames from all of its ports, which serve as designated ports.
- Alternate port—A port that provides an alternate path toward the root bridge if the root port fails and is placed in the discarding state. This port is not part of the active spanning-tree, but if the root port fails, the alternate port immediately takes over.
- Backup port—A port that provides a backup path toward the leaves of the spanning-tree if a designated port fails and is placed in the discarding state. A backup port can only exist where two or more bridge ports connect to the same LAN for which the bridge serves as the designated bridge. A backup port for a designated port immediately takes over if the port fails.
- Disabled port—The port is not part of the active spanning-tree.

### Port States Determine How a Port Processes a Frame

Each port has both a state and a role. A port's *state* determines how it processes a frame. RSTP places each port of a designated bridge in one of three states:

- Discarding—The port discards all BPDUs. A port in this state discards all frames it receives and does not learn MAC addresses.

- Learning—The port prepares to forward traffic by examining received frames for location information in order to build its MAC address table.
- Forwarding—The port filters and forwards frames. A port in the forwarding state is part of the active spanning-tree.

### Edge Ports Connect to Devices That Cannot Be Part of a Spanning-Tree

---

RSTP also defines the concept of an *edge port*, which is a designated port that connects to non-STP-capable devices, such as PCs, servers, routers, or hubs that are not connected to other switches. Because edge ports connect directly to end stations, they cannot create network loops and can transition to the forwarding state immediately. You can manually configure edge ports, and a switch can also detect edge ports by noting the absence of communication from the end stations.

The edge ports themselves do send BPDUs to the spanning-tree. If you have a good understanding of the implications on your network and want to modify RSTP on the edge port interface, see *Configuring RSTP (CLI Procedure)*.

### BPDUs Maintain the Spanning-Tree

---

Spanning-tree protocols use frames called bridge protocol data units (BPDUs) to create and maintain the spanning-tree. A BPDU frame is a message sent from one switch to another to communicate information about itself, such as its bridge ID, root path costs, and port MAC addresses. The initial exchange of BPDUs between switches determines the root bridge. Simultaneously, BPDUs are used to communicate the cost of each link between branch devices, which is based upon port speed or user configuration. RSTP uses this path cost to determine the ideal route for data frames to travel from one leaf to another leaf and then blocks all other routes. If an edge port receives a BPDU, it automatically transitions to a regular RSTP port.

When the network is in a steady state, the spanning-tree converges when the spanning-tree algorithm (STA) identifies both the root and designated bridges and all ports are in either a forwarding or blocking state. To maintain the tree, the root bridge continues to send BPDUs at a “hello time” interval (default 2 seconds). These BPDUs continue to communicate the current tree topology. When a port receives a hello BPDU, it compares the information to that already stored for the receiving port. One of three actions takes place when a switch receives a BPDU:

- If the BPDU data matches the existing entry in the MAC address table, the port resets a timer called “max age” to zero and then forwards a new BPDU with the current active topology information to the next port in the spanning-tree.
- If the topology in the BPDU has been changed, the information is updated in the MAC address table, “max age” is again set to zero, and a new BPDU is forwarded with the current active topology information to the next port in the spanning-tree.
- When an RSTP port does not receive a BPDU for three hello times, it reacts one of two ways. If the port is the root port, a complete rework of the spanning-tree occurs—see *When an RSTP Root Bridge Fails*. If the bridge is any non-root bridge, RSTP detects that the connected device cannot send BPDUs and converts that port to an edge port.

### When an RSTP Root Bridge Fails

When a link to the root port goes down, a flag called a topology change notification (TCN) is added to the BPDU. When this BPDU reaches the next port in the VLAN, the MAC address table is flushed and the BPDU is sent to the next bridge. Eventually, all ports in the VLAN have flushed their MAC address tables. Then, RSTP configures a new root port.

After a root port or a designated port fails, the alternate or backup port takes over after an exchange of BPDUs called the proposal-agreement handshake. RSTP propagates this handshake over *point-to-point links*, which are dedicated links between two network nodes, or switches, that connect one port to another. If a local port becomes a new root or designated port, it negotiates a rapid transition with the receiving port on the nearest neighboring switch by using the proposal-agreement handshake to ensure a loop-free topology.

### Switches Must Relearn MAC Addresses After a Link Failure

Because a link failure causes all associated ports to flush their MAC address table, the network may be slower as it floods to relearn the MAC addresses. There is a way to speed up this relearning process. During TCN propagation, the Layer 2 forwarding table of switches is flushed, resulting in a flood of data packets. The ARP feature causes the switch to proactively send ARP requests for IP addresses in the ARP cache (present because of Layer 3 VLAN interface). With ARP on STP enabled, as the reply comes through, the switches build up the Layer 2 forwarding table, thus limiting the flooding later. Enabling ARP on STP is most useful to prevent excessive flooding in large Layer 2 networks using RVIs.

### Selecting a Spanning-Tree Protocol

The default factory configuration for EX Series switches is RSTP, a faster version of the original STP. To determine which spanning-tree protocol is best for your situation, see [Table 545 on page 4909](#) below.

**Table 545: Selecting a Spanning-Tree Protocol**

Protocol	Advantages	Disadvantages
RSTP	<ul style="list-style-type: none"> <li>Rapid Spanning-Tree Protocol is the default switch configuration and is recommended for most network configurations because it converges more quickly than STP after a failure.</li> <li>Voice and video work better with RSTP than they do with STP.</li> <li>RSTP is backward compatible with STP so switches do not all have to run RSTP.</li> <li>RSTP supports more ports than MSTP or VSTP</li> </ul>	<ul style="list-style-type: none"> <li>RSTP does not work with 802.1D 1998 bridges.</li> <li>RSTP is not recommended for multiple VLAN networks because it is not VLAN-aware—as a result, all VLANs within a LAN share the same spanning-tree. This limits the number of forwarding paths for data traffic.</li> </ul>
STP	<ul style="list-style-type: none"> <li>Spanning-Tree Protocol works with 802.1D 1998 bridges.</li> <li>RSTP is backward compatible with STP so switches do not all have to run STP.</li> </ul>	<ul style="list-style-type: none"> <li>STP is slower than RSTP.</li> <li>STP is not recommended for multiple VLAN networks because it is not VLAN-aware—as a result, all VLANs within a LAN share the same spanning-tree. This limits the number of forwarding paths for data traffic.</li> </ul>

Table 545: Selecting a Spanning-Tree Protocol (*continued*)

Protocol	Advantages	Disadvantages
MSTP	<ul style="list-style-type: none"> <li>Multiple Spanning-Tree Protocol works with most VLANs.</li> <li>RSTP and STP are recognized as distinct spanning-tree regions by MSTP.</li> </ul>	<ul style="list-style-type: none"> <li>Some protocols require compatibility that is not provided by MSTP. In this case, use VSTP.</li> <li>MSTP supports a limited number of ports.</li> <li>MSTP uses more CPU than RSTP and does not converge as fast as RSTP.</li> </ul>
VSTP	<ul style="list-style-type: none"> <li>VLAN Spanning-Tree Protocol works with VLANs that require device compatibility.</li> <li>VSTP and RSTP are the only spanning-tree protocols that can be configured concurrently on a switch.</li> </ul>	<ul style="list-style-type: none"> <li>With VSTP there can be only STP instance per VLAN, whereas MSTP lets you combine multiple VLANs in one instance.</li> <li>VSTP supports a limited number of ports compared to RSTP.</li> <li>VSTP uses more CPU than RSTP and does not converge as fast as RSTP.</li> <li>Having a large number of VSTP and RSTP instances can cause continuous changes in the topology. As a workaround, reduce the number of VSTP instances to fewer than 190.</li> </ul>

## Understanding STP for EX Series Switches

Ethernet networks are susceptible to broadcast storms if loops are introduced. However, an Ethernet network should always include loops because they provide redundant paths in case of a link failure. Spanning-tree protocols address both of these issues because they provide link redundancy while simultaneously preventing undesirable loops.

Juniper Networks EX Series Ethernet Switches provide Layer 2 loop prevention through Spanning-Tree Protocol (STP), Rapid Spanning-Tree Protocol (RSTP), Multiple Spanning-Tree Protocol (MSTP), and VLAN Spanning-Tree Protocol (VSTP). Configure STP when you need to support older 802.1D 1998 bridges. However, note that EX Series switches configured to use STP actually run RSTP force version 0, which is compatible with STP. For an explanation of RSTP, see [“Understanding RSTP for EX Series Switches” on page 4906](#)

This topic describes:

- [Selecting a Spanning-Tree Protocol on page 4911](#)

### Selecting a Spanning-Tree Protocol

The default factory configuration for EX Series switches is RSTP, a faster version of STP. To determine which spanning-tree protocol is best for your situation, see [Table 546 on page 4911](#) below.

**Table 546: Selecting a Spanning-Tree Protocol**

Protocol	Advantages	Disadvantages
RSTP	<ul style="list-style-type: none"> <li>Rapid Spanning-Tree Protocol is the default switch configuration and is recommended for most network configurations because it converges more quickly than STP after a failure.</li> <li>Voice and video work better with RSTP than they do with STP.</li> <li>RSTP is backward compatible with STP so switches do not all have to run RSTP.</li> <li>RSTP supports more ports than MSTP or VSTP</li> </ul>	<ul style="list-style-type: none"> <li>RSTP does not work with 802.1D 1998 bridges.</li> <li>RSTP is not recommended for multiple VLAN networks because it is not VLAN-aware—as a result, all VLANs within a LAN share the same spanning-tree. ## RSTP or VSTP Forced to Run as IEEE 802.1D STP

On MX Series routers and EX Series switches in a Layer 2 environment, you can force the configured Rapid Spanning Tree Protocol (RSTP) or VLAN Spanning Tree Protocol (VSTP) to run as the original IEEE 802.1D Spanning Tree Protocol (STP) version. Configure original IEEE\_802.1D STP for compatibility with older bridges that do not support RSTP or VSTP.

Keep the following limitations in mind when RSTP or VSTP are forced to run as the original STP version:

- If you configure an instance interface as an edge port, the configuration statement is ignored.
- If you configure point-to-point link mode for an instance interface, the configuration statement is ignored.

## Understanding VSTP for EX Series Switches and QFX Series Switches

Juniper Networks EX Series Ethernet Switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), Multiple Spanning Tree Protocol (MSTP), and VLAN Spanning Tree Protocol (VSTP). The default factory configuration for EX Series switches uses RSTP. If you use VLANs, however, we recommend that you enable MSTP unless your network requires the device compatibility provided by VSTP. Switches configured to run VSTP automatically assign each VLAN to one spanning-tree instance that runs RSTP. While this approach is useful to optimize network usage in small networks with a limited number of VLANs, a VSTP configuration in a network with several hundred VLANs can overload switch CPUs. MSTP ensures that your network is not slowed down by the increased network traffic caused by hundreds of VLANs, each with its own spanning-tree instance.

When using VSTP, you can selectively configure up to 253 VLANs per switch—additional VLANs use RSTP. (VSTP and RSTP are the only spanning-tree protocols that can be configured concurrently on a switch.)

**NOTE:** When you configure VSTP, we recommend that you enable VSTP on all VLANs that can receive VSTP bridge protocol data units (BPDUs).

---

**NOTE:** When you configure VSTP with the `set protocol vstp vlan all` command, VLAN ID 1 is not set; it is excluded so that the configuration is compatible with Cisco PVST+. If you want VLAN ID 1 to be included in the VSTP configuration on your switch, you must set it separately with the `set protocol vstp vlan 1` command.

**NOTE:** Option `vlan all` is not supported in Junos OS Release 13.2X50.

### Selecting a Spanning-Tree Protocol

The default factory configuration for EX Series switches is RSTP, a faster version of STP. To determine which spanning-tree protocol is best for your situation, see [Table 547 on page 4913](#).

**Table 547: Selecting a Spanning-Tree Protocol**

Protocol	Advantages	Disadvantages
RSTP	<ul style="list-style-type: none"> <li>Rapid Spanning Tree Protocol is the default switch configuration and is recommended for most network configurations because it converges more quickly than STP after a failure.</li> <li>Voice and video work better with RSTP than they do with STP.</li> <li>RSTP is backward compatible with STP so switches do not all have to run RSTP.</li> <li>RSTP supports more ports than MSTP or VSTP.</li> </ul>	<ul style="list-style-type: none"> <li>RSTP does not work with 802.1D 1998 bridges.</li> <li>RSTP is not recommended for multiple VLAN networks because it is not VLAN-aware—as a result, all VLANs within a LAN share the same spanning tree. This limits the number of forwarding paths for data traffic.</li> </ul>
STP	<ul style="list-style-type: none"> <li>Spanning Tree Protocol works with 802.1D 1998 bridges.</li> <li>RSTP is backward compatible with STP so switches do not all have to run STP.</li> </ul>	<ul style="list-style-type: none"> <li>STP is slower than RSTP.</li> <li>STP is not recommended for multiple VLAN networks because it is not VLAN-aware—as a result, all VLANs within a LAN share the same spanning-tree. ## Understanding BPDU Protection for STP, RSTP, and MSTP on EX Series Switches

Networks frequently use multiple protocols simultaneously to achieve different goals and in some cases those protocols might conflict with each other. One such case is when spanning-tree protocols are active on the network, where a special type of switching frame called a bridge protocol data unit (BPDU) can conflict with BPDUs generated on other devices such as PCs. The different kinds of BPDUs are not compatible but they can still be recognized by other devices that use BPDUs and cause network outages. You need to protect any device that recognizes BPDUs from picking up incompatible BPDUs.

- [Different Kinds of BPDUs on page 4914](#)
- [Protecting Switches From Incompatible BPDUs on page 4914](#)

### Different Kinds of BPDUs

---

Spanning-tree protocols such as Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), and Multiple Spanning Tree Protocol (MSTP) generate their own BPDUs. These peer STP applications use their BPDUs to communicate, and ultimately, the exchange of BPDUs determines which interfaces block traffic and which interfaces become root ports and forward traffic.

User bridge applications running on a PC can also generate BPDUs. If these BPDUs are picked up by STP applications running on the switch, they can trigger STP miscalculations, and those miscalculations can lead to network outages. Similarly, BPDUs generated by STP protocols can cause problems if they are picked up by devices like PCs that are not using STP. Some mechanism for BPDU protection must be implemented in these cases.

### Protecting Switches From Incompatible BPDUs

---

To protect the state of spanning-tree protocols on switches from outside BPDUs, enable BPDU protection on the interfaces of a switch on which spanning-tree protocols are configured and are connected to user devices (such as PCs)—for example, on edge ports connected to PCs. Use the same strategy when a device on which STP is not configured is connected to a switch through a trunk interface that could be forwarding BPDUs generated by spanning-tree protocols. In this case, you would protect the device from BPDUs generated by the STP on the switch.

To configure BPDU protection on a switch on which spanning-tree protocols are configured, include the **bpdu-block-on-edge** statement at the `[edit protocols (stp| mstp|rstp) ]` hierarchy level. To prevent such a switch from forwarding BPDUs generated by spanning-tree protocols to devices, include the **bpdu-block** statement at the `[edit ethernet-switching-options]` hierarchy level.

**NOTE:** You can configure the `drop` statement under the `bpdudrop` statement only on interfaces on which no spanning-tree protocol is configured.

When an interface configured with BPDU protection encounters an incompatible BPDU, it drops that BPDU and then, either shuts down or continues to receive packets other than spanning-tree protocol BPDUs depending on the configuration defined in the `bpdudrop` statement. If the interface continues to be open after dropping all incompatible BPDUs, all packets except incompatible BPDUs continue to ingress and egress through the interface.

If the interface shuts down after dropping all BPDUs, there are two ways to re-enable the interface:

- Include the `disable-timeout (Spanning Trees)` statement in the BPDU configuration to enable the interface(s) to automatically return to service when the specified timer expires.
- Issue the operational mode command `clear ethernet-switching bpdudrop-error` on the switch.

**NOTE:** You can also configure BPDU drop protection on a specified interface or any interface of an access switch if the interfaces or interfaces do *not* have a spanning tree protocol configured. See `drop` for additional information about that option.

## Understanding Loop Protection for STP, RSTP, VSTP, and MSTP on EX Series Switches

Juniper Networks EX Series Ethernet Switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), and Multiple Spanning Tree Protocol (MSTP). Loop protection increases the efficiency of STP, RSTP, and MSTP by preventing ports from moving into a forwarding state that would result in a loop opening up in the network.

A loop-free network in spanning-tree topologies is supported through the exchange of a special type of frame called bridge protocol data unit (BPDU). Peer STP applications running on the switch interfaces use BPDUs to communicate. Ultimately, the exchange of BPDUs determines which interfaces block traffic (preventing loops) and which interfaces become root ports and forward traffic.

However, a blocking interface can transition to the forwarding state in error if the interface stops receiving BPDUs from its designated port on the segment. Such a transition error can occur when there is a hardware error on the switch or software configuration error between the switch and its neighbor.

When loop protection is enabled, the spanning-tree topology detects root ports and blocked ports and makes sure both keep receiving BPDUs. If a loop-protection-enabled interface stops receiving BPDUs from its designated port, it reacts as it would react to a problem with the physical connection on this interface. It doesn't transition the interface to a forwarding state, but instead transitions it to a loop-inconsistent state. The interface recovers and then it transitions back to the spanning-tree blocking state as soon as it receives a BPDU.

We recommend that you enable loop protection on all switch interfaces that have a chance of becoming root or designated ports. Loop protection is most effective when enabled in the entire switched network. When you enable loop protection, you must configure at least one action (**log**, **block**, or both).

Note that an interface can be configured for either loop protection or root protection, but not for both.

## Understanding Root Protection for STP, RSTP, VSTP, and MSTP on EX Series Switches

Juniper Networks EX Series Ethernet Switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), and Multiple Spanning Tree Protocol (MSTP). A loop-free network is supported through the exchange of a special type of frame called bridge protocol data unit (BPDU). Peer STP applications running on the switch interfaces use BPDUs to communicate. Ultimately, the exchange of BPDUs determines which interfaces block traffic and which interfaces become root ports and forward traffic.

However, a root port elected through this process has the possibility of being wrongly elected. A user bridge application running on a PC can generate BPDUs, too, and interfere with root port election. Root protection allows network administrators to manually enforce the root bridge placement in the network.

Enable root protection on interfaces that should not receive superior BPDUs from the root bridge and should not be elected as the root port. These interfaces become designated ports and are typically located on an administrative boundary. If the bridge receives superior STP BPDUs on a port that has root protection enabled, that port transitions to a root-prevented STP state (inconsistency state) and the interface is blocked. This blocking prevents a bridge that should not be the root bridge from being elected the root bridge. After the bridge stops receiving superior STP BPDUs on the interface with root protection, the interface returns to a listening state, followed by a learning state, and ultimately back to a forwarding state. Recovery back to the forwarding state is automatic.

When root protection is enabled on an interface, it is enabled for all the STP instances on that interface. The interface is blocked only for instances for which it receives superior BPDUs. Otherwise, it participates in the spanning-tree topology.

An interface can be configured for either root protection or loop protection, but not for both.

### Example: Faster Convergence and Improved Network Stability with RSTP on EX Series Switches

EX Series switches use Rapid Spanning Tree Protocol (RSTP) by default to provide a loop-free topology.

When switches that support redundant Routing Engines use RSTP, it is important to keep RSTP synchronized on both Routing Engines so that no loss of service occurs after a Routing Engine switchover. Nonstop bridging protocol keeps Routing Engines synchronized.

This example describes how to configure RSTP and NSB on four EX Series switches:

- [Requirements on page 4920](#)
- [Overview and Topology on page 4920](#)
- [Configuring RSTP and Nonstop Bridging on Switch 1 on page 4922](#)
- [Configuring RSTP and Nonstop Bridging on Switch 2 on page 4925](#)

- [Configuring RSTP and Nonstop Bridging on Switch 3 on page 4928](#)
- [Configuring RSTP and Nonstop Bridging on Switch 4 on page 4931](#)
- [Verification on page 4934](#)

## Requirements

---

This example uses the following hardware and software components:

- Junos OS Release 11.3 or later for EX Series switches
- Four EX Series switches

Before you configure the switches for RSTP, be sure you have:

- Installed the four switches. See *Connecting and Configuring an EX Series Switch (J-Web Procedure)*.
- Performed the initial software configuration on all switches. See *Installing and Connecting an EX3200 Switch*.

## Overview and Topology

---

RSTP works by identifying certain links as point to point links and blocking other possible paths. When one of the point-to-point links fails, a designated alternate link transitions to the forwarding state and take over. Configuring nonstop bridging (NSB) on a switch with redundant Routing Engines keeps RSTP synchronized on both Routing Engines. This way, RSTP remains active immediately after a switchover because it is already synchronized to the backup Routing Engine. RSTP does not have to reconverge after a Routing Engine switchover when NSB is enabled because the neighbor devices do not detect an RSTP change on the switch. In this example, four EX Series switches are connected in the topology displayed in [Figure 73 on page 4921](#) to create a loop-free topology with NSB applied to switches with dual Routing Engines.

Figure 73: Network Topology for RSTP

Table 548 on page 4921 shows the components of the topology for this example.

**NOTE:** You can configure RSTP on logical or physical interfaces. This example shows RSTP configured on logical interfaces.

Table 548: Components of the Topology for Configuring RSTP

Property	Settings
Switch 1	<p>The following interfaces on Switch 1 are connected in this way:</p> <ul style="list-style-type: none"> <li>• <b>ge-0/0/9</b> is connected to Switch 2</li> <li>• <b>ge-0/0/13</b> is connected to Switch 4</li> <li>• <b>ge-0/0/11</b> is connected to Switch 3</li> </ul>
Switch 2	<p>The following interfaces on Switch 2 are connected in this way:</p> <ul style="list-style-type: none"> <li>• <b>ge-0/0/14</b> is connected to Switch 1</li> <li>• <b>ge-0/0/18</b> is connected to Switch 3</li> </ul>
Switch 3	<p>The following interfaces on Switch 3 are connected in this way:</p> <ul style="list-style-type: none"> <li>• <b>ge-0/0/26</b> is connected to Switch 1</li> <li>• <b>ge-0/0/28</b> is connected to Switch 2</li> <li>• <b>ge-0/0/24</b> is connected to Switch 4</li> </ul>

Table 548: Components of the Topology for Configuring RSTP (*continued*)

Property	Settings
Switch 4	<p>The following interfaces on Switch 4 are connected in this way:</p> <ul style="list-style-type: none"> <li>• <b>ge-0/0/19</b> is connected to Switch 1</li> <li>• <b>ge-0/0/23</b> is connected to Switch 3</li> </ul>
VLAN names and tag IDs	<p><b>voice-vlan</b>, tag 10</p> <p><b>employee-vlan</b>, tag 20</p> <p><b>guest-vlan</b>, tag 30</p> <p><b>camera-vlan</b>, tag 40</p>

This configuration example creates a loop-free topology between four EX Series switches using RSTP.

An RSTP topology contains ports that have specific roles:

- The *root port* is responsible for forwarding data to the root bridge.
- The *alternate port* is a standby port for the root port. When a root port goes down, the alternate port becomes the active root port.
- The *designated port* forwards data to the downstream network segment or device.
- The *backup port* is a backup port for the designated port. When a designated port goes down, the backup port becomes the active designated port and starts forwarding data.

**NOTE:** You also can create a loop-free topology between the aggregation layer and the distribution layer using redundant trunk links. For more information about configuring redundant trunk links, see *Example: Configuring Redundant Trunk Links for Faster Recovery*.

### Configuring RSTP and Nonstop Bridging on Switch 1

#### CLI Quick Configuration

To quickly configure RSTP and nonstop bridging on Switch 1, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans voice-vlan description "Voice VLAN"
set vlans voice-vlan vlan-id 10
set vlans employee-vlan description "Employee VLAN"
set vlans employee-vlan vlan-id 20
set vlans guest-vlan description "Guest VLAN"
set vlans guest-vlan vlan-id 30
set vlans camera-vlan description "Camera VLAN"
set vlans camera-vlan vlan-id 40
set interfaces ge-0/0/13 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/9 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/11 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/13 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/9 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/11 unit 0 family ethernet-switching port-mode trunk
```

```

set protocols rstp bridge-priority 16k
set protocols rstp interface ge-0/0/13.0 cost 1000
set protocols rstp interface ge-0/0/13.0 mode point-to-point
set protocols rstp interface ge-0/0/9.0 cost 1000
set protocols rstp interface ge-0/0/9.0 mode point-to-point
set protocols rstp interface ge-0/0/11.0 cost 1000
set protocols rstp interface ge-0/0/11.0 mode point-to-point

```

If Switch 1 includes dual Routing Engines, configure NSB. To quickly configure nonstop bridging on Switch 1, copy the following commands and paste them into the switch terminal window:

```

set chassis redundancy graceful switchover
set system commit synchronize
set ethernet-switching-options nonstop-bridging

```

### Step-by-Step Procedure

To configure RSTP and nonstop bridging on Switch 1:

1. Configure the VLANs **voice-vlan**, **employee-vlan**, **guest-vlan**, and **camera-vlan**:

```

[edit vlans]
user@switch1# set voice-vlan description "Voice VLAN"
user@switch1# set voice-vlan vlan-id 10
user@switch1# set employee-vlan description "Employee VLAN"
user@switch1# set employee-vlan vlan-id 20
user@switch1# set guest-vlan description "Guest VLAN"
user@switch1# set guest-vlan vlan-id 30
user@switch1# set camera-vlan description "Camera VLAN"
user@switch1# set camera-vlan vlan-id 40

```

2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:

```

[edit interfaces]
user@switch1# set ge-0/0/13 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch1# set ge-0/0/9 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch1# set ge-0/0/11 unit 0 family ethernet-switching vlan members [10 20 30 40]

```

3. Configure the port mode for the interfaces:

```

[edit interfaces]
user@switch1# set ge-0/0/13 unit 0 family ethernet-switching port-mode trunk
user@switch1# set ge-0/0/9 unit 0 family ethernet-switching port-mode trunk
user@switch1# set ge-0/0/11 unit 0 family ethernet-switching port-mode trunk

```

4. Configure RSTP on the switch:

```

[edit protocols]
user@switch1# rstp bridge-priority 16k
user@switch1# rstp interface ge-0/0/13.0 cost 1000
user@switch1# rstp interface ge-0/0/13.0 mode point-to-point
user@switch1# rstp interface ge-0/0/9.0 cost 1000
user@switch1# rstp interface ge-0/0/9.0 mode point-to-point
user@switch1# rstp interface ge-0/0/11.0 cost 1000
user@switch1# rstp interface ge-0/0/11.0 mode point-to-point

```

### Step-by-Step Procedure

If Switch 1 includes dual Routing Engines, configure nonstop bridging. To configure NSB on Switch 1:

1. Enable graceful Routing Engine switchover (GRES):

- ```
[edit chassis redundancy]
user@switch1# set graceful-switchover
```
2. Configure the switch to always synchronize configuration changes between the Routing Engines:
- ```
[edit system]
user@switch1# set commit synchronize
```
- If you try to commit a configuration in which nonstop bridging is configured but synchronization of configuration changes is not configured, the configuration is not committed.
3. Enable nonstop bridging:
- ```
[edit ethernet-switching-options]
user@switch1# set nonstop-bridging
```

**NOTE:** This process enables NSB for all NSB-supported Layer 2 protocols on the switch, including RSTP.

**Results** Check the results of the configuration:

```
user@switch1> show configuration
interfaces {
  ge-0/0/13 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members [10 20 30 40];
        }
      }
    }
  }
  ge-0/0/9 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members [10 20 30 40];
        }
      }
    }
  }
  ge-0/0/11 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members [10 20 30 40];
        }
      }
    }
  }
}
```

```

}
protocols {
  rstp {
    bridge-priority 16k;
    interface ge-0/0/13.0 {
      cost 1000;
      mode point-to-point;
    }
    interface ge-0/0/9.0 {
      cost 1000;
      mode point-to-point;
    }
    interface ge-0/0/11.0 {
      cost 1000;
      mode point-to-point;
    }
  }
}
}
vlands {

### Configuring RSTP and Nonstop Bridging on Switch 2

#### CLI Quick Configuration

To quickly configure RSTP and nonstop bridging on Switch 2, copy the following commands and paste them into the switch terminal window:

```

[edit]
set vlans voice-vlan description "Voice VLAN"
set vlans voice-vlan vlan-id 10
set vlans employee-vlan description "Employee VLAN"
set vlans employee-vlan vlan-id 20
set vlans guest-vlan description "Guest VLAN"
set vlans guest-vlan vlan-id 30

```

```

set vlans camera-vlan description "Camera VLAN"
set vlans camera-vlan vlan-id 40
set interfaces ge-0/0/14 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/18 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/14 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/18 unit 0 family ethernet-switching port-mode trunk
set protocols rstp bridge-priority 32k
set protocols rstp interface ge-0/0/14.0 cost 1000
set protocols rstp interface ge-0/0/14.0 mode point-to-point
set protocols rstp interface ge-0/0/18.0 cost 1000
set protocols rstp interface ge-0/0/18.0 mode point-to-point

```

If Switch 2 includes dual Routing Engines, configure NSB. To quickly configure nonstop bridging on Switch 2, copy the following commands and paste them into the switch terminal window:

```

set chassis redundancy graceful switchover
set system commit synchronize
set ethernet-switching-options nonstop-bridging

```

#### Step-by-Step Procedure

To configure RSTP and nonstop bridging on Switch 2:

1. Configure the VLANs **voice-vlan**, **employee-vlan**, **guest-vlan**, and **camera-vlan**:

```

[edit vlans]
user@switch2# set voice-vlan description "Voice VLAN"
user@switch2# set voice-vlan vlan-id 10
user@switch2# set employee-vlan description "Employee VLAN"
user@switch2# set employee-vlan vlan-id 20
user@switch2# set guest-vlan description "Guest VLAN"
user@switch2# set guest-vlan vlan-id 30
user@switch2# set camera-vlan description "Camera VLAN"
user@switch2# set camera-vlan vlan-id 40

```

2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:

```

[edit interfaces]
user@switch2# set ge-0/0/14 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch2# set ge-0/0/18 unit 0 family ethernet-switching vlan members [10 20 30 40]

```

3. Configure the port mode for the interfaces:

```

[edit interfaces]
user@switch2# set ge-0/0/14 unit 0 family ethernet-switching port-mode trunk
user@switch2# set ge-0/0/18 unit 0 family ethernet-switching port-mode trunk

```

4. Configure RSTP on the switch:

```

[edit protocols]
user@switch2# rstp bridge-priority 32k
user@switch2# rstp interface ge-0/0/14.0 cost 1000
user@switch2# rstp interface ge-0/0/14.0 mode point-to-point
user@switch2# rstp interface ge-0/0/18.0 cost 1000
user@switch2# rstp interface ge-0/0/18.0 mode point-to-point

```

#### Step-by-Step Procedure

If Switch 2 includes dual Routing Engines, configure nonstop bridging. To configure NSB on Switch 2:

1. Enable graceful Routing Engine switchover (GRES):

```

[edit chassis redundancy]

```

- ```
user@switch2# set graceful-switchover
```
2. Configure the switch to always synchronize configuration changes between the Routing Engines:
 

```
[edit system]
user@switch2# set commit synchronize
```

If you try to commit a configuration in which nonstop bridging is configured but synchronization of configuration changes is not configured, the configuration is not committed.
  3. Enable nonstop bridging:
 

```
[edit ethernet-switching-options]
user@switch2# set nonstop-bridging
```

**NOTE:** This process enables NSB for all NSB-supported Layer 2 protocols on the switch, including RSTP.

**Results** Check the results of the configuration:

```
user@switch2> show configuration
interfaces {
  ge-0/0/14 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members [10 20 30 40];
        }
      }
    }
  }
  ge-0/0/18 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members [10 20 30 40];
        }
      }
    }
  }
}
protocols {
  rstp {
    bridge-priority 32k;
    interface ge-0/0/14.0 {
      cost 1000;
      mode point-to-point;
    }
    interface ge-0/0/18.0 {
      cost 1000;
      mode point-to-point;
    }
  }
}
```

```
    }  
  }  
}  
vpls {  
  voice-vlan {  
    vlan-id 10;  
  }  
  employee-vlan {  
    vlan-id 20;  
  }  
  guest-vlan {  
    vlan-id 30;  
  }  
  camera-vlan {  
    vlan-id 40;  
  }  
}  
system {  
  commit synchronize;  
}  
chassis {  
  redundancy {  
    graceful-switchover;  
  }  
  ethernet-switching-options {  
    nonstop-bridging;  
  }  
}
```

---

### Configuring RSTP and Nonstop Bridging on Switch 3

#### CLI Quick Configuration

To quickly configure RSTP and nonstop bridging on Switch 3, copy the following commands and paste them into the switch terminal window:

```
[edit]  
set vlans voice-vlan description "Voice VLAN"  
set vlans voice-vlan vlan-id 10  
set vlans employee-vlan description "Employee VLAN"  
set vlans employee-vlan vlan-id 20  
set vlans guest-vlan description "Guest VLAN"  
set vlans guest-vlan vlan-id 30  
set vlans camera-vlan description "Camera VLAN"  
set vlans camera-vlan vlan-id 40  
set interfaces ge-0/0/26 unit 0 family ethernet-switching vlan members [10 20 30 40]  
set interfaces ge-0/0/28 unit 0 family ethernet-switching vlan members [10 20 30 40]  
set interfaces ge-0/0/24 unit 0 family ethernet-switching vlan members [10 20 30 40]  
set interfaces ge-0/0/26 unit 0 family ethernet-switching port-mode trunk  
set interfaces ge-0/0/28 unit 0 family ethernet-switching port-mode trunk  
set interfaces ge-0/0/24 unit 0 family ethernet-switching port-mode trunk  
set protocols rstp bridge-priority 8k  
set protocols rstp interface ge-0/0/26.0 cost 1000  
set protocols rstp interface ge-0/0/26.0 mode point-to-point  
set protocols rstp interface ge-0/0/28.0 cost 1000  
set protocols rstp interface ge-0/0/28.0 mode point-to-point  
set protocols rstp interface ge-0/0/24.0 cost 1000  
set protocols rstp interface ge-0/0/24.0 mode point-to-point
```

If Switch 3 includes dual Routing Engines, configure NSB. To quickly configure nonstop bridging on Switch 3, copy the following commands and paste them into the switch terminal window:

```
set chassis redundancy graceful switchover
set system commit synchronize
set ethernet-switching-options nonstop-bridging
```

#### Step-by-Step Procedure

To configure RSTP and nonstop bridging on Switch 3:

1. Configure the VLANs **voice-vlan**, **employee-vlan**, **guest-vlan**, and **camera-vlan**:

```
[edit vlans]
user@switch3# set voice-vlan description "Voice VLAN"
user@switch3# set voice-vlan vlan-id 10
user@switch3# set employee-vlan description "Employee VLAN"
user@switch3# set employee-vlan vlan-id 20
user@switch3# set guest-vlan description "Guest VLAN"
user@switch3# set guest-vlan vlan-id 30
user@switch3# set camera-vlan description "Camera VLAN"
user@switch3# set camera-vlan vlan-id 40
```

2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:

```
[edit interfaces]
user@switch3# set ge-0/0/26 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch3# set ge-0/0/28 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch3# set ge-0/0/24 unit 0 family ethernet-switching vlan members [10 20 30 40]
```

3. Configure the port mode for the interfaces:

```
[edit interfaces]
user@switch3# set ge-0/0/26 unit 0 family ethernet-switching port-mode trunk
user@switch3# set ge-0/0/28 unit 0 family ethernet-switching port-mode trunk
user@switch3# set ge-0/0/24 unit 0 family ethernet-switching port-mode trunk
```

4. Configure RSTP on the switch:

```
[edit protocols]
user@switch3# rstp bridge-priority 8k
user@switch3# rstp interface ge-0/0/26.0 cost 1000
user@switch3# rstp interface ge-0/0/26.0 mode point-to-point
user@switch3# rstp interface ge-0/0/28.0 cost 1000
user@switch3# rstp interface ge-0/0/28.0 mode point-to-point
user@switch3# rstp interface ge-0/0/24.0 cost 1000
user@switch3# rstp interface ge-0/0/24.0 mode point-to-point
```

#### Step-by-Step Procedure

If Switch 3 includes dual Routing Engines, configure nonstop bridging. To configure NSB on Switch 3:

1. Enable graceful Routing Engine switchover (GRES):

```
[edit chassis redundancy]
user@switch3# set graceful-switchover
```

2. Configure the switch to always synchronize configuration changes between the Routing Engines:

```
[edit system]
user@switch3# set commit synchronize
```

If you try to commit a configuration in which nonstop bridging is configured but synchronization of configuration changes is not configured, the configuration is not committed.

3. Enable nonstop bridging:  

```
[edit ethernet-switching-options]  
user@switch3# set nonstop-bridging
```

**NOTE:** This process enables NSB for all NSB-supported Layer 2 protocols on the switch, including RSTP.

**Results** Check the results of the configuration:

```
user@switch3> show configuration  
interfaces {  
  ge-0/0/26 {  
    unit 0 {  
      family ethernet-switching {  
        port-mode trunk;  
        vlan {  
          members [10 20 30 40];  
        }  
      }  
    }  
  }  
  ge-0/0/28 {  
    unit 0 {  
      family ethernet-switching {  
        port-mode trunk;  
        vlan {  
          members [10 20 30 40];  
        }  
      }  
    }  
  }  
  ge-0/0/24 {  
    unit 0 {  
      family ethernet-switching {  
        port-mode trunk;  
        vlan {  
          members [10 20 30 40];  
        }  
      }  
    }  
  }  
}  
protocols {  
  rstp {  
    bridge-priority 8k;  
    interface ge-0/0/26.0 {  
      cost 1000;  
    }  
  }  
}
```

```

        mode point-to-point;
    }
    interface ge-0/0/28.0 {
        cost 1000;
        mode point-to-point;
    }
    interface ge-0/0/24.0 {
        cost 1000;
        mode point-to-point;
    }
    }
    bridge-priority 8k;
    }
}
}
vllans {
    voice-vlan {

}

```

### Configuring RSTP and Nonstop Bridging on Switch 4

#### CLI Quick Configuration

To quickly configure RSTP and nonstop bridging on Switch 4, copy the following commands and paste them into the switch terminal window:

```

[edit]
set vlans voice-vlan description "Voice VLAN"
set vlans voice-vlan vlan-id 10
set vlans employee-vlan description "Employee VLAN"
set vlans employee-vlan vlan-id 20
set vlans guest-vlan description "Guest VLAN"
set vlans guest-vlan vlan-id 30
set vlans camera-vlan description "Camera VLAN"
set vlans camera-vlan vlan-id 40
set interfaces ge-0/0/23 unit 0 family ethernet-switching vlan members [10 20 30 40]

```

```
set interfaces ge-0/0/19 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/23 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/19 unit 0 family ethernet-switching port-mode trunk
set protocols rstp bridge-priority 16k
set protocols rstp interface ge-0/0/23.0 cost 1000
set protocols rstp interface ge-0/0/23.0 mode point-to-point
set protocols rstp interface ge-0/0/19.0 cost 1000
set protocols rstp interface ge-0/0/19.0 mode point-to-point
```

If Switch 4 includes dual Routing Engines, configure NSB. To quickly configure nonstop bridging on Switch 4, copy the following commands and paste them into the switch terminal window:

```
set chassis redundancy graceful switchover
set system commit synchronize
set ethernet-switching-options nonstop-bridging
```

#### Step-by-Step Procedure

To configure RSTP and nonstop bridging on Switch 4:

1. Configure the VLANs **voice-vlan**, **employee-vlan**, **guest-vlan**, and **camera-vlan**:

```
[edit vlans]
user@switch4# set voice-vlan description "Voice VLAN"
user@switch4# set voice-vlan vlan-id 10
user@switch4# set employee-vlan description "Employee VLAN"
user@switch4# set employee-vlan vlan-id 20
user@switch4# set guest-vlan description "Guest VLAN"
user@switch4# set guest-vlan vlan-id 30
user@switch4# set camera-vlan description "Camera VLAN"
user@switch4# set camera-vlan vlan-id 40
```

2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:

```
[edit interfaces]
user@switch4# set ge-0/0/23 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch4# set ge-0/0/19 unit 0 family ethernet-switching vlan members [10 20 30 40]
```

3. Configure the port mode for the interfaces:

```
[edit interfaces]
user@switch4# set ge-0/0/23 unit 0 family ethernet-switching port-mode trunk
user@switch4# set ge-0/0/19 unit 0 family ethernet-switching port-mode trunk
```

4. Configure RSTP on the switch:

```
[edit protocols]
user@switch4# rstp bridge-priority 16k
user@switch4# rstp interface all cost 1000
user@switch4# rstp interface ge-0/0/23.0 cost 1000
user@switch4# rstp interface ge-0/0/23.0 mode point-to-point
user@switch4# rstp interface ge-0/0/19.0 cost 1000
user@switch4# rstp interface ge-0/0/19.0 mode point-to-point
```

#### Step-by-Step Procedure

If Switch 4 includes dual Routing Engines, configure nonstop bridging. To configure NSB on Switch 4:

1. Enable graceful Routing Engine switchover (GRES):

```
[edit chassis redundancy]
user@switch4# set graceful-switchover
```

2. Configure the switch to always synchronize configuration changes between the Routing Engines:

```
[edit system]
user@switch4# set commit synchronize
```

If you try to commit a configuration in which nonstop bridging is configured but synchronization of configuration changes is not configured, the configuration is not committed.

3. Enable nonstop bridging:

```
[edit ethernet-switching-options]
user@switch4# set nonstop-bridging
```

**NOTE:** This process enables NSB for all NSB-supported Layer 2 protocols on the switch, including RSTP.

**Results** Check the results of the configuration:

```
user@switch4> show configuration
interfaces {
  ge-0/0/23 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members [10 20 30 40];
        }
      }
    }
  }
  ge-0/0/19 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members [10 20 30 40];
        }
      }
    }
  }
}
protocols {
  rstp {
    bridge-priority 16k;
    interface ge-0/0/23.0 {
      cost 1000;
      mode point-to-point;
    }
    interface ge-0/0/19.0 {
      cost 1000;
      mode point-to-point;
    }
  }
}
```

```
    }  
  }  
}  
vpls {  
  voice-vlan {  
    vlan-id 10;  
  }  
  employee-vlan {  
    vlan-id 20;  
  }  
  guest-vlan {  
    vlan-id 30;  
  }  
  camera-vlan {  
    vlan-id 40;  
  }  
}  
system {  
  commit synchronize;  
}  
chassis {  
  redundancy {  
    graceful-switchover;  
  }  
}  
ethernet-switching-options {  
  nonstop-bridging;  
}
```

---

## Verification

To confirm that the configuration is working properly, perform these tasks on both Routing Engines:

- [Verifying RSTP Configuration on Switch 1 on page 4934](#)
- [Verifying RSTP Configuration on Switch 2 on page 4935](#)
- [Verifying RSTP Configuration on Switch 3 on page 4935](#)
- [Verifying RSTP Configuration on Switch 4 on page 4936](#)

### ***Verifying RSTP Configuration on Switch 1***

**Purpose** Verify the RSTP configuration on Switch 1.

**Action** Use the operational mode command:

```
user@switch1> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

Interface	Port ID	Designated port ID	Designated bridge ID	Port Cost	State	Role
ge-0/0/13.0	128:526	128:526	16384.0019e25040e0	1000	BLK	ALT
ge-0/0/9.0	128:522	128:522	32768.0019e2503d20	1000	BLK	ALT
ge-0/0/11.0	128:524	128:524	8192.0019e25051e0	1000	FWD	ROOT

**Meaning** Refer to the topology in [Figure 73 on page 4921](#). The operational mode command **show spanning-tree interface** shows that **ge-0/0/13.0** is in a forwarding state. The other interfaces on Switch 1 are blocking.

#### *Verifying RSTP Configuration on Switch 2*

**Purpose** Use this procedure to verify the RSTP configuration on both Switch 2 Routing Engines.

**Action** Use the operational mode command:

```
user@switch2> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

Interface	Port ID	Designated port ID	Designated bridge ID	Port Cost	State	Role
ge-0/0/14.0	128:527	128:527	32768.0019e2503d20	1000	FWD	DESC
ge-0/0/18.0	128:529	128:529	8192.0019e25051e0	1000	FWD	ROOT

**Meaning** Refer to the topology in [Figure 73 on page 4921](#). The operational mode command **show spanning-tree interface** shows that **ge-0/0/18.0** is in a forwarding state and is the root port.

#### *Verifying RSTP Configuration on Switch 3*

**Purpose** Use this procedure to verify the RSTP configuration on both Switch 3 Routing Engines.

**Action** Use the operational mode commands:

```
user@switch3> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

Interface	Port ID	Designated port ID	Designated bridge ID	Port Cost	State	Role
ge-0/0/26.0	128:539	128:539	8192.0019e25051e0	1000	FWD	DESG
ge-0/0/28.0	128:541	128:541	8192.0019e25051e0	1000	FWD	DESG
ge-0/0/24.0	128:537	128:537	8192.0019e25051e0	1000	FWD	DESG

**Meaning** Refer to the topology in [Figure 73 on page 4921](#). The operational mode command **show spanning-tree interface** shows that no interface is the root interface.

#### *Verifying RSTP Configuration on Switch 4*

**Purpose** Use this procedure to verify the RSTP configuration on both Switch 4 Routing Engines.

**Action** Use the operational mode commands:

```
user@switch4> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

Interface	Port ID	Designated port ID	Designated bridge ID	Port Cost	State	Role
ge-0/0/23.0	128:536	128:536	8192.0019e25051e0	1000	FWD	ROOT
ge-0/0/19.0	128:532	128:532	16384.0019e25040e0	1000	FWD	DESG

**Meaning** Refer to the topology in [Figure 73 on page 4921](#). The operational mode command **show spanning-tree interface** shows that interface **ge-0/0/23.0** is the root interface and forwarding.

- Related Documentation**
- [Example: Configuring Network Regions for VLANs with MSTP on EX Series Switches on page 4936](#)
  - [Understanding RSTP for EX Series Switches on page 4906](#)

### Example: Configuring Network Regions for VLANs with MSTP on EX Series Switches

Multiple Spanning Tree Protocol (MSTP) is used to create a loop-free topology in networks using multiple spanning-tree regions in which each region contains multiple spanning-tree instances (MSTIs). MSTIs provide different paths for different VLANs. This functionality facilitates better load sharing across redundant links.

Up to 64 MSTIs can be created for an EX Series switch, and each MSTI can support up to 4094 VLANs.

This example describes how to configure MSTP on four EX Series switches:

- [Requirements on page 4937](#)
- [Overview and Topology on page 4937](#)
- [Configuring MSTP on Switch 1 on page 4940](#)
- [Configuring MSTP on Switch 2 on page 4943](#)
- [Configuring MSTP on Switch 3 on page 4945](#)
- [Configuring MSTP on Switch 4 on page 4948](#)
- [Verification on page 4950](#)

### Requirements

---

This example uses the following hardware and software components:

- Junos OS Release 9.0 or later for EX Series switches
- Four EX Series switches

Before you configure the switches for MSTP, be sure you have:

- Installed and connected the four switches. See the hardware documentation for your switch.
- Performed the initial software configuration on all switches. See *Connecting and Configuring an EX Series Switch (CLI Procedure)* or *Connecting and Configuring an EX Series Switch (J-Web Procedure)*.

### Overview and Topology

---

When the number of VLANs grows in a network, MSTP provides an efficient way of creating a loop-free topology by using MSTIs. Each MSTI in the spanning-tree domain maintains its own tree. Each tree can be mapped to different links, utilizing bandwidth that would be unavailable to a single tree. MSTIs reduce the demand on system resources.

Figure 74: Network Topology for MSTP

The interfaces shown in [Figure 74 on page 4938](#) will be configured for MSTP.

**NOTE:** You can configure MSTP on logical or physical interfaces. This example shows configuring MSTP on logical interfaces.

Table 549: Components of the Topology for Configuring MSTP on EX Series Switches

Property	Settings
Switch 1	<p>The following interfaces on Switch 1 are connected in this way:</p> <ul style="list-style-type: none"> <li>• <code>ge-0/0/9</code> is connected to Switch 2</li> <li>• <code>ge-0/0/13</code> is connected to Switch 4</li> <li>• <code>ge-0/0/11</code> is connected to Switch 3</li> </ul>
Switch 2	<p>The following interfaces on Switch 2 are connected in this way:</p> <ul style="list-style-type: none"> <li>• <code>ge-0/0/14</code> is connected to Switch 1</li> <li>• <code>ge-0/0/18</code> is connected to Switch 3</li> </ul>

**Table 549: Components of the Topology for Configuring MSTP on EX Series Switches (*continued*)**

Property	Settings
Switch 3	<p>The following interfaces on Switch 3 are connected in this way:</p> <ul style="list-style-type: none"> <li>• <b>ge-0/0/26</b> is connected to Switch 1</li> <li>• <b>ge-0/0/28</b> is connected to Switch 2</li> <li>• <b>ge-0/0/24</b> is connected to Switch 4</li> </ul>
Switch 4	<p>The following interfaces on Switch 4 are connected in this way:</p> <ul style="list-style-type: none"> <li>• <b>ge-0/0/19</b> is connected to Switch 1</li> <li>• <b>ge-0/0/23</b> is connected to Switch 3</li> </ul>
VLAN names and tag IDs	<p><b>voice-vlan</b>, tag 10  <b>employee-vlan</b>, tag 20  <b>guest-vlan</b>, tag 30  <b>camera-vlan</b>, tag 40</p>
MSTIs	<p>1 2</p>
MSTI region	<b>region1</b>

The topology in [Figure 74 on page 4938](#) shows a common and internal spanning tree (CIST). The CIST is a single spanning tree connecting all devices in the network. The switch with the lowest bridge priority is elected as the root bridge of the CIST. You can control the election of the root bridge by configuring the bridge priority. Switch 3 is the root bridge of the CIST.

The ports in an MSTP topology have specific roles:

- The *root port* is responsible for forwarding data to the root bridge.
- The *alternate port* is a standby port for the root port. When a root port goes down, the alternate port becomes the active root port.
- The *designated port* forwards data to the downstream network segment or device.
- The *backup port* becomes the active designated port and starts forwarding data when the designated port goes down.

In this example, one MSTP region contains Switch 1, Switch 2, Switch 3, and Switch 4. Within the region, four VLANs are created:

- **voice-vlan** supports voice traffic and has the VLAN tag identifier of **10**.
- **employee-vlan** supports data traffic and has the VLAN tag identifier of **20**.
- **guest-vlan** supports guest VLAN traffic (for supplicants that fail authentication) and has the VLAN tag identifier of **30**.
- **camera-vlan** supports video traffic and has the VLAN tag identifier of **40**.

The VLANs are associated with specific interfaces on each of the four switches. Two MSTIs, 1 and 2, are then associated with the VLAN tag identifiers, and some MSTP parameters, such as cost, are configured on each switch.

### Configuring MSTP on Switch 1

---

#### CLI Quick Configuration

To quickly configure interfaces and MSTP on Switch 1, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans voice-vlan description "Voice VLAN"
set vlans voice-vlan vlan-id 10
set vlans employee-vlan description "Employee VLAN"
set vlans employee-vlan vlan-id 20
set vlans guest-vlan description "Guest VLAN"
set vlans guest-vlan vlan-id 30
set vlans camera-vlan description "Camera VLAN"
set vlans camera-vlan vlan-id 40
set interfaces ge-0/0/13 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/9 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/11 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/13 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/9 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/11 unit 0 family ethernet-switching port-mode trunk
set protocols mstp configuration-name region1
set protocols mstp bridge-priority 16k
set protocols mstp interface ge-0/0/13.0 cost 1000
set protocols mstp interface ge-0/0/13.0 mode point-to-point
set protocols mstp interface ge-0/0/9.0 cost 1000
set protocols mstp interface ge-0/0/9.0 mode point-to-point
set protocols mstp interface ge-0/0/11.0 cost 1000
set protocols mstp interface ge-0/0/11.0 mode point-to-point
set protocols mstp msti 1 bridge-priority 16k
set protocols mstp msti 1 vlan [10 20]
set protocols mstp msti 1 interface ge-0/0/11.0 cost 1000
set protocols mstp msti 2 bridge-priority 8k
set protocols mstp msti 2 vlan [30 40]
```

#### Step-by-Step Procedure

To configure interfaces and MSTP on Switch 1:

1. Configure the VLANs **voice-vlan**, **employee-vlan**, **guest-vlan**, and **camera-vlan**:

```
[edit vlans]
user@switch1# set voice-vlan description "Voice VLAN"
user@switch1# set voice-vlan vlan-id 10
user@switch1# set employee-vlan description "Employee VLAN"
user@switch1# set employee-vlan vlan-id 20
user@switch1# set guest-vlan description "Guest VLAN"
user@switch1# set guest-vlan vlan-id 30
user@switch1# set camera-vlan description "Camera VLAN"
user@switch1# set guest-vlan vlan-id 40
```

2. Configure the VLANs on the interfaces, including support for the Ethernet Switching protocol:

```
[edit interfaces]
user@switch1# set ge-0/0/13 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch1# set ge-0/0/9 unit 0 family ethernet-switching vlan members [10 20 30 40]
```

- ```

user@switch1# set ge-0/0/11 unit 0 family ethernet-switching vlan members [10 20 30 40]

```
3. Configure the port mode for the interfaces:
 

```

[edit interfaces]
user@switch1# set ge-0/0/13 unit 0 family ethernet-switching port-mode trunk
user@switch1# set ge-0/0/9 unit 0 family ethernet-switching port-mode trunk
user@switch1# set ge-0/0/11 unit 0 family ethernet-switching port-mode trunk

```
  4. Configure MSTP on the switch, including the two MSTIs:
 

```

[edit protocols]
user@switch1# mstp configuration-name region1
user@switch1# mstp bridge-priority 16k
user@switch1# mstp interface ge-0/0/13.0 cost 1000
user@switch1# mstp interface ge-0/0/13.0 mode point-to-point
user@switch1# mstp interface ge-0/0/9.0 cost 1000
user@switch1# mstp interface ge-0/0/9.0 mode point-to-point
user@switch1# mstp interface ge-0/0/11.0 cost 1000
user@switch1# mstp interface ge-0/0/11.0 mode point-to-point
user@switch1# mstp msti 1 bridge-priority 16k
user@switch1# mstp msti 1 vlan [10 20]
user@switch1# mstp msti 1 interface ge-0/0/11.0 cost 1000
user@switch1# mstp msti 2 bridge-priority 8k
user@switch1# mstp msti 2 vlan [30 40]

```

**Results** Check the results of the configuration:

```

user@switch1> show configuration
interfaces {
  ge-0/0/13 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members 10;
          members 20;
          members 30;
          members 40;
        }
      }
    }
  }
  ge-0/0/9 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members 10;
          members 20;
          members 30;
          members 40;
        }
      }
    }
  }
  ge-0/0/11 {
    unit 0 {
      family ethernet-switching {

```

## Configuring MSTP on Switch 2

**CLI Quick Configuration** To quickly configure interfaces and MSTP on Switch 2, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans voice-vlan description "Voice VLAN"
set vlans voice-vlan vlan-id 10
set vlans employee-vlan description "Employee VLAN"
set vlans employee-vlan vlan-id 20
set vlans guest-vlan description "Guest VLAN"
set vlans guest-vlan vlan-id 30
set vlans camera-vlan description "Camera VLAN"
set vlans camera-vlan vlan-id 40
set interfaces ge-0/0/14 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/18 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/14 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/18 unit 0 family ethernet-switching port-mode trunk
set protocols mstp configuration-name region1
set protocols mstp bridge-priority 32k
set protocols mstp interface ge-0/0/14.0 cost 1000
set protocols mstp interface ge-0/0/14.0 mode point-to-point
set protocols mstp interface ge-0/0/18.0 cost 1000
set protocols mstp interface ge-0/0/18.0 mode point-to-point
set protocols mstp msti 1 bridge-priority 32k
set protocols mstp msti 1 vlan [10 20]
set protocols mstp msti 2 bridge-priority 4k
set protocols mstp msti 2 vlan [30 40]
```

**Step-by-Step Procedure** To configure interfaces and MSTP on Switch 2:

1. Configure the VLANs **voice-vlan**, **employee-vlan**, **guest-vlan**, and **camera-vlan**:

```
[edit vlans]
user@switch2# set voice-vlan description "Voice VLAN"
user@switch2# set voice-vlan vlan-id 10
user@switch2# set employee-vlan description "Employee VLAN"
user@switch2# set employee-vlan vlan-id 20
user@switch2# set guest-vlan description "Guest VLAN"
user@switch2# set guest-vlan vlan-id 30
user@switch2# set camera-vlan vlan-description "Camera VLAN"
user@switch2# set guest-vlan vlan-id 40
```

2. Configure the VLANs on the interfaces, including support for the Ethernet Switching protocol:

```
[edit interfaces]
user@switch2# set ge-0/0/14 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch2# set ge-0/0/18 unit 0 family ethernet-switching vlan members [10 20 30 40]
```

3. Configure the port mode for the interfaces:

```
[edit interfaces]
user@switch2# set ge-0/0/14 unit 0 family ethernet-switching port-mode trunk
user@switch2# set ge-0/0/18 unit 0 family ethernet-switching port-mode trunk
```

4. Configure MSTP on the switch, including the two MSTIs:

```
[edit protocols]
user@switch2# mstp configuration-name region1
user@switch2# mstp bridge-priority 32k
```

```
user@switch2# mstp interface ge-0/0/14.0 cost 1000
user@switch2# mstp interface ge-0/0/14.0 mode point-to-point
user@switch2# mstp interface ge-0/0/18.0 cost 1000
user@switch2# mstp interface ge-0/0/18.0 mode point-to-point
user@switch2# mstp msti 1 bridge-priority 32k
user@switch2# mstp msti 1 vlan [10 20]
user@switch2# mstp msti 2 bridge-priority 4k
user@switch2# mstp msti 2 vlan [30 40]
```

**Results** Check the results of the configuration:

```
user@switch2> show configuration
interfaces {
  ge-0/0/14 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members 10;
          members 20;
          members 30;
          members 40;
        }
      }
    }
  }
  ge-0/0/18 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members 10;
          members 20;
          members 30;
          members 40;
        }
      }
    }
  }
}
protocols {
  mstp {
    configuration-name region1;
    bridge-priority 32k;
    interface ge-0/0/14.0 {
      cost 1000;
      mode point-to-point;
    }
    interface ge-0/0/18.0 {
      cost 1000;
      mode point-to-point;
    }
    msti 1 {
      bridge-priority 32k;
      vlan [10 20];
    }
  }
}
```

```

        msti 2 {
            bridge-priority 4k;
            vlan [30 40];
        }
    }
}
vlangs {
    voice-vlan {
        vlan-id 10;
    }
    employee-vlan {
        vlan-id 20;
    }
    guest-vlan {
        vlan-id 30;
    }
    camera-vlan {
        vlan-id 40;
    }
}
}

```

### Configuring MSTP on Switch 3

#### CLI Quick Configuration

To quickly configure interfaces and MSTP on Switch 3, copy the following commands and paste them into the switch terminal window:

```

[edit]
set vlans voice-vlan description "Voice VLAN"
set vlans voice-vlan vlan-id 10
set vlans employee-vlan description "Employee VLAN"
set vlans employee-vlan vlan-id 20
set vlans guest-vlan description "Guest VLAN"
set vlans guest-vlan vlan-id 30
set vlans camera-vlan description "Camera VLAN"
set vlans camera-vlan vlan-id 40
set interfaces ge-0/0/26 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/28 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/24 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/26 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/28 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/24 unit 0 family ethernet-switching port-mode trunk
set protocols mstp configuration-name region1
set protocols mstp bridge-priority 8k
set protocols mstp interface ge-0/0/26.0 cost 1000
set protocols mstp interface ge-0/0/26.0 mode point-to-point
set protocols mstp interface ge-0/0/28.0 cost 1000
set protocols mstp interface ge-0/0/28.0 mode point-to-point
set protocols mstp interface ge-0/0/24.0 cost 1000
set protocols mstp interface ge-0/0/24.0 mode point-to-point
set protocols mstp msti 1 bridge-priority 4k
set protocols mstp msti 1 vlan [10 20]
set protocols mstp msti 2 bridge-priority 16k
set protocols mstp msti 2 vlan [30 40]

```

**Step-by-Step Procedure** To configure interfaces and MSTP on Switch 3:

1. Configure the VLANs voice-vlan, employee-vlan, guest-vlan, and camera-vlan:

```
[edit vlans]
user@switch3# set voice-vlan description "Voice VLAN"
user@switch3# set voice-vlan vlan-id 10
user@switch3# set employee-vlan description "Employee VLAN"
user@switch3# set employee-vlan vlan-id 20
user@switch3# set guest-vlan description "Guest VLAN"
user@switch3# set guest-vlan vlan-id 30
user@switch3# set camera-vlan description "Camera VLAN"
user@switch3# set guest-vlan vlan-id 40
```

2. Configure the VLANs on the interfaces, including support for the Ethernet Switching protocol:

```
[edit interfaces]
user@switch3# set ge-0/0/26 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch3# set ge-0/0/28 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch3# set ge-0/0/24 unit 0 family ethernet-switching vlan members [10 20 30 40]
```

3. Configure the port mode for the interfaces:

```
[edit interfaces]
user@switch3# set ge-0/0/26 unit 0 family ethernet-switching port-mode trunk
user@switch3# set ge-0/0/28 unit 0 family ethernet-switching port-mode trunk
user@switch3# set ge-0/0/24 unit 0 family ethernet-switching port-mode trunk
```

4. Configure MSTP on the switch, including the two MSTIs:

```
[edit protocols]
user@switch3# mstp configuration-name region1
user@switch3# mstp bridge-priority 8k
user@switch3# mstp interface ge-0/0/26.0 cost 1000
user@switch3# mstp interface ge-0/0/26.0 mode point-to-point
user@switch3# mstp interface ge-0/0/28.0 cost 1000
user@switch3# mstp interface ge-0/0/28.0 mode point-to-point
user@switch3# mstp interface ge-0/0/24.0 cost 1000
user@switch3# mstp interface ge-0/0/24.0 mode point-to-point
user@switch3# mstp msti 1 bridge-priority 4k
user@switch3# mstp msti 1 vlan [10 20]
user@switch3# mstp msti 2 bridge-priority 16k
user@switch3# mstp msti 2 vlan [30 40]
```

**Results** Check the results of the configuration:

```
user@switch3> show configuration
interfaces {
  ge-0/0/26 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members 10;
          members 20;
          members 30;
          members 40;
        }
      }
    }
  }
}
```

```
}
vlands {
  voice-vlan {
    vlan-id 10;
  }
  employee-vlan {
    vlan-id 20;
  }
  guest-vlan {
    vlan-id 30;
  }
  camera-vlan {
    vlan-id 40;
  }
}
```

---

### Configuring MSTP on Switch 4

#### CLI Quick Configuration

To quickly configure interfaces and MSTP on Switch 4, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans voice-vlan description "Voice VLAN"
set vlans voice-vlan vlan-id 10
set vlans employee-vlan description "Employee VLAN"
set vlans employee-vlan vlan-id 20
set vlans guest-vlan description "Guest VLAN"
set vlans guest-vlan vlan-id 30
set vlans camera-vlan description "Camera VLAN"
set vlans camera-vlan vlan-id 40
set interfaces ge-0/0/23 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/19 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces ge-0/0/23 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/19 unit 0 family ethernet-switching port-mode trunk
set protocols mstp configuration-name region1
set protocols mstp bridge-priority 16k
set protocols mstp interface ge-0/0/23.0 cost 1000
set protocols mstp interface ge-0/0/23.0 mode point-to-point
set protocols mstp interface ge-0/0/19.0 cost 1000
set protocols mstp interface ge-0/0/19.0 mode point-to-point
set protocols mstp msti 1 bridge-priority 16k
set protocols mstp msti 1 vlan [10 20]
set protocols mstp msti 2 bridge-priority 32k
set protocols mstp msti 2 vlan [30 40]
```

#### Step-by-Step Procedure

To configure interfaces and MSTP on Switch 4:

1. Configure the VLANs `voice-vlan`, `employee-vlan`, `guest-vlan`, and `camera-vlan`:

```
[edit vlans]
user@switch4# set voice-vlan description "Voice VLAN"
user@switch4# set voice-vlan vlan-id 10
user@switch4# set employee-vlan description "Employee VLAN"
user@switch4# set employee-vlan vlan-id 20
user@switch4# set guest-vlan description "Guest VLAN"
user@switch4# set guest-vlan vlan-id 30
user@switch4# set camera-vlan description "Camera VLAN"
user@switch4# set camera-vlan vlan-id 40
```

2. Configure the VLANs on the interfaces, including support for the Ethernet Switching protocol:

```
[edit interfaces]
user@switch4# set ge-0/0/23 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch4# set ge-0/0/19 unit 0 family ethernet-switching vlan members [10 20 30 40]
```

3. Configure the port mode for the interfaces:

```
[edit interfaces]
user@switch4# set ge-0/0/23 unit 0 family ethernet-switching port-mode trunk
user@switch4# set ge-0/0/19 unit 0 family ethernet-switching port-mode trunk
```

4. Configure MSTP on the switch, including the two MSTIs:

```
[edit protocols]
user@switch4# mstp configuration-name region1
user@switch4# mstp bridge-priority 16k
user@switch4# mstp interface ge-0/0/23.0 cost 1000
user@switch4# mstp interface ge-0/0/23.0 mode point-to-point
user@switch4# mstp interface ge-0/0/19.0 cost 1000
user@switch4# mstp interface ge-0/0/19.0 mode point-to-point
user@switch4# mstp msti 1 bridge-priority 16k
user@switch4# mstp msti 1 vlan [10 20]
user@switch4# mstp msti 2 bridge-priority 32k
user@switch4# mstp msti 2 vlan [30 40]
```

**Results** Check the results of the configuration:

```
user@switch4> show configuration
interfaces {
  ge-0/0/23 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members 10;
          members 20;
          members 30;
          members 40;
        }
      }
    }
  }
  ge-0/0/19 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members 10;
          members 20;
          members 30;
          members 40;
        }
      }
    }
  }
}
```

```
protocols {
  mstp {
    configuration-name region1;
    bridge-priority 16k;
    interface ge-0/0/23.0 {
      cost 1000;
      mode point-to-point;
    }
    interface ge-0/0/19.0 {
      cost 1000;
      mode point-to-point;
    }
    msti 1 {
      bridge-priority 16k;
      vlan [10 20];
    }
    msti 2 {
      bridge-priority 32k;
      vlan [30 40];
    }
  }
}
vpls {
  voice-vlan {
    vlan-id 10;
  }
  employee-vlan {
    vlan-id 20;
  }
  guest-vlan {
    vlan-id 30;
  }
  camera-vlan {
    vlan-id 40;
  }
}
```

---

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying MSTP Configuration on Switch 1 on page 4950](#)
- [Verifying MSTP Configuration on Switch 2 on page 4952](#)
- [Verifying MSTP Configuration on Switch 3 on page 4953](#)
- [Verifying MSTP Configuration on Switch 4 on page 4955](#)

### *Verifying MSTP Configuration on Switch 1*

**Purpose** Verify the MSTP configuration on Switch 1.

**Action** Issue the operational mode commands **show spanning-tree interface** and **show spanning-tree bridge**:

```
user@switch1> show spanning-tree interface
```

## Spanning tree interface parameters for instance 0

| Interface   | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|-------------|---------|-----------------------|-------------------------|--------------|-------|------|

```

**Meaning** The operational mode command **show spanning-tree interface** displays spanning-tree domain information such as the designated port and the port roles. The spanning-tree interface parameters for instance 2 show that both ports are designated ports, which means Switch 2 is the root bridge for this instance.

The operational mode command **show spanning-tree bridge** displays the spanning-tree domain information at either the bridge level or interface level. If the optional interface name is omitted, all interfaces in the spanning-tree domain are displayed.

### *Verifying MSTP Configuration on Switch 3*

**Purpose** Verify the MSTP configuration on Switch 3.

**Action** Issue the operational mode commands **show spanning-tree interface** and **show spanning-tree bridge**:

```
user@switch3> show spanning-tree interface
```

```

**Meaning** The operational mode command **show spanning-tree interface** displays spanning-tree domain information such as the designated port and the port roles. Switch 3 is the root bridge for instance 0, which is the CIST, as well as for instance 1. In both instances, all ports on Switch 3 are designated ports.

The operational mode command **show spanning-tree bridge** displays the spanning-tree domain information at either the bridge level or the interface level. If the optional interface name is omitted, all interfaces in the spanning-tree domain are displayed.

#### *Verifying MSTP Configuration on Switch 4*

**Purpose** Verify the MSTP configuration on Switch 4.

**Action** Issue the operational mode commands **show spanning-tree interface** and **show spanning-tree bridge**:

```
user@switch4> show spanning-tree interface
```

```
Spanning tree interface parameters for instance 0

**Meaning** The operational mode command **show spanning-tree interface** displays spanning-tree domain information such as the designated port and the port roles.

The operational mode command **show spanning-tree bridge** displays the spanning-tree domain information at either the bridge level or the interface level. If the optional interface name is omitted, all interfaces in the spanning-tree domain are displayed.

## Example: Configuring BPDU Protection on Edge Interfaces to Prevent STP Miscalculations on EX Series Switches

EX Series switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree protocol (RSTP), and Multiple Spanning Tree Protocol (MSTP). All spanning-tree protocols use a special type of frame called a bridge protocol

data unit (BPDU) to communicate. Other devices—PC bridging applications, for example, also use BPDUs and generate their own BPDUs. These different BPDUs are not compatible. When BPDUs generated by spanning-tree protocols are transmitted to a device that uses another type of BPDU, they can cause problems on the device. Similarly, if switches within a spanning-tree topology receive BPDUs from other devices, network outages can occur because of STP miscalculations.

This example configures BPDU protection on an EX Series switch that uses RSTP. The upstream configuration is done on the edge interfaces, where outside BPDUs are often received from other devices:

- [Requirements on page 4957](#)
- [Overview and Topology on page 4957](#)
- [Configuration on page 4958](#)
- [Verification on page 4959](#)

### Requirements

This example uses the following hardware and software components:

- Two EX Series switches in an RSTP topology
- Junos OS Release 9.1 or later for EX Series switches

Before you configure the interfaces on Switch 2 for BPDU protection, be sure you have:

- RSTP enabled on the switches.

**NOTE:** By default, RSTP is enabled on all EX Series switches.

### Overview and Topology

The switches, being in an RSTP topology, support a loop-free network through the exchange of BPDUs. Receipt of outside BPDUs in an STP, RSTP, or MSTP topology, however, can lead to network outages by triggering an STP misconfiguration. To prevent such outages, enable BPDU protection on STP interfaces that could receive outside BPDUs. If an outside BPDU is received on a BPDU-protected interface, the interface shuts down to prevent the outside BPDU from accessing the STP interface.

[Figure 75 on page 4958](#) shows the topology for this example. In this example, Switch 1 and Switch 2 are configured for RSTP and create a loop-free topology. The interfaces on Switch 2 are edge access ports—edge access ports frequently receive outside BPDUs generated by PC applications.

This example configures interface **ge-0/0/5.0** and interface **ge-0/0/6.0** as edge ports on Switch 2, and then configures BPDU protection on those ports. With BPDU protection enabled, these interfaces shut down when they encounter an outside BPDU sent by the PCs connected to Switch 2.

Figure 75: BPDU Protection Topology

Table 550 on page 4958 shows the components that will be configured for BPDU protection.

Table 550: Components of the Topology for Configuring BPDU Protection on EX Series Switches

| Property                      | Settings                                                                                                                                           |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Switch 1 (Distribution Layer) | Switch 1 is connected to Switch 2 on a trunk interface.                                                                                            |
| Switch 2 (Access Layer)       | Switch 2 has these access ports that require BPDU protection: <ul style="list-style-type: none"> <li>• ge-0/0/5.0</li> <li>• ge-0/0/6.0</li> </ul> |

This configuration example uses RSTP topology. You also can configure BPDU protection for STP or MSTP topologies at the `[edit protocols (mstp | stp)]` hierarchy level.

### Configuration

To configure BPDU protection on two access interfaces:

#### CLI Quick Configuration

Quickly configure RSTP on the two Switch 2 interfaces, and then configure BPDU protection on all edge ports on Switch 2 by copying the following commands and pasting them into the switch terminal window:

```
[edit]
set protocols rstp interface ge-0/0/5.0 edge
set protocols rstp interface ge-0/0/6.0 edge
set protocols rstp bpdv-block-on-edge
```

**Step-by-Step Procedure** To configure RSTP on the two Switch 2 interfaces, and then configure BPDU protection:

1. Configure RSTP on interface **ge-0/0/5.0** and interface **ge-0/0/6.0**, and configure them as edge ports:

```
[edit protocols rstp]
user@switch# set interface ge-0/0/5.0 edge
user@switch# set interface ge-0/0/6.0 edge
```

2. Configure BPDU protection on all edge ports on this switch:

```
[edit protocols rstp]
user@switch# set bpdu-block-on-edge
```

**Results** Check the results of the configuration:

```
user@switch> show configuration protocols rstp
interface ge-0/0/5.0 {
  edge;
}
interface ge-0/0/6.0 {
  edge;
}
bpdu-block-on-edge;
```

### Verification

To confirm that the configuration is working properly:

- [Displaying the Interface State Before BPDU Protection Is Triggered on page 4959](#)
- [Verifying That BPDU Protection Is Working Correctly on page 4960](#)

#### *Displaying the Interface State Before BPDU Protection Is Triggered*

**Purpose** Before BPDUs can be received from PCs connected to interface **ge-0/0/5.0** and interface **ge-0/0/6.0**, confirm the interface state.

**Action** Use the operational mode command:

```
user@switch> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

| Interface  | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|------------|---------|-----------------------|-------------------------|--------------|-------|------|
| ge-0/0/0.0 | 128:513 | 128:513               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| ge-0/0/1.0 | 128:514 | 128:514               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| ge-0/0/2.0 | 128:515 | 128:515               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| ge-0/0/3.0 | 128:516 | 128:516               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| ge-0/0/4.0 | 128:517 | 128:517               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| ge-0/0/5.0 | 128:518 | 128:518               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| ge-0/0/6.0 | 128:519 | 128:519               | 32768.0019e2503f00      | 20000        | FWD   | DESG |

[output truncated]

**Meaning** The output from the operational mode command **show spanning-tree interface** shows that **ge-0/0/5.0** and interface **ge-0/0/6.0** are ports in a forwarding state.

**Verifying That BPDU Protection Is Working Correctly**

**Purpose** In this example, the PCs connected to Switch 2 start sending BPDUs to interface **ge-0/0/5.0** and interface **ge-0/0/6.0**. Verify that BPDU protection is working on the interfaces.

**Action** Use the operational mode command:

```
user@switch> show spanning-tree interface
```

```
Spanning tree interface parameters for instance 0
```

| Interface                  | Port ID | Designated port ID | Designated bridge ID | Port Cost | State | Role |

| [output truncated]         |         |                    |                      |           |       |      |

**Meaning** When BPDUs are sent from the PCs to interface **ge-0/0/5.0** and interface **ge-0/0/6.0** on Switch 2, the output from the operational mode command **show spanning-tree interface** shows that the interfaces have transitioned to a BPDU inconsistent state. The BPDU inconsistent state causes the interfaces to shut down.

Disabling the BPDU protection configuration on an interface does not automatically re-enable the interface. However, if the **disable-timeout (Spanning Trees)** statement has been included in the BPDU configuration, the interface does return to service after the timer expires. Otherwise, you must use the operational mode command **clear ethernet-switching bpd-error** to unblock and re-enable the interface.

If the PCs connected to Switch 2 send BPDUs to the interfaces again, BPDU protection is triggered once more and the interfaces transition back to the BPDU inconsistent state, causing them to shut down. In such cases, you need to find and repair the misconfiguration on the PCs that is sending BPDUs to Switch 2.

## Example: Configuring BPDU Protection on Interfaces to Prevent STP Miscalculations on EX Series Switches

Spanning-tree protocols support loop-free network communication through the exchange of a special type of frame called a bridge protocol data unit (BPDU). However, when BPDUs generated by spanning-tree protocols are communicated to devices on which spanning-tree protocols are not configured, these devices recognize the BPDUs, which can lead to network outages. You can, however, enable BPDU protection on switch interfaces to prevent BPDUs generated by spanning-tree protocols from passing through those interfaces. When BPDU protection is enabled, an interface shuts down or drops BPDU packets when any incompatible BPDU is encountered, thereby preventing the BPDUs generated by spanning-tree protocols from reaching the switch. When an interface is configured to drop BPDU packets, all traffic except the incompatible BPDUs can pass through the interface.

**NOTE:** The BPDU drop feature can be specified only on interfaces on which no spanning-tree protocol is configured.

This example configures BPDU protection on STP switch downstream interfaces that connect to two PCs:

- [Requirements on page 4961](#)
- [Overview and Topology on page 4962](#)
- [Configuration on page 4963](#)
- [Verification on page 4965](#)

### Requirements

This example uses the following hardware and software components:

- One EX Series switch in an RSTP topology
- One EX Series switch that is not in any spanning-tree topology
- Junos OS Release 9.1 or later for EX Series switches

Before you configure the interfaces on Switch 2 for BPDU protection, be sure you have:

- Ensured that RSTP is operating on Switch 1.
- Disabled or enabled RSTP on Switch 2 (depending on the configuration that you plan to implement.)

If you want to enable the BPDU shutdown feature, then it is optional to disable spanning-tree protocols on the interface.

**NOTE:** By default, RSTP is enabled on all EX Series switches.

---

## Overview and Topology

EX Series switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree protocol (RSTP), and Multiple Spanning Tree Protocol (MSTP). All spanning-tree protocols use a special type of frame called a BPDU to communicate. Other devices also use BPDUs—PC bridging applications, for example, generate their own BPDUs. These different BPDUs are not compatible. When BPDUs generated by spanning-tree protocols are transmitted to a device that uses another type of BPDU, they can cause problems on the device. Similarly, if switches within a spanning-tree topology receive BPDUs from other devices, network outages can occur because of the miscalculations caused by the outside BPDUs. Therefore, you must configure BPDU protection on interfaces in a spanning-tree topology to avoid network outages.

This example explains how to block outside BPDUs from reaching a switch interface connected to devices that are not part of the STP topology. This example addresses two scenarios. In the first scenario, an interface is shutdown when it encounters an outside BPDU. In the second scenario, an interface drops only BPDU packets while retaining the status of the interface as up and allowing all other traffic to pass through the interface.

[Figure 75 on page 4958](#) shows the topology for this example. Switch 1 and Switch 2 are connected through a trunk interface. Switch 1 is configured for RSTP while Switch 2 has a spanning-tree protocol configured on it for the first scenario, and does not have a spanning-tree protocol configured on it for the second scenario.

In the first scenario, this example configures downstream BPDU protection on Switch 2 interfaces **ge-0/0/5.0** and **ge-0/0/6.0** when the default spanning-tree protocol (RSTP) is not disabled on these interfaces. When BPDU protection is enabled with the **shutdown** statement, the switch interfaces will shut down if BPDUs generated by the laptops attempt to access Switch 2.

In the second scenario, this example configures downstream BPDU protection on Switch 2 interfaces **ge-0/0/5.0** and **ge-0/0/6.0** when the default spanning-tree protocol (RSTP) is disabled on these interfaces. When BPDU protection is enabled with the **drop** statement, the switch interfaces drop only the BPDUs while allowing remaining traffic to pass through and retaining their status as up if BPDUs generated by the laptops attempt to access Switch 2.

**CAUTION:** When configuring BPDU protection on an interface without spanning trees connected to a switch with spanning trees, be careful that you do not configure BPDU protection on all interfaces. Doing so could prevent

BPDUs being received on switch interfaces (such as a trunk interface) that you intended to have receive BPDUs from a switch with spanning trees.

Figure 76: BPDU Protection Topology

Table 551 on page 4963 shows the components that will be configured for BPDU protection.

Table 551: Components of the Topology for Configuring BPDU Protection on EX Series Switches

| Property                      | Settings                                                                                                                                                                      |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Switch 1 (Distribution Layer) | Switch 1 is connected to Switch 2 through a trunk interface. Switch 1 is configured for RSTP.                                                                                 |
| Switch 2 (Access Layer)       | Switch 2 has two downstream access ports connected to laptops: <ul style="list-style-type: none"> <li>• <code>ge-0/0/5.0</code></li> <li>• <code>ge-0/0/6.0</code></li> </ul> |

### Configuration

To configure BPDU protection on the interfaces:

#### CLI Quick Configuration

This is the first scenario that explains configuration for the **shutdown** statement. To quickly configure BPDU protection on Switch 2 for the **shutdown** statement, copy the following commands and paste them into the switch terminal window:

[edit]

```
user@switch# set ethernet-switching-options bpdu-block interface ge-0/0/5.0 shutdown
[edit]
user@switch# set ethernet-switching-options bpdu-block interface ge-0/0/6.0 shutdown
```

**Step-by-Step  
Procedure**

To configure BPDU protection for the **shutdown** statement:

1. Configure the BPDU **shutdown** statement on the downstream interface **ge-0/0/5.0** on Switch 2:

```
[edit ethernet-switching-options]
user@switch# set bpdu-block interface ge-0/0/5.0 shutdown
```

2. Configure the BPDU **shutdown** statement on the downstream interface **ge-0/0/6.0** on Switch 2:

```
[edit ethernet-switching-options]
user@switch# set bpdu-block interface ge-0/0/6.0 shutdown
```

**Results**

Check the results of the configuration:

```
user@switch> show ethernet-switching-options
bpdu-block {
  interface ge-0/0/5.0 {
    shutdown;
  }
  interface ge-0/0/6.0 {
    shutdown;
  }
}
```

**CLI Quick  
Configuration**

This is the second scenario that explains configuration for the **drop** statement. To quickly configure BPDU protection on Switch 2 for the **drop** statement, copy the following commands and paste them into the switch terminal window:

```
[edit]
user@switch# set protocols rstp interface ge-0/0/5.0 disable
user@switch# set protocols rstp interface ge-0/0/6.0 disable
user@switch# set ethernet-switching-options bpdu-block interface ge-0/0/5.0 drop
user@switch# set ethernet-switching-options bpdu-block interface ge-0/0/6.0 drop
```

**NOTE:** You can also disable RSTP globally using the `delete protocols rstp`, the `set protocols rstp disable`, or the `set protocols rstp interface all disable` command.

**Step-by-Step  
Procedure**

To configure BPDU protection for the **drop** statement:

1. Disable RSTP on both the interfaces **ge-0/0/5.0** and **ge-0/0/6.0** interfaces:

```
[edit]
user@switch# set protocols rstp interface ge-0/0/5.0 disable
user@switch# set protocols rstp interface ge-0/0/6.0 disable
```

2. Configure the BPDU **drop** statement on the downstream interface **ge-0/0/5.0** on Switch 2:

```
[edit ethernet-switching-options]
user@switch# set bpdu-block interface ge-0/0/5.0 drop
```

- Configure the BPDU **drop** statement on the downstream interface **ge-0/0/6.0** on Switch 2:

```
[edit ethernet-switching-options]
user@switch# set bpd-block interface ge-0/0/6.0 drop
```

**Results** Check the results of the configuration:

```
user@switch> show protocols rstp
interface ge-0/0/5.0 {
  disable;
}
interface ge-0/0/6.0 {
  disable;
}
user@switch> show ethernet-switching-options
bpd-block {
  interface ge-0/0/5.0 {
    drop;
  }
  interface ge-0/0/6.0 {
    drop;
  }
}
```

### Verification

To confirm that the configuration is working properly, perform these tasks:

- [Displaying the Interface State Before BPDU Protection Is Triggered on page 4965](#)
- [Verifying That BPDU Shutdown Protection Is Working Correctly on page 4965](#)
- [Verifying That BPDU Drop Protection Is Working Correctly on page 4966](#)

#### *Displaying the Interface State Before BPDU Protection Is Triggered*

**Purpose** Before any BPDUs can be received on Switch 2 on either interface **ge-0/0/5.0** or interface **ge-0/0/6.0**, confirm the state of those interfaces.

**Action** Use the operational mode command **show ethernet-switching interfaces**:

```
user@switch> show ethernet-switching interfaces
```

| Interface  | State | VLAN members | Tag | Tagging  | Blocking  |
|------------|-------|--------------|-----|----------|-----------|
| ge-0/0/5.0 | up    | default      |     | untagged | unblocked |
| ge-0/0/6.0 | up    | default      |     | untagged | unblocked |

**Meaning** The output from the operational mode command **show ethernet-switching interfaces** shows that **ge-0/0/5.0** and interface **ge-0/0/6.0** are **up** and **unblocked**.

#### *Verifying That BPDU Shutdown Protection Is Working Correctly*

**Purpose** Verify that BPDU protection is working correctly in the network by checking to see whether BPDUs have been blocked appropriately.

**Action** Issue `show ethernet-switching interfaces` to see what happened when the BPDUs reached the two interfaces configured for BPDU protection on Switch 2:

```
user@switch> show ethernet-switching interfaces
Interface  State  VLAN members  Tag  Tagging  Blocking
ge-0/0/5.0  down  default              untagged  Disabled by bpdu-control
ge-0/0/6.0  down  default              untagged  Disabled by bpdu-control
```

**Meaning** When the BPDUs sent from laptops reached interfaces `ge-0/0/5.0` and `ge-0/0/6.0` on Switch 2, the interfaces transitioned to a BPDU inconsistent state, shutting down the two interfaces to prevent BPDUs from reaching the laptops.

You need to re-enable the blocked interfaces. There are two ways to do this. If you included the statement `disable-timeout (Spanning Trees)` in the BPDU configuration, the interface returns to service after the timer expires. Otherwise, use the operational mode command `clear ethernet-switching bpdu-error` to unblock and re-enable `ge-0/0/5.0` and `ge-0/0/6.0`. This command will only re-enable an interface but the BPDU configuration for the interface will continue to exist unless you remove the BPDU configuration explicitly.

If BPDUs reach the downstream interfaces on Switch 2 again, BPDU protection is triggered again and the interfaces shut down. In such cases, you must find and repair the misconfiguration that is sending BPDUs to interfaces `ge-0/0/5.0` and `ge-0/0/6.0`.

#### *Verifying That BPDU Drop Protection Is Working Correctly*

**Purpose** Verify that BPDU drop protection is working correctly in the network by checking to see whether BPDUs have been blocked appropriately.

**Action** Issue `show ethernet-switching interfaces` to see what happened when the BPDUs reached the two interfaces configured for BPDU protection on Switch 2:

```
user@switch> show ethernet-switching interfaces
Interface  State  VLAN members  Tag  Tagging  Blocking
ge-0/0/5.0  up     default              untagged  unblocked-xSTP bpdu
                                     filter enabled
ge-0/0/6.0  up     default              untagged  unblocked-xSTP bpdu
                                     filter enabled
```

**Meaning** When the BPDUs sent from laptops reached interfaces `ge-0/0/5.0` and `ge-0/0/6.0` on Switch 2, the interfaces dropped those BPDUs to prevent them from reaching Switch 2, and the state of both the interfaces is `up`.

## Example: Configuring Loop Protection to Prevent Interfaces from Transitioning from Blocking to Forwarding in a Spanning Tree on EX Series Switches

EX Series switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree protocol (RSTP), and Multiple Spanning Tree Protocol (MSTP). Loop protection increases the efficiency of STP, RSTP, and MSTP by preventing interfaces from moving into a forwarding state that would result in a loop opening up in the network.

This example describes how to configure loop protection for an interface on an EX Series switch in an RSTP topology:

- [Requirements on page 4967](#)
- [Overview and Topology on page 4967](#)
- [Configuration on page 4969](#)
- [Verification on page 4969](#)

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 9.1 or later for EX Series switches
- Three EX Series switches in an RSTP topology

Before you configure the interface for loop protection, be sure you have:

- RSTP operating on the switches.

**NOTE:** By default, RSTP is enabled on all EX Series switches.

### Overview and Topology

A loop-free network in spanning-tree topologies is supported through the exchange of a special type of frame called bridge protocol data unit (BPDU). Peer STP applications running on the switch interfaces use BPDUs to communicate. Ultimately, the exchange of BPDUs determines which interfaces block traffic (preventing loops) and which interfaces become root ports and forward traffic.

A blocking interface can transition to the forwarding state in error if the interface stops receiving BPDUs from its designated port on the segment. Such a transition error can occur when there is a hardware error on the switch or software configuration error between the switch and its neighbor. When this happens, a loop opens up in the spanning tree.

Loops in a Layer 2 topology cause broadcast, unicast, and multicast frames to continuously circle the looped network. As a switch processes a flood of frames in a looped network, its resources become depleted and the ultimate result is a network outage.

**CAUTION:** An interface can be configured for either loop protection or root protection, but not for both.

Three EX Series switches are displayed in [Figure 77 on page 4968](#). In this example, they are configured for RSTP and create a loop-free topology. Interface **ge-0/0/6** is blocking traffic between Switch 3 and Switch 1; thus, traffic is forwarded through interface **ge-0/0/7** on Switch 2. BPDUs are being sent from the root bridge on Switch 1 to both of these interfaces.

This example shows how to configure loop protection on interface **ge-0/0/6** to prevent it from transitioning from a blocking state to a forwarding state and creating a loop in the spanning-tree topology.

**Figure 77: Network Topology for Loop Protection**

[Table 552 on page 4968](#) shows the components that will be configured for loop protection.

**Table 552: Components of the Topology for Configuring Loop Protection on EX Series Switches**

| Property | Settings                                                              |
|----------|-----------------------------------------------------------------------|
| Switch 1 | Switch 1 is the root bridge.                                          |
| Switch 2 | Switch 2 has the root port <b>ge-0/0/7</b> .                          |
| Switch 3 | Switch 3 is connected to Switch 1 through interface <b>ge-0/0/6</b> . |

A spanning-tree topology contains ports that have specific roles:

- The *root port* is responsible for forwarding data to the root bridge.
- The *alternate port* is a standby port for the root port. When a root port goes down, the alternate port becomes the active root port.
- The *designated port* forwards data to the downstream network segment or device.

This configuration example uses an RSTP topology. However, you also can configure loop protection for STP or MSTP topologies at the `[edit protocols (mstp | stp)]` hierarchy level.

### Configuration

To configure loop protection on an interface:

#### CLI Quick Configuration

To quickly configure loop protection on interface **ge-0/0/6**:

```
[edit]
set protocols rstp interface ge-0/0/6 bpdutimeout-action block
```

#### Step-by-Step Procedure

To configure loop protection:

1. Configure interface **ge-0/0/6** on Switch 3:

```
[edit protocols rstp]
user@switch# set interface ge-0/0/6 bpdutimeout-action (Spanning Trees) block
```

#### Results

Check the results of the configuration:

```
user@switch> show configuration protocols rstp
interface ge-0/0/6.0 {
  bpdutimeout-action {
    block;
  }
}
```

### Verification

To confirm that the configuration is working properly, perform these tasks:

- [Displaying the Interface State Before Loop Protection Is Triggered on page 4969](#)
- [Verifying That Loop Protection Is Working on an Interface on page 4970](#)

#### *Displaying the Interface State Before Loop Protection Is Triggered*

#### Purpose

Before loop protection is triggered on interface **ge-0/0/6**, confirm that the interface is blocking.

**Action** Use the operational mode command:

```
user@switch> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

| Interface  | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|------------|---------|-----------------------|-------------------------|--------------|-------|------|
| ge-0/0/0.0 | 128:513 | 128:513               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| ge-0/0/1.0 | 128:514 | 128:514               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| ge-0/0/2.0 | 128:515 | 128:515               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| ge-0/0/3.0 | 128:516 | 128:516               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| ge-0/0/4.0 | 128:517 | 128:517               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| ge-0/0/5.0 | 128:518 | 128:518               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| ge-0/0/6.0 | 128:519 | 128:2                 | 16384.00aabbcc0348      | 20000        | BLK   | ALT  |

[output truncated]

**Meaning** The output from the operational mode command **show spanning-tree interface** shows that **ge-0/0/6.0** is the alternate port and in a blocking state.

#### *Verifying That Loop Protection Is Working on an Interface*

**Purpose** Verify the loop protection configuration on interface **ge-0/0/6**. RSTP has been disabled on interface **ge-0/0/4** on Switch 1. This will stop BPDUs from being sent to interface **ge-0/0/6** and trigger loop protection on the interface.

**Action** Use the operational mode command:

```
user@switch> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

| Interface  | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|------------|---------|-----------------------|-------------------------|--------------|-------|------|
| ge-0/0/0.0 | 128:513 | 128:513               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| ge-0/0/1.0 | 128:514 | 128:514               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| ge-0/0/2.0 | 128:515 | 128:515               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| ge-0/0/3.0 | 128:516 | 128:516               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| ge-0/0/4.0 | 128:517 | 128:517               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| ge-0/0/5.0 | 128:518 | 128:518               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| ge-0/0/6.0 | 128:519 | 128:519               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |

(Loop-Incon)

[output truncated]

**Meaning** The operational mode command **show spanning-tree interface** shows that interface **ge-0/0/6.0** has detected that BPDUs are no longer being forwarded to it and has moved into a loop-inconsistent state. The loop-inconsistent state prevents the interface from transitioning to a forwarding state. The interface recovers and transitions back to its original state as soon as it receives BPDUs.

## Example: Configuring Root Protection to Enforce Root Bridge Placement in Spanning Trees on EX Series Switches

EX Series switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree protocol (RSTP), and Multiple Spanning Tree Protocol (MSTP). Root protection increases the efficiency of STP, RSTP, and MSTP by allowing network administrators to manually enforce the root bridge placement in the network.

This example describes how to configure root protection on an interface on an EX Series switch:

- [Requirements on page 4971](#)
- [Overview and Topology on page 4971](#)
- [Configuration on page 4974](#)
- [Verification on page 4974](#)

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 9.1 or later for EX Series switches
- Four EX Series switches in an RSTP topology

Before you configure the interface for root protection, be sure you have:

- RSTP operating on the switches.

**NOTE:** By default, RSTP is enabled on all EX Series switches.

### Overview and Topology

Peer STP applications running on switch interfaces exchange a special type of frame called a bridge protocol data unit (BPDU). Switches communicate interface information using BPDUs to create a loop-free topology that ultimately determines the root bridge and which interfaces block or forward traffic in the spanning tree.

However, a root port elected through this process has the possibility of being wrongly elected. A user bridge application running on a PC can generate BPDUs, too, and interfere with root port election.

To prevent this from happening, enable root protection on interfaces that should not receive superior BPDUs from the root bridge and should not be elected as the root port. These interfaces are typically located on an administrative boundary and are designated ports.

When root protection is enabled on an interface:

- The interface is blocked from becoming the root port.
- Root protection is enabled for all STP instances on that interface.
- The interface is blocked only for instances for which it receives superior BPDUs. Otherwise, it participates in the spanning-tree topology.

**CAUTION:** An interface can be configured for either root protection or loop protection, but not for both.

Four EX Series switches are displayed in [Figure 78 on page 4973](#). In this example, they are configured for RSTP and create a loop-free topology. Interface **ge-0/0/7** on Switch 1 is a designated port on an administrative boundary. It connects to Switch 4. Switch 3 is the root bridge. Interface **ge-0/0/6** on Switch 1 is the root port.

This example shows how to configure root protection on interface **ge-0/0/7** to prevent it from transitioning to become the root port.

Figure 78: Network Topology for Root Protection

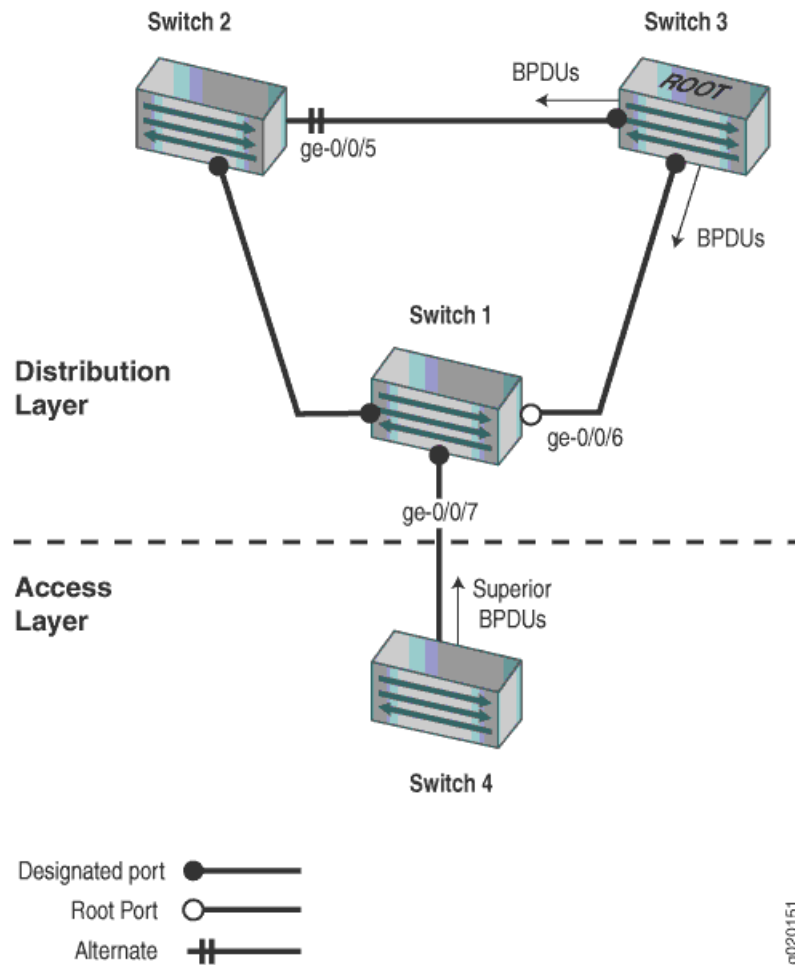

Table 553 on page 4973 shows the components that will be configured for root protection.

Table 553: Components of the Topology for Configuring Root Protection on EX Series Switches

| Property | Settings                                                                                                                                                                                                 |
|----------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Switch 1 | Switch 1 is connected to Switch 4 through interface <b>ge-0/0/7</b> .                                                                                                                                    |
| Switch 2 | Switch 2 is connected to Switch 1 and Switch 3. Interface <b>ge-0/0/4</b> is the alternate port in the RSTP topology.                                                                                    |
| Switch 3 | Switch 3 is the root bridge and is connected to Switch 1 and Switch 2.                                                                                                                                   |
| Switch 4 | Switch 4 is connected to Switch 1. After root protection is configured on interface <b>ge-0/0/7</b> , Switch 4 will send superior BPDUs that will trigger root protection on interface <b>ge-0/0/7</b> . |

A spanning tree topology contains ports that have specific roles:

- The *root port* is responsible for forwarding data to the root bridge.

- The *alternate port* is a standby port for the root port. When a root port goes down, the alternate port becomes the active root port.
- The *designated port* forwards data to the downstream network segment or device.

This configuration example uses an RSTP topology. However, you also can configure root protection for STP or MSTP topologies at the `[edit protocols (mstp | stp)]` hierarchy level.

---

### Configuration

To configure root protection on an interface:

#### CLI Quick Configuration

To quickly configure root protection on interface **ge-0/0/7**, copy the following command and paste it into the switch terminal window:

```
[edit]
set protocols rstp interface ge-0/0/7 no-root-port
```

#### Step-by-Step Procedure

To configure root protection:

1. Configure interface **ge-0/0/7**:  

```
[edit protocols rstp]
user@switch#
set interface ge-0/0/7 no-root-port (Spanning Trees)
```

#### Results

Check the results of the configuration:

```
user@switch> show configuration protocols rstp
interface ge-0/0/7.0 {
  no-root-port;
}
```

---

### Verification

To confirm that the configuration is working properly:

- [Displaying the Interface State Before Root Protection Is Triggered on page 4974](#)
- [Verifying That Root Protection Is Working on the Interface on page 4975](#)

#### *Displaying the Interface State Before Root Protection Is Triggered*

#### Purpose

Before root protection is triggered on interface **ge-0/0/7**, confirm the interface state.

**Action** Use the operational mode command:

```
user@switch> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

| Interface  | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|------------|---------|-----------------------|-------------------------|--------------|-------|------|
| ge-0/0/0.0 | 128:513 | 128:513               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| ge-0/0/1.0 | 128:514 | 128:514               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| ge-0/0/2.0 | 128:515 | 128:515               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| ge-0/0/3.0 | 128:516 | 128:516               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| ge-0/0/4.0 | 128:517 | 128:517               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| ge-0/0/5.0 | 128:518 | 128:2                 | 16384.00aabbcc0348      | 20000        | BLK   | ALT  |
| ge-0/0/6.0 | 128:519 | 128:1                 | 16384.00aabbcc0348      | 20000        | FWD   | ROOT |
| ge-0/0/7.0 | 128:520 | 128:520               | 32768.0019e2503f00      | 20000        | FWD   | DESG |

[output truncated]

**Meaning** The output from the operational mode command **show spanning-tree interface** shows that **ge-0/0/7.0** is a designated port in a forwarding state.

#### *Verifying That Root Protection Is Working on the Interface*

**Purpose** A configuration change takes place on Switch 4. A smaller bridge priority on the Switch 4 causes it to send superior BPDUs to interface **ge-0/0/7**. Receipt of superior BPDUs on interface **ge-0/0/7** will trigger root protection. Verify that root protection is operating on interface **ge-0/0/7**.

**Action** Use the operational mode command:

```
user@switch> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

| Interface  | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|------------|---------|-----------------------|-------------------------|--------------|-------|------|
| ge-0/0/0.0 | 128:513 | 128:513               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| ge-0/0/1.0 | 128:514 | 128:514               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| ge-0/0/2.0 | 128:515 | 128:515               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| ge-0/0/3.0 | 128:516 | 128:516               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| ge-0/0/4.0 | 128:517 | 128:517               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| ge-0/0/5.0 | 128:518 | 128:2                 | 16384.00aabbcc0348      | 20000        | BLK   | ALT  |
| ge-0/0/6.0 | 128:519 | 128:1                 | 16384.00aabbcc0348      | 20000        | FWD   | ROOT |
| ge-0/0/7.0 | 128:520 | 128:520               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |

(Root-Incon)  
[output truncated]

**Meaning** The operational mode command **show spanning-tree interface** shows that interface **ge-0/0/7.0** has transitioned to a root inconsistent state. The root inconsistent state makes the interface block, discarding any received BPDUs, and prevents the interface from becoming a candidate for the root port. When the root bridge no longer receives superior STP BPDUs from the interface, the interface will recover and transition back to a forwarding state. Recovery is automatic.

### Forcing RSTP or VSTP to Run as IEEE 802.1D STP (CLI Procedure)

---

**NOTE:** This procedure uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 3](#).

---

On EX Series switches running Rapid Spanning Tree Protocol (RSTP) (the default) or VLAN Spanning Tree Protocol (VSTP), you can force the original IEEE 802.1D Spanning Tree Protocol (STP) version to run in place of RSTP or VSTP. Configure the **force-version stp** statement for compatibility with older bridges that do not support RSTP or VSTP.

To force the spanning-tree protocol version to be the original IEEE 802.1D STP:

1. Enable IEEE 802.1D STP:

```
[edit protocols]  
user@switch# set (rstp | vstp) force-version stp
```

---

**NOTE:** After using the **force-version** statement to enable xSTP globally, apply the **force-version** statement for specific Layer 2 ports.

---

**Related Documentation**

- [RSTP or VSTP Forced to Run as IEEE 802.1D STP on page 4912](#)
- [Reverting to RSTP or VSTP from Forced IEEE 802.1D STP on page 4985](#)

## Configuring Spanning-Tree Protocols (J-Web Procedure)

**NOTE:** This topic applies only to the J-Web Application package.

For EX Series switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), Multiple Spanning Tree Protocol (MSTP), and VLAN Spanning Tree Protocol (VSTP). You can configure STP, RSTP, and MSTP by using the J-Web interface. You can configure bridge protocol data unit (BPDU) protection on interfaces to prevent them from receiving BPDUs that could result in STP misconfigurations, which could lead to network outages.

**NOTE:** In EX4300 switches, you can configure STP only by enabling RSTP and forcing it to act as STP. You need to select the Force STP check box from the RSTP configuration page.

To configure STP, MSTP, or RSTP for an EX Series switch by using the J-Web interface:

1. Select **Configure > Switching > Spanning Tree**.

The Spanning Tree Configuration page displays the spanning-tree protocol configuration parameters and a list of interfaces configured for each spanning-tree protocol configuration.

**NOTE:** After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See [Using the Commit Options to Commit Configuration Changes](#) for details about all commit options.

2. Click one of the following options:
  - **Add**—Creates a spanning-tree protocol configuration.
    - a. Select a protocol name.
    - b. Enter information as described in [Table 554 on page 4978](#).
    - c. Click **OK** to apply changes to the configuration or click **Cancel** to cancel without saving changes.
  - **Edit**—Modifies a selected spanning-tree protocol configuration.
    - a. Enter information as described in [Table 554 on page 4978](#).
    - b. Click **OK** to apply changes to the configuration or click **Cancel** to cancel without saving changes.
  - **Delete**—Deletes a selected spanning-tree protocol configuration.

Table 554: Spanning-Tree Protocol Configuration Parameters

| Field                                                          | Function                                                                                                                                                                                                                                                          | Your Action                                  |
|----------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------|
| General                                                        |                                                                                                                                                                                                                                                                   |                                              |
| Protocol Name                                                  | Specifies the spanning-tree protocol type: STP, MSTP, or RSTP.                                                                                                                                                                                                    | None.                                        |
| Disable                                                        | Disables spanning-tree protocols on the interface.                                                                                                                                                                                                                | To enable this option, select the check box. |
| BPDU Protect                                                   | Specifies BPDU protection on all edge interfaces on the switch.                                                                                                                                                                                                   | To enable this option, select the check box. |
| Bridge Priority                                                | Specifies the bridge priority. The bridge priority determines which bridge is elected as the root bridge. If two bridges have the same path cost to the root bridge, the bridge priority determines which bridge becomes the designated bridge for a LAN segment. | Select a value from the list.                |
| Forward Delay                                                  | Specifies the number of seconds an interface waits before changing from spanning-tree learning and listening states to the forwarding state.                                                                                                                      | Type a value.                                |
| Hello Time                                                     | Specifies the time interval in seconds at which the root bridge transmits configuration BPDUs.                                                                                                                                                                    | Type a value.                                |
| Max Age                                                        | Specifies the maximum-aging time in seconds for all MST instances. The maximum aging time is the number of seconds a switch waits without receiving spanning-tree configuration messages before attempting a reconfiguration.                                     | Type a value.                                |
| Max Hops                                                       | (MSTP only) Specifies the number of hops in a region before the BPDU is discarded.                                                                                                                                                                                | Type a value.                                |
| Configuration Name                                             | (MSTP only) Specifies the MSTP region name carried in the MSTP BPDUs.                                                                                                                                                                                             | Type a name.                                 |
| Revision Level                                                 | (MSTP only) Specifies the revision number of the MSTP configuration.                                                                                                                                                                                              | Type a value.                                |
| Force STP Version                                              | Enables or disables STP.                                                                                                                                                                                                                                          | To enable this option, select the check box. |
| <b>NOTE:</b> This option is supported only on EX4300 switches. |                                                                                                                                                                                                                                                                   |                                              |
| Ports                                                          |                                                                                                                                                                                                                                                                   |                                              |

Table 554: Spanning-Tree Protocol Configuration Parameters (*continued*)

| Field                                                         | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Your Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface Name                                                | Specifies an interface for the spanning-tree protocol.                                                                                                                                                                                                                                                                                                                                                                                                                              | <ol style="list-style-type: none"> <li>1. Click the <b>Ports</b> tab.</li> <li>2. Choose one of the following options: <ul style="list-style-type: none"> <li>• Click <b>Add</b> and select an interface from the list. For an EX8200 Virtual Chassis configuration, select the member, FPC, and the interface from the list.</li> <li>• Select an interface in the <b>Port/State</b> table and click <b>Edit</b>.</li> <li>• To delete an interface from the configuration, select it in the <b>Port/State</b> table and click <b>Remove</b>.</li> </ul> </li> </ol> |
| Cost                                                          | Specifies the link cost to determine which bridge is the designated bridge and which interface is the designated interface.                                                                                                                                                                                                                                                                                                                                                         | Type a value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Priority                                                      | Specifies the interface priority to determine which interface is elected as the root port.                                                                                                                                                                                                                                                                                                                                                                                          | Select a value from the list.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Disable Port                                                  | Disables the spanning-tree protocol on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                               | To enable the option, select the check box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>NOTE:</b> This option is not supported on EX4300 switches. |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Edge                                                          | Configures the interface as an edge interface. Edge interfaces immediately transition to a forwarding state.                                                                                                                                                                                                                                                                                                                                                                        | To enable the option, select the check box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| No Root Port                                                  | Specifies an interface as a spanning-tree designated port. If the bridge receives superior STP BPDUs on a root-protected interface, that interface transitions to a root-prevented STP state (inconsistency state) and the interface is blocked. This blocking prevents a bridge that should not be the root bridge from being elected the root bridge. When the bridge stops receiving superior STP BPDUs on the root-protected interface, interface traffic is no longer blocked. | To enable the option, select the check box.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Interface Mode                                                | Specifies the link mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <ol style="list-style-type: none"> <li>1. To enable the option, select the check box.</li> <li>2. Select one of the following: <ul style="list-style-type: none"> <li>• <b>Point to Point</b>—For a full-duplex link, the default link mode is point-to-point.</li> <li>• <b>Shared</b>—For a half-duplex link, the default link mode is shared.</li> </ul> </li> </ol>                                                                                                                                                                                               |

Table 554: Spanning-Tree Protocol Configuration Parameters (*continued*)

| Field                      | Function                                                                                                                                                                                                                                                          | Your Action                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Configuring VSTP (CLI Procedure)

The default spanning-tree protocol for EX Series switches is Rapid Spanning Tree Protocol (RSTP). VLAN Spanning Tree Protocol (VSTP) is an alternate protocol that allows EX Series switches to run one or more Spanning Tree Protocol (STP) or RSTP instances for each VLAN on which VSTP is enabled. For networks with multiple VLANs, VSTP improves intelligent tree spanning by defining best paths within the VLANs instead of within the entire network.

**NOTE:** EX Series switches can have a maximum of 253 VLANs on VSTP. Therefore, to have as many spanning-tree protocol VLANs as possible, use both VSTP and RSTP. RSTP will then be applied to VLANs that exceed the limit for VSTP. Because RSTP is enabled by default, you just need to additionally enable VSTP.

You can configure VSTP for an interface at the global level (for all configured VLANs) or for a specific VLAN.

**NOTE:**

- If you configure VSTP on an interface at both the global and the specific VLAN level, the interface configuration that is defined at the specific VLAN level overrides the interface configuration that is defined at the global level.
- If you specify VSTP to be configured on an interface that is not configured to belong to the VLAN (or VLANs), an error message is displayed.
- Option `vlan all` is not supported in Junos OS Release 13.2X50.

To configure VSTP:

1. Configure VSTP on a group of VLANs, on all VLANs, or on a specific VLAN, or a specific interface within a VLAN, or on a specific interface that belongs to all VLANs:

- To enable VSTP on multiple VLANs using a VLAN group:

```
[edit protocols]
```

```
user@switch# set vstp vlan-group group group-name vlan vlan-id-range
```

**NOTE:** EX Series switches can have a maximum of 253 VLANs on VSTP.

**NOTE:** The EX4300 switch does not support VLAN groups.

- To enable VSTP on all VLANs:

**NOTE:** When you configure VSTP with the `set protocol vstp vlan all` command, VLAN ID 1 is not set; it is excluded so that the configuration is compatible with Cisco PVST+. If you want VLAN ID 1 to be included in the VSTP configuration on your switch, you must set it separately with the `set protocol vstp vlan 1` command.

```
[edit protocols]
user@switch# set vlan vlan all
```

**NOTE:** EX Series switches can have a maximum of 253 VLANs on VSTP. RSTP will then be applied to VLANs that exceed the limit for VSTP. Be sure that RSTP is also enabled (the default setting) when you use the command `set vstp vlan all`. In addition to this being a recommended practice, your configuration will not commit if VSTP is enabled on a switch with more than 253 VLANs.

- To enable VSTP on a VLAN using a single VLAN ID:

```
[edit protocols]
user@switch# set vlan vlan vlan-id
```

- To enable VSTP on a VLAN using a single VLAN name:

```
[edit protocols]
user@switch# set vlan vlan vlan-name
```

- To enable VSTP on an interface at the global level:

```
[edit protocols]
user@switch# set vlan vlan all interface interface-name
```

**CAUTION:** Ensure that the interface is a member of all VLANs before you add the interface to the VSTP configuration. If the interface is not a member of all VLANs, this VSTP configuration will fail when you try to commit it.

- To enable VSTP on an interface for a specific VLAN:

```
[edit protocols]
user@switch# set vlan vlan vlan-id-or-vlan-name interface interface-name
```

**CAUTION:** Ensure that the interface is a member of the specified VLAN before you add the interface to the VSTP configuration. If the interface is not a member of the specified VLAN, this VSTP configuration will fail when you try to commit it.

2. (Optional) Enable the Address Resolution Protocol (ARP) for faster MAC address recovery only if a routed VLAN interface (RVI) is configured:

- To enable ARP on VSTP for all VLANs:

```
[edit protocols]
user@switch# set vlan vlan all arp-on-stp
```

- To enable ARP on VSTP on a VLAN using a single VLAN ID:

```
[edit protocols]
user@switch# set vlan vlan vlan-id arp-on-stp
```

- To enable ARP on VSTP on a VLAN using a single VLAN name:

```
[edit protocols]
user@switch# set vlan vlan vlan-name arp-on-stp
```

## Unblocking an Interface That Receives BPDUs in Error (CLI Procedure)

EX Series switches use bridge protocol data unit (BPDU) protection on interfaces to prevent them from receiving BPDUs that could trigger a spanning-tree misconfiguration. If BPDUs are received on a BPDU-protected interface, the interface either shuts down or transitions to a blocking state and stops forwarding frames. In the latter scenario, after the misconfiguration that triggered the BPDUs being sent to an interface is fixed in the topology, the interface can be unblocked and returned to service.

To unblock an interface and return it to service using the CLI:

- Automatically unblock an interface by configuring a timer that expires:

```
[edit ethernet-switching-options]
user@switch# set bpdv-block disable-timeout 30
```

All interfaces on the switch will be re-enabled (unblocked) after the timer expires. However, once an interface on the switch receives a new spanning-tree protocol BPDU, the interface returns to the blocked state.

- Manually unblock an interface using the operational mode command:

```
user@switch> clear ethernet-switching bpdv-error interface ge-0/0/6.0
```

This command will only re-enable an interface but the BPDU configuration for the interface will continue to exist unless you remove the BPDU configuration explicitly.

## Operational Tasks

- [Reverting to RSTP or VSTP from Forced IEEE 802.1D STP on page 4985](#)

## Reverting to RSTP or VSTP from Forced IEEE 802.1D STP

On MX Series routers and EX Series switches on which Rapid Spanning Tree Protocol (RSTP) or VLAN Spanning Tree Protocol (VSTP) has been forced to run as the original IEEE 802.1D Spanning Tree Protocol (STP) version, you can revert back to RSTP or VSTP.

To revert from the forced instance of the original IEEE 802.1D STP version to the originally configured RSTP or VSTP version:

1. Remove the **force-version** statement from the following RSTP or VSTP configuration:

```
user@host# delete protocols rstp force-version stp
user@host# delete protocols vstp force-version stp
```

Include this statement at the following hierarchy levels:

- [edit logical-systems *routing-instance-name* protocols rstp]
- [edit protocols rstp]
- [edit protocols vstp]
- [edit routing-instances *routing-instance-name* protocols rstp]
- [edit routing-instances *routing-instance-name* protocols vstp]

2. Revert the forced IEEE 802.1D STP to run as the configured RSTP or VSTP:

```
user@host# clear spanning-tree protocol-migration <interface interface-name>
<routing-instance routing-instance-name>
```

To revert the STP protocol globally, issue the statement without options (**clear spanning-tree protocol-migration**).

To revert the STP protocol for the specified interface only, specify the **interface *interface-name*** option.

To revert the STP protocol for a particular routing instance only, specify the **routing-instance *routing-instance-name*** option.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement updated in Junos OS Release 9.4 for EX Series switches to add VSTP support.                                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b>              | Configure the bridge priority. The bridge priority determines which bridge is elected as the root bridge. If two bridges have the same path cost to the root bridge, the bridge priority determines which bridge becomes the designated bridge for a LAN segment.                                                                                                                                                                                                                                  |
| <b>Default</b>                  | 32,768                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Description</b>         | For Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), configure interfaces as edge interfaces. Edge interfaces immediately transition to a forwarding state.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**NOTE:** Although the edge configuration statement appears in the [edit protocols stp interface (all | *interface-name*)] or [edit protocols rstp force-version stp interface (all | *interface-name*)] hierarchy on the switch, this statement has no effect on the switch operation if you configure it.

## interface (BPDU Block)

---

**Syntax**    interface (all | [*interface-name*]);

**Hierarchy Level**    [edit ethernet-switching-options **bpdu-block**]

**Release Information**    Statement introduced in Junos OS Release 9.1 for EX Series switches.

**Description**    Apply Bridge Protocol Data Unit (BPDU) protection on all interfaces or on one or more specified interfaces.

Spanning Tree Protocol (STP), Rapid Spanning Tree protocol (RSTP), and Multiple Spanning Tree Protocol (MSTP) provide Layer 2 loop prevention for EX Series switches. The spanning-tree protocols use BPDU frames to communicate. Through their exchange, spanning-tree topologies determine which interfaces block traffic and which interfaces become root ports and forward traffic. User bridge applications running on a PC can also generate BPDUs. If these BPDUs are picked up by STP applications running on the switch, they can trigger STP miscalculations that can lead to network outages.

To block outside BPDUs from reaching a switch interface connected to devices that are not part of a spanning-tree topology, configure BPDU protection on interfaces in the topology.

**CAUTION:** When configuring BPDU protection on an interface without spanning trees connected to a switch with spanning trees, be careful that you do not configure BPDU protection on all interfaces. Doing so could prevent BPDUs being received on switch interfaces (such as a trunk interface) that you intended to have receive BPDUs from a switch with spanning trees.

---

**NOTE:** Interfaces that are configured as edge interfaces can transition to a forwarding state immediately because they cannot create network loops. As edge ports are connected to end devices, it is imperative that you configure BPDU protection on edge ports to protect the switch from outside BPDUs. When BPDU protection is enabled on an edge interface, the interface shuts down on encountering an outside BPDU thereby preventing any traffic from passing through the interface. To enable BPDU protection on an edge interface, see *Configuring BPDU Protection on an Interface (CLI Procedure)*

---

**Options**    all—All interfaces.

[*interface-name*]  
[*interface-name*]  
—One or more Ethernet interface names.

The remaining statements are explained separately.

**Hierarchy Level** [edit protocols]

**Release Information** Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Configure Multiple Spanning Tree Protocol (MSTP). MSTP is defined in the IEEE 802.1Q-2003 specification and is used to create a loop-free topology in networks with multiple spanning tree regions.

The statements are explained separately.

**Default** MSTP is disabled.

| <b>Description</b>              | Configure an interface to be a spanning-tree designated port. If the bridge receives superior STP bridge protocol data units (BPDUs) on a root-protected interface, that interface transitions to a root-prevented STP state (inconsistency state) and the interface is blocked. This blocking prevents a bridge from being elected the root bridge. When the bridge stops receiving superior STP BPDUs on the root-protected interface, interface traffic is no longer blocked.                                                                                                                                                                                                                                                                        |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

            world-readable>;
            flag flag;
        }
    }
```

**Hierarchy Level** [edit protocols]

**Release Information** Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Configure Rapid Spanning Tree Protocol (RSTP). RSTP is defined in the IEEE 802.1D-2004 specification and is used to prevent loops in Layer 2 networks, which results in shorter convergence times than those provided by basic Spanning Tree Protocol (STP).

VSTP and RSTP can be configured concurrently. You can selectively configure up to 253 VLANs using VSTP; the remaining VLANs will be configured using RSTP. VSTP and RSTP are the only spanning-tree protocols that can be configured concurrently on the switch. See [“Configuring VSTP \(CLI Procedure\)” on page 4982](#) for more information on configuring VSTP and RSTP concurrently.

**BEST PRACTICE:** Configure RSTP when you configure VSTP. RSTP overhead is minimal and this configuration ensures that a spanning-tree protocol is running on all VLANs on your switch, even when your switch is supporting more than 253 VLANs.

The remaining statements are explained separately.

**Release Information**    Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**    Configure Spanning Tree Protocol (STP). When you explicitly configure STP, the switches use the IEEE 802.1D 2004 specification, force version 0. This configuration runs a version of RSTP that is compatible with the classic, basic STP (defined in the IEEE 802.1D 1998 specification).

**NOTE:** Although the `edge` configuration statement appears in the CLI on the switch, this statement has no effect on the switch operation if you configure it.

---

The remaining statements are explained separately.

**Default**    STP is disabled. By default, RSTP is enabled on all Ethernet switching ports.

**Required Privilege Level**    routing—To view this statement in the configuration.  
                                  routing-control—To add this statement to the configuration.

| <b>Release Information</b> | Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement updated in Junos OS Release 9.4 for EX Series switches to add VSTP support.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>         | Set protocol-level tracing options for MPLS, MVRP, STP, RSTP, MSTP, and VSTP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Default</b>             | Traceoptions is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Options</b>             | <p><b>disable</b>—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>name</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. We recommend that you place STP tracing output in the file <code>/var/log/stp-log</code>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b><i>trace-file</i></b> reaches its maximum size, it is renamed <b><i>trace-file .0</i></b>, then <b><i>trace-file .1</i></b>, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you must also specify a maximum file size with the size option.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 1 trace file</p> <p><b><i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b><i>flag</i></b> statements:</p> <ul style="list-style-type: none"><li>• <b>all</b>—Trace all operations.</li><li>• <b>all-failures</b>—Trace all failure conditions.</li><li>• <b>bpd</b><b>u</b>—Trace BPDU reception and transmission. Note that you must also use <b>port-transmit-state-machine</b> in order to log transmit operations.</li><li>• <b>bridge-detection-state-machine</b>—Trace the bridge detection state machine.</li></ul> |

- **error**—Trace all failure conditions.
- **events**—Trace events of the protocol state machine.
- **pdu**—Trace PDUs that were received and sent.
- **port-information-state-machine**—Trace the port information state machine.
- **port-migration-state-machine**—Trace the port migration state machine.
- **port-receive-state-machine**—Trace the port receive state machine.
- **port-role-select-state-machine**—Trace the port role selection state machine.
- **port-role-transit-state-machine**—Trace the port role transit state machine.
- **port-state-transit-state-machine**—Trace the port state transit state machine.
- **port-transmit-state-machine**—Trace the port transmit state machine.
- **ppmd**—Trace the state and events for the ppm process.
- **socket**—Trace socket activity.
- **state-machine**—Trace state machine information.
- **state-machine-variables**—Trace when the state machine variables change.
- **timers**—Trace protocol timers.
- **topology-change-state-machine**—Trace the topology change state machine.

**no-stamp**—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**replace**—(Optional) Replace an existing trace file if there is one.

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**size** *size*—(Optional) Maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named *trace-file* reaches this size, it is renamed *trace-file .0*. When the *trace-file* again reaches its maximum size, *trace-file .0* is renamed *trace-file .1* and *trace-file* is renamed *trace-file .0*. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

## vlan (Spanning Trees)

**Syntax** `vlan (all | vlan-id | vlan-name) {`  
     `bridge-priority priority;`  
     `forward-delay seconds;`  
     `hello-time seconds;`  
     `interface interface-name {`  
         `bpdu-timeout-action {`  
             `block;`  
             `log;`  
         `}`  
     `cost cost;`  
     `disable;`  
     `edge;`  
     `mode mode;`  
     `no-root-port;`  
     `priority priority;`  
     `}`  
     `max-age seconds;`  
     `traceoptions {`  
         `file filename <files number > <size size > <no-stamp | world-readable |`  
         `no-world-readable>;`  
         `flag flag;`  
     `}`  
`}`

**Hierarchy Level** [edit protocols `mstp msti msti-id`]  
                     [edit protocols `vstp`]

**Release Information** Statement introduced in Junos OS Release 9.0 for EX Series switches.  
                           Statement updated with enhanced ? (CLI completion feature) functionality in Junos OS Release 9.5 for EX Series switches.

**Description** Configure the VLANs for a Multiple Spanning Tree Instance (MSTI) or VSTP instance.

**NOTE:** When you configure VSTP with the `set protocol vstp vlan all` command, `vlan-id 1` is excluded to be compatible with Cisco PVST+. If you want `vlan-id 1` to be included in VSTP, you must set it separately with the `set protocol vstp vlan 1` command.

**TIP:** To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type `?` after `vlan` or `vlangs` in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range.

**Default** Not enabled.

**Options**    *vlan-id*—Numeric VLAN identifier.

*vlan-name*—Name of the VLAN.

              The remaining statements are explained separately.

**Required Privilege**    routing—To view this statement in the configuration.

**Level**                routing-control—To add this statement to the configuration.

## vlan (VSTP)

**Syntax** `vlan` (all | *vlan-id* | *vlan-name*) {  
     `bridge-priority` *priority*;  
     `forward-delay` *seconds*;  
     `hello-time` *seconds*;  
     `interface` (all | *interface-name*) {  
         `bpdu-timeout-action` {  
             `block`;  
             `log`;  
         }  
         `cost` *cost*;  
         `disable`;  
         `edge`;  
         `mode` *mode*;  
         `no-root-port`;  
         `priority` *priority*;  
     }  
     `max-age` *seconds*;  
     `traceoptions` {  
         `file` *filename* <files *number* > <size *size* > <no-stamp | world-readable |  
         no-world-readable>;  
         `flag` *flag*;  
     }  
 }

**Release Information** Statement introduced in Junos OS Release 9.4 for EX Series switches.  
 Statement updated with enhanced ? (CLI completion feature) functionality in Junos OS Release 9.5 for EX Series switches.  
 Option **all** introduced in Junos OS Release 10.0 for EX Series switches.

**Description** Configure VSTP VLAN parameters.

**NOTE:** Option **all** is not supported in Junos OS Release 13.2X50.

**TIP:** To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type ? after `vlan` or `vlands` in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range.

**Options** **all**—(Not supported on EX4300) All VLANs.

***vlan-id***—Numeric VLAN identifier.

***vlan-name***—Name of the VLAN.

The remaining statements are explained separately.

                priority priority;
            }
            max-age seconds;
            traceoptions {
                file filename <files number > <size size> <no-stamp | no-world-readable |
                world-readable>;
                flag flag;
            }
        }
    }
```

**Hierarchy Level** [edit protocols]

**Release Information** Statement introduced in Junos OS Release 9.4 for EX Series switches.

**Description** Configure VLAN Spanning Tree Protocol (VSTP). VSTP is used to prevent loops in Layer 2 networks on a per-VLAN basis.

You can have a maximum of 253 VSTP VLANs per switch.

If the number of VLANs on your switch exceeds the VSTP VLAN limit, you must use the **vlan (Spanning Trees)** statement to specify which VLANs or VLAN groups use VSTP. You also cannot use the **vlan all** option to configure VSTP when your switch has more than the maximum allowed VSTP VLANs. To ensure all VLANs are running a spanning-tree protocol, run RSTP for networks with large numbers of VLANs.

**NOTE:** When you configure VSTP with the `set protocol vstp vlan all` command, VLAN ID 1 is not set; it is excluded so that the configuration is compatible with Cisco PVST+. If you want VLAN ID 1 to be included in the VSTP configuration

on your switch, you must set it separately with the `set protocol vstp vlan 1` command.

**NOTE:** Option `vlan all` is not supported in Junos OS Release 13.2X50.

**BEST PRACTICE:** Configure RSTP when you configure VSTP. RSTP overhead is minimal and this configuration ensures that some spanning tree protocol is running on all VLANs on your switch, even when your switch has more than the maximum number of allowed VSTP VLANs.

The remaining statements are explained separately.

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

# Administration

- [Routine Monitoring on page 5027](#)
- [Operational Commands on page 5029](#)

## Routine Monitoring

- [Monitoring Spanning-Tree Protocols on page 5027](#)

### Monitoring Spanning-Tree Protocols

Purpose

**NOTE:** This topic applies only to the J-Web Application package.

Use the monitoring feature to view status and information about the spanning-tree protocol parameters on your EX Series switch.

Action

To display spanning-tree protocol parameter details in the J-Web interface, select **Monitor** > **Switching** > **STP**.

To display spanning-tree protocol parameter details in the CLI, enter the following commands:

- **show spanning-tree interface**
- **show spanning-tree bridge**

Meaning

[Table 555 on page 5027](#) summarizes the spanning-tree protocol parameters.

Table 555: Summary of Spanning-Tree Protocols Output Fields

| Field                                                         | Values                                                          |
|---------------------------------------------------------------|-----------------------------------------------------------------|
| Bridge Parameters                                             |                                                                 |
| Routing instance name                                         | Displays bridge information for the specified routing instance. |
| <b>NOTE:</b> The option is supported only on EX4300 switches. |                                                                 |
| Context ID                                                    | An internally generated identifier.                             |

Table 555: Summary of Spanning-Tree Protocols Output Fields (*continued*)

| Field                                                          | Values                                                                                                                                                 |
|----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| Enabled Protocol                                               | Spanning-tree protocol type enabled.                                                                                                                   |
| Root ID                                                        | Bridge ID of the elected spanning-tree root bridge.<br><br>The bridge ID consists of a configurable bridge priority and the MAC address of the bridge. |
| Root cost                                                      | Calculated cost to reach the root bridge from the bridge where the command is entered.                                                                 |
| Root port                                                      | Interface that is the current elected root port for this bridge.                                                                                       |
| Bridge ID                                                      | Locally configured bridge ID.                                                                                                                          |
| Hello time                                                     | The time for which the bridge interface remains in the listening or learning state.                                                                    |
| Forward delay                                                  | The time for which the bridge interface remains in the listening or learning state before transitioning to the forwarding state.                       |
| Extended System ID                                             | The system ID.                                                                                                                                         |
| Inter Instance ID                                              | An internally generated instance identifier.                                                                                                           |
| Maximum age                                                    | Maximum age of received bridge protocol data units (BPDUs).                                                                                            |
| Number of topology changes                                     | Total number of spanning-tree protocol topology changes detected since the switch last booted.                                                         |
| Time since last topology change                                | Number of seconds elapsed since the last topology change.                                                                                              |
| <b>NOTE:</b> This option is supported only on EX4300 switches. |                                                                                                                                                        |
| Spanning Tree Interface Details                                |                                                                                                                                                        |
| Interface Name                                                 | Interface configured to participate in the spanning-tree protocol instance.                                                                            |
| Port ID                                                        | Logical interface identifier configured to participate in the spanning-tree protocol instance.                                                         |
| Designated Port ID                                             | Port ID of the designated port for the LAN segment to which the interface is attached.                                                                 |
| Designated Bridge ID                                           | ID of the designated bridge to which the interface is attached.                                                                                        |
| Port Cost                                                      | Configured cost for the interface.                                                                                                                     |

Table 555: Summary of Spanning-Tree Protocols Output Fields (*continued*)

| Field Name                             | Field Description                                                                                                                               | Level of Output                       |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------|
| <b>Enabled protocol</b>                | Spanning-tree protocol type enabled.                                                                                                            | VSTP all, RSTP all, MSTP all, STP all |
| <b>Root ID</b>                         | Bridge ID of the elected spanning tree root bridge. The bridge ID consists of a configurable bridge priority and the MAC address of the bridge. | VSTP all, RSTP all, MSTP all, STP all |
| <b>Root cost</b>                       | Calculated cost to reach the root bridge from the bridge where the command is entered.                                                          | VSTP all                              |
| <b>Root port</b>                       | Interface that is the current elected root port for this bridge.                                                                                | VSTP all                              |
| <b>CIST regional root</b>              | Bridge ID of the elected MSTP regional root bridge.                                                                                             | MSTP all                              |
| <b>CIST internal root cost</b>         | Calculated cost to reach the regional root bridge from the bridge where the command is entered.                                                 | MSTP all                              |
| <b>Hello time</b>                      | Configured number of seconds between transmissions of configuration BPDUs.                                                                      | VSTP all, RSTP all, MSTP all, STP all |
| <b>Maximum age</b>                     | Maximum age of received protocol BPDUs.                                                                                                         | VSTP all, RSTP all, MSTP all, STP all |
| <b>Forward delay</b>                   | Configured time an STP bridge port remains in the listening and learning states before transitioning to the forwarding state.                   | VSTP all, RSTP all, MSTP all, STP all |
| <b>Message age</b>                     | Number of seconds elapsed since the most recent BPDU was received.                                                                              | VSTP all, RSTP all, STP all           |
| <b>Number of topology changes</b>      | Total number of STP topology changes detected since the switch last booted.                                                                     | VSTP all, RSTP all, MSTP all, STP all |
| <b>Time since last topology change</b> | Number of seconds elapsed since the most recent topology change.                                                                                | RSTP detail                           |
| <b>Topology change initiator</b>       | Interface name of the interface that received the topology change request.                                                                      | RSTP detail                           |

Table 556: show spanning-tree bridge Output Fields (*continued*)

| Field Name                              | Field Description                                                                                                                     | Level of Output                                   |
|-----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------|
| <b>Topology change last recvd. from</b> | Bridge ID of the bridge that requested the last topology change.                                                                      | RSTP detail                                       |
| <b>Bridge ID (local)</b>                | Locally configured bridge ID. The bridge ID consists of a configurable bridge priority and the MAC address of the bridge.             | VSTP all, RSTP all, MSTP all, STP all             |
| <b>Extended system ID (local)</b>       | Internally generated system identifier.                                                                                               | VSTP all, RSTP all, MSTP all, STP all             |
| <b>MSTI regional root</b>               | Bridge ID of the elected MSTP regional root bridge.                                                                                   | MSTP detail                                       |
| <b>Internal instance ID (local)</b>     | An internally generated identifier.                                                                                                   | VSTP all, RSTP all, MSTP all, STP all             |
| <b>Hello time (local)</b>               | Configured number of seconds between transmissions of configuration BPDUs.                                                            | RSTP detail, MSTP detail, STP detail              |
| <b>Maximum age (local)</b>              | Maximum age of received protocol BPDUs.                                                                                               | VSTP detail, RSTP detail, MSTP detail, STP detail |
| <b>Forward delay (local)</b>            | Configured time an STP bridge port remains in the listening and learning states before transitioning to the forwarding state.         | RSTP detail, MSTP detail, STP detail              |
| <b>Path Cost Method (local)</b>         | Bridges supporting 802.1D (legacy) implement only 16-bit values for path cost. Newer versions of this standard support 32-bit values. | VSTP detail, RSTP detail, MSTP detail, STP detail |
| <b>Maximum Hop count (local)</b>        | Configured maximum number of hops a BPDU can be forwarded in the MSTP region.                                                         | MSTP detail                                       |

## Sample Output

## show spanning-tree bridge

**List of Syntax** [Syntax on page 5040](#)  
[Syntax \(QFX Series\) on page 5040](#)

**Syntax** `show spanning-tree bridge`  
`<brief | detail>`  
`<msti msti-id>`  
`<routing-instance routing-instance-name>`  
`<vlan-id vlan-id>`

**Syntax (QFX Series)** `show spanning-tree bridge`  
`<brief | detail>`  
`<msti msti-id>`  
`<vlan-id vlan-id>`

**Release Information** Command introduced in Junos OS Release 8.4.  
 Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Display the configured or calculated Spanning Tree Protocol (STP) parameters.

**Options** **none**—(Optional) Display brief STP bridge information for all multiple spanning-tree instances (MSTIs).

**brief | detail**—(Optional) Display the specified level of output.

**msti *msti-id***—(Optional) Display STP bridge information for the specified MSTI.

**routing-instance *routing-instance-name***—(Optional) Display STP bridge information for the specified routing instance.

**vlan-id *vlan-id***—(Optional) Display STP bridge information for the specified VLAN.

**Required Privilege Level** view

**List of Sample Output** [show spanning-tree bridge routing-instance on page 5041](#)  
[show spanning-tree bridge msti on page 5042](#)  
[show spanning-tree bridge vlan-id \(MSTP\) on page 5043](#)  
[show spanning-tree bridge \(RSTP\) on page 5043](#)  
[show spanning-tree bridge vlan-id \(RSTP\) on page 5044](#)

**Output Fields** [Table 557 on page 5040](#) lists the output fields for the **show spanning-tree bridge** command. Output fields are listed in the approximate order in which they appear.

**Table 557: show spanning-tree bridge Output Fields**

| Field Name            | Field Description                                                  |
|-----------------------|--------------------------------------------------------------------|
| Routing instance name | Name of the routing instance under which the bridge is configured. |
| Enabled protocol      | Spanning Tree Protocol type enabled.                               |

Table 557: show spanning-tree bridge Output Fields (*continued*)

| Field Name                      | Field Description                                                                                                                               |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| Root ID                         | Bridge ID of the elected spanning-tree root bridge. The bridge ID consists of a configurable bridge priority and the MAC address of the bridge. |
| Root cost                       | Calculated cost to reach the root bridge from the bridge where the command is entered.                                                          |
| Root port                       | Interface that is the current elected root port for this bridge.                                                                                |
| CIST regional root              | Bridge ID of the elected MSTP regional root bridge.                                                                                             |
| CIST internal root cost         | Calculated cost to reach the regional root bridge from the bridge where the command is entered.                                                 |
| Hello time                      | Configured number of seconds between transmissions of configuration bridge protocol data units (BPDUs).                                         |
| Maximum age                     | Configured maximum expected arrival time of hello bridge protocol data units (BPDUs).                                                           |
| Forward delay                   | How long an STP bridge port remains in the listening and learning states before transitioning to the forwarding state.                          |
| Hop count                       | Configured maximum number of hops a BPDU can be forwarded in the MSTP region.                                                                   |
| Message age                     | Number of elapsed seconds since the most recent BPDU was received.                                                                              |
| Number of topology changes      | Total number of STP topology changes detected since the routing device last booted.                                                             |
| Time since last topology change | Number of elapsed seconds since the most recent topology change.                                                                                |
| Bridge ID (Local)               | Locally configured bridge ID. The bridge ID consists of a configurable bridge priority and the MAC address of the bridge.                       |
| Extended system ID              | System identifier.                                                                                                                              |
| MSTI regional root              | Bridge ID of the elected MSTP regional root bridge.                                                                                             |

| <b>Release Information</b>      | Command introduced in Junos OS Release 9.0 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>              | Display the configured or calculated interface-level spanning-tree protocol (can be either STP, RSTP, or MSTP) parameters. In <b>brief</b> mode, will not display interfaces that are administratively disabled or do not have a physical link.                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Options</b>                  | <p><b>none</b>—(Optional) Display brief STP interface information.</p> <p><b>brief   detail</b>—(Optional) Display the specified level of output.</p> <p><b>interface-name <i>interface-name</i></b>—(Optional) Name of an interface.</p> <p><b>msti <i>msti-id</i></b>—(Optional) Display STP bridge information for the specified MSTP instance ID or Common and Internal Spanning Tree (CIST). Specify <b>0</b> for CIST. Specify a value from 1 through <b>4094</b> for an MSTI.</p> <p><b>vlan-id <i>vlan-id</i></b>—(Optional) For MSTP interfaces, display interface information for the specified VLAN. Specify a value from <b>0</b> through <b>4094</b>.</p> |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

Table 558: show spanning-tree interface Output Fields

| Field Name                    | Field Description                                                                                                 |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------|
| Interface name                | Interface configured to participate in the STP, RSTP, or MSTP instance.                                           |
| Port ID                       | Logical interface identifier configured to participate in the MSTP instance.                                      |
| Designated port ID            | Port ID of the designated port for the LAN segment this interface is attached to.                                 |
| Designated bridge ID          | Bridge ID of the designated bridge for the LAN segment this interface is attached to.                             |
| Port Cost                     | Configured cost for the interface.                                                                                |
| Port State                    | STP port state. Forwarding (FWD), blocking (BLK), listening, learning, or disabled.                               |
| Port Role                     | MSTP or RSTP port role. Designated (DESG), backup (BKUP), alternate (ALT), (ROOT), or Root Prevented (Root-Prev). |
| Link type                     | MSTP or RSTP link type. Shared or point-to-point (pt-pt) and edge or non edge.                                    |
| Alternate                     | Identifies the interface as an MSTP or RSTP alternate root port (yes) or non-alternate root port (no).            |
| Boundary Port                 | Identifies the interface as an MSTP regional boundary port (yes) or non-boundary port (no).                       |
| Edge delay while expiry count | Number of times the edge delay timer expired on that interface.                                                   |
| Rcvd info while expiry count  | Number of times the rcvd info timer expired on that interface.                                                    |

|-----------------------|-------------------------------------------------------------------------------|
| <b>Interface name</b> | Interface configured to participate in the STP, RSTP, VSTP, or MSTP instance. |

Table 559: show spanning-tree Interface Output Fields (*continued*)

| Field Name                  | Field Description                                                                                                                                                     |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Port ID</b>              | Logical interface identifier configured to participate in the MSTP or VSTP instance.                                                                                  |
| <b>Designated port ID</b>   | Port ID of the designated port for the LAN segment to which this interface is attached.                                                                               |
| <b>Designated bridge ID</b> | Bridge ID of the designated bridge for the LAN segment to which this interface is attached.                                                                           |
| <b>Port Cost</b>            | Configured cost for the interface.                                                                                                                                    |
| <b>Port State</b>           | STP port state: forwarding ( <b>FWD</b> ), blocking ( <b>BLK</b> ), listening, learning, or disabled.                                                                 |
| <b>Port Role</b>            | MSTP, VSTP, or RSTP port role: designated ( <b>DESG</b> ), backup ( <b>BKUP</b> ), alternate ( <b>ALT</b> ), ( <b>ROOT</b> ), or Root Prevented ( <b>Root-Prev</b> ). |
| <b>Link type</b>            | MSTP, VSTP, or RSTP link type. Shared or point-to-point (pt-pt) and edge or nonedge.                                                                                  |
| <b>Alternate</b>            | Identifies the interface as an MSTP, VSTP, or RSTP alternate root port ( <b>Yes</b> ) or nonalternate root port ( <b>No</b> ).                                        |
| <b>Boundary Port</b>        | Identifies the interface as an MSTP regional boundary port ( <b>Yes</b> ) or nonboundary port ( <b>No</b> ).                                                          |

## Sample Output

### show spanning-tree interface

```
user@host> show spanning-tree interface routing-instance vs1 detail
Spanning tree interface parameters for instance 0
```

| BPDUs received                  | Total number of BPDUs received.                       |
| BPDUs sent in last interval     | Number of BPDUs sent within a specified interval.     |
| BPDUs received in last interval | Number of BPDUs received within a specified interval. |

Table 563: show spanning-tree statistics Output Fields (*continued*)

| Field Name                    | Field Description                                              |
|-------------------------------|----------------------------------------------------------------|
| <b>Interface</b>              | Interface for which the statistics are being displayed.        |
| <b>Next BPDU transmission</b> | Number of seconds until the next BPDU is scheduled to be sent. |

## Sample Output

### show spanning-tree statistics routing-instance

```

user@host> show spanning-tree statistics routing-instance vs1 detail
Routing instance level STP statistics
Message type           : bpdus
BPDUs sent             : 1396
BPDUs received         : 1027
BPDUs sent in last interval : 5      (duration: 4 sec)
BPDUs received in last interval: 4    (duration: 4 sec)

```

### show spanning-tree statistics interface routing-instance detail

```

user@host> show spanning-tree statistics interface ge-11/1/4 routing-instance vs1 detail
Interface  BPDUs sent  BPDUs received  Next BPDU
                                     transmission
ge-11/1/4      7           190           0

```

### Understanding EX4300 Virtual Chassis

EX4300 switches can act as member switches in a non-mixed Virtual Chassis—a Virtual Chassis composed entirely of EX4300 switches—as well as participate as member switches in a QFX Series Virtual Chassis or as leaf nodes in a Virtual Chassis Fabric (VCF). This topic provides information regarding EX4300 member switches in a non-mixed EX4300 Virtual Chassis only. For information on EX4300 member switches in a QFX Series Virtual Chassis, see *Understanding QFX Series Virtual Chassis*. For information on EX4300 switches in a VCF, see [“Virtual Chassis Fabric Overview” on page 5241](#).

EX4300 Virtual Chassis brings the Virtual Chassis flexible, scaling switch solution to the Juniper Networks EX4300 Ethernet Switch. You can connect up to ten EX4300 switches together to form one EX4300 Virtual Chassis and manage the unit as a single chassis. The advantages of connecting multiple switches into a Virtual Chassis include

better-managed bandwidth at a network layer, simplified configuration and maintenance because multiple switches can be managed as a single switch, increased fault tolerance and high availability (HA) because a Virtual Chassis can remain active and network traffic can be redirected to other member switches when a single member switch fails, and a simplified Layer 2 network topology that minimizes or eliminates the need for loop prevention protocols such as Spanning Tree Protocol (STP).

The Virtual Chassis also provides a flexible model for expanding your network. If you are using an EX4300 switch or EX4300 Virtual Chassis at the access layer, for instance, and need additional access ports to support more servers, computers, phones, or other devices, you can add an EX4300 switch as a Virtual Chassis member to increase the number of access ports on your network with minimal complications to the existing network topology and switch configuration. You can add this new switch to a Virtual Chassis if the switch is installed in the same building or at a different site because the long-distance optical ports can be used to interconnect EX4300 switches into the a Virtual Chassis.

You configure an EX4300 Virtual Chassis by configuring optical interfaces connecting EX4300 switches into Virtual Chassis ports (VCPs). VCPs connect switches together to form a Virtual Chassis, and are responsible for passing all data and control traffic between member switches in the Virtual Chassis. All 40-Gigabit QSFP+ optical ports on an EX4300 switch are configured as VCPs by default. All 10-Gigabit optical ports on an EX4300 switch can be configured into VCPs. You can increase the VCP bandwidth between any two member switches by connecting multiple VCP links between the switches. When multiple VCP links are interconnecting the same two member switches, a Link Aggregation Group (LAG) bundle is formed when the links are identical speeds. For instance, if you have four 40-Gigabit links configured as VCPs between member switches, a LAG with four member links at 160Gbps of bandwidth is formed. 10-Gigabit and 40-Gigabit links configured as VCPs cannot be members of the same LAG, however.

All models of EX4300 switches can be interconnected into the same EX4300 Virtual Chassis. EX4300 switches cannot be interconnected into a Virtual Chassis with any other Juniper Networks product, including other EX Series Ethernet Switches.

An EX4300 Virtual Chassis is configured, monitored, and maintained like other EX Series Virtual Chassis. See [“Understanding EX Series Virtual Chassis Components” on page 5067](#).

### Maximum Number of Switches per Virtual Chassis

The maximum number of switches that a Virtual Chassis supports varies by Virtual Chassis and can depend on the Junos OS release running on the Virtual Chassis. [Table 564 on page 5067](#) lists the maximum member switch support by Virtual Chassis and Junos OS release.

**Table 564: Maximum Member Switch Support for Virtual Chassis by Junos OS Release**

| Maximum Member Switch Support | Initial Junos OS Release                                                                                                        |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| EX2200 Virtual Chassis        | 12.2R1—Initial release. Support for up to four EX2200 member switches.                                                          |
| EX3300 Virtual Chassis        | 11.3R1—Initial release. Support for up to six EX3300 member switches<br><br>12.2R1—Support for up to ten EX3300 member switches |
| EX4200 Virtual Chassis        | 9.0R1—Initial release. Support for up to ten EX4200 member switches                                                             |

**Table 564: Maximum Member Switch Support for Virtual Chassis by Junos OS Release (*continued*)**

| Maximum Member Switch Support                    | Initial Junos OS Release                                                                                                                                                                                                                                                                                                               |

| EX4550 Virtual Chassis                           | 12.2R1—Initial release. Support for up to ten EX4550 switches                                                                                                                                                                                                                                                                          |
| EX4600 Virtual Chassis                           | 13.2X51-D25—Initial release. Support for up to ten EX4600 switches                                                                                                                                                                                                                                                                     |
| Mixed EX4200 and EX4500 Virtual Chassis          | <p>11.1R1—Initial release. Support for up to two EX4500 switches and up to eight EX4200 switches</p> <p>11.2R1—Support for up to nine EX4200 switches</p> <p>11.4R1—Support for up to nine EX4500 switches</p>                                                                                                                         |
| Mixed EX4200 and EX4550 Virtual Chassis          | 12.2R1—Initial release. Support for up to ten total EX4200 and EX4550 switches                                                                                                                                                                                                                                                         |
| Mixed EX4200, EX4500, and EX4550 Virtual Chassis | 12.2R1—Initial release. Support for up to ten total EX4200, EX4500, and EX4550 switches                                                                                                                                                                                                                                                |
| Mixed EX4300 and EX4600 Virtual Chassis          | 13.2X51-D25—Initial release. Support for up to ten total EX4300 and EX4600 switches. EX4600 switches must assume routing engine role.                                                                                                                                                                                                  |
| Mixed EX4500 and EX4550 Virtual Chassis          | 12.2R1—Initial release. Support for up to ten total EX4500 and EX4550 switches                                                                                                                                                                                                                                                         |
| EX9200 Virtual Chassis                           | 13.2R2—Initial release. Support for up to two EX9200 switches.                                                                                                                                                                                                                                                                         |

### Virtual Chassis Ports (VCPs)

You use Virtual Chassis ports (VCPs) to interconnect the member switches in a Virtual Chassis.

Some switches have dedicated VCPs. Dedicated VCPs allow you to interconnect switches without requiring any additional interface configuration.

These switches have dedicated VCPs:

- EX4200 switches, on the rear panel
- EX4500 switches, on the Virtual Chassis module
- EX4550 switches, on the Virtual Chassis module

To interconnect switches that do not have dedicated VCPs or to interconnect switches across greater distances than allowed by a dedicated-VCP connection, you configure an optical port as a VCP. You can configure those VCPs on these switches:

- EX2200 switches, through an uplink port

**NOTE:** All RJ-45 interfaces, including built-in network ports with 10/100/1000BASE-T Gigabit Ethernet connectors and 1000BASE-T RJ-45 transceivers, on EX2200 and EX2200-C switches, can also be configured into VCPs.

- EX3300 switches, through an uplink port

**NOTE:** Uplink ports 2 and 3 on EX3300 switches are configured as VCPs by default.

- EX4200 switches, through uplink module ports (SFP, SFP+, or XFP) or through an SFP+ port on the EX4200-24F switch
- EX4300 switches, through uplink ports

**NOTE:** All QSFP+ ports on an EX4300 switch are configured as VCPs by default.

- EX4500 switches, through any SFP+ port
- EX4550 switches, through any SFP+ port
- EX4600 switches, through SFP+ and QSFP+ ports.

All supported SFP, SFP+, and XFP uplink connections between EX4200, EX4500, and EX4550 switches can be configured as VCPs.

You can increase the Virtual Chassis bandwidth between member switches by configuring multiple optical ports connecting the switches as VCPs. The optical ports configured as VCPs automatically form a Link Aggregation Group (LAG) bundle. See [“Understanding EX Series Virtual Chassis Port Link Aggregation” on page 5083](#).

## Master Role

---

The member that functions in the master role in the Virtual Chassis:

- Manages the member switches.
- Runs Junos OS for EX Series switches in a master role.
- Runs the chassis management processes and control protocols.
- Represents all the member switches interconnected within the Virtual Chassis configuration. (The hostname and other properties that you assign to this switch during setup apply to all members of the Virtual Chassis configuration.)

When an EX Series switch that supports Virtual Chassis is powered on as a standalone switch, it is considered the master member. In a Virtual Chassis, one member functions as the master and a second member functions as the backup:

- In a preprovisioned configuration, one of the two members assigned as **routing-engine** functions as the master member. The selection of which member assigned as **routing-engine** functions as master and which as backup is determined by the software based on the master election algorithm. See [“Understanding How the Master in a Virtual Chassis Is Elected” on page 5078](#).
- In a configuration that is not preprovisioned, the selection of the master and backup is determined by the mastership priority value and secondary factors in the master election algorithm.

In a mixed EX4300 and EX4600 Virtual Chassis, an EX4600 switch must assume the master role.

In any mixed Virtual Chassis configuration that includes EX4200 switches, EX4500 switches, or EX4550 switches, any switch can be configured in any role in any configuration.

## Backup Role

---

The member that functions in the backup role in the Virtual Chassis:

- Maintains a state of readiness to take over the master role if the master fails.
- Runs Junos OS for EX Series switches in a backup role.
- Synchronizes with the master in terms of protocol states, forwarding tables, and so forth, so that it is prepared to preserve routing information and maintain network connectivity without disruption in case the master is unavailable.

You must have at least two member switches in the Virtual Chassis configuration in order to have a backup member.

- In a preprovisioned configuration, one of the two members assigned as **routing-engine** functions in the backup role. The selection of which member assigned as **routing-engine** functions as master and which as backup is determined by the software based on the

master election algorithm. See [“Understanding How the Master in a Virtual Chassis Is Elected” on page 5078](#).

- In a configuration that is not preprovisioned, the selection of the master and backup is determined by the mastership priority value and secondary factors in the master election algorithm.

In a mixed EX4300 and EX4600 Virtual Chassis, we strongly recommend configuring an EX4600 switch into the backup role. A mixed EX4300 and EX4600 Virtual Chassis must use an EX4600 member switch in the master role, and configuring an EX4600 switch into the backup role ensures that the Virtual Chassis remains up after a switchover event.

In any mixed Virtual Chassis configuration that includes EX4200 switches, EX4500 switches, or EX4550 switches, any switch can be configured in any role in any configuration.

### Linecard Role

A member that functions in the linecard role in the Virtual Chassis:

- Runs only a subset of Junos OS for EX Series switches.
- Does not run the chassis control protocols.
- Can detect certain error conditions (such as an unplugged cable) on any interfaces that have been configured on it through the master.

The Virtual Chassis configuration must have at least three members in order to include a linecard member.

- In a preprovisioned configuration, you can explicitly configure a member with the linecard role, which makes it ineligible for functioning as a master or backup.
- In a configuration that is not preprovisioned, the members that are not selected as master or backup function as linecard members of the Virtual Chassis configuration. The selection of the master and backup is determined by the mastership priority value and secondary factors in the master election algorithm. A switch with a mastership priority of 0 is always in the linecard role.

### Member Switch and Member ID

Each standalone EX Series switch that supports Virtual Chassis is a potential member of a Virtual Chassis configuration. When one of those switches is powered on, it receives a member ID that can be seen by viewing the front-panel LCD or by entering the **show virtual-chassis** command. If the switch is powered on as a standalone switch, that member's member ID is always 0. When the switch is interconnected with other switches in a Virtual Chassis configuration, its member ID is assigned by the master based on various factors, such as the order in which the switch was added to the Virtual Chassis configuration or the member ID assigned by a preprovisioned configuration. See [“Understanding How the Master in a Virtual Chassis Is Elected” on page 5078](#).

If the Virtual Chassis configuration previously included a member switch and that member was physically disconnected or removed from the Virtual Chassis configuration, its

member ID is not available for assignment as part of the standard sequential assignment by the master. For example, you might have a Virtual Chassis configuration composed of member 0, member 2, and member 3, because member 1 was removed. When you add another member switch and power it on, the master assigns it as member 4.

The member ID distinguishes the member switches from one another. You use the member ID:

- To assign a mastership priority value to a member switch
- To configure interfaces for a member switch (The function is similar to that of a slot number on Juniper Networks routers.)
- To apply some operational commands to a member switch
- To display status or characteristics of a member switch

### Mastership Priority

---

In a configuration that is not preprovisioned, you can designate the role (master, backup, or linecard) that a member switch assumes by configuring its mastership priority (from 0 through 255). The mastership priority value is the factor in the master election algorithm with the highest precedence for selecting the master of the Virtual Chassis configuration. A switch with a mastership priority of 0 never assumes the backup or master role.

The default value for mastership priority is 128 for EX2200, EX3300, EX4200, EX4500, EX4550, and EX4600 switches. When a standalone switch is powered on, it receives the default mastership priority value. Because it is the only member of the Virtual Chassis configuration, it is also the master. When you interconnect a standalone switch to an existing Virtual Chassis configuration (which implicitly includes its own master), we recommend that you explicitly configure the mastership priority of the members that you want to function as the master and backup.

**NOTE:** Configuring the same mastership priority value for both the master and backup helps to ensure a smooth transition from master to backup when the master becomes unavailable. It prevents the original master from preempting control from the backup when the backup has taken control of the Virtual Chassis configuration because the original master became unavailable.

In a preprovisioned configuration, you assign the role of each member switch. An EX9200 switch does not have a mastership priority and an EX9200 Virtual Chassis, therefore, must be preprovisioned.

### Mixed Virtual Chassis

---

EX4200 switches, EX4500 switches, and EX4550 switches can be interconnected into the same Virtual Chassis to form a mixed EX4200 and EX4500 Virtual Chassis, mixed EX4200 and EX4550 Virtual Chassis, mixed EX4500 and EX4550 Virtual Chassis, or mixed EX4200, EX4500, and EX4550 Virtual Chassis. The mixed Virtual Chassis supports up to 10 member switches regardless of whether the switches are EX4200 switches,

EX4500 switches, or EX4550 switches. Any model of EX4200, EX4500, or EX4550 switch can be interconnected into the same mixed Virtual Chassis. The master election process that decides member switch roles in a mixed Virtual Chassis is identical to the master election process in a non-mixed Virtual Chassis, so any member switch in a mixed Virtual Chassis can assume the master, backup, or linecard role.

EX4300 and EX4600 switches can act as member switches in a mixed EX4300 and EX4600 Virtual Chassis. An EX4600 switch must assume the master role in a mixed EX4300 and EX4600 Virtual Chassis. We strongly recommend configuring EX4600 switches only into the Routing Engine role when you are configuring a mixed EX4300 and EX4600 Virtual Chassis to ensure only EX4600 switches assume the master role.

EX2200 and EX3300 switches cannot be a part of any mixed Virtual Chassis.

### Virtual Chassis Identifier (VCID)

All members of a Virtual Chassis configuration share one Virtual Chassis identifier (VCID). This identifier is derived from internal parameters. When you are monitoring a Virtual Chassis configuration, the VCID is displayed in certain interface views and is also part of the **show virtual-chassis** output.

## Understanding Mixed EX Series and QFX Series Virtual Chassis or Virtual Chassis Fabric

This topic describes the requirements for a mixed Virtual Chassis or a mixed Virtual Chassis Fabric (VCF).

A mixed Virtual Chassis includes two or more types of EX Series switches, two or more types of QFX Series switches, or a mix of EX and QFX Series switches.

A mixed VCF is any VCF that includes two or more types of member switches. Because a VCF must use a QFX5100 switch as a spine device, a mixed VCF is any VCF that includes EX4300, QFX3500, or QFX3600 member switches in addition to the required QFX5100 switches.

**NOTE:** The optimal VCF topology is to use QFX5100 devices only. A VCF composed entirely of QFX5100 devices supports the largest breadth of features at the highest scalability while also supporting the highest number of high-speed interfaces.

This topic covers:

### Virtual Chassis Fabric Summary

[Table 565 on page 5074](#) provides a high-level overview of the permitted hardware allowed in the routing engine and line card roles of a mixed and a non-mixed VCF. The table also includes license requirements and supported configuration methods.

**Table 565: Virtual Chassis Fabric Summary**

| Category  | Allowed Routing Engines | Allowed Line Cards | License Requirement                                                               | Configuration Methods                                                    |
|-----------|-------------------------|--------------------|-----------------------------------------------------------------------------------|--------------------------------------------------------------------------|
| Non-mixed | QFX5100                 | QFX5100            | Yes (on two QFX5100 switches operating in master and backup Routing Engine roles) | Autoprovisioning<br>Preprovisioning<br>Nonprovisioning (not recommended) |

Table 565: Virtual Chassis Fabric Summary (*continued*)

| Category | Allowed Routing Engines | Allowed Line Cards                      | License Requirement                                                               | Configuration Methods                                                    |
|----------|-------------------------|-----------------------------------------|-----------------------------------------------------------------------------------|--------------------------------------------------------------------------|
| Mixed    | QFX5100                 | QFX5100<br>QFX3600<br>QFX3500<br>EX4300 | Yes (on two QFX5100 switches operating in master and backup Routing Engine roles) | Autoprovisioning<br>Preprovisioning<br>Nonprovisioning (not recommended) |

### Understanding Mixed Virtual Chassis Fabric

A VCF must use a QFX5100 switch in the spine role. A mixed VCF is, therefore, any VCF that includes EX4300, QFX3500, or QFX3600 member switches in addition to the required QFX5100 switch.

The optimal method of configuring a VCF is to use QFX5100 devices only. A non-mixed VCF composed entirely of QFX5100 devices supports the largest breadth of features at the highest scalability while also supporting the highest number of high-speed interfaces. You can, however, also configure a mixed VCF.

If you use QFX3600, QFX3500, or EX4300 devices as leaf devices in your VCF, you must configure all devices in your VCF into mixed mode. If you are turning a non-mixed VCF into a mixed VCF, you have to reboot the VCF to change the mixed mode setting.

### Virtual Chassis Summary for QFX5100, QFX3600, QFX3500, EX4600, and EX4300 Switches

[Table 566 on page 5076](#) provides a high-level overview of the permitted hardware allowed in the routing engine and line card roles of a mixed and a non-mixed Virtual Chassis for QFX5100, QFX3600, QFX3500, EX4600, and EX4300 switches. The table also includes license requirements and supported configuration methods.

Table 566: Virtual Chassis Summary

| Category  | Allowed Routing Engines | Allowed Line Cards                      | License Requirement | Configuration Methods              |
|-----------|-------------------------|-----------------------------------------|---------------------|------------------------------------|
| Non-mixed | QFX5100                 | QFX5100                                 | No                  | Nonprovisioning<br>Preprovisioning |
|           | QFX3600<br>QFX3500      | QFX3600<br>QFX3500                      | No                  | Nonprovisioning<br>Preprovisioning |
|           | EX4600                  | EX4600                                  | No                  | Nonprovisioning<br>Preprovisioning |
|           | EX4300                  | EX4300                                  | No                  | Nonprovisioning<br>Preprovisioning |
| Mixed     | QFX5100                 | QFX5100<br>QFX3600<br>QFX3500<br>EX4300 | No                  | Nonprovisioning<br>Preprovisioning |
|           | QFX3600<br>QFX3500      | QFX3600<br>QFX3500<br>EX4300            | No                  | Nonprovisioning<br>Preprovisioning |
|           | EX4600                  | EX4600<br>EX4300                        | No                  | Nonprovisioning<br>Preprovisioning |

#### Understanding the Routing Engine Role in a Mixed Virtual Chassis Using EX4300, EX4600, QFX3500, QFX3600, or QFX5100 Member Switches

In a mixed Virtual Chassis, the switch in the master Routing Engine role determines which switches are supported in the line card role of the mixed Virtual Chassis.

When a mixed Virtual Chassis is using a QFX5100 switch in the master Routing Engine role, you can use QFX5100, QFX3600, QFX3500, or EX4300 switches in the line card role.

When a mixed Virtual Chassis is using a QFX3600 or QFX3500 switch in the master Routing Engine role, you can use QFX3600, QFX3500, or EX4300 switches in the line card role.

In a mixed EX4300 and EX4600 Virtual Chassis, an EX4600 switch automatically assumes the Routing Engine role.

EX4600 switches can only be in a mixed Virtual Chassis with EX4300 switches. EX4600 switches cannot be in a mixed Virtual Chassis with QFX5100, QFX3600, or QFX3500 switches.

We recommend always configuring the same type of switch into the master and backup Routing Engine role, to ensure that the switch operating in the master role remains the same type of switch in the event of a switchover.

In most mixed Virtual Chassis, you must configure your Virtual Chassis to ensure a switch that supports the master Routing Engine assumes the master Routing Engine role. Without user configuration, any switch—with the exception of the EX4300 switch, which can never assume the master or backup Routing Engine role in a mixed Virtual Chassis or VCF—can assume the master or backup Routing Engine role.

### **Understanding EX4300, QFX3500, QFX3600, and QFX5100 Switches in a Virtual Chassis**

Up to ten EX4300 switches, QFX3500 switches, QFX3600 switches, and QFX5100 switches can be interconnected using Virtual Chassis ports (VCPs) to form a mixed or non-mixed Virtual Chassis. The mixed Virtual Chassis supports up to ten member switches regardless of the switches that compose the mixed Virtual Chassis.

EX4300 switches can also be interconnected into a mixed Virtual Chassis with EX4600 switches. See the following section for information on mixed EX4300 and EX4600 Virtual Chassis.

### **Understanding Mixed EX4300 and EX4600 Virtual Chassis**

EX4300 switches and EX4600 switches can be interconnected into the same Virtual Chassis. An EX4600 switch automatically assumes the master Routing Engine role in a mixed EX4300 and EX4600 Virtual Chassis, since EX4300 switches cannot assume the Routing Engine role in a mixed Virtual Chassis. EX4600 switches cannot be in a mixed Virtual Chassis with any other type of switch.

The mixed Virtual Chassis supports up to ten member switches.

### **Understanding EX4200, EX4500, and EX4550 Switches in a Mixed Virtual Chassis**

EX4200 switches, EX4500 switches, and EX4550 switches can be interconnected into the same Virtual Chassis to form a mixed EX4200 and EX4500 Virtual Chassis, mixed EX4200 and EX4550 Virtual Chassis, mixed EX4500 and EX4550 Virtual Chassis, or mixed EX4200, EX4500, and EX4550 Virtual Chassis. The mixed Virtual Chassis supports up to 10 member switches regardless of whether the switches are EX4200 switches, EX4500 switches, or EX4550 switches. Any model of EX4200, EX4500, or EX4550 switch can be interconnected into the same mixed Virtual Chassis. The master election process that decides member switch roles in a mixed Virtual Chassis is identical to the master election process in a non-mixed Virtual Chassis, so any member switch in a mixed Virtual Chassis can assume the master, backup, or linecard role.

EX4200 switches, EX4500 switches, and EX4550 switches cannot be interconnected into a Virtual Chassis with any other switches.

## Understanding How the Master in a Virtual Chassis Is Elected

**NOTE:** This topic does not apply to EX8200 Virtual Chassis. See *EX8200 Virtual Chassis Overview*.

All switches that are interconnected in a Virtual Chassis configuration are member switches of that Virtual Chassis. Each Virtual Chassis configuration has one member that functions as the *master* and controls the Virtual Chassis configuration.

When a Virtual Chassis configuration boots, the Juniper Networks Junos operating system (Junos OS) on the switches automatically runs a master election algorithm to determine which member switch assumes the role of master.

The algorithm proceeds from the top condition downward until the stated condition is satisfied:

1. Choose the member with the highest user-configured mastership priority (255 is the highest possible value). A switch with a mastership priority of 0 will always stay in the linecard role.
2. Choose the member that was master the last time the Virtual Chassis configuration booted.
3. Choose the member that has been included in the Virtual Chassis configuration for the longest period of time. (For this to be a deciding factor, there has to be a minimum time lapse of 1 minute between the power-ons of the individual interconnected member switches.)
4. Choose the member with the lowest MAC address.

The variations among switches and switch models do not impact the master election algorithm.

To ensure that a specific member is elected as the master:

1. Power on only the switch that you want to configure as master of the Virtual Chassis configuration.
2. Configure the mastership priority of that member to have the highest possible value (255).
3. Continue to configure other members through the master member.
4. Power on the other members.

You can also specify the switch roles by preprovisioning your Virtual Chassis. Preprovisioning a Virtual Chassis allows you to manually assign the member ID and role for each switch in the Virtual Chassis. See *Configuring an EX3300 Virtual Chassis (CLI Procedure)*, *Configuring an EX4200, EX4500, or EX4550 Virtual Chassis (CLI Procedure)*, or *Configuring a QFX Series Virtual Chassis (CLI Procedure)*.

## Understanding Software Upgrade in an EX Series Virtual Chassis

**NOTE:** This topic applies to all EX Series Virtual Chassis except EX8200 Virtual Chassis. See *Understanding Software Upgrades in an EX8200 Virtual Chassis* for information about EX8200 Virtual Chassis.

In a Virtual Chassis, each member switch must be running the same version of Juniper Networks Junos operating system (Junos OS).

You can install a new Junos OS release on the entire Virtual Chassis or on a particular member in the Virtual Chassis by using the same CLI command that you use to install Junos OS on standalone switches—the **request system software add** command.

You can use the automatic software update feature to automatically update the Junos OS version on member switches as you add them to a Virtual Chassis. See “[Understanding Automatic Software Update on Virtual Chassis Member Switches](#)” on page 5090. If you are not configuring the automatic software update feature, we recommend that you update the new member switch to the version of Junos OS running on the Virtual Chassis before adding the member switch to the Virtual Chassis.

In any mixed Virtual Chassis, the member switches must be running the same version of Junos OS. You can upgrade all member switches simultaneously by specifying a path to multiple Junos OS images in the same **request system software add** command. Multiple Junos OS images are needed to upgrade a mixed Virtual Chassis because an EX4200 switch runs a different version of Junos OS than an EX4500 or EX4550 switch. See *Installing Software on a Mixed Virtual Chassis with EX4200, EX4500, and EX4550 Switches (CLI Procedure)*.

**NOTE:** EX4500 and EX4550 switches run the same Junos OS image. You do not need to use multiple Junos OS images when updating a mixed EX4500 and EX4550 Virtual Chassis.

You can also use nonstop software upgrade (NSSU) to upgrade Junos OS on all members. NSSU provides an orderly upgrade of each member of the Virtual Chassis and takes advantage of graceful Routing Engine switchover, nonstop active routing, and link aggregation to minimize traffic disruption during the upgrade. For more information about NSSU, see “[Understanding Nonstop Software Upgrade on EX Series Switches](#)” on page 2488.

## Understanding Global Management of a Virtual Chassis

---

**NOTE:** This topic does not apply to EX8200 Virtual Chassis. See [Understanding Global Management of an EX8200 Virtual Chassis](#).

---

A Virtual Chassis is composed of multiple switches, and it, therefore, has multiple console ports and multiple out-of-band management Ethernet ports located on the switches.

You can connect a PC or laptop directly to a console port of any member switch to set up and configure the Virtual Chassis. When you connect to the console port of any member switch, the console session is redirected to the master switch, as shown in [Figure 79 on page 5081](#).

Figure 79: Console Session Redirection (EX4200 Virtual Chassis Pictured)

If the master becomes unavailable, the console session is disconnected from the old master and a new session is established with the newly elected master.

An out-of-band management Ethernet port is often referred to simply as a management Ethernet port. It uses a dedicated management channel for device maintenance and allows a system administrator to monitor and manage the switch by remote control.

The Virtual Chassis configuration can be managed remotely through SSH or Telnet using a global management interface called the virtual management Ethernet (VME) interface. The VME interface is a logical interface representing all of the out-of-band management ports on the member switches. When you connect to the Virtual Chassis configuration using the VME interface's IP address, the connection is redirected to the master member as shown in [Figure 80 on page 5082](#).

Figure 80: Management Ethernet Port Redirection to the VME Interface

If the master management Ethernet link is unavailable, the session is redirected through the backup management Ethernet link. If there is no active management Ethernet link on the backup, the VME interface chooses a management Ethernet link on one of the linecard members, selecting the linecard member with the lowest member ID as its first choice.

You can configure an IP address for the VME global management interface at any time.

You can perform remote configuration and administration of all members of the Virtual Chassis configuration through the VME interface.

## Understanding Nonvolatile Storage in a Virtual Chassis

**NOTE:** This topic applies to all EX Series Virtual Chassis except EX8200 Virtual Chassis. See *Understanding File Storage in an EX8200 Virtual Chassis* for information about EX8200 Virtual Chassis.

The EX Series or QFX Series switches store the Juniper Networks Junos operating system (Junos OS) system files in internal flash memory. In the Virtual Chassis configurations, both the master and the backup switch store the configuration information for all the member switches.

- [Nonvolatile Memory Features on page 5083](#)

### Nonvolatile Memory Features

Junos OS optimizes the way the Virtual Chassis stores its configuration if a member switch or the Virtual Chassis configuration is shut down improperly:

- If the master is not available, the backup switch takes on the role of the master and its internal flash memory takes over as the alternate location for maintaining nonvolatile configuration memory.
- If a member switch is taken offline for repair, the master stores the configuration of the member switch.

## Understanding EX Series Virtual Chassis Port Link Aggregation

**NOTE:** This topic applies to all EX Series Virtual Chassis except EX8200 Virtual Chassis. See *Understanding Virtual Chassis Port Link Aggregation in an EX8200 Virtual Chassis* for information about EX8200 Virtual Chassis.

You can combine physical Ethernet ports belonging to different member switches of a Virtual Chassis configuration to form a logical point-to-point link, known as a *link aggregation group (LAG)* or *bundle*. A LAG provides more bandwidth than a single Ethernet link can provide. Additionally, link aggregation provides network redundancy by

load-balancing traffic across all available links. If one of the links fails, the system automatically load-balances traffic across all remaining links.

Similarly, if a Virtual Chassis member switch that has LAG member interfaces on multiple member switches fails for any reason, the traffic traversing the LAG can be redirected through the active member switch. This setup has benefits for failover purposes and can be especially beneficial in cases when a member switch needs to be inactive for some time, such as during a software upgrade using NSSU.

You can configure any optical uplink port that can be used to connect EX2200, EX3300, EX4200, EX4300, EX4500, or EX4550 switches together into a Virtual Chassis port (VCP). You can configure multiple optical uplink interfaces between two member switches in the same Virtual Chassis as VCPs. If you have configured two or more optical ports as VCPs connecting the same member switches, the optical uplink ports configured as VCPs automatically form a LAG provided the optical uplink ports are configured to operate at the same link speeds. Each LAG is assigned a positive-integer identifier called a *trunk ID*.

On EX2200 and EX2200-C switches only, you can also configure the RJ-45 interfaces, including built-in network ports with 10/100/1000BASE-T Gigabit Ethernet connectors and 1000BASE-T RJ-45 transceivers, into VCPs. On EX2200 and EX2200-C switches, a LAG that includes up to 8 interfaces configured as VCPs automatically forms. The LAG bundles includes all interfaces configured as VCPs, regardless of whether the interfaces are optical transceiver interfaces, RJ-45 transceiver interfaces, or built-in network ports with 10/100/1000BASE-T Gigabit Ethernet connectors.

You can create an optical VCP LAG connecting any two member switches in any Virtual Chassis, including VCP LAG connections interconnecting different switch models in a mixed Virtual Chassis.

On an EX2200 switch only, you can also configure all RJ-45 interfaces, including built-in network ports with 10/100/1000BASE-T Gigabit Ethernet connectors and 1000BASE-T RJ-45 transceivers, on EX2200 and EX2200-C switches, into VCPs. The RJ-45 interfaces also automatically form a LAG when configured into VCPs.

[Table 567 on page 5084](#) provides the maximum member link limit for each optical VCP LAG.

**Table 567: Maximum Member Links in LAGs Over Optical Interface VCPs**

| Member Switch 1 | Member Switch 2 | Maximum Member Links in VCP LAG |
|-----------------|-----------------|---------------------------------|
| EX2200 Switch   | EX2200 Switch   | 8                               |
| EX3300 Switch   | EX3300 Switch   | 8                               |
| EX4200 Switch   | EX4200 Switch   | 8                               |
| EX4200 Switch   | EX4500 Switch   | 8                               |
| EX4200 Switch   | EX4550 Switch   | 8                               |
| EX4500 Switch   | EX4500 Switch   | 8                               |

**Table 567: Maximum Member Links in LAGs Over Optical Interface VCPs (continued)**

| Member Switch 1 | Member Switch 2 | Maximum Member Links in VCP LAG |
|-----------------|-----------------|---------------------------------|
| EX4500 Switch   | EX4550 Switch   | 8                               |
| EX4550 Switch   | EX4550 Switch   | 8                               |

A LAG over uplink VCPs provides higher overall bandwidth for forwarding traffic between the member switches connected by the optical VCPs, faster management communications, and greater redundancy of operations among the members than would be available without the LAG. A LAG over uplink VCPs provides an additional Virtual Chassis link throughput for the switches.

See [“Setting an Uplink Port on an EX Series Switch as a Virtual Chassis Port \(CLI Procedure\)” on page 5109](#) for information about configuring uplink ports as VCPs.

**NOTE:** The interfaces that are included within a bundle or LAG are sometimes referred to as *member interfaces*. Do not confuse this term with *member switches*, which refers to switches that are interconnected as a Virtual Chassis. It is possible to create a LAG that is composed of member interfaces that are located in different member switches of a Virtual Chassis.

## Understanding EX Series Virtual Chassis Configuration

**NOTE:** This topic applies to all EX Series Virtual Chassis except EX8200 Virtual Chassis. See *Understanding EX8200 Virtual Chassis Components* for information about EX8200 Virtual Chassis.

You configure and manage almost all aspects of an EX Series Virtual Chassis configuration through the master switch of the Virtual Chassis. However, you can also configure Virtual Chassis parameters when a switch is a standalone switch not interconnected with other members.

EX Series switches that support Virtual Chassis have some innate characteristics of a Virtual Chassis by default. A standalone switch is assigned member ID 0 and is the master of itself. Therefore, you can edit its Virtual Chassis configuration. When the standalone switch is interconnected with an existing Virtual Chassis configuration, the Virtual Chassis configuration statements and any uplink Virtual Chassis port (VCP) settings that you previously specified on the standalone switch remain part of its configuration.

A switch is not recognized by the Virtual Chassis as a member switch until it is interconnected with the master or interconnected with an existing member of the Virtual Chassis.

EX2200, EX3300, and EX4300 switches do not have dedicated VCPs. These switches form a Virtual Chassis by configuring optical ports connecting the member switches into VCPs. You can expand the uplink connections on these switches over long distances to connect switches at different locations into the same Virtual Chassis.

**NOTE:** Uplink ports 2 and 3 on any EX3300 switch are configured, by default, as VCPs. You can change this default configuration or configure another uplink port as a VCP on an EX3300 switch.

QSFP+ ports on an EX4300 switch are also configured, by default, as VCPs.

On all other EX Series switches, the optical ports are not configured as VCPs by default.

When an EX4200, EX4500, or EX4550 switch is located too far away to be interconnected through dedicated VCPs, you can configure an optical port as a VCP.

A link aggregation group (LAG) will be formed automatically when the new switch is added to the configuration if more than one such link with the same speed is detected between optical VCPs on the new member and an existing member. See [“Understanding EX Series Virtual Chassis Port Link Aggregation” on page 5083](#).

When an optical port is set as a VCP, it cannot be used for any other purpose. If you want to use the optical port for another purpose, you must delete the VCP setting. You can

execute this command directly on the member whose uplink VCP setting you want to delete or through the master of the Virtual Chassis configuration.

**CAUTION:** Deleting a VCP in a Virtual Chassis configuration can cause the Virtual Chassis configuration to split. For more information, see [“Understanding Split and Merge in a Virtual Chassis” on page 5087](#).

You can create a preprovisioned configuration. This type of configuration allows you to deterministically control the member ID and role assigned to a member switch by associating the switch with its serial number. For an example of a preprovisioned configuration, see *Example: Configuring an EX4200 Virtual Chassis Using a Preprovisioned Configuration File*.

**NOTE:** If a switch is interconnected with other switches in a Virtual Chassis configuration, each individual switch that is included as a member of the configuration is identified with a member ID. The member ID functions as an FPC slot number. When you are configuring interfaces for a Virtual Chassis configuration, you specify the appropriate member ID as the *slot* element of the interface name.

The default factory settings for a Virtual Chassis configuration include FPC 0 as a member of the default VLAN because FPC 0 is configured as part of the `ethernet-switching` family. To include the FPC in the default VLAN, add the `ethernet-switching` family to the configurations for those interfaces.

## Understanding Split and Merge in a Virtual Chassis

In a Virtual Chassis, two or more switches are connected together to form a unit that is managed as a single chassis. If there is a disruption to the Virtual Chassis configuration due to member switches failing or being removed from the configuration, the Virtual Chassis configuration splits into two separate Virtual Chassis. This situation could cause disruptions in the network if the two separate configurations share common resources, such as global IP addresses. The split and merge feature provides a method to prevent the separate Virtual Chassis configurations from adversely affecting the network and also allows the two parts to merge back into a single Virtual Chassis configuration.

**NOTE:** If a Virtual Chassis configuration splits into separate parts, we recommend that you resolve the problem that caused the Virtual Chassis configuration to split as soon as possible.

You can also use this feature to merge two active but separate Virtual Chassis that have not previously been part of the same configuration into one Virtual Chassis configuration.

**NOTE:** The split and merge feature is enabled by default on EX Series and QFX Series Virtual Chassis. You can disable the split and merge feature by using the `set virtual-chassis no-split-detection` command.

This topic describes:

- [What Happens When a Virtual Chassis Configuration Splits on page 5088](#)
- [Merging Virtual Chassis Configurations on page 5089](#)

### [What Happens When a Virtual Chassis Configuration Splits](#)

---

When a Virtual Chassis configuration splits into two separate Virtual Chassis configurations, the individual member switches detect this topology change and run the master election algorithm to select a new master for each of the two Virtual Chassis configurations. The new masters then determine whether their Virtual Chassis configuration remains active. One of the configurations remains active based on the following:

- It contains both the stable master and the stable backup (that is, the master and backup from the original Virtual Chassis configuration before the split).
- It contains the stable master and the configuration is greater than half the Virtual Chassis size.
- It contains the stable backup and is at least half the Virtual Chassis size.

In accordance with the rules given in the second and third list items, if the Virtual Chassis configuration splits into two equal parts and the stable master and stable backup are in different parts, then the part that contains the stable backup becomes active.

**NOTE:** The number of members in the Virtual Chassis configuration includes all member switches connected to date minus the number whose Virtual Chassis member IDs have been recycled (that is, made available for reassignment). Therefore, the size of the Virtual Chassis configuration increases when a new member switch is detected and decreases when a member switch's ID is recycled.

These rules ensure that only one of the two separate Virtual Chassis configurations created by the split remains active. The member switches in the inactive Virtual Chassis

configuration remain in a linecard role. For the inactive members to become active again, one of the following things must happen:

- The problem that caused the original Virtual Chassis configuration to split is resolved, allowing the two Virtual Chassis configurations to merge.
- You load the factory default configuration on the inactive members, which causes the inactive members to function as standalone switches or become part of a different Virtual Chassis configuration.

**NOTE:** When you remove a member switch from a Virtual Chassis configuration, we recommend that you recycle the member ID using the `request virtual-chassis recycle` command.

### Merging Virtual Chassis Configurations

There are two scenarios in which separate Virtual Chassis merge:

- A Virtual Chassis configuration that had split into two is now merging back into a single configuration because the problem that had caused it to split has been resolved.
- You want to merge two Virtual Chassis that had not previously been configured together.

Every Virtual Chassis configuration has a unique ID (VCID) that is automatically assigned when the Virtual Chassis configuration is formed. You can also explicitly assign a VCID using the `set virtual-chassis id` command. A VCID that you assign takes precedence over automatically assigned VCIDs.

When you reconnect the separate Virtual Chassis configurations or connect them for the first time, the members determine whether or not the separate Virtual Chassis configurations can merge. The members use the following rules to determine whether a merge is possible:

- If the Virtual Chassis configurations have the same VCID, then the configurations can merge. If the two Virtual Chassis were formed as the result of a split, they have the same VCID.
- If the VCIDs are different, then the two configurations can merge only if both are active (inactive configurations cannot merge, ensuring that members removed from one Virtual Chassis configuration do not become members of another Virtual Chassis configuration). If the configurations to merge are both active and one of them has a user-configured VCID, this ID becomes the ID of the merged Virtual Chassis. If neither Virtual Chassis has a user-configured VCID, then the VCID of the configuration with the highest mastership priority becomes the ID of the merged Virtual Chassis. The resulting merged Virtual Chassis configuration is active.

When you connect two Virtual Chassis configurations, the following events occur:

1. Connecting the two split Virtual Chassis configurations triggers the shortest-path-first (SPF) algorithm. The SPF algorithm computes the network topology and then triggers the master election algorithm. The master election algorithm waits for the members to synchronize the topology information before running.
2. The master election algorithm merges the VCIDs of all the members.
3. Each member runs the master election algorithm to select a master and a backup from among all members with the same VCIDs. For more information, see [“Understanding How the Master in a Virtual Chassis Is Elected”](#) on page 5078.
4. The master determines whether the Virtual Chassis configuration is active or inactive. (See [“What Happens When a Virtual Chassis Configuration Splits”](#) on page 5088.)
5. If the Virtual Chassis configuration is active, the master assigns roles to all members. If the Virtual Chassis configuration is inactive, the master assigns all members the role of linecard.
6. When the other members receive their role from the master, they change their role to backup or linecard. They also use the active or inactive state information sent by the master to set their own state to active or inactive and to construct the Virtual Chassis member list from the information sent by the master.
7. If the Virtual Chassis state is active, the master waits for messages from the members indicating that they have changed their roles to the assigned roles, and then the master changes its own role to master.

**NOTE:** When you merge two Virtual Chassis that had not previously been part of the same Virtual Chassis configuration, any configuration settings (such as the settings for Telnet and FTP services, graceful Routing Engine switchover (GRES), fast failover, VLANs, and so on) that exist on the new master become the configuration settings for all members of the new Virtual Chassis, overwriting any other configuration settings.

## Understanding Automatic Software Update on Virtual Chassis Member Switches

You can use the automatic software update feature to automatically update the Juniper Networks Junos operating system (Junos OS) version on prospective member switches as you add them to an EX Series or QFX Series Virtual Chassis.

This topic includes:

- [Automatic Software Update Basics on page 5091](#)
- [Automatic Software Update Restrictions on page 5091](#)

### Automatic Software Update Basics

---

When you have configured automatic software update on a Virtual Chassis, the Junos OS version is updated on the new member switch when you add it to the Virtual Chassis. The new member switch immediately joins the Virtual Chassis configuration and is put in the active state.

For a standalone switch to join an existing Virtual Chassis, it must be running the same version of Junos OS that is running on the Virtual Chassis master. When the master in a Virtual Chassis detects that a new switch has been added to the configuration, it checks the software version on the new switch. If the software version on the new switch is not the same as the version running on the master, the master keeps the new switch in the inactive state. If you have not enabled the automatic software update feature, you have to manually install the correct software version on each prospective member switch as it is added to the Virtual Chassis.

### Automatic Software Update Restrictions

---

You cannot use automatic software update in certain scenarios, and you must ensure that the software release version on the Virtual Chassis is supported by the release on the prospective member switch.

You cannot use the automatic software update feature to update software for a prospective member switch in the following scenarios:

- The Virtual Chassis was preprovisioned and is running Junos OS Release 10.4R2 or earlier.
- You configured the **mastership-priority** command to manually configure the mastership priority of at least one Virtual Chassis member switch and the Virtual Chassis was running Junos OS Release 10.4R2 or earlier when you committed this configuration.
- The Junos OS versions on the Virtual Chassis and the prospective member switch are different versions of the same major Junos OS release. For instance, if a Virtual Chassis is running Junos OS Release 10.4R1, the prospective member switch cannot be updated using automatic software update if it is running Junos OS Release 10.4R2, 10.4R3, or any other Junos OS Release 10.4 release version.

The automatic software update feature also has a Junos OS release dependency between the release that is already running on the Virtual Chassis and the release that is running on the prospective member switch.

[Table 568 on page 5092](#) summarizes automatic software update support for each Junos OS release combination.

Table 568: Automatic Software Update Support

| Virtual Chassis Junos OS Release                | Supported Junos OS Releases for Prospective Member Switches                                                                                                                                                        |

**Understanding MAC Address Assignment on a Virtual Chassis**

In a Virtual Chassis, multiple switches—each with its own set of interfaces with unique MAC addresses—are connected together to form one chassis that can be managed as a single switch. The MAC address assigned to each network-facing interface on the switch changes when the switch joins a Virtual Chassis. Because all Layer 2 traffic decisions are based on an interface's MAC address, understanding MAC address assignment is important to understanding how network traffic is forwarded and received by the Virtual Chassis. For additional information about how a network uses MAC addresses to forward and receive traffic, see “[Understanding Bridging and VLANs on EX Series Switches](#)” on [page 2245](#).

When a Virtual Chassis is formed, the MAC address of the switch in the master role becomes the system MAC base address. The Virtual Chassis assigns the system MAC base address as the MAC address for all Layer 3 interfaces within the Virtual Chassis. The Virtual Chassis also assigns the system MAC base address to the virtual management Ethernet (VME) interface and to all of the virtual LANs (VLANs) in the Virtual Chassis.

The system MAC base address does not change in the event of a switchover if the switch that was originally configured in the master role remains a member of the Virtual Chassis. If the switch that was originally configured in the master role is removed from the Virtual Chassis, the MAC address of the current member switch in the master role is assigned as the system MAC base address after the MAC persistence timer interval has expired. You can configure the MAC persistence timer interval.

For Layer 2 and aggregated Ethernet interfaces, the Virtual Chassis assigns a unique MAC address that is derived from the member switch MAC address to each interface. The assignment of a unique MAC address to each network interface helps ensure that functions that require MAC address differentiation—such as redundant trunk groups

(RTGs), Link Aggregation Control Protocol (LACP), and general monitoring functions—can function properly.

**NOTE:** Unique MAC address assignment for Layer 2 and aggregated Ethernet interfaces in a Virtual Chassis was introduced in Junos OS Release 11.3. The same MAC address could be assigned to interfaces on different member switches in the same Virtual Chassis prior to this release.

If you reconfigure a Layer 2 interface into a Layer 3 interface, or the reverse, within a Virtual Chassis, the MAC address of that interface changes accordingly.

MAC addresses are assigned to interfaces in a Virtual Chassis automatically—no user configuration is possible or required. You can view the MAC addresses that are assigned to the interfaces by using the **show interfaces** command.

## Understanding High Availability on an EX Series Virtual Chassis

You increase your network's high availability (HA) when you interconnect a Juniper Networks EX Series Ethernet switch into a Virtual Chassis. A Virtual Chassis is more fault tolerant than a standalone EX series switch because it remains up when a single member switch fails.

You can further improve HA by configuring the HA features available for your EX Series Virtual Chassis. You can, for instance, configure Link Aggregation Groups (LAG) bundles to include member links on multiple member switches in the same Virtual Chassis. This configuration increases fault tolerance because traffic traversing the LAG can be redirected to an active member switch when a single member switch fails.

A Virtual Chassis has dual Routing Engines—the switch in the master role and the switch in the backup role—and therefore supports many HA features not supported on standalone EX Series switches. For a complete list of High Availability features available for your EX Series Virtual Chassis, see *EX Series Virtual Chassis Software Features Overview*.

Many HA features for the EX Series Virtual Chassis are designed to improve network resiliency after a Routing Engine switchover. [Table 569 on page 5095](#) describes the effects of a Routing Engine switchover when no high availability features are enabled and when some High Availability features are enabled.

Table 569: Effects of a Routing Engine Switchover

| High Availability Feature                                             | Effect of Routing Engine Switchover                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-----------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| No HA features enabled                                                | Kernel and forwarding state information is not preserved to the backup Routing Engine. A convergence process that requires all interfaces on the Virtual Chassis to be taken offline has to be performed before the Virtual Chassis returns online. The switchover can take several minutes and the Virtual Chassis does not send or receive traffic until the switchover is complete.                                                                                                      |
| Graceful Routing Engine switchover (GRES) enabled                     | Kernel and forwarding state information is preserved on both Routing Engines, so the convergence process does not occur and the switchover happens quickly with minimal traffic loss.                                                                                                                                                                                                                                                                                                       |
| Nonstop active routing (NSR), Nonstop bridging (NSB), or both enabled | <p>Layer 2 protocols that are supported by NSB are not disrupted by a Routing Engine switchover when NSB is enabled. Layer 2 protocol information for all active Layer 2 protocols is stored on both Routing Engines when NSB is enabled.</p> <p>Layer 3 protocols that are supported by NSR are not disrupted by a Routing Engine switchover when NSR is enabled. Layer 3 protocol information for all active Layer 3 protocols is stored on both Routing Engines when NSR is enabled.</p> |
| Graceful Protocol Restart enabled                                     | Traffic is not interrupted during the switchover. Interface and kernel information is preserved. Graceful restart protocol extensions quickly collect and restore routing information for supported protocols from the neighboring devices.                                                                                                                                                                                                                                                 |

## Configuring an EX4300 Virtual Chassis (CLI Procedure)

This topic provides information about configuring a non-mixed EX4300 Virtual Chassis only. For information on configuring an QFX Virtual Chassis that includes EX4300 member switches, see *Configuring a QFX Series Virtual Chassis (CLI Procedure)*. For information on configuring EX4300 switches as leaf nodes in a VCF, see [“Preprovisioning a Virtual Chassis Fabric” on page 5264](#) or [“Autoprovisioning a Virtual Chassis Fabric” on page 5261](#).

In an EX4300 Virtual Chassis, you interconnect the EX4300 switches by using uplink ports configured as Virtual Chassis ports (VCPs). The QSFP+ uplink ports, which support 40Gbps speeds and can connect switches that are up to 492 feet (150 m) apart, are configured as VCPs by default. The SFP+ uplink ports, which support 10Gbps speeds

and can connect switches that are up to 6.2 miles (10 km) apart, can be configured into VCPs.

The simplest way to interconnect EX4300 switches into a Virtual Chassis is to install the switches within 492 feet of one another and interconnect them into a Virtual Chassis by using the QSFP+ ports.

If the member switches must be installed in locations that are more than 492 feet apart—such as at a different site or at a distant location within the same site—or if you are using the QSFP+ ports for another purpose, you must configure the SFP+ uplink module ports into VCPs. If you need additional VCP bandwidth between two member switches, you can configure additional ports as VCPs between the member switches. The ports that have identical speeds become links in a link aggregation group (LAG) to provide resiliency to the Virtual Chassis; for instance, if you had two QSFP+ ports and two SFP+ ports configured as VCPs connecting to the same switch, you would have two LAGs—one LAG with two 40Gbps QSFP+ port member links and another with two 10Gbps SFP+ port member links—between the member switches.

**NOTE:** A Virtual Chassis configuration has two Routing Engines—the master switch and the backup switch. Therefore, we recommend that you always use `commit synchronize` rather than simply `commit` to save configuration changes made for a Virtual Chassis. This ensures that the configuration changes are saved on both Routing Engines.

An EX4300 Virtual Chassis can be configured with either:

- A nonprovisioned configuration—The master sequentially assigns a member ID to other member switches. The role is determined by the mastership priority value and other factors in the master election algorithm.
- A preprovisioned configuration—You can deterministically control the member ID and role assigned to a member switch by tying the member switch to its serial number.

**NOTE:** You must configure a VLAN on all interfaces in an EX4300 Virtual Chassis, with the exception of the interfaces on member switch 0, before the interfaces can send or receive traffic. The interfaces on member switch 0 are initially placed into the default VLAN; the interfaces on all other member switches are not placed into any VLAN. See [“Configuring VLANs for EX Series Switches \(CLI Procedure\)” on page 2337](#).

**NOTE:** On an EX4300 Virtual Chassis, STP is disabled on all interfaces except the interfaces on member switch 0 until a type of STP is enabled. See *Configuring STP (CLI Procedure)* to enable STP on the interfaces in your EX4300 Virtual Chassis.

This topic includes:

- [Configuring an EX4300 Virtual Chassis with a Nonprovisioned Configuration File on page 5099](#)
- [Configuring an EX4300 Virtual Chassis with a Preprovisioned Configuration File on page 5101](#)

### [Configuring an EX4300 Virtual Chassis with a Nonprovisioned Configuration File](#)

You can use a nonprovisioned configuration to configure an EX4300 Virtual Chassis.

To configure the Virtual Chassis using a nonprovisioned configuration:

**NOTE:** We recommend that you physically cable the optical ports as the final step of this procedure.

You can, however, configure an EX4300 Virtual Chassis while the cables are physically connected.

1. Power on only the switch that you will use as the master switch.
2. Run the EZSetup program on the master switch, specifying the identification parameters. See *Connecting and Configuring an EX Series Switch (CLI Procedure)* for details.

**NOTE:** The properties that you specify for the master switch apply to the entire Virtual Chassis configuration.

3. (Optional) Configure the master switch with the virtual management Ethernet (VME) interface for out-of-band management of the Virtual Chassis:

[edit]

```
user@switch# set interfaces vme unit 0 family inet address /ip-address/mask/
```

4. (Optional) Configure mastership priority for the other member switches.

[edit virtual-chassis]

```
user@switch# set member 0 mastership-priority 255
```

```
user@switch# set member 1 mastership-priority 255
```

```
user@switch# set member 2 mastership-priority 10
```

```
user@switch# set member 3 mastership-priority 9
```

```
user@switch# set member 4 mastership-priority 8
```

```
user@switch# set member 5 mastership-priority 7
```

```
user@switch# set member 6 mastership-priority 6
```

```
user@switch# set member 7 mastership-priority 5
```

```
user@switch# set member 8 mastership-priority 4
```

```
user@switch# set member 9 mastership-priority 3
```

The mastership priority value determines the roles in a non-provisioned Virtual Chassis configuration. The switches with the highest mastership priority values assume the master and backup roles. All other switches assume the linecard role.

If you do not configure the mastership priority for any switch in your Virtual Chassis, including when you do not configure the Virtual Chassis, all switches assume the default mastership priority of 128. The master election algorithm selects the roles for the member switches. In most cases, the switches that have been powered on the longest assume the master and backup roles when all Virtual Chassis member switches are configured with the same mastership priority. See [“Understanding How the Master in a Virtual Chassis Is Elected” on page 5078](#) for additional information on the master election algorithm.

A switch with a mastership priority of 0 never assumes the master or backup role.

**NOTE:** We recommend that you specify the same mastership priority value for the intended master and backup members.

5. (Optional. Recommended for a two-member Virtual Chassis) On the master switch, disable the split and merge feature:

```
[edit virtual-chassis]
user@switch# set no-split-detection
```

6. Power on the other member switches.
7. On each individual member switch, configure the SFP+ optical ports that will be used to interconnect the EX4300 member switches into VCPs.

**NOTE:** Because QSFP+ ports are configured into VCPs by default, you do not usually have to perform this step when you are using a QSFP+ port as a VCP.

You only need to configure a QSFP+ port as a VCP if you previously configured the QSFP+ port into a network port. If you previously configured the QSFP+ port into a network port, perform this step to configure the QSFP+ port into a VCP.

```
user@switch-0> request virtual-chassis vc-port set pic-slot 1 port 0
user@switch-0> request virtual-chassis vc-port set pic-slot 1 port 1
user@switch-1> request virtual-chassis vc-port set pic-slot 1 port 0
user@switch-1> request virtual-chassis vc-port set pic-slot 1 port 1
user@switch-2> request virtual-chassis vc-port set pic-slot 1 port 0
user@switch-2> request virtual-chassis vc-port set pic-slot 1 port 1
user@switch-3> request virtual-chassis vc-port set pic-slot 1 port 0
user@switch-3> request virtual-chassis vc-port set pic-slot 1 port 1
```

**NOTE:** If you want to change the member ID that the master has assigned to a member switch, use the [request virtual-chassis renumber](#) command.

### Configuring an EX4300 Virtual Chassis with a Preprovisioned Configuration File

Preprovisioning a Virtual Chassis configuration allows you to assign the member ID and role for each switch in the Virtual Chassis.

To configure a Virtual Chassis using a preprovisioned configuration:

**NOTE:** We recommend that you physically cable the optical ports as the final step of this procedure.

You can, however, configure an EX4300 Virtual Chassis while the cables are physically connected.

1. Make a list of the serial numbers of all the switches to be connected in a Virtual Chassis configuration.
2. Note the intended role (**routing-engine** or **line-card**) of each switch. If you configure the member with a **routing-engine** role, it is eligible to function in the master or backup role. If you configure the member with a **line-card** role, it is not eligible to function in the master or backup role.
3. Power on only the switch that you plan to use as the master switch.
4. Run the EZSetup program on the master switch, specifying the identification parameters. See *Connecting and Configuring an EX Series Switch (CLI Procedure)* for details.

**NOTE:** The properties that you specify for the master switch apply to the entire Virtual Chassis configuration.

5. (Optional) Configure the master switch with the virtual management Ethernet (VME) interface for out-of-band management of the Virtual Chassis:

```
[edit]
```

```
user@switch# set interfaces vme unit 0 family inet address /ip-address/mask/
```

6. Specify the preprovisioned configuration mode:

```
[edit virtual-chassis]
```

```
user@switch# set preprovisioned
```

7. Specify all the members that you want included in the Virtual Chassis, listing each switch's serial number with the desired member ID and role.

**NOTE:** You can retrieve the switch's serial number using the **show chassis hardware** command output or by viewing the serial number ID label on the switch. See *Locating the Serial Number on an EX4300 Switch or Component*.

```
[edit virtual-chassis]
```

```
user@switch# set member 0 serial-number abc123 role routing-engine
```

```
user@switch# set member 1 serial-number def456 role routing-engine
```

```

user@switch# set member 2 serial-number ghi789 role line-card
user@switch# set member 3 serial-number jkl012 role line-card
user@switch# set member 4 serial-number mno013 role line-card
user@switch# set member 5 serial-number pqr014 role line-card
user@switch# set member 6 serial-number stu015 role line-card
user@switch# set member 7 serial-number vwx016 role line-card
user@switch# set member 8 serial-number yzz017 role line-card
user@switch# set member 9 serial-number aaa018 role line-card

```

8. (Optional. Recommended for a two-member Virtual Chassis) Disable the split and merge feature:

```

[edit virtual-chassis]
user@switch# set no-split-detection

```

9. Power on the other member switches. The member IDs and roles have been determined by the configuration, so you can power on the member switches in any order.
10. On each individual member switch, configure the SFP+ optical ports that will be used to interconnect the EX4300 member switches into VCPs.

**NOTE:** You can also use the [request virtual-chassis vc-port](#) command to configure a QSFP+ port into a VCP.

Because QSFP+ ports are configured into VCPs by default, you do not usually have to perform this step when you are using a QSFP+ port as a VCP.

You only need to configure a QSFP+ port as a VCP if you previously configured the QSFP+ port into a network port. If you previously configured the QSFP+ port into a network port, perform this step to configure the QSFP+ port into a VCP.

```

user@switch-0> request virtual-chassis vc-port set pic-slot 1 port 0
user@switch-0> request virtual-chassis vc-port set pic-slot 1 port 1
user@switch-1> request virtual-chassis vc-port set pic-slot 1 port 0
user@switch-1> request virtual-chassis vc-port set pic-slot 1 port 1
user@switch-2> request virtual-chassis vc-port set pic-slot 1 port 0
user@switch-2> request virtual-chassis vc-port set pic-slot 1 port 1
user@switch-3> request virtual-chassis vc-port set pic-slot 1 port 0
user@switch-3> request virtual-chassis vc-port set pic-slot 1 port 1

```

**NOTE:** You cannot modify the mastership priority when you are using a preprovisioned configuration. The mastership priority values are generated automatically and controlled by the role that is assigned to the member switch in the configuration file. The two Routing Engines are assigned the same mastership priority value. However, the member that was powered on first has higher prioritization according to the master election algorithm. See [“Understanding How the Master in a Virtual Chassis Is Elected”](#) on page 5078.

#### Related Documentation

- [Configuring Mastership of a Virtual Chassis \(CLI Procedure\) on page 5107](#)
- [Monitoring the Virtual Chassis Status and Statistics on EX Series Virtual Chassis on page 5157](#)

## Adding a New Switch to an Existing EX4300 Virtual Chassis (CLI Procedure)

You can use this procedure to add an EX4300 switch to an EX4300 Virtual Chassis. For information on adding an EX4300 switch to a QFX Series Virtual Chassis or to a Virtual Chassis Fabric (VCF), see *Adding a New Switch to an Existing QFX Series Virtual Chassis (CLI Procedure)* or *“Adding a Device to a Virtual Chassis Fabric” on page 5270*.

Before you begin, be sure you have:

- Mounted the new switch in a rack.
- Confirmed that the new switch is powered off.
- If you are expanding a preprovisioned configuration, made a note of the serial number (the number is on the back of the switch). You will need to edit the Virtual Chassis configuration to include the serial number of the new member switch.
- If you are expanding a preprovisioned configuration, edited the existing Virtual Chassis configuration to include the serial number of the new member switch. The parameters specified in the master Virtual Chassis configuration file are applied to the new switch after it has been interconnected to an existing member switch.

**NOTE:** If you are expanding a preprovisioned Virtual Chassis configuration, you can use the autoprovisioning feature to add member switches to that configuration.

- (Optional) Configured Ethernet interfaces on different member switches into the same LAG. See *Example: Configuring Aggregated Ethernet High-Speed Uplinks Between an EX4200 Virtual Chassis Access Switch and an EX4200 Virtual Chassis Distribution Switch*.

An active member switch might temporarily go down before coming back up as part of this procedure. Having traffic load-balanced across member switches using a LAG helps alleviate traffic loss during this procedure.

To add a new member switch to an existing Virtual Chassis configuration:

1. If the new member switch has been previously configured, revert that switch's configuration to the factory defaults before interconnecting it into the Virtual Chassis. See *“Reverting to the Default Factory Configuration for the EX Series Switch” on page 620*.

2. Interconnect the unpowered new switch to one member of the existing Virtual Chassis configuration using a QSFP+ or SFP+ port.

Connect only one VCP on the unpowered new switch to a VCP on a member switch in the existing Virtual Chassis at this point of the procedure.

3. Power on the new switch.
4. (SFP+ interface only) Set the SFP+ interface as a Virtual Chassis Port (VCP):

```
user@switch> request virtual-chassis vc-port set pic-slot 1 port port-number
```

**NOTE:** QSFP+ ports are configured as VCPs, by default. You do not, therefore, typically need to perform this step on QSFP+ ports.

You can use the [request virtual-chassis vc-port](#) to set a QSFP+ port as a VCP if the QSFP+ port had previously been configured as a network port.

5. Confirm that the new member switch is now included within the Virtual Chassis configuration by entering the **show virtual-chassis** command. The new member switch should be listed in the output and the **Status** is **Prsnt**.
6. Cable the next port into the Virtual Chassis, using Steps 2 through 5.

**CAUTION:** If you immediately cable both VCPs on the new switch into the existing Virtual Chassis at the same time, a member switch that was already part of the Virtual Chassis might become nonoperational for several seconds. Network traffic to this switch is dropped during the downtime.

The member switch will return to the normal operational state with no user intervention, and normal operation of the Virtual Chassis will resume after this downtime.

**Related Documentation**

- [Configuring an EX4300 Virtual Chassis \(CLI Procedure\)](#) on page 5097

## Replacing a Member Switch of a Virtual Chassis Configuration (CLI Procedure)

**NOTE:** This topic does not apply to Virtual Chassis Fabric (VCF) or EX8200 Virtual Chassis. See [“Removing a Device From a Virtual Chassis Fabric” on page 5277](#) or [Adding or Replacing a Member Switch or an External Routing Engine in an EX8200 Virtual Chassis \(CLI Procedure\)](#).

You can replace a member switch in a Virtual Chassis without disrupting network service on the other members. You can retain the existing configuration of the member switch and apply it to a new member switch, or you can free up the member ID and make it available for assignment to a new member switch.

If you want to replace a member switch of a *mixed* Virtual Chassis that contains EX4200, EX4500, or EX4550 switches, see [Removing an EX4200, EX4500, or EX4550 Switch From a Mixed Virtual Chassis \(CLI Procedure\)](#).

To replace a member switch, use the procedure that matches what you need to accomplish:

- [Remove, Repair, and Reinstall the Same Switch on page 5105](#)
- [Remove a Member Switch, Replace It with a Different Switch, and Reapply the Old Configuration on page 5105](#)
- [Remove a Member Switch and Make Its Member ID Available for Reassignment to a Different Switch on page 5106](#)

### **Remove, Repair, and Reinstall the Same Switch**

If you need to repair a member switch, you can remove it from the Virtual Chassis configuration without disrupting network service for the other members. The master stores the configuration for the member ID so that it can be reapplied when the member switch (with the same base MAC address) is reconnected.

To remove, repair, and reinstall the member switch:

1. Power off and disconnect the member switch to be repaired.
2. Repair, as necessary.
3. Reconnect the switch and power it on.

### **Remove a Member Switch, Replace It with a Different Switch, and Reapply the Old Configuration**

If you are unable to repair a member switch, you can replace it with a different member switch while retaining the previous configuration. The master stores the configuration of the member that was removed. When you connect a different member switch, the master assigns a new member ID. But the old configuration is still stored under the previous member ID of the previous member switch.

**NOTE:** If you have used a preprovisioned configuration, you can use the `replace` command to change the serial number in the Virtual Chassis configuration file. Substitute the serial number of the replacement member switch (on the back of the switch) for the serial number of the member switch that was removed.

To remove and replace a switch and reapply the old configuration:

1. Power off and disconnect the member switch to be replaced.
2. If the replacement member switch has been previously configured, revert that switch's configuration to the factory defaults. See [“Reverting to the Default Factory Configuration for the EX Series Switch” on page 620](#) for information about reverting to the factory default configuration on an EX Series switch or *Reverting to the Default Factory Configuration* for information about reverting to the factory default configuration on a QFX Series switch.

3. If you are interconnecting a switch using a dedicated VCP, connect one VCP on the replacement member switch to a VCP of another Virtual Chassis member switch.

If you are interconnecting a switch using an optical port configured as a VCP, cable the optical ports together then configure the port on the Virtual Chassis as a VCP:

```
user@switch> request virtual-chassis vc-port set pic-slot 1 port port-number
```

4. Power on the new member switch.
5. Confirm that the new member switch is now included in the Virtual Chassis configuration by checking the front-panel LCD or the for the member ID. It should display a member ID in the range from 0 through 9.

If you are using a switch that does not have an LCD interface, confirm the switch is part of the Virtual Chassis configuration by entering the **show virtual-chassis** and reviewing the output.

6. Cable the other VCP on the new member switch into the Virtual Chassis. Use the instruction in Step 3 to complete this step.

**CAUTION:** If you immediately cable both VCPs on the new switch into the existing Virtual Chassis at the same time, a member switch that was already part of the Virtual Chassis might become nonoperational for several seconds. Network traffic to this switch is dropped during the downtime.

The member switch will return to the normal operational state with no user intervention, and normal operation of the Virtual Chassis will resume after this downtime.

7. On the master switch, Issue the **request virtual-chassis renumber** command from the Virtual Chassis master to change the member switch's current member ID to the member ID of the member switch that was removed from the Virtual Chassis configuration.

---

### Remove a Member Switch and Make Its Member ID Available for Reassignment to a Different Switch

---

When you remove a member switch from the Virtual Chassis configuration, the master keeps that member switch's member ID in reserve. To make that member switch's member ID available for reassignment, issue the **request virtual-chassis recycle** command from the Virtual Chassis master.

**NOTE:** When you add or delete members in a Virtual Chassis configuration, internal routing changes might cause temporary traffic loss for a few seconds.

#### Related Documentation

- [Adding an EX4500 Switch to a Nonprovisioned EX4200 Virtual Chassis \(CLI Procedure\)](#)

## Configuring Mastership of a Virtual Chassis (CLI Procedure)

**NOTE:** This topic applies to all EX Series Virtual Chassis except EX8200 Virtual Chassis. See [Configuring an EX8200 Virtual Chassis \(CLI Procedure\)](#) for information about EX8200 Virtual Chassis.

You can designate the role (master, backup, or linecard) that a member switch performs within any Virtual Chassis, whether or not you are using a preprovisioned configuration.

**NOTE:** A Virtual Chassis configuration has two Routing Engines—one is the switch in the master role and the other is the switch in the backup role. Therefore, we recommend that you always use `commit synchronize` rather than `commit` to save configuration changes made for a Virtual Chassis. This ensures that the configuration changes are saved in both Routing Engines.

This topic describes:

- [Configuring Mastership Using a Preprovisioned Configuration File on page 5107](#)
- [Configuring Mastership Using a Configuration File That Is Not Preprovisioned on page 5108](#)

### Configuring Mastership Using a Preprovisioned Configuration File

To configure mastership using a preprovisioned configuration:

1. Note the serial numbers of the switches that you want to function in the master role and backup role.
2. Power on only the switch that you want to function in the master role.
3. Edit the configuration to specify the preprovisioned configuration mode:
 

```
[edit virtual-chassis]
user@switch# set preprovisioned
```
4. Specify the serial numbers of the member switches that you want to function as master and backup, specifying their role as **routing-engine**:
 

```
[edit]
user@switch# set virtual-chassis member 0 serial-number abc123 role routing-engine
user@switch# set virtual-chassis member 1 serial-number def456 role routing-engine
```

**NOTE:** You cannot directly modify the mastership priority value when you are using a preprovisioned configuration. The mastership priority values are generated automatically and controlled by the role that is assigned to the member switch in the configuration file. The two members assigned the **routing-engine** role are assigned the same mastership priority value (128). However, the member that was powered on first has higher priority for the master role election according to the master election algorithm. See [“Understanding How the Master in a Virtual Chassis Is Elected” on page 5078](#). Only two members can be configured with the **routing-engine** role.

5. Specify the serial numbers of any other member switches that you are including in the Virtual Chassis configuration. You can also explicitly configure their role as **line-card**.

### Configuring Mastership Using a Configuration File That Is Not Preprovisioned

To configure mastership of the Virtual Chassis through a configuration that is not preprovisioned:

1. Power on only the switch that you want to function in the master role.
2. Configure the highest possible mastership priority value (**255**) for the member that you want to function in the master role:
3. Configure the same mastership priority value (continue to edit the Virtual Chassis configuration on the master) for the member that you want to be in the backup role:

```
[edit virtual-chassis]
user@switch# set member 0 mastership-priority 255
```

```
[edit virtual-chassis]
user@switch# set member 1 mastership-priority 255
```

**NOTE:** We recommend that the master and backup have the same mastership priority value to prevent the master and backup status from switching back and forth between master and backup members in failover conditions.

4. Use the default mastership priority value (**128**) for the remaining member switches or configure the mastership priority to a value that is lower than the value specified for members functioning in the master and backup roles.

## Setting an Uplink Port on an EX Series Switch as a Virtual Chassis Port (CLI Procedure)

The procedure described in this topic can be used to connect two EX series switches together within the same Virtual Chassis.

You typically configure an uplink port as a Virtual Chassis Port (VCP) for one of the following reasons:

- You want to interconnect two EX series switches into a Virtual Chassis that are located in different wiring closets or sites, and the switches are farther apart than the maximum length of the dedicated VCP cable.
- You are configuring an EX Series Virtual Chassis composed of switches that support Virtual Chassis but do not have dedicated VCPs. EX2200, EX3300, and EX4300 switches support Virtual Chassis but do not have dedicated VCPs.

You must manually configure VCPs to connect EX2200 switches together to form an EX2200 Virtual Chassis. See *Setting a Port on an EX2200 Switch as a Virtual Chassis Port (CLI Procedure)*.

This procedure is usually not needed to configure an EX3300 Virtual Chassis. Uplink ports 2 and 3 on an EX3300 switch are configured as VCPs by default and, therefore, do not require user configuration to be set as VCPs. We recommend that you use this procedure to configure an uplink port on an EX3300 switch as a VCP only if you configured ports 2 and 3 as network uplink ports and the ports need to be reconfigured as VCPs, or when ports 2 and 3 cannot be used as VCPs for an unexpected reason. You can use this procedure to configure any uplink port on an EX3300 switch as a VCP.

QSFP+ ports on EX4300 switches are configured as VCPs, by default. You must use this procedure if you want to configure an SFP+ port on an EX4300 switch as a VCP, or if you want to configure a QSFP+ port that had been configured into a network port back into a VCP.

You can interconnect EX4200, EX4500, and EX4550 switches that are beyond the reach of the dedicated Virtual Chassis cables as members of a Virtual Chassis by using the uplink ports—including the ports on the SFP uplink module, SFP+ uplink module, or XFP uplink module—and connecting the uplink ports. To use the uplink ports or SFP network ports for interconnecting member switches, you must explicitly set the uplink ports as VCPs.

**NOTE:** You cannot set a 1000BASE-T copper SFP transceiver (EX-SFP-1GE-T) connection as a VCP on EX4200, EX4500, and EX4550 switches.

**NOTE:** When an uplink port is set as a VCP, it cannot be used for any other purpose. You can set one port as a VCP and configure the other port in trunk mode as an uplink to another switch.

Before you set an uplink port as a VCP:

1. Install the uplink module in the member switches that you want to interconnect, if you are configuring an uplink module port as a VCP.
2. Power on and connect to the switch that you plan to designate as the master of the Virtual Chassis.

**NOTE:** Do not power on the other switches at this point.

3. Run EZSetup on the switch that you are configuring to be the master. Follow the prompts to specify the hostname and other identification, time zone, and network properties. See *Connecting and Configuring an EX Series Switch (CLI Procedure)* for details. The properties that you specify for the master apply to the entire Virtual Chassis, including all the member switches that you later interconnect with the master.
4. If you want to configure and manage the Virtual Chassis remotely, specify the VME global management interface. You can configure the VME global management interface when you are setting up the master or you can do it after completing the other configuration steps for the Virtual Chassis. See *Configuring the Virtual Management Ethernet Interface for Global Management of an EX Series Virtual Chassis (CLI Procedure)*.
5. Configure mastership of the Virtual Chassis by using either the nonprovisioned or preprovisioned configuration. See [“Configuring Mastership of a Virtual Chassis \(CLI Procedure\)” on page 5107](#) for details.

**NOTE:** A Virtual Chassis has two Routing Engines, one in the master and the other in the backup. Therefore, we recommend that you always use **commit synchronize** rather than simply **commit** to save configuration changes made for a Virtual Chassis. This ensures that the configuration changes are saved in both Routing Engines.

Before you begin to interconnect a Virtual Chassis across long distances, such as between wiring closets:

- Prepare the existing Virtual Chassis for interconnecting with a potential member switch that is beyond the reach of a dedicated Virtual Chassis cable by setting at least one uplink VCP on an existing member of the Virtual Chassis.
- Prepare the potential member switch for interconnecting with the existing Virtual Chassis by setting at least one uplink VCP on the standalone switch.

**NOTE:** We recommend that you set two uplink VCPs within each wiring closet for redundancy.

This topic describes:

1. [Setting an Uplink VCP Between the Member Switches on page 5111](#)
2. [Setting an Uplink VCP on a Standalone Switch on page 5111](#)

### Setting an Uplink VCP Between the Member Switches

You can set an uplink port as a VCP.

**NOTE:** If you use the SFP+ uplink module, you must configure all member switches to support either 1-gigabit SFP transceivers or 10-gigabit SFP+ transceivers on EX4200 switches. See *Setting the Mode on an SFP+ or SFP+ MACSec Uplink Module (CLI Procedure)*.

To set the uplink ports for the local member switch (for example, member 0) and for a different member switch (for example, member 1) to function as VCPs:

1. Set one uplink port of member 0 as a VCP. You do not need to specify the **member member-id** option, because the command applies by default on the member where it is executed.

```
user@switch> request virtual-chassis vc-port set pic-slot 1 port 0
```

2. Set one uplink port of member 1 as a VCP.

```
user@switch> request virtual-chassis vc-port set pic-slot 1 port 0 member 1
```

This step includes the member *member-id* option, because it is executed on a different member switch than the local member switch.

### Setting an Uplink VCP on a Standalone Switch

You can set an uplink VCP on a standalone switch. You must set an uplink port on the standalone switch as a VCP prior to physically interconnecting the switch with the existing Virtual Chassis. Otherwise, the master cannot detect that the switch is a member of the Virtual Chassis.

To set one uplink VCP on the potential member, which is currently operating as a standalone switch:

1. Power on the standalone switch.
2. Set one uplink port as a VCP. You do not need to specify the **member member-id** option, because the command applies by default on the member where it is executed.

```
user@switch> request virtual-chassis vc-port set pic-slot 1 port 0
```

**NOTE:** If you do specify the member *member-id* option, use member ID 0. Because the switch is not yet interconnected with the other members of the Virtual Chassis, its current member ID is 0. Its member ID will change when it is interconnected with the Virtual Chassis. It does not impact the functioning of the uplink VCP that its VCP is set with 0 as the member ID. The VCP has significance only on the local switch.

3. After you have set the uplink VCP on the standalone switch, physically interconnect its uplink port with the VCP uplink ports of the members in the existing Virtual Chassis.

The new member switch reboots and joins the now expanded Virtual Chassis with a different member ID.

**NOTE:** The setting for the new member switch's uplink VCP remains intact and is not affected by the change of member ID.

4. If you have additional members in the second wiring closet, set a redundant VCP uplink on another member switch by issuing the **request virtual-chassis vc-port** command.

## Configuring the Timer for the Backup Member to Start Using Its Own MAC Address, as Master of a Virtual Chassis (CLI Procedure)

When a backup member takes control of a Virtual Chassis because of a reset or other temporary failure, the backup member uses the MAC address of the old master switch as the system MAC base address. This process helps ensure a smooth transition of mastership with no disruption to network connectivity.

The MAC persistence timer is used in situations in which the master switch is no longer a member of the Virtual Chassis because it has been physically disconnected or removed. If the old master switch does not rejoin the Virtual Chassis before the timer elapses, the new master switch starts using its own MAC address as the system's MAC base address. For information regarding how the system MAC base address is used to assign MAC addresses to ports in a Virtual Chassis, see [“Understanding MAC Address Assignment on a Virtual Chassis” on page 5093](#).

The default timer value is 10 minutes. The maximum timer value is 60 minutes.

You can disable the MAC persistence timer starting in Junos OS Release 12.2. When the MAC persistence timer is disabled, the MAC address of the old master switch is used as the system MAC base address; no MAC address changes occur within the Virtual Chassis even when the old master switch is no longer a member of the Virtual Chassis because it has been physically disconnected or removed.

To configure or modify the MAC persistence timer:

```
[edit virtual-chassis]
user@switch# set mac-persistence-timer minutes
```

To disable the MAC persistence timer:

```
[edit virtual-chassis]
user@switch# set mac-persistence-timer disable
```

## Disabling Split and Merge in a Virtual Chassis (CLI Procedure)

The split and merge feature is enabled by default on all EX Series switches and QFX Series devices in a Virtual Chassis. You can disable the split and merge feature. If you disable the split and merge feature and the Virtual Chassis splits, both parts of the split Virtual Chassis configuration remain active.

In a preprovisioned Virtual Chassis, if both of the Routing Engines end up in the same Virtual Chassis configuration after a split, the other part of the split Virtual Chassis configuration remains inactive. If the Routing Engines end up in different parts of the split Virtual Chassis configuration and the rest of the member switches are configured as having linecard roles, then a backup Routing Engine might not be selected for either part.

We recommend disabling split and merge on a Virtual Chassis with two member switches. A two-member switch Virtual Chassis that has disabled split and merge can reform more quickly and with less complications as a result of the feature being disabled.

To disable the split and merge feature in a Virtual Chassis:

```
[edit]
user@switch# set virtual-chassis no-split-detection
```

- [Understanding Split and Merge in a Virtual Chassis on page 5087](#)

## Configuring Automatic Software Update on Virtual Chassis Member Switches (CLI Procedure)

The automatic software update feature allows you to automatically update the software version on prospective member switches as they are added so that they can join the Virtual Chassis.

**NOTE:** The version of Junos OS running on the Virtual Chassis must be compatible with the software running on the prospective member switch for an automatic software update to occur. For information on Junos OS compatibility and other automatic software update restrictions, see [“Understanding Automatic Software Update on Virtual Chassis Member Switches” on page 5090](#).

Before you begin, ensure that you know the name or the URL of the software package to be used by the automatic software update feature.

To configure the automatic software update feature for an EX Series or QFX Series Virtual Chassis with the exception of a mixed Virtual Chassis containing at least one EX4200 switch and at least one EX4500 or EX4550 switch:

[edit]

```
user@switch# set virtual-chassis auto-sw-update package-name package-name
```

To configure the automatic software update feature on a mixed Virtual Chassis containing at least one EX4200 switch and at least one EX4500 or EX4550 switch:

[edit]

```
user@switch# set virtual-chassis auto-sw-update ex-4200 package-name package-name
```

```
user@switch# set virtual-chassis auto-sw-update ex-4500 package-name package-name
```

If the software package is located on a local directory on the switch, use the following format for **package-name**:

***/pathname/package-name***

If the software package is to be downloaded and installed from a remote location, use one of the following formats:

***ftp://hostname/pathname/package-name***

***ftp://username:prompt@ftp.hostname.net/package-name***

***http://hostname/pathname/package-name***

If you are configuring a mixed Virtual Chassis containing at least one EX4200 switch and at least one EX4500 or EX4550 switch, use the **ex-4200** keyword when you are specifying a path to a package for the EX4200 switches and the **ex-4500** when you are specifying a path to a package for the EX4500 or EX4550 switches. You do not need to specify the **ex4500** keyword when configuring automatic software update for a mixed EX4500 and EX4550 Virtual Chassis, however, because the Junos OS package for an EX4500 switch updates the software for both EX4500 and EX4550 switches.

## Assigning the Virtual Chassis ID to Determine Precedence During a Virtual Chassis Merge (CLI Procedure)

Every Virtual Chassis has a unique ID that is automatically assigned when the Virtual Chassis configuration is formed. You can also explicitly assign a Virtual Chassis ID using the **set virtual-chassis id** command. When two Virtual Chassis configurations attempt to merge, the Virtual Chassis ID that you assigned takes precedence over the automatically assigned Virtual Chassis IDs and becomes the ID for the newly merged Virtual Chassis configuration.

To configure the Virtual Chassis ID:

```
[edit]
user@switch# set virtual-chassis id id
```

## Configuring Graceful Routing Engine Switchover in a Virtual Chassis (CLI Procedure)

In a Virtual Chassis, one member switch is assigned the master role and has the master Routing Engine. Another member switch is assigned the backup role and has the backup Routing Engine. Graceful Routing Engine switchover (GRES) enables the master and backup Routing Engines in a Virtual Chassis configuration to switch from the master to backup without interruption to packet forwarding. When you configure graceful Routing Engine switchover, the backup Routing Engine automatically synchronizes with the master Routing Engine to preserve kernel state information and the forwarding state.

To set up the Virtual Chassis configuration to use graceful Routing Engine switchover (GRES):

1. Set up a minimum of two switches in a Virtual Chassis configuration with mastership priority of 255:

```
[edit]
user@switch# set virtual-chassis member 0 mastership-priority 255
[edit]
user@switch# set virtual-chassis member 1 mastership-priority 255
```

2. Set up graceful Routing Engine switchover:

```
[edit]
user@switch# set chassis redundancy graceful-switchover
```

Commit the configuration.

**NOTE:** We recommend that you use the **commit synchronize** command to save any configuration changes that you make to a multimember Virtual Chassis.

### [edit virtual-chassis] Configuration Statement Hierarchy

This topic lists supported and unsupported configuration statements in the **[edit virtual-chassis]** hierarchy level on EX Series and QFX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.
- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.

- Not all features are supported on all switch platforms.

For detailed information about feature support on specific EX Series or QFX Series switch platforms, see [Feature Explorer](#).

.

This topic lists:

- [Supported Statements in the \[edit virtual-chassis\] Hierarchy Level on page 5118](#)
- [Unsupported Statements in the \[edit virtual-chassis\] Hierarchy Level on page 5119](#)

### [Supported Statements in the \[edit virtual-chassis\] Hierarchy Level](#)

---

The following hierarchy shows the **[edit virtual-chassis]** configuration statements supported on EX Series or QFX Series switches:

```
virtual-chassis {
  aliases {
    serial-number serial-number {
      alias-name alias-name;
    }
  }
  auto-provisioned;
  auto-sw-update {
    (ex-4200 | ex-4300 | ex-4500 | ex-4600 | qfx-3 | qfx-5)
    package-name package-name;
  }
  fast-failover (ge | vcp disable | xe);
  graceful-restart {
    disable;
  }
  id id;
  mac-persistence-timer [minutes | disable];;
  member member-id {
    location location;
    mastership-priority number;
    no-management-vlan;
    role (line-card | routing-engine);
    serial-number;
  }
  no-split-detection;
  preprovisioned;
  traceoptions {
    file filename <files number> <size size> <world-readable | no-world-readable> <match
      regex>;
    flag flag ;
  }
  vc-port {
    lag-hash (packet-based | source-port-based);
  }
  vcp-no-hold-time;
}
```

---

### Unsupported Statements in the `[edit virtual-chassis]` Hierarchy Level

---

All statements in the `[edit virtual-chassis]` hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented.

## alias-name (Virtual Chassis aliases)

**Syntax** `alias-name alias-name;`

**Hierarchy Level** `[edit virtual-chassis aliases serial-number serial-number]`

**Release Information** Statement introduced in Junos OS Release 14.1X53-D10 for EX Series and QFX Series switches.

**Description** Create an alias for a member switch in a Virtual Chassis or Virtual Chassis Fabric (VCF). An alias allows you to more clearly identify the member switches in your Virtual Chassis or VCF by assigning a text label to a member switch's serial number.

The alias appears in the **Alias-Name** field in the **show virtual-chassis** command.

Alias usage is optional and aliases are used for administrative purposes only. Setting an alias has no effect on the operation of the member switch.

In the following example, the **dc-floor-1** alias name is assigned to the member switch with the serial number AB0123456789.

### set serial-number

```
[edit virtual-chassis aliases]
user@switch# set serial-number AB0123456789 alias-name dc-floor-1
```

### show virtual-chassis

```
user@switch> show virtual-chassis
Preprovisioned Virtual Chassis Fabric
Fabric ID: 9d5d.5556.919a
Fabric Mode: Enabled

Member ID  Status  Serial No  Alias-Name  Model  Mstr  prio  Role
0 (FPC 0)  Prsnt    AB0123456789  dc-floor-1  qfx5100-48s-6q  129  Master
<additional output removed for brevity>
```

**Options** *alias-name*—The text label, or alias, assigned to the member switch by the user.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Enable the automatic software update feature for Virtual Chassis or Virtual Chassis Fabric (VCF) configurations.</p> <p>You should only use the keywords that specify a device—<b>ex-4300</b>, <b>ex-4600</b>, <b>qfx-3</b>, and <b>qfx-5</b>—when configuring automatic software update on a mixed Virtual Chassis or Virtual Chassis Fabric (VCF). You can simply specify the <i>package-name</i> without specifying the device keywords in non-mixed Virtual Chassis or VCF topologies.</p> <p>You must enter the <b>auto-sw-update</b> statement multiple times—once for each device family in your mixed Virtual Chassis or VCF—in most scenarios when enabling the automatic software update for a mixed Virtual Chassis or VCF.</p> <p>The Junos OS package for an EX4500 switch updates the software for EX4500 and EX4550 switches. You do not, therefore, need to specify the <b>ex-4500</b> keyword when configuring automatic software update for a mixed Virtual Chassis that include EX4500 and EX4550 switches only. You also only have to enter the <b>ex-4500</b> keyword once to configure automatic software update for all EX4500 and EX4550 member switches in the same mixed Virtual Chassis.</p> <p>The Junos OS package for a QFX3500 device updates the software for QFX3500 and QFX3600 devices. You do not, therefore, need to specify the <b>qfx-3</b> keyword when configuring automatic software update for a Virtual Chassis composed entirely of QFX3500 and QFX3600 devices. You also have to enter the <b>qfx-3</b> keyword only once to configure automatic software update for all QFX3500 and QFX3600 member devices in the same mixed Virtual Chassis.</p> <p>The remaining statement is explained separately.</p> |
| <b>Default</b>             | The automatic software update feature is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>             | <p><b>package-name package-name</b>—Specify a path to a Junos OS software image.</p> <p><b>ex-4200</b>—Specify a path to a Junos OS image for an EX4200 switch when enabling automatic software update for a mixed EX4200 and EX4500 Virtual Chassis, mixed</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

EX4200 and EX4550 Virtual Chassis, or mixed EX4200, EX4500, or EX4550 Virtual Chassis.

**ex-4300**—Specify a path to a Junos OS image for an EX4300 switch when enabling automatic software update for a mixed Virtual Chassis or VCF.

**ex-4500**—Specify a path to a Junos OS image for an EX4500 switch, an EX4550 switch, or both types of switches when enabling automatic software update for a mixed EX4200 and EX4500 Virtual Chassis, mixed EX4200 and EX4550 Virtual Chassis, or mixed EX4200, EX4500, or EX4550 Virtual Chassis.

The Junos OS package for an EX4500 switch updates the software for EX4500 and EX4550 switches. Therefore, you only enter this command once to upgrade the EX4500 and EX4550 member switches in the same mixed Virtual Chassis.

The **ex-4500** keyword also does not need to be specified when configuring automatic software update for a mixed EX4500 and EX4550 Virtual Chassis.

**ex-4600**—Specify a path to a Junos OS image for an EX4600 switch when enabling automatic software update for a mixed Virtual Chassis.

**qfx-3**—Specify a path to a Junos OS image for a QFX3500, QFX3600, or both types of devices when enabling automatic software update for a mixed VCF.

**qfx-5**—Specify a path to a Junos OS image for a QFX5100 device when enabling automatic software update for a mixed VCF.

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.                                                                                                                                         |
| <b>Description</b>         | Configure graceful restart globally to enable the feature. You cannot enable graceful restart for specific protocols unless graceful restart is also enabled globally. You can, optionally, modify the global settings at the individual protocol level.                                                                               |

### NOTE:

- For VPNs, the **graceful-restart** statement allows a router whose VPN control plane is undergoing a restart to continue to forward traffic while recovering its state from neighboring routers.
  - For BGP, if you configure graceful restart after a BGP session has been established, the BGP session restarts and the peers negotiate graceful restart capabilities.
  - LDP sessions flap when **graceful-restart** configurations change.
-

| <b>Release Information</b>      | <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Option <b>disable</b> introduced in Junos OS Release 12.2 for EX Series switches.</p> <p>The maximum timer limit changed from no maximum timer limit to 60 minutes in Junos OS Release 12.2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).</p>                                                                                                                           |
| <b>Description</b>              | <p>Specify how long the Virtual Chassis or VCF continues to use the MAC address of the switch that was originally configured in the master role as the system MAC base address after the original master switch is removed from the Virtual Chassis or VCF. The system MAC base address does not change in the event of a switchover provided the switch originally configured in the master role remains a member of the Virtual Chassis or VCF.</p> <p>The maximum timer limit is 60 minutes starting in Junos OS Release 12.2. There are no minimum or maximum timer limits in prior Junos OS releases.</p> |
| <b>Default</b>                  | The MAC persistence timer is set to 10 minutes by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Options</b>                  | <p><b>minutes</b>—Time in minutes that the member switch in the backup role continues to use the system MAC base address of the old master before using its own system MAC base address after the switch in the master role is physically disconnected or removed from the Virtual Chassis or VCF.</p> <p><b>disable</b>—Disable the MAC persistence timer. The system MAC base address never changes when the MAC persistence timer is disabled, even when the switch in the master role is physically disconnected or removed from the Virtual Chassis or VCF.</p>                                           |
| <b>Required Privilege Level</b> | <p><b>system</b>—To view this statement in the configuration.</p> <p><b>system-control</b>—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Description</b>              | <p>The mastership priority value is the most important factor in determining the role of the member switch within a nonprovisioned Virtual Chassis or VCF configuration. Other factors (see <a href="#">“Understanding How the Master in a Virtual Chassis Is Elected” on page 5078</a>) also affect the election of the master.</p> <p>The mastership priority value takes the highest precedence in the master election algorithm. The member switch with highest mastership priority assumes the master Routing Engine role of the Virtual Chassis or VCF. Toggling back and forth between master and backup status in failover conditions is undesirable, so we recommend that you assign the same mastership priority value to both the master and the backup. Secondary factors in the master election algorithm determine which of these two members (that is, the two members that are assigned the highest mastership priority value) functions as the master of the Virtual Chassis or VCF.</p> <p>This statement is not used for the EX8200 Virtual Chassis, which determines mastership by external Routing Engine uptime. See <i>Understanding Virtual Chassis Roles in an EX8200 Virtual Chassis</i>.</p> <p>A switch with a mastership priority of <b>0</b> never takes the master or backup role.</p> |
| <b>Default</b>                  | 128                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Release Information</b> | Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series.<br>Statement introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF). |
| <b>Description</b>         | Specify the roles of the members of the Virtual Chassis or a Virtual Chassis Fabric (VCF) in a preprovisioned Virtual Chassis.                                                                                                             |

### Virtual Chassis Fabric

Specify the role to be performed by each switch. In a VCF, the spine devices are configured into the Routing Engine role and the leaf devices are configured into the line card role. You can configure several devices into the Routine Engine role, but only two will operate in the Routing Engine role at a time. The role must be associated with the member's serial number.

### EX Series (except EX8200 Virtual Chassis) and QFX Series Virtual Chassis

Specify the role to be performed by each member switch. Associate the role with the member's serial number.

When you use a preprovisioned configuration, you cannot modify the mastership priority or member ID of member switches through the user interfaces. The mastership priority value is generated by the software, based on the assigned role:

- A member configured as **routing-engine** is assigned the mastership priority **129**.
- A member configured as **line-card** is assigned the mastership priority **0**.
- A member listed in the preprovisioned configuration without an explicitly specified role is assigned the mastership priority **128**.

The configured role specifications are permanent. If both **routing-engine** members fail, a **line-card** member cannot take over as master of the Virtual Chassis configuration. You must delete the preprovisioned configuration to change the specified roles in a Virtual Chassis.

Explicitly configure two members as **routing-engine** and configure additional switches as members of the preprovisioned Virtual Chassis by specifying only their serial numbers. If you do not explicitly configure the role of the additional members, they function in a linecard role by default. In that case, a member that is functioning in a linecard role can take over mastership if the members functioning as master and backup (**routing-engine** role) both fail.

### EX8200 Virtual Chassis

Specify the role to be performed by each XRE200 External Routing Engine and each EX8200 member switch. Associate the role with the member's serial number. An EX8200 Virtual Chassis cannot function when both external Routing Engines, which must be configured in the **routing-engine** role, have failed.

- Options**
- **line-card**—Enables the member to be eligible to function only in the linecard role. Any member of the Virtual Chassis or VCF configuration other than the master or backup functions in the linecard role and runs only a subset of Junos OS for EX Series switches. A member functioning in the linecard role does not run the control protocols or the chassis management processes.

A Virtual Chassis must have at least three members for one member to function in the linecard role.

In an EX8200 Virtual Chassis configuration, all member switches must be in the linecard role.

- **routing-engine**—Enables the member to function as a master or backup of the Virtual Chassis or VCF configuration. The master manages all members and runs the chassis management processes and control protocols. The backup synchronizes with the master in terms of protocol states, forwarding tables, and so forth, so that it is prepared to preserve routing information and maintain network connectivity without disruption in case the master is unavailable.

(All Virtual Chassis composed of EX Series switches, except EX8200 switches, or QFX Series devices) Specify two and only two members as **routing-engine**. The software determines which of the two members assigned the **routing-engine** role functions as master, based on the master election algorithm. See [“Understanding How the Master in a Virtual Chassis Is Elected” on page 5078](#). In these Virtual Chassis, the **routing-engine** role is associated with a switch.

(EX8200 Virtual Chassis) All XRE200 External Routing Engines must be in the **routing-engine** role.

| <b>Description</b>         | Define tracing operations for the Virtual Chassis or VCF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Default</b>             | Tracing operations are disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>             | <p><b>detail</b>—(Optional) Generate detailed trace information for a flag.</p> <p><b>disable</b>—(Optional) Disable a flag.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <code>/var/log</code>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li><b>all</b>—All tracing operations.</li> </ul> |
|                            | <div>  <p><b>TIP:</b> The <b>all</b> flag displays a subset of logs that are useful in debugging most issues. For more detailed information, use <b>all detail</b>.</p> </div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|                            | <ul style="list-style-type: none"> <li><b>auto-configuration</b>—Trace Virtual Chassis ports (VCPs) that have been automatically configured.</li> <li><b>csn</b>—Trace Virtual Chassis complete sequence number (CSN) packets.</li> <li><b>error</b>—Trace Virtual Chassis errored packets.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

- **hello**—Trace Virtual Chassis hello packets.
- **krt**—Trace Virtual Chassis KRT events.
- **lsp**—Trace Virtual Chassis link-state packets.
- **lsp-generation**—Trace Virtual Chassis link-state packet generation.
- **me**—Trace Virtual Chassis ME events.
- **normal**—Trace normal events.
- **packets**—Trace Virtual Chassis packets.
- **parse**—Trace reading of the configuration.
- **psn**—Trace partial sequence number (PSN) packets.
- **route**—Trace Virtual Chassis routing information.
- **spf**—Trace Virtual Chassis SPF events.
- **state**—Trace Virtual Chassis state transitions.
- **task**—Trace Virtual Chassis task operations.

**no-stamp**—(Optional) Do not place a timestamp on any trace file.

**no-world-readable**—(Optional) Restrict file access to the user who created the file.

**receive**—(Optional) Trace received packets.

**replace**—(Optional) Replace a trace file rather than appending information to it.

**send**—(Optional) Trace transmitted packets.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through 1 GB

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

| <b>Hierarchy Level</b>          | [edit <a href="#">virtual-chassis</a> ]                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.<br>Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | <p>Disable the Virtual Chassis port (VCP) holddown timer for all VCPs in the Virtual Chassis or Virtual Chassis Fabric (VCF).</p> <p>The VCP holddown timer is an internal mechanism that delays a Virtual Chassis reconvergence for several seconds when a VCP becomes inactive. The purpose of this delay is to provide the VCP time to return online without having to reconverge the Virtual Chassis to adjust to the inactive VCP. All traffic to the VCP is dropped while the VCP is inactive. If the VCP remains down for a time that exceeds the VCP holddown timer, a Virtual Chassis reconvergence occurs.</p> <p>When this statement is enabled, the VCP holddown timer is disabled and the Virtual Chassis reconvergence occurs when a VCP becomes inactive. The period of time where traffic is dropped waiting for the VCP to return online is avoided.</p> <p>We recommend enabling this statement after a Virtual Chassis is operational. We recommend disabling this statement when you are adding or removing member switches from your Virtual Chassis.</p> <p>The VCP holddown timer cannot be viewed and is not user-configurable. You can only control whether the VCP holddown timer is enabled or disabled by configuring this statement.</p> |
|                                 | <p> <b>NOTE:</b> For the EX4300 Virtual Chassis, you should enable the <code>vcp-no-hold-time</code> statement before performing a software upgrade using NSSU. If you do not enable the <code>vcp-no-hold-time</code> statement, the Virtual Chassis may split during the upgrade. A split Virtual Chassis can cause disruptions to your network, and you may have to manually reconfigure your Virtual Chassis after the NSSU if the split and merge feature was disabled. For more information about a split Virtual Chassis, see <a href="#">“Understanding Split and Merge in a Virtual Chassis”</a> on page 5087</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Default</b>                  | The VCP holddown timer is enabled by default on all devices that support this statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

```

Hierarchy Level [edit]

**Release Information** Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series.  
Statement introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).

**Description** Configure a Virtual Chassis or a Virtual Chassis Fabric (VCF).

The remaining statements are explained separately.

**Default** A standalone EX Series switch is a Virtual Chassis by default. It has a default member ID of 0, a default mastership priority of 128, and a default role as master.

A QFX Series device configured in standalone mode is a Virtual Chassis by default. It has a default member ID of 0, a default mastership priority of 128, and a default role as master.

A standalone XRE200 External Routing Engine or EX8200 switch is not part of an EX8200 Virtual Chassis until a Virtual Chassis configuration is set up.

## Command Forwarding Usage with an EX Series Virtual Chassis

Some CLI commands can be run either on all members or on a specific member of a Virtual Chassis configuration. This functionality is referred to as command forwarding.

You can always specify that these commands be applied to all member switches in the Virtual Chassis by using the **all-members** option, or to a specific member switch by using the **member-member-id** option. If neither option is specified, the default command forwarding behavior, which varies by command, is used. See the **Default** row in [Table 570 on page 5150](#) to learn the command forwarding behavior for a specific command.

For example, to collect information about a particular member switch prior to contacting Juniper Networks Technical Assistance Center (JTAC), use the **request support information member member-id** command to gather data for the specified member switch. If you want to gather this data for all member switches in the Virtual Chassis, you can enter the **request support information** command, which by default uses the **all-members** option, or the **request support information all-members** command.

[Table 570 on page 5150](#) provides a list of commands that can be run either on all members of the Virtual Chassis configuration or on a specific member switch.

Table 570: Commands That Can be Run on All or Specific Members of the Virtual Chassis Configuration

| Commands Available for Command Forwarding | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | all-members                                                                   | member-member-id                                         | Default            |
|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------|----------------------------------------------------------|--------------------|
| <b>request support information</b>        | <p>Use this command when you contact JTAC about your component problem. This command is the equivalent of using the following CLI commands:</p> <ul style="list-style-type: none"> <li>• <b>show version</b></li> <li>• <b>show chassis firmware</b></li> <li>• <b>show chassis hardware</b></li> <li>• <b>show chassis environment</b></li> <li>• <b>show interfaces extensive</b> (for each configured interface)</li> <li>• <b>show configuration</b> (excluding any SECRET-DATA)</li> <li>• <b>show system virtual-memory</b></li> </ul> | Displays information for all members of the Virtual Chassis configuration.    | Displays information for the specified member switch.    | <b>all-members</b> |
| <b>request system partition hard-disk</b> | Set up the hard disk for partitioning. After this command is issued, the hard disk is partitioned the next time the system is rebooted. When the hard disk is partitioned, the contents of <b>/altroot</b> and <b>/altconfig</b> are saved and restored. All other data on the hard disk is at risk of being lost.                                                                                                                                                                                                                           | Partitions the hard disk on all members of the Virtual Chassis configuration. | Partitions the hard disk on the specified member switch. | <b>all-members</b> |
| <b>request system reboot</b>              | Reboot Junos OS for EX Series switches after a software upgrade and occasionally to recover from an error condition.                                                                                                                                                                                                                                                                                                                                                                                                                         | Reboots all members of the Virtual Chassis configuration.                     | Reboots the specified member switch.                     | <b>all-members</b> |

Table 570: Commands That Can be Run on All or Specific Members of the Virtual Chassis Configuration (*continued*)

| Commands Available for Command Forwarding | Purpose                                                                                                                                      | all-members                                                                    | member-member-id                                         | Default            |
|-------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------|----------------------------------------------------------|--------------------|
| <b>request system snapshot</b>            | Back up the currently running and active file system.                                                                                        | Backs up the file systems on all members of the Virtual Chassis configuration. | Backs up the file system on the specified member switch. | <b>all-members</b> |
| <b>request system storage cleanup</b>     | Free storage space on the switch by rotating log files and proposing a list of files for deletion. User input is required for file deletion. | Runs cleanup on all members of the Virtual Chassis configuration.              | Runs cleanup on the specified member switch.             | <b>all-members</b> |
| <b>show log user</b>                      | Display users who are viewing the system log.                                                                                                | Displays information for all members of the Virtual Chassis configuration.     | Displays information for the specified member switch.    | master switch only |
| <b>show system alarms</b>                 | Display active system alarms.                                                                                                                | Displays information for all members of the Virtual Chassis configuration.     | Displays information for the specified member switch.    | <b>all-members</b> |
| <b>show system audit</b>                  | Display the state and checksum values for file systems.                                                                                      | Displays information for all members of the Virtual Chassis configuration.     | Displays information for the specified member switch.    | <b>all-members</b> |
| <b>show system boot-messages</b>          | Display initial messages generated by the system kernel upon startup. These messages are the contents of <code>/var/run/dmesg.boot</code> .  | Displays information for all members of the Virtual Chassis configuration.     | Displays information for the specified member switch.    | <b>all-members</b> |

Table 570: Commands That Can be Run on All or Specific Members of the Virtual Chassis Configuration (*continued*)

| Commands Available for Command Forwarding | Purpose                                                                                                                                                                                                                                                                                                                                                           | all-members                                                                | member-member-id                                      | Default            |
|-------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------|-------------------------------------------------------|--------------------|
| <b>show system buffers</b>                | Display information about the buffer pool that the Routing Engine uses for local traffic. Local traffic is the routing and management traffic that is exchanged between the Routing Engine and the Packet Forwarding Engine within the switch, as well as the routing and management traffic from IP (that is, from OSPF, BGP, SNMP, ping operations, and so on). | Displays information for all members of the Virtual Chassis configuration. | Displays information for the specified member switch. | <b>all-members</b> |
| <b>show system connections</b>            | Display information about the active IP sockets on the Routing Engine. Use this command to verify which servers are active on a system and which connections are currently in progress.                                                                                                                                                                           | Displays information for all members of the Virtual Chassis configuration. | Displays information for the specified member switch. | <b>all-members</b> |
| <b>show system core-dumps</b>             | Display a core file generated by an internal Junos OS process.                                                                                                                                                                                                                                                                                                    | Displays information for all members of the Virtual Chassis configuration. | Displays information for the specified member switch. | <b>all-members</b> |
| <b>show system directory-usage</b>        | Display directory usage information.                                                                                                                                                                                                                                                                                                                              | Displays information for all members of the Virtual Chassis configuration. | Displays information for the specified member switch. | master switch only |
| <b>show system processes</b>              | Display information about software processes that are running on the switch and that have controlling terminals.                                                                                                                                                                                                                                                  | Displays information for all members of the Virtual Chassis configuration. |                                                       | <b>all-members</b> |

**Table 570: Commands That Can be Run on All or Specific Members of the Virtual Chassis Configuration (*continued*)**

| Commands Available for Command Forwarding | Purpose                                                                                                                                                                                                         | all-members                                                                                      | member-member-id                                                            | Default            |
|-------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------|--------------------|
| <b>show system reboot</b>                 | Display pending system reboots or halts.                                                                                                                                                                        | Displays information for all members of the Virtual Chassis configuration.                       | Displays information for the specified member switch.                       | <b>all-members</b> |
| <b>show system snapshot</b>               | Display information about the backup software that is located in the <code>/altroot</code> and <code>/altconfig</code> file systems. To back up software, use the <code>request system snapshot</code> command. | Displays information for all members of the Virtual Chassis configuration.                       | Displays information for the specified member switch.                       | <b>all-members</b> |
| <b>show system software</b>               | Display the Junos OS extensions loaded on your switch.                                                                                                                                                          | Displays information for all members of the Virtual Chassis configuration.                       | Displays information for the specified member switch.                       | <b>all-members</b> |
| <b>show system statistics</b>             | Display systemwide protocol-related statistics.                                                                                                                                                                 | Displays information for all members of the Virtual Chassis configuration.                       | Displays information for the specified member switch.                       | <b>all-members</b> |
| <b>show system storage</b>                | Display statistics about the amount of free disk space in the switch's file systems.                                                                                                                            | Displays information for all members of the Virtual Chassis configuration.                       | Displays information for the specified member switch.                       | <b>all-members</b> |
| <b>show system uptime</b>                 | Display the current time and information about how long the switch, the switch software, and any existing protocols have been running                                                                           | Displays information for all members of the Virtual Chassis configuration.                       | Displays information for the specified member switch.                       | <b>all-members</b> |
| <b>show system users</b>                  | Show all users who are currently logged in.                                                                                                                                                                     | Shows all users who are currently logged in to any members of the Virtual Chassis configuration. | Shows all users who are currently logged in to the specified member switch. | <b>all-members</b> |

Table 570: Commands That Can be Run on All or Specific Members of the Virtual Chassis Configuration (*continued*)

| Commands Available for Command Forwarding | Purpose                                                                                                                                                                         | all-members                                                                | member-member-id                                      | Default            |
|-------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------|-------------------------------------------------------|--------------------|
| <b>show system virtual-memory</b>         | Display the usage of Junos OS kernel memory, listed first by size of allocation and then by type of usage. Use <b>show system virtual-memory</b> for troubleshooting with JTAC. | Displays information for all members of the Virtual Chassis configuration. | Displays information for the specified member switch. | <b>all-members</b> |

**Verifying the Member ID, Role, and Neighbor Member Connections of a Virtual Chassis Member**

**Purpose** You can designate the role that a member performs within a Virtual Chassis or you can allow the role to be assigned by default. You can designate the member ID that is assigned to a specific switch by creating a permanent association between the switch's serial number and a member ID, using a preprovisioned configuration. Or you can let the member ID be assigned by the master, based on the sequence in which the member switch is powered on and on which member IDs are currently available.

The role and member ID of the member switch are displayed on the front-panel LCD.

Each member switch can be cabled to one or two other member switches, using either the dedicated Virtual Chassis ports (VCPs) on the rear panel, an uplink port that has been configured as a VCP, or an optical port that has been configured as a VCP. The members that are cabled together are considered neighbor members.

**Action** To display the role and member ID assignments using the CLI:

```
user@switch> show virtual-chassis
```

```
Virtual Chassis ID: 0000.e255.00e0
```

| Member ID | Status | Serial No | Model      | Mastership Priority | Role    | Neighbor List ID, Interface |
|-----------|--------|-----------|------------|---------------------|---------|-----------------------------|
| 0 (FPC 0) | Prsnt  | abc123    | ex4200-48p | 255                 | Master* | 1 vcp-0<br>2 vcp-1          |
| 1 (FPC 1) | Prsnt  | def456    | ex4200-24t | 255                 | Backup  | 2 vcp-0<br>0 vcp-1          |

```

2 (FPC 2)  Prsnt  abd231      ex4200-24p   128  Linecard    0 vcp-0
   1 vcp-1

```

**Meaning** This output verifies that three EX4200 switches have been interconnected as a Virtual Chassis configuration through their dedicated VCPs to create an EX4200 Virtual Chassis. The display shows which of the VCPs is connected to which neighbor. The first port (**vcp-0**) of member **0** is connected to member **1** and the second port of member **0** (**vcp-1**) is connected to member **2**. The FPC slots for the switches are the same as the member IDs.

The **Mastership Priority** values indicate that the master and backup members have been explicitly configured, because they are not using the default value (**128**).

**NOTE:** This example uses output from an EX4200 Virtual Chassis. The output, with the exception of the **Model** column, would be identical on all other Virtual Chassis.

## Verifying That Virtual Chassis Ports Are Operational

**Purpose** Display the status of Virtual Chassis ports (VCPs) in a Virtual Chassis or Virtual Chassis Fabric (VCF).

**NOTE:** VCPs are not displayed when you issue the **show interfaces** command.

**Action** Display the VCPs:

```
user@switch> show virtual-chassis vc-port all-members
```

```
fpc0:
```

| Interface<br>or<br>PIC / Port | Type | Trunk<br>ID | Status | Speed<br>(mbps) | Neighbor<br>ID Interface |
|-------------------------------|------|-------------|--------|-----------------|--------------------------|
|-------------------------------|------|-------------|--------|-----------------|--------------------------|

|       |            |   |    |       |   |              |
|-------|------------|---|----|-------|---|--------------|
| vcp-0 | Dedicated  | 1 | Up | 32000 | 1 | vcp-0        |
| vcp-1 | Dedicated  | 2 | Up | 32000 | 1 | vcp-1        |
| 1/0   | Configured | 3 | Up | 1000  | 2 | vcp-255/1/0  |
| 1/1   | Configured | 3 | Up | 1000  | 2 | vcp-255/1/1  |
| 1/2   | Configured | 4 | Up | 1000  | 4 | vcp-255/0/20 |
| 1/3   | Configured | 4 | Up | 1000  | 4 | vcp-255/0/21 |

## fpc1:

| vcp-1                         | Dedicated  | 2           | Up     | 32000           | 2              | vcp-1       |
| 1/0                           | Configured | 3           | Up     | 10000           | 1              | vcp-255/1/0 |
| 1/1                           | Configured | 3           | Up     | 10000           | 1              | vcp-255/1/1 |

## fpc4:

| Interface<br>or<br>PIC / Port | Type       | Trunk<br>ID | Status | Speed<br>(mbps) | Neighbor<br>ID | Interface   |
|-------------------------------|------------|-------------|--------|-----------------|----------------|-------------|
| vcp-0                         | Dedicated  | 1           | Down   | 32000           |                |             |
| vcp-1                         | Dedicated  | 2           | Down   | 32000           |                |             |
| 0/20                          | Configured | 3           | Up     | 1000            | 0              | vcp-255/1/2 |
| 0/21                          | Configured | 3           | Up     | 1000            | 0              | vcp-255/1/3 |

**Meaning** The dedicated VCPs are displayed as **vcp-0** and **vcp-1**. The uplink interfaces that have been set as uplink VCPs are displayed as **1/0**, **1/1**, **1/2**, and **1/3**. The network interfaces that have been set as VCPs are displayed as **0/20** and **0/21**. The neighbor interface names of uplink and network VCPs are of the form **vcp-255/pic/port**—for example, **vcp-255/1/0**. In that name, **vcp-255** indicates that the interface is a VCP, **1** is the uplink PIC number, and **0** is the port number. The **fpc** number is the same as the member ID. The trunk ID is a positive number ID assigned to the link aggregation group (LAG) formed by the Virtual Chassis. If no LAG is formed, the value is **-1**.

**NOTE:** This example uses output from an EX4200 Virtual Chassis. The output is similar on all other types of Virtual Chassis or for a VCF.

## Monitoring the Virtual Chassis Status and Statistics on EX Series Virtual Chassis

#### Purpose

**NOTE:** This topic applies only to the J-Web Application package.

Use the monitoring functionality to view the following information about the switches and the ports on EX2200, EX3300, EX4200, EX4300, EX4500, EX4550, and EX8200 switches that are members of a Virtual Chassis:

- Member details and how members are connected with each other
- Traffic statistics for Virtual Chassis ports (VCPs) of the selected members
- Details of the VCP packet counters

#### Action

To view Virtual Chassis monitoring details in the J-Web interface for a Virtual Chassis, select **Monitor > Virtual Chassis**.

**NOTE:** Virtual Chassis monitoring is supported on J-Web, on all Virtual Chassis platforms except EX3200 and EX6210.

To view member details for all members in the CLI, enter the following command:

```
user@switch> show virtual-chassis
```

To view VCP traffic statistics for a specific member in the CLI, enter the following command:

```
user@switch> show virtual-chassis vc-port statistics member member-id
```

To view the path a packet takes when going from a source interface to a destination interface in a Virtual Chassis configuration using the CLI, enter the following command:

```
user@switch> show virtual-chassis vc-path
```

**Meaning** In the J-Web interface, the top half of the screen displays details of the Virtual Chassis configuration, such as:

- Member
- Role
- Status
- Interface
- Type
- Speed
- Neighboring Member ID
- Link Status
- Error count

**NOTE:** If the member switch in the Virtual Chassis is not provisioned, the member ID will be displayed as -.

---

Click the **Stop** button to stop fetching values from the switch, and click the **Start** button to start plotting data again from the point where it was stopped.

To view a graph of the statistics for the selected VCP of the member, click **Show Graph**.

**Refresh Interval (sec)**—Displays the time interval you have set for page refresh.

Click **Clear Statistics** to clear the monitoring statistics for the selected member switch. You can specify the interval at which the member details and statistics must be refreshed.

The bottom half of the screen displays a chart of the Virtual Chassis statistics and the port packet counters.

For details about the output from CLI commands, see the [show virtual-chassis](#) and [show virtual-chassis vc-port statistics](#) command summaries.

## Verifying That Graceful Routing Engine Switchover Is Working in the Virtual Chassis

**Purpose** Verify that a Graceful Routing Engine switchover (GRES) between two member switches acting as the master and backup routing engines in a Virtual Chassis has occurred.

**Action** On the master switch, verify the member ID of the backup Routing Engine:

```
{master:0}
user@switch> show virtual-chassis
Virtual Chassis ID: 5efa.4b7a.aae6
```

| Member ID | Status | Serial No    | Model      | Mastership<br>priority | Role    | Neighbor List<br>ID | Interface |
|-----------|--------|--------------|------------|------------------------|---------|---------------------|-----------|
| 0 (FPC 0) | Prsnt  | BM0208105281 | ex4200-24t | 255                    | Master* | 1                   | vcp-0     |
| 1 (FPC 1) | Prsnt  | BP0208192350 | ex4200-48t | 255                    | Backup  | 0                   | vcp-0     |

Member ID for next new member: 2 (FPC 2)

1. Connect to the backup Routing Engine:

```
{master:0}
user@switch> request session member 1
```

```
{backup:1}
user@switch>
```

2. Verify that the backup Routing Engine is ready for switchover on member ID 1:

```
{backup:1}
user@switch> show system switchover
```

```
Graceful switchover: On
Configuration database: Ready
Kernel database: Ready
Peer state: Steady State
```

3. Switch the current backup Routing Engine to master Routing Engine:

**NOTE:** You must wait a minimum of two minutes between Routing Engine failovers for the Routing Engines to synchronize.

```
{backup:1}
user@switch> request chassis routing-engine master acquire
```

4. Verify that the master and backup Routing Engines have switched roles:

**NOTE:** Member ID 1 is now the master and member ID 0 is now the backup.

```
{master:1}
user@switch> show virtual-chassis
```

Virtual Chassis ID: 5efa.4b7a.aae6

|           |        |              |            | Mastership |         | Neighbor List |           |
|-----------|--------|--------------|------------|------------|---------|---------------|-----------|
| Member ID | Status | Serial No    | Model      | priority   | Role    | ID            | Interface |
| 0 (FPC 0) | Prsnt  | BM0208105281 | ex4200-24t | 255        | Backup  | 1             | vcp-0     |
| 1 (FPC 1) | Prsnt  | BP0208192350 | ex4200-48t | 255        | Master* | 0             | vcp-0     |

Member ID for next new member: 2 (FPC 2)

**Meaning** With graceful Routing Engine switchover enabled, when you initiated a switchover from the backup Routing Engine, the backup Routing Engine became the master and the master Routing Engine became the backup.

## request virtual-chassis recycle

---

**Syntax**    `request virtual-chassis recycle member-id member-id`

**Release Information**    Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 13.2X50-D15 for the QFX Series.

**Description**    Make a previously used member ID available for reassignment.

When you remove a member switch from the Virtual Chassis configuration, the master reserves that member ID. To make the member ID available for reassignment, you must use this command.

**NOTE:** You must run this command from the Virtual Chassis member in the master role.

**Options**    `member-id member-id`—Specify the member ID that you want to make available for reassignment to a different member.

**Required Privilege Level**    system-control

**Related Documentation**

- [request virtual-chassis renumber on page 5165](#)
- [Replacing a Member Switch of a Virtual Chassis Configuration \(CLI Procedure\) on page 5104](#)
- [Adding or Replacing a Member Switch or an External Routing Engine in an EX8200 Virtual Chassis \(CLI Procedure\)](#)

**List of Sample Output**    [request virtual-chassis recycle member-id 3 on page 5164](#)  
[request virtual-chassis recycle member-id 1 on page 5164](#)

### Sample Output

[request virtual-chassis recycle member-id 3](#)

```
user@switch> request virtual-chassis recycle member-id 3
```

### Sample Output

[request virtual-chassis recycle member-id 1](#)

```
user@external-routing-engine> request virtual-chassis recycle member-id 1
```

## request virtual-chassis renumber

## Sample Output

**request virtual-chassis vc-port set pic-slot 1 port 0**

user@switch> **request virtual-chassis vc-port set pic-slot 1 port 0**

To check the results of this command, use the **show virtual-chassis vc-port** command.

**request virtual-chassis vc-port set pic-slot 1 port 1 member 3**

user@switch> **request virtual-chassis vc-port set pic-slot 1 port 1 member 3**

To check the results of this command, use the **show virtual-chassis vc-port** command.

**request virtual-chassis vc-port delete pic-slot 1 port 1 member 3**

user@switch> **request virtual-chassis vc-port delete pic-slot 1 port 1 member 3**

To check the results of this command, use the **show virtual-chassis vc-port** command.

## request virtual-chassis vc-port diagnostics optics

| <b>Release Information</b>            | Command introduced before Junos OS Release 7.4.<br>Command introduced in Junos OS Release 9.0 for EX Series switches.<br><b>sfc</b> option introduced for the TX Matrix Plus router in JUNOS Release 9.6.<br>Command introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                             |
| <b>Description</b>                    | Display the current time and information about how long the router or switch, router or switch software, and routing protocols have been running.                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Options</b>                        | <b>none</b> —Show time since the system rebooted and processes started.<br><br><b>all-chassis</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) Show time since the system rebooted and processes started on all the routers in the chassis.<br><br><b>all-lcc</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show time since the system rebooted and processes started for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus |

router, show time since the system rebooted and processes started for all connected T1600 or T4000 LCCs.

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Show time since the system rebooted and processes started on all members of the Virtual Chassis configuration.

**director-group *name***—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the Director group.

**infrastructure *name***—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the fabric control Routing Engine and fabric manager Routing Engine.

**interconnect-device *name***—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the Interconnect device.

**invoke-on**—(MX Series routers only) (Optional) Display the time since the system rebooted and processes started on the master Routing Engine, backup Routing Engine, or both, on a router with two Routing Engines.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show time since the system rebooted and processes started for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, show time since the system rebooted and processes started for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Show time since the system rebooted and processes started on the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Show time since the system rebooted and processes started on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the Node group.

**scc**—(TX Matrix routers only) (Optional) Show time since the system rebooted and processes started for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Show time since the system rebooted and processes started for the TX Matrix Plus router. Replace *number* with 0.

**Additional Information** By default, when you issue the **show system uptime** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

**Output Fields** [Table 19 on page 223](#) describes the output fields for the **show system uptime** command. Output fields are listed in the approximate order in which they appear.

**Table 571: show system uptime Output Fields**

| Field Name               | Field Description                                                                                                                 |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>Current time</b>      | Current system time in UTC.                                                                                                       |
| <b>System booted</b>     | Date and time when the Routing Engine on the router or switch was last booted and how long it has been running.                   |
| <b>Protocols started</b> | Date and time when the routing protocols were last started and how long they have been running.                                   |
| <b>Last configured</b>   | Date and time when a configuration was last committed. Also shows the name of the user who issued the last <b>commit</b> command. |
| <b>time and up</b>       | Current time, in the local time zone, and how long the router or switch has been operational.                                     |
| <b>users</b>             | Number of users logged in to the router or switch.                                                                                |
| <b>load averages</b>     | Load averages for the last 1 minute, 5 minutes, and 15 minutes.                                                                   |

## Sample Output

### show system uptime

```
user@host> show system uptime

| <b>Output Fields</b>            | Table 572 on page 5174 lists the output fields for the <b>show virtual-chassis active-topology</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                       |

**Table 572: show virtual-chassis active-topology Output Fields**

| Field Name            | Field Description                                                                                                                                                                              |
|-----------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Destination ID</b> | Specifies the member ID of the destination.                                                                                                                                                    |
| <b>Next-hop</b>       | <p>Specifies the member ID and Virtual Chassis port (VCP) of the next hop to which packets for the destination ID are forwarded.</p> <p>The next hop can be more than one device in a VCF.</p> |

## Sample Output

### show virtual-chassis active-topology (EX4200 Virtual Chassis)

```

user@switch> show virtual-chassis active-topology
 1                      1(vcp-1)

 2                      1(vcp-1)

 3                      1(vcp-1)

 4                      1(vcp-1)

 5                      8(vcp-0) 1(vcp-1)

 6                      8(vcp-0)

 7                      8(vcp-0)

 8                      8(vcp-0)

```

### show virtual-chassis active-topology (EX8200 Virtual Chassis)

```

user@external-routing-engine> show virtual-chassis active-topology
member0:

```

| Destination ID | Next-hop           |
|----------------|--------------------|
| 1              | 1(vcp-4/0/4.32768) |
| 8              | 8(vcp-0/0.32768)   |
| 9              | 8(vcp-0/0.32768)   |

### Sample Output

#### show virtual-chassis login (Direct Login to the Master Console Port)

```
user@switch> show virtual-chassis login
Current login session initiated from host 248.1.2.3
```

#### show virtual-chassis login (Backup Console Session Redirected to the Master Console Port)

```
user@switch> show virtual-chassis login
Current login session initiated from host backup
```

## show virtual-chassis protocol adjacency

| <b>Description</b>              | Display the Virtual Chassis Control Protocol (VCCP) adjacency statistics in the Virtual Chassis or VCF for all hardware devices.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>                  | <p><b>none</b>—Display VCCP adjacency statistics in brief form for all members of the Virtual Chassis or VCF.</p> <p><b>brief   detail   extensive</b>—(Optional) Display the specified level of output. Using the <b>brief</b> option is equivalent to entering the command with no options (the default). The <b>detail</b> and <b>extensive</b> options provide identical displays.</p> <p><b>all-members</b>—(Optional) Display VCCP adjacency statistics in brief form for all members of the Virtual Chassis or VCF.</p> <p><b>local</b>—(Optional) Display VCCP adjacency statistics for the switch or external Routing Engine on which this command is entered.</p> <p><b>member <i>member-id</i></b>—(Optional) Display VCCP adjacency statistics for the specified member of the Virtual Chassis or VCF.</p> <p><b>system-id</b>—(Optional) Display VCCP adjacency statistics for the specified member of the Virtual Chassis or VCF.</p> |
| <b>Required Privilege Level</b> | clear                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Output Fields</b>            | <a href="#">Table 575 on page 5190</a> lists the output fields for the <b>show virtual-chassis protocol database</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

**Table 575: show virtual-chassis protocol database Output Fields**

| Field Name | Field Description                               | Level of Output |
|------------|-------------------------------------------------|-----------------|
| LSP ID     | Link-state protocol (LSP) data unit identifier. | All levels      |

Table 575: show virtual-chassis protocol database Output Fields (*continued*)

| Field Name       | Field Description                                      | Level of Output |
|------------------|--------------------------------------------------------|-----------------|
| <b>Sequence</b>  | Sequence number of the LSP.                            | All levels      |
| <b>Checksum</b>  | Checksum value of the LSP.                             | All levels      |
| <b>Lifetime</b>  | Remaining lifetime of the LSP, in seconds.             | All levels      |
| <b>Neighbor</b>  | MAC address of the neighbor on the advertising system. | detail          |
| <b>Interface</b> | Virtual Chassis port (VCP) interface name.             | detail          |
| <b>Metric</b>    | Metric of the prefix or neighbor.                      | detail          |

The **extensive** output was omitted from this list. The **extensive** output is useful for customer support personnel only.

## Sample Output

| <b>Output Fields</b>            | <a href="#">Table 577 on page 5197</a> lists the output fields for the <b>show virtual-chassis protocol route</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Table 577: show virtual-chassis protocol route Output Fields**

| Field Name     | Field Description                                                              |
|----------------|--------------------------------------------------------------------------------|
| <b>Dev</b>     | MAC address of the member storing the VCCP routing table.                      |
| <b>Version</b> | Version of the shortest-path-first algorithm that generated the routing table. |

Table 577: show virtual-chassis protocol route Output Fields (*continued*)

| Field Name       | Field Description                                                            |
|------------------|------------------------------------------------------------------------------|
| <b>System ID</b> | MAC address of the device.                                                   |
| <b>Version</b>   | Version of the shortest-path-first (SPF) algorithm that generated the route. |
| <b>Metric</b>    | The metric number to get to that device.                                     |
| <b>Interface</b> | Name of the Virtual Chassis port (VCP) interface connecting the devices.     |
| <b>Via</b>       | MAC address of the next-hop device, if applicable.                           |

## Sample Output

### show virtual-chassis protocol route

```

user@switch> show virtual-chassis protocol route

| <b>Output Fields</b>            | <a href="#">Table 578 on page 5200</a> lists the output fields for the <b>show virtual-chassis protocol interface</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                          |

**Table 578: show virtual-chassis protocol statistics Output Fields**

| Field Name       | Field Description                                                                    |
|------------------|--------------------------------------------------------------------------------------|
| <b>PDU type</b>  | Protocol data unit type.                                                             |
| <b>Received</b>  | Number of PDUs received since VCCP started or since the statistics were set to zero. |
| <b>Processed</b> | Number of PDUs received minus the number of PDUs dropped.                            |

Table 578: show virtual-chassis protocol statistics Output Fields (*continued*)

| Field Name                    | Field Description                                                                                                                                        |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Drops</b>                  | Number of PDUs dropped.                                                                                                                                  |
| <b>Sent</b>                   | Number of PDUs transmitted since VCCP started or since the statistics were set to zero.                                                                  |
| <b>Rexmit</b>                 | Number of PDUs retransmitted since VCCP started or since the statistics were set to zero.                                                                |
| <b>Total Packets Received</b> | Number of PDUs received since VCCP started or since the statistics were set to zero.                                                                     |
| <b>Total Packets Sent</b>     | Number of PDUs sent since VCCP started or since the statistics were set to zero.                                                                         |
| <b>LSP queue length</b>       | Number of link-state PDUs waiting in the queue for processing. This value is almost always 0.                                                            |
| <b>SPF runs</b>               | Number of shortest-path-first (SPF) calculations that have been performed.                                                                               |
| <b>Fragments Rebuilt</b>      | Number of link-state PDU fragments that the local system has computed.                                                                                   |
| <b>LSP Regenerations</b>      | Number of link-state PDUs that have been regenerated. A link-state PDU is regenerated when it is nearing the end of its lifetime and it has not changed. |
| <b>Purges initiated</b>       | Number of purges that the system initiated. A purge is initiated if the software determines that a link-state PDU must be removed from the network.      |

| <b>Output Fields</b>            | <a href="#">Table 580 on page 5207</a> lists the output fields for the <b>show virtual-chassis vc-path</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                 |

**Table 580: show virtual-chassis vc-path Output Fields**

| Field Name        | Field Description                                                                                                                                                                                                                                                                                                                                                               |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Hop</b>        | The number of hops between the source and destination interfaces.                                                                                                                                                                                                                                                                                                               |
| <b>Member</b>     | The Virtual Chassis ID of the member switch that contains the Packet Forwarding Engine for each intermediate hop.                                                                                                                                                                                                                                                               |
| <b>PFE-Device</b> | The number of the Packet Forwarding Engine in each Virtual Chassis member through which a packet passes. Each Packet Forwarding Engine is the next hop of the preceding Packet Forwarding Engine.                                                                                                                                                                               |
| <b>Interface</b>  | The name of the interface through which the Packet Forwarding Engines are connected. The interface for the first hop is always the source interface and the interface for the last hop is always the destination interface. For intermediate hops, the <b>Interface</b> field denotes the Packet Forwarding Engines through which the packet passes on its way to the next hop. |

## Sample Output

show virtual-chassis vc-path source-interface destination-interface

```
user@switch> show virtual-chassis vc-path source-interface ge-0/0/0 destination-interface
ge-1/0/1
vc-path from ge-0/0/0 to ge-1/0/1
Hop      Member    PFE-Device    Interface
0         0          1              ge-0/0/0
1         0          0              internal-1/24
2         1          3              vcp-0
3         1          4              ge-1/0/1
```

## show virtual-chassis vc-port

| <b>Description</b>              | <p>Display diagnostics data and alarms for Ethernet optical transceivers installed in ports configured as Virtual Chassis Ports (VCPs) in an EX Series switches. The information provided by this command is known as digital optical monitoring (DOM) information.</p> <p>Thresholds that trigger a high alarm, low alarm, high warning, or low warning are set by the transponder vendors. Generally, a high alarm or low alarm indicates that a transceiver is not operating properly. DOM information can be used to diagnose why a transceiver is not working.</p> <p>On some EX Series switches, the <b>request virtual-chassis vc-port diagnostics optics</b> command must be entered to run a diagnostic scan before you can gather the <b>show virtual-chassis vc-port diagnostics optics</b> output.</p> |
| <b>Options</b>                  | <p><b>none</b>—Display diagnostics information for transceivers installed in VCPs of all members of a Virtual Chassis or VCF.</p> <p><b>all-members</b>—(Optional) Display diagnostics information for transceivers installed in VCPs of all members of a Virtual Chassis or VCF.</p> <p><b>interface-name</b>—(Optional) Display diagnostics information for the transceiver installed in a specified VCP.</p> <p><b>local</b>—(Optional) Display diagnostics information for transceivers installed in VCPs on the switch or external Routing Engine on which this command is entered.</p> <p><b>member member-id</b>—(Optional) Display diagnostics information for transceivers installed in VCPs on a specified member of a Virtual Chassis or VCF.</p>                                                       |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Output Fields** [Table 582 on page 5214](#) lists the output fields for the **show virtual-chassis vc-port diagnostics optics** command. Output fields are listed in the approximate order in which they appear.

**Table 582: show virtual-chassis vc-port diagnostics optics Output Fields**

| Field Name                            | Field Description                                                                                                                                                       |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FPC                                   | Displays the FPC slot number.                                                                                                                                           |
| Virtual chassis port                  | Displays the name of the VCP.                                                                                                                                           |
| Laser bias current                    | Displays the magnitude of the laser bias power setting current, in milliamperes (mA). The laser bias provides direct modulation of laser diodes and modulates currents. |
| Laser output power                    | Displays the laser output power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm).                                                                              |
| Module temperature                    | Displays the temperature, in Celsius and Fahrenheit.                                                                                                                    |
| Module voltage                        | Displays the voltage, in Volts.                                                                                                                                         |
| Receiver signal average optical power | Displays the receiver signal average optical power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm).                                                           |
| Laser bias current high alarm         | Displays whether the laser bias power setting high alarm is <i>On</i> or <i>Off</i> .                                                                                   |
| Laser bias current low alarm          | Displays whether the laser bias power setting low alarm is <i>On</i> or <i>Off</i> .                                                                                    |
| Laser bias current high warning       | Displays whether the laser bias power setting high warning is <i>On</i> or <i>Off</i> .                                                                                 |
| Laser bias current low warning        | Displays whether the laser bias power setting low warning is <i>On</i> or <i>Off</i> .                                                                                  |
| Laser output power high alarm         | Displays whether the laser output power high alarm is <i>On</i> or <i>Off</i> .                                                                                         |
| Laser output power low alarm          | Displays whether the laser output power low alarm is <i>On</i> or <i>Off</i> .                                                                                          |

| <b>Description</b>              | Display the traffic statistics collected on Virtual Chassis ports (VCPs).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>                  | <p><b>none</b>—Display traffic statistics for VCPs of all members of a Virtual Chassis or VCF.</p> <p><b>brief   detail   extensive</b>—(Optional) Display the specified level of output. Using the <b>brief</b> option is equivalent to entering the command with no options (the default). The <b>detail</b> and <b>extensive</b> options provide identical displays.</p> <p><b>all-members</b>—(Optional) Display traffic statistics for VCPs of all members of a Virtual Chassis or VCF.</p> <p><b>interface-name</b>—(Optional) Display traffic statistics for the specified VCP.</p> <p><b>local</b>—(Optional) Display traffic statistics for VCPs on the switch or external Routing Engine on which this command is entered.</p> <p><b>member member-id</b>—(Optional) Display traffic statistics for VCPs on the specified member of a Virtual Chassis or VCF.</p> |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Output Fields** Table 582 on page 5214 lists the output fields for the **show virtual-chassis vc-port statistics** command. Output fields are listed in the approximate order in which they appear.

**Table 583: show virtual-chassis vc-port statistics Output Fields**

| Field Name                   | Field Description                                                                                                                                                                                  | Level of Output            |
|------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| <b>fpcnumber</b>             | (All Virtual Chassis except EX8200 Virtual Chassis. VCF) ID of the Virtual Chassis member. The FPC number is the same as the member ID.                                                            | All levels                 |
| <b>member number</b>         | (EX8200 Virtual Chassis only) Member ID of the Virtual Chassis member.                                                                                                                             | All levels                 |
| <b>Interface</b>             | VCP name.                                                                                                                                                                                          | <b>brief</b>               |
| <b>Input Octets/Packets</b>  | Number of octets and packets received on the VCP.                                                                                                                                                  | <b>brief, member, none</b> |
| <b>Output Octets/Packets</b> | Number of octets and packets transmitted on the VCP.                                                                                                                                               | <b>brief, member, none</b> |
| <b>master: number</b>        | Member ID of the master Routing Engine.                                                                                                                                                            | All levels                 |
| <b>Port</b>                  | VCP for which <b>RX</b> (Receive) statistics, <b>TX</b> (Transmit) statistics, or both are reported by the VCP subsystem during a sampling interval—since the statistics counter was last cleared. | <b>detail, extensive</b>   |
| <b>Total octets</b>          | Total number of octets received and transmitted on the VCP.                                                                                                                                        | <b>detail, extensive</b>   |
| <b>Total packets</b>         | Total number of packets received and transmitted on the VCP.                                                                                                                                       | <b>detail, extensive</b>   |
| <b>Unicast packets</b>       | Number of unicast packets received and transmitted on the VCP.                                                                                                                                     | <b>detail, extensive</b>   |
| <b>Broadcast packets</b>     | Number of broadcast packets received and transmitted on the VCP.                                                                                                                                   | <b>detail, extensive</b>   |
| <b>Multicast packets</b>     | Number of multicast packets received and transmitted on the VCP.                                                                                                                                   | <b>detail, extensive</b>   |
| <b>MAC control frames</b>    | Number of media access control (MAC) control frames received and transmitted on the VCP.                                                                                                           | <b>detail, extensive</b>   |

Table 583: show virtual-chassis vc-port statistics Output Fields (*continued*)

| Field Name                  | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Level of Output          |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
| <b>CRC alignment errors</b> | <p>Number of packets received on the VCP that had a length—excluding framing bits, but including frame check sequence (FCS) octets—of between 64 and 1518 octets, inclusive, and had one of the following errors:</p> <ul style="list-style-type: none"> <li>Invalid FCS with an integral number of octets (FCS error)</li> <li>Invalid FCS with a nonintegral number of octets (alignment error)</li> </ul>                                                                                                   | <b>detail, extensive</b> |
| <b>Oversize packets</b>     | Number of packets received on the VCP that were longer than 1518 octets (excluding framing bits, but including FCS octets) but were otherwise well formed.                                                                                                                                                                                                                                                                                                                                                     | <b>detail, extensive</b> |
| <b>Undersize packets</b>    | Number of packets received on the VCP that were shorter than 64 octets (excluding framing bits but including FCS octets) and were otherwise well formed..                                                                                                                                                                                                                                                                                                                                                      | <b>detail, extensive</b> |
| <b>Jabber packets</b>       | <p>Number of packets received on the VCP that were longer than 1518 octets—excluding framing bits, but including FCS octets—and that had either an FCS error or an alignment error.</p> <p><b>NOTE:</b> This definition of <i>jabber</i> is different from the definition in IEEE-802.3 section 8.2.1.5 (10Base5) and section 10.3.1.4 (10Base2). These documents define <i>jabber</i> as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is between 20 ms and 150 ms.</p> | <b>detail, extensive</b> |
| <b>Fragments received</b>   | <p>Number of packets received on the VCP that were shorter than 64 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error.</p> <p>Fragment frames normally increment because both runs (which are normal occurrences caused by collisions) and noise hits are counted.</p>                                                                                                                                                                               | <b>detail, extensive</b> |
| <b>Ifout errors</b>         | Number of outbound packets received on the VCP that could not be transmitted because of errors.                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail, extensive</b> |
| <b>Packet drop events</b>   | Number of outbound packets received on the VCP that were dropped, rather than being encapsulated and sent out of the switch as fragments. The packet drop counter is incremented if a temporary shortage of packet memory causes packet fragmentation to fail.                                                                                                                                                                                                                                                 | <b>detail, extensive</b> |
| <b>64 octets frames</b>     | Number of packets received on the VCP (including invalid packets) that were 64 octets in length (excluding framing bits, but including FCS octets).                                                                                                                                                                                                                                                                                                                                                            | <b>detail, extensive</b> |

Table 583: show virtual-chassis vc-port statistics Output Fields (*continued*)

| Field Name                     | Field Description                                                                                                                                                                 | Level of Output          |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
| <b>65–127 octets frames</b>    | Number of packets received on the VCP (including invalid packets) that were between 65 and 127 octets in length, inclusive (excluding framing bits, but including FCS octets).    | <b>detail, extensive</b> |
| <b>128–255 octets frames</b>   | Number of packets received on the VCP (including invalid packets) that were between 128 and 255 octets in length, inclusive (excluding framing bits, but including FCS octets).   | <b>detail, extensive</b> |
| <b>256–511 octets frames</b>   | Number of packets received on the VCP (including invalid packets) that were between 256 and 511 octets in length, inclusive (excluding framing bits, but including FCS octets).   | <b>detail, extensive</b> |
| <b>512–1023 octets frames</b>  | Number of packets received on the VCP (including invalid packets) that were between 512 and 1023 octets in length, inclusive (excluding framing bits, but including FCS octets).  | <b>detail, extensive</b> |
| <b>1024–1518 octets frames</b> | Number of packets received on the VCP (including invalid packets) that were between 1024 and 1518 octets in length, inclusive (excluding framing bits, but including FCS octets). | <b>detail, extensive</b> |
| <b>Rate packets per second</b> | Number of packets per second received and transmitted on the VCP.                                                                                                                 | <b>detail, extensive</b> |
| <b>Rate bytes per second</b>   | Number of bytes per second received and transmitted on the VCP.                                                                                                                   | <b>detail, extensive</b> |

## Troubleshooting Procedures

---

- [Troubleshooting an EX Series Virtual Chassis on page 5235](#)

### Troubleshooting an EX Series Virtual Chassis

This topic describes the following troubleshooting issues for a Virtual Chassis:

- [A Disconnected Member Switch's ID Is Not Available for Reassignment on page 5235](#)
- [Load Factory Default Does Not Commit on a Multimember Virtual Chassis on page 5235](#)
- [The Member ID Persists When a Member Switch Is Disconnected From a Virtual Chassis on page 5236](#)
- [A Member Switch Is Not Participating in a Mixed Virtual Chassis on page 5236](#)

#### [A Disconnected Member Switch's ID Is Not Available for Reassignment](#)

---

**Problem** **Description:** You disconnected a switch from the Virtual Chassis, but the disconnected switch's member ID is still displayed in the status output. You cannot reassign that member ID to another switch.

**Solution** When you disconnect a member of a Virtual Chassis configuration, the master retains the member ID and member configuration in its configuration database. Output from the [show virtual-chassis](#) command continues to display the member ID of the disconnected member with a status of **NotPrsnt**.

If want to permanently disconnect the member switch, you can free up the member ID by using the [request virtual-chassis recycle](#) command. This will also clear the status of that member.

#### [Load Factory Default Does Not Commit on a Multimember Virtual Chassis](#)

---

**Problem** **Description:** The **load factory-default** command fails on a multimember Virtual Chassis.

**Solution** The **load factory-default** command is not supported on a multimember Virtual Chassis configuration. For information on how to revert the switches in the Virtual Chassis to factory default settings, see [“Reverting to the Default Factory Configuration for the EX Series Switch” on page 620](#).

### The Member ID Persists When a Member Switch Is Disconnected From a Virtual Chassis

---

**Problem** **Description:** Gigabit Ethernet interfaces retain their previous slot numbers when a member switch is disconnected from the Virtual Chassis.

**Solution** If a switch had been previously connected as a member of a Virtual Chassis configuration, it retains the member ID that it was assigned as a member of that configuration even after it is disconnected and operating as a standalone switch. The interfaces that were configured while the switch was a member of the Virtual Chassis configuration retain the old member ID as the first digit of the interface name.

For example, if the switch was previously member 1, its interfaces are named **ge-1/0/0** and so on.

To change the switch's member ID, so that its member ID is **0**, and to rename the switch's interfaces accordingly:

1. To change the member ID to 0:  

```
user@switch> request virtual-chassis renumber member-id 1 new-member-id 0
```
2. To rename the interfaces to match the new member ID:  

```
[edit virtual-chassis]  
user@switch# replace pattern ge-1/ with ge-0/
```

### A Member Switch Is Not Participating in a Mixed Virtual Chassis

---

**Problem** **Description:** A member switch in a mixed Virtual Chassis is not participating in the Virtual Chassis. The **show virtual-chassis** output indicates the member switch status is **Inactive** or **NotPrsnt**.

This issue is most likely to occur immediately after you have cabled a mixed Virtual Chassis.

**Solution** The Virtual Chassis mode on the switch might not be set to **mixed** mode. If the member switch is an EX4500 switch and is cabled into the Virtual Chassis through the dedicated Virtual Chassis port (VCP), the PIC mode might also be set to **Intraconnect** instead of **virtual-chassis**.

To verify the Virtual Chassis mode:

```
user@switch> show virtual-chassis mode  
fpc0:  
-----  
Mixed Mode: Enabled  
fpc1:  
-----
```

```
Mixed Mode: Enabled
fpc2:
```

```
-----
Mixed Mode: Enabled
fpc3:
```

```
-----
Mixed Mode: Enabled
fpc4:
```

```
-----
Mixed Mode: Disabled
fpc5:
```

```
-----
Mixed Mode: Enabled
```

To change the Virtual Chassis mode on a member switch (in this case, member ID 4) to **mixed** mode:

```
user@switch> request virtual-chassis mode mixed member 4
```

(EX4500 switch only) To verify the PIC mode:

```
user@switch> show chassis pic-mode
```

```
fpc0:
```

```
-----
Pic Mode: Not-Applicable
```

```
fpc1:
```

```
-----
Pic Mode: Not-Applicable

```
-----
Pic Mode: PIC 3: Intraconnect
```

```
fpc5:
```

```
-----
Pic Mode: PIC 3: virtual-chassis
```

To change the PIC mode on an EX4500 switch to **virtual-chassis** mode (in this case, member ID 4):

```
user@switch> request chassis pic-mode virtual-chassis member 4
```

The member switch must be rebooted for the Virtual Chassis mode or PIC mode setting change to take effect. To reboot the member switch (in this case, member ID 4):

```
user@switch> request system reboot member 4
```

### Virtual Chassis Fabric Overview

The Juniper Networks Virtual Chassis Fabric (VCF) provides a low-latency, high-performance fabric architecture that can be managed as a single device. VCF is an evolution of the Virtual Chassis feature, which enables you to interconnect multiple devices into a single logical device, inside of a fabric architecture. The VCF architecture is optimized to support small and medium-sized data centers that contain a mix of 1-Gbps, 10-Gbps, and 40-Gbps Ethernet interfaces.

Video: [What is Virtual Chassis Fabric?](#)

A VCF is constructed using a spine-and-leaf architecture. In the spine-and-leaf architecture, each spine device is interconnected to each leaf device. A VCF supports up to thirty-two total devices, and up to four devices can be configured as spine devices. See [Figure 81 on page 5242](#) for an illustration of the VCF spine-and-leaf architecture.

Figure 81: VCF Spine-and-Leaf Architecture

Each spine device must be a QFX5100 device. In an optimal VCF configuration, the leaf devices are also QFX5100 devices. You can, however, also create a mixed VCF by configuring QFX3600, QFX3500, and EX4300 switches as leaf devices. See [“Understanding Virtual Chassis Fabric Components” on page 5243](#) for more information about the spine-and-leaf architecture.

A VCF provides the following benefits:

- **Latency**—VCF provides predictable low latency because it uses a fabric architecture that ensures each device is one or two hops away from every other device in the fabric. The weighted algorithm that makes traffic-forwarding decisions in a VCF is designed to avoid congestion and ensures low latency by intelligently forwarding traffic over all paths within the VCF to any destination device., ensuring predictable low latency for all traffic traversing the VCF.
- **Resiliency**—The VCF architecture provides a resilient framework because traffic has multiple paths across the fabric. Traffic is, therefore, easily diverted within the fabric when a device or link fails.
- **Flexibility**—You can easily expand the size of your VCF by adding devices to the fabric as your networking needs grow.
- **Investment protection**—In environments that need to expand because the capabilities of a traditional QFX5100, QFX3600, QFX3500, or EX4300 Virtual Chassis are maximized, a VCF is often a logical upgrade option because it enables the system to evolve without having to remove the existing, previously purchased devices from the network.
- **Manageability**—VCF provides multiple features that simplify configuration and management. VCF, for instance, has an autoprovisioning feature that enables you to plug and play devices into the fabric after minimal initial configuration. VCF leverages many of the existing configuration procedures from a Virtual Chassis, so that you can configure and maintain a VCF easily if you are already familiar with the procedures for configuring and maintaining a Virtual Chassis.

---

### Spine-and-Leaf Topology

The VCF uses a spine-and-leaf architecture where each device in the fabric is either a spine device or a leaf device.

A VCF can have up to four spine devices, and up to thirty-two total devices. Each spine device has at least one direct Virtual Chassis port (VCP) connection to each leaf device in the VCF.

All traffic entering a leaf device can, therefore, be forwarded to any directly connected spine device and is always two hops away from any other leaf device—leaf device to leaf device traffic travels from the source leaf device to a spine device to the destination leaf device—within the VCF.

See [Figure 82 on page 5244](#) for an illustration of the VCF spine-and-leaf architecture:

Figure 82: VCF Spine-and-Leaf Architecture

Traffic is forwarded through a VCF using a weighted algorithm designed to avoid congestion. Traffic travelling across the VCF from one leaf device to another leaf device is forwarded using the best path available at the time, so any connection to a spine device can be used to transport traffic from one leaf device to another leaf device.

### Spine Devices

A spine device:

- Must be a QFX5100 device.
- Is configured into the Routing Engine role, but can operate in the Routing Engine role or the linecard role..

**NOTE:** Only two devices can simultaneously operate in the Routing Engine role within a VCF. A VCF, however, supports up to four spine devices. In scenarios where a VCF has three or more spine devices, the devices that are not operating in the Routing Engine role operate in the linecard role.

A spine device that is configured into the Routing Engine role but is operating in the linecard role assumes the Routing Engine role when an active Routing Engine fails.

- Has a direct connection to each leaf device.
- Typically connects a router, firewall, or other data center networking device to the VCF.

A VCF should always have at least two active spine devices. A VCF supports up to four spine devices.

You can configure any QFX5100 device as a spine device. In the most common VCF configurations, QFX5100-24Q devices are used as spine devices.

### Leaf Devices

A leaf device:

- Is optimally a QFX5100 device, but can also be a QFX3500, QFX3600, or EX4300 device.
- Has a direct connection to each spine device.
- Always operates in the linecard role.
- Typically connects an endpoint device—for instance, a server or other storage device in a data center—to the VCF.

A VCF can have up to thirty-two total devices and up to four devices can be configuring into spine devices. The devices that are not spine devices in a VCF operate as leaf devices.

In the most common VCF configurations, QFX5100-48S devices are used as leaf devices.

### Routing Engine Role

A VCF has two devices operating in the Routing Engine role—a master Routing Engine and a backup Routing Engine.

The device that functions as the master Routing Engine:

- Is a spine device.
- Manages the member devices.
- Runs the chassis management processes and control protocols.
- Represents all the member devices interconnected within the VCF configuration. (The hostname and other parameters that you assign to this device during setup apply to all members of the VCF.)

The device that functions as the backup Routing Engine:

- Is a spine device.
- Maintains a state of readiness to take over the master role if the master fails.
- Synchronizes with the master in terms of protocol states, forwarding tables, and so forth, so that it preserves routing information and maintains network connectivity without disruption when the master is unavailable.

All spine devices in a VCF are configured into the Routing Engine role.

**NOTE:** Only two devices can simultaneously operate in the Routing Engine role within a VCF. A VCF, however, supports up to four spine devices. In scenarios where a VCF has three or more spine devices, the devices that are not operating in the Routing Engine role operate in the linecard role.

A spine device that is configured into the Routing Engine role but is operating in the linecard role assumes the Routing Engine role when an active Routing Engine fails.

The master and backup Routing Engines are selected by the master election algorithm. If a VCF has more than two spine devices, the spine devices that are not selected as the master or backup Routing Engine operate in the linecard role even though the devices are configured into the Routing Engine role.

A spine device operating in the linecard role can complete all spine-related functions with no limitations within a VCF. A spine device operating in the linecard role assumes the backup Routing Engine role when the master or backup Routing Engine fails.

### Linecard Role

---

All leaf devices in a VCF operate in the linecard role. In autoprovisioned configurations, leaf devices are assigned the linecard role when they are cabled into the VCF. In preprovisioned configurations, leaf devices are manually configured into the linecard role. In nonprovisioned configurations, leaf devices are assigned the linecard role according to the master election algorithm, which uses the mastership priority values to set the roles of each device in the VCF.

All spine devices in a VCF are configured into the Routing Engine role, but operate in the linecard role when they are not selected as the master or backup Routing Engine by the master election algorithm. A spine device operating in the linecard role can complete all spine-related functions with no limitations within a VCF. A spine device operating in the linecard role becomes the new backup Routing Engine when the master or backup Routing Engine fails.

A member that functions in the linecard role in a VCF:

- Runs only a subset of Junos OS.
- Detects certain error conditions (such as an unplugged cable) on any interfaces that have been configured on it through the device functioning as the master Routing Engine.

### Master Routing Engine Election Process

---

The device in the master Routing Engine role in a VCF is always a spine device.

In a preprovisioned or autoprovisioned VCF, up to four spine devices are assigned the Routing Engine role during the configuration process. The spine device that has been powered on the longest assumes the master Routing Engine role; the spine device that has been powered on the second longest assumes the backup Routing Engine role. The remaining spine devices assume the linecard role.

In a nonprovisioned VCF, the master and backup Routing Engines are selected using the following algorithm:

1. Choose the QFX5100 device with the highest user-configured mastership priority (255 is the highest possible value) as the master Routing Engine, and the QFX5100 switch with the second highest mastership priority value as the backup Routing Engine.  
  
A QFX5100 switch with a mastership priority of 0 will always stay in the linecard role.
2. Choose the QFX5100 device that was master the last time the VCF booted.

3. Choose the QFX5100 device that has been included in the VCF configuration for the longest period of time.
4. Choose the QFX5100 device with the lowest MAC address.

QFX3500, QFX3600, and EX4300 devices never assume the master or backup Routing Engine role in a VCF.

We strongly recommend that you configure the mastership priority of the QFX5100 devices in your VCF to ensure that the correct devices assume their intended roles when you configure your VCF using a nonprovisioned configuration.

### Virtual Chassis Ports (VCPs)

Virtual Chassis ports (VCPs) are used in a VCF to interconnect leaf devices to spine devices. All control and data traffic in a VCF is transported over VCPs.

VCPs in a VCF are either SFP+ connections that support 10-Gbps or QSFP+ connections that support 40-Gbps.

10-Gbps SFP+ and 40-Gbps QSFP+ links are automatically converted into VCPs in most scenarios when a device is added to an autoprovisioned or preprovisioned VCF. Automatic VCP conversion is discussed in more detail in the following section.

You can manually configure a 10-Gbps SFP+ and 40-Gbps QSFP+ link into a VCP.

Channelized interfaces cannot be configured into VCPs.

### Automatic Virtual Chassis Port (VCP) Conversion

10-Gbps SFP+ and 40-Gbps QSFP+ links are not configured into VCPs, by default.

10-Gbps SFP+ and 40-Gbps QSFP+ links are automatically converted into VCPs when:

- Link Layer Discovery Protocol (LLDP) is enabled on the interfaces on both ends of the link. LLDP is enabled by default.
- the device being added to the VCF is configured into fabric mode.
- The interfaces on both ends of the link are not configured as VCPs. The following interfaces are configured as VCPs:
  - The 40-Gbps QSFP+ port on an EX4300 switch, by default.
  - Any interface in the VCF that has been a VCP. If a device is removed from a VCF, the interface that was interconnected to the removed device remains configured as a VCP until it is configured into a network port using the **request virtual-chassis vc-port delete** command.
  - Any interface that has been configured into a VCP using the **request virtual-chassis vc-port set** command.

To change any of the above interfaces into a network interface so that the interface can become eligible for automatic VCP conversion, use the **request virtual-chassis vc-port delete** command.

- one of the devices is already part of a VCF that was autoprovisioned or preprovisioned.

Automatic VCP conversion does not work in nonprovisioned VCFs.

Automatic VCP conversion does not convert a VCP interface into a network interface when a device is removed from a VCF. If automatic VCP conversion has converted an interface into a VCP and you want the interface to function as a network interface, you must manually disable the VCP interface.

---

### VCF Configuration Options

You can configure a VCF using autoprovisioned, preprovisioned, or nonprovisioned configuration.

Autoprovisioned configuration allows you to *plug and play* leaf devices into a VCF after completing a minimal initial configuration procedure.

In a preprovisioned configuration, you deterministically control the devices in your VCF by associating each device's serial number to a member ID and role.

Nonprovisioned configuration is possible, but not recommended for most VCF installations. Nonprovisioned configuration is a highly manual procedure that should only be performed by expert users.

See [“Understanding Virtual Chassis Fabric Configuration” on page 5251](#) for additional information on the VCF configuration options.

---

### Fabric Mode

A device must be configured into fabric mode in order for it to join a VCF. You should always configure a device into fabric mode before interconnecting it into a VCF.

In preprovisioned and nonprovisioned configurations, a device is not participating as a VCF member until it is configured into fabric mode.

In autoprovisioned configurations, a spine device is not participating as a VCF member until it is configured into fabric mode. A spine device that is not configured into fabric mode is configured into fabric mode when it is interconnected into the VCF. The final step of the process of configuring the device into fabric mode is a device reboot. We strongly recommend configuring the spine device into fabric mode before interconnecting it into the VCF to eliminate this reboot.

A leaf device in an autoprovisioned configuration is also rebooted to complete the fabric mode configuration when it is interconnected into a VCF without being set into fabric mode. You can avoid the downtime that accompanies the reboot by setting the device into fabric mode before interconnecting it into the VCF.

A standalone device that is not part of a VCF should never be configured into fabric mode. A device is not in fabric mode, by default.

---

### Mixed Mode

---

The optimal method of configuring a VCF is to use QFX5100 devices only. A VCF composed entirely of QFX5100 devices supports the largest breadth of features at the highest scalability while also supporting the highest number of high-speed interfaces.

You can, however, configure other devices as leaf devices in your VCF. QFX5100, QFX3600, QFX3500, or EX4300 devices can be used as leaf devices in a VCF.

If you use QFX3600, QFX3500, or EX4300 devices as leaf devices in your VCF, you must configure all devices in your VCF into mixed mode.

A device that is not part of a Virtual Chassis or a VCF with other devices should never be configured into mixed mode. A device is not configured into mixed mode, by default.

---

### Virtual Management Ethernet Interface

---

VCF configuration can be managed remotely using a global management interface called the virtual management Ethernet (VME) interface. The VME interface is a logical interface representing all of the out-of-band management ports on the member devices. When you connect to the VCF using the VME interface's IP address, the connection is always redirected to the device acting in the master Routing Engine role.

A VME interface should always be used to configure a VCF. The VME interface is not tied to a device, so it can always be used to log in to the VCF even after the master Routing Engine changes.

We strongly recommend cabling the management port on all spine devices to the network to ensure that you always have a direct connection to the master Routing Engine through the VME interface, regardless of which spine device assumes the master Routing Engine role. The management ports on leaf devices can also be used by the VME interface to access the VCF, so you can also cable leaf device management ports to the network, if desired.

---

### Virtual Chassis Fabric Port Link Aggregation Group Bundles

---

You can increase the bandwidth on links configured as VCPs within a VCF between two devices by configuring multiple same-speed links between two devices into VCPs. If, for instance, you configure two 40-Gbps QSFP+ links that are connecting the same devices in a VCF into VCPs, the two VCP links form one LAG bundle with two member links and 80-Gbps of total available bandwidth.

A VCP LAG bundle provides more bandwidth than a single VCP link can provide. A VCP LAG bundle also improves performance by load-sharing traffic across links within the bundle, and provides redundancy because traffic can be forwarded across another member link in the VCP LAG bundle when one VCP link fails.

VCP LAG bundling occurs automatically when same-speed VCP links are configured between two devices. No user configuration is required. VCP LAG bundling works only on same-speed VCP links; 10-Gbps and 40-Gbps links cannot be in the same VCP LAG bundle.

### Virtual Chassis Fabric License Requirements

---

A feature license is required to configure a VCF. The VCF feature license is an independent feature license; the enhanced feature licenses (EFLs) or advanced feature licenses (AFLs) that must be purchased to enable some features on some Juniper switches cannot be purchased to enable VCF.

For a VCF deployment, two license keys are recommended for redundancy—one for the device in the master Routing Engine role and the other for the device in the backup Routing Engine role.

To purchase a feature license for VCF, contact your Juniper Networks sales representative (<http://www.juniper.net/us/en/contact-us/sales-offices>). The Juniper sales representative will provide you with the feature license files and license keys. You will be asked to supply the chassis serial number of your switch; you can obtain the serial number by running the **show virtual-chassis** command.

### Hardware Requirements for a Virtual Chassis Fabric

---

A VCF can contain up to four devices configured as spines and up to thirty-two total devices.

All spine devices must be QFX5100 devices. We recommend optimizing the performance of your VCF by also configuring QFX5100 devices as your leaf devices. A non-mixed VCF has the highest port density and feature support for a VCF in addition to supporting more spine devices. Nevertheless, you can configure any combination of QFX5100, QFX3600, QFX3500, or EX4300 devices into leaf devices within your VCF.

You can configure any QFX5100 device as a spine device. In the most common VCF configurations, the QFX5100-24Q devices are used as spine devices and QFX5100-48S devices are used as leaf devices.

### Software Requirements in a Virtual Chassis Fabric

---

All devices in a VCF must be running the same version of Junos OS software that supports VCF. VCF is initially supported for twenty total member devices in Junos OS Release 13.2X51-D20 for QFX5100, QFX3600, QFX3500, and EX4300 devices.

In Junos OS Release 14.1X53-D15, support for thirty-two member devices in a VCF was introduced.

The devices in the VCF must be using the version of software for standalone switches.

The flex software bundle is supported on non-mixed VCFs using QFX5100 member switches only. You cannot use the flex software bundle in mixed VCFs. The flex software bundle is the software that includes "jinstall-qfx-5-flex" text in the filename when it is downloaded from the Software Center.

We recommend configuring a device to the Junos OS release running on the VCF before interconnecting it into the VCF. For additional information on VCF software upgrades, see "[Understanding Software Upgrades in a Virtual Chassis Fabric](#)" on page 5258.

For information on software upgrade options for an operational VCF, see [“Understanding Software Upgrades in a Virtual Chassis Fabric” on page 5258](#).

## Understanding Virtual Chassis Fabric Configuration

This topic describes the configuration options available for your Virtual Chassis Fabric (VCF).

This topic covers:

- [Virtual Chassis Fabric Setup on page 5251](#)
- [Configuration File Management in a VCF on page 5253](#)
- [Logging into a Virtual Chassis Fabric on page 5253](#)
- [Understanding Interface Numbering on page 5253](#)

### Virtual Chassis Fabric Setup

---

You must setup your VCF using one of the following options:

- [Autoprovisioned Virtual Chassis Fabric Configuration on page 5251](#)
- [Preprovisioned Virtual Chassis Fabric Configuration on page 5252](#)
- [Nonprovisioned Virtual Chassis Fabric Configuration on page 5252](#)

#### ***Autoprovisioned Virtual Chassis Fabric Configuration***

Autoprovisioned configuration allows you to “plug and play” leaf devices into a VCF after minimal initial configuration.

The minimal configuration requirements for autop provisioning a VCF include setting the configuration mode to autoprovisioned and explicitly identifying the spine devices in your VCF by serial number. After this minimal configuration is complete, all supported devices—supported devices are either devices that have been zeroized or devices in factory default mode that have never been configured into a Virtual Chassis or VCF—are automatically added to the VCF as leaf devices when they are cabled to spine devices using supported 10-Gbps SFP+ ports or 40-Gbps QSFP+ ports. The Virtual Chassis ports (VCPs) are created automatically. Other parameters such as fabric and mixed mode are automatically detected and set.

A spine device in an autoprovisioned configuration should be configured into fabric mode before being interconnected into a VCF. A spine device in an autoprovisioned VCF must

also have the same mixed mode setting as other member devices in the VCF. You should configure your spine device into fabric mode and, if necessary, mixed mode before interconnecting it into the VCF.

A leaf device in an autoprovisioned configuration is rebooted to complete the fabric mode configuration when it is interconnected into a VCF without being set into fabric mode. The leaf device is also rebooted if the device needs to be configured into or out of mixed mode to participate in the VCF. You can avoid the downtime that accompanies the reboot of the leaf device by setting the leaf device into fabric mode and into or out of mixed mode before interconnecting it into the VCF.

### ***Preprovisioned Virtual Chassis Fabric Configuration***

In a preprovisioned configuration, you deterministically control the devices in your VCF by associating each device's serial number to a member ID and role.

The advantage of configuring a VCF using a preprovisioned configuration is that you can explicitly control which devices are added to your VCF, and in what roles. VCF configuration, notably, occurs automatically when two devices that have been configured into fabric mode (and mixed mode, if applicable) are interconnected by a supported 10-Gbps SFP+ port or a 40-Gbps QSFP+ port after the preprovisioned configuration is defined.

The disadvantage of using a preprovisioned configuration is that the configuration process is more manual than the autoprovisioned configuration process.

### ***Nonprovisioned Virtual Chassis Fabric Configuration***

**CAUTION:** We discourage nonprovisioned VCF configuration. You can configure all aspects of a VCF using autoprovisioned or preprovisioned configuration. Nonprovisioned VCF configuration should only be used by VCF experts in specialized scenarios.

A nonprovisioned VCF is the default method for creating a VCF; it is the configuration mode used when a VCF has not been configured into autoprovisioned or preprovisioned mode.

In a nonprovisioned VCF, member roles are determined by a mastership election algorithm. The first value checked by the mastership election algorithm is the mastership priority value. The devices with the highest mastership priority values assume the Routing Engine role, which is used by the spine devices in a VCF. All other devices assume the linecard role.

If two or more devices have the same mastership priority value and are candidates for the Routing Engine role, the mastership election algorithm uses other parameters to determine which device is elected as the Routing Engine. See [“Understanding How the Master in a Virtual Chassis Is Elected” on page 5078](#).

The default mastership priority value for all devices is 128. You should always configure your spine devices with the highest mastership priority to ensure a spine device assumes the Routing Engine role.

In a nonprovisioned VCF, you must manually configure every VCP.

### Configuration File Management in a VCF

You configure a VCF by logging onto the master Routing Engine and making configuration changes. See the next section for information on logging into a VCF.

The configuration file that is modified when you are on the master Routing Engine is automatically shared with all other devices in the VCF when it is committed. Each device stores its own copy of the configuration file.

### Logging into a Virtual Chassis Fabric

The recommended method of logging into a VCF is through the use of a Virtual Management Ethernet (VME) interface. The VME interface is a logical interface representing all of the out-of-band management ports on the member devices. When you connect to the VCF configuration using the VME interface's IP address, the connection is always redirected to the management port on device in the master Routing Engine role. The VME interface is not tied to a device, so it can always be used to log in to the VCF even after the master Routing Engine changes. We recommend cabling the management ports—an *me* or *em* interface—on each spine device in your VCF to support the VME interface.

If you log in to the console port of any member device in a VCF, your session is automatically redirected to the device acting in the master Routing Engine role.

### Understanding Interface Numbering

Interfaces in Junos OS are specified as follows:

*type-fpc/pic/port*

A VCF applies this convention as follows:

- *type*—The interface type.
- *fpc*—Flexible PIC Concentrator. In a VCF, the *fpc* is the member ID of the switch. For instance, the *fpc* of member 16 in the VCF is 16.
- *pic*—the number of the PIC (Physical Interface Card) on the member device.
- *port*—the port number.

For more detailed information on interface numbering, see *Understanding Interface Naming Conventions*.

## Understanding Mixed EX Series and QFX Series Virtual Chassis or Virtual Chassis Fabric

This topic describes the requirements for a mixed Virtual Chassis or a mixed Virtual Chassis Fabric (VCF).

A mixed Virtual Chassis includes two or more types of EX Series switches, two or more types of QFX Series switches, or a mix of EX and QFX Series switches.

A mixed VCF is any VCF that includes two or more types of member switches. Because a VCF must use a QFX5100 switch as a spine device, a mixed VCF is any VCF that includes EX4300, QFX3500, or QFX3600 member switches in addition to the required QFX5100 switches.

**NOTE:** The optimal VCF topology is to use QFX5100 devices only. A VCF composed entirely of QFX5100 devices supports the largest breadth of features at the highest scalability while also supporting the highest number of high-speed interfaces.

### Understanding Mixed Virtual Chassis Fabric

A VCF must use a QFX5100 switch in the spine role. A mixed VCF is, therefore, any VCF that includes EX4300, QFX3500, or QFX3600 member switches in addition to the required QFX5100 switch.

The optimal method of configuring a VCF is to use QFX5100 devices only. A non-mixed VCF composed entirely of QFX5100 devices supports the largest breadth of features at the highest scalability while also supporting the highest number of high-speed interfaces. You can, however, also configure a mixed VCF.

If you use QFX3600, QFX3500, or EX4300 devices as leaf devices in your VCF, you must configure all devices in your VCF into mixed mode. If you are turning a non-mixed VCF into a mixed VCF, you have to reboot the VCF to change the mixed mode setting.

### Virtual Chassis Summary for QFX5100, QFX3600, QFX3500, EX4600, and EX4300 Switches

[Table 566 on page 5076](#) provides a high-level overview of the permitted hardware allowed in the routing engine and line card roles of a mixed and a non-mixed Virtual Chassis for QFX5100, QFX3600, QFX3500, EX4600, and EX4300 switches. The table also includes license requirements and supported configuration methods.

Table 585: Virtual Chassis Summary

| Category  | Allowed Routing Engines | Allowed Line Cards                      | License Requirement | Configuration Methods              |
|-----------|-------------------------|-----------------------------------------|---------------------|------------------------------------|
| Non-mixed | QFX5100                 | QFX5100                                 | No                  | Nonprovisioning<br>Preprovisioning |
|           | QFX3600<br>QFX3500      | QFX3600<br>QFX3500                      | No                  | Nonprovisioning<br>Preprovisioning |
|           | EX4600                  | EX4600                                  | No                  | Nonprovisioning<br>Preprovisioning |
|           | EX4300                  | EX4300                                  | No                  | Nonprovisioning<br>Preprovisioning |
| Mixed     | QFX5100                 | QFX5100<br>QFX3600<br>QFX3500<br>EX4300 | No                  | Nonprovisioning<br>Preprovisioning |
|           | QFX3600<br>QFX3500      | QFX3600<br>QFX3500<br>EX4300            | No                  | Nonprovisioning<br>Preprovisioning |
|           | EX4600                  | EX4600<br>EX4300                        | No                  | Nonprovisioning<br>Preprovisioning |

#### Understanding the Routing Engine Role in a Mixed Virtual Chassis Using EX4300, EX4600, QFX3500, QFX3600, or QFX5100 Member Switches

In a mixed Virtual Chassis, the switch in the master Routing Engine role determines which switches are supported in the line card role of the mixed Virtual Chassis.

When a mixed Virtual Chassis is using a QFX5100 switch in the master Routing Engine role, you can use QFX5100, QFX3600, QFX3500, or EX4300 switches in the line card role.

When a mixed Virtual Chassis is using a QFX3600 or QFX3500 switch in the master Routing Engine role, you can use QFX3600, QFX3500, or EX4300 switches in the line card role.

In a mixed EX4300 and EX4600 Virtual Chassis, an EX4600 switch automatically assumes the Routing Engine role.

EX4600 switches can only be in a mixed Virtual Chassis with EX4300 switches. EX4600 switches cannot be in a mixed Virtual Chassis with QFX5100, QFX3600, or QFX3500 switches.

We recommend always configuring the same type of switch into the master and backup Routing Engine role, to ensure that the switch operating in the master role remains the same type of switch in the event of a switchover.

In most mixed Virtual Chassis, you must configure your Virtual Chassis to ensure a switch that supports the master Routing Engine assumes the master Routing Engine role. Without user configuration, any switch—with the exception of the EX4300 switch, which can never assume the master or backup Routing Engine role in a mixed Virtual Chassis or VCF—can assume the master or backup Routing Engine role.

### **Understanding EX4300, QFX3500, QFX3600, and QFX5100 Switches in a Virtual Chassis**

Up to ten EX4300 switches, QFX3500 switches, QFX3600 switches, and QFX5100 switches can be interconnected using Virtual Chassis ports (VCPs) to form a mixed or non-mixed Virtual Chassis. The mixed Virtual Chassis supports up to ten member switches regardless of the switches that compose the mixed Virtual Chassis.

EX4300 switches can also be interconnected into a mixed Virtual Chassis with EX4600 switches. See the following section for information on mixed EX4300 and EX4600 Virtual Chassis.

### **Understanding Mixed EX4300 and EX4600 Virtual Chassis**

EX4300 switches and EX4600 switches can be interconnected into the same Virtual Chassis. An EX4600 switch automatically assumes the master Routing Engine role in a mixed EX4300 and EX4600 Virtual Chassis, since EX4300 switches cannot assume the Routing Engine role in a mixed Virtual Chassis. EX4600 switches cannot be in a mixed Virtual Chassis with any other type of switch.

The mixed Virtual Chassis supports up to ten member switches.

### **Understanding EX4200, EX4500, and EX4550 Switches in a Mixed Virtual Chassis**

EX4200 switches, EX4500 switches, and EX4550 switches can be interconnected into the same Virtual Chassis to form a mixed EX4200 and EX4500 Virtual Chassis, mixed EX4200 and EX4550 Virtual Chassis, mixed EX4500 and EX4550 Virtual Chassis, or mixed EX4200, EX4500, and EX4550 Virtual Chassis. The mixed Virtual Chassis supports up to 10 member switches regardless of whether the switches are EX4200 switches, EX4500 switches, or EX4550 switches. Any model of EX4200, EX4500, or EX4550 switch can be interconnected into the same mixed Virtual Chassis. The master election process that decides member switch roles in a mixed Virtual Chassis is identical to the master election process in a non-mixed Virtual Chassis, so any member switch in a mixed Virtual Chassis can assume the master, backup, or linecard role.

EX4200 switches, EX4500 switches, and EX4550 switches cannot be interconnected into a Virtual Chassis with any other switches.

## Understanding Traffic Flow Through a Virtual Chassis Fabric

A Virtual Chassis Fabric (VCF) forwards unicast traffic using a smart trunking algorithm that sends all traffic across multiple paths based on end-to-end available bandwidth. The smart trunking algorithm avoids unnecessary congestion due to improper traffic allocation while optimizing fabric bandwidth utilization because traffic is forwarded through the VCF relative to available bandwidth.

The smart trunking algorithm works by considering the overall available path bandwidth of each path in the VCF when making traffic-forwarding decisions, and then forwarding traffic across the paths relative to available path bandwidth. If a VCF with two spine devices, for instance, has one path from leaf device 1 to leaf device 4 that contains two 40-Gbps QSFP+ links and a second path from leaf device 1 to leaf device 4 that contains two 10-Gbps SFP+ links, the algorithm tries to balance traffic sent on the paths so that four times more packets are sent on the first path with 40 Gbps of available bandwidth across the entire path than are sent on the second path with 10 Gbps of total bandwidth.

You can optimize how traffic is forwarded through the VCF by adding spine devices to maximize the number of available paths between all leaf devices, and by using as many 40-Gbps QSFP+ interfaces as Virtual Chassis ports (VCPs) as possible.

VCF also supports adaptive load balancing (ALB). ALB enables the VCF trunking algorithm to use dynamic load information on interfaces and traffic queues to make forwarding decisions within the VCF. When ALB is implemented using flowlets, traffic flows that enter the VCF are spliced into smaller flows—flowlets—and individually forwarded across the VCF to the same destination device over different paths when the inactivity time between packet bursts on the sending interface exceeds the user-configurable inactivity interval. When ALB is implemented using per-packet mode, the sending interface actively monitors all paths available between two member devices and forwards traffic through the VCF using the best available path at the moment.

Implementing ALB using flowlets is effective in environments that periodically experience extremely large traffic flows—*elephant flows*—that are substantially larger than the majority of other traffic flowing through the VCF. The VCF is better able to manage the elephant flows by splicing them into smaller flowlets using ALB.

ALB is supported on a non-mixed VCF composed entirely of QFX5100 switches only. You should enable ALB using flowlets in non-mixed VCFs in environments where a small number of traffic flows are disproportionately larger than the majority of the other traffic flows.

## Understanding Software Upgrades in a Virtual Chassis Fabric

This topic provides an overview of software upgrades on Virtual Chassis Fabric (VCF).

It contains the following sections:

- [Virtual Chassis Fabric Software Basics on page 5259](#)
- [Nonstop Software Upgrade \(NSSU\) on page 5259](#)
- [Automatic Software Update on page 5259](#)
- [Traditional Software Upgrade on page 5259](#)

---

### Virtual Chassis Fabric Software Basics

---

VCF is initially supported in Junos OS Release 13.2X51-D20. All devices in a VCF must be running the same version of Junos OS that supports VCF.

At initial VCF configuration, you should configure all devices to the same Junos OS release before interconnecting them into a VCF.

When you are adding a device to an existing VCF, you should update the Junos OS release on the new device to the Junos OS release running in the VCF before interconnecting it into the VCF. Updating the Junos OS on the device before interconnecting it helps ensure the device is gracefully added to the VCF, without the downtime that is required to reboot the device after an automatic software update or the troubleshooting that is required if the device isn't added to the VCF due to mismatched software releases.

Before you interconnect a device into a VCF, you should upgrade the software on the device being added to the VCF to the version of Junos OS running on the VCF.

---

### Nonstop Software Upgrade (NSSU)

---

Nonstop software upgrade (NSSU) enables you to upgrade the software running on all member devices in a VCF with minimal network traffic disruption during the upgrade.

NSSU upgrades the software on each device individually while all other devices continue normal operations.

For additional information on NSSU in a VCF, see *Understanding Nonstop Software Upgrade on a Virtual Chassis Fabric*.

---

### Automatic Software Update

---

Automatic software update automatically upgrades the Junos OS running on a device joining a VCF to the version of Junos OS running on the VCF at the moment the new device is cabled into the VCF.

Automatic software update is enabled using the **set virtual-chassis auto-sw-update** statement.

---

### Traditional Software Upgrade

---

You can upgrade software on a VCF using the traditional method of upgrading software for Junos OS by logging onto the master Routing Engine and using the **request system software add** command to initiate the upgrade on a non-mixed VCF or the **request system software add set [package-name package-name ...]** to initiate the upgrade on a mixed VCF, where *package-name* is the path to an image for one device family.

When you upgrade Junos OS on a VCF using the traditional software upgrade, the entire system is down until the upgrade is complete.

### Autoprovisioning a Virtual Chassis Fabric

Autoprovisioning a Virtual Chassis Fabric (VCF) enables you to “plug and play” devices into your VCF after minimal initial configuration.

Update all devices to the same version of Junos OS that supports VCF. See *Upgrading Software* or *Installing Software on an EX Series Switch with a Single Routing Engine (CLI Procedure)*.

To configure a VCF using autoprovisioning:

1. Make a list of the serial numbers of all the spine devices in the VCF. The spine devices must be QFX5100 devices. You can configure up to four spine devices in a VCF. You can get the device's serial number in the **show virtual-chassis** output or by following the instructions in *Locating the Serial Number on a QFX5100 Device or Component*.
2. Configure each device into fabric mode. If needed, configure the devices into mixed mode.

Configure the device to reboot as part of the procedure to complete this configuration step.

Configure mixed mode if your VCF includes QFX3600, QFX3500, or EX4300 devices as leaf devices.

If you are configuring a VCF composed entirely of QFX5100 devices:

```
user@device> request virtual-chassis mode fabric local reboot
```

If you are configuring a VCF composed of two or more types of devices:

```
user@device> request virtual-chassis mode fabric mixed local reboot
```

**NOTE:** A spine device whose fabric or mixed mode setting is improperly set cannot join a VCF. You can check the mode settings by using the `show virtual-chassis mode` command.

We recommend that you set the fabric and mixed mode settings before you interconnect your spine devices into the VCF to avoid the following issues:

- Incurring downtime as the devices reboot to commit the mixed mode or fabric settings.
- Manually correcting potential issues related to VCF formation because the device did not immediately join the VCF.

You can, however, use the `request virtual-chassis mode fabric local` or `request virtual-chassis mode mixed local` commands to set a spine device into fabric or mixed mode after interconnecting your VCF.

The fabric and mixed mode settings are automatically updated for a leaf device when it is interconnected into an autoprovisioned VCF. If the fabric or mixed mode settings are changed when a leaf device is interconnected into a VCF, the leaf device reboots before joining the VCF.

---

3. When the reboot is complete, log in to one of the spine devices in your VCF.

4. Set the configuration mode to autoprovisioned:

```
[edit]
```

```
user@device# set virtual-chassis auto-provisioned
```

5. Configure your spine devices into the Routing Engine role:

```
[edit virtual-chassis]
```

```
user@device# set member member-id serial-number serial-number role routing-engine
```

For instance, to configure the four spine devices with the serial numbers “SERIALNUMB00”, “SERIALNUMB01”, “SERIALNUMB02”, and “SERIALNUMB03” into the Routing Engine role as members 0 through 3:

```
[edit virtual-chassis]
```

```
user@device# set member 0 serial-number SERIALNUMB00 role routing-engine
```

```
user@device# set member 1 serial-number SERIALNUMB01 role routing-engine
```

```
user@device# set member 2 serial-number SERIALNUMB02 role routing-engine
```

```
user@device# set member 3 serial-number SERIALNUMB03 role routing-engine
```

6. (Recommended) Configure a virtual management Ethernet (VME) interface for management of the VCF configuration:

```
[edit]
```

```
user@device# set interfaces vme unit 0 family inet address /ip-address/mask/
```

**NOTE:** A VME accesses the device in the master Routing Engine role using a management port, so cable management port em0 or em1 on each spine device in your VCF so the VME is available regardless of which spine device assumes the master Routing Engine role. See *Connecting a QFX Series Device to a Management Console*

7. Commit the configuration:

```
user@device# commit
```

8. Cable your VCF.

After your autoprovisioned VCF configuration is committed, you can cable any EX4300, QFX3500, QFX3600, or QFX5100 device that is zeroized or that has never been configured to a spine device using a supported SFP+ or QSFP+ interface. The device that is zeroized or in factory-default mode is added to the VCF as a leaf device. All VCPs are configured as part of this process.

**NOTE:** Mixed mode and fabric mode are checked and, if needed, set automatically on the device as part of this process. If the mixed or fabric mode has to be changed to become part of the VCF, the device reboots. The device participates in the VCF with no further user intervention after this reboot is complete.

**NOTE:** Automatic VCP conversion only works when the interfaces on both ends of the link are not configured into VCPs.

The 40-Gbps QSFP+ interfaces on EX4300 switches are configured as VCPs, by default. You must, therefore, delete the VCP on the 40-Gbps QSFP+ interface using the `request virtual-chassis vc-port delete` command before interconnecting it into the VCF in order for the link to be converted into a VCP. You can also manually configure the link into a VCP using the `request virtual-chassis vc-port set` command.

The device joins the VCF immediately without a reboot if the mixed or fabric mode setting does not need to be changed.

9. Install the VCF feature licenses.

For a VCF deployment, two license keys are recommended for redundancy—one for the device in the master role and the other for the device in the backup role.

To purchase a feature license for VCF, contact your Juniper Networks sales representative (<http://www.juniper.net/us/en/contact-us/sales-offices>). The Juniper sales representative will provide you with the feature license files and license keys. You will be asked to supply the chassis serial number of your switch; you can obtain the serial number by running the `show virtual-chassis` command.

After obtaining the licenses, follow the instructions in *Generating License Keys*.

- [Adding a Device to a Virtual Chassis Fabric on page 5270](#)
- [Removing a Device From a Virtual Chassis Fabric on page 5277](#)
- [Understanding Virtual Chassis Fabric Components on page 5243](#)
- [Preprovisioning a Virtual Chassis Fabric on page 5264](#)

## Preprovisioning a Virtual Chassis Fabric

Preprovisioning a Virtual Chassis Fabric (VCF) configuration allows you to assign the member ID and role for each device in the VCF.

Update all devices to the same version of Junos OS that supports VCF. See *Upgrading Software* or *Installing Software on an EX Series Switch with a Single Routing Engine (CLI Procedure)*.

To preprovision a VCF:

1. Make a list of the serial numbers of all the devices to be connected in the VCF. You can get a device's serial number in the **show virtual-chassis** output or by following the instructions in *Locating the Serial Number on a QFX5100 Device or Component*, *Locating the Serial Number on a QFX3600 or QFX3600-I Device or Component*, *Locating the Serial Number on a QFX3500 Device or Component*, or *Locating the Serial Number on an EX4300 Switch or Component*.
2. Decide the desired role (**routing-engine** or **line-card**) for each device.

In a VCF, you configure up to four QFX5100 devices into the Routing Engine role as spine devices. All other devices are configured into the linecard role as leaf devices.

**NOTE:** Only two devices can simultaneously operate in the Routing Engine role within a VCF. A VCF, however, supports up to four spine devices. In scenarios where a preprovisioned VCF has three or more spine devices, the devices that are not operating in the Routing Engine role operate in the linecard role.

A spine device operating in the linecard role assumes the Routing Engine role when an active Routing Engine fails.

3. Configure each individual device into fabric mode. If needed, configure the devices into mixed mode.

Reboot each device to complete this configuration step.

Mixed mode must be configured if your VCF includes QFX3500, QFX3600, or EX4300 devices as leaf nodes.

If you are configuring a VCF composed entirely of QFX5100 devices:

```
user@device> request virtual-chassis mode fabric local reboot
```

If you are configuring a VCF that includes EX4300, QFX3500, or QFX3600 devices as leaf nodes:

```
user@device> request virtual-chassis mode fabric mixed local reboot
```

**NOTE:** A device whose fabric or mixed mode setting is improperly set cannot join a VCF. You can check the mode settings using the `show virtual-chassis mode` command.

We recommend that you set the fabric and mixed mode before you interconnect your devices into a VCF to avoid the following issues:

- Incurring downtime as the devices reboot to commit the mixed mode or fabric settings.
- Manually correcting potential issues related to VCF formation because the device did not immediately join the VCF.

You can, however, use the `request virtual-chassis mode fabric local` or `request virtual-chassis mode mixed local` commands to set a device into fabric or mixed mode after interconnecting your VCF.

4. Log in to one of your spine devices after the reboot has completed.

5. Specify the preprovisioned configuration mode:

```
[edit virtual-chassis]
user@device# set preprovisioned
```

6. Associate a member ID with a serial number for each device in your VCF, and configure the role for each device:

```
[edit virtual-chassis]
user@device# set member member-id serial-number serial-number role (line-card |
routing-engine)
```

Configure your spine devices into the Routing Engine role. You must use QFX5100 devices as your spine devices.

Configure your leaf devices into the linecard role.

For instance, if you wanted to preprovision a VCF with twenty member devices:

```
[edit virtual-chassis]
user@device# set member 0 serial-number SERIALNUMB00 role routing-engine
user@device# set member 1 serial-number SERIALNUMB01 role routing-engine
user@device# set member 2 serial-number SERIALNUMB02 role routing-engine
user@device# set member 3 serial-number SERIALNUMB03 role routing-engine
user@device# set member 4 serial-number SERIALNUMB04 role line-card
user@device# set member 5 serial-number SERIALNUMB05 role line-card
user@device# set member 6 serial-number SERIALNUMB06 role line-card
user@device# set member 7 serial-number SERIALNUMB07 role line-card
user@device# set member 8 serial-number SERIALNUMB08 role line-card
user@device# set member 9 serial-number SERIALNUMB09 role line-card
user@device# set member 10 serial-number SERIALNUMB10 role line-card
user@device# set member 11 serial-number SERIALNUMB11 role line-card
user@device# set member 12 serial-number SERIALNUMB12 role line-card
user@device# set member 13 serial-number SERIALNUMB13 role line-card
user@device# set member 14 serial-number SERIALNUMB14 role line-card
```

```

user@device# set member 15 serial-number SERIALNUMB15 role line-card
user@device# set member 16 serial-number SERIALNUMB16 role line-card
user@device# set member 17 serial-number SERIALNUMB17 role line-card
user@device# set member 18 serial-number SERIALNUMB18 role line-card
user@device# set member 19 serial-number SERIALNUMB19 role line-card

```

7. (Recommended) Configure a virtual management Ethernet (VME) interface for management of the VCF configuration:

```
[edit]
```

```
user@device# set interfaces vme unit 0 family inet address /ip-address/mask/
```

**NOTE:** A VME accesses the device in the master Routing Engine role using a management port, so cable management port em0 or em1 on each spine device in your VCF so the VME is available regardless of which spine device assumes the master Routing Engine role. See *Connecting a QFX Series Device to a Management Console*

8. Commit the configuration:

```
user@device# commit
```

9. Interconnect the spine device that you configured in the previous steps to all leaf devices by using the supported SFP+ and QSFP+ interfaces.

**NOTE:** The automatic Virtual Chassis port (VCP) conversion feature is enabled and automatically configures SFP+ and QSFP+ interfaces into VCPs when the VCF configuration mode is set to preprovisioned. You do not need to manually configure VCPs.

If you want to configure an SFP+ or QSFP+ interface into a network interface, disable LLDP on that interface. See *Configuring LLDP*.

**NOTE:** Automatic VCP conversion only works when the interfaces on both ends of the link are not configured into VCPs.

The 40-Gbps QSFP+ interfaces on EX4300 switches are configured as VCPs, by default. You must, therefore, delete the VCP on the 40-Gbps QSFP+ interface using the `request virtual-chassis vc-port delete` command before interconnecting it into the VCF in order for the link to be converted into a VCP. You can also manually configure the link into a VCP using the `request virtual-chassis vc-port set` command.

10. Interconnect all other spine devices to all other leaf devices using the supported SFP+ and QSFP+ interfaces.
11. Install the VCF feature licenses.

For a VCF deployment, two license keys are recommended for redundancy—one for the device in the master role and the other for the device in the backup role.

To purchase a feature license for VCF, contact your Juniper Networks sales representative (<http://www.juniper.net/us/en/contact-us/sales-offices>). The Juniper sales representative will provide you with the feature license files and license keys. You will be asked to supply the chassis serial number of your switch; you can obtain the serial number by running the **show virtual-chassis** command.

After obtaining the licenses, follow the instructions in *Generating License Keys*.

- [Autoprovisioning a Virtual Chassis Fabric on page 5261](#)

## Configuring a Nonprovisioned Virtual Chassis Fabric

**CAUTION:** Configure your Virtual Chassis Fabric (VCF) using autoprovisioning or preprovisioning unless you have a compelling reason to use nonprovisioned configuration. You can configure all aspects of a VCF using autoprovisioned or preprovisioned configuration. The process for autoprovisioning your VCF is described in “[Autoprovisioning a Virtual Chassis Fabric](#)” on page 5261 and the process for preprovisioning your VCF is described in “[Preprovisioning a Virtual Chassis Fabric](#)” on page 5264.

Nonprovisioned VCF configuration is highly discouraged. Nonprovisioned VCF configuration should only be used by VCF experts in specialized scenarios.

A nonprovisioned VCF is the configuration mode used when a VCF has not been configured into autoprovisioned or preprovisioned mode.

In a nonprovisioned VCF, you configure the device roles by setting the mastership priority value of each device. If no mastership priority values are set, a master election algorithm process runs and selects the role for each device.

You must manually configure all Virtual Chassis ports (VCPs) in a nonprovisioned VCF. The automatic VCP conversion feature, which automatically configures supported 10-Gbps SFP+ links and 40-Gbps QSFP+ links into VCPs on autoprovisioned and preprovisioned VCFs, is not supported on nonprovisioned VCFs.

Update all devices to the same version of Junos OS that supports VCF. See *Upgrading Software or Installing Software on an EX Series Switch with a Single Routing Engine (CLI Procedure)*.

To configure a nonprovisioned VCF:

1. Power on the devices.
2. Configure each individual device into fabric mode. If needed, configure the devices into mixed mode.

Reboot each device to complete this configuration step.

A VCF must have QFX5100 devices in the spine role, and operates most efficiently when the leaf nodes are also QFX5100 devices. Mixed mode must be configured if your VCF also includes at least one QFX3600, QFX3500, or EX4300 device in the leaf role.

If you are configuring a VCF composed entirely of QFX5100 devices:

```
user@device> request virtual-chassis mode fabric local reboot
```

If you are configuring a VCF using at least one QFX3600, QFX3500, or EX4300 device as a leaf device:

```
user@device> request virtual-chassis mode fabric mixed local reboot
```

**NOTE:** A device whose fabric or mixed mode setting is improperly set cannot join a VCF. You can check the mode settings using the `show virtual-chassis mode` command.

We recommend setting the fabric and mixed mode settings before interconnecting your devices into a VCF to avoid the following issues:

- Incurring downtime as the devices reboot to commit the mixed mode or fabric settings.
- Manually correcting potential issues related to VCF formation because the device did not immediately join the VCF.

We strongly recommend configuring the mixed and fabric settings before you interconnect a device into a VCF. You can, however, use the `request virtual-chassis mode fabric local` or `request virtual-chassis mode mixed local` commands to set a device into fabric or mixed mode after you have interconnected your VCF.

3. After the device reboots are complete, cable your spine devices to your leaf devices using supported SFP+ and QSFP+ interfaces.
4. (Recommended) Configure a virtual management Ethernet (VME) interface for management of the VCF configuration:

[edit]

```
user@device# set interfaces vme unit 0 family inet address /ip-address/mask/
```

**NOTE:** A VME accesses the device in the master Routing Engine role using a management port, so cable management port em0 or em1 on each spine device in your VCF so the VME is available regardless of which spine device assumes the master Routing Engine role. See *Connecting a QFX Series Device to a Management Console*

5. Configure the desired SFP+ and QSFP+ interfaces into Virtual Chassis ports (VCPs):

```
user@device> request virtual-chassis vc-port set pic-slot pic-slot-number port port-number
user@device> request virtual-chassis vc-port set pic-slot pic-slot-number port port-number
```

The `show virtual-chassis vc-port` must be issued on the ports at both ends of the link in order for that link to be configured into a VCP.

6. Enter the `show virtual-chassis` command to confirm that the VCPs are operational and to learn the member ID of each member device in your VCF.

If you want to change the member ID that has been assigned to a member device, use the `request virtual-chassis renumber` command.

7. (Optional) Configure the mastership priority for each member device:

```
[edit virtual-chassis]
user@device# set member member-id mastership-priority number
```

In a nonprovisioned VCF, member roles are determined by a mastership election algorithm. The first value checked by the mastership election algorithm is the mastership priority value. The two QFX5100 devices with the highest mastership priority values assume the master and backup Routing Engine role, which must be used by the spine devices in a VCF. All other devices assume the linecard role.

QFX5100 devices assume the Routing Engine role, regardless of mastership priority settings. QFX5100 devices can also assume the linecard role.

QFX3600, QFX3500, and EX4300 devices always assume the linecard role in a VCF, regardless of the mastership priority settings.

**NOTE:** A spine device that isn't selected as master or backup Routing Engine assumes the linecard role. The spine devices should still be configured with a higher mastership priority value than the leaf devices to assure a spine device assumes the Routing Engine role when the master or backup Routing Engine fails.

If two or more devices have the same mastership priority value and are candidates for the Routing Engine role, the mastership election algorithm uses other parameters to determine which device is elected into the Routing Engine role. See [“Understanding How the Master in a Virtual Chassis Is Elected” on page 5078](#).

A device with a mastership priority of 0 never assumes the master or backup role.

For instance, to configure the mastership priority for member devices 0 through 19 in your VCF.

```
[edit virtual-chassis]
```

```
user@device# set member 0 mastership-priority 255
user@device# set member 1 mastership-priority 255
user@device# set member 2 mastership-priority 255
user@device# set member 3 mastership-priority 255
user@device# set member 4 mastership-priority 100
user@device# set member 5 mastership-priority 95
user@device# set member 6 mastership-priority 90
user@device# set member 7 mastership-priority 85
user@device# set member 8 mastership-priority 80
user@device# set member 9 mastership-priority 75
user@device# set member 10 mastership-priority 70
user@device# set member 11 mastership-priority 65
user@device# set member 12 mastership-priority 60
user@device# set member 13 mastership-priority 55
user@device# set member 14 mastership-priority 50
user@device# set member 15 mastership-priority 45
user@device# set member 16 mastership-priority 40
user@device# set member 17 mastership-priority 35
user@device# set member 18 mastership-priority 30
user@device# set member 19 mastership-priority 25
```

8. Install the VCF feature licenses.

For a VCF deployment, two license keys are recommended for redundancy—one for the device in the master role and the other for the device in the backup role.

To purchase a feature license for VCF, contact your Juniper Networks sales representative (<http://www.juniper.net/us/en/contact-us/sales-offices>). The Juniper sales representative will provide you with the feature license files and license keys. You will be asked to supply the chassis serial number of your switch; you can obtain the serial number by running the **show virtual-chassis** command.

After obtaining the licenses, follow the instructions in *Generating License Keys*.

## Adding a Device to a Virtual Chassis Fabric

This topic describes how to add a device to a Virtual Chassis Fabric (VCF).

It contains the following sections:

- [Adding a Leaf Device to an Autoprovisioned Virtual Chassis Fabric on page 5271](#)
- [Adding a Spine Device to an Autoprovisioned Virtual Chassis Fabric on page 5272](#)
- [Adding a Spine or Leaf Device to a Preprovisioned Virtual Chassis Fabric on page 5273](#)
- [Adding a Spine or Leaf Device to a Nonprovisioned Virtual Chassis Fabric on page 5275](#)

### Adding a Leaf Device to an Autoprovisioned Virtual Chassis Fabric

Update your device to the same version of Junos OS running on the devices in the VCF. See *Upgrading Software* or *Installing Software on an EX Series Switch with a Single Routing Engine (CLI Procedure)*.

To add a leaf device to an autoprovisioned VCF:

1. Log onto the device that you are adding to the VCF.
2. (Optional) Perform this step if you want to avoid the downtime associated with an extra reboot when your device is interconnected into your VCF. If you do not perform this step, the VCF auto-detects the fabric and mixed mode settings and, if needed, reboots the device as part of the process of changing these settings.

Configure the leaf device into fabric mode. Configure your device into mixed mode if your VCF includes QFX3600, QFX3500, or EX4300 devices as leaf devices..

If you are configuring a VCF composed entirely of QFX5100 devices:

```
user@device> request virtual-chassis mode fabric local
```

If you are configuring a VCF composed of two or more types of devices:

```
user@device> request virtual-chassis mode fabric mixed local
```

3. If the leaf device that you are adding to the VCF has not previously been configured, proceed to the next step.

If your device has been configured, zeroize your device and reboot:

```
user@device> request system zeroize
```

```
warning: System will be rebooted and may not boot without configuration
Erase all data, including configuration and log files? [yes,no] (yes) yes
```

**NOTE:** You must zeroize your device if you have previously entered one or more configuration commands, including basic configuration commands.

Your device will not join the VCF if it contains any configuration until it has been zeroized.

**NOTE:** The `request virtual-chassis mode fabric local` and `request virtual-chassis mode fabric mixed local` commands are entered in operational mode, so those settings are maintained when the device is zeroized.

You cannot use other methods to set a device into factory default mode before inserting it into a VCF if it was previously configured in another Virtual Chassis or VCF. You must use **`request system zeroize`**.

For additional information on this procedure, see [“Reverting to the Default Factory Configuration for the EX Series Switch” on page 620](#) or [Reverting to the Default Factory Configuration](#).

4. (Required only if you are adding a device that turns a non-mixed VCF into a mixed VCF) Log in to the VCF and set all devices in the VCF to mixed mode. Configure all devices to reboot to complete this procedure.

```
user@device> request virtual-chassis mode mixed all-members reboot
```

The VCF experiences downtime as part of the reboot procedure.

5. Interconnect your leaf device into the existing spine devices, using at least one 10-Gbps SFP+ interface or 40-Gbps QSFP+ interface to connect to each spine device in the VCF.

An autoprovisioned VCF automatically adds a supported device in factory-default mode to the VCF when it is connected to a spine devices using a supported SFP+ or QSFP+ link. The SFP+ or QSFP+ link is automatically converted into a Virtual Chassis port (VCP) as part of this process.

No further configuration is required.

---

### Adding a Spine Device to an Autoprovisioned Virtual Chassis Fabric

---

Update your device to the same version of Junos OS running on the devices in the VCF before interconnecting it into the VCF. See *Upgrading Software* or *Installing Software on an EX Series Switch with a Single Routing Engine (CLI Procedure)*.

To add a spine device to an autoprovisioned VCF:

1. Log in to your VCF.
2. If you are replacing a spine device that is already part of the VCF, power off the spine device in the VCF.

Follow the steps in [“Removing a Device From a Virtual Chassis Fabric” on page 5277](#) to remove the device from the VCF.

3. Modify the configuration.

If your new spine device is replacing an existing spine, modify the configuration to remove the old spine.

You can skip this step if you are not replacing an existing spine device.

```
[edit virtual-chassis]
```

```
user@device# delete member member-id
```

where *member-id* is the member ID of the spine that is removed from this procedure.

Add the spine device to the configuration:

```
[edit virtual-chassis]
```

```
user@device# set member member-id serial-number serial-number role routing-engine
```

For instance, to configure a spine device with the serial number OU81234567890 as member 3:

```
[edit virtual-chassis]
```

```
user@device# set member 3 serial-number OU81234567890 role routing-engine
```

4. Commit the configuration.

```
[edit]
```

```
user@device# commit
```

5. Log in to the device that is going to be added to the VCF.
6. Configure the device into fabric mode. If needed, also configure the device into mixed mode.

Reboot the device to complete this configuration step.

If you are configuring a VCF composed entirely of QFX5100 devices:

```
user@device> request virtual-chassis mode fabric local reboot
```

If you are configuring a VCF composed of QFX5100 devices and at least one other type of device:

```
user@device> request virtual-chassis mode fabric mixed local reboot
```

**NOTE:** We recommend setting the fabric and mixed mode settings before interconnecting your devices into a VCF to avoid the following issues:

- Incurring downtime as the devices reboot to commit the mixed mode or fabric settings.
- Manually correcting potential issues related to VCF formation because the device did not immediately join the VCF.

You can, however, use the `request virtual-chassis mode fabric local` or `request virtual-chassis mode mixed local` commands to set a device into fabric or mixed mode after interconnecting your VCF.

7. (Required only if you are adding a device that turns a non-mixed VCF into a mixed VCF) Log in to the VCF and set all devices in the VCF to mixed mode. Configure all devices to reboot to complete this procedure.

```
user@device> request virtual-chassis mode mixed all-members reboot
```

The VCF experiences downtime as part of the reboot procedure.

8. After the device reboots, interconnect the new device into the VCF by cabling the device to the leaf devices in the VCF using supported SFP+ or QSFP+ interfaces.

The SFP+ or QSFP+ links are converted into VCPs automatically.

The new spine device should be operational once the cabling is complete.

### Adding a Spine or Leaf Device to a Preprovisioned Virtual Chassis Fabric

Update your device to the same version of Junos OS running on the devices in the VCF before interconnecting it into the VCF. See *Upgrading Software* or *Installing Software on an EX Series Switch with a Single Routing Engine (CLI Procedure)*.

To add a spine or leaf device to a preprovisioned VCF:

1. Log in to your VCF.
2. If you are replacing a device that is already part of the VCF, power off the device in the VCF.

Follow the steps in [“Removing a Device From a Virtual Chassis Fabric”](#) on page 5277 to remove the device from the VCF.

3. Modify the configuration.

If your new device is replacing an existing device, modify the configuration to remove the old device.

You can skip this portion of the procedure if you are not replacing an existing device.

```
[edit virtual-chassis]
user@device# delete member member-id
```

where *member-id* is the member ID of the spine that is removed from this procedure.

Add the new device to the configuration:

```
[edit virtual-chassis]
user@device# set member member-id serial-number serial-number role routing-engine
```

For instance, to configure a device with the serial number OU81234567890 into the Routine Engine role as member 3:

```
[edit virtual-chassis]
user@device# set member 3 serial-number OU81234567890 role routing-engine
```

4. Commit the configuration.

```
[edit]
user@device# commit
```

5. Log in to the device that is going to be added to the VCF.

6. Configure the device into fabric mode. If needed, also configure the device into mixed mode.

Reboot the device to complete this configuration step.

If you are configuring a VCF composed entirely of QFX5100 devices:

```
user@device> request virtual-chassis mode fabric local reboot
```

If you are configuring a VCF composed of two or more types of devices:

```
user@device> request virtual-chassis mode fabric mixed local reboot
```

**NOTE:** If you are adding a QFX3600, QFX3500, or EX4300 device to a VCF that is composed entirely of QFX5100 devices, you must also log in to the VCF and set all of the devices in the VCF into mixed mode.

Log in to the VCF and enter the **request virtual-chassis mode mixed all-members reboot** command to perform this task.

The VCF reboots and incurs downtime to complete this procedure.

---

**NOTE:** We recommend that you set the fabric and mixed mode settings before you interconnect your devices into a VCF to avoid the following issues:

- Incurring downtime as the devices reboot to commit the mixed mode or fabric settings.
- Manually correcting potential issues related to VCF formation because the device did not immediately join the VCF.

You can, however, use the `request virtual-chassis mode fabric local` or `request virtual-chassis mode mixed local` commands to recover a device that was not set into fabric or mixed mode before you interconnect it into your VCF.

7. (Required only if you are adding a device that turns a non-mixed VCF into a mixed VCF) Log in to the VCF and set all devices in the VCF to mixed mode. Configure all devices to reboot to complete this procedure.

```
user@device> request virtual-chassis mode mixed all-members reboot
```

The VCF experiences downtime as part of the reboot procedure.

8. After the device reboots, interconnect the new device into the VCF using supported SFP+ or QSFP+ interfaces.

The SFP+ or QSFP+ links are converted into VCPs automatically.

The new device should be operational shortly after the cabling is complete.

### Adding a Spine or Leaf Device to a Nonprovisioned Virtual Chassis Fabric

**CAUTION:** Configure your VCF using autoprovisioning or preprovisioning unless you have a compelling reason to use nonprovisioned configuration. You can configure all aspects of a VCF using autoprovisioned or preprovisioned configuration.

Nonprovisioned VCF configuration is highly discouraged. Nonprovisioned VCF configuration should only be used by VCF experts in specialized scenarios.

Update your device to the same version of Junos OS running on the devices in the VCF before interconnecting it into the VCF. See *Upgrading Software* or *Installing Software on an EX Series Switch with a Single Routing Engine (CLI Procedure)*.

To add a spine or leaf device to a nonprovisioned VCF:

1. Log in to your VCF.
2. If you are replacing a device that is already part of the VCF, power off the device in the VCF. Uncable the device once the power off is complete.

You can skip this step if you are adding a new device without replacing an existing device. You must skip this step if there is no configuration for the device that you are removing from the VCF.

If the device is configured, delete the device from the VCF configuration:

```
[edit virtual-chassis]
user@device# delete member member-id
```

where *member-id* is the member ID of the device that you are removing.

3. Log in to the device that you are going to add to the VCF.
4. Configure the device into fabric mode. If needed, also configure the device into mixed mode.

Reboot the device to complete this configuration step.

If you are configuring a VCF composed entirely of QFX5100 devices:

```
user@device> request virtual-chassis mode fabric local reboot
```

If you are configuring a VCF that includes at least one QFX3600, QFX3500, or EX4300 devices as a leaf device:

```
user@device> request virtual-chassis mode fabric mixed local reboot
```

**NOTE:** If you are adding a QFX3600, QFX3500, or EX4300 device to a VCF that is composed entirely of QFX5100 devices, you must also log in to the VCF and set all of the devices in the VCF into mixed mode.

Log in to the VCF and enter the **request virtual-chassis mode mixed all-members reboot** command to perform this task.

The VCF reboots and incurs downtime to complete this procedure.

**NOTE:** We recommend that you set the fabric and mixed mode settings before you interconnect your devices into a VCF to avoid the following issues:

- Incurring downtime as the devices reboot to commit the mixed mode or fabric settings.
- Manually correcting potential issues related to VCF formation because the device did not immediately join the VCF.

You can, however, use the **request virtual-chassis mode fabric local** or **request virtual-chassis mode mixed local** commands to set a device into fabric or mixed mode after interconnecting your VCF.

5. (Required only if you are adding a device that turns a non-mixed VCF into a mixed VCF) Log in to the VCF and set all devices in the VCF to mixed mode, Configure all devices to reboot to complete this procedure.

```
user@device> request virtual-chassis mode mixed all-members reboot
```

The VCF experiences downtime as part of the reboot procedure.

6. After the device reboots, interconnect it into the VCF using supported SFP+ or QSFP+ interfaces.

7. Configure the SFP+ or QSFP+ interfaces into Virtual Chassis ports (VCPs):

```
user@device> request virtual-chassis vc-port set pic-slot pic-slot-number port port-number
user@device> request virtual-chassis vc-port set pic-slot pic-slot-number port port-number
```

The **request virtual-chassis vc-port** must be configured on the ports at both ends of the link in order for that link to be configured into a VCP.

8. (Optional) Log in to the VCF and set the mastership priority of the new device:

```
[edit virtual-chassis]
user@device# set member member-id mastership-priority number
```

If needed, enter the **show virtual-chassis** command to learn the member ID of the new member device in the VCF.

## Removing a Device From a Virtual Chassis Fabric

This topic describes how to remove a device from a Virtual Chassis Fabric (VCF):

To remove a device from a VCF:

1. Power off the device that you are removing from the VCF.
2. Uncable the device that you are removing from the VCF.
3. Log in to the Virtual Management ethernet (VME) interface. Remove the device from the VCF configuration.

You can skip this step if you are removing a device that was never configured.

```
[edit virtual-chassis]
user@device# delete member member-id
```

4. Delete the Virtual Chassis port (VCP) or ports on the devices that are still in the VCF but were connected to the removed device.

```
user@device> request virtual-chassis vc-port delete pic-slot pic-slot port port-number member member-id
```

When a device is removed from a VCF, the interface on the other end of the VCP link that was connected to the removed device remains configured as a VCP.

You can check the results of this command using the **show virtual-chassis vc-port** command.

5. (Required only if you are removing a device that turns a mixed VCF into a homogenous VCF) Log in to the VCF and disable mixed mode for all of the devices in the VCF, Configure all devices to reboot to complete this procedure.

```
user@device> request virtual-chassis mode mixed disable all-members reboot
```

This step should only be taken if you are removing a QFX3600, QFX3500, or EX4300 device from a mixed VCF and the only devices remaining in the VCF are QFX5100 devices.

The VCF experiences downtime as part of the reboot procedure.

6. Commit the configuration.

```
[edit]
user@device# commit
```

7. Power on the device that was removed from the VCF, and log in to it.

8. (Optional, but recommended) Delete the VCP or VCPs on the device that was removed:

```
user@device> request virtual-chassis vc-port delete pic-slot pic-slot port port-number member member-id
```

9. (Optional, but recommended) Reset the fabric and mixed mode settings.

If you are removing a device that was part of a VCF composed entirely of the same device:

```
user@device> request virtual-chassis mode fabric disable reboot
```

If you are removing a device that was part of a VCF composed of two or more device types:

```
user@device> request virtual-chassis mode fabric mixed disable reboot
```

Reboot the device to complete the process.

We recommend resetting the fabric and mixed mode settings immediately after removing it from the VCF to avoid any potential issues with your device if it is placed in your network in another role.

- [Understanding Virtual Chassis Fabric Components on page 5243](#)

## Upgrading Software for a Virtual Chassis Fabric

This topic describes the processes that can be used to update software on an operational Virtual Chassis Fabric (VCF).

You should update the software on each device before initially interconnecting your VCF. This process describes the options that are available for upgrading software after a VCF is setup.

It contains the following sections:

- [NSSU on page 5279](#)
- [Automatic Software Update on page 5279](#)
- [Standard Upgrade on page 5279](#)

## NSSU

Nonstop software upgrade (NSSU) enables you to upgrade the software running on all member devices in a VCF with minimal network traffic disruption during the upgrade.

See *Upgrading Software on a Virtual Chassis Fabric Using Nonstop Software Upgrade*.

## Automatic Software Update

Automatic software update automatically upgrades the Junos OS running on a device joining a VCF to the version of Junos OS running on the VCF at the moment the new device is cabled into the VCF.

To configure the automatic software update feature for a VCF composed entirely of QFX5100 devices:

[edit]

```
user@device# set virtual-chassis auto-sw-update package-name package-name
```

To configure the automatic software update feature on a VCF composed of QFX5100 devices and at least one other type of device:

[edit]

```
user@device# set virtual-chassis auto-sw-update qfx-5 package-name package-name
```

```
user@device# set virtual-chassis auto-sw-update qfx-3 package-name package-name
```

```
user@device# set virtual-chassis auto-sw-update ex-4300 package-name package-name
```

where **qfx-5** specifies the path to the Junos OS used to run a QFX5100 devices, **qfx-3** specifies the path to the Junos OS used to run QFX3600 and QFX3500 devices, and **ex4300** specifies the path to the Junos OS used to run EX4300 switches.

If the software package is located on a local directory on the switch, use the following format for **package-name**:

**/pathname/package-name**

If the software package is to be downloaded and installed from a remote location, use one of the following formats:

**ftp://hostname/pathname/package-name**

**ftp://username:prompt@ftp.hostname.net/package-name**

**http://hostname/pathname/package-name**

## Standard Upgrade

You can upgrade software on a VCF using the traditional method of upgrading software for Junos OS by logging onto the master Routing Engine and using the **request system software add** command to initiate the upgrade on a non-mixed VCF or the **request system**

**software add set** [*package-name package-name ...*] to initiate the upgrade on a mixed VCF, where *package-name* is the path to an image for one device family.

When you upgrade Junos OS on a VCF using the traditional software upgrade, each device in the VCF must reboot. The entire system is down until the upgrade process is complete.

For information on performing this procedure, see *Upgrading Software*.

### [edit virtual-chassis] Configuration Statement Hierarchy

This topic lists supported and unsupported configuration statements in the **[edit virtual-chassis]** hierarchy level on EX Series and QFX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.

- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms.

For detailed information about feature support on specific EX Series or QFX Series switch platforms, see [Feature Explorer](#).

This topic lists:

- [Supported Statements in the \[edit virtual-chassis\] Hierarchy Level on page 5281](#)
- [Unsupported Statements in the \[edit virtual-chassis\] Hierarchy Level on page 5282](#)

### Supported Statements in the [edit virtual-chassis] Hierarchy Level

The following hierarchy shows the **[edit virtual-chassis]** configuration statements supported on EX Series or QFX Series switches:

```
virtual-chassis {
  aliases {
    serial-number serial-number {

### Unsupported Statements in the [edit virtual-chassis] Hierarchy Level

All statements in the **[edit virtual-chassis]** hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented.

## alias-name (Virtual Chassis aliases)

**Syntax** `alias-name alias-name;`

**Hierarchy Level** `[edit virtual-chassis aliases serial-number serial-number]`

**Release Information** Statement introduced in Junos OS Release 14.1X53-D10 for EX Series and QFX Series switches.

**Description** Create an alias for a member switch in a Virtual Chassis or Virtual Chassis Fabric (VCF). An alias allows you to more clearly identify the member switches in your Virtual Chassis or VCF by assigning a text label to a member switch's serial number.

The alias appears in the **Alias-Name** field in the **show virtual-chassis** command.

Alias usage is optional and aliases are used for administrative purposes only. Setting an alias has no effect on the operation of the member switch.

In the following example, the **dc-floor-1** alias name is assigned to the member switch with the serial number AB0123456789.

### set serial-number

```
[edit virtual-chassis aliases]
user@switch# set serial-number AB0123456789 alias-name dc-floor-1
```

### show virtual-chassis

```
user@switch> show virtual-chassis
Preprovisioned Virtual Chassis Fabric
Fabric ID: 9d5d.5556.919a
Fabric Mode: Enabled

Member ID  Status   Serial No   Alias-Name   Model          Mstr  prio  Role
0 (FPC 0)  Prsnt    AB0123456789 dc-floor-1   qfx5100-48s-6q 129   Master
<additional output removed for brevity>
```

**Options** *alias-name*—The text label, or alias, assigned to the member switch by the user.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.2X51-D20 for EX Series switches and QFX Series devices in a Virtual Chassis Fabric (VCF).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | <p>Enable the auto-provisioned configuration mode for a Virtual Chassis Fabric (VCF).</p> <p>When a VCF is autoprovisioned, you can plug and play leaf devices that have not been configured or are zeroized into your VCF without user configuration. The leaf devices are automatically configured into the linecard role and all other VCF configuration—configuring Virtual Chassis ports (VCPs), the member ID, fabric mode, mixed mode (if applicable), and other parameters—is completed without further user action when a supported spine device interconnects to the leaf device by using a 10-Gbps SFP+ or 40-Gbps QSFP+ link that can be converted into a VCP.</p> <p>A leaf device whose fabric or mixed mode setting is changed as part of the autoprovisioning process automatically reboots. You can avoid this reboot by configuring the fabric or mixed mode setting on the leaf device before interconnecting into the VCF.</p> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Description</b>         | <p>Enable the automatic software update feature for Virtual Chassis or Virtual Chassis Fabric (VCF) configurations.</p> <p>You should only use the keywords that specify a device—<b>ex-4300</b>, <b>ex-4600</b>, <b>qfx-3</b>, and <b>qfx-5</b>—when configuring automatic software update on a mixed Virtual Chassis or Virtual Chassis Fabric (VCF). You can simply specify the <i>package-name</i> without specifying the device keywords in non-mixed Virtual Chassis or VCF topologies.</p> <p>You must enter the <b>auto-sw-update</b> statement multiple times—once for each device family in your mixed Virtual Chassis or VCF—in most scenarios when enabling the automatic software update for a mixed Virtual Chassis or VCF.</p> <p>The Junos OS package for an EX4500 switch updates the software for EX4500 and EX4550 switches. You do not, therefore, need to specify the <b>ex-4500</b> keyword when configuring automatic software update for a mixed Virtual Chassis that include EX4500 and EX4550 switches only. You also only have to enter the <b>ex-4500</b> keyword once to configure automatic software update for all EX4500 and EX4550 member switches in the same mixed Virtual Chassis.</p> <p>The Junos OS package for a QFX3500 device updates the software for QFX3500 and QFX3600 devices. You do not, therefore, need to specify the <b>qfx-3</b> keyword when configuring automatic software update for a Virtual Chassis composed entirely of QFX3500 and QFX3600 devices. You also have to enter the <b>qfx-3</b> keyword only once to configure automatic software update for all QFX3500 and QFX3600 member devices in the same mixed Virtual Chassis.</p> <p>The remaining statement is explained separately.</p> |
| <b>Default</b>             | The automatic software update feature is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>             | <p><b>package-name package-name</b>—Specify a path to a Junos OS software image.</p> <p><b>ex-4200</b>—Specify a path to a Junos OS image for an EX4200 switch when enabling automatic software update for a mixed EX4200 and EX4500 Virtual Chassis, mixed</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

EX4200 and EX4550 Virtual Chassis, or mixed EX4200, EX4500, or EX4550 Virtual Chassis.

**ex-4300**—Specify a path to a Junos OS image for an EX4300 switch when enabling automatic software update for a mixed Virtual Chassis or VCF.

**ex-4500**—Specify a path to a Junos OS image for an EX4500 switch, an EX4550 switch, or both types of switches when enabling automatic software update for a mixed EX4200 and EX4500 Virtual Chassis, mixed EX4200 and EX4550 Virtual Chassis, or mixed EX4200, EX4500, or EX4550 Virtual Chassis.

The Junos OS package for an EX4500 switch updates the software for EX4500 and EX4550 switches. Therefore, you only enter this command once to upgrade the EX4500 and EX4550 member switches in the same mixed Virtual Chassis.

The **ex-4500** keyword also does not need to be specified when configuring automatic software update for a mixed EX4500 and EX4550 Virtual Chassis.

**ex-4600**—Specify a path to a Junos OS image for an EX4600 switch when enabling automatic software update for a mixed Virtual Chassis.

**qfx-3**—Specify a path to a Junos OS image for a QFX3500, QFX3600, or both types of devices when enabling automatic software update for a mixed VCF.

**qfx-5**—Specify a path to a Junos OS image for a QFX5100 device when enabling automatic software update for a mixed VCF.

**Release Information**    Statement introduced in Junos OS Release 13.2X51-D15 for EX Series switches.  
                              Statement introduced in Junos OS Release 13.2X51-D20 for QFX Series devices.  
                              The **fabric-load-balance** statement introduced in Junos OS Release 14.1X53-D10.

**Description**    Configure the hashing key used to hash link aggregation group (LAG) and equal-cost multipath (ECMP) traffic, or enable adaptive load balancing (ALB) in a Virtual Chassis Fabric (VCF).

The hashing algorithm is used to make traffic-forwarding decisions for traffic entering a LAG bundle or for traffic exiting a switch when ECMP is enabled.

For LAG bundles, the hashing algorithm determines how traffic entering a LAG bundle is placed onto the bundle's member links. The hashing algorithm tries to manage bandwidth by evenly load-balancing all incoming traffic across the member links in the bundle.

When ECMP is enabled, the hashing algorithm determines how incoming traffic is forwarded to the next-hop device.

The remaining statements are explained separately.

| <b>Release Information</b> | Statement introduced in Junos OS Release 14.1X53-D10.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>         | <p>Enable adaptive load balancing (ALB) for a VCF, and specify how ALB is implemented.</p> <p>When ALB is enabled, the Virtual Chassis ports (VCPs) are reset. Packets are dropped and might potentially arrive out of order for a brief period of time as a result of this VCP reset. Normal operation of the VCF resumes after the VCP reset with no further user action.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Default</b>             | <p>ALB is disabled, by default.</p> <p>If you do not specify a mode when enabled ALB, ALB is enabled using flowlet mode with an inactivity timer of 16 microseconds.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Options</b>             | <p><b>flowlet</b>—Implement ALB by using flowlets.</p> <p>When ALB is implemented using flowlets, traffic flows that enter the VCF are spliced into smaller flows—flowlets—and individually forwarded across the VCF to the same destination device over different paths when the inactivity time between packet bursts on the sending interface exceeds the user-configurable inactivity interval.</p> <p>The inactivity interval is 16 microseconds by default, and can be configured using the <b>inactivity-interval</b> statement. You should configure the inactivity interval to ensure in-order packet delivery, so that overall performance is not negatively impacted by the packet reordering process at the receiving device. To ensure in-order packet delivery, the inactivity interval should be larger than the largest latency skew among all the paths in the VCF from any node to any other node.</p> <p>Implementing ALB using flowlets is especially effective in environments that periodically experience extremely large traffic flows—<i>elephant flows</i>—that are substantially larger than the majority of other traffic flowing through the VCF. The VCF is better able to manage elephant flows by splicing them into smaller flowlets using ALB.</p> <p><b>per-packet</b>—Implement ALB using per-packet mode.</p> <p>When per-packet mode is enabled, the VCF forwarding algorithm dynamically monitors all paths in the VCF and forwards packets to destination devices using the best available path at that moment. Flows are reordered at the destination node when per-packet mode is used to enable ALB, so some performance impact due to packet reordering is experienced.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 14.1X53-D10.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | <p>Set the inactivity interval for adaptive load balancing (ALB) using flowlets within a VCF.</p> <p>The inactivity interval is the amount of time that occurs between packet bursts on a sending interface before a traffic flow is spliced into smaller traffic flows—flowlets—when ALB is implemented using flowlets. The flowlets are then individually forwarded across the VCF to the same destination device over different paths.</p> <p>You should configure the inactivity interval to ensure in-order packet delivery, so that overall performance is not negatively impacted by the packet re-ordering process at the receiving device. To ensure in-order packet delivery, the inactivity interval should be larger than the largest latency skew among all the paths in the VCF from any node to any other node.</p> |
| <b>Default</b>                  | <p>ALB is disabled, by default.</p> <p>If ALB is enabled without specifying a mode, ALB is enabled using flowlet mode with an inactivity interval of 16 microseconds.</p> <p>If ALB is enabled using flowlet mode without specifying an inactivity interval, the inactivity interval is set to 16 microseconds.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Release Information</b>      | <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Option <b>disable</b> introduced in Junos OS Release 12.2 for EX Series switches.</p> <p>The maximum timer limit changed from no maximum timer limit to 60 minutes in Junos OS Release 12.2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series.</p> <p>Statement introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).</p>                                                                                                                           |
| <b>Description</b>              | <p>Specify how long the Virtual Chassis or VCF continues to use the MAC address of the switch that was originally configured in the master role as the system MAC base address after the original master switch is removed from the Virtual Chassis or VCF. The system MAC base address does not change in the event of a switchover provided the switch originally configured in the master role remains a member of the Virtual Chassis or VCF.</p> <p>The maximum timer limit is 60 minutes starting in Junos OS Release 12.2. There are no minimum or maximum timer limits in prior Junos OS releases.</p> |
| <b>Default</b>                  | The MAC persistence timer is set to 10 minutes by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Options</b>                  | <p><b>minutes</b>—Time in minutes that the member switch in the backup role continues to use the system MAC base address of the old master before using its own system MAC base address after the switch in the master role is physically disconnected or removed from the Virtual Chassis or VCF.</p> <p><b>disable</b>—Disable the MAC persistence timer. The system MAC base address never changes when the MAC persistence timer is disabled, even when the switch in the master role is physically disconnected or removed from the Virtual Chassis or VCF.</p>                                           |

| <b>Description</b>              | <p>The mastership priority value is the most important factor in determining the role of the member switch within a nonprovisioned Virtual Chassis or VCF configuration. Other factors (see <a href="#">“Understanding How the Master in a Virtual Chassis Is Elected” on page 5078</a>) also affect the election of the master.</p> <p>The mastership priority value takes the highest precedence in the master election algorithm. The member switch with highest mastership priority assumes the master Routing Engine role of the Virtual Chassis or VCF. Toggling back and forth between master and backup status in failover conditions is undesirable, so we recommend that you assign the same mastership priority value to both the master and the backup. Secondary factors in the master election algorithm determine which of these two members (that is, the two members that are assigned the highest mastership priority value) functions as the master of the Virtual Chassis or VCF.</p> <p>This statement is not used for the EX8200 Virtual Chassis, which determines mastership by external Routing Engine uptime. See <i>Understanding Virtual Chassis Roles in an EX8200 Virtual Chassis</i>.</p> <p>A switch with a mastership priority of <b>0</b> never takes the master or backup role.</p> |
| <b>Default</b>                  | 128                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Release Information</b> | Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series.<br>Statement introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF). |
| <b>Description</b>         | Specify the roles of the members of the Virtual Chassis or a Virtual Chassis Fabric (VCF) in a preprovisioned Virtual Chassis.                                                                                                             |

### Virtual Chassis Fabric

Specify the role to be performed by each switch. In a VCF, the spine devices are configured into the Routing Engine role and the leaf devices are configured into the line card role. You can configure several devices into the Routine Engine role, but only two will operate in the Routing Engine role at a time. The role must be associated with the member's serial number.

### EX Series (except EX8200 Virtual Chassis) and QFX Series Virtual Chassis

Specify the role to be performed by each member switch. Associate the role with the member's serial number.

When you use a preprovisioned configuration, you cannot modify the mastership priority or member ID of member switches through the user interfaces. The mastership priority value is generated by the software, based on the assigned role:

- A member configured as **routing-engine** is assigned the mastership priority **129**.
- A member configured as **line-card** is assigned the mastership priority **0**.
- A member listed in the preprovisioned configuration without an explicitly specified role is assigned the mastership priority **128**.

The configured role specifications are permanent. If both **routing-engine** members fail, a **line-card** member cannot take over as master of the Virtual Chassis configuration. You must delete the preprovisioned configuration to change the specified roles in a Virtual Chassis.

Explicitly configure two members as **routing-engine** and configure additional switches as members of the preprovisioned Virtual Chassis by specifying only their serial numbers. If you do not explicitly configure the role of the additional members, they function in a linecard role by default. In that case, a member that is functioning in a linecard role can take over mastership if the members functioning as master and backup (**routing-engine** role) both fail.

### EX8200 Virtual Chassis

Specify the role to be performed by each XRE200 External Routing Engine and each EX8200 member switch. Associate the role with the member's serial number. An EX8200 Virtual Chassis cannot function when both external Routing Engines, which must be configured in the **routing-engine** role, have failed.

- Options**
- **line-card**—Enables the member to be eligible to function only in the linecard role. Any member of the Virtual Chassis or VCF configuration other than the master or backup functions in the linecard role and runs only a subset of Junos OS for EX Series switches. A member functioning in the linecard role does not run the control protocols or the chassis management processes.

A Virtual Chassis must have at least three members for one member to function in the linecard role.

In an EX8200 Virtual Chassis configuration, all member switches must be in the linecard role.

- **routing-engine**—Enables the member to function as a master or backup of the Virtual Chassis or VCF configuration. The master manages all members and runs the chassis management processes and control protocols. The backup synchronizes with the master in terms of protocol states, forwarding tables, and so forth, so that it is prepared to preserve routing information and maintain network connectivity without disruption in case the master is unavailable.

(All Virtual Chassis composed of EX Series switches, except EX8200 switches, or QFX Series devices) Specify two and only two members as **routing-engine**. The software determines which of the two members assigned the **routing-engine** role functions as master, based on the master election algorithm. See [“Understanding How the Master in a Virtual Chassis Is Elected” on page 5078](#). In these Virtual Chassis, the **routing-engine** role is associated with a switch.

(EX8200 Virtual Chassis) All XRE200 External Routing Engines must be in the **routing-engine** role.

| <b>Description</b>         | Define tracing operations for the Virtual Chassis or VCF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Default</b>             | Tracing operations are disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>             | <p><b>detail</b>—(Optional) Generate detailed trace information for a flag.</p> <p><b>disable</b>—(Optional) Disable a flag.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <code>/var/log</code>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li><b>all</b>—All tracing operations.</li> </ul> |
|                            | <p> <b>TIP:</b> The all flag displays a subset of logs that are useful in debugging most issues. For more detailed information, use all detail.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|                            | <ul style="list-style-type: none"> <li><b>auto-configuration</b>—Trace Virtual Chassis ports (VCPs) that have been automatically configured.</li> <li><b>csn</b>—Trace Virtual Chassis complete sequence number (CSN) packets.</li> <li><b>error</b>—Trace Virtual Chassis errored packets.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

- **hello**—Trace Virtual Chassis hello packets.
- **krt**—Trace Virtual Chassis KRT events.
- **lsp**—Trace Virtual Chassis link-state packets.
- **lsp-generation**—Trace Virtual Chassis link-state packet generation.
- **me**—Trace Virtual Chassis ME events.
- **normal**—Trace normal events.
- **packets**—Trace Virtual Chassis packets.
- **parse**—Trace reading of the configuration.
- **psn**—Trace partial sequence number (PSN) packets.
- **route**—Trace Virtual Chassis routing information.
- **spf**—Trace Virtual Chassis SPF events.
- **state**—Trace Virtual Chassis state transitions.
- **task**—Trace Virtual Chassis task operations.

**no-stamp**—(Optional) Do not place a timestamp on any trace file.

**no-world-readable**—(Optional) Restrict file access to the user who created the file.

**receive**—(Optional) Trace received packets.

**replace**—(Optional) Replace a trace file rather than appending information to it.

**send**—(Optional) Trace transmitted packets.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through 1 GB

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

**Hierarchy Level** [edit]

**Release Information** Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 13.2X50-D15 for the QFX Series.  
Statement introduced in Junos OS Release 13.2X51-D20 for Virtual Chassis Fabric (VCF).

**Description** Configure a Virtual Chassis or a Virtual Chassis Fabric (VCF).

The remaining statements are explained separately.

**Default** A standalone EX Series switch is a Virtual Chassis by default. It has a default member ID of 0, a default mastership priority of 128, and a default role as master.

A QFX Series device configured in standalone mode is a Virtual Chassis by default. It has a default member ID of 0, a default mastership priority of 128, and a default role as master.

A standalone XRE200 External Routing Engine or EX8200 switch is not part of an EX8200 Virtual Chassis until a Virtual Chassis configuration is set up.

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Routine Monitoring

---

- [Verifying the Member ID, Role, Status, and Neighbor Member Connections of a Virtual Chassis Fabric Member Device on page 5313](#)
- [Verifying Virtual Chassis Port Connections in a Virtual Chassis Fabric on page 5314](#)
- [Verifying the Virtual Chassis Fabric Mode Settings on page 5315](#)

### Verifying the Member ID, Role, Status, and Neighbor Member Connections of a Virtual Chassis Fabric Member Device

**Purpose** Use this procedure to learn the current member ID, role, status, Virtual Chassis port (VCP) connections, and other information for the devices in your VCF.

Understanding the current member IDs, roles, device statuses, and VCP connections is required for routine monitoring of your VCF. You'll often need to identify this basic operational information to confirm a device or a VCP is working properly in the VCF, or how the VCF topology changed as a result of a configuration change or network error.

**Action** To display VCF status using the CLI:

#### [show virtual-chassis \(Virtual Chassis Fabric\)](#)

```
user@switch> show virtual-chassis
Preprovisioned Virtual Chassis Fabric
Fabric ID: 0282.5fa0.3f08
Fabric Mode: Enabled
```

|             |        |              |             | Mstr |         | Mixed Route Neighbor |      |    |   |
|-------------|--------|--------------|-------------|------|---------|----------------------|------|----|---|

| vcp-255/1/2 |        |              |             |      |         |                      |      |    | 4 |
| vcp-255/1/3 |        |              |             |      |         |                      |      |    | 4 |

```

1 (FPC 1) Prsnt    AB3112230001 qfx5100-48s    129    Backup      N  F    3
vcp-255/1/0
   2
vcp-255/1/1
   4
vcp-255/1/2
   4
vcp-255/1/3
2 (FPC 2) Prsnt    AB3112460011 qfx5100-48s      0    Linecard    N  F    1
vcp-255/1/0
   0
vcp-255/1/1
3 (FPC 3) Prsnt    AB3112460011 qfx5100-48s      0    Linecard    N  F    1
vcp-255/1/0
   0
vcp-255/1/1
4 (FPC 4) Prsnt    AB3112430011 qfx5100-48s      0    Linecard    N  F    1
vcp-255/1/0
   0
vcp-255/1/1

```

**Meaning** This output verifies that fabric mode is enabled and that all devices in the VCF are participating in the fabric, as shown by the **Prsnt** status output for each device.

The Neighbor ID and Interface outputs show that all VCPs are operating correctly.

## Verifying Virtual Chassis Port Connections in a Virtual Chassis Fabric

**Purpose** Verify the Virtual Chassis Ports (VCPs) in your Virtual Chassis Fabric (VCF).

You should use this command if you suspect a VCP link in your VCF is broken.

**Action** To display the VCPs of a device:

```
user@switch> show virtual-chassis vc-port member 4
fpc4:
```

```

-----
Interface  Type           Trunk  Status  Speed  Neighbor
or         / Port         ID      Up      (mbps)  ID  Interface
0/48      Auto-Configured -1     Up      40000   0   vcp-255/0/2
0/49      Auto-Configured -1     Up      40000   1   vcp-255/0/2
0/50      Auto-Configured -1     Up      40000   2   vcp-255/0/2
0/51      Auto-Configured -1     Up      40000   3   vcp-255/0/2

```

**Meaning** All of the VCPs on this device are up and active.

If the **Status** of an interface is **Absent** or the interface that you thought was a VCP does not appear in the command output, you likely have a problem with a link that has not been converted into a VCP. In this scenario, configure the interface on the link into a VCP using the **request virtual-chassis vc-port** command.

  - [Preprovisioning a Virtual Chassis Fabric on page 5264](#)

## Verifying the Virtual Chassis Fabric Mode Settings

**Purpose** Verify the Virtual Chassis Fabric (VCF) mode settings on a device.

You must configure all devices in a VCF into fabric mode using the **request virtual-chassis mode fabric** command for the devices to operate in a VCF.

All VCFs use QFX5100 devices in the spine role. If a VCF uses a QFX3500, QFX3600, or EX4300 devices as a leaf node, you must also configure each device into mixed mode using the **request virtual-chassis mode mixed** command.

You must also configure a device out of mixed and fabric mode if it is removed from a VCF and placed into your network in a different role.

**Action** To display the current mode of a device:

```
user@switch> show virtual-chassis mode
fpc0:
```

```
-----
Current mode : Fabric with mixed devices
Future mode after reboot : Fabric with mixed devices
```

**Meaning** The output indicates that the switch is currently in mixed and fabric mode.

The output also indicates that the mode will not change when the device is rebooted without further configuration. You must reboot the device to change the fabric or mixed mode, so the **Future mode after reboot** output differs from the **Current mode** output when the mode has been changed but the device has not been rebooted.

## request virtual-chassis mode

---

**Syntax**    request virtual-chassis mode  
              fabric  
              mixed  
              <disable>  
              <reboot>  
              <all-members>  
              <local>  
              <member *member-id*>

**Release Information**    Command introduced in Junos OS Release 11.1 for EX Series switches.  
                              Command introduced in Junos OS Release 13.2X51-D20 for QFX Series devices.  
                              The **fabric** keyword introduced in Junos OS Release 13.2X51-D20 for EX Series switches and QFX Series devices in a Virtual Chassis Fabric (VCF).  
                              Command introduced in Junos OS Release 13.2X51-D20 for VCF.

**Description**    Configure the mode for a device or multiple devices in a Virtual Chassis or a VCF.

A device must be configured in fabric mode to participate as a member device in a VCF.

A device must be configured in mixed mode when it is participating in a Virtual Chassis or a VCF with different types of devices.

Do not enable the **request virtual-chassis mode mixed** command for a standalone device or for a member switch that is intended to remain in a non-mixed Virtual Chassis or VCF. Enabling this command reduces the maximum scaling numbers for some features on the switch, Virtual Chassis, or VCF.

You do not need to configure mixed mode if the only devices in your Virtual Chassis are EX4500 and EX4550 switches.

To avoid potential traffic disruptions and configuration issues for a mixed Virtual Chassis, we recommend configuring mixed mode on your device before cabling it into your Virtual Chassis. We recommend rebooting your device to complete this configuration procedure before interconnecting your device into the Virtual Chassis.

To avoid potential traffic disruptions and configuration issues, we recommend configuring the fabric and, if applicable, the mixed mode settings on your device before cabling it into a VCF. We recommend rebooting your device to complete this configuration procedure before interconnecting your device into the VCF. You can change the fabric and mixed mode settings after the device has been added to a Virtual Chassis or VCF, however.

If you set some of the devices in a mixed Virtual Chassis or VCF to mixed mode using this command but not others, the mixed Virtual Chassis or VCF might not form. If you experience this issue, enter the **request virtual-chassis mode mixed all-members** command to set the Virtual Chassis mode to mixed for all devices in the Virtual Chassis or VCF. You then need to reboot the devices that have been set into mixed mode to complete the procedure. The Virtual Chassis or VCF forms after the devices have rebooted.

When you do not use this command to set any of the switches in a mixed EX4200 and EX4500 Virtual Chassis to mixed mode, a mixed EX4200 and EX4500 Virtual Chassis

forms with one of the switches assuming the master role if the switches are running Junos OS Release 11.4 or later. All other switches in the mixed EX4200 and EX4500 Virtual Chassis are placed into the linecard role. If you experience this behavior, enter the **request virtual-chassis mode mixed all-members** command to set the Virtual Chassis mode to mixed for all switches in the Virtual Chassis. You will then need to reboot the switches to complete the procedure. The Virtual Chassis will form after all of the switches have rebooted.

The Virtual Chassis mode setting is maintained through reboots even though it is set in operational mode.

- Options**
- none**—Set the Virtual Chassis mode for all members of the Virtual Chassis or VCF.
  - all-members**—(Optional) Set the Virtual Chassis mode for all members of the Virtual Chassis or VCF.
  - disable**—Disable the Virtual Chassis fabric or mixed mode setting if it was previously enabled.
  - fabric**—Set the device into fabric mode so that the device can participate in a VCF.
  - local**—(Optional) Set the Virtual Chassis mode on the member device where the command is issued.
  - member *member-id***—(Optional) Set the Virtual Chassis mode to mixed on the specified member of the Virtual Chassis or VCF.
  - mixed**—Set the device into mixed mode so that the device can participate in a mixed Virtual Chassis or mixed VCF.

**NOTE:** You do not need to set mixed mode if the only devices in your Virtual Chassis are QFX3500 and QFX3600 devices.

You do not need to configure mixed mode if the only devices in your Virtual Chassis are EX4500 and EX4550 switches.

**Required Privilege Level** system-control

## Sample Output

**request virtual-chassis vc-port set pic-slot 1 port 0**

user@switch> request virtual-chassis vc-port set pic-slot 1 port 0

To check the results of this command, use the [show virtual-chassis vc-port](#) command.

**request virtual-chassis vc-port set pic-slot 1 port 1 member 3**

user@switch> request virtual-chassis vc-port set pic-slot 1 port 1 member 3

To check the results of this command, use the [show virtual-chassis vc-port](#) command.

**request virtual-chassis vc-port delete pic-slot 1 port 1 member 3**

user@switch> request virtual-chassis vc-port delete pic-slot 1 port 1 member 3

To check the results of this command, use the [show virtual-chassis vc-port](#) command.

## request virtual-chassis vc-port diagnostics optics

**Table 586: show forwarding-options enhanced-hash-key Output Fields**

| Field Name                   | Field Description                                                                                        |
|------------------------------|----------------------------------------------------------------------------------------------------------|
| <b>Hash-Mode</b>             | Current hash mode: Layer 2 header or Layer 2 payload.                                                    |
| <b>Protocol</b>              | Indicates whether the Protocol field is or is not used by the hashing algorithm: Yes or No.              |
| <b>Destination L4 Port</b>   | Indicates whether the Destination L4 Port field is or is not used by the hashing algorithm: Yes or No.   |
| <b>Source L4 Port</b>        | Indicates whether the Source L4 Port field is or is not used by the hashing algorithm: Yes or No.        |
| <b>Destination IPv4 Addr</b> | Indicates whether the Destination IPv4 Addr field is or is not used by the hashing algorithm: Yes or No. |

Table 586: show forwarding-options enhanced-hash-key Output Fields (*continued*)

| Field Name                     | Field Description                                                                                                                                                                                                                    |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Source IPv4 Addr</b>        | Indicates whether the Source IPv4 Addr field is or is not used by the hashing algorithm: Yes or No.                                                                                                                                  |
| <b>Vlan id</b>                 | Indicates whether the Vlan id field is or is not used by the hashing algorithm: Yes or No.                                                                                                                                           |
| <b>Next Hdr</b>                | Indicates whether the Next Hdr field is or is not used by the hashing algorithm: Yes or No.                                                                                                                                          |
| <b>Destination IPv6 Addr</b>   | Indicates whether the Destination IPv6 Addr field is or is not used by the hashing algorithm: Yes or No.                                                                                                                             |
| <b>Source IPv6 Addr</b>        | Indicates whether the Source IPv6 Addr field is or is not used by the hashing algorithm: Yes or No.                                                                                                                                  |
| <b>Ether Type</b>              | Indicates whether the Ether Type field is or is not used by the hashing algorithm: Yes or No.                                                                                                                                        |
| <b>Destination MAC Address</b> | Indicates whether the Destination MAC Address field is or is not used by the hashing algorithm: Yes or No.                                                                                                                           |
| <b>Source MAC Address</b>      | Indicates whether the Source MAC Address field is or is not used by the hashing algorithm: Yes or No.                                                                                                                                |
| <b>Load Balancing Method</b>   | Indicates the load balancing method for adaptive load balancing (ALB): flowlet or per-packet.<br><br>The load balancing method is flowlet by default, and can be configured using the <a href="#">fabric-load-balance</a> statement. |
| <b>Fabric Link Scale</b>       | Indicates the fabric link scale, in mbps.                                                                                                                                                                                            |
| <b>Inactivity Interval</b>     | Indicates the fabric load balance inactivity interval, in microseconds (us).<br><br>The inactivity interval is 16 microseconds by default, and can be configured using the <a href="#">inactivity-interval</a> statement.            |
| <b>Hash Region Size/Trunk</b>  | Indicates the hash region size, in buckets per fabric trunk.                                                                                                                                                                         |

## Sample Output

### Sample Output

#### show virtual-chassis login (Direct Login to the Master Console Port)

```
user@switch> show virtual-chassis login
Current login session initiated from host 248.1.2.3
```

#### show virtual-chassis login (Backup Console Session Redirected to the Master Console Port)

```
user@switch> show virtual-chassis login
Current login session initiated from host backup
```

## show virtual-chassis mode

## Sample Output

### show virtual-chassis mode (EX4200)

```
user@switch>show virtual-chassis mode
fpc0:
-----
Mixed Mode: Disabled
```

## Sample Output

### show virtual-chassis mode (QFX5100)

```
user@switch>show virtual-chassis mode
fpc0:
-----
Current mode : Fabric with similar devices
Future mode after reboot : Fabric with similar devices

fpc1:
-----
Current mode : Fabric with similar devices
Future mode after reboot : Fabric with similar devices

fpc2:
-----
Current mode : Fabric with similar devices
Future mode after reboot : Fabric with similar devices

fpc3:
```

-----  
Current mode : Fabric with similar devices  
Future mode after reboot : Fabric with similar devices

fpc4:

-----  
Current mode : Fabric with similar devices  
Future mode after reboot : Fabric with similar devices

## show virtual-chassis protocol adjacency

| <b>Output Fields</b>            | <a href="#">Table 575 on page 5190</a> lists the output fields for the <b>show virtual-chassis protocol database</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

Table 591: show virtual-chassis protocol database Output Fields

| Field Name | Field Description                               | Level of Output |
|------------|-------------------------------------------------|-----------------|
| LSP ID     | Link-state protocol (LSP) data unit identifier. | All levels      |

Table 591: show virtual-chassis protocol database Output Fields (*continued*)

| Field Name       | Field Description                                      | Level of Output |
|------------------|--------------------------------------------------------|-----------------|
| <b>Sequence</b>  | Sequence number of the LSP.                            | All levels      |
| <b>Checksum</b>  | Checksum value of the LSP.                             | All levels      |
| <b>Lifetime</b>  | Remaining lifetime of the LSP, in seconds.             | All levels      |
| <b>Neighbor</b>  | MAC address of the neighbor on the advertising system. | detail          |
| <b>Interface</b> | Virtual Chassis port (VCP) interface name.             | detail          |
| <b>Metric</b>    | Metric of the prefix or neighbor.                      | detail          |

The **extensive** output was omitted from this list. The **extensive** output is useful for customer support personnel only.

| <b>Output Fields</b>            | <a href="#">Table 577 on page 5197</a> lists the output fields for the <b>show virtual-chassis protocol route</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**Table 593: show virtual-chassis protocol route Output Fields**

| Field Name     | Field Description                                                              |
|----------------|--------------------------------------------------------------------------------|
| <b>Dev</b>     | MAC address of the member storing the VCCP routing table.                      |
| <b>Version</b> | Version of the shortest-path-first algorithm that generated the routing table. |

Table 593: show virtual-chassis protocol route Output Fields (*continued*)

| Field Name       | Field Description                                                            |
|------------------|------------------------------------------------------------------------------|
| <b>System ID</b> | MAC address of the device.                                                   |
| <b>Version</b>   | Version of the shortest-path-first (SPF) algorithm that generated the route. |
| <b>Metric</b>    | The metric number to get to that device.                                     |
| <b>Interface</b> | Name of the Virtual Chassis port (VCP) interface connecting the devices.     |
| <b>Via</b>       | MAC address of the next-hop device, if applicable.                           |

## Sample Output

### show virtual-chassis protocol route

```

user@switch> show virtual-chassis protocol route

| <b>Output Fields</b>            | <a href="#">Table 578 on page 5200</a> lists the output fields for the <b>show virtual-chassis protocol interface</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                          |

**Table 594: show virtual-chassis protocol statistics Output Fields**

| Field Name       | Field Description                                                                    |
|------------------|--------------------------------------------------------------------------------------|
| <b>PDU type</b>  | Protocol data unit type.                                                             |
| <b>Received</b>  | Number of PDUs received since VCCP started or since the statistics were set to zero. |
| <b>Processed</b> | Number of PDUs received minus the number of PDUs dropped.                            |

Table 594: show virtual-chassis protocol statistics Output Fields (*continued*)

| Field Name                    | Field Description                                                                                                                                        |
|-------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Drops</b>                  | Number of PDUs dropped.                                                                                                                                  |
| <b>Sent</b>                   | Number of PDUs transmitted since VCCP started or since the statistics were set to zero.                                                                  |
| <b>Rexmit</b>                 | Number of PDUs retransmitted since VCCP started or since the statistics were set to zero.                                                                |
| <b>Total Packets Received</b> | Number of PDUs received since VCCP started or since the statistics were set to zero.                                                                     |
| <b>Total Packets Sent</b>     | Number of PDUs sent since VCCP started or since the statistics were set to zero.                                                                         |
| <b>LSP queue length</b>       | Number of link-state PDUs waiting in the queue for processing. This value is almost always 0.                                                            |
| <b>SPF runs</b>               | Number of shortest-path-first (SPF) calculations that have been performed.                                                                               |
| <b>Fragments Rebuilt</b>      | Number of link-state PDU fragments that the local system has computed.                                                                                   |
| <b>LSP Regenerations</b>      | Number of link-state PDUs that have been regenerated. A link-state PDU is regenerated when it is nearing the end of its lifetime and it has not changed. |
| <b>Purges initiated</b>       | Number of purges that the system initiated. A purge is initiated if the software determines that a link-state PDU must be removed from the network.      |

| Trunk ID              | <p>A positive-number ID assigned to a link aggregation group (LAG) formed by the Virtual Chassis. The trunk ID value is –1 if no trunk is formed. A LAG between uplink VCPs requires that the link speed be the same on connected interfaces and that at least two VCPs on one member be connected to at least two VCPs on the other member in an EX4200 or EX4500 Virtual Chassis.</p> <p>Dedicated VCP LAGs are assigned trunk IDs 1 and 2. Trunk IDs for LAGs formed with uplink VCPs therefore have values of 3 or greater.</p> <p>The trunk ID value changes if the link-adjacency state between LAG members changes; trunk membership is then allocated or deallocated.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Description</b>              | <p>Display diagnostics data and alarms for Ethernet optical transceivers installed in ports configured as Virtual Chassis Ports (VCPs) in an EX Series switches. The information provided by this command is known as digital optical monitoring (DOM) information.</p> <p>Thresholds that trigger a high alarm, low alarm, high warning, or low warning are set by the transponder vendors. Generally, a high alarm or low alarm indicates that a transceiver is not operating properly. DOM information can be used to diagnose why a transceiver is not working.</p> <p>On some EX Series switches, the <b>request virtual-chassis vc-port diagnostics optics</b> command must be entered to run a diagnostic scan before you can gather the <b>show virtual-chassis vc-port diagnostics optics</b> output.</p> |
| <b>Options</b>                  | <p><b>none</b>—Display diagnostics information for transceivers installed in VCPs of all members of a Virtual Chassis or VCF.</p> <p><b>all-members</b>—(Optional) Display diagnostics information for transceivers installed in VCPs of all members of a Virtual Chassis or VCF.</p> <p><b>interface-name</b>—(Optional) Display diagnostics information for the transceiver installed in a specified VCP.</p> <p><b>local</b>—(Optional) Display diagnostics information for transceivers installed in VCPs on the switch or external Routing Engine on which this command is entered.</p> <p><b>member member-id</b>—(Optional) Display diagnostics information for transceivers installed in VCPs on a specified member of a Virtual Chassis or VCF.</p>                                                       |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

**Output Fields** [Table 582 on page 5214](#) lists the output fields for the **show virtual-chassis vc-port diagnostics optics** command. Output fields are listed in the approximate order in which they appear.

**Table 597: show virtual-chassis vc-port diagnostics optics Output Fields**

| Field Name                            | Field Description                                                                                                                                                       |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| FPC                                   | Displays the FPC slot number.                                                                                                                                           |
| Virtual chassis port                  | Displays the name of the VCP.                                                                                                                                           |
| Laser bias current                    | Displays the magnitude of the laser bias power setting current, in milliamperes (mA). The laser bias provides direct modulation of laser diodes and modulates currents. |
| Laser output power                    | Displays the laser output power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm).                                                                              |
| Module temperature                    | Displays the temperature, in Celsius and Fahrenheit.                                                                                                                    |
| Module voltage                        | Displays the voltage, in Volts.                                                                                                                                         |
| Receiver signal average optical power | Displays the receiver signal average optical power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm).                                                           |
| Laser bias current high alarm         | Displays whether the laser bias power setting high alarm is <i>On</i> or <i>Off</i> .                                                                                   |
| Laser bias current low alarm          | Displays whether the laser bias power setting low alarm is <i>On</i> or <i>Off</i> .                                                                                    |
| Laser bias current high warning       | Displays whether the laser bias power setting high warning is <i>On</i> or <i>Off</i> .                                                                                 |
| Laser bias current low warning        | Displays whether the laser bias power setting low warning is <i>On</i> or <i>Off</i> .                                                                                  |
| Laser output power high alarm         | Displays whether the laser output power high alarm is <i>On</i> or <i>Off</i> .                                                                                         |
| Laser output power low alarm          | Displays whether the laser output power low alarm is <i>On</i> or <i>Off</i> .                                                                                          |
| Laser output power high warning       | Displays whether the laser output power high warning is <i>On</i> or <i>Off</i> .                                                                                       |

| <b>Description</b>              | Display the traffic statistics collected on Virtual Chassis ports (VCPs).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>                  | <p><b>none</b>—Display traffic statistics for VCPs of all members of a Virtual Chassis or VCF.</p> <p><b>brief   detail   extensive</b>—(Optional) Display the specified level of output. Using the <b>brief</b> option is equivalent to entering the command with no options (the default). The <b>detail</b> and <b>extensive</b> options provide identical displays.</p> <p><b>all-members</b>—(Optional) Display traffic statistics for VCPs of all members of a Virtual Chassis or VCF.</p> <p><b>interface-name</b>—(Optional) Display traffic statistics for the specified VCP.</p> <p><b>local</b>—(Optional) Display traffic statistics for VCPs on the switch or external Routing Engine on which this command is entered.</p> <p><b>member member-id</b>—(Optional) Display traffic statistics for VCPs on the specified member of a Virtual Chassis or VCF.</p> |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Output Fields** Table 582 on page 5214 lists the output fields for the **show virtual-chassis vc-port statistics** command. Output fields are listed in the approximate order in which they appear.

**Table 598: show virtual-chassis vc-port statistics Output Fields**

| Field Name                   | Field Description                                                                                                                                                                    | Level of Output            |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| <b>fpcnumber</b>             | (All Virtual Chassis except EX8200 Virtual Chassis. VCF) ID of the Virtual Chassis member. The FPC number is the same as the member ID.                                              | All levels                 |
| <b>member number</b>         | (EX8200 Virtual Chassis only) Member ID of the Virtual Chassis member.                                                                                                               | All levels                 |
| <b>Interface</b>             | VCP name.                                                                                                                                                                            | <b>brief</b>               |
| <b>Input Octets/Packets</b>  | Number of octets and packets received on the VCP.                                                                                                                                    | <b>brief, member, none</b> |
| <b>Output Octets/Packets</b> | Number of octets and packets transmitted on the VCP.                                                                                                                                 | <b>brief, member, none</b> |
| <b>master: number</b>        | Member ID of the master Routing Engine.                                                                                                                                              | All levels                 |
| <b>Port</b>                  | VCP for which RX (Receive) statistics, TX (Transmit) statistics, or both are reported by the VCP subsystem during a sampling interval—since the statistics counter was last cleared. | <b>detail, extensive</b>   |
| <b>Total octets</b>          | Total number of octets received and transmitted on the VCP.                                                                                                                          | <b>detail, extensive</b>   |
| <b>Total packets</b>         | Total number of packets received and transmitted on the VCP.                                                                                                                         | <b>detail, extensive</b>   |
| <b>Unicast packets</b>       | Number of unicast packets received and transmitted on the VCP.                                                                                                                       | <b>detail, extensive</b>   |
| <b>Broadcast packets</b>     | Number of broadcast packets received and transmitted on the VCP.                                                                                                                     | <b>detail, extensive</b>   |
| <b>Multicast packets</b>     | Number of multicast packets received and transmitted on the VCP.                                                                                                                     | <b>detail, extensive</b>   |
| <b>MAC control frames</b>    | Number of media access control (MAC) control frames received and transmitted on the VCP.                                                                                             | <b>detail, extensive</b>   |

Table 598: show virtual-chassis vc-port statistics Output Fields (*continued*)

| Field Name                  | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Level of Output          |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------|
| <b>CRC alignment errors</b> | <p>Number of packets received on the VCP that had a length—excluding framing bits, but including frame check sequence (FCS) octets—of between 64 and 1518 octets, inclusive, and had one of the following errors:</p> <ul style="list-style-type: none"> <li>Invalid FCS with an integral number of octets (FCS error)</li> <li>Invalid FCS with a nonintegral number of octets (alignment error)</li> </ul>                                                                                                   | <b>detail, extensive</b> |
| <b>Oversize packets</b>     | Number of packets received on the VCP that were longer than 1518 octets (excluding framing bits, but including FCS octets) but were otherwise well formed.                                                                                                                                                                                                                                                                                                                                                     | <b>detail, extensive</b> |
| <b>Undersize packets</b>    | Number of packets received on the VCP that were shorter than 64 octets (excluding framing bits but including FCS octets) and were otherwise well formed..                                                                                                                                                                                                                                                                                                                                                      | <b>detail, extensive</b> |
| <b>Jabber packets</b>       | <p>Number of packets received on the VCP that were longer than 1518 octets—excluding framing bits, but including FCS octets—and that had either an FCS error or an alignment error.</p> <p><b>NOTE:</b> This definition of <i>jabber</i> is different from the definition in IEEE-802.3 section 8.2.1.5 (10Base5) and section 10.3.1.4 (10Base2). These documents define <i>jabber</i> as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is between 20 ms and 150 ms.</p> | <b>detail, extensive</b> |
| <b>Fragments received</b>   | <p>Number of packets received on the VCP that were shorter than 64 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error.</p> <p>Fragment frames normally increment because both runs (which are normal occurrences caused by collisions) and noise hits are counted.</p>                                                                                                                                                                               | <b>detail, extensive</b> |
| <b>Ifout errors</b>         | Number of outbound packets received on the VCP that could not be transmitted because of errors.                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail, extensive</b> |
| <b>Packet drop events</b>   | Number of outbound packets received on the VCP that were dropped, rather than being encapsulated and sent out of the switch as fragments. The packet drop counter is incremented if a temporary shortage of packet memory causes packet fragmentation to fail.                                                                                                                                                                                                                                                 | <b>detail, extensive</b> |
| <b>64 octets frames</b>     | Number of packets received on the VCP (including invalid packets) that were 64 octets in length (excluding framing bits, but including FCS octets).                                                                                                                                                                                                                                                                                                                                                            | <b>detail, extensive</b> |

Table 598: show virtual-chassis vc-port statistics Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                 | Level of Output   |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| 65–127 octets frames    | Number of packets received on the VCP (including invalid packets) that were between 65 and 127 octets in length, inclusive (excluding framing bits, but including FCS octets).    | detail, extensive |
| 128–255 octets frames   | Number of packets received on the VCP (including invalid packets) that were between 128 and 255 octets in length, inclusive (excluding framing bits, but including FCS octets).   | detail, extensive |
| 256–511 octets frames   | Number of packets received on the VCP (including invalid packets) that were between 256 and 511 octets in length, inclusive (excluding framing bits, but including FCS octets).   | detail, extensive |
| 512–1023 octets frames  | Number of packets received on the VCP (including invalid packets) that were between 512 and 1023 octets in length, inclusive (excluding framing bits, but including FCS octets).  | detail, extensive |
| 1024–1518 octets frames | Number of packets received on the VCP (including invalid packets) that were between 1024 and 1518 octets in length, inclusive (excluding framing bits, but including FCS octets). | detail, extensive |
| Rate packets per second | Number of packets per second received and transmitted on the VCP.                                                                                                                 | detail, extensive |
| Rate bytes per second   | Number of bytes per second received and transmitted on the VCP.                                                                                                                   | detail, extensive |

# Troubleshooting Procedures

- [Troubleshooting Virtual Chassis Fabric on page 5391](#)

## Troubleshooting Virtual Chassis Fabric

---

This topic describes some of the following common troubleshooting issues for a Virtual Chassis Fabric (VCF):

- [Virtual Chassis Port Link Does Not Form on page 5391](#)
- [QFX5100 Leaf Device Assumes Routing Engine Role on page 5392](#)

### Virtual Chassis Port Link Does Not Form

**Problem**    **Description:** You connect a 40-Gbps QSFP+ port or a 10-Gbps SFP+ port between a leaf device and a spine device in an autoprovisioned or preprovisioned VCF. You expect the automatic Virtual Chassis port (VCP) conversion feature to convert the link into a VCP link, but the conversion doesn't occur.

The [show virtual-chassis vc-port](#) output indicates that the status of the interface is **Absent** or one or both of interfaces don't appear in the [show virtual-chassis vc-port](#) output.

**Cause**    If one end of a link is configured as a VCP and the other is not configured as a VCP, the VCP link does not form.

The automatic VCP conversion feature, therefore, does not work in the following situations:

- a 40-Gbps QSFP+ or 10-Gbps SFP+ interface on one end of the link is already configured as a VCP.

If you have previously removed a device from a VCF but haven't used the **request virtual-chassis vc-port delete** command to convert the interface that was connected to the removed device out of VCP mode, the interface is still configured as a VCP.

If you have removed a device from one Virtual Chassis or VCF and not changed the VCP port setting, the device being added to the VCF might also be configured as a VCP.

- a 40-Gbps QSFP+ port on an EX4300 switch, which is configured as a VCP by default, is interconnecting to a spine device.

**Solution** Manually configure the interface that is not configured as a VCP into a VCP using the **request virtual-chassis vc-port set** command.

### QFX5100 Leaf Device Assumes Routing Engine Role

**Problem** **Description:** A QFX5100 device configured as a leaf device assumes the Routing Engine role during VCF setup. The **show virtual-chassis** output confirms the role.

**Solution** The device can assume the Routing Engine role for several minutes during setup before it receives the configuration from the master Routing Engine, but eventually returns to the linecard role with no user intervention.
