#### YEAR 2000 NOTICE

Juniper Networks hardware and software products are Year 2000 compliant. Junos OS has no known time-related limitations through the year 2038. However, the NTP application is known to have some difficulty in the year 2036.

#### END USER LICENSE AGREEMENT

The Juniper Networks product that is the subject of this technical documentation consists of (or is intended for use with) Juniper Networks software. Use of such software is subject to the terms and conditions of the End User License Agreement ("EULA") posted at <http://www.juniper.net/support/eula.html>. By downloading, installing or using such software, you agree to the terms and conditions of that EULA.

# Table of Contents

	About the Documentation . . . . .	cix
	Documentation and Release Notes . . . . .	cix
	Supported Platforms . . . . .	cix
	Using the Examples in This Manual . . . . .	cix
	Merging a Full Example . . . . .	cx
	Merging a Snippet . . . . .	cx
	Documentation Conventions . . . . .	cxi
	Documentation Feedback . . . . .	cxiii
	Requesting Technical Support . . . . .	cxiii
	Self-Help Online Tools and Resources . . . . .	cxiii
	Opening a Case with JTAC . . . . .	cxiv
<b>Part 1</b>	<b>Getting Started with ELS</b>	
<b>Chapter 1</b>	<b>Getting Started with ELS . . . . .</b>	<b>3</b>
	Getting Started . . . . .	3
	Getting Started with Enhanced Layer 2 Software . . . . .	3
	Understanding Enhanced Layer 2 Software Support . . . . .	3
	Using the ELS Translator Tool . . . . .	4
	Configuring a VLAN . . . . .	5
	Configuring the Native VLAN Identifier . . . . .	6
	Configuring Layer 2 Interfaces . . . . .	6
	Configuring Layer 3 Interfaces . . . . .	6
	Configuring an IRB Interface . . . . .	7
	Configuring an Aggregated Ethernet Interface and Configuring LACP on That Interface . . . . .	7
	Enhanced Layer 2 CLI Configuration Statement and Command Changes . . . . .	8
	Enhanced Layer 2 CLI Configuration Statement and Command Changes . . .	17
<b>Part 2</b>	<b>System Setup</b>	
<b>Chapter 2</b>	<b>Overview . . . . .</b>	<b>29</b>
	Software Overview . . . . .	29
	Understanding Software Infrastructure and Processes . . . . .	29
	Routing Engine and Packet Forwarding Engine . . . . .	29
	Junos OS Processes . . . . .	30

<b>Chapter 3</b>	<b>Configuration</b> . . . . .	<b>33</b>
	Initial Configuration . . . . .	33
	Configuring the LCD Panel on EX Series Switches (CLI Procedure) . . . . .	33
	Disabling or Enabling Menus and Menu Options on the LCD Panel . . . . .	33
	Configuring a Custom Display Message . . . . .	34
	Configuring Date and Time for the EX Series Switch (J-Web Procedure) . . . . .	35
	Configuring System Identity for an EX Series Switch (J-Web Procedure) . . . . .	36
	Configuration Statements . . . . .	37
	arp (System) . . . . .	39
	authentication-key . . . . .	40
	auxiliary . . . . .	41
	boot-server (NTP) . . . . .	42
	broadcast . . . . .	43
	broadcast-client . . . . .	44
	console (System Ports) . . . . .	45
	default-address-selection . . . . .	46
	domain-name . . . . .	47
	gre-path-mtu-discovery . . . . .	47
	host-name . . . . .	48
	icmpv4-rate-limit . . . . .	48
	icmpv6-rate-limit . . . . .	49
	inet6-backup-router . . . . .	50
	internet-options . . . . .	51
	ipip-path-mtu-discovery . . . . .	52
	ipv6-duplicate-addr-detection-transmits . . . . .	52
	ipv6-path-mtu-discovery . . . . .	53
	ipv6-path-mtu-discovery-timeout . . . . .	53
	ipv6-reject-zero-hop-limit . . . . .	54
	lcd-menu . . . . .	55
	location (System) . . . . .	57
	menu-item . . . . .	59
	multicast-client . . . . .	62
	no-multicast-echo . . . . .	63
	no-ping-record-route . . . . .	64
	no-ping-time-stamp . . . . .	64
	no-redirects (IPv4 Traffic) . . . . .	65
	no-tcp-rfc1323-paws . . . . .	66
	no-tcp-rfc1323 . . . . .	66
	ntp . . . . .	67
	path-mtu-discovery . . . . .	68
	peer (NTP) . . . . .	69
	port-type . . . . .	70
	ports . . . . .	71
	power . . . . .	72
	processes . . . . .	73
	server (NTP) . . . . .	74
	tcp-drop-synfin-set . . . . .	75
	traceoptions (SBC Configuration Process) . . . . .	76
	trusted-key . . . . .	78

<b>Chapter 4</b>	<b>Administration . . . . .</b>	<b>79</b>
	Operational Commands . . . . .	79
	clear chassis display message . . . . .	81
	clear system reboot . . . . .	84
	configure . . . . .	88
	op . . . . .	90
	request chassis pic . . . . .	92
	request chassis routing-engine master . . . . .	96
	request system halt . . . . .	101
	request system logout . . . . .	107
	request system power-off . . . . .	108
	request system reboot . . . . .	113
	request system reboot . . . . .	118
	request system scripts convert . . . . .	120
	request system scripts refresh-from commit . . . . .	122
	request system scripts refresh-from event . . . . .	123
	request system scripts refresh-from op . . . . .	124
	request system storage cleanup . . . . .	125
	restart . . . . .	135
	set chassis display message . . . . .	146
	set date . . . . .	149
	show chassis fan . . . . .	150
	show chassis firmware . . . . .	163
	show chassis lcd . . . . .	174
	show configuration . . . . .	187
	show host . . . . .	190
	show ntp associations . . . . .	191
	show ntp status . . . . .	193
	show system firmware . . . . .	196
	show system reboot . . . . .	198
	show system software . . . . .	201
	show system storage . . . . .	209
	show system switchover . . . . .	217
	show system uptime . . . . .	221
	show system users . . . . .	226
	show system virtual-memory . . . . .	231
	show task replication . . . . .	289
	show version . . . . .	291
	show version fpc . . . . .	304
<b>Chapter 5</b>	<b>Troubleshooting Procedures . . . . .</b>	<b>305</b>
	Troubleshooting Loss of the Root Password . . . . .	305

<b>Part 3</b>	<b>User Interfaces</b>	
<b>Chapter 6</b>	<b>Overview</b>	<b>311</b>
	Software Overview	311
	Understanding Software Infrastructure and Processes	311
	Routing Engine and Packet Forwarding Engine	311
	Junos OS Processes	312
	User Interfaces	313
	CLI User Interface Overview	313
	CLI Overview	313
	CLI Help and Command Completion	313
	CLI Command Modes	313
	EX Series Switches Hardware and CLI Terminology Mapping	315
<b>Chapter 7</b>	<b>Configuration</b>	<b>317</b>
	Configuration Tasks	317
	Using the J-Web CLI Terminal	317
	Configuring the Web Browser	317
	Setting Domain Name, Hostname, and Name Server	318
	Enabling SSH on your system	318
	Sample Configuration on an EX Series Switch	318
	Statement Hierarchies	319
	[edit access] Configuration Statement Hierarchy on EX Series Switches	322
	Supported Statements in the [edit access] Hierarchy Level	322
	Unsupported Statements in the [edit access] Hierarchy Level	324
	[edit accounting-options] Configuration Statement Hierarchy on EX Series Switches	325
	Supported Statements in the [edit accounting-options] Hierarchy Level	326
	Unsupported Statements in the [edit accounting-options] Hierarchy Level	326
	[edit chassis] Configuration Statement Hierarchy on EX Series Switches	327
	Supported Statements in the [edit chassis] Hierarchy Level	327
	[edit class-of-service] Configuration Statement Hierarchy on EX Series Switches	328
	Supported Statements in the [edit class-of-service] Hierarchy Level	329
	Unsupported Statements in the [edit class-of-service] Hierarchy Level	330
	[edit ethernet-switching-options] Configuration Statement Hierarchy on EX Series Switches	331
	Supported Statements in the [edit ethernet-switching-options] Hierarchy Level	331
	Unsupported Statements in the [edit ethernet-switching-options] Hierarchy Level	334
	[edit event-options] Configuration Statement Hierarchy on EX Series Switches	334
	Supported Statements in the [edit event-options] Hierarchy Level	334
	Unsupported Statements in the [edit event-options] Hierarchy Level	336

[edit firewall] Configuration Statement Hierarchy on EX Series Switches . . .	336
Supported Statements in the [edit firewall] Hierarchy Level . . . . .	337
Unsupported Statements in the [edit firewall] Hierarchy Level . . . . .	337
[edit forwarding-options] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	338
Supported Statements in the [edit forwarding-options] Hierarchy	
Level . . . . .	338
Unsupported Statements in the [edit forwarding-options] Hierarchy	
Level . . . . .	340
[edit interfaces] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	342
[edit interfaces ae] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	343
Supported Statements in the [edit interfaces ae] Hierarchy Level . . .	343
Unsupported Statements in the [edit interfaces ae] Hierarchy Level . .	346
[edit interfaces ge] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	346
Supported Statements in the [edit interfaces ge] Hierarchy Level . . .	347
Unsupported Statements in the [edit interfaces ge] Hierarchy Level . .	350
[edit interfaces gr] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	350
Supported Statements in the [edit interfaces gr] Hierarchy Level . . .	350
Unsupported Statements in the [edit interfaces gr] Hierarchy Level . .	353
[edit interfaces interface-range] Configuration Statement Hierarchy on EX	
Series Switches . . . . .	353
Supported Statements in the [edit interfaces interface-range] Hierarchy	
Level . . . . .	354
Unsupported Statements in the [edit interfaces interface-range]	
Hierarchy Level . . . . .	357
[edit interfaces lo] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	360
Supported Statements in the [edit interfaces lo] Hierarchy Level . . . .	361
Unsupported Statements in the [edit interfaces lo] Hierarchy Level . .	363
[edit interfaces me] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	363
Supported Statements in the [edit interfaces me] Hierarchy Level . . .	364
Unsupported Statements in the [edit interfaces me] Hierarchy	
Level . . . . .	366
[edit interfaces vlan] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	367
Supported Statements in the [edit interfaces vlan] Hierarchy Level . . .	367
Unsupported Statements in the [edit interfaces vlan] Hierarchy	
Level . . . . .	370
[edit interfaces vme] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	370
Supported Statements in the [edit interfaces vme] Hierarchy Level . .	370
Unsupported Statements in the [edit interfaces vme] Hierarchy	
Level . . . . .	373

[edit interfaces xe] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	373
Supported Statements in the [edit interfaces xe] Hierarchy Level . . .	373
Unsupported Statements in the [edit interfaces xe] Hierarchy Level . .	377
[edit poe] Configuration Statement Hierarchy on EX Series Switches . . . .	377
Supported Statements in the [edit poe] Hierarchy Level . . . . .	377
[edit policy-options] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	378
Supported Statements in the [edit policy-options] Hierarchy Level . .	378
Unsupported Statements in the [edit policy-options] Hierarchy	
Level . . . . .	389
[edit protocols] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	389
[edit protocols bfd] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	391
Supported Statements in the [edit protocols bfd] Hierarchy Level . . .	391
Unsupported Statements in the [edit protocols bfd] Hierarchy	
Level . . . . .	391
[edit protocols bgp] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	392
Supported Statements in the [edit protocols bgp] Hierarchy Level . .	392
Unsupported Statements in the [edit protocols bgp] Hierarchy	
Level . . . . .	400
[edit protocols connections] Configuration Statement Hierarchy on EX	
Series Switches . . . . .	401
Supported Statements in the [edit protocols connections] Hierarchy	
Level . . . . .	402
Unsupported Statements in the [edit protocols connections] Hierarchy	
Level . . . . .	402
[edit protocols dcbx] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	403
Supported Statements in the [edit protocols dcbx] Hierarchy Level . .	403
Unsupported Statements in the [edit protocols dcbx] Hierarchy	
Level . . . . .	403
[edit protocols dot1x] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	404
Supported Statements in the [edit protocols dot1x] Hierarchy Level . .	404
Unsupported Statements in the [edit protocols dot1x] Hierarchy	
Level . . . . .	405
[edit protocols igmp] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	406
Supported Statements in the [edit protocols igmp] Hierarchy Level . .	406
Unsupported Statements in the [edit protocols igmp] Hierarchy	
Level . . . . .	407

[edit protocols igmp-snooping] Configuration Statement Hierarchy on EX Series Switches . . . . .	407
Supported Statements in the [edit protocols igmp-snooping] Hierarchy Level . . . . .	407
Unsupported Statements in the [edit protocols igmp-snooping] Hierarchy Level . . . . .	408
[edit protocols isis] Configuration Statement Hierarchy on EX Series Switches . . . . .	408
Supported Statements in the [edit protocols isis] Hierarchy Level . . . . .	409
Unsupported Statements in the [edit protocols isis] Hierarchy Level . . . . .	411
[edit protocols lacp] Configuration Statement Hierarchy on EX Series Switches . . . . .	411
Supported Statements in the [edit protocols lacp] Hierarchy Level . . . . .	411
Unsupported Statements in the [edit protocols lacp] Hierarchy Level . . . . .	412
[edit protocols link-management] Configuration Statement Hierarchy on EX Series Switches . . . . .	412
Supported Statements in the [edit protocols link-management] Hierarchy Level . . . . .	412
Unsupported Statements in the [edit protocols link-management] Hierarchy Level . . . . .	413
[edit protocols lldp] Configuration Statement Hierarchy on EX Series Switches . . . . .	413
Supported Statements in the [edit protocols lldp] Hierarchy Level . . . . .	414
Unsupported Statements in the [edit protocols lldp] Hierarchy Level . . . . .	414
[edit protocols lldp-med] Configuration Statement Hierarchy on EX Series Switches . . . . .	415
Supported Statements in the [edit protocols lldp-med] Hierarchy Level . . . . .	415
Unsupported Statements in the [edit protocols lldp-med] Hierarchy Level . . . . .	415
[edit protocols mld] Configuration Statement Hierarchy on EX Series Switches . . . . .	416
Supported Statements in the [edit protocols mld] Hierarchy Level . . . . .	416
Unsupported Statements in the [edit protocols mld] Hierarchy Level . . . . .	417
[edit protocols mld-snooping] Configuration Statement Hierarchy on EX Series Switches . . . . .	417
Supported Statements in the [edit protocols mld-snooping] Hierarchy Level . . . . .	417
Unsupported Statements in the [edit protocols mld-snooping] Hierarchy Level . . . . .	418
[edit protocols mpls] Configuration Statement Hierarchy on EX Series Switches . . . . .	418
Supported Statements in the [edit protocols mpls] Hierarchy Level . . . . .	418
Unsupported Statements in the [edit protocols mpls] Hierarchy Level . . . . .	420

[edit protocols msdp] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	429
Supported Statements in the [edit protocols msdp] Hierarchy	
Level . . . . .	430
Unsupported Statements in the [edit protocols msdp] Hierarchy	
Level . . . . .	431
[edit protocols mstp] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	431
Supported Statements in the [edit protocols mstp] Hierarchy Level . .	432
Unsupported Statements in the [edit protocols mstp] Hierarchy	
Level . . . . .	433
[edit protocols mvrp] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	433
Supported Statements in the [edit protocols mvrp] Hierarchy Level . .	433
Unsupported Statements in the [edit protocols mvrp] Hierarchy	
Level . . . . .	434
[edit protocols neighbor-discovery] Configuration Statement Hierarchy on	
EX Series Switches . . . . .	434
Supported Statements in the [edit protocols neighbor-discovery]	
Hierarchy Level . . . . .	434
Unsupported Statements in the [edit neighbor-discovery] Hierarchy	
Level . . . . .	435
[edit protocols oam] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	435
Supported Statements in the [edit protocols oam] Hierarchy Level . .	435
Unsupported Statements in the [edit protocols oam] Hierarchy	
Level . . . . .	437
[edit protocols ospf] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	438
Supported Statements in the [edit protocols ospf] Hierarchy Level . .	438
Unsupported Statements in the [edit protocols ospf] Hierarchy	
Level . . . . .	440
[edit protocols ospf3] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	441
Supported Statements in the [edit protocols ospf3] Hierarchy	
Level . . . . .	441
Unsupported Statements in the [edit protocols ospf3] Hierarchy	
Level . . . . .	444
[edit protocols pim] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	444
Supported Statements in the [edit protocols pim] Hierarchy Level . . .	445
Unsupported Statements in the [edit protocols pim] Hierarchy	
Level . . . . .	447
[edit protocols rip] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	447
Supported Statements in the [edit protocols rip] Hierarchy Level . . .	448
Unsupported Statements in the [edit protocols rip] Hierarchy Level . .	449

[edit protocols ripng] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	450
Supported Statements in the [edit protocols ripng] Hierarchy Level . .	450
Unsupported Statements in the [edit protocols ripng] Hierarchy	
Level . . . . .	451
[edit protocols router-advertisement] Configuration Statement Hierarchy	
on EX Series Switches . . . . .	451
Supported Statements in the [edit protocols router-advertisement]	
Hierarchy Level . . . . .	452
Unsupported Statements in the [edit protocols router-advertisement]	
Hierarchy Level . . . . .	452
[edit protocols router-discovery] Configuration Statement Hierarchy on EX	
Series Switches . . . . .	452
Supported Statements in the [edit protocols router-discovery] Hierarchy	
Level . . . . .	453
Unsupported Statements in the [edit protocols router-discovery]	
Hierarchy Level . . . . .	453
[edit protocols rstp] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	453
Supported Statements in the [edit protocols rstp] Hierarchy Level . .	454
Unsupported Statements in the [edit protocols rstp] Hierarchy	
Level . . . . .	454
[edit protocols rsvp] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	455
Supported Statements in the [edit protocols rsvp] Hierarchy Level . .	455
Unsupported Statements in the [edit protocols rsvp] Hierarchy	
Level . . . . .	456
[edit protocols sflow] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	459
Supported Statements in the [edit protocols sflow] Hierarchy Level . .	459
Unsupported Statements in the [edit sflow] Hierarchy Level . . . . .	460
[edit protocols stp] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	460
Supported Statements in the [edit protocols stp] Hierarchy Level . .	460
Unsupported Statements in the [edit protocols stp] Hierarchy	
Level . . . . .	461
[edit protocols uplink-failure-detection] Configuration Statement Hierarchy	
on EX Series Switches . . . . .	461
Supported Statements in the [edit protocols uplink-failure-detection]	
Hierarchy Level . . . . .	462
Unsupported Statements in the [edit protocols uplink-failure-detection]	
Hierarchy Level . . . . .	462
[edit protocols vrrp] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	462
Supported Statements in the [edit protocols vrrp] Hierarchy Level . .	463
Unsupported Statements in the [edit protocols vrrp] Hierarchy	
Level . . . . .	463

[edit protocols vstp] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	463
Supported Statements in the [edit protocols vstp] Hierarchy Level . . .	464
Unsupported Statements in the [edit protocols vstp] Hierarchy	
Level . . . . .	464
[edit redundant-power-system] Configuration Statement Hierarchy on EX	
Series Switches . . . . .	465
Supported Statements in the [edit redundant-power-system] Hierarchy	
Level . . . . .	465
Unsupported Statements in the [edit redundant-power-system]	
Hierarchy Level . . . . .	465
[edit routing-options] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	465
Supported Statements in the [edit routing-options] Hierarchy Level . .	466
Unsupported Statements in the [edit routing-options] Hierarchy	
Level . . . . .	482
[edit security] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	482
Supported Statements in the [edit security] Hierarchy Level . . . . .	483
Unsupported Statements in the [edit security] Hierarchy Level . . . . .	485
[edit services] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	485
Supported Statements in the [edit services] Hierarchy Level . . . . .	486
Unsupported Statements in the [edit services] Hierarchy Level . . . . .	488
[edit snmp] Configuration Statement Hierarchy on EX Series Switches . .	488
Supported Statements in the [edit snmp] Hierarchy Level . . . . .	489
Unsupported Statements in the [edit snmp] Hierarchy Level . . . . .	493
[edit system] Configuration Statement Hierarchy on EX Series Switches . .	495
Supported Statements in the [edit system] Hierarchy Level . . . . .	495
Unsupported Statements in the [edit system] Hierarchy Level . . . . .	507
[edit virtual-chassis] Configuration Statement Hierarchy . . . . .	508
Supported Statements in the [edit virtual-chassis] Hierarchy Level . .	508
Unsupported Statements in the [edit virtual-chassis] Hierarchy	
Level . . . . .	509
[edit vlans] Configuration Statement Hierarchy on EX Series Switches . .	509
Supported Statements in the [edit vlans] Hierarchy Level . . . . .	510
Unsupported Statements in the [edit vlans] Hierarchy Level . . . . .	511
<b>Chapter 8</b>	
<b>Administration . . . . .</b>	<b>513</b>
Operational Commands . . . . .	513
set cli directory . . . . .	514
set cli idle-timeout . . . . .	515
set cli prompt . . . . .	516
set cli restart-on-upgrade . . . . .	517
set cli screen-length . . . . .	518
set cli screen-width . . . . .	519
set cli timestamp . . . . .	520
start shell . . . . .	521

<b>Part 4</b>	<b>Access and User Management</b>	
<b>Chapter 9</b>	<b>Overview</b>	<b>525</b>
	Software Overview	525
	Understanding Software Infrastructure and Processes	525
	Routing Engine and Packet Forwarding Engine	525
	Junos OS Processes	526
<b>Chapter 10</b>	<b>Configuration</b>	<b>529</b>
	Configuration Tasks	529
	Configuring Management Access for the EX Series Switch (J-Web Procedure)	529
	Generating SSL Certificates to Be Used for Secure Web Access	532
	Configuring MS-CHAPv2 to Provide Password-Change Support (CLI Procedure)	533
	Configuration Statements	533
	allow-commands	535
	allow-configuration	536
	announcement	537
	archive-sites	537
	authentication (Login)	538
	authentication-order	539
	change-type	540
	class (Assigning a Class to an Individual User)	540
	class (Defining Login Classes)	541
	class-usage-profile	542
	counters	543
	deny-commands	543
	deny-configuration	544
	destination-classes	545
	fields (for Interface Profiles)	546
	file (Associating with a Profile)	547
	file (Configuring a Log File)	548
	files	549
	filter-profile	550
	format	551
	full-name	552
	idle-timeout (System-Login)	552
	interface-profile	553
	interval (Accounting Options)	554
	login	555
	login-alarms	556
	login-tip	556
	maximum-length	557
	message	558
	mib-profile	559
	minimum-changes	560
	minimum-length	561
	object-names	562
	operation	562

	password (Login) . . . . .	563
	permissions . . . . .	564
	radius-options (edit system) . . . . .	565
	retry-options . . . . .	566
	root-authentication . . . . .	567
	root-login . . . . .	568
	routing-engine-profile . . . . .	569
	size . . . . .	570
	source-classes . . . . .	570
	start-time (Log File Transfer) . . . . .	571

## Part 8

## System Services

### Chapter 24

<b>Overview . . . . .</b>	<b>1353</b>
Software Overview . . . . .	1353
Understanding Software Infrastructure and Processes . . . . .	1353
Routing Engine and Packet Forwarding Engine . . . . .	1353
Junos OS Processes . . . . .	1354
DHCP Local Server . . . . .	1355
Extended DHCP Local Server Overview . . . . .	1356
Interaction Among the DHCP Client, Extended DHCP Local Server, and Address-Assignment Pools . . . . .	1358
Providing DHCP Client Configuration Information . . . . .	1358
Minimal Configuration for Clients . . . . .	1360
DHCP Local Server and Address-Assignment Pools . . . . .	1360
DHCPv6 Local Server Overview . . . . .	1361
DHCP Local Server Handling of Client Information Request Messages . . .	1363
Configuring Group-Specific DHCP Local Server Options . . . . .	1364

Understanding Dynamic Reconfiguration of Extended DHCP Local Server	
Clients	1364
Default Client/Server Interaction	1364
Dynamic Client/Server Interaction for DHCPv4	1365
Dynamic Client/Server Interaction for DHCPv6	1365
Manually Forcing the Local Server to Initiate the Reconfiguration	
Process	1366
Action Taken for Events That Occur During a Reconfiguration	1366
DHCP Snooping Support	1367
DHCP Auto Logout Overview	1368
Auto Logout Overview	1368
How DHCP Identifies and Releases Clients	1368
Option 60 and Option 82 Requirements	1369
Address-Assignment Pools Overview	1370
Assign a Specific IP Address to a Client Using DHCP Option 50 and DHCPv6	
IA_NA Option	1371
Multiple Address Assignment for DHCPv6 Clients	1371
Multiple Address Assignment Using Local Address Pools or RADIUS	1371
Junos OS Predefined Variable for Multiple DHCPv6 Address	
Assignment	1372
Centrally Configured Opaque DHCP Options	1373
Data Flow for RADIUS-Sourced DHCP Options	1375
Multiple VSA 26-55 Instances Configuration	1376
DHCP Options That Cannot Be Centrally Configured	1376
Port Number Requirements for DHCP Firewall Filters	1377
DHCP Relay Agent	1378
Extended DHCP Relay Agent Overview	1379
Interaction Among the DHCP Relay Agent, DHCP Client, and DHCP	
Servers	1380
DHCP Liveness Detection	1381
DHCP Relay Proxy Overview	1382
Interaction Among DHCP Relay Proxy, DHCP Client, and DHCP	
Servers	1382
DHCPv6 Relay Agent Overview	1384
Configuring Group-Specific DHCP Relay Options	1384
DHCP Snooping Support	1385
DHCP Auto Logout Overview	1387
Auto Logout Overview	1387
How DHCP Identifies and Releases Clients	1387
Option 60 and Option 82 Requirements	1388
Public Key Cryptography Overview	1388
Understanding Public Key Cryptography on Switches	1389
Public Key Infrastructure (PKI) and Digital Certificates	1389
Self-Signed Certificates Overview	1390
Understanding Self-Signed Certificates on EX Series Switches	1390

<b>Chapter 25</b>	<b>Configuration</b>	<b>1393</b>
	DHCP Local Server Examples	1393
	Example: Minimum Extended DHCP Local Server Configuration	1393
	Example: Extended DHCP Local Server Configuration with Optional Pool Matching	1394
	Example: Configuring Group Liveness Detection for DHCP Local Server Clients	1395
	DHCP Relay Agent Examples	1398
	Example: Minimum DHCP Relay Agent Configuration	1398
	Example: Configuring DHCP Relay Agent Selective Traffic Processing Based on DHCP Option Strings	1399
	Example: Configuring DHCP Snooping Support for DHCP Relay Agent	1403
	Configuration Tasks	1404
	Configuring DHCP Services (J-Web Procedure)	1405
	Configuring DHCP Services (J-Web Procedure) on EX Series Switches	1405
	Configuring DHCP Services on EX4300 Switches (J-Web Procedure)	1408
	Configuring a DHCP SIP Server (CLI Procedure)	1412
	Configuring a DHCP Client (CLI Procedure)	1413
	Configuring a DHCP Server on Switches (CLI Procedure)	1414
	Configuring an Extended DHCP Server on a Switch	1415
	Configuring an Extended DHCP Relay Server on EX Series Switches (CLI Procedure)	1416
	Enabling HTTPS and XNM-SSL Services on Switches Using Self-Signed Certificates (CLI Procedure)	1417
	Manually Generating Self-Signed Certificates on Switches (CLI Procedure)	1417
	Generating a Public-Private Key Pair on Switches	1418
	Generating Self-Signed Certificates on Switches	1418
	Deleting Self-Signed Certificates (CLI Procedure)	1419
	Configuration Tasks for DHCP Local Server	1419
	Using External AAA Authentication Services with DHCP	1420
	Grouping Interfaces with Common DHCP Configurations	1421
	Guidelines for Configuring Interface Ranges for Groups of DHCP Interfaces	1422
	Overriding Default DHCP Local Server Configuration Settings	1423
	Specifying the Maximum Number of DHCP Clients Per Interface	1424
	Automatically Logging Out DHCP Clients	1426
	Enabling Processing of Client Information Requests	1427
	Specifying the Delegated Address Pool for IPv6 Prefix Assignment	1428
	Enabling DHCPv6 Rapid Commit Support	1428
	Deleting DHCP Local Server and DHCP Relay Override Settings	1429
	Configuring Dynamic Client Reconfiguration of Extended Local Server Clients	1429
	Configuring Dynamic Reconfiguration Attempts for DHCP Clients	1432
	Configuring Deletion of the Client When Dynamic Reconfiguration Fails	1433
	Configuring Reconfiguration of the Client on Receipt of RADIUS-Initiated Disconnect	1433

Configuring a Token for DHCP Local Server Authentication . . . . .	1434
Preventing Binding of Clients That Do Not Support Reconfigure	
Messages . . . . .	1434
Requesting DHCP Local Server to Initiate Reconfiguration of Client	
Bindings . . . . .	1435
Configuring Detection of DHCP Local Server Client Connectivity . . . . .	1436
Configuring DHCP Snooped Packets Forwarding Support for DHCP Local	
Server . . . . .	1437
Configuring Passwords for Usernames . . . . .	1439
Creating Unique Usernames for DHCP Clients . . . . .	1439
Configuring How the Extended DHCP Local Server Determines Which	
Address-Assignment Pool to Use . . . . .	1442
Configuration Tasks for DHCP Relay Agent . . . . .	1443
Using External AAA Authentication Services with DHCP . . . . .	1444
Grouping Interfaces with Common DHCP Configurations . . . . .	1445
Guidelines for Configuring Interface Ranges for Groups of DHCP	
Interfaces . . . . .	1446
Overriding the Default DHCP Relay Configuration Settings . . . . .	1447
Changing the Gateway IP Address (giaddr) Field to the giaddr of the DHCP	
Relay Agent . . . . .	1449
Replacing the DHCP Relay Request and Release Packet Source Address . .	1450
Overriding Option 82 Information . . . . .	1450
Using Layer 2 Unicast Transmission for DHCP Packets . . . . .	1451
Trusting Option 82 Information . . . . .	1451
Specifying the Maximum Number of DHCP Clients Per Interface . . . . .	1451
Automatically Logging Out DHCP Clients . . . . .	1453
How DHCP Relay Agent Uses Option 82 for Auto Logout . . . . .	1454
Configuring DHCP Snooping for DHCP Relay Agent . . . . .	1455
Enabling and Disabling DHCP Snooped Packets Support for DHCP Relay	
Agent . . . . .	1455
Configuring DHCP Snooped Packets Forwarding Support for DHCP Relay	
Agent . . . . .	1460
Sending Release Messages When Clients Are Deleted . . . . .	1462
Disabling Automatic Binding of Stray DHCP Requests . . . . .	1463
Using DHCP Relay Agent Option 82 Information . . . . .	1464
Configuring Option 82 Information . . . . .	1465
Including a Prefix in DHCP Options . . . . .	1466
Including a Textual Description in DHCP Options . . . . .	1468
Configuring Server Groups . . . . .	1469
Configuring Active Server Groups . . . . .	1469
Enabling DHCP Relay Proxy Mode . . . . .	1470
Inserting DHCPv6 Interface-ID Option (Option 18) In DHCPv6 Packets . .	1470
DHCP Liveness Detection Overview . . . . .	1472
Configuring Detection of DHCP Relay or DHCP Relay Proxy Client	
Connectivity . . . . .	1473
Disabling DHCP Relay . . . . .	1474
DHCP Local Server Configuration Statements . . . . .	1475

<b>Part 9</b>	<b>Access Control</b>	
<b>Chapter 27</b>	<b>Overview . . . . .</b>	<b>1821</b>
	Access Control Overview . . . . .	1821
	802.1X for EX Series Switches Overview . . . . .	1821
	How 802.1X Authentication Works . . . . .	1821
	802.1X Features Overview . . . . .	1822
	Supported Features Related to 802.1X Authentication . . . . .	1823
	Understanding Authentication on EX Series Switches . . . . .	1824
	Sample Basic Authentication Topology . . . . .	1824
	802.1X Authentication . . . . .	1825
	MAC RADIUS Authentication . . . . .	1827
	Captive Portal Authentication . . . . .	1827
	Static MAC Bypass of Authentication . . . . .	1828
	Fallback of Authentication Methods . . . . .	1828
	Understanding Guest VLANs for 802.1X on EX Series Switches . . . . .	1830
	Understanding 802.1X and RADIUS Accounting on EX Series Switches . .	1830
	Understanding 802.1X and LLDP and LLDP-MED on EX Series Switches . .	1831
	Understanding 802.1X and VoIP on EX Series Switches . . . . .	1834
	Understanding 802.1X and VSAs on EX Series Switches . . . . .	1837
	Understanding Dynamic VLANs for 802.1X on EX Series Switches . . . . .	1837
	Understanding Server Fail Fallback and Authentication on EX Series Switches . . . . .	1838
	Authentication Process Flow for EX Series Switches . . . . .	1839
	Understanding Authentication Session Timeout . . . . .	1841
<b>Chapter 28</b>	<b>Configuration . . . . .</b>	<b>1843</b>
	Configuration Examples . . . . .	1843
	Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch . . . . .	1843
	Example: Setting Up 802.1X in Conference Rooms to Provide Internet Access to Corporate Visitors on an EX Series Switch . . . . .	1847
	Example: Setting Up 802.1X for Single Supplicant or Multiple Supplicant Configurations on an EX Series Switch . . . . .	1852
	Example: Setting Up VoIP with 802.1X and LLDP-MED on an EX Series Switch . . . . .	1858
	Example: Configuring VoIP on an EX Series Switch Without Including 802.1X Authentication . . . . .	1866
	Example: Configuring Static MAC Bypass of Authentication on an EX Series Switch . . . . .	1872
	Example: Configuring 802.1X Authentication Options When the RADIUS Server is Unavailable to an EX Series Switch . . . . .	1875
	Example: Configuring MAC RADIUS Authentication on an EX Series Switch . . . . .	1881
	Example: Applying a Firewall Filter to 802.1X-Authenticated Supplicants Using RADIUS Server Attributes on an EX Series Switch . . . . .	1887

Example: Applying Firewall Filters to Multiple Supplicants on Interfaces	
Enabled for 802.1X or MAC RADIUS Authentication . . . . .	1893
Example: Setting Up Captive Portal Authentication on an EX Series	
Switch . . . . .	1898
Example: Configuring Fallback Options on EX Series Switches for EAP-TTLS	
Authentication and Odyssey Access Clients . . . . .	1903
Configuration Tasks . . . . .	1907
Configuring 802.1X Interface Settings (CLI Procedure) . . . . .	1908
Configuring 802.1X RADIUS Accounting (CLI Procedure) . . . . .	1909
Filtering 802.1X Supplicants Using RADIUS Server Attributes . . . . .	1910
Configuring Match Statements on the RADIUS Server . . . . .	1911
Applying a Port Firewall Filter from the RADIUS Server . . . . .	1913
Configuring LLDP (CLI Procedure) . . . . .	1913
Enabling LLDP on Interfaces . . . . .	1914
Adjusting LLDP Advertisement Settings . . . . .	1914
Adjusting SNMP Notification Settings of LLDP Changes . . . . .	1915
Specifying a Management Address for the LLDP Management TLV . .	1916
Configuring LLDP Power Negotiation . . . . .	1916
Configuring LLDP-MED (CLI Procedure) . . . . .	1917
Enabling LLDP-MED on Interfaces . . . . .	1917
Configuring Location Information Advertised by the Switch . . . . .	1917
Configuring for Fast Start . . . . .	1918
VSA Match Conditions and Actions . . . . .	1918
Configuring Server Fail Fallback (CLI Procedure) . . . . .	1921
Configuring MAC RADIUS Authentication (CLI Procedure) . . . . .	1923
Configuring Static MAC Bypass of Authentication (CLI Procedure) . . . .	1924
Specifying RADIUS Server Connections on an EX Series Switch (CLI	
Procedure) . . . . .	1925
Configuring Captive Portal Authentication (CLI Procedure) . . . . .	1926
Configuring Secure Access for Captive Portal . . . . .	1926
Enabling an Interface for Captive Portal . . . . .	1927
Configuring Bypass of Captive Portal Authentication . . . . .	1927
Designing a Captive Portal Authentication Login Page on an EX Series	
Switch . . . . .	1928
Controlling Authentication Session Timeouts (CLI Procedure) . . . . .	1930
Configuration Statements . . . . .	1931
[edit access] Configuration Statement Hierarchy on EX Series Switches . .	1933
Supported Statements in the [edit access] Hierarchy Level . . . . .	1933
Unsupported Statements in the [edit access] Hierarchy Level . . . . .	1938
[edit protocols dot1x] Configuration Statement Hierarchy on EX Series	
Switches . . . . .	1939

<b>Part 10</b>	<b>Class of Service</b>	
<b>Chapter 30</b>	<b>Overview .....</b>	<b>2041</b>
	CoS Overview .....	2041
	Junos OS CoS for EX Series Switches Overview .....	2042
	How Junos OS CoS Works .....	2042
	Default CoS Behavior on EX Series Switches .....	2043
	Understanding Junos OS CoS Components for EX Series Switches .....	2043
	Code-Point Aliases .....	2044
	Policers .....	2044
	Classifiers .....	2044
	Forwarding Classes .....	2044
	Tail Drop Profiles .....	2045
	Schedulers .....	2045
	Rewrite Rules .....	2045
	Understanding CoS Code-Point Aliases .....	2046
	Default Code-Point Aliases .....	2046

Understanding CoS Classifiers . . . . .	2049
Behavior Aggregate Classifiers . . . . .	2049
Multifield Classifiers . . . . .	2051
Understanding CoS Forwarding Classes . . . . .	2052
Default Forwarding Classes . . . . .	2053
Understanding CoS Congestion Management . . . . .	2055
Weighted Tail Drop Congestion Management . . . . .	2055
Weighted Random Early Detection Congestion Management . . . . .	2056
Understanding CoS Schedulers . . . . .	2060
Default Schedulers . . . . .	2060
Excess Rate . . . . .	2061
Transmission Rate . . . . .	2061
Scheduler Buffer Size . . . . .	2061
Priority Scheduling . . . . .	2062
Scheduler Drop-Profile Maps . . . . .	2063
Scheduler Maps . . . . .	2063
Understanding CoS Two-Color Marking . . . . .	2067
Understanding CoS Rewrite Rules . . . . .	2067
How Rewrite Rules Work . . . . .	2067
Default Rewrite Rule . . . . .	2068
Understanding Port Shaping and Queue Shaping for CoS on EX Series Switches . . . . .	2069
Port Shaping . . . . .	2069
Queue Shaping . . . . .	2070
Understanding Junos OS EZQoS for CoS Configurations on EX Series Switches . . . . .	2070
Understanding CoS Queues on EX8200 Line Cards That Include Oversubscribed Ports . . . . .	2071
Oversubscribed Ports on Line Cards . . . . .	2071
EX8200 Line Cards That Include Oversubscribed Ports . . . . .	2072
Ingress Queueing . . . . .	2072
Egress Queues . . . . .	2073
<b>Chapter 31 Configuration . . . . .</b>	<b>2075</b>
Configuration Examples . . . . .	2075
Example: Configuring CoS on EX Series Switches . . . . .	2075
Configuration Tasks . . . . .	2099
Configuring CoS (J-Web Procedure) . . . . .	2100
Defining CoS Code-Point Aliases (CLI Procedure) . . . . .	2101
Defining CoS Code-Point Aliases (J-Web Procedure) . . . . .	2101
Defining CoS Classifiers (CLI Procedure) . . . . .	2103
Defining CoS Classifiers (J-Web Procedure) . . . . .	2105
Defining CoS Forwarding Classes (CLI Procedure) . . . . .	2107
Defining CoS Forwarding Classes (J-Web Procedure) . . . . .	2107
Defining CoS Schedulers and Scheduler Maps (CLI Procedure) . . . . .	2109
Configuring a Scheduler and a Scheduler Map . . . . .	2109
Assigning a Scheduler Map to Interfaces . . . . .	2110
Assigning Scheduler Maps to Interfaces on EX8200 Line Cards That Include Oversubscribed Ports . . . . .	2110

Defining CoS Schedulers (J-Web Procedure) . . . . .	2111
Defining CoS Scheduler Maps (J-Web Procedure) . . . . .	2114
Configuring CoS Congestion Management (CLI Procedure) . . . . .	2115
Configuring a Weighted Tail Drop Profile . . . . .	2116
Configuring a Weighted Random Early Detection Drop Profile . . . . .	2116
Defining CoS Drop Profiles (J-Web Procedure) . . . . .	2118
Defining CoS Rewrite Rules (CLI Procedure) . . . . .	2120
Defining CoS Rewrite Rules (J-Web Procedure) . . . . .	2121
Assigning CoS Components to Interfaces (CLI Procedure) . . . . .	2123
Assigning CoS Components to Interfaces (J-Web Procedure) . . . . .	2123
Configuring Junos OS EZQoS for CoS (CLI Procedure) . . . . .	2125
Configuring CoS Traffic Classification for Ingress Queuing on Oversubscribed Ports on EX8200 Line Cards (CLI Procedure) . . . . .	2126
Configuration Statements . . . . .	2127
[edit class-of-service] Configuration Statement Hierarchy on EX Series Switches . . . . .	2128
Supported Statements in the [edit class-of-service] Hierarchy Level . . . . .	2128
Unsupported Statements in the [edit class-of-service] Hierarchy Level . . . . .	2130
broadcast . . . . .	2131
buffer-size . . . . .	2132
classifiers . . . . .	2133

transmit-rate (EX Series Switches) . . . . .	2154
unit . . . . .	2155

<b>Chapter 32</b>	<b>Administration</b> . . . . .	<b>2157</b>
	Routine Monitoring . . . . .	2157
	Monitoring CoS Classifiers . . . . .	2157
	Monitoring CoS Forwarding Classes . . . . .	2158
	Monitoring Interfaces That Have CoS Components . . . . .	2160
	Monitoring CoS Rewrite Rules . . . . .	2161
	Monitoring CoS Scheduler Maps . . . . .	2162
	Monitoring CoS Value Aliases . . . . .	2164
	Monitoring CoS Drop Profiles . . . . .	2164
	Operational Commands . . . . .	2165
	show class-of-service . . . . .	2167
	show class-of-service classifier . . . . .	2172
	show class-of-service code-point-aliases . . . . .	2174
	show class-of-service drop-profile . . . . .	2176
	show class-of-service forwarding-class . . . . .	2179
	show pfe statistics traffic cpu . . . . .	2181
	show pfe statistics traffic egress-queues . . . . .	2185
	show pfe statistics traffic multicast . . . . .	2187
<b>Chapter 33</b>	<b>Troubleshooting Procedures</b> . . . . .	<b>2191</b>
	Troubleshooting CoS Schedulers on a 40-port SFP+ Line Card in an EX8200 Switch . . . . .	2191
	Troubleshooting a CoS Classifier Configuration for a TCAM Space Error . . . . .	2192
<b>Part 11</b>	<b>Device Security</b>	
<b>Chapter 34</b>	<b>Overview</b> . . . . .	<b>2197</b>
	Storm Control Overview . . . . .	2197
	Understanding Storm Control on Switching Devices . . . . .	2197
	Unknown Unicast Forwarding Overview . . . . .	2199
	Understanding Unknown Unicast Forwarding . . . . .	2199
<b>Chapter 35</b>	<b>Configuration</b> . . . . .	<b>2201</b>
	Configuration Examples . . . . .	2201
	Example: Configuring Storm Control to Prevent Network Outages on EX Series Switches . . . . .	2201
	Configuration Tasks . . . . .	2204
	Configuring Unknown Unicast Forwarding (CLI Procedure) . . . . .	2205
	Configuring Autorecovery From the Disabled State on Secure or Storm Control Interfaces (CLI Procedure) . . . . .	2206
	Configuring or Disabling Storm Control (CLI Procedure) . . . . .	2207
	Configuring Storm Control . . . . .	2208

Understanding Multiple VLAN Registration Protocol (MVRP) on EX Series Switches . . . . .	2264
How MVRP Updates, Creates, and Deletes VLANs on the Switches . . . . .	2264
MVRP Is Disabled by Default on the Switches . . . . .	2264
MRP Timers Control MVRP Updates . . . . .	2265
MVRP Uses MRP Messages to Transmit Switch and VLAN States . . . . .	2265
Compatibility Issues with Junos OS Releases of MVRP . . . . .	2266
Understanding MAC Address Aging . . . . .	2267
Q-in-Q Tunneling . . . . .	2269
Understanding Q-in-Q Tunneling on EX Series Switches . . . . .	2269
How Q-in-Q Tunneling Works . . . . .	2269
Sending and Receiving Untagged Packets . . . . .	2270
Disabling MAC Address Learning . . . . .	2270
Mapping C-VLANs to S-VLANs . . . . .	2271
Limitations for Q-in-Q Tunneling . . . . .	2272
Layer 2 Protocol Tunneling . . . . .	2272
Understanding Layer 2 Protocol Tunneling on EX Series Switches . . . . .	2272
Layer 2 Protocols Supported by L2PT on EX Series Switches . . . . .	2273
How L2PT Works . . . . .	2274
L2PT and Q-in-Q Tunneling on EX Series Switches . . . . .	2275
Redundant Trunk Groups . . . . .	2275
Understanding Redundant Trunk Links . . . . .	2276
Proxy ARP . . . . .	2278
Understanding Proxy ARP on EX Series Switches . . . . .	2278
What Is ARP? . . . . .	2278
Proxy ARP Overview . . . . .	2278
Best Practices for Proxy ARP on EX Series Switches . . . . .	2279
<b>Chapter 38 Configuration . . . . .</b>	<b>2281</b>
Configuration Examples . . . . .	2281
Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch . . . . .	2281
Example: Connecting Access Switches to a Distribution Switch . . . . .	2291

Example: Configuring a Private VLAN on a Single Switch . . . . .	2302
Example: Using Virtual Routing Instances to Route Among VLANs on EX Series Switches . . . . .	2306
Example: Configuring Automatic VLAN Administration Using MVRP on EX Series Switches . . . . .	2310
Example: Configuring Layer 2 Protocol Tunneling on EX Series Switches . .	2322
Example: Configuring Redundant Trunk Links for Faster Recovery . . . . .	2326
Example: Configuring Proxy ARP on an EX Series Switch . . . . .	2331
Configuration Tasks . . . . .	2333
Configuring VLANs for EX Series Switches (J-Web Procedure) . . . . .	2334
Configuring VLANs for EX Series Switches (CLI Procedure) . . . . .	2337
Why Create a VLAN? . . . . .	2337
Creating a VLAN Using the Minimum Procedure . . . . .	2337
Creating a VLAN Using All of the Options . . . . .	2338
Configuration Guidelines for VLANs . . . . .	2339
Configuring Integrated Routing and Bridging Interfaces (CLI Procedure) . .	2340
Configuring MAC Table Aging (CLI Procedure) . . . . .	2341
Configuring the Native VLAN Identifier (CLI Procedure) . . . . .	2342
Creating a Private VLAN on a Single Switch (CLI Procedure) . . . . .	2343
Creating a Private VLAN Spanning Multiple Switches (CLI Procedure) . .	2345
Configuring Virtual Routing Instances (CLI Procedure) . . . . .	2347
Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure ) . . . . .	2348
Enabling MVRP . . . . .	2348
Disabling MVRP . . . . .	2348
Disabling Dynamic VLANs . . . . .	2348
Configuring Timer Values . . . . .	2349
Configuring MVRP Registration Mode . . . . .	2350
Using MVRP in a Mixed-Release Network . . . . .	2350
Configuring Q-in-Q Tunneling (CLI Procedure) . . . . .	2351
Configuring All-in-One Bundling . . . . .	2352
Configuring Many-to-Many Bundling . . . . .	2353
Configuring a Specific Interface Mapping with VLAN Rewrite Option . .	2355
Configuring Layer 2 Protocol Tunneling on EX Series Switches (CLI Procedure) . . . . .	2357
Configuring Redundant Trunk Groups (J-Web Procedure) . . . . .	2358
Configuring Proxy ARP (CLI Procedure) . . . . .	2360
Adding a Static MAC Address Entry to the Ethernet Switching Table (CLI Procedure) . . . . .	2361
Configuring MAC Limiting (CLI Procedure) . . . . .	2361
Limiting the Number of MAC Addresses Learned by an Interface . . .	2362
Limiting the Number of MAC Addresses Learned by a VLAN . . . . .	2362
Configuring MAC Notification (CLI Procedure) . . . . .	2363
Enabling MAC Notification . . . . .	2363
Disabling MAC Notification . . . . .	2364
Setting the MAC Notification Interval . . . . .	2364

<b>Chapter 45</b>	<b>Configuration . . . . .</b>	<b>2615</b>
	Configuration Tasks . . . . .	2615
	Configuring Gigabit Ethernet Interfaces (CLI Procedure) . . . . .	2616
	Configuring VLAN Options and Interface Mode . . . . .	2617
	Configuring the Link Settings . . . . .	2617
	Configuring the IP Options . . . . .	2618
	Configuring Gigabit Ethernet Interfaces (J-Web Procedure) . . . . .	2619
	Port Role Configuration with the J-Web Interface (with CLI References) . . . . .	2625
	Adding a Logical Unit Description to the Configuration . . . . .	2629
	Disabling a Physical Interface . . . . .	2630
	Example: Disabling a Physical Interface . . . . .	2631
	Disabling a Logical Interface . . . . .	2631
	Configuring Flow Control . . . . .	2632
	Configuring the Interface Address . . . . .	2632
	Configuring Interface IPv4 Addresses . . . . .	2634
	Configuring Interface IPv6 Addresses . . . . .	2637

Configuring the Interface Bandwidth .....	2637
Configuring the Media MTU .....	2638
Media MTU Overview .....	2639
How to Configure the Media MTU .....	2640
Encapsulation Overhead by Encapsulation Type .....	2641
Media MTU Sizes by Interface Type for M5 and M7i Routers with CFEB, M10 and M10i Routers with CFEB, and M20 and M40 Routers ..	2642
Media MTU Sizes by Interface Type for M40e Routers .....	2642
Media MTU Sizes by Interface Type for M160 Routers .....	2644
Media MTU Sizes by Interface Type for M7i Routers with CFEB-E, M10i Routers with CFEB-E, and M320 and M120 Routers .....	2644
Media MTU Sizes by Interface Type for MX Series Routers .....	2645
Media MTU Sizes by Interface Type for T320 Routers .....	2646
Media MTU Sizes by Interface Type for T640 Platforms .....	2646
Media MTU Sizes by Interface Type for J2300 Platforms .....	2647
Media MTU Sizes by Interface Type for J4300 and J6300 Platforms ..	2647
Media MTU Sizes by Interface Type for J4350 and J6350 Platforms ..	2648
Media MTU Sizes by Interface Type for EX Series Switches and ACX Series Routers .....	2650
Media MTU Sizes by Interface Type for PTX Series Packet Transport Routers .....	2650
Setting the Protocol MTU .....	2651
Interface Ranges .....	2651
Configuring Interface Ranges .....	2652
Expanding Interface Range Member and Member Range Statements .....	2655
Configuration Inheritance for Member Interfaces .....	2656
Member Interfaces Inheriting Configuration from Configuration Groups .....	2657
Interfaces Inheriting Common Configuration .....	2658
Configuring Inheritance Range Priorities .....	2658
Configuration Expansion Where Interface Range Is Used .....	2659
Configuring Accounting for the Physical Interface .....	2660
Applying an Accounting Profile to the Physical Interface .....	2660
Configuring Accounting for the Logical Interface .....	2661
Applying an Accounting Profile to the Logical Interface .....	2661
Configuring Ethernet Loopback Capability .....	2662
Configuring Gratuitous ARP .....	2663
Configuring Static ARP Table Entries .....	2664
Example: Configuring Static ARP Table Entries .....	2665
Disabling the Transmission of Redirect Messages on an Interface .....	2665
Configuring Restricted and Unrestricted Proxy ARP .....	2665
Enabling or Disabling SNMP Notifications on Logical Interfaces .....	2666
Configuring Aggregated Ethernet Links (CLI Procedure) .....	2667
Configuring Aggregated Ethernet Interfaces (J-Web Procedure) .....	2668
Configuring Aggregated Ethernet LACP (CLI Procedure) .....	2671

Configuring LACP Link Protection of Aggregated Ethernet Interfaces (CLI Procedure) . . . . .	2672
Configuring LACP Link Protection for a Single Link at the Global Level . . . . .	2674
Configuring LACP Link Protection for a Single Link at the Aggregated Interface Level . . . . .	2674
Configuring Subgroup Bundles to Provide LACP Link Protection to Multiple Links in an Aggregated Ethernet Interface . . . . .	2675
Configuring Aggregated Ethernet Link Protection . . . . .	2676
Configuring Link Protection for Aggregated Ethernet Interfaces . . . . .	2677
Configuring Primary and Backup Links for Link Aggregated Ethernet Interfaces . . . . .	2677
Reverting Traffic to a Primary Link When Traffic is Passing Through a Backup Link . . . . .	2677

## Part 21

### Chapter 66

## Network Management and Monitoring

<b>Overview . . . . .</b>	<b>3959</b>
Real-Time Performance Monitoring . . . . .	3959
Understanding Real-Time Performance Monitoring on EX Series	
Switches . . . . .	3960
RPM Packet Collection . . . . .	3960
Tests and Probe Types . . . . .	3960
Hardware Timestamps . . . . .	3961
Limitations of RPM on EX Series Switches . . . . .	3963
Analyzers and Port Mirroring . . . . .	3963
Understanding Port Mirroring and Analyzers on EX4300 Switches . . . . .	3964
Port Mirroring Overview . . . . .	3964
Analyzer Overview . . . . .	3965
Port Mirroring and Analyzer Terminologies . . . . .	3965
Configuration Guidelines for Port Mirroring and Analyzers on EX4300	
Switches . . . . .	3966
sFlow Monitoring Technology . . . . .	3969
Understanding How to Use sFlow Technology for Network Monitoring on	
an EX Series Switch . . . . .	3969
Sampling Mechanism and Architecture of sFlow Technology on EX	
Series Switches . . . . .	3969
Adaptive Sampling . . . . .	3970
sFlow Agent Address Assignment . . . . .	3971
Ethernet OAM Link Fault Management and Connectivity Fault Management . . . . .	3971
Understanding Ethernet OAM Link Fault Management for an EX Series	
Switch . . . . .	3972
Understanding Ethernet OAM Connectivity Fault Management for an EX	
Series Switch . . . . .	3973
Understanding Ethernet Frame Delay Measurements on Switches . . . . .	3974
Ethernet Frame Delay Measurements . . . . .	3975
Types of Ethernet Frame Delay Measurements . . . . .	3975
Limitations . . . . .	3976
Uplink Failure Detection . . . . .	3976
Understanding Uplink Failure Detection . . . . .	3977
Uplink Failure Detection Overview . . . . .	3977
Failure Detection Pair . . . . .	3978
Network Analytics . . . . .	3978
Network Analytics Overview . . . . .	3978
Analytics Feature Overview . . . . .	3979
Network Analytics Enhancements Overview . . . . .	3980
Summary of CLI Changes . . . . .	3981
Understanding Enhanced Network Analytics Streaming Data . . . . .	3985
Google Protocol Buffer (GPB) . . . . .	3985
JavaScript Object Notation (JSON) . . . . .	3988

	Comma-separated Values (CSV) . . . . .	3988
	Tab-separated Values (TSV) . . . . .	3988
	Queue Statistics Output for JSON, CSV, and TSV . . . . .	3989
	Traffic Statistics Output for JSON, CSV, and TSV . . . . .	3989
	Understanding Enhanced Analytics Local File Output . . . . .	3991
	Prototype File for the Google Protocol Buffer Stream Format . . . . .	3993
<b>Chapter 67</b>	<b>Configuration . . . . .</b>	<b>3995</b>
	Configuration Examples . . . . .	3995
	Example: Configuring sFlow Technology to Monitor Network Traffic on EX Series Switches . . . . .	3995
	Example: Configuring Mirroring for Local Monitoring of Employee Resource Use on EX4300 Switches . . . . .	4000
	Example: Configuring Mirroring for Remote Monitoring of Employee Resource Use on EX4300 Switches . . . . .	4006
	Example: Configuring Mirroring for Remote Monitoring of Employee Resource Use Through a Transit Switch on EX4300 Switches . . . . .	4016
	Example: Configuring Ethernet OAM Connectivity Fault Management on EX Series Switches . . . . .	4023
	Example: Configuring Ethernet OAM Link Fault Management on EX Series Switches . . . . .	4027
	Example: Configuring Enhanced Network Analytics Features . . . . .	4029
	Configuration Tasks . . . . .	4039
	Configuring SNMP (J-Web Procedure) . . . . .	4040
	Configuring Mirroring on EX4300 Switches to Analyze Traffic (CLI Procedure) . . . . .	4043
	Configuring an Analyzer for Local Traffic Analysis . . . . .	4044
	Configuring an Analyzer for Remote Traffic Analysis . . . . .	4044
	Configuring Port Mirroring . . . . .	4045
	Configuring Port Mirroring to Analyze Traffic (J-Web Procedure) . . . . .	4047
	Configuring sFlow Technology for Network Monitoring (CLI Procedure) . . . . .	4049
	Configuring Real-Time Performance Monitoring (J-Web Procedure) . . . . .	4050
	Configuring the Interface for RPM Timestamping for Client/Server on an EX Series Switch (CLI Procedure) . . . . .	4057
	Configuring Ethernet OAM Connectivity Fault Management (CLI Procedure) . . . . .	4058
	Creating the Maintenance Domain . . . . .	4058
	Configuring the Maintenance Domain MIP Half Function . . . . .	4059
	Creating a Maintenance Association . . . . .	4059
	Configuring the Continuity Check Protocol . . . . .	4060
	Configuring a Maintenance Association End Point . . . . .	4060
	Configuring a Connectivity Fault Management Action Profile . . . . .	4061
	Configuring the Linktrace Protocol . . . . .	4061
	Configuring Ethernet OAM Link Fault Management (CLI Procedure) . . . . .	4062
	Configuring Interfaces for Uplink Failure Detection (CLI Procedure) . . . . .	4064
	Configuring MEP Interfaces on Switches to Support Ethernet Frame Delay Measurements (CLI Procedure) . . . . .	4065
	Configuring One-Way Ethernet Frame Delay Measurements on Switches (CLI Procedure) . . . . .	4066

Configuring an Iterator Profile on a Switch (CLI Procedure) . . . . .	4067
Triggering an Ethernet Frame Delay Measurement Session on a Switch . .	4068
Configuring Two-Way Ethernet Frame Delay Measurements on Switches (CLI Procedure) . . . . .	4069
Configuring Queue Monitoring . . . . .	4070
Configuring Traffic Monitoring . . . . .	4072
Configuring a Local File for Network Analytics Data . . . . .	4073
Configuring a Remote Collector for Streaming Analytics Data . . . . .	4074
Configuration Statements: SNMP . . . . .	4075
[edit snmp] Configuration Statement Hierarchy on EX Series Switches . .	4078

<b>Part 25</b>	<b>Spanning-Tree Protocols</b>	
<b>Chapter 81</b>	<b>Overview . . . . .</b>	<b>4903</b>
	Spanning Trees Overview . . . . .	4903
	Understanding MSTP for EX Series Switches . . . . .	4904
	MSTP Maps Multiple VLANs . . . . .	4904
	Configuring MSTP Regions . . . . .	4905
	Selecting a Spanning-Tree Protocol . . . . .	4905
	Understanding RSTP for EX Series Switches . . . . .	4906
	Spanning-Tree Protocols Help Prevent Broadcast Storms . . . . .	4906
	RSTP is an Enhancement of the Original STP . . . . .	4907
	Port Roles Determine Participation in The Spanning-Tree . . . . .	4907

Port States Determine How a Port Processes a Frame . . . . .	4907
Edge Ports Connect to Devices That Cannot Be Part of a Spanning-Tree . . . . .	4908
BPDUs Maintain the Spanning-Tree . . . . .	4908
When an RSTP Root Bridge Fails . . . . .	4909
Switches Must Relearn MAC Addresses After a Link Failure . . . . .	4909
Selecting a Spanning-Tree Protocol . . . . .	4909
Understanding STP for EX Series Switches . . . . .	4910
Selecting a Spanning-Tree Protocol . . . . .	4911
RSTP or VSTP Forced to Run as IEEE 802.1D STP . . . . .	4912
Understanding VSTP for EX Series Switches and QFX Series Switches . . . . .	4912
Selecting a Spanning-Tree Protocol . . . . .	4913
Understanding BPDU Protection for STP, RSTP, and MSTP on EX Series Switches . . . . .	4914
Different Kinds of BPDUs . . . . .	4914
Protecting Switches From Incompatible BPDUs . . . . .	4914
Understanding Loop Protection for STP, RSTP, VSTP, and MSTP on EX Series Switches . . . . .	4916
Understanding Root Protection for STP, RSTP, VSTP, and MSTP on EX Series Switches . . . . .	4917
<b>Chapter 82 Configuration . . . . .</b>	<b>4919</b>
Configuration Examples . . . . .	4919
Example: Faster Convergence and Improved Network Stability with RSTP on EX Series Switches . . . . .	4919
Example: Configuring Network Regions for VLANs with MSTP on EX Series Switches . . . . .	4936
Example: Configuring BPDU Protection on Edge Interfaces to Prevent STP Miscalculations on EX Series Switches . . . . .	4956
Example: Configuring BPDU Protection on Interfaces to Prevent STP Miscalculations on EX Series Switches . . . . .	4961
Example: Configuring Loop Protection to Prevent Interfaces from Transitioning from Blocking to Forwarding in a Spanning Tree on EX Series Switches . . . . .	4967
Example: Configuring Root Protection to Enforce Root Bridge Placement in Spanning Trees on EX Series Switches . . . . .	4971
Configuration Tasks . . . . .	4976
Forcing RSTP or VSTP to Run as IEEE 802.1D STP (CLI Procedure) . . . . .	4976
Configuring Spanning-Tree Protocols (J-Web Procedure) . . . . .	4977
Configuring VSTP (CLI Procedure) . . . . .	4982
Unblocking an Interface That Receives BPDUs in Error (CLI Procedure) . . . . .	4984
Operational Tasks . . . . .	4984
Reverting to RSTP or VSTP from Forced IEEE 802.1D STP . . . . .	4985

## Chapter 84

## Virtual Chassis

<b>Overview</b>	<b>5065</b>
Virtual Chassis Overview	5065
Understanding EX4300 Virtual Chassis	5065
Understanding EX Series Virtual Chassis Components	5067
Maximum Number of Switches per Virtual Chassis	5067
Virtual Chassis Ports (VCPs)	5068
Master Role	5070
Backup Role	5070
Linecard Role	5071
Member Switch and Member ID	5071
Mastership Priority	5072
Mixed Virtual Chassis	5072
Virtual Chassis Identifier (VCID)	5073
Understanding Mixed EX Series and QFX Series Virtual Chassis or Virtual Chassis Fabric	5073
Virtual Chassis Fabric Summary	5074
Understanding Mixed Virtual Chassis Fabric	5075
Virtual Chassis Summary for QFX5100, QFX3600, QFX3500, EX4600, and EX4300 Switches	5075
Understanding the Routing Engine Role in a Mixed Virtual Chassis Using EX4300, EX4600, QFX3500, QFX3600, or QFX5100 Member Switches	5076
Understanding EX4300, QFX3500, QFX3600, and QFX5100 Switches in a Virtual Chassis	5077
Understanding Mixed EX4300 and EX4600 Virtual Chassis	5077
Understanding EX4200, EX4500, and EX4550 Switches in a Mixed Virtual Chassis	5077
Understanding How the Master in a Virtual Chassis Is Elected	5078
Understanding Software Upgrade in an EX Series Virtual Chassis	5079
Understanding Global Management of a Virtual Chassis	5080
Understanding Nonvolatile Storage in a Virtual Chassis	5083
Nonvolatile Memory Features	5083
Understanding EX Series Virtual Chassis Port Link Aggregation	5083
Understanding EX Series Virtual Chassis Configuration	5086
Understanding Split and Merge in a Virtual Chassis	5087
What Happens When a Virtual Chassis Configuration Splits	5088
Merging Virtual Chassis Configurations	5089
Understanding Automatic Software Update on Virtual Chassis Member Switches	5090
Automatic Software Update Basics	5091
Automatic Software Update Restrictions	5091
Understanding MAC Address Assignment on a Virtual Chassis	5093
Understanding High Availability on an EX Series Virtual Chassis	5094

<b>Chapter 85</b>	<b>Configuration</b>	<b>5097</b>
	Configuration Tasks	5097
	Configuring an EX4300 Virtual Chassis (CLI Procedure)	5097
	Configuring an EX4300 Virtual Chassis with a Nonprovisioned Configuration File	5099
	Configuring an EX4300 Virtual Chassis with a Preprovisioned Configuration File	5101
	Adding a New Switch to an Existing EX4300 Virtual Chassis (CLI Procedure)	5103
	Replacing a Member Switch of a Virtual Chassis Configuration (CLI Procedure)	5104
	Remove, Repair, and Reinstall the Same Switch	5105
	Remove a Member Switch, Replace It with a Different Switch, and Reapply the Old Configuration	5105
	Remove a Member Switch and Make Its Member ID Available for Reassignment to a Different Switch	5106
	Configuring Mastership of a Virtual Chassis (CLI Procedure)	5107
	Configuring Mastership Using a Preprovisioned Configuration File	5107
	Configuring Mastership Using a Configuration File That Is Not Preprovisioned	5108
	Setting an Uplink Port on an EX Series Switch as a Virtual Chassis Port (CLI Procedure)	5109
	Setting an Uplink VCP Between the Member Switches	5111
	Setting an Uplink VCP on a Standalone Switch	5111
	Configuring the Timer for the Backup Member to Start Using Its Own MAC Address, as Master of a Virtual Chassis (CLI Procedure)	5113
	Disabling Split and Merge in a Virtual Chassis (CLI Procedure)	5114
	Configuring Automatic Software Update on Virtual Chassis Member Switches (CLI Procedure)	5114
	Assigning the Virtual Chassis ID to Determine Precedence During a Virtual Chassis Merge (CLI Procedure)	5116
	Configuring Graceful Routing Engine Switchover in a Virtual Chassis (CLI Procedure)	5116
	Configuration Statements	5117
	[edit virtual-chassis] Configuration Statement Hierarchy	5117
	Supported Statements in the [edit virtual-chassis] Hierarchy Level	5118
	Unsupported Statements in the [edit virtual-chassis] Hierarchy Level	5119
	aliases (Virtual Chassis)	5120
	alias-name (Virtual Chassis aliases)	5121
	auto-sw-update	5122
	graceful-restart (Enabling Globally)	5124
	graceful-switchover	5125
	id	5126
	location (Virtual Chassis)	5127

	mastership-priority	5129
	member	5131
	no-management-vlan	5132

	no-split-detection . . . . .	5133
	package-name . . . . .	5134
	preprovisioned . . . . .	5135
	redundancy (Graceful Switchover) . . . . .	5136
	role . . . . .	5137
	serial-number . . . . .	5140
	serial-number (Virtual Chassis aliases) . . . . .	5141
	traceoptions (Virtual Chassis) . . . . .	5142
	vcp-no-hold-time . . . . .	5145
	virtual-chassis . . . . .	5147
<b>Chapter 86</b>	<b>Administration . . . . .</b>	<b>5149</b>
	Routine Monitoring . . . . .	5149
	Command Forwarding Usage with an EX Series Virtual Chassis . . . . .	5149
	Verifying the Member ID, Role, and Neighbor Member Connections of a Virtual Chassis Member . . . . .	5154
	Verifying That Virtual Chassis Ports Are Operational . . . . .	5155
	Monitoring the Virtual Chassis Status and Statistics on EX Series Virtual Chassis . . . . .	5157
	Verifying That Graceful Routing Engine Switchover Is Working in the Virtual Chassis . . . . .	5159
	Operational Commands . . . . .	5160
	clear virtual-chassis vc-port statistics . . . . .	5161
	request session member . . . . .	5163
	request virtual-chassis recycle . . . . .	5164
	request virtual-chassis renumber . . . . .	5165
	request virtual-chassis vc-port . . . . .	5166
	request virtual-chassis vc-port diagnostics optics . . . . .	5168
	show system uptime . . . . .	5169
	show virtual-chassis active-topology . . . . .	5174
	show virtual-chassis device-topology . . . . .	5179
	show virtual-chassis login . . . . .	5185
	show virtual-chassis protocol adjacency . . . . .	5186
	show virtual-chassis protocol database . . . . .	5190
	show virtual-chassis protocol interface . . . . .	5194
	show virtual-chassis protocol route . . . . .	5197
	show virtual-chassis protocol statistics . . . . .	5200
	show virtual-chassis . . . . .	5203
	show virtual-chassis vc-path . . . . .	5207
	show virtual-chassis vc-port . . . . .	5209
	show virtual-chassis vc-port diagnostics optics . . . . .	5213
	show virtual-chassis vc-port statistics . . . . .	5227
<b>Chapter 87</b>	<b>Troubleshooting . . . . .</b>	<b>5235</b>
	Troubleshooting Procedures . . . . .	5235
	Troubleshooting an EX Series Virtual Chassis . . . . .	5235
	A Disconnected Member Switch's ID Is Not Available for Reassignment . . . . .	5235
	Load Factory Default Does Not Commit on a Multimember Virtual Chassis . . . . .	5235

The Member ID Persists When a Member Switch Is Disconnected From a Virtual Chassis . . . . .	5236
A Member Switch Is Not Participating in a Mixed Virtual Chassis . . . .	5236

## Part 27

### Chapter 88

## Virtual Chassis Fabric

<b>Overview . . . . .</b>	<b>5241</b>
Virtual Chassis Fabric Overview . . . . .	5241
Virtual Chassis Fabric Overview . . . . .	5241
Understanding Virtual Chassis Fabric Components . . . . .	5243
Spine-and-Leaf Topology . . . . .	5243
Spine Devices . . . . .	5244
Leaf Devices . . . . .	5244
Routing Engine Role . . . . .	5245
Linecard Role . . . . .	5246
Master Routing Engine Election Process . . . . .	5246
Virtual Chassis Ports (VCPs) . . . . .	5247
Automatic Virtual Chassis Port (VCP) Conversion . . . . .	5247
VCF Configuration Options . . . . .	5248
Fabric Mode . . . . .	5248
Mixed Mode . . . . .	5249
Virtual Management Ethernet Interface . . . . .	5249
Virtual Chassis Fabric Port Link Aggregation Group Bundles . . . . .	5249
Virtual Chassis Fabric License Requirements . . . . .	5250
Hardware Requirements for a Virtual Chassis Fabric . . . . .	5250
Software Requirements in a Virtual Chassis Fabric . . . . .	5250
Understanding Virtual Chassis Fabric Configuration . . . . .	5251
Virtual Chassis Fabric Setup . . . . .	5251
Configuration File Management in a VCF . . . . .	5253
Logging into a Virtual Chassis Fabric . . . . .	5253
Understanding Interface Numbering . . . . .	5253
Understanding Mixed EX Series and QFX Series Virtual Chassis or Virtual Chassis Fabric . . . . .	5254
Virtual Chassis Fabric Summary . . . . .	5254
Understanding Mixed Virtual Chassis Fabric . . . . .	5255
Virtual Chassis Summary for QFX5100, QFX3600, QFX3500, EX4600, and EX4300 Switches . . . . .	5255
Understanding the Routing Engine Role in a Mixed Virtual Chassis Using EX4300, EX4600, QFX3500, QFX3600, or QFX5100 Member Switches . . . . .	5256
Understanding EX4300, QFX3500, QFX3600, and QFX5100 Switches in a Virtual Chassis . . . . .	5257
Understanding Mixed EX4300 and EX4600 Virtual Chassis . . . . .	5257
Understanding EX4200, EX4500, and EX4550 Switches in a Mixed Virtual Chassis . . . . .	5257
Understanding Traffic Flow Through a Virtual Chassis Fabric . . . . .	5258
Understanding Software Upgrades in a Virtual Chassis Fabric . . . . .	5258
Virtual Chassis Fabric Software Basics . . . . .	5259
Nonstop Software Upgrade (NSSU) . . . . .	5259

	Automatic Software Update . . . . .	5259
	Traditional Software Upgrade . . . . .	5259
<b>Chapter 89</b>	<b>Configuration . . . . .</b>	<b>5261</b>
	Configuration Tasks . . . . .	5261
	Autoprovisioning a Virtual Chassis Fabric . . . . .	5261
	Preprovisioning a Virtual Chassis Fabric . . . . .	5264
	Configuring a Nonprovisioned Virtual Chassis Fabric . . . . .	5267
	Adding a Device to a Virtual Chassis Fabric . . . . .	5270
	Adding a Leaf Device to an Autoprovisioned Virtual Chassis Fabric . . . . .	5271
	Adding a Spine Device to an Autoprovisioned Virtual Chassis Fabric . . . . .	5272
	Adding a Spine or Leaf Device to a Preprovisioned Virtual Chassis Fabric . . . . .	5273
	Adding a Spine or Leaf Device to a Nonprovisioned Virtual Chassis Fabric . . . . .	5275
	Removing a Device From a Virtual Chassis Fabric . . . . .	5277
	Upgrading Software for a Virtual Chassis Fabric . . . . .	5278
	NSSU . . . . .	5279
	Automatic Software Update . . . . .	5279
	Standard Upgrade . . . . .	5279
	Configuration Statements . . . . .	5280
	[edit virtual-chassis] Configuration Statement Hierarchy . . . . .	5280
	Supported Statements in the [edit virtual-chassis] Hierarchy Level . . . . .	5281
	Unsupported Statements in the [edit virtual-chassis] Hierarchy Level . . . . .	5282

# About the Documentation

- Documentation and Release Notes on page cix
- Supported Platforms on page cix
- Using the Examples in This Manual on page cix
- Documentation Conventions on page cxi
- Documentation Feedback on page cxiii
- Requesting Technical Support on page cxiii

## Documentation and Release Notes

---

To obtain the most current version of all Juniper Networks® technical documentation, see the product documentation page on the Juniper Networks website at <http://www.juniper.net/techpubs/>.

If the information in the latest release notes differs from the information in the documentation, follow the product Release Notes.

Juniper Networks Books publishes books by Juniper Networks engineers and subject matter experts. These books go beyond the technical documentation to explore the nuances of network architecture, deployment, and administration. The current list can be viewed at <http://www.juniper.net/books>.

## Supported Platforms

---

For the features described in this document, the following platforms are supported:

- EX Series

## Using the Examples in This Manual

---

If you want to use the examples in this manual, you can use the **load merge** or the **load merge relative** command. These commands cause the software to merge the incoming configuration into the current candidate configuration. The example does not become active until you commit the candidate configuration.

If the example configuration contains the top level of the hierarchy (or multiple hierarchies), the example is a *full example*. In this case, use the **load merge** command.

If the example configuration does not start at the top level of the hierarchy, the example is a *snippet*. In this case, use the **load merge relative** command. These procedures are described in the following sections.

## Merging a Full Example

To merge a full example, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration example into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following configuration to a file and name the file **ex-script.conf**. Copy the **ex-script.conf** file to the **/var/tmp** directory on your routing platform.

```
system {
  scripts {
    commit {
      file ex-script.xml;
    }
  }
}
interfaces {
  fxp0 {
    disable;
    unit 0 {
      family inet {
        address 10.0.0.1/24;
      }
    }
  }
}
```

2. Merge the contents of the file into your routing platform configuration by issuing the **load merge** configuration mode command:

```
[edit]
user@host# load merge /var/tmp/ex-script.conf
load complete
```

## Merging a Snippet

To merge a snippet, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration snippet into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following snippet to a file and name the file **ex-script-snippet.conf**. Copy the **ex-script-snippet.conf** file to the **/var/tmp** directory on your routing platform.

```
commit {
  file ex-script-snippet.xml; }
```

2. Move to the hierarchy level that is relevant for this snippet by issuing the following configuration mode command:

```
[edit]
user@host# edit system scripts
[edit system scripts]
```

3. Merge the contents of the file into your routing platform configuration by issuing the **load merge relative** configuration mode command:

```
[edit system scripts]
user@host# load merge relative /var/tmp/ex-script-snippet.conf
load complete
```

For more information about the **load** command, see the *CLI User Guide*.

## Documentation Conventions

Table 1 on page cxi defines notice icons used in this guide.

Table 1: Notice Icons

Icon	Meaning	Description
	Informational note	Indicates important features or instructions.
	Caution	Indicates a situation that might result in loss of data or hardware damage.
	Warning	Alerts you to the risk of personal injury or death.
	Laser warning	Alerts you to the risk of personal injury from a laser.
	Tip	Indicates helpful information.
	Best practice	Alerts you to a recommended use or implementation.

Table 2 on page cxi defines the text and syntax conventions used in this guide.

Table 2: Text and Syntax Conventions

Convention	Description	Examples
<b>Bold text like this</b>	Represents text that you type.	To enter configuration mode, type the <b>configure</b> command:  user@host> <b>configure</b>

Table 2: Text and Syntax Conventions (*continued*)

Convention	Description	Examples
Fixed-width text like this	Represents output that appears on the terminal screen.	<pre>user@host&gt; show chassis alarms</pre> <p>No alarms currently active</p>
<i>Italic text like this</i>	<ul style="list-style-type: none"> <li>Introduces or emphasizes important new terms.</li> <li>Identifies guide names.</li> <li>Identifies RFC and Internet draft titles.</li> </ul>	<ul style="list-style-type: none"> <li>A policy <i>term</i> is a named structure that defines match conditions and actions.</li> <li><i>Junos OS CLI User Guide</i></li> <li>RFC 1997, <i>BGP Communities Attribute</i></li> </ul>
<i>Italic text like this</i>	Represents variables (options for which you substitute a value) in commands or configuration statements.	<p>Configure the machine's domain name:</p> <pre>[edit] root@# set system domain-name domain-name</pre>
Text like this	Represents names of configuration statements, commands, files, and directories; configuration hierarchy levels; or labels on routing platform components.	<ul style="list-style-type: none"> <li>To configure a stub area, include the <b>stub</b> statement at the <b>[edit protocols ospf area area-id]</b> hierarchy level.</li> <li>The console port is labeled <b>CONSOLE</b>.</li> </ul>
< > (angle brackets)	Encloses optional keywords or variables.	<b>stub &lt;default-metric metric&gt;;</b>
(pipe symbol)	Indicates a choice between the mutually exclusive keywords or variables on either side of the symbol. The set of choices is often enclosed in parentheses for clarity.	<b>broadcast   multicast</b> <b>(string1   string2   string3)</b>
# (pound sign)	Indicates a comment specified on the same line as the configuration statement to which it applies.	<b>rsvp { # Required for dynamic MPLS only</b>
[ ] (square brackets)	Encloses a variable for which you can substitute one or more values.	<b>community name members [ community-ids ]</b>
Indentation and braces ( { } )	Identifies a level in the configuration hierarchy.	<pre>[edit] routing-options {   static {     route default {       nexthop address;       retain;     }   } }</pre>
;(semicolon)	Identifies a leaf statement at a configuration hierarchy level.	
<b>GUI Conventions</b>		
<b>Bold text like this</b>	Represents graphical user interface (GUI) items you click or select.	<ul style="list-style-type: none"> <li>In the Logical Interfaces box, select <b>All Interfaces</b>.</li> <li>To cancel the configuration, click <b>Cancel</b>.</li> </ul>

Table 2: Text and Syntax Conventions (*continued*)

Convention	Description	Examples
> (bold right angle bracket)	Separates levels in a hierarchy of menu selections.	In the configuration editor hierarchy, select <b>Protocols&gt;Ospf</b> .

## Documentation Feedback

We encourage you to provide feedback, comments, and suggestions so that we can improve the documentation. You can provide feedback by using either of the following methods:

- Online feedback rating system—On any page at the Juniper Networks Technical Documentation site at <http://www.juniper.net/techpubs/index.html>, simply click the stars to rate the content, and use the pop-up form to provide us with information about your experience. Alternately, you can use the online feedback form at <https://www.juniper.net/cgi-bin/docbugreport/>.
- E-mail—Send your comments to [techpubs-comments@juniper.net](mailto:techpubs-comments@juniper.net). Include the document or topic name, URL or page number, and software version (if applicable).

## Requesting Technical Support

Technical product support is available through the Juniper Networks Technical Assistance Center (JTAC). If you are a customer with an active J-Care or JNASC support contract, or are covered under warranty, and need post-sales technical support, you can access our tools and resources online or open a case with JTAC.

- JTAC policies—For a complete understanding of our JTAC procedures and policies, review the *JTAC User Guide* located at <http://www.juniper.net/us/en/local/pdf/resource-guides/7100059-en.pdf>.
- Product warranties—For product warranty information, visit <http://www.juniper.net/support/warranty/>.
- JTAC hours of operation—The JTAC centers have resources available 24 hours a day, 7 days a week, 365 days a year.

## Self-Help Online Tools and Resources

For quick and easy problem resolution, Juniper Networks has designed an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

- Find CSC offerings: <http://www.juniper.net/customers/support/>
- Search for known bugs: <http://www2.juniper.net/kb/>
- Find product documentation: <http://www.juniper.net/techpubs/>
- Find solutions and answer questions using our Knowledge Base: <http://kb.juniper.net/>

- Download the latest versions of software and review release notes:  
<http://www.juniper.net/customers/csc/software/>
- Search technical bulletins for relevant hardware and software notifications:  
<http://kb.juniper.net/InfoCenter/>
- Join and participate in the Juniper Networks Community Forum:  
<http://www.juniper.net/company/communities/>
- Open a case online in the CSC Case Management tool: <http://www.juniper.net/cm/>

To verify service entitlement by product serial number, use our Serial Number Entitlement (SNE) Tool: <https://tools.juniper.net/SerialNumberEntitlementSearch/>

## Opening a Case with JTAC

You can open a case with JTAC on the Web or by telephone.

- Use the Case Management tool in the CSC at <http://www.juniper.net/cm/>.
- Call 1-888-314-JTAC (1-888-314-5822 toll-free in the USA, Canada, and Mexico).

For international or direct-dial options in countries without toll-free numbers, see <http://www.juniper.net/support/requesting-support.html>.

- [Configuring an IRB Interface on page 7](#)
- [Configuring an Aggregated Ethernet Interface and Configuring LACP on That Interface on page 7](#)
- [Enhanced Layer 2 CLI Configuration Statement and Command Changes on page 8](#)

## Understanding Enhanced Layer 2 Software Support

---

Enhanced Layer 2 software (ELS) is automatically supported if your device is running a Junos OS release that supports it. You do not need to take any action to enable ELS, and you cannot disable ELS.

ELS is available on the following EX Series switches and QFX Series devices.

**Table 3: ELS Support**

Device	Initial ELS Release
EX4300 switches	13.2X50-D10
EX4600 switches	13.2X51-D25

Table 3: ELS Support (*continued*)

Device	Initial ELS Release
EX9200 switches	12.3R2
QFX3500 switches	13.2X50-D15
QFX3600 switches	13.2X50-D15
QFX5100 switches	13.2X51-D10

ELS is supported on the EX4300, EX4600, and EX9200 switches for all Junos OS releases, starting with the initial releases shown in [Table 3 on page 3](#).

ELS support was introduced on QFX3500 and QFX3600 switches in Junos OS Release 13.2X50-D15. ELS is only supported on the software package that supports Virtual Chassis (the **jinstall-qfx-3-\*** software package) for QFX3500 and QFX3600 switches.

For QFX5100 switches, ELS support was introduced in Junos OS Release 13.2X51-D10 and is supported on the **jinstall-qfx-5-\*** software package.

**NOTE:** ELS is not supported on software packages that can be installed in a QFabric system.

### Using the ELS Translator Tool

The ELS Translator is a web-based tool that converts Junos OS Layer 2 configurations to Enhanced Layer 2 Software (ELS) configurations. This conversion tool supports all Juniper Networks EX Series, MX Series, and QFX Series platforms with ELS installed. The ELS Translator is hosted on Juniper Networks Customer Support website for EX Series switches, MX Series Universal Edge routers, and QFX Series switches and is available to registered users, internal users, partners, and premium service contract customers. You need to login using your Juniper Networks user name and password to access the ELS Translator tool.

[Click](#) to access the ELS translator tool.

If you are upgrading from a version of Junos OS that does not support ELS to a version of Junos OS that supports ELS, we recommend updating your configuration with the ELS Translator Tool using the following procedure:

1. Log onto your device using the console port.

**NOTE:** Only perform this procedure from the console port. You will lose connectivity to your device if you perform this procedure from a management port or any other interface.

2. Copy your entire existing configuration into another file. Save the file to a remote location. See *Saving a Configuration to a File*.
3. Retain the portion of your existing configuration related to management network connectivity (such as **[edit system]**). Delete all other top-level configuration hierarchy levels (such as **[edit interfaces]**, **[edit protocols]**, and **[edit vlans]**). Issue a **commit** operation to remove the deleted configuration hierarchy levels.
4. Perform the software upgrade. Reboot your device to complete the upgrade. See *Software Installation Overview*

**NOTE:** Maintain your console port connection during the reboot.

5. [Click](#) to access the ELS translator tool in a web browser. Follow the instructions on the page to update your configuration.
6. Return to your console port connection. When the switch has rebooted to complete the software upgrade, copy the configuration from the ELS Translator Tool onto your switch. See *Uploading a Configuration File*.
7. Commit the new configuration.

**NOTE:** It is possible a script might not translate correctly, so review translated scripts carefully before loading the converted configuration on your switch or other device.

## Configuring a VLAN

You can configure one or more VLANs to perform Layer 2 bridging. The Layer 2 bridging functions include integrated routing and bridging (IRB) for support for Layer 2 bridging and Layer 3 IP routing on the same interface. EX Series and QFX Series switches can function as Layer 2 switches, each with multiple bridging, or broadcast, domains that participate in the same Layer 2 network. You can also configure Layer 3 routing support for a VLAN.

To configure a VLAN:

1. Create the VLAN by setting the unique VLAN name and configuring the VLAN ID:

```
[edit]
user@host# set vlans vlan-name vlan-id vlan-id-number
```

2. Assign at least one interface to the VLAN:

```
[edit]
user@host# set interface interface-name family ethernet-switching vlan members vlan-name
```

---

### Configuring the Native VLAN Identifier

EX Series and QFX Series switches support receiving and forwarding routed or bridged Ethernet frames with 802.1Q VLAN tags. Typically, trunk ports, which connect switches to each other, accept untagged control packets but do not accept untagged data packets. You can enable a trunk port to accept untagged data packets by configuring a native VLAN ID on the interface on which you want the untagged data packets to be received.

To configure the native VLAN ID:

1. On the interface on which you want untagged data packets to be received, set the interface mode to trunk, which specifies that the interface is in multiple VLANs and can multiplex traffic between different VLANs.

```
[edit interfaces]
user@host# set interface-name unit logical-unit-number family ethernet-switching
interface-mode trunk
```

2. Configure the native VLAN ID:

```
[edit interfaces]
user@host# set interface-name native-vlan-id number
```

3. Assign the interface to the native VLAN ID:

```
[edit interfaces]
user@host# set interface-name unit logical-unit-number family ethernet-switching vlan
members native-vlan-id-number
```

---

### Configuring Layer 2 Interfaces

To ensure that your high-traffic network is tuned for optimal performance, explicitly configure some settings on the switch's network interfaces.

To configure a Gigabit Ethernet interface or 10-Gigabit Ethernet interface for trunk interface mode:

```
[edit]
user@host# set interfaces interface-name unit logical-unit-number family ethernet-switching
interface-mode trunk
```

To configure a Gigabit Ethernet interface or 10-Gigabit Ethernet interface for access interface mode:

```
[edit]
user@host# set interfaces interface-name unit logical-unit-number family ethernet-switching
interface-mode access
```

---

### Configuring Layer 3 Interfaces

To configure a Layer 3 interface, you must assign an IP address to the interface. You assign an address to an interface by specifying the address when configuring the protocol family. For the inet or inet6 family, configure the interface IP address.

You can configure interfaces with a 32-bit IP version 4 (IPv4) address and optionally with a destination prefix, sometimes called a subnet mask. An IPv4 address utilizes a 4-octet dotted decimal address syntax (for example, 192.16.1.1). An IPv4 address with destination prefix utilizes a 4-octet dotted decimal address syntax with a destination prefix appended (for example, 192.16.1.1/30).

To specify an IP address for the logical unit using IPv4:

```
[edit]
user@host# set interfaces interface-name unit logical-unit-number family inet address ip-address
```

You represent IP version 6 (IPv6) addresses in hexadecimal notation using a colon-separated list of 16-bit values. You assign a 128-bit IPv6 address to an interface.

To specify an IP address for the logical unit using IPv6:

```
[edit]
user@host# set interfaces interface-name unit logical-unit-number family inet6 address ip-address
```

### Configuring an IRB Interface

Integrated routing and bridging (IRB) provides support for Layer 2 bridging and Layer 3 IP routing on the same interface. IRB enables you to route packets to another routed interface or to another VLAN that has a Layer 3 protocol configured. IRBs allow the device to recognize packets that are being sent to local addresses so that they are bridged (switched) whenever possible and are routed only when necessary. Whenever packets can be switched instead of routed, several layers of processing are eliminated. An interface named *irb* functions as a logical router on which you can configure a Layer 3 logical interface for VLAN. For redundancy, you can combine an IRB interface with implementations of the Virtual Router Redundancy Protocol (VRRP) in both bridging and virtual private LAN service (VPLS) environments.

To configure an IRB interface:

1. Create a Layer 2 VLAN by assigning it a name and a VLAN ID:

```
[edit]
user@host# set vlans vlan-name vlan-id vlan-id
```

2. Create an IRB logical interface:

```
[edit]
user@host# set interface irb unit logical-unit-number family inet address ip-address
```

3. Associate the IRB interface with the VLAN:

```
[edit]
user@host# set vlans vlan-name l3-interface irb.logical-unit-number
```

### Configuring an Aggregated Ethernet Interface and Configuring LACP on That Interface

Use the link aggregation feature to aggregate one or more links to form a virtual link or link aggregation group (LAG). The MAC client can treat this virtual link as if it were a single link to increase bandwidth, provide graceful degradation as failure occurs, and increase availability.

To configure an aggregated Ethernet interface:

1. Specify the number of aggregated Ethernet interfaces to be created:

```
[edit chassis]
user@host# set aggregated-devices ethernet device-count number
```

2. Specify the name of the link aggregation group interface:

```
[edit interfaces]
user@host# set interfaces aex
```

3. Specify the minimum number of links for the aggregated Ethernet interface (*aex*), that is, the defined bundle, to be labeled “up”:

```
[edit interfaces]
user@host# set aex aggregated-ether-options minimum-links number
```

4. Specify the link speed for the aggregated Ethernet bundle:

```
[edit interfaces]
user@host# set aex aggregated-ether-options link-speed link-speed
```

5. Specify the members to be included within the aggregated Ethernet bundle:

```
[edit interfaces]
user@host# set interface-name ether-options 802.3ad aex
user@host# set interface-name ether-options 802.3ad aex
```

6. Specify an interface family for the aggregated Ethernet bundle:

```
[edit interfaces]
user@host# set aex unit 0 family inet address ip-address
```

For aggregated Ethernet interfaces on the device, you can configure the Link Aggregation Control Protocol (LACP). LACP bundles several physical interfaces to form one logical interface. You can configure aggregated Ethernet with or without LACP enabled.

When LACP is enabled, the local and remote sides of the aggregated Ethernet links exchange protocol data units (PDUs), containing information about the state of the link. You can configure Ethernet links to actively transmit PDUs, or you can configure the links to passively transmit them, sending out LACP PDUs only when they receive them from another link. One side of the link must be configured as active for the link to be up.

To configure LACP:

1. Enable one side of the aggregated Ethernet link as active:

```
[edit interfaces]
user@host# set aex aggregated-ether-options lacp active
```

2. Specify the interval at which the interfaces send LACP packets:

```
[edit interfaces]
user@host# set aex aggregated-ether-options lacp periodic interval
```

---

### Enhanced Layer 2 CLI Configuration Statement and Command Changes

The enhanced Layer 2 Command Line Interface (CLI) feature is introduced in Junos OS Release 12.3R2. The enhanced Layer 2 CLI feature changes the CLI for some Layer 2 features on EX Series switches. This enhanced CLI will be used to configure Layer 2 features on future EX Series hardware platforms, and also to configure Layer 2 features on other Juniper Networks products.

**NOTE:** When configuring xSTP on EX4300 and EX4600 switches, you must add all the interfaces in the applied VLANs in configurations. For MSTP, configure all interfaces in all VLANs at the [edit protocols mstp interface] hierarchy level.

The following tables provide a list of existing commands that were moved to new hierarchies or changed on EX Series switches as part of this CLI enhancement effort. The table is provided as a high-level reference only. For detailed information about these commands, use the links to the configuration statements provided in the table or see the technical documentation.

**Table 4: Enhanced Layer 2 CLI Changes**

Original Hierarchy	Changed Hierarchy	Change Description
<pre> ethernet-switching-options {   analyzer {     name {       ...     }   } } </pre>	<pre> forwarding-options {   analyzer {     name {       ...     }   } } </pre>	Statements moved to different hierarchy.
<pre> ethernet-switching-options {   authentication-whitelist {     ...   } } </pre>	<pre> switch-options {   ...   authentication-whitelist {     ...   } } </pre>	Hierarchy renamed.
<pre> ethernet-switching-options {   bpd-block {     ...   } } </pre>	<pre> protocols {   layer2-control {     bpd-block {       ...     }   } } </pre>	Statement moved to different hierarchy.
<pre> ethernet-switching-options {   dot1q-tunneling {     ether-type (0x8100   0x88a8   0x9100);     ...   } } </pre>	<pre> interfaces interface-name {   ether-options {     ethernet-switch-profile {       tag-protocol-id [tpids];     }   } }  interfaces interface-name {   aggregated-ether-options {     ethernet-switch-profile {       tag-protocol-id [tpids];     }   } } </pre>	Statement replaced with new statement and moved to different hierarchy.

Table 4: Enhanced Layer 2 CLI Changes (*continued*)

Original Hierarchy	Changed Hierarchy	Change Description
<pre> ethernet-switching-options {   interfaces <i>interface-name</i> {     no-mac-learning;     ...   } } </pre>	<pre> switch-options {   interfaces <i>interface-name</i> {     no-mac-learning;     ...   } } </pre>	Hierarchy renamed.
<pre> ethernet-switching-options {   mac-notification {     notification-interval <i>seconds</i>;     ...   } } </pre>	—	Statements deleted.
<pre> ethernet-switching-options {   mac-table-aging-time <i>seconds</i>;   ... } </pre>	<pre> protocols {   l2-learning {     global-mac-table-aging-time <i>seconds</i>;     ...   } } </pre>	Statement replaced with new statement and moved to different hierarchy.
<pre> ethernet-switching-options {   nonstop-bridging; } </pre>	<pre> protocols {   layer2-control {     nonstop-bridging {     }   } } </pre>	Statement moved to different hierarchy.
<pre> ethernet-switching-options {   port-error-disable {     disable-timeout <i>timeout</i>;     ...   } } </pre>	<pre> interfaces <i>interface-name</i> family   ethernet-switching {     recovery-timeout <i>seconds</i>;   } } </pre>	Statement replaced with a new statement.
<pre> ethernet-switching-options {   redundant-trunk-group {     group <i>name</i> {       description;       interface <i>interface-name</i> {         primary;       }       preempt-cutover-timer <i>seconds</i>;       ...     }   } } </pre>	<pre> switch-options {   redundant-trunk-group {     group <i>name</i> {       description;       interface <i>interface-name</i> {         primary;       }       preempt-cutover-timer <i>seconds</i>;       ...     }   } } </pre>	Hierarchy renamed.

Table 4: Enhanced Layer 2 CLI Changes (*continued*)

Original Hierarchy	Changed Hierarchy	Change Description
<pre> ethernet-switching-options {   secure-access-port {     interface (all   <i>interface-name</i>) {       (dhcp-trusted   no-dhcp-trusted );       static-ip <i>ip-address</i> {         mac <i>mac-address</i>;         vlan <i>vlan-name</i>;       }     }   }   vlan (all   <i>vlan-name</i>) {     (arp-inspection   no-arp-inspection );     dhcp-option82 {       disable;       circuit-id {         prefix <i>hostname</i>;         use-interface-description;         use-vlan-id;       }       remote-id {         prefix (<i>hostname</i>   mac   none);         use-interface-description;         use-string <i>string</i>;       }       vendor-id [<i>string</i>];     }     (examine-dhcp   no-examine-dhcp);   }   (ip-source-guard   no-ip-source-guard); } </pre>	<pre> vlans <i>vlan-name</i> forwarding-options{   dhcp-security {     arp-inspection;     group <i>group-name</i> {       interface <i>interface-name</i> {         static-ip <i>ip-address</i> {           mac <i>mac-address</i>;         }       }     }     overrides {       no-option-82;       trusted;     }   }   ip-source-guard;   no-dhcp-snooping;   option-82 {     circuit-id {       prefix {         host-name;         routing-instance-name;       }       use-interface-description (device           logical);       use-vlan-id;     }     remote-id {       host-name;       use-interface-description (device           logical);       use-string <i>string</i>;     }     vendor-id {       use-string <i>string</i>;     }   } } </pre>	<p>Statements moved to different hierarchy.</p> <p><b>NOTE:</b> The statement <b>examine-dhcp</b> does not exist in the changed hierarchy. Instead, DHCP snooping is enabled automatically when other DHCP security features are enabled on a VLAN. See “<a href="#">Configuring Port Security (CLI Procedure)</a>” on page 4539 for additional information.</p>
<pre> ethernet-switching-options {   secure-access-port {     dhcp-snooping-file {       location <i>local_pathname</i>   <i>remote_URL</i>;       timeout <i>seconds</i>;       write-interval <i>seconds</i>;     }   } } </pre>	<pre> system [   processes [     dhcp-service     dhcp-snooping-file <i>local_pathname</i>         <i>remote_URL</i>;     write-interval <i>interval</i>;   ] } </pre>	<p>Statement moved to different hierarchy.</p>
<pre> ethernet-switching-options {   secure-access-port vlan (all   <i>vlan-name</i>) {     mac-move-limit   } } </pre>	<pre> vlans <i>vlan-name</i> switch-options {   mac-move-limit } </pre>	<p>Statement moved to different hierarchy.</p>

Table 4: Enhanced Layer 2 CLI Changes (*continued*)

Original Hierarchy	Changed Hierarchy	Change Description
<pre> ethernet-switching-options {   static {     vlan <i>vlan-id</i> {       mac <i>mac-address</i> next-hop         <i>interface-name</i>;       ...     }   } } </pre>	<pre> vlangs {   <i>vlan-name</i> {     switch-options {       interface <i>interface-name</i> {         static-mac <i>mac-address</i>;         ...       }     }   } } </pre>	Statement replaced with new statement and moved to different hierarchy.
<pre> ethernet-switching-options {   storm-control {     (...)   } } </pre>	<pre> forwarding-options {   storm-control-profiles <i>profile-name</i> {     (...)   } }  interfaces <i>interface-name</i> unit <i>number</i> family <i>family</i>   ethernet-switching {     storm-control <i>storm-control-profile</i>;   } </pre>	Storm control configuration is done in two steps. The first step is to create a storm control profile at the [edit forwarding-options] hierarchy, and the second step is to bind the profile to a logical interface at the [edit interfaces] hierarchy. See <a href="#">“Example: Configuring Storm Control to Prevent Network Outages on EX Series Switches”</a> on page 2201 for additional information.
<pre> ethernet-switching-options {   traceoptions {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;no-stamp&gt;       &lt;replace&gt; &lt;size <i>size</i>&gt; &lt;world-readable           no-world-readable&gt;;     flag <i>flag</i> &lt;disable&gt;;     ...   } } </pre>	—	Statements removed.
<pre> ethernet-switching-options {   unknown-unicast-forwarding {     (...)   } } </pre>	<pre> switch-options on page 2212 {   unknown-unicast-forwarding {     (...)   } } </pre>	Hierarchy renamed.

Table 4: Enhanced Layer 2 CLI Changes (*continued*)

Original Hierarchy	Changed Hierarchy	Change Description
<pre> ethernet-switching-options {   voip {     interface (all   [<i>interface-name</i>         access-ports]) {       forwarding-class (assured-forwarding           best-effort   expedited-forwarding           network-control);       vlan <i>vlan-name</i>;       ...     }   } } </pre>	<pre> switch-options {   voip {     interface (all   [<i>interface-name</i>         access-ports]) {       forwarding-class (assured-forwarding           best-effort   expedited-forwarding           network-control);       vlan <i>vlan-name</i>;       ...     }   } } </pre>	Hierarchy renamed.
<pre> interfaces <i>interface-name</i> {   ether-options {     link-mode <i>mode</i>;     speed (auto-negotiation   <i>speed</i>)   } } </pre>	<pre> interfaces <i>interface-name</i> {   link-mode <i>mode</i>;   speed <i>speed</i>) } </pre>	Statements moved to different hierarchy.
<pre> interfaces <i>interface-name</i> {   unit <i>logical-unit-number</i> {     family ethernet-switching {       native-vlan-id <i>vlan-id</i>     }   } } </pre>	<pre> interfaces <i>interface-name</i> {   native-vlan-id <i>vlan-id</i> } </pre>	Statement moved to different hierarchy.
<pre> interfaces <i>interface-name</i> {   unit <i>logical-unit-number</i> {     family ethernet-switching {       port-mode <i>mode</i>     }   } } </pre>	<pre> interfaces <i>interface-name</i> {   unit <i>logical-unit-number</i> {     family ethernet-switching {       interface-mode <i>mode</i>     }   } } </pre>	Statement replaced with a new statement.
<pre> interfaces vlan </pre>	<pre> interfaces irb </pre>	Statement replaced with a new statement.

Table 4: Enhanced Layer 2 CLI Changes (*continued*)

Original Hierarchy	Changed Hierarchy	Change Description
<pre> protocols {   igmp-snooping {     traceoptions {       file filename &lt;files number&gt;       &lt;no-stamp&gt; &lt;replace&gt;       &lt;size maximum-file-size&gt;       &lt;world-readable         no-world-readable&gt;;       flag flag &lt;flag-modifier&gt; &lt;disable&gt;;     }     vlan (all   vlan-identifier) {       disable;       data-forwarding {         receiver {           install;           source-vlans vlan-name;         }         source {           groups ip-address;         }       }       immediate-leave;       interface (all   interface-name) {         multicast-router-interface;         static {           group multicast-ip-address;         }       }       proxy {         source-address ip-address;       }       robust-count number;     }   } } </pre>	<pre> protocols {   igmp-snooping {     vlan vlan-name {       immediate-leave;       interface interface-name {         group-limit &lt;1..65535&gt;         host-only-interface         multicast-router-interface;         immediate-leave;         static {           group multicast-ip-address {             source &lt;&gt;           }         }       }     }     l2-querier {       source-address ip-address;     }     proxy {       source-address ip-address;     }     query-interval number;     query-last-member-interval number;     query-response-interval number;     robust-count number;     traceoptions {       file filename &lt;files number&gt;       &lt;no-stamp&gt; &lt;replace&gt;       &lt;size maximum-file-size&gt;       &lt;world-readable         no-world-readable&gt;;       flag flag &lt;flag-modifier&gt;;     }   } } </pre>	IGMP snooping is configured on a VLAN.
<pre> vlans {   vlan-name {     dot1q-tunneling {       customer-vlans (id   native   range);       layer2-protocol-tunneling all         protocol-name {         drop-threshold number;         shutdown-threshold number;         ...       }     }   } } </pre>	<pre> interface interface-name {   encapsulation extended-vlan-bridge;   flexible-vlan-tagging;   native-vlan-id number;   unit logical-unit-number {     input-vlan-map action;     output-vlan-map action;     vlan-id number;     vlan-id-list [vlan-id vlan-id-vlan-id];   } } </pre>	Statements replaced with new statements and moved to different hierarchy

Table 4: Enhanced Layer 2 CLI Changes (*continued*)

Original Hierarchy	Changed Hierarchy	Change Description
<pre> vlangs {   vlan-name {     filter{       input filter-name       output filter-name;       ...     }   } } </pre>	<pre> vlangs {   vlan-name {     forwarding-options {       filter{         input filter-name         output filter-name;         ...       }     }   } } </pre>	Statements moved to different hierarchy.
<pre> vlangs {   vlan-name {     interface interface-name {       egress;       ingress;       mapping (native (push   swap)   policy           tag (push   swap));       pvlan-trunk;       ...     }   } } </pre>	—	Statements removed. You can assign interfaces to a VLAN using the [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family ethernet-switching vlan members <i>vlan-name</i> ] hierarchy.
<pre> vlangs {   vlan-name {     isolation-id id-number;     ...   } } </pre>	—	Statement removed.
<pre> vlangs {   vlan-name {     l3-interface vlan.logical-interface-number;     ...   } } </pre>	<pre> vlangs {   vlan-name {     l3-interface irb.logical-interface-number;     ...   } } </pre>	Syntax changed.
<pre> vlangs {   vlan-name {     l3-interface-ingress-counting       layer-3-interface-name;     ...   } } </pre>	—	Statement removed. Ingress traffic is automatically tracked.

Table 4: Enhanced Layer 2 CLI Changes (*continued*)

Original Hierarchy	Changed Hierarchy	Change Description
<pre>vlan {   vlan-name {     mac-limit limit action action;     ...   } }</pre>	<pre>vlan {   vlan-name {     switch-options {       interface-mac-limit limit {         packet-action action;         ...       }     }   } }  vlan {   vlan-name {     switch-options {       interface interface-name {         interface-mac-limit limit {           packet-action action;           ...         }       }     }   } }</pre>	Statements moved to different hierarchies and renamed.
<pre>vlan {   vlan-name {     mac-table-aging-time seconds;     ...   } }</pre>	<pre>protocols {   l2-learning {     global-mac-table-aging-time seconds;     ...   } }</pre>	Statement moved to different hierarchy and renamed.
<pre>vlan {   vlan-name {     no-local-switching;     ...   } }</pre>	—	Statement removed.
<pre>vlan {   vlan-name {     no-mac-learning;     ...   } }</pre>	<pre>vlan {   vlan-name {     switch-options {       no-mac-learning limit       ...     }   } }</pre>	Statement moved to different hierarchy.
<pre>vlan {   vlan-name {     primary-vlan vlan-name;     ...   } }</pre>	—	Statement removed.

Table 4: Enhanced Layer 2 CLI Changes (*continued*)

Original Hierarchy	Changed Hierarchy	Change Description
<pre> vlangs {   vlan-name {     vlan-prune;     ...   } } </pre>	—	Statement removed.
<pre> vlangs {   vlan-name {     vlan-range vlan-id-low-vlan-id-high;     ...   } } </pre>	<pre> vlangs {   vlan-name {     vlan-id-list [vlan-id-numbers];     ...   } } </pre>	Statement replaced with new statement.

### Enhanced Layer 2 CLI Configuration Statement and Command Changes

The enhanced Layer 2 Command Line Interface (CLI) feature is introduced in Junos OS Release 12.3R2. The enhanced Layer 2 CLI feature changes the CLI for some Layer 2 features on EX Series switches. This enhanced CLI will be used to configure Layer 2 features on future EX Series hardware platforms, and also to configure Layer 2 features on other Juniper Networks products.

The following tables provide a list of existing commands that were moved to new hierarchies or changed on EX Series switches as part of this CLI enhancement effort. The table is provided as a high-level reference only. For detailed information about these commands, use the links to the configuration statements provided in the table or see the technical documentation.

Table 5: Enhanced Layer 2 CLI Changes

Original Hierarchy	Changed Hierarchy	Change Description
<pre> ethernet-switching-options {   analyzer {     name {       ...     }   } } </pre>	<pre> forwarding-options {   analyzer {     name {       ...     }   } } </pre>	Statements moved to different hierarchy.
<pre> ethernet-switching-options {   authentication-whitelist {     ...   } } </pre>	<pre> switch-options {   ...   authentication-whitelist {     ...   } } </pre>	Hierarchy renamed.

Table 5: Enhanced Layer 2 CLI Changes (*continued*)

Original Hierarchy	Changed Hierarchy	Change Description
<pre> ethernet-switching-options {   bpdu-block {     ...   } } </pre>	<pre> protocols {   layer2-control {     bpdu-block {       ...     }   } } </pre>	Statement moved to different hierarchy.
<pre> ethernet-switching-options {   dot1q-tunneling {     ether-type (0x8100   0x88a8   0x9100);     ...   } } </pre>	<pre> interfaces interface-name {   ether-options {     ethernet-switch-profile {       tag-protocol-id [tpids];     }   } }  interfaces interface-name {   aggregated-ether-options {     ethernet-switch-profile {       tag-protocol-id [tpids];     }   } } </pre>	Statement replaced with new statement and moved to different hierarchy.
<pre> ethernet-switching-options {   interfaces interface-name {     no-mac-learning;     ...   } } </pre>	<pre> switch-options {   interfaces interface-name {     no-mac-learning;     ...   } } </pre>	Hierarchy renamed.
<pre> ethernet-switching-options {   mac-notification {     notification-interval seconds;     ...   } } </pre>	—	Statements deleted.
<pre> ethernet-switching-options {   mac-table-aging-time seconds;   ... } </pre>	<pre> protocols {   l2-learning {     global-mac-table-aging-time seconds;     ...   } } </pre>	Statement replaced with new statement and moved to different hierarchy.
<pre> ethernet-switching-options {   nonstop-bridging; } </pre>	<pre> protocols {   layer2-control {     nonstop-bridging {     }   } } </pre>	Statement moved to different hierarchy.

Table 5: Enhanced Layer 2 CLI Changes (*continued*)

Original Hierarchy	Changed Hierarchy	Change Description
<pre> ethernet-switching-options {   port-error-disable {     disable-timeout <i>timeout</i>;     ...   } } </pre>	<pre> interfaces <i>interface-name</i> family   ethernet-switching {     <i>recovery-timeout</i> <i>seconds</i>;   } </pre>	Statement replaced with a new statement.
<pre> ethernet-switching-options {   <i>redundant-trunk-group</i> {     group <i>name</i> {       description;       interface <i>interface-name</i> {         primary;       }       preempt-cutover-timer <i>seconds</i>;       ...     }   } } </pre>	<pre> switch-options {   <i>redundant-trunk-group</i> {     group <i>name</i> {       description;       interface <i>interface-name</i> {         primary;       }       preempt-cutover-timer <i>seconds</i>;       ...     }   } } </pre>	Hierarchy renamed.

Table 5: Enhanced Layer 2 CLI Changes (*continued*)

Original Hierarchy	Changed Hierarchy	Change Description
<pre> ethernet-switching-options {   secure-access-port {     interface (all   interface-name) {       (dhcp-trusted   no-dhcp-trusted );       static-ip ip-address {         mac mac-address;         vlan vlan-name;       }     }   }   vlan (all   vlan-name) {     (arp-inspection   no-arp-inspection );     dhcp-option82 {       disable;       circuit-id {         prefix hostname;         use-interface-description;         use-vlan-id;       }       remote-id {         prefix (hostname   mac   none);         use-interface-description;         use-string string;       }       vendor-id [string];     }     (examine-dhcp   no-examine-dhcp);   }   (ip-source-guard   no-ip-source-guard); } </pre>	<pre> vlans vlan-name forwarding-options{   dhcp-security {     arp-inspection;     group group-name {       interface interface-name {         static-ip ip-address {           mac mac-address;         }       }     }     overrides {       no-option-82;       trusted;     }   }   ip-source-guard;   no-dhcp-snooping;   option-82 {     circuit-id {       prefix {         host-name;         routing-instance-name;       }       use-interface-description (device           logical);       use-vlan-id;     }     remote-id {       host-name;       use-interface-description (device           logical);       use-string string;     }     vendor-id {       use-string string;     }   } } </pre>	<p>Statements moved to different hierarchy.</p> <p><b>NOTE:</b> The statement <b>examine-dhcp</b> does not exist in the changed hierarchy. Instead, DHCP snooping is enabled automatically when other DHCP security features are enabled on a VLAN. See “<a href="#">Configuring Port Security (CLI Procedure)</a>” on page 4539 for additional information.</p>
<pre> ethernet-switching-options {   secure-access-port {     dhcp-snooping-file {       location local_pathname   remote_URL;       timeout seconds;       write-interval seconds;     }   } } </pre>	<pre> system [   processes [     dhcp-service     dhcp-snooping-file local_pathname         remote_URL;     write-interval interval;   ] ] </pre>	<p>Statement moved to different hierarchy.</p>

## Software Overview

---

- [Understanding Software Infrastructure and Processes on page 29](#)

### Understanding Software Infrastructure and Processes

Each switch runs the Juniper Networks Junos operating system (Junos OS) for Juniper Networks EX Series Ethernet Switches on its general-purpose processors. Junos OS includes processes for Internet Protocol (IP) routing and for managing interfaces, networks, and the chassis.

The Junos OS runs on the Routing Engine. The Routing Engine kernel coordinates communication among the Junos OS processes and provides a link to the Packet Forwarding Engine.

With the J-Web interface and the command-line interface (CLI) to the Junos OS, you configure switching features and routing protocols and set the properties of network interfaces on your switch. After activating a software configuration, use either the J-Web or CLI user interface to monitor the switch, manage operations, and diagnose protocol and network connectivity problems.

- [Routing Engine and Packet Forwarding Engine on page 29](#)
- [Junos OS Processes on page 30](#)

### Routing Engine and Packet Forwarding Engine

---

A switch has two primary software processing components:

- **Packet Forwarding Engine**—Processes packets; applies filters, routing policies, and other features; and forwards packets to the next hop along the route to their final destination.
- **Routing Engine**—Provides three main functions:
  - Creates the packet forwarding switch fabric for the switch, providing route lookup, filtering, and switching on incoming data packets, then directing outbound packets to the appropriate interface for transmission to the network

- Maintains the routing tables used by the switch and controls the routing protocols that run on the switch.
- Provides control and monitoring functions for the switch, including controlling power and monitoring system status.

### Junos OS Processes

The Junos OS running on the Routing Engine and Packet Forwarding Engine consists of multiple processes that are responsible for individual functions.

The separation of functions provides operational stability, because each process accesses its own protected memory space. In addition, because each process is a separate software package, you can selectively upgrade all or part of the Junos OS, for added flexibility.

Table 6 on page 30 describes the primary Junos OS processes.

**Table 6: Junos OS Processes**

Process	Name	Description
Chassis process	chassisd	<p>Detects hardware on the system that is used to configure network interfaces.</p> <p>Monitors the physical status of hardware components and field-replaceable units (FRUs), detecting when environment sensors such as temperature sensors are triggered.</p> <p>Relays signals and interrupts—for example, when devices are taken offline, so that the system can close sessions and shut down gracefully.</p>
Ethernet switching process	eswd	<p>Handles Layer 2 switching functionality such as MAC address learning, Spanning Tree protocol and access port security. The process is also responsible for managing Ethernet switching interfaces, VLANs, and VLAN interfaces.</p> <p>Manages Ethernet switching interfaces, VLANs, and VLAN interfaces.</p>
Forwarding process	pfem	<p>Defines how routing protocols operate on the switch. The overall performance of the switch is largely determined by the effectiveness of the forwarding process.</p>
Interface process	dcd	<p>Configures and monitors network interfaces by defining physical characteristics such as link encapsulation, hold times, and keepalive timers.</p>
Management process	mgd	<p>Provides communication between the other processes and an interface to the configuration database.</p> <p>Populates the configuration database with configuration information and retrieves the information when queried by other processes to ensure that the system operates as configured.</p> <p>Interacts with the other processes when commands are issued through one of the user interfaces on the switch.</p> <p>If a process terminates or fails to start when called, the management process attempts to restart it a limited number of times to prevent thrashing and logs any failure information for further investigation.</p>
Routing protocol process	rpd	<p>Defines how routing protocols such as RIP, OSPF, and BGP operate on the device, including selecting routes and maintaining forwarding tables.</p>

## CHAPTER 3

# Configuration

- [Initial Configuration on page 33](#)
- [Configuration Statements on page 37](#)

### Initial Configuration

---

- [Configuring the LCD Panel on EX Series Switches \(CLI Procedure\) on page 33](#)
- [Configuring Date and Time for the EX Series Switch \(J-Web Procedure\) on page 35](#)
- [Configuring System Identity for an EX Series Switch \(J-Web Procedure\) on page 36](#)

### Configuring the LCD Panel on EX Series Switches (CLI Procedure)

This topic applies to hardware devices in the EX Series product family, which includes switches and the XRE200 External Routing Engine, that support the LCD panel interface.

The LCD panel on the front panel of EX Series switches displays a variety of information about the switch in the Status menu and provides the Maintenance menu to allow you to perform basic operations such as initial setup and reboot. You can disable these menus or individual menu options if you do not want switch users to use them. You can also set a custom message that will be displayed on the panel.

This topic describes:

- [Disabling or Enabling Menus and Menu Options on the LCD Panel on page 33](#)
- [Configuring a Custom Display Message on page 34](#)

#### Disabling or Enabling Menus and Menu Options on the LCD Panel

---

By default, the Maintenance menu, the Status menu, and the options in those menus in the LCD panel are enabled. Users can configure and troubleshoot the switch using the Maintenance menu and view certain details about the switch using the Status menu.

If you do not want users to be able to use those menus or use some of the menu options, you can disable the menus or individual menu options. You can re-enable the menus or menu options.

Issue the `show chassis lcd` operational mode command to see which menus and menu options are currently enabled.

**NOTE:** On some platforms you must specify an FPC slot number in these commands. See the [lcd-menu](#) statement for details.

To disable a menu:

```
[edit]
user@switch# set chassis lcd-menu menu-item menu-name disable
```

To enable a menu:

```
[edit]
user@switch# delete chassis lcd-menu menu-item menu-name disable
```

To disable a menu option:

```
[edit]
user@switch# set chassis lcd-menu menu-item menu-option disable
```

To enable a menu option:

```
[edit]
user@switch# delete chassis lcd-menu menu-item menu-option disable
```

### Configuring a Custom Display Message

---

You can configure the second line of the LCD to display a custom message temporarily for 5 minutes or permanently.

To display a custom message temporarily:

- On an EX3200 switch, a standalone EX3300 switch, a standalone EX4200 switch, a standalone EX4500 switch, an EX8200 switch, or an XRE200 External Routing Engine:

```
user@switch> set chassis display message message
```

- On an EX3300, EX4200, or EX4500 switch in a Virtual Chassis configuration:

```
user@switch> set chassis display message message fpc-slot slot-number
```

To display a custom message permanently:

- On an EX3200 switch, a standalone EX3300 switch, a standalone EX4200 switch, a standalone EX4500 switch, an EX8200 switch, or an XRE200 External Routing Engine:

```
user@switch> set chassis display message message permanent
```

- On an EX3300, EX4200, or EX4500 switch in a Virtual Chassis configuration:

```
user@switch> set chassis display message message fpc-slot slot-number permanent
```

**NOTE:** The buttons on the LCD panel are disabled when the LCD is configured to display a custom message.

To disable the display of the custom message:

```
user@switch> clear chassis display message
```

You can view the custom message by issuing the command [show chassis lcd](#).

Configuring Date and Time for the EX Series Switch (J-Web Procedure)

**NOTE:** This topic applies only to the J-Web Application package.

To configure date and time on an EX Series switch:

1. Select **Configure > System Properties > Date & Time**.
2. To modify the information, click **Edit**. Enter information into the Edit Date & Time page as described in [Table 7 on page 35](#).
3. Click one of the following options:
  - To apply the configuration, click **OK**.
  - To cancel your entries and return to the System Properties page, click **Cancel**.

**NOTE:** After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See [Using the Commit Options to Commit Configuration Changes](#) for details about all commit options.

Table 7: Date and Time Settings

Time	Function	Your Action
Time Zone	Identifies the timezone that the switching platform is located in.	Select the appropriate time zone from the list.

Table 7: Date and Time Settings (*continued*)

Time	Function	Your Action
Set Time	Synchronizes the system time with that of the NTP server. You can also manually set the system time and date.	<p>To immediately set the time, Click one of the following options:</p> <ul style="list-style-type: none"> <li>• <b>Synchronize with PC time</b>—The switch synchronizes the time with that of the PC.</li> <li>• <b>NTP Servers</b>—The switch sends a request to the NTP server and synchronizes the system time.</li> <li>• <b>Manual</b>—A pop-up window allows you to select the current date and time from a list.</li> </ul>

## Configuring System Identity for an EX Series Switch (J-Web Procedure)

**NOTE:** This topic applies only to the J-Web Application package.

To configure identification details for an EX Series switch:

1. Select **Configure > System Properties > System Identity**. The System Identity page displays configuration details.
2. To modify the configuration, click **Edit**. Enter information into the System Identity page as described in [Table 8 on page 36](#).

**NOTE:** After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See [Using the Commit Options to Commit Configuration Changes](#) for details about all commit options.

Table 8: System Identity Configuration Summary

Field	Function	Your Action
Host Name	Defines the hostname of the switching platform.	Type the hostname.
Domain Name	Defines the network or subnetwork that the machine belongs to.	Type the domain name.

Table 8: System Identity Configuration Summary (*continued*)

Field	Function	Your Action
Root Password	Sets the root password that user <i>root</i> can use to log in to the switching platform.	Type a plain-text password. The system encrypts the password.  <b>NOTE:</b> After a root password has been defined, it is required when you log in to the J-Web user interface or the CLI.
Confirm Root Password	Verifies that the root password has been typed correctly.	Retype the password.
DNS Name Servers	Specifies a DNS server for the switching platform to use to resolve hostnames into addresses.	To add an IP address, click <b>Add</b> .  To edit an IP address, click <b>Edit</b> .  To delete an IP address, click <b>Delete</b> .
Domain Search	Specifies the domains to be searched.	To add a domain, click <b>Add</b> .  To edit a domain click <b>Edit</b> .  To delete a domain, click <b>Delete</b> .

## arp (System)

<b>Syntax</b>	<pre>arp {     aging-timer <i>minutes</i>;     gratuitous-arp-delay <i>seconds</i>;     gratuitous-arp-on-ifup;     interfaces {         <i>interface-name</i> {             aging-timer <i>minutes</i>;         }     }     passive-learning;     purging; }</pre> <p>For EX-Series switches:</p> <pre>arp {     aging-timer <i>minutes</i>; }</pre>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	<p>Specify ARP options. You can enable backup VRRP routers to learn ARP requests for VRRP-IP to VRRP-MAC address translation. You can also set the time interval between ARP updates.</p> <p>For EX-Series switches, set only the time interval between ARP updates.</p>
<b>Options</b>	<p><b>aging-timer</b>—Time interval in minutes between ARP updates. In environments where the number of ARP entries to update is high (for example, on routers only, metro Ethernet environments), increasing the time between updates can improve system performance.</p> <p><b>passive-learning</b> (QFX-Series only)—Configure switches to learn the ARP mappings (IP-to-MAC address) for hosts sending the requests.</p> <p><b>Default:</b> 20 minutes</p> <p><b>Range:</b> 1 to 240 minutes</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring Junos OS ARP Learning and Aging Options for Mapping IPv4 Network Addresses to MAC Addresses</i></li> <li>• <i>Junos OS Network Interfaces Library for Routing Devices</i></li> </ul>

- For more information about ARP updates, see the [Junos OS System Basics Configuration Guide](#).

## authentication-key

---

<b>Syntax</b>	<code>authentication-key <i>key-number</i> type <i>type</i> value <i>password</i>;</code>
<b>Hierarchy Level</b>	[edit system <a href="#">ntp</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	<p>Configure Network Time Protocol (NTP) authentication keys so that the router or switch can send authenticated packets. If you configure the router or switch to operate in authenticated mode, you must configure a key.</p> <p>Both the keys and the authentication scheme (MD5) must be identical between a set of peers sharing the same key number.</p>
<b>Options</b>	<p><b><i>key-number</i></b>—Positive integer that identifies the key.</p> <p><b><i>type type</i></b>—Authentication type. It can only be <b>md5</b>.</p> <p><b><i>value password</i></b>—The key itself, which can be from 1 through 8 ASCII characters. If the key contains spaces, enclose it in quotation marks.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring NTP Authentication Keys</a></li><li>• <a href="#">broadcast on page 43</a></li><li>• <a href="#">peer on page 69</a></li><li>• <a href="#">server on page 74</a></li><li>• <a href="#">trusted-key on page 78</a></li></ul>

## auxiliary

---

<b>Syntax</b>	<pre> auxiliary {   disable;   insecure;   type <i>terminal-type</i>;   port-type (mini-usb   rj45); } </pre>
<b>Hierarchy Level</b>	[edit system <b>ports</b> ]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
<b>Description</b>	<p>Configure the characteristics of the auxiliary port.</p> <p>Remaining statement is explained separately.</p>
<b>Default</b>	<b>disable</b> is the default option.
<b>Options</b>	<p><b>disable</b>—Disable the port.</p> <p><b>insecure</b>—Disable super user access or root logins to establish terminal connection.</p> <p><b>type <i>terminal-type</i></b>—Type of terminal that is connected to the port.</p> <p><b>Range:</b> <b>ansi</b>, <b>vt100</b>, <b>small-xterm</b>, <b>xterm</b></p> <p><b>Default:</b> The terminal type is unknown, and the user is prompted for the terminal type. The remaining statement is explained separately.</p>
<b>Required Privilege Level</b>	<p><b>system</b>—To view this statement in the configuration.</p> <p><b>system-control</b>—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Configuring Junos OS to Set Console and Auxiliary Port Properties</i></li> </ul>

## boot-server (NTP)

---

<b>Syntax</b>	<code>boot-server (address   hostname);</code>
<b>Hierarchy Level</b>	[edit system <a href="#">ntp</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	<p>Configure the server that NTP queries when the router or switch boots to determine the local date and time.</p> <p>When you boot the router or switch, it issues an <b>ntpdate</b> request, which polls a network server to determine the local date and time. You need to configure a server that the router or switch uses to determine the time when the router or switch boots. You can either configure an IP address or a hostname for the boot server. If you configure a hostname instead of an IP address, the <b>ntpdate</b> request resolves the hostname to an IP address when the router or switch boots up.</p> <p>If you configure an NTP boot server, then when the router or switch boots, it immediately synchronizes with the boot server even if the NTP process is explicitly disabled or if the time difference between the client and the boot server exceeds the threshold value of 1000 seconds.</p>
<b>Options</b>	<ul style="list-style-type: none"><li>• <b>address</b>—The IP address of an NTP boot server.</li><li>• <b>hostname</b>—The hostname of an NTP boot server.</li></ul>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Synchronizing and Coordinating Time Distribution Using NTP</i></li></ul>

## broadcast

<b>Syntax</b>	<code>broadcast address &lt;key key-number&gt; &lt;routing-instance-name routing-instance-name&gt; &lt;ttl value&gt; &lt;version value&gt;;</code>
<b>Hierarchy Level</b>	[edit system <a href="#">ntp</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. <b>routing-instance-name</b> option added in Junos OS Release 14.1
<b>Description</b>	Configure the local router or switch to operate in broadcast mode with the remote system at the specified <b>address</b> . In this mode, the local router or switch sends periodic broadcast messages to a client population at the specified broadcast or multicast <b>address</b> . Normally, you include this statement only when the local router or switch is operating as a transmitter.
<b>Options</b>	<p><b>address</b>—The broadcast address on one of the local networks or a multicast address assigned to NTP. You must specify an address, not a hostname. If the multicast address is used, it must be <b>224.0.1.1</b>.</p> <p><b>key key-number</b>—(Optional) All packets sent to the address include authentication fields that are encrypted using the specified key number. <b>Range:</b> Any unsigned 32-bit integer</p> <p><b>routing-instance-name routing-instance-name</b>—(Optional) The routing instance name in which the interface has address in the broadcast subnet. <b>Default:</b> The default routing instance is used to broadcast packets.</p> <p><b>ttl value</b>—(Optional) Time-to-live (TTL) value to use. <b>Range:</b> 1 through 255 <b>Default:</b> 1</p> <p><b>version value</b>—(Optional) Specify the version number to be used in outgoing NTP packets. <b>Range:</b> 1 through 4 <b>Default:</b> 4</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Configuring the NTP Time Server and Time Services</i></li> </ul>

## **broadcast-client**

---

<b>Syntax</b>	<code>broadcast-client;</code>
<b>Hierarchy Level</b>	<code>[edit system <a href="#">ntp</a>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure the local router or switch to listen for broadcast messages on the local network to discover other servers on the same subnet.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Router or Switch to Listen for Broadcast Messages Using NTP</i></li></ul>

## console (System Ports)

<b>Syntax</b>	<pre>console {   disable;   insecure;   log-out-on-disconnect;   type <i>terminal-type</i>; }</pre>
<b>Hierarchy Level</b>	[edit system <a href="#">ports</a> ]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p><b>disable</b> option added in Junos OS Release 7.6.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
<b>Description</b>	Configure the characteristics of the console port.
<b>Default</b>	The console port is enabled and its speed is 9600 baud.
<b>Options</b>	<p><b>disable</b>—Disable console login connections.</p> <p><b>insecure</b>—Disable root login connections to the console and auxiliary ports. Configuring the console port as insecure also prevents superusers and anyone with a user identifier (UID) of 0 from establishing terminal connections in multiuser mode. This option can be used to prevent a user from attempting password recovery by booting into single-user mode, if the user does not know the root password.</p> <p><b>log-out-on-disconnect</b>—Log out the session when the data carrier on the console port is lost.</p>
	<p> <b>NOTE:</b> The <b>log-out-on-disconnect</b> option is not operational on MX80 routers. On MX80 routers you must manually log out from the console with the <b>request system logout u0</b> command.</p>
	<p><b>type <i>terminal-type</i></b>—Type of terminal that is connected to the port.</p> <p><b>Range:</b> <b>ansi, vt100, small-xterm, xterm</b></p> <p><b>Default:</b> The terminal type is unknown, and the user is prompted for the terminal type.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Configuring Junos OS to Set Console and Auxiliary Port Properties</i></li> </ul>

## default-address-selection

---

<b>Syntax</b>	default-address-selection;
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Use the loopback interface, <b>lo0</b> , as the source address for all locally generated IP packets when the packet is sent through a routed interface, and also when the packet is sent through a local interface such as <b>fxp0</b> . The <b>lo0</b> interface is the interface to the router's or switch's Routing Engine.
<b>Default</b>	<p>The default address is used as the source address for all locally generated IP packets on outgoing interfaces that are unnumbered. If an outgoing interface is numbered, the default address is chosen using the following sequence:</p> <ul style="list-style-type: none"><li>• The primary address on the loopback interface <b>lo0</b> that is <i>not</i> <b>127.0.0.1</b> is used.</li><li>• The primary address for the primary interface or the preferred address (if configured) for the primary interface is used.</li></ul> <p>By default, the primary address on an interface is selected as the numerically lowest local address configured on the interface.</p> <p>An interface's <i>primary address</i> is used by default as the local address for broadcast and multicast packets sourced locally and sent out through the interface. An interface's <i>preferred address</i> is the default local address used for packets sourced by the local router or switch to destinations on the subnet. By default, the numerically lowest local address configured for the interface is chosen as the preferred address on the subnet.</p> <p>To configure a different primary address or preferred address, include the <b>primary</b> or <b>preferred</b> statement at the <b>[edit interfaces interface-name unit logical-unit-number family family address address]</b> or <b>[edit logical-systems logical-system-name interfaces interface-name unit logical-unit-number family family address address]</b> hierarchy levels.</p> <p>For more information about default, primary, and preferred addresses for an interface, see "Configuring Default, Primary, and Preferred Addresses and Interfaces" in the <i>Junos OS Network Interfaces Library for Routing Devices</i>.</p>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Junos OS to Select a Fixed Source Address for Locally Generated TCP/IP Packets</i></li><li>• <i>Junos OS Network Interfaces Library for Routing Devices</i></li></ul>

## domain-name

---

<b>Syntax</b>	<code>domain-name <i>domain-name</i>;</code>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure the name of the domain in which the router or switch is located. This is the default domain name that is appended to hostnames that are not fully qualified.
<b>Options</b>	<i>domain-name</i> —Name of the domain.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Reaching a Domain Name System Server</i></li> </ul>

## gre-path-mtu-discovery

---

<b>Syntax</b>	<code>(gre-path-mtu-discovery   no-gre-path-mtu-discovery);</code>
<b>Hierarchy Level</b>	[edit system <a href="#">internet-options</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure path MTU discovery for outgoing GRE tunnel connections: <ul style="list-style-type: none"> <li>• <b>gre-path-mtu-discovery</b>—Path MTU discovery is enabled.</li> <li>• <b>no-gre-path-mtu-discovery</b>—Path MTU discovery is disabled.</li> </ul>
<b>Default</b>	Path MTU discovery is enabled.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring Junos OS for Path MTU Discovery on Outgoing GRE Tunnel Connections</i></li> </ul>

## host-name

---

<b>Syntax</b>	<code>host-name <i>hostname</i>;</code>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Set the hostname of the router or switch.
<b>Options</b>	<i>hostname</i> —Name of the router or switch.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Understanding Hostnames</i></li><li>• <i>Configuring the Hostname of the Router or Switch</i></li></ul>

## icmpv4-rate-limit

---

<b>Syntax</b>	<code>icmpv4-rate-limit {     bucket-size <i>seconds</i>;     packet-rate <i>pps</i>; }</code>
<b>Hierarchy Level</b>	[edit system <a href="#">internet-options</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure rate-limiting parameters for ICMPv4 messages sent.
<b>Options</b>	<b>bucket-size <i>seconds</i></b> —Number of seconds in the rate-limiting bucket. <b>Range:</b> 0 through 4294967295 seconds <b>Default:</b> 5  <b>packet-rate <i>pps</i></b> —Rate-limiting packets earned per second. <b>Range:</b> 0 through 4294967295 pps <b>Default:</b> 1000
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Junos OS ICMPv4 Rate Limit for ICMPv4 Routing Engine Messages</i></li></ul>

## icmpv6-rate-limit

---

<b>Syntax</b>	icmpv6-rate-limit { bucket-size <i>seconds</i> ; packet-rate <i>packet-rate</i> ; }
<b>Hierarchy Level</b>	[edit system <a href="#">internet-options</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure rate-limiting parameters for ICMPv6 messages sent.
<b>Options</b>	<p><b>bucket-size <i>seconds</i></b>—Number of seconds in the rate-limiting bucket.  <b>Range:</b> 0 through 4294967295 seconds  <b>Default:</b> 5</p> <p><b>packet-rate <i>pps</i></b>—Rate-limiting packets earned per second.  <b>Range:</b> 0 through 4294967295 pps  <b>Default:</b> 1000</p>
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Configuring Junos OS ICMPv6 Rate Limit for ICMPv6 Routing Engine Messages</i></li> </ul>

## inet6-backup-router

---

<b>Syntax</b>	<code>inet6-backup-router <i>address</i> &lt;destination <i>destination-address</i>&gt;;</code>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Set a default router (running IP version 6 [IPv6]) to use while the local router or switch (running IPv6) is booting and if the routing protocol processes fail to start. The Junos OS removes the route to this router or switch as soon as the software starts.
<b>Options</b>	<p><b><i>address</i></b>—Address of the default router.</p> <p><b><i>destination destination-address</i></b>—(Optional) Destination address that is reachable through the backup router. You can include this option to achieve network reachability while loading, configuring, and recovering the router or switch, but without the risk of installing a default route in the forwarding table.</p> <p><b>Default:</b> All hosts (default route) are reachable through the backup router.</p>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring a Backup Router</i></li></ul>

## internet-options

<b>Syntax</b>	<pre> internet-options {   (gre-path-mtu-discovery   no-gre-path-mtu-discovery);   icmpv4-rate-limit bucket-size <i>bucket-size</i> packet-rate <i>packet-rate</i>;   icmpv6-rate-limit bucket-size <i>bucket-size</i> packet-rate <i>packet-rate</i>;   (ipip-path-mtu-discovery   no-ipip-path-mtu-discovery);   ipv6-duplicate-addr-detection-transmits;   (ipv6-reject-zero-hop-limit   no-ipv6-reject-zero-hop-limit);   (ipv6-path-mtu-discovery   no-ipv6-path-mtu-discovery);   ipv6-path-mtu-discovery-timeout;   no-tcp-rfc1323;   no-tcp-rfc1323-paws;   (path-mtu-discovery   no-path-mtu-discovery);   source-port upper-limit &lt;<i>upper-limit</i>&gt;;   (source-quench   no-source-quench);   tcp-drop-synfin-set;   tcp-mss <i>mss-value</i>; } </pre>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
<b>Description</b>	<p>Configure system IP options to protect against certain types of DoS attacks.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring the Junos OS ICMPv4 Rate Limit for ICMPv4 Routing Engine Messages</i></li> <li>• <i>Configuring the Junos OS ICMPv6 Rate Limit for ICMPv6 Routing Engine Messages</i></li> <li>• <i>Configuring the Junos OS for IP-IP Path MTU Discovery on IP-IP Tunnel Connections</i></li> <li>• <i>Configuring the Junos OS for Path MTU Discovery on Outgoing GRE Tunnel Connections</i></li> <li>• <i>Configuring the Junos OS for Path MTU Discovery on Outgoing TCP Connections</i></li> <li>• <i>Configuring the Junos OS for IPv6 Duplicate Address Detection Attempts</i></li> <li>• <i>Configuring the Junos OS for Acceptance of IPv6 Packets with a Zero Hop Limit</i></li> <li>• <i>Configuring the Junos OS to Ignore ICMP Source Quench Messages</i></li> <li>• <i>Configuring the Junos OS to Enable the Router or Switch to Drop Packets with the SYN and FIN Bits Set</i></li> <li>• <i>Configuring the Junos OS to Disable TCP RFC 1323 Extensions</i></li> <li>• <i>Configuring the Junos OS to Disable the TCP RFC 1323 PAWS Extension</i></li> <li>• <i>Configuring the Junos OS to Extend the Default Port Address Range</i></li> </ul>

## ipip-path-mtu-discovery

---

<b>Syntax</b>	(ipip-path-mtu-discovery   no-ipip-path-mtu-discovery);
<b>Hierarchy Level</b>	[edit system internet-options]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure path MTU discovery for outgoing IP-IP tunnel connections: <ul style="list-style-type: none"><li>• <b>ipip-path-mtu-discovery</b>—Path MTU discovery is enabled.</li><li>• <b>no-ipip-path-mtu-discovery</b>—Path MTU discovery is disabled.</li></ul>
<b>Default</b>	Path MTU discovery is enabled.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Junos OS for IP-IP Path MTU Discovery on IP-IP Tunnel Connections</i></li><li>• <a href="#">internet-options on page 51</a></li></ul>

## ipv6-duplicate-addr-detection-transmits

---

<b>Syntax</b>	ipv6-duplicate-addr-detection-transmits;
<b>Hierarchy Level</b>	[edit system <a href="#">internet-options</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.1. Statement introduced in Junos OS Release 9.1 for EX Series switches.
<b>Description</b>	Control the number of attempts for IPv6 duplicate address detection.  The range of values supported for ipv6-duplicate-addr-detection-transmits is from 0 to 20.
<b>Default</b>	The default value is 3.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Junos OS for IPv6 Duplicate Address Detection Attempts</i></li></ul>

## ipv6-path-mtu-discovery

<b>Syntax</b>	(ipv6-path-mtu-discovery   no-ipv6-path-mtu-discovery);
<b>Hierarchy Level</b>	[edit system <a href="#">internet-options</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2. Statement introduced in Junos OS Release 9.2 for EX Series switches.
<b>Description</b>	Configure path MTU discovery for IPv6 packets: <ul style="list-style-type: none"> <li>• <b>ipv6-path-mtu-discovery</b>—IPv6 path MTU discovery is enabled.</li> <li>• <b>no-ipv6-path-mtu-discovery</b>—IPv6 path MTU discovery is disabled.</li> </ul>
<b>Default</b>	IPv6 path MTU discovery is enabled.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring Junos OS for IPv6 Path MTU Discovery</i></li> </ul>

## ipv6-path-mtu-discovery-timeout

<b>Syntax</b>	ipv6-path-mtu-discovery-timeout <i>minutes</i> ;
<b>Hierarchy Level</b>	[edit system <a href="#">internet-options</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2. Statement introduced in Junos OS Release 9.2 for EX Series switches.
<b>Description</b>	Set the IPv6 path MTU discovery timeout interval.
<b>Options</b>	<i>minutes</i> —IPv6 path MTU discovery timeout. <b>Default:</b> 10 minutes
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring Junos OS for IPv6 Path MTU Discovery</i></li> </ul>

## ipv6-reject-zero-hop-limit

---

<b>Syntax</b>	(ipv6-reject-zero-hop-limit   no-ipv6-reject-zero-hop-limit);
<b>Hierarchy Level</b>	[edit system <a href="#">internet-options</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.1. Statement introduced in Junos OS Release 9.1 for EX Series switches.
<b>Description</b>	Enable and disable rejecting incoming IPv6 packets with a zero hop limit value in their header.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Junos OS for Acceptance of IPv6 Packets with a Zero Hop Limit</i></li></ul>

## lcd-menu

**Syntax** EX3200, EX3300, EX4200, or EX4500 switch:

```
lcd-menu fpc slot-number {
  menu-item (menu-name | menu-option) <disable>;
}
```

EX6200 or EX8200 switch or XRE200 External Routing Engine:

```
lcd-menu {
  menu-item (menu-name | menu-option) <disable>;
}
```

**Hierarchy Level** [edit chassis]

**Release Information** Statement introduced in Junos OS Release 10.2 for EX Series switches.

**Description** Disable or enable the Maintenance menu or the Status menu in the LCD panel.

**Options** none—(EX6200 and EX8200 switches and XRE200 External Routing Engines only) Disable or enable the specified menu or menu options.

**fpc slot-number**—(EX3200, EX3300, EX4200, and EX4500 switches only) Disable or enable the specified menu or menu options, where **slot-number** is:

- 0—On standalone switches.
- 0–9—On a device in a Virtual Chassis. The value is the member ID of the device.

**NOTE:** This option is not available on an EX8200 Virtual Chassis. The LCD panel on an XRE200 External Routing Engine provides information for the XRE200 External Routing Engine only.

**disable**—(Optional) Disable the specified menu.

The remaining statement is explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-level—To add this statement to the configuration.

## location (System)

<b>Syntax</b>	<pre>location {   altitude <i>feet</i>;   building <i>name</i>;   country-code <i>code</i>;   floor <i>number</i>;   hcoord <i>horizontal-coordinate</i>;   lata <i>transport-area</i>;   latitude <i>degrees</i>;   longitude <i>degrees</i>;   npa-nxx <i>number</i>;   postal-code <i>postal-code</i>;   rack <i>number</i>;   vcoord <i>vertical-coordinate</i>; }</pre>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
<b>Description</b>	Configure the system location in various formats.
<b>Options</b>	<p><b>altitude <i>feet</i></b>—Number of feet above sea level.</p> <p><b>building <i>name</i></b>—Name of building. The name of the building can be 1 to 28 characters in length. If the string contains spaces, enclose it in quotation marks (" ").</p> <p><b>country-code <i>code</i></b>—Two-letter country code.</p> <p><b>floor <i>number</i></b>—Floor in the building.</p> <p><b>hcoord <i>horizontal-coordinate</i></b>—Bellcore Horizontal Coordinate.</p> <p><b>lata <i>transport-area</i></b>—Local Access Transport Area.</p> <p><b>latitude <i>degrees</i></b>—Latitude in degree format.</p> <p><b>longitude <i>degrees</i></b>—Longitude in degree format.</p> <p><b>npa-nxx <i>number</i></b>—First six digits of the phone number (area code and exchange).</p> <p><b>postal-code <i>postal-code</i></b>—Postal code.</p> <p><b>rack <i>number</i></b>—Rack number.</p> <p><b>vcoord <i>vertical-coordinate</i></b>—Bellcore Vertical Coordinate.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>

**Related Documentation** • *Specifying the Physical Location of the Router or Switch*

## menu-item

---

<b>Syntax</b>	<code>menu-item (<i>menu-name</i>   <i>menu-option</i>) &lt;disable&gt;;</code>
<b>Hierarchy Level</b>	<code>[edit chassis <b>lcd-menu</b>],</code> <code>[edit chassis <b>lcd-menu</b> <i>fpc slot-number</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 10.2 for EX Series switches.
<b>Description</b>	<p>Disable or enable the Maintenance menu, the Status menu, or an individual option in one of those menus in the LCD panel.</p> <p>On EX3200, EX3300, EX4200, and EX4500 switches, you use <b>menu-item</b> at the <code>[edit chassis <b>lcd-menu</b> <i>fpc slot-number</i>]</code> hierarchy level.</p> <p>On EX6200 and EX8200 switches, and on XRE200 External Routing Engines, you use <b>menu-item</b> at the <code>[edit chassis <b>lcd-menu</b>]</code> hierarchy level.</p>
<b>Options</b>	<p><b><i>menu-name</i></b>—Name of the LCD menu:</p> <ul style="list-style-type: none"> <li>• <b>maintenance-menu</b></li> <li>• <b>status-menu</b></li> </ul> <p><b><i>menu-option</i></b>—Specific option on one of the LCD menus. You must include the quotation marks when you type the option. <a href="#">Table 9 on page 60</a> describes the different menu options of the LCD menus supported on the switches.</p>

Table 9: Menu Options of the LCD Menus Supported on the Switches

Menu	Menu Options	Option Descriptions	Platforms Supported
maintenance-menu	"maintenance-menu halt-menu"	System halt option	All switches except EX2200
	"maintenance-menu system-reboot"	System reboot option	All switches except EX2200
	"maintenance-menu rescue-config"	Load rescue option	All switches except EX2200
	"maintenance-menu vc-uplink-config"	Request VC port option for a device in a Virtual Chassis configuration	EX3300, EX4200, and EX4500 switches and XRE200 External Routing Engines only
	"maintenance-menu factory-default"	Factory default option	All switches except EX2200
status-menu	"status-menu vcp-status"	Virtual Chassis port (VCP) status for a device in a Virtual Chassis configuration	EX3300, EX4200, and EX4500 switches and XRE200 External Routing Engines only
	"status-menu sf-status1-menu"	Status of the switch fabric on the Switch Fabric and Routing Engine (SRE) module in slot SRE0 on EX8208 switches	EX8208 and EX8216 switches only
		Status of the switch fabric on the Switch Fabric (SF) modules in slots SF0 and SF1 on EX8216 switches	
	"status-menu sf-status2-menu"	Status of the switch fabric on the SRE module in slot SRE1 on EX8208 switches	EX8208 and EX8216 switches only
		Status of the switch fabric on the SF modules in slots SF2–SF5 on EX8216 switches	
	"status-menu sf-status3-menu"	Status of the switch fabric on the SF modules in slots SF6 and SF7 on EX8216 switches	EX8216 switches only
	"status-menu power-status"	Status of the power supply or power supplies	EX3200, EX3300, EX4200, and EX4500 switches

Table 9: Menu Options of the LCD Menus Supported on the Switches (*continued*)

Menu	Menu Options	Option Descriptions	Platforms Supported
			and XRE200 External Routing Engines only
	"status-menu psu-status1-menu"	Status of the power supplies in slots P0 and P1	EX8208 and EX8216 switches only
	"status-menu psu-status2-menu"	Status of the power supplies in slots P2–P5	EX8208 and EX8216 switches only
	"status-menu environ-menu"	Status of the fan; current chassis temperature	All switches (except EX2200) and XRE200 External Routing Engine
	"status-menu show-version"	The version of Junos OS loaded on the switch	All switches except EX2200

**disable**—(Optional) Disable the specified menu.

**Required Privilege Level** view-level—To view this statement in the configuration.  
control-level—To add this statement to the configuration.

## multicast-client

---

<b>Syntax</b>	<code>multicast-client &lt;address&gt;;</code>
<b>Hierarchy Level</b>	[edit system <a href="#">ntp</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	For NTP, configure the local router or switch to listen for multicast messages on the local network to discover other servers on the same subnet.
<b>Options</b>	<b>address</b> —(Optional) One or more IP addresses. If you specify addresses, the router or switch joins those multicast groups. <b>Default:</b> 224.0.1.1.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Router or Switch to Listen for Multicast Messages Using NTP</i></li></ul>

## no-multicast-echo

```
Syntax  no-multicast-echo {
        arp {
            aging-timer minutes;
            gratuitous-arp-delay seconds;
            gratuitous-arp-on-ifup;
            interfaces {
                interface-name {
                    aging-timer minutes;
                }
            }
            passive-learning;
            purging;
        }
        host-name hostname;
        location {
            altitude feet;
            building name;

## no-ping-time-stamp

---

<b>Syntax</b>	no-ping-time-stamp;
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.4. Statement introduced in Junos OS Release 9.4 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the Junos OS to disable the recording of timestamps in ping responses.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	• <i>Configuring Junos OS to Disable the Reporting of IP Address and Timestamps in Ping Responses</i>

## no-redirects (IPv4 Traffic)

<b>Syntax</b>	no-redirects;
<b>Hierarchy Level</b>	[edit system], [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 11.1 for the QFX Series. Statement introduced in Junos OS Release 12.3 for EX Series switches.
<b>Description</b>	<p>Stop protocol redirect messages for IPv4 traffic from being sent on the entire switch or on an interface on the router or switch.</p> <p>To disable the sending of protocol redirect messages for the entire router or switch, include the <b>no-redirects</b> statement at the [edit system] hierarchy level.</p> <p>To disable the sending of protocol redirect messages on a specific interface, include the <b>no-redirects</b> statement at the [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i>] hierarchy level.</p>
<b>Default</b>	The router or switch sends redirect messages.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring Junos OS to Disable Protocol Redirect Messages on the Router or Switch</i></li> <li>• <i>Understanding the Protocol Redirect Mechanism on EX Series Switches</i></li> <li>• <i>Configuring Junos OS to Disable Sending Protocol Redirect Messages on EX Series Switches (CLI Procedure)</i></li> <li>• <i>Junos OS Network Interfaces Library for Routing Devices</i></li> </ul>

## no-tcp-rfc1323-paws

---

<b>Syntax</b>	no-tcp-rfc1323-paws;
<b>Hierarchy Level</b>	[edit system internet-options]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure the Junos OS to disable the RFC 1323 Protection Against Wrapped Sequence (PAWS) number extension.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Junos OS to Disable the TCP RFC 1323 PAWS Extension</i></li></ul>

## no-tcp-rfc1323

---

<b>Syntax</b>	no-tcp-rfc1323;
<b>Hierarchy Level</b>	[edit system internet-options]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure the Junos OS to disable RFC 1323 TCP extensions.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Junos OS to Disable TCP RFC 1323 Extensions</i></li></ul>

## ntp

<b>Syntax</b>	<pre> ntp {   authentication-key number type type value password;   boot-server address;   broadcast &lt;address&gt; &lt;key key-number&gt; &lt;routing-instance-name routing-instance-name&gt;     &lt;version value&gt; &lt;ttl value&gt;;   broadcast-client;   multicast-client &lt;address&gt;;   peer address &lt;key key-number&gt; &lt;version value&gt; &lt;prefer&gt;;   server address &lt;key key-number&gt; &lt;version value&gt; &lt;prefer&gt;;   source-address source-address &lt;routing-instance routing-instance-name&gt;;   trusted-key [ key-numbers ]; } </pre>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
<b>Description</b>	<p>Configure NTP on the router or switch.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Synchronizing and Coordinating Time Distribution Using NTP</i></li> </ul>

## path-mtu-discovery

---

<b>Syntax</b>	(path-mtu-discovery   no-path-mtu-discovery);
<b>Hierarchy Level</b>	[edit system <a href="#">internet-options</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure path MTU discovery for outgoing Transmission Control Protocol (TCP) connections: <ul style="list-style-type: none"><li>• <b>path-mtu-discovery</b>—Path MTU discovery is enabled.</li><li>• <b>no-path-mtu-discovery</b>—Path MTU discovery is disabled.</li></ul>
<b>Default</b>	Path MTU discovery is enabled.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Junos OS for Path MTU Discovery on Outgoing TCP Connections</i></li></ul>

## peer (NTP)

<b>Syntax</b>	<code>peer address &lt;key key-number&gt; &lt;version value&gt; &lt;prefer&gt;;</code>
<b>Hierarchy Level</b>	[edit system <a href="#">ntp</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	For NTP, configure the local router or switch to operate in symmetric active mode with the remote system at the specified address. In this mode, the local router or switch and the remote system can synchronize with each other. This configuration is useful in a network in which either the local router or switch or the remote system might be a better source of time.
<b>Options</b>	<p><b>address</b>—Address of the remote system. You must specify an address, not a hostname.</p> <p><b>key key-number</b>—(Optional) All packets sent to the address include authentication fields that are encrypted using the specified key number.</p> <p><b>Range:</b> Any unsigned 32-bit integer</p> <p><b>prefer</b>—(Optional) Mark the remote system as the preferred host, which means that if all other factors are equal, this remote system is chosen for synchronization among a set of correctly operating systems.</p> <p><b>version value</b>—(Optional) Specify the NTP version number to be used in outgoing NTP packets.</p> <p><b>Range:</b> 1 through 4</p> <p><b>Default:</b> 4</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring the NTP Time Server and Time Services</i></li> </ul>

## port-type

---

<b>Syntax</b>	port-type (mini-usb   rj45);
<b>Hierarchy Level</b>	[edit system ports <a href="#">auxiliary</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.3 for EX Series switches.
<b>Description</b>	(EX2200-C and EX4550 switch only) Set the RJ-45 console port or the Mini-USB console port as the active console port.
<b>Default</b>	The RJ-45 console port is the active port.
<b>Options</b>	<b>mini-usb</b> —Set the Mini USB type-B console port as the active console port. <b>rj45</b> —Set the RJ-45 console port as the active console port.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Console Port Type (CLI Procedure)</i></li></ul>

## ports

<b>Syntax</b>	<pre> ports {   auxiliary {     disable;     insecure;     type <i>terminal-type</i>;     port-type (mini-usb   rj45);   }   console {     disable;     insecure;     log-out-on-disconnect;     type <i>terminal-type</i>;   } } </pre>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
<b>Description</b>	<p>Configure the properties of the console and auxiliary ports. The ports are located on the router's craft interface.</p> <p>See the switch's hardware documentation for port locations.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Configuring Junos OS to Set Console and Auxiliary Port Properties</i></li> </ul>

## power

---

<b>Syntax</b>	power (off   on);
<b>Hierarchy Level</b>	[edit <a href="#">chassis fpc slot</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.4 for EX Series switches.
<b>Description</b>	On an EX6200 or EX8200 switch, turn a specified Flexible PIC Concentrator (FPC) on or off. See <a href="#">“EX Series Switches Hardware and CLI Terminology Mapping” on page 315</a> .
<div> <b>NOTE:</b> On an EX6200 switch, the power statement has no effect when you configure it for an uplink port FPC on the Switch Fabric and Routing Engine (SRE) module. If you configure the statement for those FPCs, the configuration will be committed, but a message that informs you that the configuration has no effect is logged in the system log. You cannot turn the power on and off for these FPCs.</div>	
<b>Options</b>	<ul style="list-style-type: none"><li>• on—Turn on the specified FPC.</li><li>• off—Turn off the specified FPC.</li></ul>
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Removing a Line Card from an EX6200 Switch</i></li></ul>

## processes

<b>Syntax</b>	<pre>processes {   process-name (enable   disable) failover (alternate-media   other-routing-engine);   timeout seconds; }</pre>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure which Junos OS processes are running on the router or switch.

**CAUTION:** Never disable any of the software processes unless instructed to do so by a customer support engineer.

<b>Default</b>	All processes are enabled by default.
<b>Options</b>	<p><b>(enable   disable)</b>—(Optional) Enable or disable a specified process.</p> <p><b>failover (alternate-media   other-routing-engine)</b>—(Optional) For routers or switches with redundant Routing Engines only, switch to backup media if a process fails repeatedly. If a process fails four times within 30 seconds, the router or switch reboots from the alternate media or the other Routing Engine.</p> <p><b>process-name</b>—One of the valid process names. You can obtain a complete list of process names by using the CLI command completion feature. After specifying a process name, command completion also indicates any additional options for that process.</p> <p><b>timeout seconds</b>—(Optional) How often the system checks the watchdog timer, in seconds. If the watchdog timer has not been checked in the specified number of seconds, the system reloads. If you set the time value too low, it is possible for the system to reboot immediately after it loads.</p> <p><b>Values:</b> 15, 60, or 180</p> <p><b>Default:</b> 180 seconds (rounded up to 291 seconds by the Junos kernel)</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>Disabling Junos OS Processes</li> </ul>

## server (NTP)

---

<b>Syntax</b>	<code>server address &lt;key key-number&gt; &lt;version value&gt; &lt;prefer&gt;;</code>
<b>Hierarchy Level</b>	[edit system ntp]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	<p>For NTP, configure the local router or switch to operate in client mode with the remote system at the specified <b>address</b>. In this mode, the local router or switch can be synchronized with the remote system, but the remote system can never be synchronized with the local router or switch.</p> <p>If the NTP client time drifts so that the difference in time from the NTP server exceeds 128 milliseconds, the client is automatically stepped back into synchronization. If the offset between the NTP client and server exceeds the 1000-second threshold, the client still synchronizes with the server, but it also generates a system log message noting that the threshold was exceeded.</p>
<b>Options</b>	<p><b>address</b>—Address of the remote system. You must specify an address, not a hostname.</p> <p><b>key key-number</b>—(Optional) Use the specified key number to encrypt authentication fields in all packets sent to the specified address.</p> <p><b>Range:</b> Any unsigned 32-bit integer</p> <p><b>prefer</b>—(Optional) Mark the remote system as preferred host, which means that if all other things are equal, this remote system is chosen for synchronization among a set of correctly operating systems.</p> <p><b>version value</b>—(Optional) Specify the version number to be used in outgoing NTP packets.</p> <p><b>Range:</b> 1 through 4</p> <p><b>Default:</b> 4</p>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the NTP Time Server and Time Services</i></li></ul>

---

## tcp-drop-synfin-set

---

<b>Syntax</b>	tcp-drop-synfin-set;
<b>Hierarchy Level</b>	[edit system internet-options]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure the router or switch to drop packets that have both the SYN and FIN bits set.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Junos OS to Enable the Router or Switch to Drop Packets with the SYN and FIN Bits Set</i></li><li>• <i>TCP Headers with SYN and FIN Flags Set</i></li></ul>

## traceoptions (SBC Configuration Process)

---

<b>Syntax</b>	<pre>traceoptions {   file <i>filename</i> &lt;files <i>number</i>&gt; &lt;match <i>regex</i>&gt; &lt;size <i>size</i>&gt;     &lt;world-readable   no-world-readable&gt;;   flag <i>flag</i>; }</pre>
<b>Hierarchy Level</b>	[edit system processes sbc-configuration-process]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5. Statement introduced in Junos OS Release 9.5 for EX Series switches.
<b>Description</b>	Configure trace options for the session border controller (SBC) process of the border signaling gateway (BSG).
<b>Options</b>	<p><b>file <i>filename</i></b>—Name of the file that receives the output of the tracing operation. Enclose the name in quotation marks. All files are placed in the directory <b>/var/log</b>. You can include the following file options:</p> <ul style="list-style-type: none"><li>• <b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</li></ul> <p>If you specify a maximum number of files, you must also specify a maximum file size with the <b>size</b> option and a filename.</p> <p><b>Range:</b> 2 through 1000 <b>Default:</b> 3 files</p> <ul style="list-style-type: none"><li>• <b>match <i>regex</i></b>—(Optional) Refine the output to include lines that contain the regular expression.</li><li>• <b>no-world-readable</b>—(Optional) Disable unrestricted file access.</li><li>• <b>size <i>size</i></b>—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named <b>trace-file</b> reaches this size, it is renamed <b>trace-file.0</b>. When the trace-file again reaches its maximum size, <b>trace-file.0</b> is renamed <b>trace-file.1</b> and <b>trace-file</b> is renamed <b>trace-file.0</b>. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum file size, you also must specify a maximum number of trace files with the files option and filename.</li></ul> <p><b>Syntax:</b> <b>xk</b> to specify KB, <b>xm</b> to specify MB, or <b>xg</b> to specify GB. <b>Range:</b> 10 KB through 1 GB <b>Default:</b> 128 KB</p> <ul style="list-style-type: none"><li>• <b>world-readable</b>—(Optional) Enable unrestricted file access.</li></ul>

**flag flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:

- **all trace-level**—Trace all SBC process operations.
- **common trace-level**—Trace common events.
- **configuration trace-level**—Trace configuration events.
- **device-monitor trace-level**—Trace device monitor events.
- **ipc trace-level**—Trace IPC events.
- **memory—pool trace-level**—Trace memory pool events.
- **trace-level**—Trace level options are related to the severity of the event being traced. When you choose a trace level, messages at that level and higher levels are captured. Enter one of the following trace levels as the **trace-level**:
  - **debug**—Log all code flow of control.
  - **error**—Log failures with a short-term effect.
  - **info**—Log summary for normal operations, such as the policy decisions made for a call.
  - **trace**—Log program trace START and EXIT macros.
  - **warning**—Log failure recovery events or failure of an external entity.
- **ui trace-level**—Trace user interface operations.

<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
---------------------------------	---

------------------------------	--

## trusted-key

---

<b>Syntax</b>	<code>trusted-key [ <i>key-numbers</i> ];</code>
<b>Hierarchy Level</b>	[edit system <a href="#">ntp</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	For NTP, configure the keys you are allowed to use when you configure the local router or switch to synchronize its time with other systems on the network.
<b>Options</b>	<i>key-numbers</i> —One or more key numbers. Each key can be any 32-bit unsigned integer except 0.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring NTP Authentication Keys</i></li><li>• <a href="#">authentication-key on page 40</a></li><li>• <a href="#">broadcast on page 43</a></li><li>• <a href="#">peer on page 69</a></li><li>• <a href="#">server on page 74</a></li></ul>

## clear chassis display message

<b>List of Syntax</b>	<a href="#">Syntax on page 81</a> <a href="#">Syntax (TX Matrix Router) on page 81</a> <a href="#">Syntax (TX Matrix Plus Router) on page 81</a> <a href="#">Syntax (QFabric Systems) on page 81</a>
<b>Syntax</b>	clear chassis display message
<b>Syntax (TX Matrix Router)</b>	clear chassis display message <lcc <i>number</i>   scc>
<b>Syntax (TX Matrix Plus Router)</b>	clear chassis display message <lcc <i>number</i>   sfc <i>number</i> >
<b>Syntax (QFabric Systems)</b>	clear chassis display message <node-device <i>name</i>   interconnect-device <i>name</i> >
<b>Release Information</b>	<p>Command introduced in Junos OS Release 7.5.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>sfc</b> option for the TX Matrix Plus routers introduced in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	<p>(M40e, M160, M320, T Series routers, EX Series, and QFabric systems only) Clear or stop a text message on the craft interface display, which is on the front of the router or switch or on the LCD panel display on the router or switch. The craft interface alternates the display of text messages with standard craft interface messages, switching between messages every 2 seconds. By default, on both the router and the switch, the text message is displayed for 5 minutes. The craft interface display has four 20-character lines. The LCD panel display has two 16-character lines, and text messages appear only on the second line.</p>
<b>Options</b>	<p><b>none</b>—Clear or stop a text message on the craft interface display.</p> <p><b>interconnect-device <i>name</i></b>—(QFabric systems only) (Optional) On a QFabric system, clear or stop a text message on the LCD panel display on the specified Interconnect device.</p> <p><b>lcc <i>number</i></b>—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.</p> <p>Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"> <li>• 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.</li> <li>• 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.</li> </ul>

- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**node-device *name***—(QFabric systems only) (Optional) On a QFabric system, clear or stop a text message on the LCD panel display on the specified Node device in a Node group.

**scc**—(TX Matrix routers only) (Optional) Clear or stop a text message on the craft interface on the TX Matrix router (switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Clear or stop a text message on the craft interface on the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

**Required Privilege Level** clear

## clear system reboot

---

<b>List of Syntax</b>	<a href="#">Syntax on page 84</a> <a href="#">Syntax (EX Series Switches) on page 84</a> <a href="#">Syntax (TX Matrix Router) on page 84</a> <a href="#">Syntax (TX Matrix Plus Router) on page 84</a> <a href="#">Syntax (QFX Series) on page 84</a>
<b>Syntax</b>	clear system reboot <both-routing-engines>
<b>Syntax (EX Series Switches)</b>	clear system reboot <all-members> <both-routing-engines> <local> <member <i>member-id</i> >
<b>Syntax (TX Matrix Router)</b>	clear system reboot <both-routing-engines> <all-chassis   all-lcc   lcc <i>number</i>   scc>
<b>Syntax (TX Matrix Plus Router)</b>	clear system reboot <both-routing-engines> <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> >
<b>Syntax (QFX Series)</b>	clear system reboot <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <node-group <i>name</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Clear any pending system software reboots or halts. When issued on a TX Matrix router without any options, the default behavior clears all pending system software reboots or halts on all T640 routers connected to the TX Matrix router. When issued on a TX Matrix Plus router without any options, the default behavior clears all pending system software reboots or halts on all T1600 or T4000 routers connected to the TX Matrix Plus router.
<b>Options</b>	<b>none</b> —Clear all pending system software reboots or halts.  <b>all-chassis</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) Clear all halt or reboot requests for all the Routing Engines in the chassis.  <b>all-lcc</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, clear all halt or reboot requests for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, clear all halt or reboot requests on the l connected T1600 or T4000 LCCs.

**all-members**—(EX4200 switches only) (Optional) Clear all halt or reboot requests on all members of the Virtual Chassis configuration.

**both-routing-engines**—(Systems with multiple Routing Engines) (Optional) Clear all halt or reboot requests on both Routing Engines. On a TX Matrix router, clear both Routing Engines on all chassis connected to the TX Matrix router. Likewise, on a TX Matrix Plus router, clear both Routing Engines on all chassis connected to the TX Matrix Plus router.

**infrastructure *name***—(QFabric systems) (Optional) Clear all halt or reboot requests on the fabric control Routing Engines or fabric manager Routing Engines.

**interconnect-device *name***—(QFabric systems) (Optional) Clear all halt or reboot requests on the Interconnect device.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, clear all halt or reboot requests for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, clear all halt or reboot requests for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches only) (Optional) Clear all halt or reboot requests on the local Virtual Chassis member.

**member *member-id***—(EX4200 switches only) (Optional) Clear all halt or reboot requests on the specified member of the Virtual Chassis configuration. Replace *member-id* with a value from 0 through 9.

**node-group *name***—(QFabric systems) (Optional) Clear all halt or reboot requests on the Node group.

**scc**—(TX Matrix routers only) (Optional) Clear all halt or reboot requests for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Clear all halt or reboot requests for the TX Matrix Plus router. Replace *number* with 0.

**Required Privilege Level**      maintenance

<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">request system reboot on page 113</a></li><li>• <i>request system reboot</i></li><li>• <i>Rebooting and Halting a Device</i></li><li>• <a href="#">Routing Matrix with a TX Matrix Plus Router Solutions Page</a></li></ul>
<b>List of Sample Output</b>	<a href="#">clear system reboot on page 87</a> <a href="#">clear system reboot (TX Matrix Router) on page 87</a> <a href="#">clear system reboot (QFX Series) on page 87</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### clear system reboot

```
user@host> clear system reboot
reboot requested by root at Sat Dec 12 19:37:34 1998
[process id 17855]
Terminating...
```

### clear system reboot (TX Matrix Router)

```
user@host> clear system reboot
scc-re0:
-----
No shutdown/reboot scheduled.
lcc0-re0:
-----
No shutdown/reboot scheduled.
lcc2-re0:
-----
No shutdown/reboot scheduled.
```

### clear system reboot (QFX Series)

```
user@switch> clear system reboot node-group node1
No shutdown/reboot scheduled.
```

## configure

---

<b>Syntax</b>	<code>configure</code> <code>&lt;batch&gt;</code> <code>&lt;dynamic&gt;</code> <code>&lt;exclusive&gt;</code> <code>&lt;private&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Enter configuration mode. When this command is entered without any optional keywords, everyone can make configuration changes and commit all changes made to the configuration.
<b>Options</b>	<p><b>none</b>—Enter configuration mode.</p> <p><b>batch</b>—(Optional) Work in the batch commit mode where commit operations are executed in batches.</p> <p><b>dynamic</b>—(Optional) Configure routing policies and certain routing policy objects in a dynamic database that is not subject to the same verification required in the standard configuration database. As a result, the time it takes to commit changes to the dynamic database is much shorter than for the standard configuration database. You can then reference these policies and policy objects in routing policies you configure in the standard database.</p> <p><b>exclusive</b>—(Optional) Lock the candidate configuration for as long as you remain in configuration mode, allowing you to make changes without interference from other users. Other users can enter and exit configuration mode, but they cannot change the configuration.</p> <p><b>private</b>—(Optional) Allow multiple users to edit different parts of the configuration at the same time and to commit only their own changes, or to roll back without interfering with one another's changes. You cannot commit changes in configure private mode when another user is in configure exclusive mode.</p>
<b>Additional Information</b>	For more information about the different methods of entering configuration mode and the restrictions that apply, see the <i>Junos OS Administration Library for Routing Devices</i> .
<b>Required Privilege Level</b>	configure
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show configuration on page 187</a></li></ul>
<b>List of Sample Output</b>	<a href="#">configure on page 89</a>
<b>Output Fields</b>	When you enter this command, you are placed in configuration mode and the system prompt changes from <i>hostname&gt;</i> to <i>hostname#</i> .

## Sample Output

configure

```
user@host> configure
Entering configuration mode
[edit]
user@host#
```

## op

---

<b>Syntax</b>	<code>op filename</code> <code>&lt;detail&gt;</code> <code>&lt;argument-name argument-value&gt;</code> <code>&lt;key (md5   sha-256   sha1) key-value</code> <code>&lt;url url&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 7.6. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>key</b> option introduced in Junos OS Release 10.0. <b>url</b> option introduced in Junos OS Release 10.0.
<b>Description</b>	Execute an op script stored in one of the following locations: <ul style="list-style-type: none"><li>• On the router or switch in the <code>/var/db/scripts/op</code> directory</li><li>• At a remote URL</li></ul>
<b>Options</b>	<b>detail</b> —(Optional) Display detailed output.  <b>argument-name argument-value</b> —(Optional) Specify one or more arguments to the script. For each argument you include on the command line, you must specify a corresponding value for the argument.  <b>key (md5   sha-256   sha1) key-value</b> —(Optional) With the <code>&lt;url&gt;</code> option, specify a checksum hash to verify the integrity of the script. You can include the <code>&lt;key&gt;</code> option if the <b>checksum</b> statement is included at the <code>[edit system scripts op file filename]</code> hierarchy level.  <b>url url</b> —(Optional) Specify a URL where the script is located.
<b>Additional Information</b>	For more information about Junos op scripts, see the <i>Junos OS Automation Library</i> .
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Executing an Op Script</i> in the <i>Junos OS Automation Library</i></li><li>• <i>Executing an Op Script from a Remote Site</i> in the <i>Junos OS Automation Library</i></li><li>• <i>checksum</i></li><li>• <a href="#">file checksum md5 on page 650</a></li><li>• <a href="#">file checksum sha-256 on page 652</a></li><li>• <a href="#">file checksum sha1 on page 651</a></li></ul>
<b>List of Sample Output</b>	<a href="#">op on page 91</a> <a href="#">op url on page 91</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

op

```
user@host> op script1 interface ge-0/2/0.0 protocol inet
```

op url

```
user@host> op url https://www.juniper.net/fa/2009-04-01.01.slax key md5

## request chassis pic

---

<b>List of Syntax</b>	<a href="#">Syntax on page 92</a> <a href="#">Syntax (ACX4000 Series Routers) on page 92</a> <a href="#">Syntax (TX Matrix and TX Matrix Plus Routers) on page 92</a>
<b>Syntax</b>	<code>request chassis pic (offline   online) fpc-slot <i>slot-number</i> pic-slot <i>slot-number</i></code>
<b>Syntax (ACX4000 Series Routers)</b>	<code>request chassis pic (offline   online) fpc-slot <i>slot-number</i> pic-slot <i>slot-number</i></code>
<b>Syntax (TX Matrix and TX Matrix Plus Routers)</b>	<code>request chassis pic (offline   online) fpc-slot <i>slot-number</i> pic-slot <i>slot-number</i> &lt;lcc <i>number</i>&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 12.3 for ACX4000 Routers. Command introduced in Junos OS Release 13.2 for the QFX Series.
<b>Description</b>	Control the operation of the PIC.

**NOTE:** The `request chassis pic (offline | online) fpc-slot slot number pic-slot slot-number` command is not supported for built-in PICs on MX Series routers.

To view a list of built-in PICs on the router or switch chassis, use the `show chassis hardware` command.

**NOTE:** This command is not supported on MX960 and MX2020 routers with MPC5EQ.

**NOTE:** T1600 routers and TX Matrix Plus routers with 100-Gigabit Ethernet PICs require two adjacent PIC slots, 0 and 1, for each PIC. Therefore, only online and offline command options to PIC slot 0 are allowed. Use of the online and offline command options for PIC slot 1 with the described router and PIC combination is not allowed.

**NOTE:** In T Series routers, when the PIC state is set from offline to online or vice-versa before the processing is complete for the previous command, you are provided feedback on the status of your request. The following sample messages are displayed if you try to set a PIC offline or online:

```
user@switch> request chassis pic fpc-slot 1 pic-slot 0 online
fpc 1 pic 0 online initiated, use "show chassis fpc pic-status" to verify
```

```
user@switch> request chassis pic fpc-slot 1 pic-slot 0 online
FPC 1 PIC 0 already transitioning to online
```

When the same PIC is set to a different state while the transition is in progress, you are provided feedback on the status of your request.

```
user@switch> request chassis pic fpc-slot 1 pic-slot 0 offline
FPC 1, PIC 0 already transitioning to online. Please retry later.
```

**Options**    **offline**—Take the PIC offline.

**online**—Bring the PIC online.

**fpc-slot *slot-number***—Flexible PIC Concentrator (FPC) slot number. Replace *slot-number* with a value appropriate for your router or switch:

- ACX4000 routers—1 or 2.
- EX Series switches:
  - EX3200 switches and EX4200 standalone switches—0.
  - EX4200 switches in a Virtual Chassis configuration—0 through 9 (switch's member ID).
  - EX8208 switches—0 through 7 (line card).
  - EX8216 switches—0 through 15 (line card).
- M5, M7i, M10, and M10i routers—0 or 1.
- M20 routers—0 through 3.
- M40 and M40e routers—0 through 7.
- M120 routers—0 through 5.
- M160 routers—0 through 7.
- M320 routers—0 through 7.
- MX 5, MX10, and MX40 routers—0 or 1.
- MX80 routers—0 or 1.
- MX240 routers—0 through 2
- MX480 routers—0 through 5
- MX2020 routers—0 through 19.

- MX2010 routers—0 through 9.
- MX960 routers—0 through 11.
- PTX5000 routers—0 or 1.
- T Series routers—0 through 7.
- TX Matrix and TX Matrix Plus routers only—On a TX Matrix router, if you specify the number of the T640 router by using the **lcc number** option (the recommended method), replace **slot-number** with a value from 0 through 7. Otherwise, replace **slot-number** with a value from 0 through 31.

Likewise, on a TX Matrix Plus router, if you specify the **number** of the T1600 or T4000 router by using the **lcc number** option (the recommended method), replace **slot-number** with a value from 0 through 7. Otherwise, for the FPC slot number, replace **slot-number** with a value from 0 through 31. On a TX Matrix Plus router with 3D SIBs to assign the FPC slot number, replace **slot-number** with a value from 0 through 63. For example, the following commands have the same result:

```
user@host> request chassis pic fpc-slot 1 lcc 1 pic-slot 0 offline
user@host> request chassis pic fpc-slot 9 pic-slot 0 offline
```

- QFX5100 standalone switches—0.

**pic-slot slot-number**—PIC slot number.

- EX3200 and EX4200 switches—0 for built-in network interfaces and 1 for interfaces on uplink modules.
- EX8208 and EX8216 switches—0.
- M Series routers—0, 1, 2, or 3
- MX960 router—**slot-number** corresponds to the slot number of the Packet Forwarding Engine.
- PTX5000 routers—0 or 1.
- T320 router—0 or 1.
- T640 router—0, 1, 2, or 3.
- T1600 router —0, 1, 2, or 3.
- T4000 router—0, 1, 2, or 3.
- QFX5100 standalone switches—0, 1, or 2. PIC 0 is used for all interfaces that are not configured on expansion modules, and PIC 1 and PIC 2 are used for interfaces configured on expansion modules.

**lcc number**—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**Required Privilege Level** maintenance

**List of Sample Output** [request chassis pic on page 95](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

`request chassis pic`

```
user@host> request chassis pic pic-slot 0 online fpc-slot 0
FPC 0, PIC 0 is already online
```

## request chassis routing-engine master

---

<b>List of Syntax</b>	<a href="#">Syntax on page 96</a> <a href="#">Syntax (M Series, MX Series, T Series Routers) on page 96</a> <a href="#">Syntax (TX Matrix Routers) on page 96</a> <a href="#">Syntax (TX Matrix Plus Routers) on page 96</a> <a href="#">Syntax (MX Series Virtual Chassis) on page 96</a> <a href="#">Syntax (QFX Series) on page 96</a>
<b>Syntax</b>	request chassis routing-engine master (acquire   release   switch) <force> <no-confirm>
<b>Syntax (M Series, MX Series, T Series Routers)</b>	request chassis routing-engine master (acquire   release   switch <check>) <no-confirm>
<b>Syntax (TX Matrix Routers)</b>	request chassis routing-engine master (acquire   release   switch) (lcc <i>number</i>   scc   all-chassis) <force> <no-confirm>
<b>Syntax (TX Matrix Plus Routers)</b>	request chassis routing-engine master (acquire   release   switch) (lcc <i>number</i>   sfc   all-chassis   all-lcc) <force> <no-confirm>
<b>Syntax (MX Series Virtual Chassis)</b>	request chassis routing-engine master (acquire   release   switch <check>) <all-members> <local> <member <i>member-id</i> > <no-confirm>
<b>Syntax (QFX Series)</b>	request chassis routing-engine master (release   switch) <check> <interconnect-device <i>name</i> > <node-group <i>name</i> > <no-confirm>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. <b>all-chassis</b> option added in Junos OS Release 8.0. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.3 for QFX Series. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers. Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.
<b>Description</b>	For routers or switches with multiple Routing Engines, control which Routing Engine is the master.

**CAUTION:** (Routing matrix based on the TX Matrix or TX Matrix Plus routers only) Within the routing matrix, we recommend that all Routing Engines run the same Junos OS Release. If you run different releases on the Routing Engines and a change in mastership occurs on any backup Routing Engine in the routing matrix, one or all routers (in a routing matrix based on the TX Matrix router or in a routing matrix based on a TX Matrix Plus router) might become logically disconnected from the TX Matrix router and cause data loss. For more information, see the [TX Matrix Router Hardware Guide](#) or the *Junos OS High Availability Library for Routing Devices*.

**NOTE:** Successive graceful Routing Engine switchover events must be a minimum of 240 seconds (4 minutes) apart after both Routing Engines have come up.

If the router or switch displays a warning message similar to “Standby Routing Engine is not ready for graceful switchover. Packet Forwarding Engines that are not ready for graceful switchover might be reset,” do not attempt switchover. If you choose to proceed with switchover, only the Packet Forwarding Engines that were not ready for graceful switchover are reset. None of the Flexible PIC concentrators (FPCs) should spontaneously restart. We recommend that you wait until the warning no longer appears and then proceed with the switchover.

You will receive an error message stating “Command aborted. Not ready for mastership switch, try after n seconds” when this command is re-entered before 240 seconds have elapsed on EX Series switches.

**NOTE:** On a QFabric system, to avoid traffic loss on the network Node group, switch mastership of the routing engine to the backup routing engine, and then reboot.

**Options** **acquire**—Attempt to become the master Routing Engine.

**release**—Request that the other Routing Engine become the master.

**switch**—Toggle mastership between Routing Engines.

**NOTE:** The **acquire** option should be used with caution because acquiring a Routing Engine may result in a corrupted database. If possible, use the **switch** option instead.

The **acquire**, **release**, and **switch** options have the following suboptions:

**all-chassis**—(TX Matrix and TX Matrix Plus routers only) On a routing matrix composed of a TX Matrix router and the attached T640 routers, switch mastership on all the Routing Engines in the routing matrix. Likewise, on a routing matrix composed of a TX Matrix Plus router and the attached T1600 or T4000 routers, switch mastership on all the Routing Engines in the routing matrix.

**all-lcc**—(TX Matrix Plus routers only) Request to acquire mastership for all line-card chassis (LCC).

**all-members**—(MX Series routers only) (Optional) Control Routing Engine mastership on the Routing Engines in all member routers of the Virtual Chassis configuration.

**check**—(QFabric systems, MX104, MX480, MX960, MX2010, and MX2020 routers, and PTX5000 routers only) (Optional) Available only with the **switch** option. Check graceful switchover status of the standby Routing Engine before toggling mastership between Routing Engines.

**interconnect-device *name***—(QFabric systems only) (Optional) Control Routing Engine mastership on the Routing Engines on an Interconnect device.

**lcc *number***—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Control Routing Engine mastership on the Routing Engines in the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Control Routing Engine mastership on the Routing Engines of the specified member in the Virtual Chassis Configuration. Replace *member-id* with a value of 0 or 1.

**no-confirm**—(Optional) Do not request confirmation for the switch.

**node-group *name***—(QFabric systems only) (Optional) Control Routing Engine mastership on the Routing Engines on a Node group.

**scc**—(TX Matrix routers only) TX Matrix (switch-card chassis).

**sfc**—(TX Matrix Plus routers only) TX Matrix Plus router (or switch-fabric chassis).

**force**—(Optional) Available only with the **acquire** option. Force the change to a new master Routing Engine.

**NOTE:** The **force** option is not supported on the M Series, MX Series, or T Series routers.

**Additional Information** Because both Routing Engines are always running, the transition from one to the other as the master Routing Engine is immediate. However, the changeover interrupts communication to the System and Switch Board (SSB). The SSB takes several seconds to reinitialize the Flexible PIC Concentrators (FPCs) and restart the PICs. Interior gateway protocol (IGP) and BGP convergence times depend on the specific network environment.

By default, the Routing Engine in slot 0 (**RE0**) is the master and the Routing Engine in slot 1 (**RE1**) is the backup. To change the default master Routing Engine, include the **routing-engine** statement at the **[edit chassis redundancy]** hierarchy level in the configuration. For more information, see the *Junos OS Administration Library for Routing Devices*

To have the backup Routing Engine become the master Routing Engine, use the **request chassis routing-engine master switch** command. If you use this command to change the master and then restart the chassis software for any reason, the master reverts to the default setting.

**NOTE:** Although the configurations on the two Routing Engines do not have to be the same and are not automatically synchronized, we recommend making both configurations the same.

**Required Privilege Level** maintenance

**List of Sample Output**

- [request chassis routing-engine master acquire on page 100](#)
- [request chassis routing-engine master switch on page 100](#)
- [request chassis routing-engine master switch check on page 100](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request chassis routing-engine master acquire

```
user@host> request chassis routing-engine master acquire

warning: Traffic will be interrupted while the PFE is re-initialized

warning: The other routing engine's file system could be corrupted

Reset other routing engine and become master ? [yes,no] (no)
```

### request chassis routing-engine master switch

```
user@host> request chassis routing-engine master switch

warning: Traffic will be interrupted while the PFE is re-initialized
Toggle mastership between Routing Engines ? [yes,no] (no) yes

Resolving mastership...
Complete. The other Routing Engine becomes the master.
```

Switch mastership back to the local Routing Engine:

```
user@host> request chassis routing-engine master switch

warning: Traffic will be interrupted while the PFE is re-initialized
Toggle mastership between routing engines ? [yes,no] (no) yes

Resolving mastership...
Complete. The local routing engine becomes the master.
```

### request chassis routing-engine master switch check

Usage shown for M Series, MX Series, and T Series routers.

```
{master}[edit]
```

```
user@host> request chassis routing-engine master switch check
```

```
warning: Standby Routing Engine is not ready for graceful switchover.
```

```
{master}[edit]
```

```
user@host> request chassis routing-engine master switch check
Switchover Ready
```

You can similarly check the backup Routing Engine.

## request system halt

Release Information	<div>Command introduced before Junos OS Release 7.4. <b>other-routing-engine</b> option introduced in Junos OS Release 8.0. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series. <b>director-device</b> option introduced for QFabric systems in Junos OS Release 12.2. <b>backup-routing-engine</b> option introduced in Junos OS Release 13.1.</div>
Description	<div>Stop the router or switch software.</div>

**NOTE:** When you issue this command on an individual component—for example, a Node device—in a QFabric system, you will receive a warning that says “Hardware-based members will halt, Virtual Junos Routing Engines will reboot.” If you want to halt only one member of a Node group, issue this command with the **member** option on the Node device CLI, because you cannot issue this command from the QFabric CLI. Also, issuing this command might cause traffic loss on an individual component.

When you issue this command on a QFX5100 switch, you are not prompted to reboot. You must power cycle the switch to reboot.

**Options** **none**—Stop the router or switch software immediately.

**all-chassis**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Halt all chassis.

**all-lcc**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, halt all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, halt all T1600 or T4000 routers connected to the TX Matrix Plus router.

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Halt all members of the Virtual Chassis configuration.

**at time** —(Optional) Time at which to stop the software, specified in one of the following ways:

- **now**—Stop the software immediately. This is the default.
- **+minutes**—Number of minutes from now to stop the software.
- **yymmddhhmm**—Absolute time at which to stop the software, specified as year, month, day, hour, and minute.
- **hh:mm**—Absolute time on the current day at which to stop the software.

**backup-routing-engine**—(Optional) Halt the backup Routing Engine. This command halts the backup Routing Engine, regardless from which Routing Engine the command is executed. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is halted. If you issue the command from the backup Routing Engine, the backup Routing Engine is halted.

**both-routing-engines**—(Optional) Halt both Routing Engines at the same time.

**director-device** *director-device-id*—(QFabric systems only) Halt a specific Director device.

**lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, halt a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, halt a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Halt the local Virtual Chassis member.

**in *minutes***—(Optional) Number of minutes from now to stop the software. This option is an alias for the at *+minutes* option.

**media (compact-flash | disk | removable-compact-flash | usb)**—(Optional) Boot medium for the next boot. (The options **removable-compact-flash** and **usb** pertain to J Series routers only.)

**media (external | internal)**—(EX Series and QFX Series switches and MX Series routers only) (Optional) Halt the boot media:

- **external**—Halt the external mass storage device.
- **internal**—Halt the internal flash device.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Halt the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**message "*text*"**—(Optional) Message to display to all system users before stopping the software.

**other-routing-engine**—(Optional) Halt the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is halted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is halted.

**scc**—(TX Matrix routers only) (Optional) Halt the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Halt the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

**slice *slice***—(EX Series and QFX Series switches only) (Optional) Halt a partition on the boot media. This option has the following suboptions:

- 1—Halt partition 1.
- 2—Halt partition 2.

- **alternate**—Reboot from the alternate partition.

**Additional Information** On the M7i router, the **request system halt** command does not immediately power down the Packet Forwarding Engine. The power-down process can take as long as 5 minutes.

On a TX Matrix router and TX Matrix Plus router if you issue the **request system halt** command on the master Routing Engine, all the master Routing Engines connected to the routing matrix are halted. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are halted.

**NOTE:** If you have a router or switch with two Routing Engines and you want to shut the power off to the router or switch or remove a Routing Engine, you must first halt the backup Routing Engine (if it has been upgraded), and then halt the master Routing Engine. To halt a Routing Engine, issue the **request system halt** command. You can also halt both Routing Engines at the same time by issuing the **request system halt both-routing-engines** command.

**Required Privilege Level** maintenance

**Related Documentation**

- [clear system reboot on page 84](#)
- [request system power-off on page 108](#)
- *Rebooting and Halting a Device*

**List of Sample Output**

- [request system halt on page 106](#)
- [request system halt \(In 2 Hours\) on page 106](#)
- [request system halt \(Immediately\) on page 106](#)
- [request system halt \(At 1:20 AM\) on page 106](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system halt

```
user@host> request system halt
Halt the system ? [yes,no] (no) yes

*** FINAL System shutdown message from root@section2 ***
System going down IMMEDIATELY
Terminated
...
syncing disks... 11 8 done
The operating system has halted.
Please press any key to reboot.
```

### request system halt (In 2 Hours)

The following example, which assumes that the time is 5 PM (1700), illustrates three different ways to request that the system stop 2 hours from now:

```
user@host> request system halt at +120
user@host> request system halt in 120
user@host> request system halt at 19:00
```

### request system halt (Immediately)

```
user@host> request system halt at now
```

### request system halt (At 1:20 AM)

To stop the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

```
user@host> request system halt at yymdd120
request system halt at 120
Halt the system at 120? [yes,no] (no) yes
```

## request system logout

<b>Syntax</b>	<code>request system logout (pid <i>pid</i>   terminal <i>terminal</i>   user <i>username</i>) &lt;all&gt;</code>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Log out users from the router or switch and the configuration database. If a user held the <b>configure exclusive</b> lock, this command clears the exclusive lock.
<b>Options</b>	<p><b>all</b>—(Optional) Log out all sessions owned by a particular PID, terminal session, or user. (On a TX Matrix or TX Matrix Plus router, this command is broadcast to all chassis.)</p> <p><b>pid <i>pid</i></b>—Log out the user session using the specified management process identifier (PID). The PID type must be management process.</p> <p><b>terminal <i>terminal</i></b>—Log out the user for the specified terminal session.</p> <p><b>user <i>username</i></b>—Log out the specified user.</p>
<b>Required Privilege Level</b>	configure
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Junos OS Administration Library for Routing Devices</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">request system logout on page 107</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system logout

```
user@host> request system logout user tammy all
Connection closed by foreign host.
```

## request system power-off

<b>Syntax (MX Series Router)</b>	<code>request system power-off</code> <code>&lt;all-members&gt;</code> <code>&lt;at <i>time</i>&gt;</code> <code>&lt;both-routing-engines&gt;</code> <code>&lt;in <i>minutes</i>&gt;</code> <code>&lt;local&gt;</code>

	<pre> &lt;media (external   internal)&gt; &lt;member <i>member-id</i>&gt; &lt;message "<i>text</i>"&gt; &lt;other-routing-engine&gt; </pre>
<b>Syntax (QFX Series)</b>	<pre> request system power-off &lt;at <i>time</i>&gt; &lt;in <i>minutes</i>&gt; &lt;media (external   internal)&gt; &lt;message "<i>text</i>"&gt; &lt;slice <i>slice</i>&gt; </pre>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 8.0.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Power off the software.
	<p> <b>NOTE:</b> When you issue this command on an individual component in a QFabric system, you will receive a warning that says “Hardware-based members will halt, Virtual Junos Routing Engines will reboot.” If you want to halt only one member, use the <code>member</code> option. You cannot issue this command from the QFabric CLI.</p>
	<p> <b>NOTE:</b> For a standalone chassis (such as MX Series, PTX Series, and T Series routers), the request to power off the system is applicable only to the Routing Engines. When you request to power off both Routing Engines, all the FPCs in the chassis shut down after approximately 10 minutes and the chassis fans run at full speed. The FPCs shut down because they no longer have communication with the Routing Engines and an Inter-Integrated Circuit (I2C) timeout occurred.</p>
<b>Options</b>	<p><b>none</b>—Power off the router or switch software immediately.</p> <p><b>all-chassis</b>—(Optional) (TX Matrix and TX Matrix Plus router only) Power off all Routing Engines in the chassis.</p> <p><b>all-icc</b>—(Optional) (TX Matrix and TX Matrix Plus router only) On a TX Matrix router, power off all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, power off all T1600 routers (or line-card chassis) connected to the TX Matrix Plus router.</p> <p><b>all-members</b>—(EX4200 switches and MX Series routers only) (Optional) Power off all members of the Virtual Chassis configuration.</p> <p><b>at <i>time</i></b>—(Optional) Time at which to power off the software, specified in one of the following ways:</p>

- **now**—Power off the software immediately. This is the default.
- **+minutes**—Number of minutes from now to power off the software.
- **yymmddhhmm**—Absolute time at which to power off the software, specified as year, month, day, hour, and minute.
- **hh:mm**—Absolute time on the current day at which to power off the software.

**both-routing-engines**—(Optional) Power off both Routing Engines at the same time.

**in minutes**—(Optional) Number of minutes from now to power off the software. This option is an alias for the **at +minutes** option.

**lcc number**—(Optional) (TX Matrix and TX Matrix Plus router only) On a TX Matrix router, power off a T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, power off a specific router that is connected to the TX Matrix Plus router. Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Power off the local Virtual Chassis member.

**media (compact-flash | disk | removable-compact-flash | usb)**—(Optional) Boot medium for the next boot. (The options **removable-compact-flash** and **usb** pertain to the J Series routers only.)

**media (external | internal)**—(EX Series and QFX Series switches and MX Series routers only) (Optional) Power off the boot media:

- **external**—Power off the external mass storage device.
- **internal**—Power off the internal flash device.

**member member-id**—(EX4200 switches and MX Series routers only) (Optional) Power off the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**message "text"**—(Optional) Message to display to all system users before powering off the software.

**other-routing-engine**—(Optional) Power off the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is halted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is halted.

**scc**—(Optional) (TX Matrix router only) Power off only the master Routing Engine or the backup Routing Engine on the TX Matrix router (or switch-card chassis). If you issue the command from the master Routing Engine, the master SCC is powered off. If you issue the command from the backup Routing Engine, the backup SCC is powered off.

**sfc number**—(Optional) (TX Matrix Plus router only) Power off only the master Routing Engine or the backup Routing Engine on the TX Matrix Plus router (or switch-fabric chassis). If you issue the command from the master Routing Engine, the master SFC is powered off. If you issue the command from the backup Routing Engine, the backup SFC is powered off. Replace *number* with zero.

**slice slice**—(EX Series and QFX Series switches only) (Optional) Power off a partition on the boot media. This option has the following suboptions:

- **1**—Power off partition 1.
- **2**—Power off partition 2.
- **alternate**—Reboot from the alternate partition.

**Additional Information** On a routing matrix composed of a TX Matrix router and T640 routers, if you issue the **request system power-off** command on the TX Matrix master Routing Engine, all the master Routing Engines connected to the routing matrix are powered off. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are powered off.

Likewise, on a routing matrix composed of a TX Matrix Plus router and T1600 routers, if you issue the **request system power-off** command on the TX Matrix Plus master Routing Engine, all the master Routing Engines connected to the routing matrix are powered off. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are powered off.

If you issue the **request system power-off both-routing-engines** command on the TX Matrix or TX Matrix Plus router, all the Routing Engines on the routing matrix are powered off.

**Required Privilege Level** maintenance

**List of Sample Output** [request system power-off on page 112](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system power-off

```
user@host> request system power-off message "This router will be powered off in 30 minutes.  
Please save your data and log out immediately."  
warning: This command will not halt the other routing-engine.  
If planning to switch off power, use the both-routing-engines option.  
Power Off the system ? [yes,no] (no) yes  
  
*** FINAL System shutdown message from remote@nutmeg ***  
System going down IMMEDIATELY  
  
This router will be powered off in 30 minutes. Please save your data and log out  
immediately.  
  
Shutdown NOW!  
[pid 5177]
```

<other-routing-engine>

<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Option <b>other-routing-engine</b> introduced in Junos OS Release 8.0. Command introduced in Junos OS Release 9.0 for EX Series switches. Option <b>sfc</b> introduced for the TX Matrix Plus router in Junos OS Release 9.6. Option <b>both-routing-engines</b> introduced in Junos OS Release 12.1.
<b>Description</b>	Reboot the software.
<b>Options</b>	<p><b>none</b>—Reboot the software immediately.</p> <p><b>all-chassis</b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router or TX Matrix Plus router, reboot all routers connected to the TX Matrix or TX Matrix Plus router, respectively.</p> <p><b>all-lcc</b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router or TX Matrix Plus router, reboot all line card chassis connected to the TX Matrix or TX Matrix Plus router, respectively.</p> <p><b>all-members</b>—(EX4200 switches and MX Series routers only) (Optional) Reboot the software on all members of the Virtual Chassis configuration.</p> <p><b>at time</b>—(Optional) Time at which to reboot the software, specified in one of the following ways:</p> <ul style="list-style-type: none"><li>• <b>now</b>—Stop or reboot the software immediately. This is the default.</li><li>• <b>+minutes</b>—Number of minutes from now to reboot the software.</li><li>• <b>yymmddhhmm</b>—Absolute time at which to reboot the software, specified as year, month, day, hour, and minute.</li><li>• <b>hh:mm</b>—Absolute time on the current day at which to stop the software, specified in 24-hour time.</li></ul> <p><b>both-routing-engines</b>—(Optional) Reboot both Routing Engines at the same time.</p> <p><b>in minutes</b>—(Optional) Number of minutes from now to reboot the software. This option is an alias for the <b>at +minutes</b> option.</p> <p><b>lcc number</b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Line-card chassis number. Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"><li>• 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.</li><li>• 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.</li></ul>

- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Reboot the software on the local Virtual Chassis member.

**media (compact-flash | disk | removable-compact-flash | usb)**—(Optional) Boot medium for next boot. (The options **removable-compact-flash** and **usb** pertain to the J Series routers only.)

**media (external | internal)**—(EX Series switches and MX Series routers only) (Optional) Reboot the boot media:

- **external**—Reboot the external mass storage device.
- **internal**—Reboot the internal flash device.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Reboot the software on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

**message "*text*"**—(Optional) Message to display to all system users before stopping or rebooting the software.

**other-routing-engine**—(Optional) Reboot the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is rebooted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is rebooted.

**partition**—(TX Matrix Plus routers only) (Optional) Reboot using the specified partition on the boot media. This option has the following suboptions:

- 1—Reboot from partition 1.
- 2—Reboot from partition 2.
- **alternate**—Reboot from the alternate partition.

**scc**—(TX Matrix routers only) (Optional) Reboot the Routing Engine on the TX Matrix switch-card chassis. If you issue the command from re0, re0 is rebooted. If you issue the command from re1, re1 is rebooted.

**sfc *number***—(TX Matrix Plus routers only) (Optional) Reboot the Routing Engine on the TX Matrix Plus switch-fabric chassis. If you issue the command from re0, re0 is rebooted. If you issue the command from re1, re1 is rebooted. Replace ***number*** with 0.

**slice *slice***—(EX Series switches only) (Optional) Reboot a partition on the boot media. This option has the following suboptions:

- 1—Power off partition 1.
- 2—Power off partition 2.
- **alternate**—Reboot from the alternate partition.

**Additional Information** Reboot requests are recorded in the system log files, which you can view with the **show log** command (see [show log](#)). Also, the names of any running processes that are scheduled to be shut down are changed. You can view the process names with the **show system processes** command (see [show system processes](#)).

On a TX Matrix or TX Matrix Plus router, if you issue the **request system reboot** command on the master Routing Engine, all the master Routing Engines connected to the routing matrix are rebooted. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are rebooted.

**NOTE:** Before issuing the **request system reboot** command on a TX Matrix Plus router with no options or the **all-chassis**, **all-lcc**, **lcc number**, or **sfc** options, verify that master Routing Engine for all routers in the routing matrix are in the same slot number. If the master Routing Engine for a line-card chassis is in a different slot number than the master Routing Engine for a TX Matrix Plus router, the line-card chassis might become logically disconnected from the routing matrix after the **request system reboot** command.

**NOTE:** To reboot a router that has two Routing Engines, reboot the backup Routing Engine (if you have upgraded it) first, and then reboot the master Routing Engine.

**Required Privilege Level** maintenance

**List of Sample Output**

- [request system reboot on page 117](#)
- [request system reboot \(at 2300\) on page 117](#)
- [request system reboot \(in 2 Hours\) on page 117](#)
- [request system reboot \(Immediately\) on page 117](#)
- [request system reboot \(at 1:20 AM\) on page 117](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system reboot

```
user@host> request system reboot
Reboot the system ? [yes,no] (no)
```

### request system reboot (at 2300)

```
user@host> request system reboot at 2300 message ?Maintenance time!?
Reboot the system ? [yes,no] (no) yes
```

```
shutdown: [pid 186]
*** System shutdown message from root@berry.network.net ***
System going down at 23:00
```

### request system reboot (in 2 Hours)

The following example, which assumes that the time is 5 PM (17:00), illustrates three different ways to request the system to reboot in two hours:

```
user@host> request system reboot at +120
user@host> request system reboot in 120
user@host> request system reboot at 19:00
```

### request system reboot (Immediately)

```
user@host> request system reboot at now
```

### request system reboot (at 1:20 AM)

To reboot the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

```
user@host> request system reboot at 06060120
request system reboot at 120
Reboot the system at 120? [yes,no] (no) yes
```

## request system reboot

---

<b>Syntax</b>	<pre>request system reboot &lt;all-members   local   member member-id&gt; &lt;at time&gt; &lt;in minutes&gt; &lt;media (external   internal)&gt; &lt;message "text"&gt; &lt;slice (1   2   alternate)&gt;</pre>
<b>Release Information</b>	Command introduced in Junos OS Release 9.0 for EX Series switches. Option <b>partition</b> changed to <b>slice</b> in Junos OS Release 10.0 for EX Series switches.
<b>Description</b>	<p>Reboot the Junos OS.</p> <p>Reboot requests are recorded in the system log files, which you can view with the <b>show log</b> command. You can view the process names with the <b>show system processes</b> command.</p>
<b>Options</b>	<p><b>none</b>—Reboots the software immediately.</p> <p><b>all-members   local   member member-id</b>—(EX4200 switch only) (Optional) Specify which member of the Virtual Chassis to reboot:</p> <ul style="list-style-type: none"><li>• <b>all-members</b>—Reboots each switch that is a member of the Virtual Chassis.</li><li>• <b>local</b>—Reboots the local switch, meaning the switch you are logged into, only.</li><li>• <b>member member-id</b>—Reboots the specified member switch of the Virtual Chassis.</li></ul> <p><b>at time</b>—(Optional) Time at which to reboot the software, specified in one of the following ways:</p> <ul style="list-style-type: none"><li>• <b>+minutes</b>—Number of minutes from now to reboot the software.</li><li>• <b>hh:mm</b>—Absolute time on the current day at which to reboot the software, specified in 24-hour time.</li><li>• <b>now</b>—Stop or reboot the software immediately. This is the default.</li><li>• <b>yymmddhhmm</b>—Absolute time at which to reboot the software, specified as year, month, day, hour, and minute.</li></ul> <p><b>in minutes</b>—(Optional) Number of minutes from now to reboot the software. This option is an alias for the <b>at +minutes</b> option.</p> <p><b>media (external   internal)</b>—(Optional) Boot medium for the next boot. The external option reboots the switch using a software package stored on an external boot source, such as a USB flash drive. The internal option reboots the switch using a software package stored in an internal memory source.</p> <p><b>message "text"</b>—(Optional) Message to display to all system users before rebooting the software.</p>

**slice (1 | 2 | alternate)**—(Optional) Reboot using the specified partition on the boot media.

This option has the following suboptions:

- **1**—Reboot from partition 1.
- **2**—Reboot from partition 2.
- **alternate**—Reboot from the alternate partition, which is the partition that did not boot the switch at the last bootup.

**Required Privilege Level** maintenance

**Related Documentation** [• clear system reboot on page 84](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system reboot

```

```

### request system reboot (at 1:20 AM)

To reboot the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

```
user@host> request system reboot at 06060120
request system reboot at 120
Reboot the system at 120? [yes,no] (no) yes
```

## request system scripts convert

---

<b>Syntax</b>	<b>request system scripts convert</b> (slax-to-xslt   xslt-to-slax) <b>source</b> <i>source/filename</i> <b>destination</b> <i>destination/&lt;filename&gt;</i> <b>&lt;partial&gt;</b> <b>&lt;version (1.0   1.1)&gt;</b>
<b>Release Information</b>	Command introduced in Junos OS Release 8.2. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>partial</b> and <b>version</b> options added in Junos OS Release 12.2.
<b>Description</b>	Convert an Extensible Stylesheet Language Transformations (XSLT) script to Stylesheet Language, Alternative syntaX (SLAX), or convert a SLAX script to XSLT.
<b>Options</b>	<b>destination</b> <i>destination/&lt;filename&gt;</i> —Specify a destination for the converted file. Optionally, you can specify a filename for the converted file. If you do not specify a filename, the software assigns one automatically. The default destination filename is <b>SLAX-Conversion-Temp</b> or <b>slax-temp</b> depending on the Junos OS release, with a randomly generated, five-character, alpha-numeric extension. For example, the software converts a source file called <b>test.xml</b> to <b>slax-temp.kWwQk</b> . The software converts a source file called <b>test1.slax</b> to <b>slax-temp.zN61h</b> .  <b>partial</b> —(Optional) Convert partial script input.  <b>slax-to-xslt</b> —Convert a SLAX script to XSLT.  <b>source</b> <i>source/filename</i> —Specify a source file that you want to convert.  <b>version</b> —(Optional) Specify the SLAX version listed in the version statement of the generated script for XSLT-to-SLAX conversions. Acceptable values are 1.0 and 1.1. The default is 1.1.  <b>xslt-to-slax</b> —Convert an XSLT script to SLAX.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Converting Scripts Between SLAX and XSLT</i></li></ul>
<b>List of Sample Output</b>	<a href="#">request system scripts convert slax-to-xslt on page 120</a> <a href="#">request system scripts convert xslt-to-slax on page 121</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system scripts convert slax-to-xslt

```
user@host> request system scripts convert slax-to-xslt source /var/db/scripts/op/script1.slax
destination /var/db/scripts/op
conversion complete
```

**request system scripts convert xslt-to-slax**

```
user@host> request system scripts convert xslt-to-slax source /var/db/scripts/commit/script1.xml  
destination /var/db/scripts/commit partial version 1.0  
conversion complete
```

## request system scripts refresh-from commit

---

<b>Syntax</b>	<code>request system scripts refresh-from commit file <i>file-name</i> url <i>url-path</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 10.1 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Automatically download the initial Junos OS configuration and a set of standard commit scripts during a Junos XML management protocol/NETCONF session when a switch is brought up for the first time.</p> <p>The Junos XML management protocol equivalent for this operational mode command is:</p> <pre>&lt;request-script-refresh-from&gt;   &lt;type&gt;commit&lt;/type&gt;   &lt;file&gt;file-name&lt;/file&gt;   &lt;URL&gt;URL&lt;/URL&gt; &lt;/request-script-refresh-from&gt;</pre>
<b>Options</b>	<p><b>file <i>file-name</i></b>—Name of the file to be downloaded.</p> <p><b>url <i>url-path</i></b>—URL of the file to be downloaded.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Understanding Automatic Refreshing of Scripts on EX Series Switches on page 613</a></li><li>• <a href="#">Junos OS Junos XML Management Protocol Guide</a></li><li>• <a href="#">Junos OS NETCONF XML Management Protocol Guide</a></li></ul>

```
user@switch> request system scripts refresh-from event file config.txt url http://host1.juniper.net
user@switch>
```

## request system scripts refresh-from op

---

<b>Syntax</b>	<code>request system scripts refresh-from op file <i>file-name</i> url <i>url-path</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 10.1 for EX Series switches.
<b>Description</b>	<p>Automatically download the initial Junos OS configuration and a set of standard op scripts during a Junos XML management protocol/NETCONF session when a switch is brought up for the first time.</p> <p>The Junos XML management protocol equivalent for this operational mode command is:</p> <pre>&lt;request-script-refresh-from&gt;   &lt;type&gt;op&lt;/type&gt;   &lt;file&gt;file-name&lt;/file&gt;   &lt;URL&gt;URL&lt;/URL&gt; &lt;/request-script-refresh-from&gt;</pre>
<b>Options</b>	<p><code>file <i>file-name</i></code>—Name of the file to be downloaded.</p> <p><code>url <i>url-path</i></code>—URL of the file to be downloaded.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Understanding Automatic Refreshing of Scripts on EX Series Switches on page 613</a></li><li>• <a href="#">Junos OS Junos XML Management Protocol Guide</a></li><li>• <a href="#">Junos OS NETCONF XML Management Protocol Guide</a></li></ul>
<b>List of Sample Output</b>	<a href="#">request system scripts refresh-from op file config.txt url http://host1.juniper.net on page 124</a>

### Sample Output

`request system scripts refresh-from op file config.txt url http://host1.juniper.net`

```
user@switch> request system scripts refresh-from op file config.txt url http://host1.juniper.net
user@switch>
```

## request system storage cleanup

<b>List of Syntax</b>	<a href="#">Syntax on page 125</a> <a href="#">Syntax (EX Series Switches) on page 125</a> <a href="#">Syntax (MX Series Router) on page 125</a> <a href="#">Syntax (QFX Series) on page 125</a>
<b>Syntax</b>	request system storage cleanup <dry-run>
<b>Syntax (EX Series Switches)</b>	request system storage cleanup <all-members> <dry-run> <local> <member <i>member-id</i> >
<b>Syntax (MX Series Router)</b>	request system storage cleanup <all-members> <dry-run> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	request system storage cleanup <component ( <i>serial number</i>   <i>UUID</i>   all)> <director-group <i>name</i> > <dry-run> <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <name-tag <i>name-tag</i> > <node-group <i>name</i> > <prune> <qfabric (component <i>name</i> )   dry-run   name-tag   repository> <repository (core   log)>
<b>Release Information</b>	Command introduced in Junos OS Release 7.4. <b>dry-run</b> option introduced in Junos OS Release 7.6. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Free storage space on the router or switch by rotating log files and proposing a list of files for deletion. User input is required for file deletion. On a QFabric system, you can delete debug files located on individual devices or on the entire QFabric system.
<b>Options</b>	<b>all-members</b> —(EX4200 switches and MX Series routers only) (Optional) Delete files on the Virtual Chassis master Routing Engine only.

**NOTE:** To delete files on the other members of the Virtual Chassis configuration, log in to each backup Routing Engine and delete the files using the `request system storage cleanup local` command.

**component** (*UUID | serial number | all*)—(QFabric systems only) (Optional) Delete files located on individual QFabric system devices or on the entire QFabric system.

**director-group** *name*—(QFabric systems only) (Optional) Delete files on the Director group.

**dry-run**—(Optional) List files proposed for deletion (without deleting them).

**infrastructure** *name*—(QFabric systems only) (Optional) Delete files on the fabric control Routing Engine and fabric manager Routing Engine.

**interconnect-device** *name*—(QFabric systems only) (Optional) Delete files on the Interconnect device.

**local**—(EX4200 switches and MX Series routers only) (Optional) Delete files on the local Virtual Chassis member.

**member** *member-id*—(EX4200 switches and MX Series routers only) (Optional) Delete files on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**name-tag** *name-tag*—(QFabric systems only) (Optional) Delete debug files that match a specific regular expression.

**node-group** *name*—(QFabric systems only) (Optional) Delete files on the Node group.

**prune**—(QFabric systems only) (Optional) Delete debug files located in either the core or log debug repositories of a QFabric system device.

**qfabric component** *name*—(QFabric systems only) (Optional) Delete debug files located in the debug repositories of a QFabric system device.

**repository** (*core | log*)—(QFabric systems only) (Optional) Specify the repository on the QFabric system device for which you want to delete debug files.

**Additional Information** If logging is configured and being used, the **dry-run** option rotates the log files. In that case, the output displays the message “Currently rotating log files, please wait.” If no logging is currently under way, the output displays only a list of files to delete.

**Required Privilege Level** maintenance

[request system storage cleanup node-group group-name \(QFabric Systems\) on page 132](#)

[request system storage cleanup qfabric component device-name \(QFabric Systems\) on page 133](#)

[request system storage cleanup qfabric component device-name repository core \(QFabric Systems\) on page 133](#)

[request system storage cleanup qfabric component all \(QFabric Systems\) on page 133](#)

**Output Fields** [Table 10 on page 127](#) describes the output fields for the **request system storage cleanup** command. Output fields are listed in the approximate order in which they appear.

**Table 10: request system storage cleanup Output Fields**

Field Name	Field Description
List of files to delete:	Shows list of files available for deletion.
Size	Size of the core-dump file.
Date	Last core-dump file modification date and time.
Name	Name of the core-dump file.
Directory to delete:	Shows list of directories available for deletion.
Repository scope:	Repository where core-dump files and log files are stored. The core-dump files are located in the <b>core</b> repository, and the log files are located in the <b>log</b> repository. The default <b>Repository scope</b> is shared since both the <b>core</b> and <b>log</b> repositories are shared by all of the QFabric system devices.
Repository head:	Name of the top-level repository location.
Repository name:	Name of the repository: <b>core</b> or <b>log</b> .
Creating list of debug artifacts to be removed under:	Shows location of files available for deletion.
List of debug artifacts to be removed under:	Shows list of files available for deletion.

## Sample Output

### `request system storage cleanup dry-run`

```
user@host> request system storage cleanup dry-run
Currently rotating log files, please wait.
This operation can take up to a minute.
```

List of files to delete:

**Release Information**

Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
 Command introduced in Junos OS Release 11.1 for the QFX Series.  
 Command introduced in Junos OS Release 12.2 for ACX Series routers.  
 Options added:

- **dynamic-flow-capture** in Junos OS Release 7.4.
- **dlsr** in Junos OS Release 7.5.
- **event-processing** in Junos OS Release 7.5.
- **ppp** in Junos OS Release 7.5.
- **l2ald** in Junos OS Release 8.0.
- **link-management** in Release 8.0.
- **pgcp-service** in Junos OS Release 8.4.
- **sbc-configuration-process** in Junos OS Release 9.5.
- **services pgcp gateway** in Junos OS Release 9.6.
- **sfc** and **all-sfc** for the TX Matrix Router in Junos OS Release 9.6.

**Description** Restart a Junos OS process.

**CAUTION:** Never restart a software process unless instructed to do so by a customer support engineer. A restart might cause the router or switch to drop calls and interrupt transmission, resulting in possible loss of data.

**Options** **none**—Same as **gracefully**.

**adaptive-services**—(Optional) Restart the configuration management process that manages the configuration for stateful firewall, Network Address Translation (NAT), intrusion detection services (IDS), and IP Security (IPsec) services on the Adaptive Services PIC.

**all-chassis**—(TX Matrix and TX Matrix Plus routers only) (Optional) Restart the software process on all chassis.

**all-lcc**—(TX Matrix and TX Matrix Plus routers only) (Optional) For a TX Matrix router, restart the software process on all T640 routers connected to the TX Matrix router. For a TX Matrix Plus router, restart the software process on all T1600 routers connected to the TX Matrix Plus router.

**all-members**—(MX Series routers only) (Optional) Restart the software process for all members of the Virtual Chassis configuration.

**all-sfc**—(TX Matrix Plus routers only) (Optional) For a TX Matrix Plus router, restart the software processes for the TX Matrix Plus router (or switch-fabric chassis).

**ancpd-service**—(Optional) Restart the Access Node Control Protocol (ANCP) process, which works with a special Internet Group Management Protocol (IGMP) session to collect outgoing interface mapping events in a scalable manner.

**application-identification**—(Optional) Restart the process that identifies an application using intrusion detection and prevention (IDP) to allow or deny traffic based on applications running on standard or nonstandard ports.

**audit-process**—(Optional) Restart the RADIUS accounting process that gathers statistical data that can be used for general network monitoring, analyzing, and tracking usage patterns, for billing a user based on the amount of time or type of services accessed.

**auto-configuration**—(Optional) Restart the Interface Auto-Configuration process.

**autoinstallation**—(EX Series switches only) (Optional) Restart the autoinstallation process.

**captive-portal-content-delivery**—(Optional) Restart the HTTP redirect service by specifying the location to which a subscriber's initial Web browser session is redirected, enabling initial provisioning and service selection for the subscriber.

**ce-l2tp-service**—(M10, M10i, M7i, and MX Series routers only) (Optional) Restart the Universal Edge Layer 2 Tunneling Protocol (L2TP) process, which establishes L2TP tunnels and Point-to-Point Protocol (PPP) sessions through L2TP tunnels.

**chassis-control**—(Optional) Restart the chassis management process.

**class-of-service**—(Optional) Restart the class-of-service (CoS) process, which controls the router's or switch's CoS configuration.

**clksyncd-service**—(Optional) Restart the external clock synchronization process, which uses synchronous Ethernet (SyncE).

**database-replication**—(EX Series switches and MX Series routers only) (Optional) Restart the database replication process.

**datapath-trace-service**—(Optional) Restart the packet path tracing process.

**dhcp**—(J Series routers and EX Series switches only) (Optional) Restart the software process for a Dynamic Host Configuration Protocol (DHCP) server. A DHCP server allocates network IP addresses and delivers configuration settings to client hosts without user intervention.

**dhcp-service**—(Optional) Restart the Dynamic Host Configuration Protocol process.

**dialer-services**—(J Series routers and EX Series switches only) (Optional) Restart the ISDN dial-out process.

**diameter-service**—(Optional) Restart the diameter process.

**disk-monitoring**—(Optional) Restart disk monitoring, which checks the health of the hard disk drive on the Routing Engine.

**dls**—(J Series routers and QFX Series only) (Optional) Restart the data link switching (DLSw) service.

**dot1x-protocol**—(EX Series switches only) (Optional) Restart the port-based network access control process.

**dynamic-flow-capture**—(Optional) Restart the dynamic flow capture (DFC) process, which controls DFC configurations on Monitoring Services III PICs.

**ecc-error-logging**—(Optional) Restart the error checking and correction (ECC) process, which logs ECC parity errors in memory on the Routing Engine.

**ethernet-connectivity-fault-management**—(Optional) Restart the process that provides IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.

**ethernet-link-fault-management**—(EX Series switches and MX Series routers only) (Optional) Restart the process that provides the OAM link fault management (LFM) information for Ethernet interfaces.

**ethernet-switching**—(EX Series switches only) (Optional) Restart the Ethernet switching process.

**event-processing**—(Optional) Restart the event process (eventd).

**fibre-channel**—(QFX Series only) (Optional) Restart the Fibre Channel process.

**firewall**—(Optional) Restart the firewall management process, which manages the firewall configuration and enables accepting or rejecting packets that are transiting an interface on a router or switch.

**general-authentication-service**—(EX Series switches and MX Series routers only) (Optional) Restart the general authentication process.

**gracefully**—(Optional) Restart the software process.

**iccp-service**—(Optional) Restart the Inter-Chassis Communication Protocol (ICCP) process.

**idp-policy**—(Optional) Restart the intrusion detection and prevention (IDP) protocol process.

**immediately**—(Optional) Immediately restart the software process.

**interface-control**—(Optional) Restart the interface process, which controls the router's or switch's physical interface devices and logical interfaces.

**ipsec-key-management**—(Optional) Restart the IPsec key management process.

**isdn-signaling**—(J Series routers and QFX Series only) (Optional) Restart the ISDN signaling process, which initiates ISDN connections.

**kernel-replication**—(Optional) Restart the kernel replication process, which replicates the state of the backup Routing Engine when graceful Routing Engine switchover (GRES) is configured.

**l2-learning**—(Optional) Restart the Layer 2 address flooding and learning process.

**l2cpd-service**—(Optional) Restart the Layer 2 Control Protocol process, which enables features such as Layer 2 protocol tunneling and nonstop bridging.

**l2tp-service**—(M10, M10i, M7i, and MX Series routers only) (Optional) Restart the Layer 2 Tunneling Protocol (L2TP) process, which sets up client services for establishing Point-to-Point Protocol (PPP) tunnels across a network and negotiating Multilink PPP if it is implemented.

**l2tp-universal-edge**—(MX Series routers only) (Optional) Restart the L2TP process, which establishes L2TP tunnels and PPP sessions through L2TP tunnels.

**lACP**—(Optional) Restart the Link Aggregation Control Protocol (LACP) process. LACP provides a standardized means for exchanging information between partner systems on a link to allow their link aggregation control instances to reach agreement on the identity of the LAG to which the link belongs, and then to move the link to that LAG,

and to enable the transmission and reception processes for the link to function in an orderly manner.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) For a TX Matrix router, restart the software process for a specific T640 router that is connected to the TX Matrix router. For a TX Matrix Plus router, restart the software process for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**license-service**—(EX Series switches only) (Optional) Restart the feature license management process.

**link-management**—(TX Matrix and TX Matrix Plus routers and EX Series switches only) (Optional) Restart the Link Management Protocol (LMP) process, which establishes and maintains LMP control channels.

**lldpd-service**—(EX Series switches only) (Optional) Restart the Link Layer Discovery Protocol (LLDP) process.

**local**—(MX Series routers only) (Optional) Restart the software process for the local Virtual Chassis member.

**local-policy-decision-function**—(Optional) Restart the process for the Local Policy Decision Function, which regulates collection of statistics related to applications and application groups and tracking of information about dynamic subscribers and static interfaces.

**mac-validation**—(Optional) Restart the Media Access Control (MAC) validation process, which configures MAC address validation for subscriber interfaces created on demux interfaces in dynamic profiles on MX Series routers.

**member *member-id***—(MX Series routers only) (Optional) Restart the software process for a specific member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**mib-process**—(Optional) Restart the Management Information Base (MIB) version II process, which provides the router's MIB II agent.

**mobile-ip**—(Optional) Restart the Mobile IP process, which configures Junos OS Mobile IP features.

**mountd-service**—(EX Series switches and MX Series routers only) (Optional) Restart the service for NFS mount requests.

**mpls-traceroute**—(Optional) Restart the MPLS Periodic Traceroute process.

**mspd**—(Optional) Restart the Multiservice process.

**multicast-snooping**—(EX Series switches and MX Series routers only) (Optional) Restart the multicast snooping process, which makes Layer 2 devices, such as VLAN switches, aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.

**named-service**—(Optional) Restart the DNS Server process, which is used by a router or a switch to resolve hostnames into addresses.

**network-access-service**—(J Series routers and QFX Series only) (Optional) Restart the network access process, which provides the router's Challenge Handshake Authentication Protocol (CHAP) authentication service.

**nfsd-service**—(Optional) Restart the Remote NFS Server process, which provides remote file access for applications that need NFS-based transport.

**packet-triggered-subscribers**—(Optional) Restart the packet-triggered subscribers and policy control (PTSP) process, which allows the application of policies to dynamic subscribers that are controlled by a subscriber termination device.

**peer-selection-service**—(Optional) Restart the Peer Selection Service process.

**pgcp-service**—(Optional) Restart the pgcpd service process running on the Routing Engine. This option does not restart pgcpd processes running on mobile station PICs. To restart pgcpd processes running on mobile station PICs, use the **services pgcp gateway** option.

**pgm**—(Optional) Restart the process that implements the Pragmatic General Multicast (PGM) protocol for assisting in the reliable delivery of multicast packets.

**pic-services-logging**—(Optional) Restart the logging process for some PICs. With this process, also known as fsad (the file system access daemon), PICs send special logging information to the Routing Engine for archiving on the hard disk.

**pki-service**—(Optional) Restart the PKI Service process.

**ppp**—(Optional) Restart the Point-to-Point Protocol (PPP) process, which is the encapsulation protocol process for transporting IP traffic across point-to-point links.

**ppp-service**—(Optional) Restart the Universal Edge PPP process, which is the encapsulation protocol process for transporting IP traffic across Universal Edge routers.

**pppoe**—(Optional) Restart the Point-to-Point Protocol over Ethernet (PPPoE) process, which combines PPP that typically runs over broadband connections with the Ethernet link-layer protocol that allows users to connect to a network of hosts over a bridge or access concentrator.

**protected-system-domain-service**—(Optional) Restart the Protected System Domain (PSD) process.

**redundancy-interface-process**—(Optional) Restart the ASP redundancy process.

**remote-operations**—(Optional) Restart the remote operations process, which provides the ping and traceroute MIBs.

**root-system-domain-service**—(Optional) Restart the Root System Domain (RSD) service.

**routing**—(ACX Series routers, QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the routing protocol process.

**routing <logical-system *logical-system-name*>**—(Optional) Restart the routing protocol process, which controls the routing protocols that run on the router or switch and maintains the routing tables. Optionally, restart the routing protocol process for the specified logical system only.

**sampling**—(Optional) Restart the sampling process, which performs packet sampling based on particular input interfaces and various fields in the packet header.

**sbc-configuration-process**—(Optional) Restart the session border controller (SBC) process of the border signaling gateway (BSG).

**scc**—(TX Matrix routers only) (Optional) Restart the software process on the TX Matrix router (or switch-card chassis).

**sdk-service**—(Optional) Restart the SDK Service process, which runs on the Routing Engine and is responsible for communications between the SDK application and Junos OS. Although the SDK Service process is present on the router, it is turned off by default.

**secure-neighbor-discovery**—(QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the secure Neighbor Discovery Protocol (NDP) process, which provides support for protecting NDP messages.

**sfc *number***—(TX Matrix Plus routers only) (Optional) Restart the software process on the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

**service-deployment**—(Optional) Restart the service deployment process, which enables Junos OS to work with the Session and Resource Control (SRC) software.

**services**—(Optional) Restart a service.

**services pgcp gateway *gateway-name***—(Optional) Restart the pgcpd process for a specific border gateway function (BGF) running on an MS-PIC. This option does not restart the pgcpd process running on the Routing Engine. To restart the pgcpd process on the Routing Engine, use the **pgcp-service** option.

**sflow-service**—(EX Series switches only) (Optional) Restart the flow sampling (sFlow technology) process.

**snmp**—(Optional) Restart the SNMP process, which enables the monitoring of network devices from a central location and provides the router's or switch's SNMP master agent.

**soft**—(Optional) Reread and reactivate the configuration without completely restarting the software processes. For example, BGP peers stay up and the routing table stays constant. Omitting this option results in a graceful restart of the software process.

**static-subscribers**—(Optional) Restart the static subscribers process, which associates subscribers with statically configured interfaces and provides dynamic service activation and activation for these subscribers.

**statistics-service**—(Optional) Restart the process that manages the Packet Forwarding Engine statistics.

**subscriber-management**—(Optional) Restart the Subscriber Management process.

**subscriber-management-helper**—(Optional) Restart the Subscriber Management Helper process.

**tunnel-oamd**—(Optional) Restart the Tunnel OAM process, which enables the Operations, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol tunneling (L2PT) allows service providers to send Layer 2 PDUs across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.

**usb-control**—(J Series routers and MX Series routers only) (Optional) Restart the USB control process.

**vrp**—(ACX Series routers, EX Series switches, and MX Series routers only) (Optional) Restart the Virtual Router Redundancy Protocol (VRRP) process, which enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.

**web-management**—(J Series routers, QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the Web management process.

**Required Privilege Level**

reset

## Sample Output

### restart interfaces

```
user@host> restart interfaces
interfaces process terminated
interfaces process restarted
```

## set chassis display message

---

<b>List of Syntax</b>	<a href="#">Syntax on page 146</a> <a href="#">Syntax (TX Matrix Router) on page 146</a> <a href="#">Syntax (TX Matrix Plus Router) on page 146</a>
<b>Syntax</b>	set chassis display message " <i>message</i> " <permanent>
<b>Syntax (TX Matrix Router)</b>	set chassis display message " <i>message</i> " ( <i>lcc number</i>   <i>scc</i> ) <permanent>
<b>Syntax (TX Matrix Plus Router)</b>	set chassis display message " <i>message</i> " ( <i>fpc-slot slot-number</i>   <i>lcc number</i>   <i>sfc number</i> ) <permanent>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option for TX Matrix Plus router introduced in Junos OS Release 9.6.
<b>Description</b>	Display or stop a text message on the craft interface display, which is on the front of the router, or on the LCD panel display on the switch. The craft interface alternates the display of text messages with standard craft interface messages three times, switching between messages every 60 seconds.

**NOTE:** On T Series routers, when this command is executed with the **permanent** option, the display of the text message alternates with that of the standard craft interface message continuously every 60 seconds.

By default, on both the router and the switch, the text message is displayed for 5 minutes. The craft interface display has four 20-character lines. The LCD panel display has two 16-character lines, and text messages appear only on the second line.

**Options**    **"message"**—Message to display. On the craft interface display, if the message is longer than 20 characters, it wraps onto the next line. If a word does not fit on one line, the entire word moves down to the next line. Any portion of the message that does not fit on the display is truncated. An empty pair of quotation marks (" ") deletes the text message from the craft interface display. On the LCD panel display, the message is limited to 16 characters.

**fpc-slot slot-number**—(TX Matrix Plus routers and EX4200 and QFX Series only) On the router or switch, display the text message on the craft interface for a specific Flexible PIC Concentrator (FPC). Replace **slot-number** with a value from 0 through 31. On the switch, display the text message for a specific member of a Virtual Chassis, where **fpc-slot slot-number** corresponds to the member ID. Replace **slot-number** with a value from 0 through 9. On the QFX Series, the **slot-number** is always 0. On a TX Matrix Plus router with 3D SIBs replace **slot-number** with a value from 0 through 63.

**lcc number**—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**permanent**—(Optional) Display a text message on the craft interface display or LCD panel display permanently.

**scc**—(TX Matrix routers only) Display the text message on the craft interface display of the TX Matrix router (switch-card chassis).

**sfc number**—(TX Matrix Plus routers only) Display the text message on the craft interface display of the TX Matrix Plus router (or switch-fabric chassis).

[set chassis display message \(Deleting\) on page 148](#)

**Output Fields** See *show chassis craft-interface* for an explanation of output fields.

## Sample Output

### set chassis display message (Creating)

The following example shows how to set the display message and verify the result:

```
user@host> set chassis display message "NOC contact Dusty (888) 555-1234"
message sent
```

```
user@host> show chassis craft-interface
Red alarm:      LED off, relay off
Yellow alarm:   LED off, relay off
Host OK LED:    On
Host fail LED:  Off
FPCs           0 1 2 3 4 5 6 7
```

```
-----  
Green  ..  *..  *  *.  
Red    .....  
LCD screen:  
+-----+  
|NOC contact Dusty|  
|(888) 555-1234  |  
+-----+
```

### set chassis display message (Deleting)

The following example shows how to delete the display message and verify that the message is removed:

```
user@host> set chassis display message ""  
message sent
```

```
user@host> show chassis craft-interface  
Red alarm:      LED off, relay off  
Yellow alarm:   LED off, relay off  
Host OK LED:    On  
Host fail LED:  Off  
FPCs           0  1  2  3  4  5  6  7  
-----

<b>Release Information</b>	Command introduced in Junos OS Release 10.0 on MX Series 3D Universal Edge Routers, M120 routers, and M320 routers, T320 routers, T640 routers, T1600 routers, TX Matrix Routers, and TX Matrix Plus routers. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 11.4 for EX Series switches. Command introduced in Junos OS Release 12.3 for PTX5000 Packet Transport Routers. Command introduced in Junos OS Release 12.1 for T4000 routers. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for ACX Series Routers. Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.
<b>Description</b>	(T Series routers, TX Matrix routers, TX Matrix Plus routers, M120 routers, M320 routers, MX104 routers, MX2010 routers, MX2020 routers, MX Series 3D Universal Edge Routers,

QFX3008-I Interconnect devices, EX Series switches, and PTX Series Packet Transport Routers only) Show information about the fan tray and fans.

**Options** **all-members**—(MX Series routers only) (Optional) Display information about the fan tray and fans for all members of the Virtual Chassis configuration.

**local**—(MX Series routers only) (Optional) Display information about the fan tray and fans for the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display information about the fan tray and fans for the specified member of the Virtual Chassis configuration. For an MX Series Virtual Chassis, replace *member-id* variable with a value 0 or 1.

**interconnect-device *name***—(QFX3000-G QFabric systems only) (Optional) Display information about the fan tray and fans for the specified QFX3008-I Interconnect device.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display information about the fan tray and fans for the specified T640 router (line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display information about the fan tray and fans for the specified router (line-card chassis) that is connected to a TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**scc**—(TX Matrix routers only) (Optional) Display information about the fan tray and fans for the TX Matrix router (switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display information about the fan tray and fans for the TX Matrix Plus router (switch-fabric chassis). Replace *number* variable with 0.

**Description** On routers and switches, display the version levels of the firmware running on the System Control Board (SCB), Switching and Forwarding Module (SFM), System and Switch Board (SSB), Forwarding Engine Board (FEB), Flexible PIC Concentrators (FPCs), and Routing Engines. On a TX Matrix Plus router, display the version levels of the firmware running on the FPCs and the Switch Processor Mezzanine Board (SPMBs).

On EX2200, EX3200, and EX4200 switches, and the QFX Series, display the version levels of the firmware running on the switch. On an EX8208 switch, display the version levels of the firmware running on the Switch Fabric and Routing Engine (SRE) modules and on the line cards (shown as FPCs). On an EX8216 switch, display the version levels of the firmware running on the Routing Engine (RE) modules and on the line cards (shown as FPCs).

**Options** **none**—Display the version levels of the firmware running. For an EX4200 switch that is a member of a Virtual Chassis, display version levels for all members. For a TX Matrix router, display version levels for the firmware on the TX Matrix router and on all the T640 routers connected to the TX Matrix router. For a TX Matrix Plus router, display version levels for the firmware on the TX Matrix Plus router and on all the routers connected to the TX Matrix Plus router.

**all-members**—(MX Series routers only) (Optional) Display the version levels of the firmware running for all members of the Virtual Chassis configuration.

**interconnect-device *name***—(QFabric systems) (Optional) Display the version levels of the firmware running on the Interconnect device.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display version levels for the firmware on a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display the version levels for the firmware on a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display the version levels of the firmware running for the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display the version levels of the firmware running for the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**node-device**—(QFabric systems only) (Optional) Display the version levels of the firmware running on the Node device.

**scc**—(TX Matrix router only) (Optional) Display version levels for the firmware on the TX Matrix router (switch-card chassis).

**sfc number**—(TX Matrix Plus router only) (Optional) Display version levels for the firmware on the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with **0**.

**detail**—(EX3200, EX3300, EX4200, and EX4500 standalone and Virtual Chassis member switches only) (Optional) Display version levels of the firmware running on the switch for its programmable hardware components.

**Required Privilege Level** view

**Output Fields** [Table 12 on page 166](#) lists the output fields for the **show chassis firmware** command. Output fields are listed in the approximate order in which they appear.

Table 12: show chassis firmware Output Fields

Field Name	Field Description
<b>Part</b>	(MX Series, MX2010, and MX2020 routers) Chassis part name.
<b>Type</b>	(MX Series, MX2010, and MX2020 routers) Type of firmware: On routers: <b>ROM</b> or <b>O/S</b> . On switches: <b>uboot</b> or <b>loader</b> .
<b>Version</b>	(MX Series, MX2010, and MX2020 routers) Version of firmware running on the chassis part.
<b>FPC</b>	( <i>detail</i> option only) Number of FPC. For a standalone switch, the value is 0. For a Virtual Chassis configuration, value in the range of 0-9; refers to the member ID assigned to the switch.
<b>AFEB</b>	(MX104 routers) Version of the compact Forwarding Engine Board.
<b>Boot</b>	( <i>detail</i> option only) Version of the SYSPLD.
<b>PoE</b>	( <i>detail</i> option only) Version of the PoE firmware.
<b>PFE-&lt;number&gt;</b>	( <i>detail</i> option only) Version of the PFE used in the switch.
<b>PHY-</b>	( <i>detail</i> option only) Version of the physical layer device (PHY) used in the switch.
<b>microcode</b>	( <i>detail</i> option only) Microcode of the physical layer devices (PHY) used in the switch.
<b>uboot</b>	( <i>detail</i> option only) Version of the u-boot used in the switch.
<b>loader</b>	( <i>detail</i> option only) Version of the loader used in the switch.

## Sample Output

## show chassis lcd

---

<b>List of Syntax</b>	<a href="#">show chassis lcd (EX Series) on page 174</a> <a href="#">show chassis lcd (QFX Series and QFabric Systems) on page 174</a>
<b>show chassis lcd (EX Series)</b>	<code>show chassis lcd</code> <code>&lt;fpc-slot <i>fpc-slot-number</i>&gt;</code> <code>&lt;menu &lt;(all-members   local   member <i>member-id</i>)&gt;&gt;</code>
<b>show chassis lcd (QFX Series and QFabric Systems)</b>	<code>show chassis lcd</code> <code>&lt;fpc-slot <i>fpc-slot-number</i>&gt;</code> <code>&lt;interconnect-device <i>device-id</i>&gt;</code> <code>&lt;node-device <i>device-id</i>&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 9.0 for EX Series switches. <code>menu</code> option introduced in Junos OS Release 10.2 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 13.1 for QFabric systems.
<b>Description</b>	Display the information that appears on the LCD panel of EX3200, EX3300, EX4200, EX4500, EX6200, and EX8200 switches, XRE200 External Routing Engines, QFX Series standalone switches, and Interconnect devices and Node devices within a QFabric system. Display the status of the currently selected port parameter of the Status LED for each network port on the device.
<b>Options</b>	<b>none</b> —Display the information that appears on the LCD panel (for any EX Series member switch in a Virtual Chassis or for XRE200 External Routing Engines, display the information for all Virtual Chassis members). Display the status of the currently selected port parameter of the Status LED for each network port.  <b>fpc-slot &lt;<i>fpc-slot-number</i>&gt;</b> —(Optional) Display the information as follows: <ul style="list-style-type: none"><li>(EX3200, EX3300, EX4200, and EX4500 switches, or the QFX Series) Display the information that appears on the LCD panel for either an FPC slot with no <i>fpc-slot-number</i> value specified or for the FPC slot specified by <b>fpc-slot 0</b>. <i>fpc-slot</i> refers to the switch itself and <b>0</b> is the only valid value for <i>fpc-slot-number</i>. Output for these options is the same as for the <b>none</b> option.  Also display the status of the currently selected port parameter of the Status LED for each network port.</li><li>(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) If no <i>fpc-slot-number</i> value is specified, display the information that appears on the LCD panel for all members of the Virtual Chassis. Output for this option is the same as for the <b>none</b> option. If the <i>fpc-slot-number</i> value is specified (it equals the <i>member-id</i> value), display the information for the specified member.  Also display the status of the currently selected port parameter of the Status LED for each network port.</li><li>(EX6200 or EX8200 switches)—Display the information that appears on the LCD panel for the line card in the line-card slot specified by the <i>fpc-slot-number</i> value.</li></ul>

Also display the status of the currently selected port parameter of the Status LED for each network port.

**interconnect-device *device-id***—(QFabric systems only) (Optional) Display the front panel contents and LED status of all the ports on the Interconnect device.

**menu**—(Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel.

**menu all-members**—(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) (Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel for all Virtual Chassis members.

**menu local**—(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) (Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel for the Virtual Chassis member from which you issued the command.

**menu member *member-id***—(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) (Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel for the specified Virtual Chassis member.

**node-device *device-id***—(QFabric systems only) (Optional) Display the front panel contents and LED status of all the ports on the Node device.

**Required Privilege Level**

**Output Fields** Table 13 on page 176 lists the output fields for the **show chassis lcd** command. Output fields are listed in the approximate order in which they appear.

**Table 13: show chassis lcd Output Fields**

Field Name	Field Description
<b>membernumber</b> (XRE200 External Routing Engine)	Member ID of the device whose content is being displayed.
<b>Front panel contents for slot</b>	FPC slot number of the switch whose content is being displayed. The number is always <b>0</b> , except for EX4200 switches in a Virtual Chassis, where it is the member ID value.
<b>Front panel contents</b> (EX6200, EX8200 switch, XRE200 External Routing Engine, and QFX Series)	<p>On EX6200 switches, EX8200 switches, and XRE200 External Routing Engines, no slot number is displayed.</p> <p>On XRE200 External Routing Engines, this field appears under the <b>member number</b> field for each member device in the EX8200 Virtual Chassis.</p>
<b>LCD screen</b>	<p>The first line displays the hostname (for Virtual Chassis members, displays the member ID, the current role, and hostname; for EX8200 switches, displays <b>RE</b> and the hostname). The second line displays the currently selected port parameter of the Status LED and the alarms counter. The Status LED port parameters are:</p> <ul style="list-style-type: none"> <li>• <b>ADM</b>—Administrative</li> <li>• <b>SPD</b>—Speed</li> <li>• <b>DPX</b>—Duplex</li> <li>• <b>POE</b>—Power over Ethernet (EX3200 and EX4200 switches only)</li> </ul>
<b>LEDs status</b>	Current state of the Alarms, System, and Master LEDs (chassis status LEDs).
<b>Interface</b>	Names of the interfaces on the switch.
<b>LED (ADM/SPD/DPX/POE)</b>	<p>State of the currently selected port parameter of the Status LED for the interface. The Status LED port parameters are:</p> <p><b>NOTE:</b> The XRE200 External Routing Engine always displays the <b>NA</b> parameter. The QFX Series products do not have any of the port parameters listed below.</p> <ul style="list-style-type: none"> <li>• <b>ADM</b>—Administrative</li> <li>• <b>SPD</b>—Speed</li> <li>• <b>DPX</b>—Duplex</li> <li>• <b>NA</b>—Not applicable.</li> <li>• <b>POE</b>—Power over Ethernet</li> </ul>
<b>fpcx</b>	On standalone EX Series and QFX Series switches, always <b>0</b> . On EX Series Virtual Chassis member switches, member ID of the Virtual Chassis member whose LCD menu is displayed.

## Sample Output

### show chassis lcd (Two-Member EX4200 Virtual Chassis)

```
user@switch> show chassis lcd
```

## show configuration

---

<b>Syntax</b>	<code>show configuration</code> <code>&lt;statement-path&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Display the configuration that currently is running on the router or switch, which is the last committed configuration.
<b>Options</b>	<p><b>none</b>—Display the entire configuration.</p> <p><b>statement-path</b>—(Optional) Display one of the following hierarchies in a configuration. (Each <b>statement-path</b> option has additional suboptions not described here. See the appropriate configuration guide or EX Series switch documentation for more information.)</p> <ul style="list-style-type: none"> <li>• <b>access</b>—Network access configuration.</li> <li>• <b>access-profile</b>—Access profile configuration.</li> <li>• <b>accounting-options</b>—Accounting data configuration.</li> <li>• <b>applications</b>—Applications defined by protocol characteristics.</li> <li>• <b>apply-groups</b>—Groups from which configuration data is inherited.</li> <li>• <b>chassis</b>—Chassis configuration.</li> <li>• <b>chassis network-services</b>—Current running mode.</li> <li>• <b>class-of-service</b>—Class-of-service configuration.</li> <li>• <b>diameter</b>—Diameter base protocol layer configuration.</li> <li>• <b>ethernet-switching-options</b>—(EX Series switch only) Ethernet switching configuration.</li> <li>• <b>event-options</b>—Event processing configuration.</li> <li>• <b>firewall</b>—Firewall configuration.</li> <li>• <b>forwarding-options</b>—Options that control packet sampling.</li> <li>• <b>groups</b>—Configuration groups.</li> <li>• <b>interfaces</b>—Interface configuration.</li> <li>• <b>jsrc</b>—JSRC partition configuration.</li> <li>• <b>jsrc-partition</b>—JSRC partition configuration.</li> <li>• <b>logical-systems</b>—Logical system configuration.</li> <li>• <b>poe</b>—(EX Series switch only) Power over Ethernet configuration.</li> <li>• <b>policy-options</b>—Routing policy option configuration.</li> <li>• <b>protocols</b>—Routing protocol configuration.</li> </ul>

- **routing-instances**—Routing instance configuration.
- **routing-options**—Protocol-independent routing option configuration.
- **security**—Security configuration.
- **services**—Service PIC applications configuration.
- **snmp**—Simple Network Management Protocol configuration.
- **system**—System parameters configuration.
- **virtual-chassis**—(EX Series switch only) Virtual Chassis configuration.
- **vlan**—(EX Series switch only) VLAN configuration.

**Additional Information** The portions of the configuration that you can view depend on the user class that you belong to and the corresponding permissions. If you do not have permission to view a portion of the configuration, the text **ACCESS-DENIED** is substituted for that portion of the configuration. If you do not have permission to view authentication keys and passwords in the configuration, because the secret permission bit is not set for your user account, the text **SECRET-DATA** is substituted for that portion of the configuration. If an identifier in the configuration contains a space, the identifier is displayed in quotation marks.

Likewise, when you issue the **show configuration** command with the **| display set** pipe option to view the configuration as **set** commands, those portions of the configuration that you do not have permissions to view are substituted with the text **ACCESS-DENIED**.

**Required Privilege Level**

view

- *Overview of Junos OS CLI Operational Mode Commands*

**List of Sample Output**

[show configuration on page 188](#)  
[show configuration policy-options on page 189](#)

**Output Fields**

This command displays information about the current running configuration.

## Sample Output

**show configuration**

```
user@host> show configuration

## show host

---

<b>Syntax</b>	<code>show host <i>hostname</i></code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display Domain Name System (DNS) hostname information.
<b>Options</b>	<i>hostname</i> —Hostname or address.
<b>Additional Information</b>	The <b>show host</b> command displays the raw data received from the DNS server.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show host on page 190</a>

## Sample Output

### show host

```
user@host> show host snark
snark.boojum.net has address 192.168.1.254

user@host> show host 192.168.1.254
Name: snark.boojum.net
Address: 192.168.1.254
Aliases:
```

## show ntp associations

<b>Syntax</b>	<code>show ntp associations</code> <code>&lt;no-resolve&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display Network Time Protocol (NTP) peers and their state.
<b>Options</b>	<b>none</b> —Display NTP peers and their state.  <b>no-resolve</b> —(Optional) Suppress symbolic addressing.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show ntp status on page 193</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show ntp associations on page 192</a>
<b>Output Fields</b>	<a href="#">Table 14 on page 191</a> describes the output fields for the <b>show ntp associations</b> command. Output fields are listed in the approximate order in which they appear.

**Table 14: show ntp associations Output Fields**

Field Name	Field Description
<b>remote</b>	Address or name of the remote NTP peer.
<b>refid</b>	Reference identifier of the remote peer. If the reference identifier is not known, this field shows a value of <b>0.0.0.0</b> .
<b>st</b>	Stratum of the remote peer.
<b>t</b>	Type of peer: <b>b</b> (broadcast), <b>l</b> (local), <b>m</b> (multicast), or <b>u</b> (unicast).
<b>when</b>	When the last packet from the peer was received.
<b>poll</b>	Polling interval, in seconds.
<b>reach</b>	Reachability register, in octal.
<b>delay</b>	Current estimated delay of the peer, in milliseconds.
<b>offset</b>	Current estimated offset of the peer, in milliseconds.
<b>disp</b>	Current estimated dispersion of the peer, in milliseconds.

Table 14: show ntp associations Output Fields (*continued*)

Field Name	Field Description
<i>peer-name</i>	<p>Peer name and status of the peer in the clock selection process:</p> <ul style="list-style-type: none"> <li>• space—Discarded because of a high stratum value or failed sanity checks.</li> <li>• x—Designated "falseticker" by the intersection algorithm.</li> <li>• .—Culled from the end of the candidate list.</li> <li>• — —Discarded by the clustering algorithm.</li> <li>• +—Included in the final selection set.</li> <li>• #—Selected for synchronization, but the distance exceeds the maximum.</li> <li>• *—Selected for synchronization.</li> <li>• o—Selected for synchronization, but the packets-per-second (pps) signal is in use.</li> </ul>

## Sample Output

### show ntp associations

```

user@host> show ntp associations
      remote          refid      st t when poll reach  delay  offset  disp

## show ntp status

<b>Syntax</b>	<code>show ntp status</code> <code>&lt;no-resolve&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the values of internal variables returned by Network Time Protocol (NTP) peers.
<b>Options</b>	<b>none</b> —Display the values of internal variables returned by NTP peers.  <b>no-resolve</b> —(Optional) Suppress symbolic addressing.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show ntp associations on page 191</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show ntp status on page 194</a>
<b>Output Fields</b>	<a href="#">Table 15 on page 193</a> describes the output fields for the <b>show ntp status</b> command. Output fields are listed in the approximate order in which they appear.

**Table 15: show ntp status Output Fields**

Field Name	Field Description
<b>status</b>	System status word, a code representing the status items listed.
<b>leap_none</b>	Indicates a normal synchronized state with no leap seconds imminent. Other options could be <b>leap_add_sec</b> , <b>leap_del_sec</b> , or <b>leap_alarm</b> , indicating a leap second will be added, deleted, or a leap second requirement is upcoming.
<b>sync_ntp</b>	Indicates the current synchronization source, in this case, an NTP server. Other options include <b>sync_alarm</b> and <b>sync_unspec</b> , both indicating that the router has not been synched.
<b>x events</b>	Indicates the number of events that have occurred since that last code change. An event is often the receipt of an NTP polling message.
<b>event_peer/strat_chg</b>	Describes the most recent event, in this case, the stratum of the peer server changed.
<b>version</b>	A detailed description of the version of NTP being used.
<b>processor</b>	Indicates the current hardware platform and version of the processor.
<b>system</b>	Detailed description of the name and version of the operating system in use.
<b>leap</b>	The number of leap seconds in use.

Table 15: show ntp status Output Fields (*continued*)

Field Name	Field Description
<b>stratum</b>	The stratum of the peer server. Anything greater than 1 is a secondary reference source, and the number roughly represents the number of hops away from the stratum 1 server.. Stratum 1 is a primary reference, such as an atomic clock.
<b>precision</b>	The precision of the peer clock, how precisely the frequency and time can be maintained with this particular timekeeping system.
<b>rootdelay</b>	The total roundtrip delay to the primary reference source, in seconds.
<b>rootdispersion</b>	The maximum error relative to the primary reference source, in seconds.
<b>peer</b>	An identification number of the peer in use.
<b>refid</b>	Reference identifier of the remote peer. If the reference identifier is not known, this field shows a value of 0.0.0.0.
<b>reftime</b>	The local time, in timestamp format, when the local clock was last updated. If the local clock has never been synchronized, the value is zero.
<b>poll</b>	The NTP broadcast message polling interval, in seconds.
<b>clock</b>	The current time on the local router clock.
<b>state</b>	The current mode of NTP operation, where 1 is symmetric active, 2 is symmetric passive, 3 is client, 4 is server, and 5 is broadcast.
<b>offset</b>	Current estimated offset of the peer, in milliseconds. Indicates the time difference between the reference clock and the local clock.
<b>frequency</b>	The frequency of the clock.
<b>jitter</b>	Indicates the magnitude of jitter, in milliseconds, between several time queries.
<b>stability</b>	A measure of how well this clock can maintain a constant frequency.

## Sample Output

### show ntp status

```

user@host> show ntp status
assID=0 status=0544 leap_none, sync_local_proto, 4 events, event_peer/strat_chg,
version="ntpd 4.2.2p1@1.1570-o Tue May 19 13:57:55 UTC 2009 (1)",
processor="x86_64", system="Linux/2.6.18-164.el5", leap=00, stratum=4,

stability=0.000, tai=0

```

## show system firmware

**Syntax** show system firmware  
<compatibility>

**Release Information** Command introduced in Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.4 for EX Series switches.

**Description** (J Series routers and EX8200 switches only) Display firmware information.

**NOTE:** On SRX100, SRX210, SRX240, and SRX 650 devices, the **show system firmware** command now displays all the installed firmware versions, even if the installed firmware versions are earlier than the currently installed firmware version.

**Options** **compatibility**—(Optional) Display firmware compatibility information.

**Required Privilege Level** view

**List of Sample Output** [show system firmware on page 197](#)  
[show system firmware compatibility on page 197](#)

**Output Fields** [Table 16 on page 196](#) lists the output fields for the show system firmware command. Output fields are listed in the approximate order in which they appear.

**Table 16: show system firmware Output Fields**

Field Name	Field Description
<b>Part</b>	Physical part on the router or switch affected by the firmware.
<b>Type</b>	Type of firmware on the router or switch.
<b>Tag</b>	Location of the firmware on the interface.
<b>Current version</b>	Firmware version on the affected router or switch parts.
<b>Available version</b>	New versions of firmware for upgrading or downgrading.
<b>Status</b>	Firmware condition on the router or switch.
<b>Action</b>	Whether you can upgrade or downgrade, or if no action is available ( <b>none</b> ).

## Sample Output

### show system firmware

```
user@host> show system firmware
```

Part	Type	Tag	Current version	Available version	Status
FPC 0	ROM Monitor	0	0	6.4.10	OK
Routing Engine 0	RE BIOS	0	0		OK

### show system firmware compatibility

```
user@host> show system firmware compatibility
```

Part	Type	Tag	Current version	Available version	Action
FPC 0	ROM Monitor	0	0	6.4.10	None
Routing Engine 0	RE BIOS	0	0		None

## show system reboot

<b>List of Syntax</b>	<a href="#">Syntax on page 198</a> <a href="#">Syntax (EX Series Switches) on page 198</a> <a href="#">Syntax (TX Matrix Router) on page 198</a> <a href="#">Syntax (TX Matrix Plus Router) on page 198</a> <a href="#">Syntax (MX Series Router) on page 198</a> <a href="#">Syntax (QFX Series) on page 198</a>
<b>Syntax</b>	show system reboot <both-routing-engines>
<b>Syntax (EX Series Switches)</b>	show system reboot <all-members> <both-routing-engines> <local> <member <i>member-id</i> >
<b>Syntax (TX Matrix Router)</b>	show system reboot <all-chassis   all-lcc   lcc <i>number</i>   scc> <both-routing-engines>
<b>Syntax (TX Matrix Plus Router)</b>	show system reboot <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> > <both-routing-engines>
<b>Syntax (MX Series Router)</b>	show system reboot <all-members> <both-routing-engines> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	show system reboot <both-routing-engines> <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <node-device <i>name</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display pending system reboots or halts.
<b>Options</b>	<b>none</b> —Display pending reboots or halts on the active Routing Engine.  <b>all-chassis</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display halt or reboot request information for all the T640 routers in the chassis that are connected to the TX Matrix router. On a TX Matrix router, display halt or reboot request information for all the T1600 or T4000 routers in the chassis that are connected to the TX Matrix Plus router.

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Display halt or reboot request information for all members of the Virtual Chassis configuration.

**all-lcc**—(TX Matrix routers and TX Matrix Plus router only) (Optional) On a TX Matrix router, display system halt or reboot request information for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display halt or reboot request information for all connected T1600 or T4000 LCCs.

**both-routing-engines**—(Systems with multiple Routing Engines) (Optional) Display halt or reboot request information on both Routing Engines.

**infrastructure *name***—(QFabric systems only) (Optional) Display reboot request information on the fabric manager Routing Engines and fabric control Routing Engines.

**interconnect-device *name***—(QFabric systems only) (Optional) Display reboot request information on the Interconnect device.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display halt or reboot request information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display halt or reboot request information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display halt or reboot request information for the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display halt or reboot request information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Display reboot request information on the Node group.

**scc**—(TX Matrix router only) (Optional) Display halt or reboot request information for the TX Matrix router (or switch-card chassis).

**sfc**—(TX Matrix Plus router only) (Optional) Display halt or reboot request information for the TX Matrix Plus router.

**Additional Information** By default, when you issue the **show system reboot** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) backup Routing Engines that are connected to it.

## show system storage

<b>List of Syntax</b>	<a href="#">Syntax on page 209</a> <a href="#">Syntax (EX Series Switches) on page 209</a> <a href="#">Syntax (MX Series Router) on page 209</a> <a href="#">Syntax (QFX Series) on page 209</a> <a href="#">Syntax (SRX Series) on page 209</a> <a href="#">Syntax (TX Matrix Router) on page 209</a> <a href="#">Syntax (TX Matrix Plus Router and TX Matrix Plus Router with 3D SIBs) on page 209</a>
<b>Syntax</b>	<pre>show system storage &lt;detail&gt; &lt;invoke-on (all-routing-engines   other-routing-engine)&gt;</pre>
<b>Syntax (EX Series Switches)</b>	<pre>show system storage &lt;detail&gt; &lt;all-members&gt; &lt;local&gt; &lt;member member-id&gt; &lt;invoke-on (all-routing-engines   other-routing-engine)&gt;</pre>
<b>Syntax (MX Series Router)</b>	<pre>show system storage &lt;detail&gt; &lt;all-members&gt; &lt;local&gt; &lt;member member-id&gt; &lt;invoke-on (all-routing-engines   other-routing-engine)&gt;</pre>
<b>Syntax (QFX Series)</b>	<pre>show system storage &lt;detail&gt; &lt;infrastructure name&gt; &lt;interconnect-device name&gt; &lt;node-group name&gt; &lt;invoke-on (all-routing-engines   other-routing-engine)&gt;</pre>
<b>Syntax (SRX Series)</b>	<pre>show system storage &lt;detail&gt; &lt;partitions&gt; &lt;invoke-on (all-routing-engines   other-routing-engine)&gt;</pre>
<b>Syntax (TX Matrix Router)</b>	<pre>show system storage &lt;detail&gt; &lt;all-chassis   all-lcc   lcc number   scc&gt; &lt;invoke-on (all-routing-engines   other-routing-engine)&gt;</pre>
<b>Syntax (TX Matrix Plus Router and TX Matrix Plus Router with 3D SIBs)</b>	<pre>show system storage &lt;detail&gt; &lt;all-chassis   all-lcc   lcc number   sfc number&gt; &lt;invoke-on (all-routing-engines   other-routing-engine)&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p>

**sfc** option introduced for the TX Matrix Plus router in JUNOS Release 9.6.

Command introduced in Junos OS Release 11.1 for the QFX Series.

Option **invoke-on (all-routing-engines | other-routing-engine)** introduced in Junos OS Release 14.1

<b>Description</b>	Display statistics about the amount of free disk space in the router's or switch's file systems.
<b>Options</b>	<p><b>none</b>—Display standard information about the amount of free disk space in the router's or switch's file systems.</p> <p><b>detail</b>—(Optional) Display detailed output.</p> <p><b>invoke-on all-routing-engines</b>—(Optional) Display the system storage information on all master and backup Routing Engines on a routing matrix based on the TX Matrix or TX Matrix Plus router or on a router that has dual Routing Engines.</p> <p><b>invoke-on other-routing-engines</b>—(Optional) Display the system storage information on the other Routing Engine. For example, if you issue this command on the master Routing Engine on an M320 router, the JUNOS Software displays the system storage information on the backup Routing Engine. On a routing matrix based on the TX Matrix or TX Matrix Plus router, if you issue this command on the TX Matrix or TX Matrix Plus router's master Routing Engine, the JUNOS Software displays all the system storage information on all the backup Routing Engines.</p> <p><b>all-chassis</b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display system storage statistics for all the routers in the chassis.</p> <p><b>all-lcc</b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system storage statistics for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display system storage statistics for all routers connected to the TX Matrix Plus router.</p> <p><b>all-members</b>—(EX4200 switches and MX Series routers only) (Optional) Display system storage statistics for all members of the Virtual Chassis configuration.</p> <p><b>infrastructure <i>name</i></b>—(QFabric systems only) (Optional) Display system storage statistics for the fabric control Routing Engines or fabric manager Routing Engines.</p> <p><b>interconnect-device <i>name</i></b>—(QFabric systems only) (Optional) Display system storage statistics for the Interconnect device.</p> <p><b>lcc <i>number</i></b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system storage statistics for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system storage statistics for a specific router that is connected to the TX Matrix Plus router.</p>

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display system storage statistics for the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display system storage statistics for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Display system storage statistics for the Node group.

**scc**—(TX Matrix routers only) (Optional) Display system storage statistics for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display system storage statistics for the TX Matrix Plus router. Replace *number* with 0.

**Additional Information** By default, when you issue the **show system storage** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

**Output Fields** Table 17 on page 212 describes the output fields for the **show system storage** command. Output fields are listed in the approximate order in which they appear.

**Table 17: show system storage Output Fields**

Field Name	Field Description
<b>Filesystem</b>	Name of the filesystem.
<b>Size</b>	Size of the filesystem.
<b>Used</b>	Amount of space used in the filesystem.
<b>Avail</b>	Amount of space available in the filesystem.
<b>Capacity</b>	Percentage of the filesystem space that is being used.
<b>Mounted on</b>	Directory in which the filesystem is mounted.

## Sample Output

### show system storage

```

user@host> show system storage

## show system switchover

<b>List of Syntax</b>	<a href="#">Syntax on page 217</a> <a href="#">Syntax (TX Matrix Router) on page 217</a> <a href="#">Syntax (TX Matrix Plus Router) on page 217</a> <a href="#">Syntax (MX Series Router) on page 217</a>
<b>Syntax</b>	show system switchover
<b>Syntax (TX Matrix Router)</b>	show system switchover <all-chassis   all-lcc   lcc <i>number</i>   scc>
<b>Syntax (TX Matrix Plus Router)</b>	show system switchover <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> >
<b>Syntax (MX Series Router)</b>	show system switchover <all-members> <local> <member <i>member-id</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 13.2X51-D20 for QFX Series switches.
<b>Description</b>	Display whether graceful Routing Engine switchover is configured, the state of the kernel replication (ready or synchronizing), any replication errors, and whether the primary and standby Routing Engines are using compatible versions of the kernel database.

**NOTE:** Issue the **show system switchover** command *only* on the backup Routing Engine. This command is *not* supported on the master Routing Engine, because the kernel-replication process daemon does not run on the master Routing Engine. This process runs only on the backup Routing Engine.

Beginning Junos OS Release 9.6, the **show system switchover** command has been deprecated on the master Routing Engine on all routers other than a TX Matrix (switch-card chassis) or a TX Matrix Plus (switch-fabric chassis) router.

However, in a routing matrix, if you issue the **show system switchover** command on the master Routing Engine of the TX Matrix router (or switch-card chassis), the CLI displays graceful switchover information for the master Routing Engine of the T640 routers (or line-card chassis) in the routing matrix. Likewise, if you issue the **show system switchover** command on the master Routing Engine of a TX Matrix Plus router (or switch-fabric chassis), the CLI displays output for the master Routing Engine of T1600 or T4000 routers in the routing matrix.

**Options** **all-chassis**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display graceful Routing Engine switchover information for all Routing Engines on the TX Matrix router and the T640 routers configured in the routing matrix. On a TX Matrix Plus router, display graceful Routing Engine switchover information for all Routing Engines on the TX Matrix Plus router and the T1600 or T4000 routers configured in the routing matrix.

**all-lcc**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display graceful Routing Engine switchover information for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display graceful Routing Engine switchover information for all connected T1600 or T4000 LCCs.

Note that in this instance, packets get dropped. The LCCs perform GRES on their own chassis (GRES cannot be handled by one particular chassis for the entire router) and synchronization is not possible as the LCC plane bringup time varies for each LCC. Therefore, when there is traffic on these planes, there may be a traffic drop.

**all-members**—(MX Series routers only) (Optional) Display graceful Routing Engine switchover information for all Routing Engines on all members of the Virtual Chassis configuration.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display graceful Routing Engine switchover information for a specific T640 router connected to the TX Matrix router. On a TX Matrix Plus router, display graceful Routing Engine switchover information for a specific router connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display graceful Routing Engines switchover information for all Routing Engines on the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display graceful Routing Engine switchover information for all Routing Engines on the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**scc**—(TX Matrix router only) (Optional) Display graceful Routing Engine switchover information for the TX Matrix router (or switch-card chassis).

**sfc**—(TX Matrix Plus routers only) (Optional) Display graceful Routing Engine switchover information for the TX Matrix Plus router.

<b>Additional Information</b>	<p>If you issue the <b>show system switchover</b> command on a TX Matrix backup Routing Engine, the command is broadcast to all the T640 backup Routing Engines that are connected to it.</p> <p>Likewise, if you issue the <b>show system switchover</b> command on a TX Matrix Plus backup Routing Engine, the command is broadcast to all the T1600 or T4000 backup Routing Engines that are connected to it.</p> <p>If you issue the <b>show system switchover</b> command on the active Routing Engine in the master router of an MX Series Virtual Chassis, the router displays an error message that graceful Routing Engine switchover (GRES) is not enabled on this member.</p>
<b>Required Privilege Level</b>	view

## show system uptime

<b>List of Syntax</b>	<a href="#">Syntax on page 221</a> <a href="#">Syntax (EX Series Switches) on page 221</a> <a href="#">Syntax (QFX Series) on page 221</a> <a href="#">Syntax (TX Matrix Router) on page 221</a> <a href="#">Syntax (TX Matrix Plus Router) on page 221</a> <a href="#">Syntax (MX Series Router) on page 221</a>
<b>Syntax</b>	show system uptime
<b>Syntax (EX Series Switches)</b>	show system uptime <all-members> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	show system uptime <director-group <i>name</i> > <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <node-group <i>name</i> >
<b>Syntax (TX Matrix Router)</b>	show system uptime <all-chassis   all-lcc   lcc <i>number</i>   scc>
<b>Syntax (TX Matrix Plus Router)</b>	show system uptime <detail> <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> >
<b>Syntax (MX Series Router)</b>	show system uptime <all-members> <invoke-on> <local> <member <i>member-id</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in JUNOS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the current time and information about how long the router or switch, router or switch software, and routing protocols have been running.
<b>Options</b>	<b>none</b> —Show time since the system rebooted and processes started.  <b>all-chassis</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) Show time since the system rebooted and processes started on all the routers in the chassis.  <b>all-lcc</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show time since the system rebooted and processes started for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus

router, show time since the system rebooted and processes started for all connected T1600 or T4000 LCCs.

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Show time since the system rebooted and processes started on all members of the Virtual Chassis configuration.

**director-group *name***—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the Director group.

**infrastructure *name***—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the fabric control Routing Engine and fabric manager Routing Engine.

**interconnect-device *name***—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the Interconnect device.

**invoke-on**—(MX Series routers only) (Optional) Display the time since the system rebooted and processes started on the master Routing Engine, backup Routing Engine, or both, on a router with two Routing Engines.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show time since the system rebooted and processes started for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, show time since the system rebooted and processes started for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Show time since the system rebooted and processes started on the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Show time since the system rebooted and processes started on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the Node group.

**scc**—(TX Matrix routers only) (Optional) Show time since the system rebooted and processes started for the TX Matrix router (or switch-card chassis).

**sfc number**—(TX Matrix Plus routers only) (Optional) Show time since the system rebooted and processes started for the TX Matrix Plus router. Replace *number* with 0.

**Additional Information** By default, when you issue the **show system uptime** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

**Output Fields** [Table 19 on page 223](#) describes the output fields for the **show system uptime** command. Output fields are listed in the approximate order in which they appear.

**Table 19: show system uptime Output Fields**

Field Name	Field Description
<b>Current time</b>	Current system time in UTC.
<b>System booted</b>	Date and time when the Routing Engine on the router or switch was last booted and how long it has been running.
<b>Protocols started</b>	Date and time when the routing protocols were last started and how long they have been running.
<b>Last configured</b>	Date and time when a configuration was last committed. Also shows the name of the user who issued the last <b>commit</b> command.
<b>time and up</b>	Current time, in the local time zone, and how long the router or switch has been operational.
<b>users</b>	Number of users logged in to the router or switch.
<b>load averages</b>	Load averages for the last 1 minute, 5 minutes, and 15 minutes.

## Sample Output

## show system users

<b>List of Syntax</b>	<a href="#">Syntax on page 226</a> <a href="#">Syntax (TX Matrix Router) on page 226</a> <a href="#">Syntax (TX Matrix Plus Router) on page 226</a> <a href="#">Syntax (MX Series Router) on page 226</a>
<b>Syntax</b>	show system users <no-resolve>
<b>Syntax (TX Matrix Router)</b>	show system users <all-chassis   all-lcc   lccnumber   scc> <no-resolve>
<b>Syntax (TX Matrix Plus Router)</b>	show system users <detail> <all-chassis   all-lcc   lcc number   sfc number> <no-resolve>
<b>Syntax (MX Series Router)</b>	show system users <all-members> <local> <member member-id> <no-resolve>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>sfc</b> option introduced for the TX Matrix Plus router in JUNOS OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	List information about the users who are currently logged in to the router or switch.

**NOTE:** The **show system users** command lists the information about administrative users that are logged in to a router or switch using the CLI, J-Web, or an SSH client. The output does not list information about web users or automated users that are logged in from a remote client application using Junos XML APIs, such as NETCONF.

- Options**    **none**—List information about the users who are currently logged in to the router or switch.
- all-chassis**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Show users currently logged in to all the routers in the chassis.
- all-lcc**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show users currently logged in to all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, show users currently logged in to all connected T1600 or T4000 LCCs.
- all-members**—(MX Series routers only) (Optional) Display users currently logged in to all members of the Virtual Chassis configuration.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show users currently logged in to a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, show users currently logged in to a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display users currently logged in to the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display users currently logged in to the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**no-resolve**—(Optional) Do not attempt to resolve IP addresses to hostnames.

**scc**—(TX Matrix routers only) (Optional) Show users currently logged in to the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Show users currently logged in to the TX Matrix Plus router. Replace *number* with 0.

**Additional Information** By default, when you issue the **show system users** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

**Output Fields** Table 20 on page 228 describes the output fields for the **show system users** command. Output fields are listed in the approximate order in which they appear.

**Table 20: show system users Output Fields**

Field Name	Field Description
<b>time and up</b>	Current time, in the local time zone, and how long the router or switch has been operational.
<b>users</b>	Number of users logged in to the router or switch.
<b>load averages</b>	Load averages for the last 1 minute, 5 minutes, and 15 minutes.
<b>USER</b>	Username.
<b>TTY</b>	Terminal through which the user is logged in.
<b>FROM</b>	System from which the user has logged in. A hyphen indicates that the user is logged in through the console.
<b>LOGIN@</b>	Time when the user logged in.
<b>IDLE</b>	How long the user has been idle.
<b>WHAT</b>	Processes that the user is running.

## show system virtual-memory

<b>List of Syntax</b>	<a href="#">Syntax on page 231</a> <a href="#">Syntax (EX Series) on page 231</a> <a href="#">Syntax (TX Matrix Router) on page 231</a> <a href="#">Syntax (TX Matrix Plus Router) on page 231</a> <a href="#">Syntax (MX Series Router) on page 231</a> <a href="#">Syntax (QFX Series) on page 231</a>
<b>Syntax</b>	show system virtual-memory
<b>Syntax (EX Series)</b>	show system virtual-memory <all-members> <local> <member <i>member-id</i> >
<b>Syntax (TX Matrix Router)</b>	show system virtual-memory <all-chassis   all-lcc   lcc <i>number</i>   scc>
<b>Syntax (TX Matrix Plus Router)</b>	show system virtual-memory <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> >
<b>Syntax (MX Series Router)</b>	show system virtual-memory <all-members> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	show system virtual-memory <infrastructure <i>name</i> > <interconnect-device <i>name</i> > <node-group <i>name</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the usage of Junos OS kernel memory listed first by size of allocation and then by type of usage. Use the <b>show system virtual-memory</b> command for troubleshooting with Juniper Networks Customer Support.
<b>Options</b>	<b>none</b> —Display kernel dynamic memory usage information.  <b>all-chassis</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display kernel dynamic memory usage information for all chassis.  <b>all-lcc</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display kernel dynamic memory usage information for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display kernel dynamic memory usage information for all connected T1600 or T4000 LCCs.

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Display kernel dynamic memory usage information for all members of the Virtual Chassis configuration.

**infrastructure *name***—(QFabric systems only) (Optional) Display kernel dynamic memory usage information for the fabric control Routing Engine and fabric manager Routing Engine.

**interconnect-device *name***—(QFabric systems only) (Optional) Display kernel dynamic memory usage information for the Interconnect device.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display kernel dynamic memory usage information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display kernel dynamic memory usage information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display kernel dynamic memory usage information for the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display kernel dynamic memory usage information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Display kernel dynamic memory usage information for the Node group.

**scc**—(TX Matrix routers only) (Optional) Display kernel dynamic memory usage information for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display kernel dynamic memory usage information for the TX Matrix Plus router. Replace *number* with 0.

**Additional Information** By default, when you issue the **show system virtual-memory** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix

or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

**NOTE:** The `show system virtual-memory` command with the `| display XML` pipe option now displays XML output for the command in the parent tags: `<vmstat-memstat-malloc>`, `<vmstat-memstat-zone>`, `<vmstat-sumstat>`, `<vmstat-intr>`, and `<vmstat-kernel-state>` with each child element as a separate XML tag. In Junos OS Releases 10.1 and earlier, the `| display XML` option for this command does not have an XML API element and the entire output is displayed in a single `<output>` tag element.

Output Fields	<p><a href="#">Table 21 on page 234</a> lists the output fields for the <code>show system virtual-memory</code> command. Output fields are listed in the approximate order in which they appear.</p>

Table 21: show system virtual-memory Output Fields

Field Name	Field Description
<b>Memory statistics by bucket size</b>	
<b>Size</b>	Memory block size (bytes). The kernel memory allocator appropriates blocks of memory whose size is exactly a power of 2.
<b>In Use</b>	Number of memory blocks of this size that are in use (bytes).
<b>Free</b>	Number of memory blocks of this size that are free (bytes).
<b>Requests</b>	Number of memory allocation requests made.
<b>HighWater</b>	Maximum value the free list can have. Once the system starts reclaiming physical memory, it continues until the free list is increased to this value.
<b>Couldfree</b>	Total number of times that the free elements for a bucket size exceed the high-water mark for that bucket size.
<b>Memory usage type by bucket size</b>	
<b>Size</b>	Memory block size (bytes).
<b>Type(s)</b>	Kernel modules that are using these memory blocks. For a definition of each type, refer to a FreeBSD book.
<b>Memory statistics by type</b>	
<b>Type</b>	Kernel module that is using dynamic memory.
<b>InUse</b>	Number of memory blocks used by this type. The number is rounded up.
<b>MemUse</b>	Amount of memory in use, in kilobytes (KB).
<b>HighUse</b>	Maximum memory ever used by this type.
<b>Limit</b>	Maximum memory that can be allocated to this type.
<b>Requests</b>	Total number of dynamic memory allocation requests this type has made.
<b>Type Limit</b>	Number of times requests were blocked for reaching the maximum limit.
<b>Kern Limit</b>	Number of times requests were blocked for the kernel map.
<b>Size(s)</b>	Memory block sizes this type is using.
<b>Memory Totals</b>	
<b>In Use</b>	Total kernel dynamic memory in use (bytes, rounded up).
<b>Free</b>	Total kernel dynamic memory free (bytes, rounded up).

Table 21: show system virtual-memory Output Fields (*continued*)

Field Name	Field Description
<b>Requests</b>	Total number of memory allocation requests.
<b>ITEM</b>	Kernel module that is using memory.
<b>Size</b>	Memory block size (bytes).
<b>Limit</b>	Maximum memory that can be allocated to this type.
<b>Used</b>	Number of memory blocks used by this type. The number is rounded up.
<b>Free</b>	Number of memory blocks available to this type.
<b>Requests</b>	Total number of memory allocation requests this type has made.
<b>interrupt</b>	Timer events and scheduling interruptions.
<b>total</b>	Total number of interruptions for each type.
<b>rate</b>	Interruption rate.
<b>Total</b>	Total for all interruptions.

## Sample Output

## show task replication

<b>Syntax</b>	<b>show task replication</b>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 8.5.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 13.2X51-D20 for QFX Series switches.</p> <p>Support for logical systems introduced in Junos OS Release 13.3</p>
<b>Description</b>	Displays nonstop active routing (NSR) status. When you issue this command on the master Routing Engine, the status of nonstop active routing synchronization is also displayed.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show task replication (Issued on the Master Routing Engine) on page 289</a> <a href="#">show task replication (Issued on the Backup Routing Engine) on page 290</a>
<b>Output Fields</b>	Table 22 on page 289 lists the output fields for the <b>show task replication</b> command. Output fields are listed in the approximate order in which they appear.

**Table 22: show task replication Output Fields**

Field Name	Field Description
<b>Stateful replication</b>	Displays whether or not graceful Routing Engine switchover is configured. The status can be <b>Enabled</b> or <b>Disabled</b> .
<b>RE mode</b>	Displays the Routing Engine on which the command is issued: <b>Master</b> , <b>Backup</b> , or <b>Not applicable</b> (when the router has only one Routing Engine).
<b>Protocol</b>	Protocols that are supported by nonstop active routing.
<b>Synchronization Status</b>	Nonstop active routing synchronization status for the supported protocols. States are <b>NotStarted</b> , <b>InProgress</b> , and <b>Complete</b> .

## Sample Output

### show task replication (Issued on the Master Routing Engine)

```

user@host> show task replication
  Stateful Replication: Enabled
    RE mode: Master

  Protocol              Synchronization Status
  OSPF                  NotStarted
  BGP                   Complete
  IS-IS                 NotStarted

```

LDP	Complete
PIM	Complete

**show task replication (Issued on the Backup Routing Engine)**

```
user@host> show task replication
Stateful Replication: Enabled
RE mode: Backup
```

## show version

<b>Syntax (TX Matrix Plus Router)</b>	<pre>show version &lt;all-chassis   all-lcc   lcc number   sfc number&gt; &lt;brief   detail&gt;</pre>
<b>Syntax (MX Series Router)</b>	<pre>show version &lt;brief   detail&gt; &lt;all-members&gt; &lt;local&gt; &lt;member member-id&gt;</pre>
<b>Syntax (QFX Series)</b>	<pre>show version &lt;brief   detail&gt; &lt;component component-name   all&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	<p>Display the hostname and version information about the software running on the router or switch.</p> <p>Beginning in Junos OS Release 13.3, the <b>show version</b> command output includes the <b>Junos</b> field that displays the Junos OS version running on the device. This field provides a consistent means of identifying the Junos OS version, rather than extracting that information from the list of installed sub-packages.</p>
<b>Options</b>	<p><b>none</b>—Display standard information about the hostname and version of the software running on the router or switch.</p>

**brief | detail**—(Optional) Display the specified level of output.

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Display standard information about the hostname and version of the software running on all members of the Virtual Chassis configuration.

**component all**—(QFabric systems only) (Optional) Display the host name and version information about the software running on all the components on the QFabric system.

**component *component-name***—(QFabric systems only) (Optional) Display the host name and version information about the software running on a specific QFabric system component. Replace *component-name* with the name of the QFabric system component. The *component-name* can be the name of a diagnostics Routing Engine, Director group, fabric control Routing Engine, fabric manager Routing Engine, Interconnect device, or Node group.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display standard information about the hostname and version of the software running on the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display standard information about the hostname and version of the software running on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**scc**—(TX Matrix routers only) (Optional) Display the hostname and version information about the software running on the TX Matrix router (or switch-card chassis).

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display the host name and version information about the software running on for a specified T640 router (line-card chassis or LCC) that is connected to the TX Matrix router. On a TX Matrix Plus router, display the host name and version information about the software running for a specified T1600 or T4000 router (LCC) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display the hostname and version information about the software running on the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

**Additional Information** By default, when you issue the **show version** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) or T1600 or T4000 (in a routing matrix based on a TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) or T1600 or T4000 (in a routing matrix based on a TX Matrix Plus router) backup Routing Engines that are connected to it.

## Sample Output

### show version (Devices Running Junos OS Release 13.3 and Later)

The following output is from the MX240 Router and shows the **Junos** field introduced in Junos OS 13.3. Depending on the platform running Junos OS 13.3, you might see different installed sub-packages, but the **Junos** field is common across all platforms that run Junos OS 13.3 and later.

# Troubleshooting Procedures

- Troubleshooting Loss of the Root Password on page 305

## Troubleshooting Loss of the Root Password

---

**Problem**    **Description:** If you forget the root password for a switch, use the password recovery procedure to reset the root password.

**NOTE:** You need physical access to the switch to recover the root password.

**TIP:** For a video on recovering the root password for routers, see *Recovering the Root Password*. The procedure is similar for switches.

**Solution**    To recover the root password:

1. Power off your switch by unplugging the power cord or turning off the power at the wall switch.
2. Insert one end of the Ethernet cable into the serial port on the management device and connect the other end to the console port on the back of the switch. See [Figure 1 on page 306](#).

Figure 1: Connecting to the Console Port on the EX Series Switch

3. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate COM port to use (for example, COM1).
4. Configure the port settings as follows:
  - Bits per second: 9600
  - Data bits: 8
  - Parity: None
  - Stop bits: 1
  - Flow control: None
5. Power on your switch by plugging in the power cord or turning on the power at the wall switch.
6. When the following prompt appears, press the Spacebar to access the switch's bootstrap loader command prompt:
 

```
Hit [Enter] to boot immediately, or space bar for command prompt.
Booting [kernel] in 1 second...
```

**NOTE:** If the switch is in unattended mode for U-Boot, access to the bootstrap loader command prompt is blocked. If the root password is lost, you must reset the switch to the factory default configuration using the LCD panel. For more information, see [“Reverting to the Default Factory Configuration for the EX Series Switch”](#) on page 620.

7. At the following prompt, type **boot -s** to start up the system in single-user mode:
 

```
loader> boot -s
```
8. At the following prompt, type **recovery** to start the root password recovery procedure:
 

```
Enter full path name of shell or 'recovery' for root password recovery or RETURN for /bin/sh: recovery
```

A series of messages describe consistency checks, mounting of filesystems, and initialization and checkout of management services. Then the CLI prompt appears.

9. Enter configuration mode in the CLI:

```
user@switch> configure
```

10. Set the root password. For example:

```
user@switch# set system root-authentication plain-text-password
```

11. At the following prompt, enter the new root password. For example, juniper1:

```
user@switch# juniper1
```

```
Retype new password:
```

12. At the second prompt, reenter the new root password.

13. If you are finished configuring the network, commit the configuration.

```
root@switch# commit
```

```
commit complete
```

14. Exit configuration mode in the CLI.

```
root@switch# exit
```

15. Exit operational mode in the CLI.

```
root@switch> exit
```

16. At the prompt, enter **y** to reboot the switch.

```
Reboot the system? [y/n] y
```

## Software Overview

---

- [Understanding Software Infrastructure and Processes on page 311](#)

### Understanding Software Infrastructure and Processes

Each switch runs the Juniper Networks Junos operating system (Junos OS) for Juniper Networks EX Series Ethernet Switches on its general-purpose processors. Junos OS includes processes for Internet Protocol (IP) routing and for managing interfaces, networks, and the chassis.

The Junos OS runs on the Routing Engine. The Routing Engine kernel coordinates communication among the Junos OS processes and provides a link to the Packet Forwarding Engine.

With the J-Web interface and the command-line interface (CLI) to the Junos OS, you configure switching features and routing protocols and set the properties of network interfaces on your switch. After activating a software configuration, use either the J-Web or CLI user interface to monitor the switch, manage operations, and diagnose protocol and network connectivity problems.

- [Routing Engine and Packet Forwarding Engine on page 311](#)
- [Junos OS Processes on page 312](#)

### Routing Engine and Packet Forwarding Engine

---

A switch has two primary software processing components:

- **Packet Forwarding Engine**—Processes packets; applies filters, routing policies, and other features; and forwards packets to the next hop along the route to their final destination.
- **Routing Engine**—Provides three main functions:
  - Creates the packet forwarding switch fabric for the switch, providing route lookup, filtering, and switching on incoming data packets, then directing outbound packets to the appropriate interface for transmission to the network

- Maintains the routing tables used by the switch and controls the routing protocols that run on the switch.
- Provides control and monitoring functions for the switch, including controlling power and monitoring system status.

### Junos OS Processes

The Junos OS running on the Routing Engine and Packet Forwarding Engine consists of multiple processes that are responsible for individual functions.

The separation of functions provides operational stability, because each process accesses its own protected memory space. In addition, because each process is a separate software package, you can selectively upgrade all or part of the Junos OS, for added flexibility.

Table 6 on page 30 describes the primary Junos OS processes.

**Table 23: Junos OS Processes**

Process	Name	Description
Chassis process	chassisd	<p>Detects hardware on the system that is used to configure network interfaces.</p> <p>Monitors the physical status of hardware components and field-replaceable units (FRUs), detecting when environment sensors such as temperature sensors are triggered.</p> <p>Relays signals and interrupts—for example, when devices are taken offline, so that the system can close sessions and shut down gracefully.</p>
Ethernet switching process	eswd	<p>Handles Layer 2 switching functionality such as MAC address learning, Spanning Tree protocol and access port security. The process is also responsible for managing Ethernet switching interfaces, VLANs, and VLAN interfaces.</p> <p>Manages Ethernet switching interfaces, VLANs, and VLAN interfaces.</p>
Forwarding process	pfem	<p>Defines how routing protocols operate on the switch. The overall performance of the switch is largely determined by the effectiveness of the forwarding process.</p>
Interface process	dcd	<p>Configures and monitors network interfaces by defining physical characteristics such as link encapsulation, hold times, and keepalive timers.</p>
Management process	mgd	<p>Provides communication between the other processes and an interface to the configuration database.</p> <p>Populates the configuration database with configuration information and retrieves the information when queried by other processes to ensure that the system operates as configured.</p> <p>Interacts with the other processes when commands are issued through one of the user interfaces on the switch.</p> <p>If a process terminates or fails to start when called, the management process attempts to restart it a limited number of times to prevent thrashing and logs any failure information for further investigation.</p>
Routing protocol process	rpd	<p>Defines how routing protocols such as RIP, OSPF, and BGP operate on the device, including selecting routes and maintaining forwarding tables.</p>

## User Interfaces

---

- [CLI User Interface Overview on page 313](#)
- [EX Series Switches Hardware and CLI Terminology Mapping on page 315](#)

### CLI User Interface Overview

You can use two interfaces to monitor, configure, troubleshoot, and manage a Juniper Networks EX Series Ethernet Switch: the J-Web graphical user interface and the Junos operating system (Junos OS) command-line interface (CLI). Both of these user interfaces are shipped with the switch. This topic describes the CLI. For information about the J-Web user interface, see *J-Web User Interface for EX Series Switches Overview*.

- [CLI Overview on page 313](#)
- [CLI Help and Command Completion on page 313](#)
- [CLI Command Modes on page 313](#)

---

#### CLI Overview

---

Junos operating system (Junos OS) CLI is a Juniper Networks specific command shell that runs on top of a UNIX-based operating system kernel. The CLI provides command help and command completion.

The CLI also provides a variety of UNIX utilities, such as Emacs-style keyboard sequences that allow you to move around on a command line and scroll through recently executed commands, regular expression matching to locate and replace values and identifiers in a configuration, filter command output, or log file entries, store and archive router files on a UNIX-based file system, and exit from the CLI environment and create a UNIX C shell or Bourne shell to navigate the file system, manage switch processes, and so on.

---

#### CLI Help and Command Completion

---

To access CLI Help, type a question mark (?) at any level of the hierarchy. The system displays a list of the available commands or statements and a short description of each.

To complete a command, statement, or option that you have partially typed, press the Tab key or the Spacebar. If the partially typed letters uniquely identify a command, the complete command name appears. Otherwise, a beep indicates that you have entered an ambiguous command and the possible completions are displayed. This completion feature also applies to other strings, such as filenames, interface names, usernames, and configuration statements.

---

#### CLI Command Modes

---

The CLI has two modes, operational mode and configuration mode.

In operational mode, you enter commands to monitor and troubleshoot switch hardware and software and network connectivity. Operational mode is indicated by the `>` prompt—for example, `user@switch>`.

In configuration mode, you can define all properties of the Juniper Networks Junos operating system (Junos OS), including interfaces, VLANs, Virtual Chassis information, routing protocols, user access, and several system hardware properties.

To enter configuration mode, enter the **configure** command: .

```
user@switch> configure
```

Configuration mode is indicated by the `#` prompt, and includes the current location in the configuration hierarchy—for example:

```
[edit interfaces ge-0/0/12]
user@switch#
```

In configuration mode, you are actually viewing and changing the candidate configuration file. The candidate configuration allows you to make configuration changes without causing operational changes to the current operating configuration, called the active configuration. When you commit the changes you added to the candidate configuration, the system updates the active configuration. Candidate configurations enable you to alter your configuration without causing potential damage to your current network operations.

To activate your configuration changes, enter the **commit** command.

To return to operational mode, go to the top of the configuration hierarchy and then quit—for example:

```
[edit interfaces ge-0/0/12]
user@switch# top
[edit]
user@switch# exit
```

You can also activate your configuration changes and exit configuration mode with a single command, **commit and-quit**. This command succeeds only if there are no mistakes or syntax errors in the configuration.

**TIP:** When you commit the candidate configuration, you can require an explicit confirmation for the commit to become permanent by using the **commit confirmed** command. This is useful for verifying that a configuration change works correctly and does not prevent management access to the switch. After you issue the **commit confirmed** command, you must issue another **commit** command within the defined period of time (10 minutes by default) or the system reverts to the previous configuration.

## EX Series Switches Hardware and CLI Terminology Mapping

The terms used to describe hardware components in EX Series switches documentation are sometimes different from the terms used in the Junos OS command line interface (CLI).

See the following topics to map the hardware terms used in EX Series switches documentation to the corresponding terms used in the CLI:

- *EX2200 Switch Hardware and CLI Terminology Mapping*
- *EX3200 Switch Hardware and CLI Terminology Mapping*
- *EX4200 Switch Hardware and CLI Terminology Mapping*
- *EX4500 Switch Hardware and CLI Terminology Mapping*
- *EX6210 Switch Hardware and CLI Terminology Mapping*
- *EX8208 Switch Hardware and CLI Terminology Mapping*
- *EX8216 Switch Hardware and CLI Terminology Mapping*

## CHAPTER 7

# Configuration

- Configuration Tasks on page 317
- Statement Hierarchies on page 319

## Configuration Tasks

---

- Using the J-Web CLI Terminal on page 317

### Using the J-Web CLI Terminal

**NOTE:** This topic applies only to the J-Web Application package.

The J-Web CLI terminal provides access to the Junos OS command-line interface (CLI) through the J-Web interface. The functionality and behavior of the CLI available through the CLI Terminal page is the same as that of the Junos OS CLI available through the switch console. The CLI terminal supports all CLI commands and other features such as CLI help and autocompletion. Using the CLI terminal page, you can fully configure, monitor, and manage the switch.

This topic covers:

- Configuring the Web Browser on page 317
- Setting Domain Name, Hostname, and Name Server on page 318
- Enabling SSH on your system on page 318
- Sample Configuration on an EX Series Switch on page 318

### Configuring the Web Browser

---

Configure your Web browser as follows:

- Install Java Runtime Environment (JRE) version 1.4 or later on your system. JRE is a software package that must be installed on the client system to run Java applications. You can download the latest version of JRE from the Java software website <http://www.java.com/>. Installing JRE installs Java plug-ins, which once installed, load automatically and transparently to render Java applets.

**NOTE:** By default Mozilla Firefox has blocked JRE versions earlier than 1.6.0\_31 and 1.7.0 through 1.7.0\_2. However, Mozilla Firefox users can still click **Add-ons > Plugin** to enable Java.

- Set your browser to support and enable Java applets. To know more about checking the status of java applets in your browser see [http://java.com/en/download/help/enable\\_browser.xml](http://java.com/en/download/help/enable_browser.xml).

---

### Setting Domain Name, Hostname, and Name Server

Configure the domain name and hostname of the switch on your system. Ensure that the DNS server setting is correct. DNS name resolution must happen properly. Ensure that there is connectivity between the client and the management device.

You can set the domain name, hostname, and the DNS name server either through the J-Web interface or the CLI:

- To set through the J-Web interface:

See “Configuring System Identity for an EX Series Switch (J-Web Procedure)” on [page 36](#) for more information.

- To set through the CLI:

```
set system domain-name domain-name
```

```
set system host-name host-name
```

```
set system name-server dns-ip-address
```

---

### Enabling SSH on your system

SSH provides a secure method of logging in to the switch, and encrypting traffic so that it is not intercepted. If SSH is not enabled on the system, the CLI terminal page displays the error message:

To enable SSH on your system, do the following:

```
set system services ssh
```

---

### Sample Configuration on an EX Series Switch

1. Type the **configure** command to enter the configuration mode:

```
user@switch> configure
```

2. Log in as host:

```
user@switch# set system host-name host
```

3. Configure the encrypted password; for example:

```
user@switch# set system root-authentication encrypted-password  
"$1$mr3D4eVf$mc7y54e6hk4JulpwWPao6."
```

4. Map the hostname to the IP address:

```
user@switch# set system static-host-mapping host inet 10.9.221.31
```

5. Configure the IP address for the DNS server:

```
user@switch# set system name-server 10.0.220.1
```

6. Enable the system services by using:

```
set system services:user@switch# set system services ssh
```

7. Select **Troubleshoot > CLI Terminal**. The password window is displayed.

8. Enter the password, and click **OK**. The CLI Terminal window appears on the J-Web page.

**NOTE:** If you exit from the CLI terminal, the connection is lost. Click **CLI Terminal** if you want to connect again.

## **[edit access] Configuration Statement Hierarchy on EX Series Switches**

This topic lists supported and unsupported configuration statements in the **[edit access]** hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.
- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see [Feature Explorer](#).

This topic lists:

- [Supported Statements in the \[edit access\] Hierarchy Level on page 322](#)
- [Unsupported Statements in the \[edit access\] Hierarchy Level on page 324](#)

### **Supported Statements in the [edit access] Hierarchy Level**

---

The following hierarchy shows the **[edit access]** configuration statements supported on EX Series switches:

```
access {  
  address-assignment {  
    abated-utilization percentage;  
    abated-utilization-v6 percentage;  
    high-utilization percentage;  
    high-utilization-v6 percentage;  
    pool pool-name {  
      family inet {  
        dhcp-attributes {  
          boot-file filename;  
          boot-server hostname;  
          domain-name domain-name;  
          grace-period seconds;  
          maximum-lease-time (seconds | infinite);  
          name-server {  
            address;  
          }  
        }  
      }  
    }  
  }  
}
```

```

netbios-node-type (b-node | h-node | m-node | p-node);
option option-index (array (byte | flag | integer | ip-address | short | string |
    unsigned-integer | unsigned-short) [ type-values ] | byte 8-bit-value |
    flag (false | off | on | true) | integer signed-32-bit-value | ip-address address |
    short signed-16-bit-value | string text-string | unsigned-integer 32-bit-value |
    unsigned-short 16-bit-value);
router {
    address;
}
server-identifier ipv4-address;
tftp-server hostname;
wins-server {
    address;
}
}
host hostname {
    hardware-address mac-address;
    ip-address ip-address;
}
network ip-prefix </prefix-length>;
range name {
    high upper-limit;
    low lower-limit;
}
}
link pool-name;
}
}
address-pool pool-name {
    address address-or-prefix;
    address-range <low lower-limit> <high upper-limit>;
}
profile profile-name {
    accounting (Access Profile) {
        accounting-stop-on-access-deny;
        accounting-stop-on-failure;
        coa-immediate-update;
        immediate-update;
        order (radius | none);
        statistics (time | volume-time);
    }
}
authentication-order (ldap | password | radius);
client client-name {
    chap-secret chap-secret;
    firewall-user {
        password password;
    }
    no-rfc2486;
    pap-password password;
}
radius {
    accounting-server server-address;
    attributes {
        exclude [exclude-options];
        ignore [ignore-options];
    }
}

```

```

    }
    authentication-server server-address;
  }
  radius-options {
    revert-interval interval;
  }
  session-options {
    client-group [group-names];
    client-idle-timeout minutes;
    client-session-timeout minutes;
  }
  radius-options {
    revert-interval interval;
  }
  radius-server server-address {
    port port-number;
    retry attempts;
    routing-instance instance-name;
    secret password;
    source-address address;
    timeout minutes;
  }
}

```

### Unsupported Statements in the [edit access] Hierarchy Level

All statements in the [edit access] hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented with the following exceptions:

**Table 24: Unsupported [edit access] Configuration Statements on EX Series Switches**

Statement	Hierarchy Level
<b>NOTE:</b> Variables, such as <i>filename</i> , are not shown in the statements or hierarchies.	
aaa	[edit access terminate-code]
administrative-reset	[edit access terminate-code aaa shutdown]
authentication-denied	[edit access terminate-code aaa deny]
client-request	[edit access terminate-code aaa dhcp]
compliance	[edit access ppp-options]
deny	[edit access terminate-code aaa]
dhcp	[edit access terminate-code]
group-profile	[edit access]
ike	[edit access profile client]

Table 24: Unsupported [edit access] Configuration Statements on EX Series Switches (*continued*)

Statement	Hierarchy Level
initiate-dead-peer-detection	[edit access profile client ike]
lost-carrier	[edit access terminate-code dhcp]
nak	[edit access terminate-code dhcp]
nas-logout	[edit access terminate-code dhcp]
no-offers	[edit access terminate-code dhcp]
no-resources	[edit access terminate-code aaa deny]
ppp-options	[edit access]
preference	[edit access profile client ike reverse-route]
remote-reset	[edit access terminate-code aaa shutdown]
rfc	[edit access ppp-options compliance]
reverse-route	[edit access profile client ike]
server-request-timeout	[edit access terminate-code aaa deny]
shutdown	[edit access terminate-code aaa]
terminate-code	[edit access]

## [edit accounting-options] Configuration Statement Hierarchy on EX Series Switches

This topic lists supported and unsupported configuration statements in the **[edit accounting-options]** hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.
- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see [Feature Explorer](#).

This topic lists:

- [Supported Statements in the \[edit accounting-options\] Hierarchy Level on page 326](#)
- [Unsupported Statements in the \[edit accounting-options\] Hierarchy Level on page 326](#)

### Supported Statements in the [edit accounting-options] Hierarchy Level

The following hierarchy shows the **[edit accounting-options]** configuration statements supported on EX Series switches:

```
accounting-options {  
  class-usage-profile profile-name {  
    destination-classes destination-class-name;  
    file filename;  
    interval minutes;  
    source-classes source-class-name;  
  }  
  file {  
    archive-sites site-url {  
      password password;  
    }  
    files number;  
    size bytes;  
    start-time time;  
    transfer-interval minutes;  
  }  
  filter-profile profile-name {  
    counters counter-name;  
    file filename;  
    interval minutes;  
  }  
  interface-profile profile-name {  
    fields [interface-profile-fields];  
    file file-name;  
    interval minutes;  
  }  
  mib-profile profile-name {  
    file filename;  
    interval minutes;  
    object-names [mib-object-names];  
    operation [snmp-operations];  
  }

## [edit interfaces lo] Configuration Statement Hierarchy on EX Series Switches

This topic lists supported and unsupported configuration statements in the **[edit interfaces lo]** hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.
- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see [Feature Explorer](#).

This topic lists:

- [Supported Statements in the \[edit interfaces lo\] Hierarchy Level on page 361](#)
- [Unsupported Statements in the \[edit interfaces lo\] Hierarchy Level on page 363](#)

### Supported Statements in the [edit interfaces lo] Hierarchy Level

The following hierarchy shows the [edit interfaces lo] configuration statements supported on EX Series switches.

```

interfaces {
  lo0 {
    accounting-profile name;
    description text;
    disable;
    hold-time down milliseconds up milliseconds ;
    traceoptions {
      flag flag;
    }
    (traps | no-traps);
    unit logical-unit-number {
      accounting-profile name;
      arp-resp;
      bandwidth rate;
      description text;
      disable;
      family ccc;
      family inet {
        address ipv4-address {
          preferred;

### Supported Statements in the [edit interfaces xe] Hierarchy Level

The following hierarchy shows the [edit interfaces xe] configuration statements supported on EX Series switches.

```

interfaces {
  xe-fpc/pic/port {
    accounting-profile name;
    clocking (external | internal);
    description text;
    disable;
    ether-options {
      802.3ad {
        aex;
        (backup | primary);
      }
    }
  }
}

```

```
    lacp {
        force-up;
    }
}
(flow-control | no-flow-control);
(loopback | no-loopback);
}
framing (lan-phy | wan-phy);
(gratuitous-arp-reply | no-gratuitous-arp-reply);
hold-time up milliseconds down milliseconds;
mtu bytes;
no-gratuitous-arp-request;
optics-options {
    alarm alarm-type;
    warning alarm-type;
    wavelength nanometers;
}
traceoptions {
    flag flag;
}
(traps | no-traps);
unit logical-unit-number {
    accounting-profile name;
    bandwidth rate;
    description text;

    vlan-id (VLAN Tagging and Layer 3 Subinterfaces) vlan-id-number;
    }
    vlan-tagging;
    }
    }

```

### Unsupported Statements in the `[edit interfaces xe]` Hierarchy Level

All statements in the `[edit interfaces xe]` hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented.

**Related Documentation**

- [\[edit interfaces\] Configuration Statement Hierarchy on EX Series Switches on page 342](#)

### `[edit poe]` Configuration Statement Hierarchy on EX Series Switches

This topic lists supported configuration statements in the `[edit poe]` hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see [Feature Explorer](#).

This topic lists:

### Supported Statements in the `[edit poe]` Hierarchy Level

The following hierarchy shows the `[edit poe]` configuration statements supported on EX Series switches except for EX6200 and EX8200 switches:

```
poe {
  guard-band watts;
  interface (all | interface-name) {
    disable;
    maximum-power watts;
    priority (high | low);
    telemetries {
      disable;
      duration hours;
      interval minutes;
    }
  }
  lldp-priority;
  management (class | static);
  notification-control {
    fpc slot-number {
      disable;
    }
  }
}
```

The following hierarchy shows the `[edit poe]` configuration statements supported on EX Series switches for EX6200 and EX8200 switches:

```
poe {
  fpc (all | slot-number) {
```

```
guard-band watts;
lldp-priority;
management (class | static);
maximum-power watts;
}
interface (all | interface-name) {
  af-mode;
  disable;
  maximum-power watts;
  priority (high | low);
  telemetries {
    disable;
    duration hours;
    interval minutes;
  }
}
notification-control {
  fpc slot-number {
    disable;
  }
}
}
```

## [\[edit policy-options\]](#) Configuration Statement Hierarchy on EX Series Switches

This topic lists supported and unsupported configuration statements in the [\[edit policy-options\]](#) hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.
- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see [Feature Explorer](#).
- [Supported Statements in the \[edit policy-options\] Hierarchy Level on page 378](#)
- [Unsupported Statements in the \[edit policy-options\] Hierarchy Level on page 389](#)

### Unsupported Statements in the [edit policy-options] Hierarchy Level

All statements in the **[edit policy-options]** hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented.

## [\[edit protocols bfd\]](#) Configuration Statement Hierarchy on EX Series Switches

This topic lists supported and unsupported configuration statements in the [\[edit protocols bfd\]](#) hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.
- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see [Feature Explorer](#).

This topic lists:

- [Supported Statements in the \[edit protocols bfd\] Hierarchy Level on page 391](#)
- [Unsupported Statements in the \[edit protocols bfd\] Hierarchy Level on page 391](#)

### [Supported Statements in the \[edit protocols bfd\] Hierarchy Level](#)

The following hierarchy shows the [\[edit protocols bfd\]](#) configuration statements supported on EX Series switches:

```
protocols {
  bfd {
    no-issu-timer-negotiation;
    traceoptions {
      file <filename> <files number> <match regular-expression> <size maximum-file-size>
        <world-readable | no-world-readable>;
      flag <flag>;
      no-remote-trace;
    }
  }
}
```

### [Unsupported Statements in the \[edit protocols bfd\] Hierarchy Level](#)

All statements in the [\[edit protocols bfd\]](#) hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented.

## [edit protocols connections] Configuration Statement Hierarchy on EX Series Switches

This topic lists supported and unsupported configuration statements in the **[edit protocols connections]** hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.
- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see *EX Series Switch Software Features Overview*.

This topic lists:

- [Supported Statements in the \[edit protocols connections\] Hierarchy Level on page 402](#)
- [Unsupported Statements in the \[edit protocols connections\] Hierarchy Level on page 402](#)

### Supported Statements in the [edit protocols connections] Hierarchy Level

The following hierarchy shows the **[edit protocols connections]** configuration statements supported on EX Series switches:

```
protocols {
  connections {
    interface-switch connection-name {
      interface interface-name.unit-number;
    }
    lsp-switch connection-name {
      receive-lsp label-switched-path;
      transmit-lsp label-switched-path;
    }
    remote-interface-switch connection-name {
      interface interface-name.unit-number;
      receive-lsp label-switched-path;
      transmit-lsp label-switched-path;
    }
  }
}
```

### Unsupported Statements in the [edit protocols connections] Hierarchy Level

All statements in the **[edit protocols connections]** hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented with the following exceptions:

**Table 31: Unsupported [edit protocols connections] Configuration Statements on EX Series Switches**

Statement	Hierarchy
<i>NOTE:</i> Variables, such as <i>p2mp-receive-switch</i> , are not shown in the statements or hierarchies.	
p2mp-receive-switch	[edit protocols connections]
p2mp-transmit-switch	[edit protocols connections]

## [\[edit protocols mld\]](#) Configuration Statement Hierarchy on EX Series Switches

This topic lists supported and unsupported configuration statements in the [\[edit protocols mld\]](#) hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.
- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see *EX Series Switch Software Features Overview*.

This topic lists:

- [Supported Statements in the \[edit protocols mld\] Hierarchy Level on page 416](#)
- [Unsupported Statements in the \[edit protocols mld\] Hierarchy Level on page 417](#)

### [Supported Statements in the \[edit protocols mld\] Hierarchy Level](#)

---

The following hierarchy shows the [\[edit protocols mld\]](#) configuration statements supported on EX Series switches:

```
protocols {
  mld {
    accounting;
    interface interface-name {
      (accounting | no-accounting);
      disable;
      group-limit number;
      group-policy [ policy-names ];
      immediate-leave;
      oif-map [ map-names ];
      passive <allow-receive> <send-general-query> <send-group-query>;
      ssm-map ssm-map-name;
      ssm-map-policy policy-name;
      static {
        group multicast-group-address {
          exclude;
          group-count number;
          group-increment increment;
          source source-ip-address {
            source-count number;
            source-increment number;
          }
        }
      }
    }
  }
}
```

```

    }
  }
  version (1 | 2);
}
maximum-transmit-rate packets-per-second;
query-interval seconds;
query-last-member-interval seconds;
query-response-interval seconds;
robust-count number;
traceoptions {
  file filename <files number> <size maximum-file-size> <world-readable |
    no-world-readable>;
  flag flag <flag-modifier> <disable>;
}
}
}

```

### Unsupported Statements in the [edit protocols mld] Hierarchy Level

All statements in the [edit protocols mld] hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented.

## [edit protocols msdp] Configuration Statement Hierarchy on EX Series Switches

This topic lists supported and unsupported configuration statements in the **[edit protocols msdp]** hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.
- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see *EX Series Switch Software Features Overview*.

This topic lists:

- [Supported Statements in the \[edit protocols msdp\] Hierarchy Level on page 430](#)
- [Unsupported Statements in the \[edit protocols msdp\] Hierarchy Level on page 431](#)

### Supported Statements in the [edit protocols msdp] Hierarchy Level

The following hierarchy shows the [edit protocols msdp] configuration statements supported on EX Series switches:

```
protocols {
  msdp {
    active-source-limit {
      log-interval seconds;
      log-warning value;
      maximum number;
      threshold number;
    }
    data-encapsulation (disable | enable);
    disable;
    export [ policy-names ];
    group group-name {
      disable;
      export [ policy-names ];
      import [ policy-names ];
      local-address address;
      mode (mesh-group | standard);
      peer address {
        active-source-limit {
          log-interval seconds;
          log-warning value;
          maximum number;
          threshold number;
        }
        authentication-key peer-key;
        default-peer;
        disable;
        export [ policy-names ];
        hold-time seconds;
        import [ policy-names ];
        keep-alive seconds;
        local-address address;
        sa-hold-time seconds;
        traceoptions {
          file filename <files number> <size maximum-file-size> <world-readable |
            no-world-readable>;
          flag flag <flag-modifier> <disable>;
        }
      }
    }
    traceoptions {
      file filename <files number> <size maximum-file-size> <world-readable |
        no-world-readable>;
      flag flag <flag-modifier> <disable>;
    }
  }
  hold-time seconds;
  import [ policy-names ];
  keep-alive seconds;
  local-address address;
  peer address {
```

```

    active-source-limit {
        log-interval seconds;
        log-warning value;
        maximum number;
        threshold number;
    }
    authentication-key peer-key;
    default-peer;
    disable;
    export [ policy-names ];
    hold-time seconds;
    import [ policy-names ];
    keep-alive seconds;
    local-address address;
    sa-hold-time seconds;
    traceoptions {

### [edit protocols mstp] Configuration Statement Hierarchy on EX Series Switches

This topic lists supported and unsupported configuration statements in the [edit protocols mstp] hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.

- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see *EX Series Switch Software Features Overview*.

This topic lists:

- [Supported Statements in the \[edit protocols mstp\] Hierarchy Level on page 432](#)
- [Unsupported Statements in the \[edit protocols mstp\] Hierarchy Level on page 433](#)

### Supported Statements in the [edit protocols mstp] Hierarchy Level

The following hierarchy shows the **[edit protocols mstp]** configuration statements supported on EX Series switches:

```
protocols {
  mstp {
    bpdu-block-on-edge;
    bpdu-destination-mac-address provider-bridge-group;
    bridge-priority priority;
    configuration-name configuration-name;
    disable;
    forward-delay seconds;
    hello-time seconds;
    interface interface-name {
      access-trunk;
      bpdu-timeout-action {
        alarm;
        block;
      }
      cost cost;
      edge;
      mode (point-to-point | shared);
      no-root-port;
      priority interface-priority;
    }
    max-age seconds;
    max-hops hops;
    msti identifier {
      bridge-priority priority;
      interface interface-name {
        cost cost;
        priority interface-priority;
      }
      vlan [ vlan-ids ];
    }
    priority-hold-time seconds;
    revision-level revision-level;
    traceoptions {
      file filename <files number> <size maximum-file-size> <world-readable |
        no-world-readable>;
      flag flag <disable>;
    }
  }
}
```

```
}
}
```

### Unsupported Statements in the [edit protocols mstp] Hierarchy Level

All statements in the **[edit protocols mstp]** hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented.

### [edit protocols uplink-failure-detection] Configuration Statement Hierarchy on EX Series Switches

This topic lists supported and unsupported configuration statements in the **[edit protocols uplink-failure-detection]** hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.
- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see *EX Series Switch Software Features Overview*.

This topic lists:

- [Supported Statements in the \[edit protocols uplink-failure-detection\] Hierarchy Level on page 462](#)
- [Unsupported Statements in the \[edit protocols uplink-failure-detection\] Hierarchy Level on page 462](#)

### Supported Statements in the [edit protocols uplink-failure-detection] Hierarchy Level

---

The following hierarchy shows the [edit protocols uplink-failure-detection] configuration statements supported on EX Series switches:

```
protocols {
  uplink-failure-detection {
    action {
      log;
    }
    group {
      group-name {
        link-to-monitor {
          interface-name;
        }
        link-to-disable {
          interface-name;
        }
      }
    }
    traceoptions {
      file filename <files number> <no-stamp> <replace> <size size> <world-readable |
        no-world-readable>;
      flag (all | dcd | groups | interface | parse );
    }
  }
}
```

### Unsupported Statements in the [edit protocols uplink-failure-detection] Hierarchy Level

### [edit security] Configuration Statement Hierarchy on EX Series Switches

This topic lists supported and unsupported configuration statements in the [edit security] hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.
- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see *EX Series Switch Software Features Overview*.

This topic lists:

- [Supported Statements in the \[edit security\] Hierarchy Level on page 483](#)
- [Unsupported Statements in the \[edit security\] Hierarchy Level on page 485](#)

### Supported Statements in the [edit security] Hierarchy Level

### Supported Statements in the [edit services] Hierarchy Level

The following hierarchy shows the **[edit services]** configuration statements supported on EX Series switches:

```
services {
  captive-portal {
    authentication-profile-name authentication-profile-name;
    custom-options {
      banner-message string;
      footer-bgcolor color;
      footer-message string;
      footer-text-color color;
      form-header-bgcolor color;
      form-header-message string;
      footer-header-text-color color;
      form-reset-label label-name;
      form-submit-label label-name;
      header-bgcolor color;
      header-logo filename;
      header-message string;
      header-text-color color0;
      post-authentication-url url;
    }
  }
  interface (all | interface-name) {
    quiet-period seconds;
    retries number-of-retries;
    server-timeout seconds;
    session-expiry seconds;
    supplicant (multiple | single | single-secure);
  }
  secure-authentication (http | https);
  traceoptions {
    file filename <files number> <size maximum-file-size> <world-readable |
      no-world-readable>;

### [edit snmp] Configuration Statement Hierarchy on EX Series Switches

This topic lists supported and unsupported configuration statements in the [edit snmp] hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.

- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see *EX Series Switch Software Features Overview*

This topic lists:

- [Supported Statements in the \[edit snmp\] Hierarchy Level on page 489](#)
- [Unsupported Statements in the \[edit snmp\] Hierarchy Level on page 493](#)

### Supported Statements in the [edit snmp] Hierarchy Level

The following hierarchy shows the **[edit snmp]** configuration statements supported on EX Series switches:

```
snmp {
  client-list list-name {
    address {
      restrict;
    }
  }
  community community-name {
    authorization (read-only | read-write);
    client-list-name list-name;
    clients {
      address <restrict>;
    }
    routing-instance instance-name;
    routing-instance instance-name {
      client-list-name list-name;
      clients {
        address <restrict>;
      }
    }
    view view-name;
  }
  contact contact-information;
  description description;
  engine-id {
    (local engine-id | use-default-ip-address | use-mac-address);
  }
  filter-duplicates;
  filter-interfaces {
    interfaces
    all-internal-interfaces;
    interface 1;
    interface 2;
  }
  health-monitor {
    falling-threshold percentage;
    idp {
      falling-threshold;
      interval seconds;
    }
  }
}
```

```
        rising-threshold;
    }
    interval seconds;
    rising-threshold percentage;
}
interface [ interface-names ];
location location;
name system-name;
nonvolatile {
    commit-delay seconds;
}

## [edit system] Configuration Statement Hierarchy on EX Series Switches

This topic lists supported and unsupported configuration statements in the [edit system] hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.
- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see *EX Series Switch Software Features Overview*.

This topic lists:

- [Supported Statements in the \[edit system\] Hierarchy Level on page 495](#)
- [Unsupported Statements in the \[edit system\] Hierarchy Level on page 507](#)

### Supported Statements in the [edit system] Hierarchy Level

The following hierarchy shows the [edit system] configuration statements supported on EX Series switches.

```

system {
  accounting {
    destination {
      radius {
        server {
          server-address {
            accounting-port port-number;
            port port-number;
            retry number;
            secret password;
            source-address address;
            timeout seconds;
          }
        }
      }
    }
  }
  tacplus {

```

```

server {
    server-address {
        port port-number;
        secret password;
        single-connection;
        timeout seconds;
    }
}
}

## [edit virtual-chassis] Configuration Statement Hierarchy

This topic lists supported and unsupported configuration statements in the **[edit virtual-chassis]** hierarchy level on EX Series and QFX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.
- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms.

For detailed information about feature support on specific EX Series or QFX Series switch platforms, see [Feature Explorer](#).

This topic lists:

- [Supported Statements in the \[edit virtual-chassis\] Hierarchy Level on page 508](#)
- [Unsupported Statements in the \[edit virtual-chassis\] Hierarchy Level on page 509](#)

### Supported Statements in the [edit virtual-chassis] Hierarchy Level

The following hierarchy shows the **[edit virtual-chassis]** configuration statements supported on EX Series or QFX Series switches:

```
virtual-chassis {
  aliases {
    serial-number serial-number {
      alias-name alias-name;
    }
  }
  auto-provisioned;
  auto-sw-update {
    (ex-4200 | ex-4300 | ex-4500 | ex-4600 | qfx-3 | qfx-5)
    package-name package-name;
  }
  fast-failover (ge | vcp disable | xe);
}
```

```

graceful-restart {
  disable;
}
id id;
mac-persistence-timer [minutes | disable];;
member member-id {
  location location;
  mastership-priority number;
  no-management-vlan;
  role (line-card | routing-engine);
  serial-number;
}
no-split-detection;
preprovisioned;
traceoptions {
  file filename <files number> <size size> <world-readable | no-world-readable> <match
    regex>;
  flag flag ;
}
vc-port {
  lag-hash (packet-based | source-port-based);
}
vcp-no-hold-time;
}

```

### Unsupported Statements in the [edit virtual-chassis] Hierarchy Level

All statements in the [edit virtual-chassis] hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented.

### [edit vlans] Configuration Statement Hierarchy on EX Series Switches

This topic lists supported and unsupported configuration statements in the [edit vlans] hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.

- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see *EX Series Switch Software Features Overview*.

This topic lists:

- [Supported Statements in the \[edit vlans\] Hierarchy Level on page 510](#)
- [Unsupported Statements in the \[edit vlans\] Hierarchy Level on page 511](#)

---

### Supported Statements in the [edit vlans] Hierarchy Level

The following hierarchy shows the **[edit vlans]** configuration statements supported on one or more of the EX Series switches:

```
vlans {  
  vlan-name {  
    description text-description;  
    dot1q-tunneling {  
      customer-vlans (id | native | range);  
      layer2-protocol-tunneling all | protocol-name {  
        drop-threshold number;  
        shutdown-threshold number;  
      }  
    }  
  }  
  filter {  
    input filter-name  
    output filter-name;  
  }  
  interface interface-name {  
    egress;  
    ingress;  
    mapping (native (push | swap) | policy | tag (push | swap));  
    pvlan-trunk;  
  }  
  isolation-id id-number;  
  l3-interface vlan.logical-interface-number;  
  l3-interface-ingress-counting layer-3-interface-name;  
  mac-limit limit action action;  
  mac-table-aging-time seconds;  
  no-local-switching;  
  no-mac-learning;  
  primary-vlan vlan-name;  
  vlan-id number;  
  vlan-prune;  
  vlan-range vlan-id-low-vlan-id-high;  
}
```

Unsupported Statements in the [edit vlans] Hierarchy Level

All statements in the [edit vlans] hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented with the following exceptions:

Table 45: Unsupported [edit vlans] Configuration Statements on EX Series Switches

# Administration

- [Operational Commands on page 513](#)

### Operational Commands

---

- [set cli directory](#)
- [set cli idle-timeout](#)
- [set cli prompt](#)
- [set cli restart-on-upgrade](#)
- [set cli screen-length](#)
- [set cli screen-width](#)
- [set cli timestamp](#)
- [start shell](#)

## set cli directory

---

<b>Syntax</b>	set cli directory <i>directory</i>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Set the current working directory.
<b>Options</b>	<i>directory</i> —Pathname of the working directory.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>CLI User Interface Overview</i></li><li>• <i>show cli directory</i></li></ul>
<b>List of Sample Output</b>	<a href="#">set cli directory on page 514</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### set cli directory

```
user@host> set cli directory /var/home/regress
Current directory: /var/home/regress
```

## set cli idle-timeout

---

<b>Syntax</b>	set cli idle-timeout < <i>minutes</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Set the maximum time that an individual session can be idle before the user is logged off the router or switch.
<b>Options</b>	<i>minutes</i> —(Optional) Maximum idle time. The range of values, in minutes, is 0 through 100,000. If you do not issue this command, and the user's login class does not specify this value, the user is never forced off the system after extended idle times. Setting the value to 0 disables the timeout.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>CLI User Interface Overview</i></li> <li>• <i>show cli</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">set cli idle-timeout on page 515</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### set cli idle-timeout

```
user@host> set cli idle-timeout 60
Idle timeout set to 60 minutes
```

## set cli prompt

---

<b>Syntax</b>	set cli prompt <i>string</i>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Set the prompt so that it is displayed within the CLI.
<b>Options</b>	<i>string</i> —CLI prompt string. To include spaces in the prompt, enclose the string in quotation marks. By default, the string is <i>username@hostname</i> .
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>CLI User Interface Overview</i></li><li>• <i>show cli</i></li></ul>
<b>List of Sample Output</b>	<a href="#">set cli prompt on page 516</a>
<b>Output Fields</b>	When you enter this command, the new CLI prompt is displayed.

## Sample Output

### set cli prompt

```
user@host> set cli prompt lab1-router>
lab1-router>
```

## set cli restart-on-upgrade

---

<b>Syntax</b>	set cli restart-on-upgrade string (off   on)
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	For an individual session, set the CLI to prompt you to restart the router or switch after upgrading the software.
<b>Options</b>	<b>off</b> —Disables the prompt. <b>on</b> —Enables the prompt.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>CLI User Interface Overview</i></li> <li>• <i>show cli</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">set cli restart-on-upgrade on page 517</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### set cli restart-on-upgrade

```
user@host> set cli restart-on-upgrade on
Enabling restart-on-upgrade
```

## set cli screen-length

---

<b>Syntax</b>	<code>set cli screen-length <i>length</i></code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Set terminal screen length.
<b>Options</b>	<i>length</i> —Number of lines of text that the terminal screen displays (0 through 10,000). The default is 24.
<b>Additional Information</b>	The point at which the ---( <b>more</b> )--- prompt appears on the screen is a function of this setting and the settings for the <code>set cli screen-width</code> and <code>set cli terminal</code> commands.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>CLI User Interface Overview</i></li><li>• <a href="#">set cli screen-width on page 519</a></li><li>• <i>set cli terminal</i></li><li>• <i>show cli</i></li></ul>
<b>List of Sample Output</b>	<a href="#">set cli screen-length on page 518</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### set cli screen-length

```
user@host> set cli screen-length 75
Screen length set to 75
```

## set cli screen-width

---

<b>Syntax</b>	<code>set cli screen-width <i>width</i></code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Set the terminal screen width.
<b>Options</b>	<i>width</i> —Number of characters (0 through 1024) in a line. The default is 80.
<b>Additional Information</b>	The point at which the ---( <b>more</b> )--- prompt appears on the screen is a function of this setting and the settings for the <code>set cli screen-length</code> and <code>set cli terminal</code> commands.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>CLI User Interface Overview</i></li> <li>• <a href="#">set cli screen-length on page 518</a></li> <li>• <i>set cli terminal</i></li> <li>• <i>show cli</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">set cli screen-width on page 519</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### set cli screen-width

```
user@host> set cli screen-width
Screen width set to 132
```

## set cli timestamp

---

<b>Syntax</b>	set cli timestamp (format <i>timestamp-format</i>   disable)
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Set a timestamp for CLI output.
<b>Options</b>	<p><b>format <i>timestamp-format</i></b>—Set the date and time format for the timestamp. The timestamp format you specify can include the following placeholders in any order:</p> <ul style="list-style-type: none"><li>• <b>%m</b>—Two-digit month</li><li>• <b>%d</b>—Two-digit date</li><li>• <b>%T</b>—Six-digit hour, minute, and seconds</li></ul> <p><b>disable</b>—Remove the timestamp from the CLI.</p>
<div> <b>NOTE:</b> A timestamp is displayed by default when no command output is generated.</div>	
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>CLI User Interface Overview</i></li><li>• <i>show cli</i></li></ul>
<b>List of Sample Output</b>	<a href="#">set cli timestamp on page 520</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### set cli timestamp

```
user@host> set cli timestamp format '%m-%d-%T'
'04-21-17:39:13'
CLI timestamp set to: '%m-%d-%T'
```

## start shell

<b>Syntax</b>	start shell (csh   sh) <user <i>username</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Exit from the CLI environment and create a UNIX-level shell. To return to the CLI, type <b>exit</b> from the shell.
<div>  <b>NOTE:</b> <ul style="list-style-type: none"> <li>To issue this command, the user must have the required login access privileges configured by including the <b>permissions</b> statement at the [edit system login class <i>class-name</i>] hierarchy level.</li> <li>UNIX wheel group membership or permissions are no longer required to issue this command.</li> </ul> </div>	
<b>Options</b>	<b>csh</b> —Create a UNIX C shell.  <b>sh</b> —Create a UNIX Bourne shell.  <b>user <i>username</i></b> —(Optional) Start the shell as another user.
<b>Additional Information</b>	When you are in the shell, the shell prompt has the following format:  <i>username@hostname</i> %  An example of the prompt is:  root@host%
<b>Required Privilege Level</b>	shell and maintenance
<b>List of Sample Output</b>	<a href="#">start shell csh on page 521</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### start shell csh

```

user@host> start shell csh
%

exit
%
```

```
username@hostname% start shell sh
%

exit
user@host>
```

## CHAPTER 9

# Overview

- [Software Overview on page 525](#)

## Software Overview

---

- [Understanding Software Infrastructure and Processes on page 525](#)

### Understanding Software Infrastructure and Processes

Each switch runs the Juniper Networks Junos operating system (Junos OS) for Juniper Networks EX Series Ethernet Switches on its general-purpose processors. Junos OS includes processes for Internet Protocol (IP) routing and for managing interfaces, networks, and the chassis.

The Junos OS runs on the Routing Engine. The Routing Engine kernel coordinates communication among the Junos OS processes and provides a link to the Packet Forwarding Engine.

With the J-Web interface and the command-line interface (CLI) to the Junos OS, you configure switching features and routing protocols and set the properties of network interfaces on your switch. After activating a software configuration, use either the J-Web or CLI user interface to monitor the switch, manage operations, and diagnose protocol and network connectivity problems.

- [Routing Engine and Packet Forwarding Engine on page 525](#)
- [Junos OS Processes on page 526](#)

### Routing Engine and Packet Forwarding Engine

---

A switch has two primary software processing components:

- **Packet Forwarding Engine**—Processes packets; applies filters, routing policies, and other features; and forwards packets to the next hop along the route to their final destination.
- **Routing Engine**—Provides three main functions:
  - Creates the packet forwarding switch fabric for the switch, providing route lookup, filtering, and switching on incoming data packets, then directing outbound packets to the appropriate interface for transmission to the network

- Maintains the routing tables used by the switch and controls the routing protocols that run on the switch.
- Provides control and monitoring functions for the switch, including controlling power and monitoring system status.

### Junos OS Processes

The Junos OS running on the Routing Engine and Packet Forwarding Engine consists of multiple processes that are responsible for individual functions.

The separation of functions provides operational stability, because each process accesses its own protected memory space. In addition, because each process is a separate software package, you can selectively upgrade all or part of the Junos OS, for added flexibility.

Table 6 on page 30 describes the primary Junos OS processes.

**Table 46: Junos OS Processes**

Process	Name	Description
Chassis process	chassisd	<p>Detects hardware on the system that is used to configure network interfaces.</p> <p>Monitors the physical status of hardware components and field-replaceable units (FRUs), detecting when environment sensors such as temperature sensors are triggered.</p> <p>Relays signals and interrupts—for example, when devices are taken offline, so that the system can close sessions and shut down gracefully.</p>
Ethernet switching process	eswd	<p>Handles Layer 2 switching functionality such as MAC address learning, Spanning Tree protocol and access port security. The process is also responsible for managing Ethernet switching interfaces, VLANs, and VLAN interfaces.</p> <p>Manages Ethernet switching interfaces, VLANs, and VLAN interfaces.</p>
Forwarding process	pfem	<p>Defines how routing protocols operate on the switch. The overall performance of the switch is largely determined by the effectiveness of the forwarding process.</p>
Interface process	dcd	<p>Configures and monitors network interfaces by defining physical characteristics such as link encapsulation, hold times, and keepalive timers.</p>
Management process	mgd	<p>Provides communication between the other processes and an interface to the configuration database.</p> <p>Populates the configuration database with configuration information and retrieves the information when queried by other processes to ensure that the system operates as configured.</p> <p>Interacts with the other processes when commands are issued through one of the user interfaces on the switch.</p> <p>If a process terminates or fails to start when called, the management process attempts to restart it a limited number of times to prevent thrashing and logs any failure information for further investigation.</p>
Routing protocol process	rpd	<p>Defines how routing protocols such as RIP, OSPF, and BGP operate on the device, including selecting routes and maintaining forwarding tables.</p>

  - For more information about basic system parameters, supported protocols, and software processes, see *Junos OS System Basics Configuration Guide*

## CHAPTER 10

# Configuration

- [Configuration Tasks on page 529](#)
- [Configuration Statements on page 533](#)

### Configuration Tasks

---

- [Configuring Management Access for the EX Series Switch \(J-Web Procedure\) on page 529](#)
- [Generating SSL Certificates to Be Used for Secure Web Access on page 532](#)
- [Configuring MS-CHAPv2 to Provide Password-Change Support \(CLI Procedure\) on page 533](#)

### Configuring Management Access for the EX Series Switch (J-Web Procedure)

You can manage an EX Series switch remotely through the J-Web interface. To communicate with the switch, the J-Web interface uses HTTP. HTTP enables easy Web access, but uses no encryption. The data that is transmitted between the Web browser and the switch by means of HTTP is vulnerable to interception and attack. To enable secure Web access the switch supports HTTPS. You can enable HTTP or HTTPS access on specific interfaces and ports as needed.

Navigate to the Secure Access Configuration page by selecting **Configure > System Properties > Management Access**. On this page, you can enable HTTP and HTTPS access on interfaces for managing the EX Series switch through the J-Web interface. You can also install SSL certificates and enable Junos XML management protocol over SSL with the Secure Access page.

1. Click **Edit** to modify the configuration. Enter information into the Management Access Configuration page as described in [Table 47 on page 530](#).
2. To verify that Web access is enabled correctly, connect to the switch using the appropriate method:
  - For HTTP access—In your Web browser, type **http://URL** or **http://IP address**.
  - For HTTPS access—In your Web browser, type **https://URL** or **https://IP address**.
  - For SSL Junos XML management protocol access—To use this option, you must have a Junos XML management protocol client such as Junos Scope. For information about how to log in to Junos Scope, see the *Junos Scope Software User Guide*.

**NOTE:** After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See [Using the Commit Options to Commit Configuration Changes](#) for details about all commit options.

**Table 47: Secure Management Access Configuration Summary**

Field	Function	Your Action
<b>Management Access tab</b>		
Management Port IP/Management Port IPv6	<p>Specifies the management port IP address. The software supports both IPv4 ( displayed as IP) and IPv6 address.</p> <p><b>NOTE:</b> IPv6 is not supported on EX2200 and EX 4500 switches.</p>	<p>To specify an IPv4 address:</p> <ol style="list-style-type: none"> <li>1. Select the check box <b>IPv4 address</b>.</li> <li>2. Type an IP address—for example: <b>10.10.10.10</b>.</li> <li>3. Enter the subnet mask or address prefix. For example, 24 bits represents <b>255.255.255.0</b>.</li> <li>4. Click <b>OK</b>.</li> </ol> <p>To specify an IPv6 address:</p> <ol style="list-style-type: none"> <li>1. Select the check box <b>IPv6 address</b>.</li> <li>2. Type an IP address—for example: <b>2001:ab8:85a3::8a2e:370:7334</b>.</li> <li>3. Enter the subnet mask or address prefix.</li> <li>4. Click <b>OK</b>.</li> </ol>
Default Gateway	Defines a default gateway through which to direct packets addressed to networks that are not explicitly listed in the bridge table constructed by the switch.	For IPv4 address type a 32-bit IP address, in dotted decimal notation. Type a 128-bit IP address for IPv6 address type.
Loopback address	Specifies the IP address of the loopback interface.	Type an IP address.
Subnet Mask	Specifies the subnet mask for the loopback interface.	Enter the subnet mask or address prefix.
<b>Services tab</b>		
Services	Specifies services to be enabled: telnet and SSH.	Select to enable the required services.
Enable Junos XML management protocol over Clear Text	Enables clear text access to the Junos XML management protocol XML scripting API.	To enable clear text access, select the <b>Enable Junos XML management protocol over Clear Text</b> check box.
Enable Junos XML protocol over SSL	Enables secure SSL access to the Junos XML management protocol XML scripting API.	To enable SSL access, select the <b>Enable Junos XML management protocol over SSL</b> check box.

Table 47: Secure Management Access Configuration Summary (*continued*)

Field	Function	Your Action
Junos XML management protocol Certificate	Specifies SSL certificates to be used for encryption.  This field is available only after you create at least one SSL certificate.	To enable an SSL certificate, select a certificate from the Junos XML management protocol SSL Certificate list—for example, <b>new</b> .
Enable HTTP	Enables HTTP access on interfaces.	To enable HTTP access, select the <b>Enable HTTP access</b> check box.  Select and clear interfaces by clicking the direction arrows:  <ul style="list-style-type: none"> <li>To enable HTTP access on an interface, add the interface to the HTTP Interfaces list. You can either select either all interfaces or specific interfaces.</li> </ul>
Enable HTTPS	Enables HTTPS access on interfaces.	To enable HTTPS access, select the <b>Enable HTTPS access</b> check box.  Select and deselect interfaces by clicking the direction arrows:  <ul style="list-style-type: none"> <li>To enable HTTPS access on an interface, add the interface to the HTTPS Interfaces list. You can either select either all interfaces or specific interfaces.</li> </ul> <p><b>NOTE:</b> Specify the certificate to be used for HTTPS access.</p>

**Certificates tab**

Certificates	Displays digital certificates required for SSL access to the switch.  Allows you to add and delete SSL certificates.	To add a certificate:  <ol style="list-style-type: none"> <li>Have a general SSL certificate available. See Generating SSL Certificates for more information.</li> <li>Click <b>Add</b>. The Add a Local Certificate page opens.</li> <li>Type a name in the Certificate Name box—for example, <b>new</b>.</li> <li>Open the certificate file and copy its contents.</li> <li>Paste the generated certificate and RSA private key in the Certificate box.</li> </ol> <p>To edit a certificate, select it and click <b>Edit</b>.</p> <p>To delete a certificate, select it and click <b>Delete</b>.</p>

- [Understanding J-Web User Interface Sessions](#)
- [Enabling HTTPS and XNM-SSL Services on Switches Using Self-Signed Certificates \(CLI Procedure\) on page 1417](#)

## Generating SSL Certificates to Be Used for Secure Web Access

You can set up secure Web access for an EX Series switch. To enable secure Web access, you must generate a digital Secure Sockets Layer (SSL) certificate and then enable HTTPS access on the switch.

To generate an SSL certificate:

1. Enter the following **openssl** command in your SSH command-line interface on a BSD or Linux system on which **openssl** is installed. The **openssl** command generates a self-signed SSL certificate in the privacy-enhanced mail (PEM) format. It writes the certificate and an unencrypted 1024-bit RSA private key to the specified file.

```
% openssl req -x509 -nodes -newkey rsa:1024 -keyout filename.pem -out filename.pem
```

where **filename** is the name of a file in which you want the SSL certificate to be written—for example, **my-certificate**.

2. When prompted, type the appropriate information in the identification form. For example, type **US** for the country name.
3. Display the contents of the file that you created.

```
cat my-certificate.pem
```

You can use the J-Web Configuration page to install the SSL certificate on the switch. To do this, copy the file containing the certificate from the BSD or Linux system to the switch. Then open the file, copy its contents, and paste them into the Certificate box on the J-Web Secure Access Configuration page.

You can also use the following CLI statement to install the SSL certificate on the switch:

```
[edit]  
user@switch# set security certificates local my-signed-cert load-key-file my-certificate.pem
```

## Configuring MS-CHAPv2 to Provide Password-Change Support (CLI Procedure)

Junos OS for EX Series switches enables you to configure the Microsoft Corporation implementation of the Challenge Handshake Authentication Protocol version 2 (MS-CHAPv2) on the switch to provide password-change support. Configuring MS-CHAPv2 on the switch provides users accessing a switch the option of changing the password when the password expires, is reset, or is configured to be changed at next login.

See RFC 2433, *Microsoft PPP CHAP Extensions*, for information about MS-CHAP.

Before you configure MS-CHAPv2 to provide password-change support, ensure that you have:

- Configured RADIUS server authentication. Configure users on the authentication server and set the first-tried option in the authentication order to radius. See [“Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch” on page 1843](#).

To configure MS-CHAPv2, specify the following:

```
[edit system radius-options]
user@switch# set password-protocol mschap-v2
```

You must have the required access permission on the switch in order to change your password.

## allow-commands

---

<b>Syntax</b>	<code>allow-commands "regular-expression";</code>
<b>Hierarchy Level</b>	[edit system login <a href="#">class</a> <i>class-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Specify the operational mode commands that members of a login class can use.
<b>Default</b>	If you omit this statement and the <b>deny-commands</b> statement, users can issue only those commands for which they have access privileges through the <b>permissions</b> statement.
<b>Options</b>	<b>regular-expression</b> —Extended (modern) regular expression as defined in POSIX 1003.2. If the regular expression contains any spaces, operators, or wildcard characters, enclose it in quotation marks.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Specifying Access Privileges for Junos OS Operational Mode Commands</i></li> <li>• <a href="#">deny-commands on page 543</a></li> <li>• <a href="#">user on page 577</a></li> </ul>

## allow-configuration

---

<b>Syntax</b>	<code>allow-configuration "regular-expression";</code>
<b>Hierarchy Level</b>	[edit system login <a href="#">class</a> <i>class-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Explicitly allow configuration access to the specified levels in the hierarchy even if the permissions set with the <b>permissions</b> statement do not grant such access by default.
<b>Default</b>	If you omit this statement and the <b>deny-configuration</b> statement, users can edit only those commands for which they have access privileges through the <b>permissions</b> statement.
<b>Options</b>	<b>regular-expression</b> —Extended (modern) regular expression as defined in POSIX 1003.2. If the regular expression contains any spaces, operators, or wildcard characters, enclose it in quotation marks.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Specifying Access Privileges Using allow/deny-configuration Statements</i></li><li>• <i>Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies</i></li><li>• <a href="#">deny-configuration on page 544</a></li><li>• <a href="#">user on page 577</a></li></ul>

## announcement

---

<b>Syntax</b>	<code>announcement text;</code>
<b>Hierarchy Level</b>	[edit system <a href="#">login</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure a system login announcement. This announcement appears after a user logs in.
<b>Options</b>	<b>text</b> —Text of the announcement. If the text contains any spaces, enclose it in quotation marks.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring the Junos OS to Display a System Login Announcement</i></li> <li>• <a href="#">message on page 558</a></li> </ul>

## archive-sites

---

<b>Syntax</b>	<code>archive-sites {     site-name; }</code>
<b>Hierarchy Level</b>	[edit accounting-options <a href="#">file filename</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure an archive site. If more than one site name is configured, an ordered list of archive sites for the accounting-data log files is created. When a file is archived, the router or switch attempts to transfer the file to the first URL in the list, moving to the next site only if the transfer does not succeed. The log file is stored at the archive site with a filename of the format <b>router-name_log-filename_timestamp</b> .
<b>Options</b>	<b>site-name</b> —Any valid FTP URL to a destination. For information about specifying valid FTP URLs, see the <i>Getting Started Guide for Routing Devices</i> .
<b>Required Privilege Level</b>	snmp—To view this statement in the configuration. snmp-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring Archive Sites</i></li> </ul>

## authentication (Login)

---

Syntax	<pre>authentication {   (encrypted-password "password"   plain-text-password);   load-key-file URL filename;   ssh-dsa "public-key";   ssh-ecdsa "public-key";   ssh-rsa "public-key"; }</pre>
Hierarchy Level	[edit system login <b>user</b> <i>username</i> ]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	Authentication methods that a user can use to log in to the router or switch. You can assign multiple authentication methods to a single user.
Options	<p><b>encrypted-password "password"</b>—Message Digest 5 (MD5) or other encrypted authentication. Specify the MD5 or other password. You can specify only one encrypted password for each user.</p> <p>You cannot configure a blank password for <b>encrypted-password</b> using blank quotation marks (" "). You must configure a password whose number of characters range from 1 through 128 characters and enclose the password in quotation marks.</p> <p><b>load-key-file URL filename</b>—Load previously-generated RSA (SSH version 1 and SSH version 2) and DSA (SSH version 2) public keys from a named file at a specified URL location. The file contains one or more SSH keys.</p> <p><b>plain-text-password</b>—When using this option, the command-line interface (CLI) prompts you for the password and then encrypts it.</p> <p><b>ssh-dsa "public-key"</b>—SSH version 2 authentication. Specify the DSA public key. You can specify one or more public keys for each user.</p> <p><b>ssh-ecdsa "public-key"</b>—SSH version 2 authentication. Specify the ECDSA public key. You can specify one or more public keys for each user.</p> <p><b>ssh-rsa "public-key"</b>—SSH version 1 and SSH version 2 authentication. Specify the RSA public key. You can specify one or more public keys for each user.</p>
Required Privilege Level	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <i>Configuring Junos OS User Accounts</i></li><li>• <a href="#">root-authentication on page 567</a></li></ul>

## authentication-order

---

<b>Syntax</b>	<code>authentication-order [ <i>authentication-methods</i> ];</code>
<b>Hierarchy Level</b>	<code>[edit system]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure the order in which the software tries different user authentication methods when attempting to authenticate a user. For each login attempt, the software tries the authentication methods in order, starting with the first one, until the password matches.
<b>Default</b>	If you do not include the <b>authentication-order</b> statement, users are verified based on their configured passwords.
<b>Options</b>	<p><b><i>authentication-methods</i></b>—One or more authentication methods, listed in the order in which they should be tried. The method can be one or more of the following:</p> <ul style="list-style-type: none"> <li>• <b>password</b>—Use the password configured for the user with the <b>authentication</b> statement at the <code>[edit system login user]</code> hierarchy level.</li> <li>• <b>radius</b>—Use RADIUS authentication services.</li> <li>• <b>tacplus</b>—Use TACACS+ authentication services.</li> </ul>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring the Junos OS Authentication Order for RADIUS, TACACS+, and Local Password Authentication</i></li> <li>• <a href="#">authentication on page 538</a></li> </ul>

## change-type

---

<b>Syntax</b>	<code>change-type (character-sets   set-transitions);</code>
<b>Hierarchy Level</b>	[edit system login <a href="#">password</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Set requirements for using character sets in plain-text passwords. When you combine this statement with the <b>minimum-changes</b> statement, you can check for the total number of character sets included in the password or for the total number of character-set changes in the password. Newly created passwords must meet these requirements.
<b>Options</b>	Specify one of the following: <ul style="list-style-type: none"><li>• <b>character-sets</b>—The number of character sets in the password. Valid character sets include uppercase letters, lowercase letters, numbers, punctuation, and other special characters.</li><li>• <b>set-transitions</b>—The number of transitions between character sets.</li></ul>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Special Requirements for Junos OS Plain-Text Passwords</i></li><li>• <a href="#">minimum-changes on page 560</a></li></ul>

## class (Assigning a Class to an Individual User)

---

<b>Syntax</b>	<code>class class-name;</code>
<b>Hierarchy Level</b>	[edit system login <a href="#">user</a> <i>username</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Assign a user to a login class. You must assign each user to a login class.
<b>Options</b>	<b>class-name</b> —One of the classes defined at the [edit system login class] hierarchy level.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Junos OS User Accounts</i></li></ul>

## class (Defining Login Classes)

<b>Syntax</b>	<pre> class <i>class-name</i> {   <b>allow-commands</b> "<i>regular-expression</i>";   ( <b>allow-configuration</b>   allow-configuration-regexps ) "<i>regular expression 1</i>" "<i>regular expression 2</i>";   configuration-breadcrumbs;   <b>deny-commands</b> "<i>regular-expression</i>";   ( <b>deny-configuration</b>   deny-configuration-regexps ) "<i>regular expression 1</i>" "<i>regular expression 2</i>";   <b>idle-timeout</b> <i>minutes</i>;   login-script <i>filename</i>;   <b>login-tip</b>;   <b>permissions</b> [ <i>permissions</i> ]; }</pre>
<b>Hierarchy Level</b>	[edit system <a href="#">login</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Define a login class.
<b>Options</b>	<p><b><i>class-name</i></b>—A name you choose for the login class.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>Defining Junos OS Login Classes</li> <li><a href="#">user on page 577</a></li> </ul>

## class-usage-profile

---

Syntax	<pre>class-usage-profile <i>profile-name</i> {     <i>file filename</i>;     <i>interval minutes</i>;     source-classes {         <i>source-class-name</i>;     }     destination-classes {         <i>destination-class-name</i>;     } }</pre>
Hierarchy Level	[edit accounting-options]
Release Information	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
Description	<p>Create a class usage profile, which is used to log class usage statistics to a file in the <code>/var/log</code> directory. The class usage profile logs class usage statistics for the configured source classes on every interface that has <b>destination-class-usage</b> configured.</p> <p>For information about configuring source classes, see the <a href="#">Junos OS Routing Protocols Library for Routing Devices</a>. For information about configuring source class usage, see <a href="#">Network Management Administration Guide for Routing Devices</a>.</p>
Options	<p><b>profile-name</b>—Name of the destination class profile.</p> <p>The remaining statements are explained separately.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Configuring Class Usage Profiles</a></li></ul>

## counters

---

<b>Syntax</b>	<code>counters {     counter-name; }</code>
<b>Hierarchy Level</b>	[edit accounting-options <a href="#">filter-profile</a> <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Names of counters for which filter profile statistics are collected. The packet and byte counts for the counters are logged to a file in the <code>/var/log</code> directory.
<b>Options</b>	<i>counter-name</i> —Name of the counter.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring the Counters</i></li> </ul>

## deny-commands

---

<b>Syntax</b>	<code>deny-commands "regular-expression";</code>
<b>Hierarchy Level</b>	[edit system login <a href="#">class</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Specify the operational mode commands that the user is denied permission to issue even though the permissions set with the <b>permissions</b> statement would allow it.
<b>Default</b>	If you omit this statement and the <b>allow-commands</b> statement, users can issue only those commands for which they have access privileges through the <b>permissions</b> statement.
<b>Options</b>	<i>regular-expression</i> —Extended (modern) regular expression as defined in POSIX 1003.2. If the regular expression contains any spaces, operators, or wildcard characters, enclose it in quotation marks.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Specifying Access Privileges for Junos OS Operational Mode Commands</i></li> <li>• <a href="#">allow-commands on page 535</a></li> <li>• <a href="#">user on page 577</a></li> </ul>

## deny-configuration

---

<b>Syntax</b>	<code>deny-configuration "regular-expression";</code>
<b>Hierarchy Level</b>	[edit system login <a href="#">class</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Explicitly deny configuration access to the specified levels in the hierarchy even if the permissions set with the <b>permissions</b> statement grant such access by default. Note that the user cannot view a particular hierarchy if configuration access is denied for that hierarchy.
<b>Default</b>	If you omit this statement and the <b>allow-configuration</b> statement, users can edit those levels in the configuration hierarchy for which they have access privileges through the <b>permissions</b> statement.
<b>Options</b>	<b>regular-expression</b> —Extended (modern) regular expression as defined in POSIX 1003.2. If the regular expression contains any spaces, operators, or wildcard characters, enclose it in quotation marks.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Specifying Access Privileges Using allow/deny-configuration Statements</i></li><li>• <a href="#">allow-configuration on page 536</a></li><li>• <a href="#">user on page 577</a></li></ul>

---

## destination-classes

---

<b>Syntax</b>	<code>destination-classes {     <i>destination-class-name</i>; }</code>
<b>Hierarchy Level</b>	[edit accounting-options <a href="#">class-usage-profile</a> <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Specify the destination classes for which statistics are collected.
<b>Options</b>	<b><i>destination-class-name</i></b> —Name of the destination class to include in the source class usage profile.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring a Class Usage Profile</i></li></ul>

## fields (for Interface Profiles)

---

<b>Syntax</b>	<pre>fields {     field-name; }</pre>
<b>Hierarchy Level</b>	[edit accounting-options <b>interface-profile</b> <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Statistics to collect in an accounting-data log file for an interface.
<b>Options</b>	<p><i>field-name</i>—Name of the field:</p> <ul style="list-style-type: none"><li>• <b>input-bytes</b>—Input bytes</li><li>• <b>input-errors</b>—Generic input error packets</li><li>• <b>input-multicast</b>—Input packets arriving by multicast</li><li>• <b>input-packets</b>—Input packets</li><li>• <b>input-unicast</b>—Input unicast packets</li><li>• <b>output-bytes</b>—Output bytes</li><li>• <b>output-errors</b>—Generic output error packets</li><li>• <b>output-multicast</b>—Output packets sent by multicast</li><li>• <b>output-packets</b>—Output packets</li><li>• <b>output-unicast</b>—Output unicast packets</li></ul>
<b>Required Privilege Level</b>	<p><b>interface</b>—To view this statement in the configuration.</p> <p><b>interface-control</b>—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Interface Profile</i></li></ul>

## file (Associating with a Profile)

<b>Syntax</b>	<code>file <i>filename</i>;</code>
<b>Hierarchy Level</b>	[edit accounting-options <a href="#">class-usage-profile</a> <i>profile-name</i> ], [edit accounting-options <a href="#">filter-profile</a> <i>profile-name</i> ], [edit accounting-options <a href="#">interface-profile</a> <i>profile-name</i> ], [edit accounting-options <a href="#">mib-profile</a> <i>profile-name</i> ], [edit accounting-options <a href="#">routing-engine-profile</a> <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. The [edit accounting-options <a href="#">mib-profile</a> <i>profile-name</i> ] hierarchy added in Junos OS Release 8.2. Statement introduced in Junos OS Release 9.0 for EX Series Switches.
<b>Description</b>	Specify the accounting log file associated with the profile.
<b>Options</b>	<b><i>filename</i></b> —Name of the log file. You must specify a filename already configured in the <b>file</b> statement at the [edit accounting-options] hierarchy level.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring the Interface Profile</a></li> <li>• <a href="#">Configuring the Filter Profile</a></li> <li>• <a href="#">Configuring the MIB Profile</a></li> <li>• <a href="#">Configuring the Routing Engine Profile</a></li> </ul>

## file (Configuring a Log File)

---

<b>Syntax</b>	<pre>file <i>filename</i> {     archive-sites {         <i>site-name</i>;     }     files <i>number</i>;     nonpersistent;     size <i>bytes</i>;     source-classes <i>time</i>;     transfer-interval <i>minutes</i>; }</pre>
<b>Hierarchy Level</b>	[edit accounting-options]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Specify a log file to be used for accounting data.
<b>Options</b>	<i>filename</i> —Name of the file in which to write accounting data.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>Configuring Accounting-Data Log Files</li></ul>

---

## files

---

<b>Syntax</b>	<code>files <i>number</i>;</code>
<b>Hierarchy Level</b>	[edit accounting-options <a href="#">file</a> <i>filename</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Specify the maximum number of log files to be used for accounting data.
<b>Options</b>	<i>number</i> —The maximum number of files. When a log file (for example, <b>profilelog</b> ) reaches its maximum size, it is renamed <b>profilelog.0</b> , then <b>profilelog.1</b> , and so on, until the maximum number of log files is reached. Then the oldest log file is overwritten. The minimum value for <i>number</i> is 3 and the default value is 10.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Accounting-Data Log Files</i></li></ul>

## filter-profile

---

<b>Syntax</b>	<pre>filter-profile <i>profile-name</i> {     counters {         counter-name;     }     file <i>filename</i>;     interval <i>minutes</i>; }</pre>
<b>Hierarchy Level</b>	[edit accounting-options]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Create a profile to filter and collect packet and byte count statistics and write them to a file in the <code>/var/log</code> directory. To apply the profile to a firewall filter, you include the <b>accounting-profile</b> statement at the [edit firewall filter <i>filter-name</i> ] hierarchy level. For more information about firewall filters, see <a href="#">Firewall Filters Feature Guide for Routing Devices</a> .
<b>Options</b>	<p><i>profile-name</i>—Name of the filter profile.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Filter Profile</a></li></ul>

## format

---

<b>Syntax</b>	<code>format ( md5   sha1   sha256   sha512 );</code>
<b>Hierarchy Level</b>	[edit system login password]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure the authentication algorithm for plain-text passwords.
<b>Default</b>	For Junos OS, the default encryption format is <b>md5</b> . For Junos-FIPS software, the default encryption format is <b>sha1</b> .
<b>Options</b>	The hash algorithm that authenticates the password can be one of these algorithms: <ul style="list-style-type: none"> <li>• <b>md5</b>—Produces a 128-bit digest.</li> <li>• <b>sha1</b>—Produces a 160-bit digest.</li> <li>• <b>sha256</b>—Produces a 256-bit digest.</li> <li>• <b>sha512</b>—Produces a 512-bit digest.</li> </ul>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Special Requirements for Junos OS Plain-Text Passwords</i></li> </ul>

## full-name

---

<b>Syntax</b>	<code>full-name</code> <i>complete-name</i> ;
<b>Hierarchy Level</b>	[edit system login user]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the complete name of a user.
<b>Options</b>	<i>complete-name</i> —Full name of the user. If the name contains spaces, enclose it in quotation marks.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Junos OS User Accounts</i></li><li>• <a href="#">user on page 577</a></li><li>• <i>user</i></li></ul>

## idle-timeout (System-Login)

---

<b>Syntax</b>	<code>idle-timeout</code> <i>minutes</i> ;
<b>Hierarchy Level</b>	[edit system login <a href="#">class</a> <i>class-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	For a login class, configure the maximum time that a session can be idle before the user is logged out of the router or switch. The session times out after remaining at the CLI operational mode prompt for the specified time.
<b>Default</b>	If you omit this statement, a user is never forced off the system after extended idle times.
<b>Options</b>	<i>minutes</i> —Maximum idle time. <b>Range:</b> 0 through 4294967295 minutes
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Timeout Value for Idle Login Sessions</i></li><li>• <a href="#">user on page 577</a></li></ul>

## interface-profile

---

<b>Syntax</b>	<pre>interface-profile <i>profile-name</i> {     <b>fields</b> {         <i>field-name</i>;     }     <b>file</b> <i>filename</i>;     <b>interval</b> <i>minutes</i>; }</pre>
<b>Hierarchy Level</b>	[edit accounting-options]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
<b>Description</b>	Create a profile to filter and collect error and packet statistics and write them to a file in the <code>/var/log</code> directory. You can specify an interface profile for either a physical or a logical interface.
<b>Options</b>	<p><b><i>profile-name</i></b>—Name of the interface profile.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring the Interface Profile</i></li> </ul>

## interval (Accounting Options)

---

<b>Syntax</b>	<code>interval minutes;</code>
<b>Hierarchy Level</b>	[edit accounting-options <a href="#">class-usage-profile</a> <i>profile-name</i> ], [edit accounting-options <a href="#">filter-profile</a> <i>profile-name</i> ], [edit accounting-options <a href="#">interface-profile</a> <i>profile-name</i> ], [edit accounting-options <a href="#">mib-profile</a> <i>profile-name</i> ], [edit accounting-options <a href="#">routing-engine-profile</a> <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. The [edit accounting-options <a href="#">mib-profile</a> <i>profile-name</i> ] hierarchy level added in Junos OS Release 8.2. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Specify how often statistics are collected for the accounting profile.
<b>Options</b>	<b>minutes</b> —Length of time between each collection of statistics. <b>Range:</b> 1 through 2880 minutes <b>Default:</b> 30 minutes
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Interface Profile</i></li><li>• <i>Configuring the Filter Profile</i></li><li>• <i>Configuring the MIB Profile</i></li><li>• <i>Configuring the Routing Engine Profile</i></li></ul>

## login

```
Syntax login {
    announcement text;
    class class-name {
        allow-commands "regular-expression";
        allow-configuration-regexps "regular expression 1" "regular expression 2";

        (encrypted-password "password" | plain-text-password);
        ssh-rsa "public-key";
        ssh-dsa "public-key";
    }
}
```

**Hierarchy Level** [edit system]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Configure user access to the router or switch.

**NOTE:** The remaining statements are explained separately.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

**Related Documentation**

- *Defining Junos OS Login Classes*

## login-alarms

---

**Syntax** login-alarms;

**Hierarchy Level** [edit system login class *class-name*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Show system alarms automatically when an **admin** user logs in to the router or switch.

**Options** *class-name*—Login class name.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

**Related Documentation**

- *Configuring System Alarms to Appear Automatically Upon Login*

## login-tip

---

**Syntax** login-tip;

**Hierarchy Level** [edit system login class *class-name*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Enable CLI tips at login.

**Default** Disabled.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

**Related Documentation**

- *Configuring Login Tips*

---

## maximum-length

---

<b>Syntax</b>	maximum-length <i>length</i> ;
<b>Hierarchy Level</b>	[edit system login passwords]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Specify the maximum number of characters allowed in plain-text passwords. Newly created passwords must meet this requirement.
<b>Default</b>	For Junos-FIPS software, the maximum number of characters for plain-text passwords is 20. For Junos OS, no maximum is set.
<b>Options</b>	<b>length</b> —The maximum number of characters the password can include. <b>Range:</b> 1 to 64 characters
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Special Requirements for Junos OS Plain-Text Passwords</i></li><li>• <i>Example: Changing the Requirements for Junos OS Plain-Text Passwords</i></li><li>• <a href="#">password (Login) on page 563</a></li></ul>

## message

---

<b>Syntax</b>	<code>message <i>text</i>;</code>
<b>Hierarchy Level</b>	[edit system login]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	<p>Configure a system login message. This message appears before a user logs in.</p> <p>You can format the message using the following special characters:</p> <ul style="list-style-type: none"><li>• \n—New line</li><li>• \t—Horizontal tab</li><li>• \'—Single quotation mark</li><li>• \"—Double quotation mark</li><li>• \\—Backslash</li></ul>
<b>Options</b>	<i>text</i> —Text of the message.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Junos OS to Display a System Login Message</i></li><li>• <a href="#">announcement on page 537</a></li></ul>

## mib-profile

**Syntax** `mib-profile profile-name {  
     file filename;  
     interval minutes;  
     object-names {  
         mib-object-name;  
     }  
     operation operation-name;  
 }`

**Hierarchy Level** [edit accounting-options]

**Release Information** Statement introduced in Junos OS Release 8.2.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Create a MIB profile to collect selected MIB statistics and write them to a file in the `/var/log` directory.

**NOTE:** Do not configure MIB objects related to interface octets or packets for a MIB profile, because it can cause the SNMP walk or a CLI show command to time out.

**Options** *profile-name*—Name of the MIB statistics profile.

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
 interface-control—To add this statement to the configuration.

**Related Documentation**

- *Configuring the MIB Profile*

## minimum-changes

---

<b>Syntax</b>	<code>minimum-changes <i>number</i>;</code>
<b>Hierarchy Level</b>	[edit system login passwords]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	<p>Specify the minimum number of character sets (or character set changes) required in plain-text passwords. Newly created passwords must meet this requirement.</p> <p>This statement is used in combination with the <b>change-type</b> statement. If the change-type is <b>character-sets</b>, then the number of character sets included in the password is checked against the specified minimum. If change-type is <b>set-transitions</b>, then the number of character set changes in the password is checked against the specified minimum.</p>
<b>Default</b>	For Junos OS, the minimum number of changes is 1. For Junos-FIPS Software, the minimum number of changes is 3.
<b>Options</b>	<i>number</i> —The minimum number of character sets (or character set changes) required for the password.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Special Requirements for Junos OS Plain-Text Passwords</i></li><li>• <a href="#">change-type on page 540</a></li></ul>

## minimum-length

<b>Syntax</b>	minimum-length <i>length</i> ;
<b>Hierarchy Level</b>	[edit system login passwords]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	<p>Specify the minimum number of characters required in plain-text passwords. Newly created passwords must meet this requirement.</p> <p>This statement can be used in combination with all of the other requirement options for plain-text passwords, such as <b>minimum-upper-cases</b>, <b>minimum-punctuations</b>, <b>minimum-lower-cases</b>, and so on.</p> <p>Using several password minimum requirement options will cause the <b>minimum-length</b> to be reset if the total sum of the required minimums exceeds the <b>minimum-length</b> setting.</p>
<b>Default</b>	For Junos OS, the minimum number of characters for plain-text passwords is six. For Junos-FIPS software, the minimum number of characters for plain-text passwords is 10.
<b>Options</b>	<b>length</b> —The minimum number of characters the password must include. <b>Range:</b> 6 to 20 characters
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Special Requirements for Junos OS Plain-Text Passwords</i></li> <li>• <i>Example: Changing the Requirements for Junos OS Plain-Text Passwords</i></li> <li>• <a href="#">maximum-length on page 557</a></li> </ul>

## object-names

---

<b>Syntax</b>	<code>object-names {     <i>mib-object-name</i>; }</code>
<b>Hierarchy Level</b>	[edit accounting-options <a href="#">mib-profile</a> <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.2. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Specify the name of each MIB object for which MIB statistics are collected for an accounting-data log file.
<b>Options</b>	<i>mib-object-name</i> —Name of a MIB object. You can specify more than one MIB object name.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the MIB Profile</i></li></ul>

## operation

---

<b>Syntax</b>	<code>operation <i>operation-name</i>;</code>
<b>Hierarchy Level</b>	[edit accounting-options <a href="#">mib-profile</a> <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.2. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Specify the name of the operation used to collect MIB statistics for an accounting-data log file.
<b>Options</b>	<i>operation-name</i> —Name of the operation to use. You can specify a <b>get</b> , <b>get-next</b> , or <b>walk</b> operation. <b>Default:</b> walk
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the MIB Profile</i></li></ul>

## password (Login)

<b>Syntax</b>	<pre>password {   change-type (set-transitions   character-set);   format (md5   sha1   sha256   sha512);   maximum-length length;   minimum-changes number;   minimum-length length;   minimum-lower-cases number;   minimum-numeric number;   minimum-punctuations number;   minimum-upper-cases number; }</pre>
<b>Hierarchy Level</b>	[edit system <a href="#">login</a> ]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
<b>Description</b>	<p>Configure special requirements such as character length and encryption format for plain-text passwords. Newly created passwords must meet these requirements.</p> <p>Using several password minimum requirement options will cause the <b>minimum-length</b> to be reset if the total sum of the required minimums exceeds the <b>minimum-length</b> setting.</p> <p>The individual statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Special Requirements for Junos OS Plain-Text Passwords</i></li> <li><i>Example: Changing the Requirements for Junos OS Plain-Text Passwords</i></li> </ul>

## permissions

---

<b>Syntax</b>	<code>permissions [ <i>permissions</i> ];</code>
<b>Hierarchy Level</b>	[edit system login <a href="#">class</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure the login access privileges to be provided on the router or switch.
<b>Options</b>	<i>permissions</i> —Privilege type. For a list of permission flag types, see <i>Understanding Junos OS Access Privilege Levels</i> .
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Access Privilege Levels</i></li><li>• <a href="#">user on page 577</a></li></ul>

## radius-options (edit system)

<b>Syntax</b>	<pre>radius-options {   attributes {     nas-ip-address <i>ip-address</i>;   }   enhanced-accounting;   password-protocol <i>mschap-v2</i>; }</pre>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.3.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>MS-CHAPv2 password protocol configuration option introduced in Junos OS Release 9.2.</p> <p>MS-CHAPv2 password protocol configuration option introduced in Junos OS Release 9.2 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<div>  <b>NOTE:</b> The <code>radius-options</code> statement is not available on QFabric systems. </div>	
<p><b>enhanced-accounting</b> statement introduced in Junos OS Release 14.1.</p>	
<b>Description</b>	Configure RADIUS options for the NAS-IP address for outgoing RADIUS packets and password protocol used in RADIUS packets.
<b>Options</b>	<p><b>enhanced-accounting</b>—View the attribute values of a logged in user.</p> <p><b>nas-ip-address <i>ip-address</i></b>—IP address of the network access server (NAS) that requests user authentication.</p> <p><b>password-protocol <i>mschap-v2</i></b>—Protocol MS-CHAPv2, used for password authentication and password changing.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring MS-CHAPv2 for Password-Change Support</i></li> <li>• <i>Configuring RADIUS Authentication (QFX Series)</i></li> <li>• <i>Configuring RADIUS System Accounting</i></li> <li>• <i>enhanced-accounting</i></li> </ul>

## retry-options

---

<b>Syntax</b>	<pre>retry-options {     backoff-factor <i>seconds</i>;     backoff-threshold <i>number</i>;     maximum-time <i>seconds</i>;     minimum-time <i>seconds</i>;     tries-before-disconnect <i>number</i>; }</pre>
<b>Hierarchy Level</b>	[edit system <a href="#">login</a> ]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.0.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>maximum-time</b> option introduced in Junos OS Release 9.6.</p> <p><b>maximum-time</b> option introduced in Junos OS Release 9.6 for EX Series switches.</p>
<b>Description</b>	Maximum number of times a user can attempt to enter a password while logging in through SSH or Telnet before being disconnected.
<b>Required Privilege Level</b>	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Limiting the Number of User Login Attempts for SSH and Telnet Sessions</i></li><li>• <a href="#">rate-limit on page 1668</a></li></ul>

## root-authentication

<b>Syntax</b>	<pre> root-authentication {   (encrypted-password "password"   plain-text-password);   load-key-file URL filename;   ssh-dsa "public-key";   ssh-ecdsa "public-key";   ssh-rsa "public-key"; } </pre>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
<b>Description</b>	<p>Configure the authentication methods for the root-level user, whose username is <b>root</b>.</p>

You can use the **load-key-file** *URL filename* statement to load an SSH key file that was previously generated using **ssh-keygen**. The *URL filename* is the path to the file's location and name. When using this option, the contents of the key file are copied into the configuration immediately after entering the **load-key-file** *URL* statement. This command loads RSA (SSH version 1 and SSH version 2) and DSA (SSH version 2) public keys.

Optionally, you can use the **ssh-dsa**, **ssh-ecdsa**, or **ssh-rsa** statements to directly configure SSH RSA, DSA, or ECDSA keys to authenticate root logins. You can configure more than one public key for SSH authentication of root logins as well as for user accounts. When a user logs in as root, the public keys are referenced to determine whether the private key matches any of them.

To view the SSH keys entries, use the configuration mode **show** command. For example:

```

[edit system]
user@host# set root-authentication load-key-file my-host:.ssh/id_dsa.pub
.file.19692 | 0 KB | 0.3 kB/s | ETA: 00:00:00 | 100%
[edit system]
user@host# show
root-authentication {
  ssh-rsa "1024 35 9727638204084251055468226757249864241630322
20740496252839038203869014158453496417001961060835872296
15634757491827360336127644187426594689320773910834481012
68312595772262546166799927831612350043866091586628382248
97467326056611921489539813965561563786211940327687806538
16960202749164163735913269396344008443 boojum@juniper.net"; #
SECRET-DATA
}

```

<b>Options</b>	<b>encrypted-password "password"</b> — MD5 or other encrypted authentication. Specify the MD5 or other password. You can specify only one encrypted password.
----------------	---

You cannot configure a blank password for **encrypted-password** using blank quotation marks (" "). You must configure a password whose number of characters range from 1 through 128 characters and enclose the password in quotation marks.

**plain-text-password**—Plain-text password. The CLI prompts you for the password and then encrypts it. The CLI displays the encrypted version, and the software places the encrypted version in its user database. You can specify only one plain-text password.

**ssh-ecdsa "public/private-key"**—SSH ECDSA (variant of DSA that uses elliptic curve cryptography) public key. You can specify one or more public keys.

**ssh-dsa "public-key"**—SSH version 2 authentication. Specify the DSA (SSH version 2) public key. You can specify one or more public keys.

**ssh-rsa "public-key"**—SSH version 1 authentication. Specify the RSA (SSH version 1 and SSH version 2) public key. You can specify one or more public keys.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

## root-login

---

**Syntax** root-login (allow | deny | deny-password);

**Hierarchy Level** [edit system services ssh]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Control user access through SSH.

**Default** Allow user access through SSH.

**Options** **allow**—Allow users to log in to the router or switch as root through SSH.

**deny**—Disable users from logging in to the router or switch as root through SSH.

**deny-password**—Allow users to log in to the router or switch as root through SSH when the authentication method (for example, RSA authentication) does not require a password.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

**Related Documentation**

- *Configuring SSH Service for Remote Access to the Router or Switch*

## routing-engine-profile

---

<b>Syntax</b>	<pre> routing-engine-profile <i>profile-name</i> {     fields {         <i>field-name</i>;     }     file <i>filename</i>;     interval <i>minutes</i>; } </pre>
<b>Hierarchy Level</b>	[edit accounting-options]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
<b>Description</b>	Create a Routing Engine profile to collect selected Routing Engine statistics and write them to a file in the <code>/var/log</code> directory.
<b>Options</b>	<p><b><i>profile-name</i></b>—Name of the Routing Engine statistics profile.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring the Routing Engine Profile</i></li> </ul>

## size

---

<b>Syntax</b>	<code>size bytes;</code>
<b>Hierarchy Level</b>	[edit accounting-options <a href="#">file</a> <i>filename</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Specify attributes of an accounting-data log file.
<b>Options</b>	<b>bytes</b> —Maximum size of each log file, in bytes, kilobytes (KB), megabytes (MB), or gigabytes (GB). When a log file (for example, <b>profilelog</b> ) reaches its maximum size, it is renamed <b>profilelog.0</b> , then <b>profilelog.1</b> , and so on, until the maximum number of log files is reached. Then the oldest log file is overwritten. If you do not specify a size, the file is closed, archived, and renamed when the time specified for the transfer interval is exceeded.  <b>Syntax:</b> <i>x</i> to specify bytes, <i>xk</i> to specify KB, <i>xm</i> to specify MB, <i>xg</i> to specify GB <b>Range:</b> 256 KB through 1 GB
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Maximum Size of the File</i></li></ul>

## source-classes

---

<b>Syntax</b>	<pre>source-classes {     source-class-name; }</pre>
<b>Hierarchy Level</b>	[edit accounting-options <a href="#">class-usage-profile</a> <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Specify the source classes for which statistics are collected.
<b>Options</b>	<b>source-class-name</b> —Name of the source class to include in the class usage profile.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring a Class Usage Profile</i></li></ul>

---

## start-time (Log File Transfer)

---

<b>Syntax</b>	<code>start-time <i>time</i>;</code>
<b>Hierarchy Level</b>	[edit accounting-options <a href="#">file</a> <i>filename</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.2. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Specify the start time for transfer of an accounting-data log file.
<b>Options</b>	<i>time</i> —Start time for file transfer. <b>Syntax:</b> <i>YYYY-MM-DD.hh:mm</i>
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Start Time for File Transfer</i></li></ul>

## tacplus-options

---

<b>Syntax</b>	<pre>tacplus-options {   (exclude-cmd-attribute   no-cmd-attribute-value);   enhanced-accounting;   service-name <i>service-name</i>;   timestamp-and-timezone; }</pre>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>no-cmd-attribute-value</b> and <b>exclude-cmd-attribute</b> options introduced in Junos OS Release 9.3.</p> <p>Statement introduced in Junos OS Release 11.1 for QFX Series.</p> <p><b>timestamp-and-timezone</b> option introduced in Junos OS Release 12.2.</p> <p><b>enhanced-accounting</b> option introduced in Junos OS Release 14.1.</p>
<b>Description</b>	Configure TACACS+ options for authentication and accounting.
<b>Options</b>	<p><b>enhanced-accounting</b>—View the attribute values of a logged in user.</p> <p><b>exclude-cmd-attribute</b>—Exclude the <b>cmd</b> attribute value completely from start and stop accounting records to enable logging of accounting records in the correct log file on a TACACS+ server.</p> <p><b>no-cmd-attribute-value</b>—Set the <b>cmd</b> attribute value to an empty string in the TACACS+ accounting start and stop requests to enable logging of accounting records in the correct log file on a TACACS+ server.</p> <p><b>service-name <i>service-name</i></b>—Name of the authentication service used when you configure multiple TACACS+ servers to use the same authentication service.</p> <p><b>Default:</b> junos-exec</p> <p><b>timestamp-and-timezone</b>—Include this statement if you want start time, stop time, and timezone attributes included in start/stop accounting records.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring TACACS+ Authentication</i></li><li>• <i>Configuring TACACS+ System Accounting</i></li><li>• <i>Junos OS Authentication Order for RADIUS, TACACS+, and Password Authentication</i></li><li>• <i>enhanced-accounting</i></li></ul>

---

## tacplus-server

---

<b>Syntax</b>	<pre>tacplus-server server-address {     secret password;     single-connection;     source-address source-address;     timeout seconds; }</pre>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure the IPv4 or IPv6 TACACS+ server.
<b>Options</b>	<b>server-address</b> —Address of the IPv4 or IPv6 TACACS+ authentication server.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring TACACS+ Authentication</i></li></ul>

## traceoptions (Address-Assignment Pool)

---

**Syntax**    `traceoptions {  
              file filename {  
                  files number;  
                  size maximum-file-size;  
                  match regex;  
                  (world-readable | no-world-readable);  
              }  
              flag address-assignment;  
              flag all;  
              flag configuration;  
              flag framework;  
              flag ldap;  
              flag local-authentication;  
              flag radius;  
          }`

**Hierarchy Level**    [edit system processes general-authentication-service]

**Release Information**    Flag for tracing address-assignment pool operations introduced in Junos OS Release 9.0.  
                              **option-name** option introduced in Junos OS Release 8.3.  
                              Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**    Configure tracing options.

**Options**    **file *filename***—Name of the file that receives the output of the tracing operation. Enclose the name in quotation marks. All files are placed in the directory **/var/log**.

**files *number***—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

              If you specify a maximum number of files, you also must specify a maximum file size with the **size** option and a filename.

**Range:** 2 through 1000

**Default:** 3 files

**flag *flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. You can include the following flags:

- **address-assignment**—All address-assignment events
- **all**—All tracing operations
- **configuration**—Configuration events
- **framework**—Authentication framework events
- **ldap**—LDAP authentication events
- **local-authentication**—Local authentication events

- **radius**—RADIUS authentication events

**match *regex***—(Optional) Refine the output to include lines that contain the regular expression.

**no-world-readable**—(Optional) Restrict access to the originator of the trace operation only.

**size *size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option and filename.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through 1 GB

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

**Related Documentation**

- *Configuring Address-Assignment Pools*

## transfer-interval

**Syntax** transfer-interval *minutes*;

**Hierarchy Level** [edit accounting-options **file** *filename*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Specify the length of time the file remains open and receives new statistics before it is closed and transferred to an archive site.

**Options** ***minutes***—Time the file remains open and receives new statistics before it is closed and transferred to an archive site.

**Range:** 5 through 2880 minutes

**Default:** 30 minutes

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Related Documentation**

- *Configuring the Transfer Interval of the File*

## uid

---

<b>Syntax</b>	<code>uid <i>uid-value</i>;</code>
<b>Hierarchy Level</b>	[edit system login <a href="#">user</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Numeric identifier associated with the user account name, either assigned by an administrator or assigned automatically when you commit the user configuration. It is used by applications that request numeric identifiers, such as some RADIUS queries or secure applications such as flow-tap monitoring.
<b>Options</b>	<b><i>uid-value</i></b> —Number associated with the login account. This value must be unique on the router or switch. <b>Range:</b> 100 through 64000
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Junos OS User Accounts</i></li></ul>

## user (Access)

---

<b>Syntax</b>	<pre> user username {   authentication {     class class-name;     (encrypted-password "password"   plain-text-password);     full-name complete-name;     load-key-file URL filename;     ssh-dsa "public-key" &lt;from hostname&gt;;     ssh-rsa "public-key" &lt;from hostname&gt;;     uid uid-value;   } } </pre>
<b>Hierarchy Level</b>	[edit system <a href="#">login</a> ]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
<b>Description</b>	Configure access permission for individual users.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring Junos OS User Accounts</i></li> <li>• <a href="#">class on page 540</a></li> </ul>

# Administration

- [Routine Monitoring on page 579](#)
- [Operational Commands on page 581](#)

## Routine Monitoring

---

- [Managing Users \(J-Web Procedure\) on page 579](#)

### Managing Users (J-Web Procedure)

You can use the Users Configuration page for user information to add new users to an EX Series switch. For each account, you define a login name and password for the user and specify a login class for access privileges.

To configure users:

1. Select **Configure > System Properties > User Management**.

The User Management page displays details of users, the authentication order, the RADIUS servers and TACACS servers present.

2. Click **Edit**.
3. Click any of the following options on the **Users** tab:
  - **Add**—Select this option to add a user. Enter details as described in [Table 48 on page 580](#).
  - **Edit**—Select this option to edit an existing user's details. Enter details as described in [Table 48 on page 580](#).
  - **Delete**—Select this option to delete a user.
4. Click an option on the **Authentication Methods and Order** tab:
  - **Authentication Order**—Drag and drop the authentication type from the Available Methods section to the Selected Methods. Click the up or down buttons to modify the authentication order.
  - **RADIUS server**—Click one of the following options:
    - **Add**—Select this option to add an authentication server. Enter details as described in [Table 49 on page 581](#).

- **Edit**—Select this option to modify the authentication server details. Enter details as described in [Table 49 on page 581](#).
- **Delete**—Select this option to delete an authentication server from the list.
- TACACS server—Click one of the following options:
  - **Add**—Select this option to add an authentication server. Enter details as described in [Table 49 on page 581](#).
  - **Edit**—Select this option to modify the authentication server details. Enter details as described in [Table 49 on page 581](#).
  - **Delete**—Select this option to delete an authentication server from the list.

**NOTE:** After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See [Using the Commit Options to Commit Configuration Changes](#) for details about all commit options.

**Table 48: User Management Configuration Page Summary**

Field	Function	Your Action
<b>User Information</b>		
Username (required)	Specifies the name that identifies the user.	Type the username. It must be unique within the switching platform. Do not include spaces, colons, or commas in the username.
User Id	Specifies the user identification.	Type the user's ID.
Full Name	Specifies the user's full name.	Type the user's full name. If the full name contains spaces, enclose it in quotation marks. Do not include colons or commas.
Login Class (required)	Defines the user's access privilege.	Select the user's login class from the list: <ul style="list-style-type: none"> <li>• <b>operator</b></li> <li>• <b>read-only</b></li> <li>• <b>super-user/superuser</b></li> <li>• <b>unauthorized</b></li> </ul> This list also includes any user-defined login classes.
Password	Specifies the login password for this user.	Type the login password for this user. The login password must meet these criteria: <ul style="list-style-type: none"> <li>• The password must be at least 6 characters long.</li> <li>• It can include alphabetic, numeric, and special characters, but not control characters.</li> <li>• It must contain at least one change of case or character class.</li> </ul>

Table 48: User Management Configuration Page Summary (*continued*)

Field	Function	Your Action
Confirm Password	Verifies the login password for this user.	Retype the login password for this user.

Table 49: Add an Authentication Server

Field	Function	Your Action
IP Address	Specifies the IP address of the server.	Type the server's 32-bit IP address, in dotted decimal notation.
Password	Specifies the password of the server.	Type the password of the server.
Confirm Password	Verifies that the password of the server is entered correctly.	Retype the password of the server.
Server Port	Specifies the port with which the server is associated.	Type the port number.
Source Address	Specifies the source address of the server.	Type the server's 32-bit IP address, in dotted decimal notation.
Retry Attempts	Specifies the number of login retries allowed after a login failure.	Type the number.  <b>NOTE:</b> Only 1 retry is permitted for a TACACS server.
Time out	Specifies the time interval to wait before the connection to the server is closed.	Type the interval in seconds.

## Operational Commands

- [request message](#)
- [show subscribers](#)

## request message

---

<b>Syntax</b>	<code>request message all message "text"</code> <code>request message message "text" (terminal <i>terminal-name</i>   user <i>user-name</i>)</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display a message on the screens of all users who are logged in to the router or switch or on specific screens.
<b>Options</b>	<b>all</b> —Display a message on the terminal of all users who are currently logged in.  <b>message "text"</b> —Message to display.  <b>terminal <i>terminal-name</i></b> —Name of the terminal on which to display the message.  <b>user <i>user-name</i></b> —Name of the user to whom to direct the message.
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">request message message on page 582</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request message message

```
user@host> request message message "Maintenance window in 10 minutes" user maria
Message from user@host on tty0 at 20:27 ...
Maintenance window in 10 minutes
EOF
```

## show subscribers

**Syntax** show subscribers  
 <detail | extensive | terse>  
 <aci-interface-set-name *aci-interface-set-name*>  
 <address *address*>  
 <agent-circuit-identifier *agent-circuit-identifier-substring*>  
 <client-type *client-type*>  
 <count>  
 <id>  
 <interface *interface*>  
 <logical-system *logical-system*>  
 <mac-address *mac-address*>  
 <physical-interface *physical-interface-name*>  
 <profile-name *profile-name*>  
 <routing-instance *routing-instance*>  
 <stacked-vlan-id *stacked-vlan-id*>  
 <subscriber-state *subscriber-state*>  
 <user-name *user-name*>  
 <vci *vci-identifier*>  
 <vpi *vpi-identifier*>  
 <vlan-id *vlan-id*>

**Release Information** Command introduced in Junos OS Release 9.3.  
 Command introduced in Junos OS Release 9.3 for EX Series switches.  
**client-type**, **mac-address**, **subscriber-state**, and **extensive** options introduced in Junos OS Release 10.2.  
**count** option usage with other options introduced in Junos OS Release 10.2.  
 Command introduced in Junos OS Release 11.1 for the QFX Series.  
 Options **aci-interface-set-name** and **agent-circuit-identifier** introduced in Junos OS Release 12.2.  
 The **physical-interface** and **user-name** options introduced in Junos OS Release 12.3.  
 Options **vci** and **vpi** introduced in Junos OS Release 12.3R3 and supported in later 12.3Rx releases.  
 Options **vci** and **vpi** supported in Junos OS Release 13.2 and later releases. (Not supported in Junos OS Release 13.1.)

**Description** Display information for active subscribers.

**Options** **detail | extensive | terse**—(Optional) Display the specified level of output.

**aci-interface-set-name**—(Optional) Display all dynamic subscriber sessions that use the specified agent circuit identifier (ACI) interface set. Use the ACI interface set name generated by the router, such as aci-1003-ge-1/0/0.4001, and not the actual ACI value found in the DHCP or PPPoE control packets.

**address**—(Optional) Display subscribers whose IP address matches the specified address. You must specify the IPv4 or IPv6 address prefix without a netmask (for example, 192.168.17.1). If you specify the IP address as a prefix with a netmask (for example, 192.168.17.1/32), the router displays a message that the IP address is invalid, and rejects the command.

***agent-circuit-identifier-substring***—(Optional) Display all dynamic subscriber sessions whose ACI value matches the specified substring.

***client-type***—(Optional) Display subscribers whose client type matches the specified client type (DHCP, L2TP, PPP, PPPOE, VLAN, or static).

***count***—(Optional) Display the count of total subscribers and active subscribers for any specified option. You can use the ***count*** option alone or with the ***address***, ***client-type***, ***interface***, ***logical-system***, ***mac-address***, ***profile-name***, ***routing-instance***, ***stacked-vlan-id***, ***subscriber-state***, or ***vlan-id*** options.

***id***—(Optional) Display a specific subscriber session whose session id matches the specified subscriber ID. You can display subscriber IDs by using the ***show subscribers extensive*** or the ***show subscribers interface extensive*** commands.

***interface***—(Optional) Display subscribers whose interface matches the specified interface.

***logical-system***—(Optional) Display subscribers whose logical system matches the specified logical system.

***mac-address***—(Optional) Display subscribers whose MAC address matches the specified MAC address.

***physical-interface-name***—(M120, M320, and MX Series routers only) (Optional) Display subscribers whose physical interface matches the specified physical interface.

***profile-name***—(Optional) Display subscribers whose dynamic profile matches the specified profile name.

***routing-instance***—(Optional) Display subscribers whose routing instance matches the specified routing instance.

***stacked-vlan-id***—(Optional) Display subscribers whose stacked VLAN ID matches the specified stacked VLAN ID.

***subscriber-state***—(Optional) Display subscribers whose subscriber state matches the specified subscriber state (ACTIVE, CONFIGURED, INIT, TERMINATED, or TERMINATING).

***user-name***—(M120, M320, and MX Series routers only) (Optional) Display subscribers whose username matches the specified subscriber name.

***vci-identifier***—(MX Series routers with MPCs and ATM MICs with SFP only) (Optional) Display active ATM subscribers whose ATM virtual circuit identifier (VCI) matches the specified VCI identifier. The range of values is **0** through **255**.

***vpi-identifier***—(MX Series routers with MPCs and ATM MICs with SFP only) (Optional) Display active ATM subscribers whose ATM virtual path identifier (VPI) matches the specified VPI identifier. The range of values is **0** through **65535**.

***vlan-id***—(Optional) Display subscribers whose VLAN ID matches the specified VLAN ID.

**NOTE:** Due to display limitations, logical system and routing instance output values are truncated when necessary.

**Output Fields** [Table 50 on page 586](#) lists the output fields for the **show subscribers** command. Output fields are listed in the approximate order in which they appear.

**Table 50: show subscribers Output Fields**

Field Name	Field Description
<b>Interface</b>	Interface associated with the subscriber. The router or switch displays subscribers whose interface matches or begins with the specified interface.  The * character indicates a continuation of addresses for the same session.
<b>IP Address/VLAN ID</b>	Subscriber IP address or VLAN ID associated with the subscriber in the form <i>tpid.vlan-id</i>  No IP address or VLAN ID is assigned to an L2TP tunnel-switched session. For these subscriber sessions the value is <b>Tunnel-switched</b> .
<b>User Name</b>	Name of subscriber.
<b>LS:RI</b>	Logical system and routing instance associated with the subscriber.
<b>Type</b>	Subscriber client type (DHCP, L2TP, PPP, PPPoE, STATIC-INTERFACE, VLAN).
<b>IP Address</b>	Subscriber IPv4 address.
<b>IP Netmask</b>	Subscriber IP netmask.
<b>Primary DNS Address</b>	IP address of primary DNS server.
<b>Secondary DNS Address</b>	IP address of secondary DNS server.
<b>Primary WINS Address</b>	IP address of primary WINS server.
<b>Secondary WINS Address</b>	IP address of secondary WINS server.
<b>IPv6 Address</b>	Subscriber IPv6 address, or multiple addresses.
<b>IPv6 Prefix</b>	Subscriber IPv6 prefix. If you are using DHCPv6 prefix delegation, this is the delegated prefix.
<b>IPv6 User Prefix</b>	IPv6 prefix obtained through ND/RA.
<b>IPv6 Address Pool</b>	Subscriber IPv6 address pool. The IPv6 address pool is used to allocate IPv6 prefixes to the DHCPv6 clients.
<b>IPv6 Network Prefix Length</b>	Length of the network portion of the IPv6 address.
<b>IPv6 Prefix Length</b>	Length of the subscriber IPv6 prefix.

Table 50: show subscribers Output Fields (*continued*)

Field Name	Field Description
<b>Logical System</b>	Logical system associated with the subscriber.
<b>Routing Instance</b>	Routing instance associated with the subscriber.
<b>Interface Type</b>	Whether the subscriber interface is <b>Static</b> or <b>Dynamic</b> .
<b>Interface Set</b>	Internally generated name of the dynamic ACI interface set used by the subscriber session.
<b>Interface Set Type</b>	Interface type of the ACI interface set: <b>Dynamic</b> . This is the only ACI interface set type currently supported.
<b>Interface Set Session ID</b>	Identifier of the dynamic ACI interface set entry in the session database.
<b>Underlying Interface</b>	Name of the underlying interface for the subscriber session.
<b>Dynamic Profile Name</b>	Dynamic profile used for the subscriber.
<b>Dynamic Profile Version</b>	Version number of the dynamic profile used for the subscriber.
<b>MAC Address</b>	MAC address associated with the subscriber.
<b>State</b>	Current state of the subscriber session ( <b>Init</b> , <b>Configured</b> , <b>Active</b> , <b>Terminating</b> , <b>Tunneled</b> ).
<b>L2TP State</b>	Current state of the L2TP session, <b>Tunneled</b> or <b>Tunnel-switched</b> . When the value is <b>Tunnel-switched</b> , two entries are displayed for the subscriber; the first entry is at the LNS interface on the LTS and the second entry is at the LAC interface on the LTS.
<b>Tunnel switch Profile Name</b>	Name of the L2TP tunnel switch profile that initiates tunnel switching.
<b>Local IP Address</b>	IP address of the local gateway (LAC).
<b>Remote IP Address</b>	IP address of the remote peer (LNS).
<b>VLAN Id</b>	VLAN ID associated with the subscriber in the form <i>tpid.vlan-id</i> .
<b>Stacked VLAN Id</b>	Stacked VLAN ID associated with the subscriber in the form <i>tpid.vlan-id</i> .
<b>RADIUS Accounting ID</b>	RADIUS accounting ID associated with the subscriber.
<b>Agent Circuit ID</b>	Option 82 agent circuit ID associated with the subscriber. The ID is displayed as an ASCII string unless the value has nonprintable characters, in which case it is displayed in hexadecimal format.
<b>Agent Remote ID</b>	Option 82 agent remote ID associated with the subscriber. The ID is displayed as an ASCII string unless the value has nonprintable characters, in which case it is displayed in hexadecimal format.
<b>DHCP Relay IP Address</b>	IP address used by the DHCP relay agent.

Table 50: show subscribers Output Fields (*continued*)

Field Name	Field Description
ATM VPI	(MX Series routers with MPCs and ATM MICs with SFP only) ATM virtual path identifier (VPI) on the subscriber's physical interface.
ATM VCI	(MX Series routers with MPCs and ATM MICs with SFP only) ATM virtual circuit identifier (VCI) for each VPI configured on the subscriber interface.
Login Time	Date and time at which the subscriber logged in.
Effective shaping-rate	Actual downstream traffic shaping rate for the subscriber, in kilobits per second.
IPv4 rpf-check Fail Filter Name	Name of the filter applied by the dynamic profile to IPv4 packets that fail the RPF check.
IPv6 rpf-check Fail Filter Name	Name of the filter applied by the dynamic profile to IPv6 packets that fail the RPF check.
DHCP Options	len = number of hex values in the message. The hex values specify the type, length, value (TLV) for DHCP options, as defined in RFC 2132.
Session ID	ID number for a subscriber service session.
Underlying Session ID	For DHCPv6 subscribers on a PPPoE network, displays the session ID of the underlying PPPoE interface.
Service Sessions	Number of service sessions (that is, a service activated using RADIUS CoA) associated with the subscribers.
Service Session Name	Service session profile name.
Session Timeout (seconds)	Number of seconds of access provided to the subscriber before the session is automatically terminated.
Idle Timeout (seconds)	Number of seconds subscriber can be idle before the session is automatically terminated.
IPv6 Delegated Address Pool	Name of the pool used for DHCPv6 prefix delegation.
IPv6 Delegated Network Prefix Length	Length of the prefix configured for the IPv6 delegated address pool.
IPv6 Interface Address	Address assigned by the Framed-Ipv6-Prefix AAA attribute.
IPv6 Framed Interface Id	Interface ID assigned by the Framed-Interface-Id AAA attribute.
ADF IPv4 Input Filter Name	Name assigned to the Ascend-Data-Filter (ADF) interface IPv4 input filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.

Table 50: show subscribers Output Fields (*continued*)

Field Name	Field Description
<b>ADF IPv4 Output Filter Name</b>	Name assigned to the Ascend-Data-Filter (ADF) interface IPv4 output filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
<b>ADF IPv6 Input Filter Name</b>	Name assigned to the Ascend-Data-Filter (ADF) interface IPv6 input filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
<b>ADF IPv6 Output Filter Name</b>	Name assigned to the Ascend-Data-Filter (ADF) interface IPv6 output filter (client or service session). The filter name is followed by the rules (in hexadecimal format) associated with the ADF filter and the decoded rule in Junos OS filter style.
<b>IPv4 Input Filter Name</b>	Name assigned to the IPv4 input filter (client or service session).
<b>IPv4 Output Filter Name</b>	Name assigned to the IPv4 output filter (client or service session).
<b>IPv6 Input Filter Name</b>	Name assigned to the IPv6 input filter (client or service session).
<b>IPv6 Output Filter Name</b>	Name assigned to the IPv6 output filter (client or service session).
<b>IFL Input Filter Name</b>	Name assigned to the logical interface input filter (client or service session).
<b>IFL Output Filter Name</b>	Name assigned to the logical interface output filter (client or service session).

## Sample Output

### show subscribers (IPv4)

```

user@host> show subscribers
Interface          IP Address/VLAN ID  User Name          LS:RI
ge-1/3/0.1073741824 100                 WHOLESALE-CLIENT  default:default

# Troubleshooting Procedures

- Troubleshooting Loss of the Root Password on page 601

## Troubleshooting Loss of the Root Password

---

**Problem**    **Description:** If you forget the root password for a switch, use the password recovery procedure to reset the root password.

**NOTE:** You need physical access to the switch to recover the root password.

**TIP:** For a video on recovering the root password for routers, see *Recovering the Root Password*. The procedure is similar for switches.

**Solution**    To recover the root password:

1. Power off your switch by unplugging the power cord or turning off the power at the wall switch.
2. Insert one end of the Ethernet cable into the serial port on the management device and connect the other end to the console port on the back of the switch. See [Figure 1 on page 306](#).

Figure 2: Connecting to the Console Port on the EX Series Switch

3. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate COM port to use (for example, COM1).
4. Configure the port settings as follows:
  - Bits per second: 9600
  - Data bits: 8
  - Parity: None
  - Stop bits: 1
  - Flow control: None
5. Power on your switch by plugging in the power cord or turning on the power at the wall switch.
6. When the following prompt appears, press the Spacebar to access the switch's bootstrap loader command prompt:
 

Hit [Enter] to boot immediately, or space bar for command prompt.  
Booting [kernel] in 1 second...

**NOTE:** If the switch is in unattended mode for U-Boot, access to the bootstrap loader command prompt is blocked. If the root password is lost, you must reset the switch to the factory default configuration using the LCD panel. For more information, see [“Reverting to the Default Factory Configuration for the EX Series Switch”](#) on page 620.

7. At the following prompt, type **boot -s** to start up the system in single-user mode:  
**loader> boot -s**
8. At the following prompt, type **recovery** to start the root password recovery procedure:  
**Enter full path name of shell or 'recovery' for root password recovery or RETURN for /bin/sh: recovery**

A series of messages describe consistency checks, mounting of filesystems, and initialization and checkout of management services. Then the CLI prompt appears.

9. Enter configuration mode in the CLI:

```
user@switch> configure
```

10. Set the root password. For example:

```
user@switch# set system root-authentication plain-text-password
```

11. At the following prompt, enter the new root password. For example, juniper1:

```
user@switch# juniper1
```

```
Retype new password:
```

12. At the second prompt, reenter the new root password.

13. If you are finished configuring the network, commit the configuration.

```
root@switch# commit
```

```
commit complete
```

14. Exit configuration mode in the CLI.

```
root@switch# exit
```

15. Exit operational mode in the CLI.

```
root@switch> exit
```

16. At the prompt, enter **y** to reboot the switch.

```
Reboot the system? [y/n] y
```

## Software Overview

---

- [Understanding Software Infrastructure and Processes on page 607](#)

### Understanding Software Infrastructure and Processes

Each switch runs the Juniper Networks Junos operating system (Junos OS) for Juniper Networks EX Series Ethernet Switches on its general-purpose processors. Junos OS includes processes for Internet Protocol (IP) routing and for managing interfaces, networks, and the chassis.

The Junos OS runs on the Routing Engine. The Routing Engine kernel coordinates communication among the Junos OS processes and provides a link to the Packet Forwarding Engine.

With the J-Web interface and the command-line interface (CLI) to the Junos OS, you configure switching features and routing protocols and set the properties of network interfaces on your switch. After activating a software configuration, use either the J-Web or CLI user interface to monitor the switch, manage operations, and diagnose protocol and network connectivity problems.

- [Routing Engine and Packet Forwarding Engine on page 607](#)
- [Junos OS Processes on page 608](#)

### Routing Engine and Packet Forwarding Engine

---

A switch has two primary software processing components:

- **Packet Forwarding Engine**—Processes packets; applies filters, routing policies, and other features; and forwards packets to the next hop along the route to their final destination.
- **Routing Engine**—Provides three main functions:
  - Creates the packet forwarding switch fabric for the switch, providing route lookup, filtering, and switching on incoming data packets, then directing outbound packets to the appropriate interface for transmission to the network

- Maintains the routing tables used by the switch and controls the routing protocols that run on the switch.
- Provides control and monitoring functions for the switch, including controlling power and monitoring system status.

### Junos OS Processes

The Junos OS running on the Routing Engine and Packet Forwarding Engine consists of multiple processes that are responsible for individual functions.

The separation of functions provides operational stability, because each process accesses its own protected memory space. In addition, because each process is a separate software package, you can selectively upgrade all or part of the Junos OS, for added flexibility.

Table 6 on page 30 describes the primary Junos OS processes.

**Table 51: Junos OS Processes**

Process	Name	Description
Chassis process	chassisd	<p>Detects hardware on the system that is used to configure network interfaces.</p> <p>Monitors the physical status of hardware components and field-replaceable units (FRUs), detecting when environment sensors such as temperature sensors are triggered.</p> <p>Relays signals and interrupts—for example, when devices are taken offline, so that the system can close sessions and shut down gracefully.</p>
Ethernet switching process	eswd	<p>Handles Layer 2 switching functionality such as MAC address learning, Spanning Tree protocol and access port security. The process is also responsible for managing Ethernet switching interfaces, VLANs, and VLAN interfaces.</p> <p>Manages Ethernet switching interfaces, VLANs, and VLAN interfaces.</p>
Forwarding process	pfem	<p>Defines how routing protocols operate on the switch. The overall performance of the switch is largely determined by the effectiveness of the forwarding process.</p>
Interface process	dcd	<p>Configures and monitors network interfaces by defining physical characteristics such as link encapsulation, hold times, and keepalive timers.</p>
Management process	mgd	<p>Provides communication between the other processes and an interface to the configuration database.</p> <p>Populates the configuration database with configuration information and retrieves the information when queried by other processes to ensure that the system operates as configured.</p> <p>Interacts with the other processes when commands are issued through one of the user interfaces on the switch.</p> <p>If a process terminates or fails to start when called, the management process attempts to restart it a limited number of times to prevent thrashing and logs any failure information for further investigation.</p>
Routing protocol process	rpd	<p>Defines how routing protocols such as RIP, OSPF, and BGP operate on the device, including selecting routes and maintaining forwarding tables.</p>

- Configuration Files Terms on page 615

### Understanding Configuration Files for EX Series Switches

A configuration file stores the complete configuration of a switch. The current configuration of a switch is called the active configuration. You can alter this current configuration and you can also return to a previous configuration or to a rescue configuration. For more information, see “[Configuration Files Terms](#)” on page 615.

Juniper Networks Junos operating system (Junos OS) saves the 50 most recently committed configuration files on the switch so that you can return to a previous configuration. The configuration files are named:

- **juniper.conf.gz**—The current active configuration.
- **juniper.conf.1.gz** to **juniper.conf.49.gz**—Rollback configurations.

The configuration files are available in the **/config** folder on the switch.

To make changes to the configuration file, you have to work in the configuration mode in the CLI or use the configuration tools in the J-Web interface. When making changes to a configuration file, you are viewing and changing the candidate configuration file. The candidate configuration allows you to make configuration changes without causing operational changes to the active configuration or causing potential damage to your current network operations. Once you commit the changes made to the candidate configuration, the system updates the active configuration.

## Using the CLI Viewer in the J-Web Interface to View Configuration Text

---

**NOTE:** This topic applies only to the J-Web Application package.

---

To view the entire configuration file contents in text format, select **Configure > CLI Tools > CLI Viewer**. The main pane displays the configuration in text format.

Each level in the hierarchy is indented to indicate each statement's relative position in the hierarchy. Each level is generally set off with braces, with an open brace ( { ) at the beginning of each hierarchy level and a closing brace ( } ) at the end. If the statement at a hierarchy level is empty, the braces are not displayed. Each leaf statement ends with a semicolon ( ; ), as does the last statement in the hierarchy.

This indented representation is used when the configuration is displayed or saved as an ASCII file. However, when you load an ASCII configuration file, the format of the file is not so strict. The braces and semicolons are required, but the indentation and use of new lines are not required in ASCII configuration files.

## Using the CLI Editor in the J-Web Interface to Edit Configuration Text

---

**NOTE:** This topic applies only to the J-Web Application package.

---

Use the CLI Editor to edit configuration if you know the Junos OS CLI or prefer a command interface.

To edit the entire configuration in text format:

---

**CAUTION:** We recommend that you use this method to edit and commit the configuration only if you have experience editing configurations through the CLI.

---

1. Select **Configure > CLI Tools > CLI Editor**. The work area displays the configuration in a text editor.
2. Navigate to the hierarchy level you want to edit.

You can edit the candidate configuration using standard text editor operations—insert lines (by using the Enter key), delete lines, and modify, copy, and paste text.

3. Click **Commit** to load and commit the configuration.

The switching platform checks the configuration for the correct syntax before committing it.

  - [Understanding J-Web Configuration Tools](#)

## Using the Point and Click CLI Tool in the J-Web Interface to Edit Configuration Text

**NOTE:** This topic applies only to the J-Web Application package.

To edit the configuration on a series of pages of clickable options that steps you through the hierarchy, select **Configure > CLI Tools > Point&Click CLI**. The side pane displays the top level of the configured hierarchy, and the work area displays configured hierarchy options and the Icon Legend.

To expand or hide the hierarchy of all the statements in the side pane, click **Expand all** or **Hide all**. To expand or hide an individual statement in the hierarchy, click the expand (+) or collapse (–) icon to the left of the statement.

**TIP:** Only those statements included in the committed configuration are displayed in the hierarchy.

The configuration information in the work area consists of configuration options that correspond to configuration statements. Configuration options that contain subordinate statements are identified by the term *Nested*.

To include, edit, or delete statements in the candidate configuration, click one of the links described in [Table 52 on page 611](#). Then specify configuration information by typing in a field, selecting a value from a list, or selecting a check box (toggle).

**Table 52: J-Web Edit Point & Click Configuration Links**

Link	Function
Add new entry	Displays fields and lists for a statement identifier, allowing you to add a new identifier to a statement.
Configure	Displays information for a configuration option that has not been configured, allowing you to include a statement.
Delete	Deletes the corresponding statement or identifier from the configuration. All subordinate statements and identifiers contained within a deleted statement are also discarded.
Edit	Displays information for a configuration option that has already been configured, allowing you to edit a statement.
Identifier	Displays fields and lists for an existing statement identifier, allowing you to edit the identifier.

As you navigate through the configuration, the hierarchy level is displayed at the top of the work area. You can click a statement or identifier in the hierarchy to display the corresponding configuration options in the work area.

The work area includes icons that display information about statements and identifiers when you place your cursor over them. [Table 53 on page 612](#) describes these icons.

**Table 53: J-Web Edit Point & Click Configuration Icons**

Icon	Function
C	Displays a comment about a statement.
I	Indicates that a statement is inactive.
M	Indicates that a statement has been added or modified but has not been committed.
*	Indicates that the statement or identifier is required in the configuration.
?	Provides online help information.

After typing or selecting your configuration edits, click a button in the work area (described in [Table 54 on page 612](#)) to apply your changes or cancel them, refresh the display, or discard parts of the candidate configuration. An updated configuration does not take effect until you commit it.

**Table 54: J-Web Edit Point & Click Configuration Buttons**

Button	Function
Refresh	Updates the display with any changes to the configuration made by other users.
Commit	Verifies edits and applies them to the current configuration file running on the switch.
Discard	Removes edits applied to or deletes existing statements or identifiers from the candidate configuration.

## Understanding Automatic Refreshing of Scripts on EX Series Switches

You can automatically refresh **commit**, **event**, and **op** scripts using operational mode commands on EX Series switches. The commands are:

- [request system scripts refresh-from commit](#)
- [request system scripts refresh-from event](#)
- [request system scripts refresh-from op](#)

The existing Junos operating system (Junos OS) command-line interface (CLI) **refresh** and **refresh-from** configuration mode statements have been extended to work with Junos XML management protocol and NETCONF XML management protocol sessions.

## Understanding Autoinstallation of Configuration Files

Autoinstallation is the automatic configuration of a device over the network from a preexisting configuration file that you create and store on a configuration server—typically a Trivial File Transfer Protocol (TFTP) server. You can use autoinstallation to configure new devices automatically and to deploy multiple devices from a central location in the network.

You enable autoinstallation so that the switches in your network implement autoinstallation when they are powered on. To configure autoinstallation, you specify a configuration server, an autoinstallation interface, and a protocol for IP address acquisition.

This topic describes:

- [Typical Uses for Autoinstallation on page 613](#)
- [Autoinstallation Configuration Files and IP Addresses on page 614](#)
- [Typical Autoinstallation Process on a New Switch on page 614](#)

### Typical Uses for Autoinstallation

Typical uses for autoinstallation of the software include:

- To deploy and update multiple devices from a central location in the network.
- To update a device—Autoinstallation occurs when a device that has been manually configured for autoinstallation is powered on.

## Autoinstallation Configuration Files and IP Addresses

---

For the autoinstallation process to work, you must store one or more host-specific or default configuration files on a configuration server in the network and have a service available—typically Dynamic Host Configuration Protocol (DHCP)—to assign an IP address to the switch.

You can set up the following configuration files for autoinstallation on the switch:

- **network.conf**—Default configuration file for autoinstallation, in which you specify IP addresses and associated hostnames for devices on the network.
- **switch.conf**—Default configuration file for autoinstallation with a minimum configuration sufficient for you to telnet to the device and configure it manually.
- **hostname.conf**—Host-specific configuration file for autoinstallation on a device that contains all the configuration information necessary for the switch. In the filename, **hostname** is replaced with the hostname assigned to the switch.

If the server with the autoinstallation configuration file is not on the same LAN segment as the new device, or if a specific device is required by the network, you must configure an intermediate device directly attached to the new switch, through which the new switch can send TFTP, Boot Protocol (BOOTP), and Domain Name System (DNS) requests. In this case, you specify the IP address of the intermediate device as the location to receive TFTP requests for autoinstallation.

## Typical Autoinstallation Process on a New Switch

---

When the switch configured for autoinstallation is powered on, it performs the following autoinstallation tasks:

1. The switch sends out DHCP or BOOTP requests on each connected interface simultaneously to obtain an IP address.

If a DHCP server responds to these requests, it provides the switch with some or all of the following information:

- An IP address and subnet mask for the autoinstallation interface.
- The location of the (typically) TFTP server, Hypertext Transfer Protocol (HTTP) server, or FTP server on which the configuration file is stored.
- The name of the configuration file to be requested from the TFTP server.
- The IP address or hostname of the TFTP server.

If the DHCP server provides the server's hostname, a DNS server must be available on the network to resolve the name to an IP address.

- The IP address of an intermediate device if the configuration server is on a different LAN segment from the switch.

2. After the switch acquires an IP address, the autoinstallation process on the switch attempts to download a configuration file in the following ways:
  - a. If the DHCP server specifies the host-specific configuration file **hostname.conf**, the switch uses that filename in the TFTP server request. The autoinstallation process on the new switch makes three unicast TFTP requests for **hostname.conf**. If these attempts fail, the switch broadcasts three requests to any available TFTP server for the file.
  - b. If the switch does not locate a **hostname.conf** file, the autoinstallation process sends three unicast TFTP requests for a **network.conf** file that contains the switch's hostname-to-IP-address mapping information. If these attempts fail, the switch broadcasts three requests to any available TFTP server for the file.
  - c. If the switch fails to find a **network.conf** file that contains a hostname entry for the switch, the autoinstallation process sends out a DNS request and attempts to resolve the switch's IP address to a hostname.
  - d. If the switch determines its hostname, it sends a TFTP request for the **hostname.conf** file.
  - e. If the switch is unable to map its IP address to a hostname, it sends TFTP requests for the default configuration file **switch.conf**. The TFTP request procedure is the same as for the **network.conf** file.
3. After the switch locates a configuration file on a TFTP server, the autoinstallation process downloads the file, installs the file on the switch, and commits the configuration.

## Configuration Files Terms

[Table 55 on page 615](#) lists the various configuration file terms used for EX Series switches and their definitions.

**Table 55: Configuration File Terms**

Term	Definition
active configuration	The current committed configuration of a switch.
candidate configuration	A working copy of the configuration that allows users to make configurational changes without causing any operational changes until this copy is committed.
configuration group	Group of configuration statements that can be inherited by the rest of the configuration.

Table 55: Configuration File Terms (*continued*)

Term	Definition
commit a configuration	Have the candidate configuration checked for proper syntax, activated, and marked as the current configuration file running on the switching platform.
configuration hierarchy	The Junos OS configuration consists of a hierarchy of statements. There are two types of statements: container statements, which contain other statements, and leaf statements, which do not contain other statements. All the container and leaf statements together form the configuration hierarchy.
default configuration	The default configuration contains the initial values set for each configuration parameter when a switch is shipped.
rescue configuration	Well-known configuration that recovers a switch from a configuration that denies management access. You set a current committed configuration to be the rescue configuration through the J-Web interface or CLI.
roll back a configuration	Return to a previously committed configuration.

## CHAPTER 14

# Configuration

- Configuration Tasks on page 617
- Configuration Statements on page 629

### Configuration Tasks

---

- Uploading a Configuration File (CLI Procedure) on page 617
- Uploading a Configuration File (J-Web Procedure) on page 619
- Loading a Previous Configuration File (CLI Procedure) on page 619
- Reverting to the Default Factory Configuration for the EX Series Switch on page 620
- Reverting to the Rescue Configuration for the EX Series Switch on page 624
- Setting or Deleting the Rescue Configuration (CLI Procedure) on page 625
- Setting or Deleting the Rescue Configuration (J-Web Procedure) on page 625
- Configuring Autoinstallation of Configuration Files (CLI Procedure) on page 626
- Using the Commit Options to Commit Configuration Changes (J-Web Procedure) on page 628

### Uploading a Configuration File (CLI Procedure)

You can create a configuration file on your local system, copy the file to the EX Series switch and then load the file into the CLI. After you have loaded the configuration file, you can commit it to activate the configuration on the switch. You can also edit the configuration interactively using the CLI and commit it at a later time.

To upload a configuration file from your local system:

1. Create the configuration file using a text editor such as Notepad, making sure that the syntax of the configuration file is correct. For more information about testing the syntax of a configuration file see the *Junos OS System Basics and Services Command Reference*.
2. In the configuration text file, use an option to perform the required action when the file is loaded. [Table 56 on page 618](#) lists and describes some options for the **load** command.

Table 56: Options for the load command

Options	Description
<b>merge</b>	Combines the current active configuration and the configuration in <i>filename</i> or the one that you type at the terminal. A <b>merge</b> operation is useful when you are adding a new section to an existing configuration. If the active configuration and the incoming configuration contain conflicting statements, the statements in the incoming configuration override those in the active configuration.
<b>override</b>	Discards the current candidate configuration and loads the configuration in <i>filename</i> or the one that you type at the terminal. When you use the <b>override</b> option and commit the configuration, all system processes reparse the configuration. You can use the <b>override</b> option at any level of the hierarchy.
<b>replace</b>	Searches for the <b>replace</b> tags, deletes the existing statements of the same name, if any, and replaces them with the incoming configuration. If there is no existing statement of the same name, the <b>replace</b> operation adds the statements marked with the <b>replace</b> tag to the active configuration.  <b>NOTE:</b> For this operation to work, you must include <b>replace</b> tags in the text file or in the configuration you type at the terminal.

- Press Ctrl+A to select all the text in the configuration file.
- Press Ctrl+C to copy the contents of the configuration text file to the Clipboard.
- Log in to the switch using your username and password.
- To enter configuration mode:  

```
user@switch> configure
```

You will see this output, with the hash or pound mark indicating configuration mode.

**Entering configuration mode**

```
[edit]
user@switch#
```
- Load the configuration file:  

```
[edit]
user@switch# load merge terminal
```
- At the cursor, paste the contents of the Clipboard using the mouse and the Paste icon:  

```
[edit]
user@switch# load merge terminal
[Type ^D at a new line to end input]
>Cursor is here. Paste the contents of the clipboard here<
```
- Press Enter.
- Press Ctrl+D to set the end-of-file marker.

To view results of the configuration steps before committing the configuration, type the **show** command at the user prompt.

To commit these changes to the active configuration, type the **commit** command at the user prompt. You can also edit the configuration interactively using the CLI and commit it at a later time.

- Related Documentation**
- [Uploading a Configuration File \(J-Web Procedure\) on page 619](#)
  - [Understanding Configuration Files for EX Series Switches on page 609](#)

## Uploading a Configuration File (J-Web Procedure)

**NOTE:** This topic applies only to the J-Web Application package.

You can create a configuration file on your local system, copy the file to the EX Series switch and then load the file into the CLI. After you have loaded the configuration file, you can commit it to activate the configuration on the switch. You can also edit the configuration interactively using the CLI and commit it at a later time.

To upload a configuration file from your local system:

1. Select **Maintain > Config Management > Upload**.  
The work area displays the File to Upload box.
2. Specify the name of the file to upload using one of the following methods:
  - Type the absolute path and filename in the File to Upload box.
  - Click **Browse** to navigate to the file.
3. Click **Upload and Commit** to upload and commit the configuration.  
The switch checks the configuration for the correct syntax before committing it.

- Related Documentation**
- [Uploading a Configuration File \(CLI Procedure\) on page 617](#)
  - [Understanding J-Web Configuration Tools](#)
  - [Understanding Configuration Files for EX Series Switches on page 609](#)

## Loading a Previous Configuration File (CLI Procedure)

You can return to a previously committed configuration file if you need to revert to a previous configuration. The EX Series switch saves the last 50 committed configurations, including the rollback number, date, time, and name of the user who issued the **commit** configuration command.

### Syntax

**rollback** <number>

### Options

- **none**—Return to the most recently saved configuration.
- **number**—Configuration to return to.
  - **Range:** 0 through 49. The most recently saved configuration is number 0, and the oldest saved configuration is number 49.

- **Default:** 0

To return to a configuration prior to the most recently committed one:

1. Specify the rollback number (here, 1 is entered and the configuration returns to the previously committed configuration):

```
[edit]
user@switch# rollback 1
load complete
```

2. Activate the configuration you have loaded:

```
[edit]
user@switch# commit
```

#### Related Documentation

- [Configuration Files Terms on page 615](#)
- [For more information on rollback, see \*Junos OS CLI User Guide\*.](#)

## Reverting to the Default Factory Configuration for the EX Series Switch

If for any reason the current active configuration fails, you can revert to the factory-default configuration.

You can also roll back to a previous configuration, as described in “[Loading a Previous Configuration File \(CLI Procedure\)](#)” on page 619, or revert to the rescue configuration, as described in “[Reverting to the Rescue Configuration for the EX Series Switch](#)” on page 624.

**TIP:** If you have lost the root password, it is not necessary to revert to the factory-default configuration to reset it. See “[Troubleshooting Loss of the Root Password](#)” on page 305.

The factory-default configuration contains the basic configuration settings for the switch. This is the first configuration of the switch and it is loaded when the switch is first powered on. For the factory-default configuration file for your switch, see the complete list under the Configuration tab of *Configuration File Management on EX Series Switches*.

**TIP:** You can run the EZsetup script to complete the initial configuration of the switch *after* reverting to the factory-default configuration. (The EZsetup script is available only on fixed configuration switches, it is not available on modular switches.) For information on completing the initial configuration using either the CLI or the J-Web interface, see *Connecting and Configuring an EX Series Switch (CLI Procedure)* or *Connecting and Configuring an EX Series Switch (J-Web Procedure)*.

You can revert to the factory-default configuration by using the **Menu** button to the right of the LCD panel or by using the **request system zeroize** operational command or the **load factory-default** configuration command. (If your switch model does not have an LCD panel, use these commands.) You can also use the **load factory-default** command to revert to the factory-default configuration file that contains all default settings *except* the root password setting, which is retained.

These procedures are described in the following sections:

- [Reverting to the Factory-Default Configuration by Using the LCD Panel on page 621](#)
- [Reverting to the Factory-Default Configuration by Using the request system zeroize Command on page 622](#)
- [Reverting to the Factory-Default Configuration by Using the load factory-default Command on page 622](#)

### Reverting to the Factory-Default Configuration by Using the LCD Panel

To set the switch to the factory-default configuration, use the LCD panel and buttons on the front panel of the switch shown in [Figure 3 on page 621](#). If the switch model does not have an LCD panel, use one of the CLI commands described in the following sections.

**Figure 3: EX Series Switch LCD Panel**

**NOTE:** To revert a member switch of a Virtual Chassis to the factory-default configuration, first disconnect the cables connected to the Virtual Chassis ports (VCPs) to avoid affecting Virtual Chassis configuration parameters (member ID, mastership priority, and setting of VCP uplinks) on other members. See *Disconnecting a Fiber-Optic Cable from an EX Series Switch*, *Disconnecting a Virtual Chassis Cable from an EX4200 Switch*, or *Disconnecting a Virtual Chassis Cable from an EX4500 Switch*.

To revert to the factory-default configuration by using the LCD panel:

1. Press the **Menu** button until you see MAINTENANCE MENU on the panel.
2. Press the **Enter** button.
3. Press **Menu** until you see FACTORY DEFAULT.
4. Press **Enter**. The display says RESTORE DEFAULT?

5. Press **Enter**. The screen flashes **FACTORY DEFAULT IN PROGRESS** and returns to the idle menu.
6. Complete the initial configuration of the switch. See *Connecting and Configuring an EX Series Switch (CLI Procedure)* or *Connecting and Configuring an EX Series Switch (J-Web Procedure)*

### Reverting to the Factory-Default Configuration by Using the `request system zeroize` Command

---

The **request system zeroize** command is a standard Junos OS operational mode command that removes all configuration information and resets all key values. The operation unlinks all user-created data files, including customized configuration and log files, from their directories. The switch then reboots and reverts to the factory-default configuration.

To completely erase user-created data so that it is unrecoverable, use the **request system zeroize media** command.

**CAUTION:** Before issuing **request system zeroize**, use the **request system snapshot** command to back up the files currently used to run the switch to a secondary device.

---

To revert to the factory-default configuration by using the **request system zeroize** command:

1. `user@switch> request system zeroize`  
warning: System will be rebooted and may not boot without configuration  
Erase all data, including configuration and log files? [yes,no] (yes)
  2. Type **yes** to remove configuration and log files and revert to the factory default configuration.
- 

**NOTE:** The **auto-image-upgrade** statement is added under the **[edit chassis]** hierarchy level when you use this procedure, and thus the automatic image upgrade feature is made available on the switch.

---

3. Complete the initial configuration of the switch. See *Connecting and Configuring an EX Series Switch (CLI Procedure)* or *Connecting and Configuring an EX Series Switch (J-Web Procedure)*

### Reverting to the Factory-Default Configuration by Using the `load factory-default` Command

---

The **load factory-default** command is a standard Junos OS configuration command that replaces the current active configuration with the factory-default configuration (except the root password setting, which by default is not set but which you must set in order to commit the new configuration in this procedure).

If you want to run the EZsetup script to complete the initial configuration of the switch after you revert to the factory-default configuration, do not use the **load factory-default**

command. Instead do the reversion using either the LCD panel or the **request system zeroize** command. If you use the **load factory-default** command to revert to the factory-default configuration, the configuration for the root password is retained and the EZsetup script will not run. (The EZsetup script is available only on fixed configuration switches, it is not available on modular switches.)

**NOTE:** The **load factory-default** command by itself is not supported on EX3300, EX4200, EX4500, and EX4550 switches configured in a Virtual Chassis.

To revert to the factory-default configuration by using the **load factory-default** command:

**NOTE:** If you use this procedure, you must delete the system commit factory settings, set the root password, and commit the configuration. These steps are not required when you revert to the factory-default configuration by using **request system zeroize**. Also, the **auto-image-upgrade** statement is not added to the configuration when you use this procedure; it *is* added to the configuration when you use **request system zeroize**.

1. [edit]  
user@switch# **load factory-default**
2. [edit]  
user@switch# **delete system commit factory-settings**
3. [edit]  
user@switch# **set system root-authentication plain-text-password**
4. [edit]  
user@switch# **commit**
5. Check the member ID and mastership priority with the **show virtual-chassis** command and check to see whether there are remaining settings for uplink VCPs by using the **show virtual-chassis vc-port** command.

## Reverting to the Rescue Configuration for the EX Series Switch

If someone inadvertently commits a configuration that denies management access to an EX Series switch and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration by using the LCD panel on the switch. The rescue configuration is a previously committed, valid configuration.

You can also revert to the default factory configuration, as described in [“Reverting to the Default Factory Configuration for the EX Series Switch” on page 620](#).

Before you begin to revert to the rescue configuration:

- Ensure that you have physical access to the switch.
- A rescue configuration for the switch must have been previously set.

To revert the switch to the rescue configuration:

1. At the LCD panel on the switch, press **Menu** until you see **MAINTENANCE MENU**.
2. Press **Enter**.
3. Press **Menu** until you see **Load Rescue**.
4. Press **Enter**.
5. When **Commit Rescue** is displayed, press **Enter**.

The LCD panel displays the message **Commit Rescue in Progress**. When the reversion is complete, it displays the idle menu.

.....  
**NOTE:** If there is no rescue configuration saved on the switch, the message **Commit rescue failed** is displayed.  
.....

### Related Documentation

## Setting or Deleting the Rescue Configuration (CLI Procedure)

A rescue configuration is a well-known configuration that recovers a switch from a configuration that denies management access. You set a current committed configuration to be the rescue configuration through the J-Web interface or CLI.

If someone inadvertently commits a configuration that denies management access to an EX Series switch and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration by using the LCD panel on the switch. The rescue configuration is a previously committed, valid configuration. We recommend that the rescue configuration include the IP address (accessible from the network) for the management port.

To set the current active configuration as the rescue configuration:

```
user@switch> request system configuration rescue save
```

To delete an existing rescue configuration:

```
user@switch> request system configuration rescue delete
```

### Related Documentation

- [Reverting to the Rescue Configuration for the EX Series Switch on page 624](#)
- [Configuration Files Terms on page 615](#)

## Configuring Autoinstallation of Configuration Files (CLI Procedure)

Autoinstallation is the automatic configuration of a device over the network from a pre-existing configuration file that you create and store on a configuration server—typically a Trivial File Transfer Protocol (TFTP) server. You can use autoinstallation to automatically deploy multiple devices from a central location in the network.

To specify autoinstallation to run when you power on a switch already installed in your network, you can enable it by specifying one or more interfaces, protocols, and configuration servers to be used for autoinstallation.

Before you explicitly enable and configure autoinstallation on the switch, perform these tasks as needed for your network's configuration:

- Have a service available—typically Dynamic Host Configuration Protocol (DHCP)—to assign an IP address to the switch
- Configure a DHCP server on your network to meet your network requirements. You can configure a switch to operate as a DHCP server. For more information, see *Configuring a DHCP Server on Switches (CLI Procedure)*.
- Create one of the following configuration files, and store it on a TFTP server (or HTTP server or FTP server) in the network:
  - A host-specific file with the name **hostname.conf** for each switch undergoing autoinstallation. Replace **hostname** with the name of a switch. The **hostname.conf** file typically contains all the configuration information necessary for the switch with this hostname.
  - A default configuration file named **switch.conf** with the minimum configuration necessary to enable you to telnet into the new switch for further configuration.
- Physically attach the switch to the network using a Gigabit Ethernet port.
- If you configure the DHCP server to provide only the TFTP server hostname, add an IP address-to-hostname mapping entry for the TFTP server to the DNS database file on the Domain Name System (DNS) server in the network.
- If the switch is not on the same network segment as the DHCP server (or other device providing IP address resolution), configure an existing device as an intermediate device to receive TFTP and DNS requests and forward them to the TFTP server and the DNS server. You must configure the LAN or serial interface on the intermediate device with

the IP addresses of the hosts providing TFTP and DNS services. Connect this interface to the switch.

- If you are using **hostname.conf** files for autoinstallation, you must also complete the following tasks:
  - Configure the DHCP server to provide a **hostname.conf** filename to each switch. Each switch uses its **hostname.conf** filename to request a configuration file from the TFTP server. Copy the necessary **hostname.conf** configuration files to the TFTP server.
  - Create a default configuration file named **network.conf**, and copy it to the TFTP server. This file contains IP-address-to-hostname mapping entries. If the DHCP server does not send a **hostname.conf** filename to a new switch, the switch uses **network.conf** to resolve its hostname based on its IP address.

Alternatively, you can add the IP-address-to-hostname mapping entry for the switch to a DNS database file.

The switch uses the hostname to request a **hostname.conf** file from the TFTP server.

To configure autoinstallation:

1. Specify the URL address of one or more servers from which to obtain configuration files.

```
[edit system]
user@switch# set autoinstallation configuration-servers tftp://tftpconfig.sp.com
```

**NOTE:** You can also use an FTP address, for example, **ftp://user:password@sftpconfig.sp.com**.

2. Configure one or more Ethernet interfaces to perform autoinstallation and one or two procurement protocols for each interface. The switch uses the protocols to send a request for an IP address for the interface:

```
[edit system]
user@switch# set autoinstallation interfaces ge-0/0/0 bootp
```

## Using the Commit Options to Commit Configuration Changes (J-Web Procedure)

You can use the single-commit feature to commit all outstanding configuration changes in the J-Web interface on EX Series switches simultaneously. This helps in reducing the time J-Web takes for committing configurations because when changes are committed at every step, rollback configurations pile up.

For example, suppose you want to delete a firewall filter and add a new one. With immediate commits, you would need to commit your changes twice for this action. Using single commit, you can decrease the number of commits to one, thus saving time for working on other configurations.

When you edit a configuration, you work on a copy of the current configuration, which is your candidate configuration. The changes you make to the candidate configuration are visible through the user interface immediately, allowing other users to edit those configurations, but they do not take effect on the switch until you commit the changes. When you commit the configuration, the candidate file is checked for proper syntax, activated, and marked as the current, operational software configuration file. If multiple users are editing the configuration when you commit the candidate configuration, changes made by all users take effect.

You can configure the commit options to either commit all configuration changes together or commit each configuration change immediately using the J-Web Commit Preference page.

**NOTE:** There are some pages on which configuration changes must be committed immediately. For such pages, if you configure the commit options for a single commit, the system displays warning notifications that remind you to commit your changes immediately. An example of such a page is the Interface Page (Configure > Interface).

To configure the commit options on an EX Series switch using the J-Web interface:

1. Select **Commit Options**.

**NOTE:** All action links except **Preference** are disabled unless you edit, add, or delete a configuration.

2. Choose an action. See [Table 57 on page 629](#) for details on the actions.
3. Configure the commit options by selecting **Preference**. See [Table 58 on page 629](#) for details on preference options.

Table 57: Commit Options

Menu Item	Function	Your Action
Commit	Commits the candidate configuration of the current user session, along with changes from other user sessions.	<ol style="list-style-type: none"> <li>1. Select <b>Commit Options &gt; Commit</b>.  Changes are committed after the system validates your configuration. A window displays that the configuration was successfully committed or that the commit failed.</li> <li>2. Click <b>OK</b>.  Click <b>Details</b> to view the commit log.</li> </ol>
Compare	Displays the XML log of pending uncommitted configurations on the device.	<ol style="list-style-type: none"> <li>1. Select <b>Commit Options &gt; Compare</b>.  The XML log of pending configurations on the devices are displayed similar to the CLI interface, in a “human-readable” form.</li> <li>2. Click <b>Close</b>.</li> </ol>
Discard	Discards the candidate configuration of your current session, along with changes from other user sessions.	<ol style="list-style-type: none"> <li>1. Select <b>Commit Options &gt; Discard</b>.</li> <li>2. Click <b>OK</b> to confirm the discard action.  Your changes are discarded after the system validates your configuration.</li> </ol>
Preference	Indicates your choice of committing all global configurations together or committing each configuration change immediately.	<ol style="list-style-type: none"> <li>1. Select <b>Commit Options &gt; Preference</b>. The Commit Preference page is displayed.</li> <li>2. Configure the commit options by selecting your preference. See <a href="#">Table 58 on page 629</a> for details on preference options.</li> </ol>

Table 58: Commit Preference Options

Option	Function
Validate and commit configuration changes	Sets the system to validate and force an immediate commit on every screen after every configuration change.
Validate configuration changes	<p>Loads all the configuration changes for an accumulated single commit. If there are errors in loading the configuration, the errors are logged. This is the default mode.</p> <p>Once you select this option, you need to select <b>Commit Options &gt; Commit</b> to commit your changes.</p>

## archival

---

**Syntax**

```
archival {  
  configuration {  
    archive-sites {  
      file://<path>/<filename>;  
      ftp://username@host:<port>url-path password password;  
      http://username@host:<port>url-path password password;  
      pasvftp://username@host:<port>url-path password password;  
      scp://username@host:<port>url-path password password;  
    }  
    transfer-interval interval;  
    transfer-on-commit;  
  }  
}
```

**Hierarchy Level** [edit system]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure copying of the currently active configuration to an archive site. An archive site can be a file, or an FTP or SCP location.

**NOTE:** The edit system archival hierarchy is not available on QFabric systems.

---

**Options** The remaining statements are explained separately.

**NOTE:** The [edit system archival] hierarchy is not available on QFabric systems.

---

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

## archive-sites (Configuration File)

<b>Syntax</b>	<pre>archive-sites {     file://&lt;path&gt;/&lt;filename&gt;;     ftp://username@host:&lt;port&gt;url-path password password;     http://username@host:&lt;port&gt;url-path password password;     pasvftp://username@host:&lt;port&gt;url-path password password;     scp://username@host:&lt;port&gt;url-path password password; }</pre>
<b>Hierarchy Level</b>	[edit system archival configuration]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	<p>Specify where to transfer the current configuration files. When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks ( " ") and enclose the IPv6 host address in brackets ( [ ] ). For example, "scp://username&lt;:password&gt;@[ipv6-host-address]&lt;:port&gt;/url-path"</p> <p>If you specify more than one archive site, the router or switch attempts to transfer the configuration files to the first archive site in the list, moving to the next only if the transfer fails.</p> <p>The destination filename is saved in the following format, where <i>n</i> corresponds to the number of the compressed configuration rollback file that has been archived:</p> <p><b><i>router-name_juniper.conf.n.gz_YYYYMMDD_HHMMSS.</i></b></p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> <b>NOTE:</b> The time included in the destination filename is always in Coordinated Universal Time (UTC) regardless of whether the time on the router or switch is configured as UTC or the local time zone. The default time zone on the router or switch is UTC.</p> </div> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> <b>NOTE:</b> The [edit system archival] hierarchy is not available on QFabric systems.</p> </div>
<b>Options</b>	<p>The prefix used in the configuration statement determines the form of transfer:</p> <p><b>file://</b> —transfer on a path to a named file</p> <p><b>ftp://</b> —transfer using active FTP server</p> <p><b>pasvftp://</b> —transfer to a device that only accepts passive FTP services</p>

**scp://** —transfer to a known host using background SCP file transfers

<b>Required Privilege</b>	system—To view this statement in the configuration.
<b>Level</b>	system-control—To add this statement to the configuration.

<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Using Junos OS to Configure a Router or Switch to Transfer Its Configuration to an Archive Site</i></li><li>• <i>Junos OS Commit Model for Router or Switch Configuration</i></li><li>• <a href="#">configuration on page 635</a></li><li>• <a href="#">transfer-on-commit on page 639</a></li></ul>
------------------------------	---

## autoinstallation

<b>Syntax</b>	<pre> autoinstallation {   configuration-servers {     url;   }   interfaces {     interface-name {       bootp;       rarp;     }   } } </pre>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.1 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.</p>
<b>Description</b>	<p>For ACX Series routers, J Series Services routers, and EX Series switches only. Download a configuration file automatically from an FTP, Hypertext Transfer Protocol (HTTP), or Trivial FTP (TFTP) server. When you power on a router or switch configured for autoinstallation, it requests an IP address from a Dynamic Host Configuration Protocol (DHCP) server. Once the router or switch has an address, it sends a request to a configuration server and downloads and installs a configuration.</p>
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>ACX Series Autoinstallation Overview</i></li> <li>• <i>Before You Begin Autoinstallation on an ACX Series Universal Access Router</i></li> <li>• <i>Autoinstallation Configuration of ACX Series Universal Access Routers</i></li> <li>• <i>USB Autoinstallation on ACX Series Routers</i></li> <li>• <i>Verifying Autoinstallation on ACX Series Universal Access Routers</i></li> <li>• <i>show system autoinstallation status</i></li> <li>• <i>Upgrading Software by Using Automatic Software Download</i></li> <li>• <i>J Series Services Router Basic LAN and WAN Access Configuration Guide</i></li> <li>• <a href="#">configuration-servers on page 636</a></li> <li>• <a href="#">idle-timeout on page 552</a></li> </ul>

## synchronize (Commit configuration)

---

<b>Syntax</b>	synchronize;
<b>Hierarchy Level</b>	[edit system commit]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	<p>For devices with multiple Routing Engines only. Configure a <b>commit</b> command to automatically result in a <b>commit synchronize</b> action between dual Routing Engines within the same chassis. The Routing Engine on which you execute the <b>commit</b> command (the requesting Routing Engine) copies and loads its candidate configuration to the other (the responding) Routing Engines. All Routing Engines then perform a syntax check on the candidate configuration file being committed. If no errors are found, the configuration is activated and becomes the current operational configuration on all Routing Engines.</p> <p>Starting with Junos OS Release 9.3, accounting of events and operations on a backup Routing Engine is not supported on accounting servers such as TACACS+ or RADIUS. Logging of accounting events is supported only for events and operations on a master Routing Engine.</p>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Multiple Routing Engines to Synchronize Committed Configurations Automatically</i></li></ul>

## configuration

**Syntax**

```
configuration {
  transfer-interval interval;
  transfer-on-commit;
  archive-sites {
    file://<path>/<filename>;
    ftp://username@host:<port>url-path password password;
    http://username@host:<port>url-path password password;
    pasvftp://username@host:<port>url-path password password;
    scp://username@host:<port>url-path password password;
  }
}
```

**Hierarchy Level** [edit system archival]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure the router or switch to periodically transfer its currently active configuration (or after each commit).

**NOTE:** The [edit system archival] hierarchy is not available on QFabric systems.

**Options** The remaining statements are explained separately.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

**Related Documentation**

## configuration-servers

---

<b>Syntax</b>	<pre>configuration-servers {     url; }</pre>
<b>Hierarchy Level</b>	[edit system <a href="#">autoinstallation</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	For J Series Services Routers and EX Series switches only, configure the URL address of a server from which to obtain configuration files. Examples of URLs:  <b><i>tftp://hostname/path/filename</i></b>  <b><i>ftp://username:prompt@ftp.hostname.net/filename /</i></b>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Upgrading Software by Using Automatic Software Download</i></li><li>• Getting Started Guide for your router model</li><li>• <a href="#">autoinstallation on page 633</a></li><li>• <a href="#">idle-timeout on page 552</a></li></ul>

## interfaces

---

<b>Syntax</b>	<pre> interfaces {   interface-name {     bootp;     rarp;     slarp;   } } </pre>
<b>Hierarchy Level</b>	[edit system <a href="#">autoinstallation</a> ]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
<b>Description</b>	For J Series Services Routers and EX Series switches only. Configure the interface on which to perform autoinstallation. A request for an IP address is sent from the interface. Specify the IP address procurement protocol.
<b>Options</b>	<p><b>rarpbootp</b>—Send requests over serial interfaces with Frame Relay.</p> <p><b>rarp</b>—Send requests over Ethernet interfaces.</p> <p><b>slarp</b>—(On J Series Services Routers only) Send requests over serial interfaces with HDLC.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Upgrading Software by Using Automatic Software Download</i></li> <li>• <i>J Series Services Router Basic LAN and WAN Access Configuration Guide</i></li> <li>• <a href="#">autoinstallation on page 633</a></li> </ul>

## transfer-interval (Configuration)

---

<b>Syntax</b>	<code>transfer-interval <i>interval</i>;</code>
<b>Hierarchy Level</b>	[edit system archival configuration]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the router or switch to periodically transfer its currently active configuration to an archive site.
<hr/>	
<div> <b>NOTE:</b> The <code>edit system archival</code> hierarchy is not available on QFabric systems.</div> <hr/>	
<b>Options</b>	<b><i>interval</i></b> —Interval at which to transfer the current configuration to an archive site. <b>Range:</b> 15 through 2880 minutes
<hr/>	
<div> <b>NOTE:</b> The <code>[edit system archival]</code> hierarchy is not available on QFabric systems.</div> <hr/>	
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Using Junos OS to Configure a Router or Switch to Transfer Its Configuration to an Archive Site</i></li><li>• <i>archive</i></li><li>• <a href="#">configuration on page 635</a></li><li>• <a href="#">transfer-on-commit on page 639</a></li></ul>

## transfer-on-commit

<b>Syntax</b>	transfer-on-commit;
<b>Hierarchy Level</b>	[edit system archival configuration]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the router or switch to transfer its currently active configuration to an archive site each time you commit a candidate configuration.

**NOTE:** When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks ( " ") and enclose the IPv6 host address in brackets ( [ ] ). For example, "ftp://username<:password>@[ipv6-host-address]<:port>/url-path" .

**NOTE:** The [edit system archival] hierarchy is not available on QFabric systems.

<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Using Junos OS to Configure a Router or Switch to Transfer Its Configuration to an Archive Site</i></li> <li>• <i>archive</i></li> <li>• <a href="#">configuration on page 635</a></li> <li>• <a href="#">transfer-interval on page 638</a></li> </ul>

# Administration

- [Operational Commands on page 645](#)

## Routine Monitoring

---

- [Managing Configuration Files Through the Configuration History \(J-Web Procedure\) on page 641](#)
- [Verifying Autoinstallation Status on page 644](#)

## Managing Configuration Files Through the Configuration History (J-Web Procedure)

---

NOTE: This topic applies only to the J-Web Application package.

---

Use the Configuration History function to manage configuration files.

1. [Displaying Configuration History on page 641](#)
2. [Displaying Users Editing the Configuration on page 642](#)
3. [Comparing Configuration Files with the J-Web Interface on page 643](#)
4. [Downloading a Configuration File with the J-Web Interface on page 643](#)
5. [Loading a Previous Configuration File with the J-Web Interface on page 643](#)

### Displaying Configuration History

---

To manage configuration files with the J-Web interface, select **Maintain > Config Management > History**. The main pane displays History — Database Information page.

[Table 59 on page 642](#) summarizes the contents of the display.

The configuration history display allows you to:

- View a configuration.
- Compare two configurations.
- Download a configuration file to your local system.
- Roll back the configuration to any of the previous versions stored on the switch.

Table 59: J-Web Configuration History Summary

Field	Description
Number	Version of the configuration file.
Date/Time	Date and time the configuration was committed.
User	Name of the user who committed the configuration.
Client	Method by which the configuration was committed: <ul style="list-style-type: none"> <li><b>cli</b>—A user entered a Junos OS CLI command.</li> <li><b>junoscript</b>—A Junos XML protocol client performed the operation. Commit operations performed by users through the J-Web interface are identified in this way.</li> <li><b>snmp</b>—An SNMP <b>set</b> request started the operation.</li> <li><b>other</b>—Another method was used to commit the configuration.</li> </ul>
Comment	Comment.
Log Message	Method used to edit the configuration: <ul style="list-style-type: none"> <li>Imported via paste— Configuration was edited and loaded with the <b>Configure &gt; CLI Tools &gt; Edit Configuration Text</b> option.</li> <li>Imported upload [<i>filename</i>]<b>—</b>Configuration was uploaded with the <b>Configure &gt; CLI Tools &gt; Point Click Editor</b> option.</li> <li>Modified via J-Web Configure — Configuration was modified with the J-Web Configure menu.</li> <li>Rolled back via <i>user-interface</i><b>—</b> Configuration was rolled back to a previous version through the user interface specified by <i>user-interface</i>, which can be Web Interface or CLI.</li> </ul>
Action	Action to perform with the configuration file. The action can be <b>Download</b> or <b>Rollback</b> .

### Displaying Users Editing the Configuration

To display a list of users editing the switching platform configuration, select **Config Management > History**. The list is displayed as Database Information in the main pane. [Table 60 on page 642](#) summarizes the Database Information display.

Table 60: J-Web Configuration Database Information Summary

Field	Description
User Name	Name of user editing the configuration.
Start Time	Time of day the user logged in to the switch.
Idle Time	Elapsed time since the user issued a configuration command from the CLI.
Terminal	Terminal on which the user is logged in.
PID	Process identifier assigned to the user by the switching platform.
Edit Flags	Designates a private or exclusive edit.

**Table 60: J-Web Configuration Database Information Summary** *(continued)*

Field	Description
Edit Path	Level of the configuration hierarchy that the user is editing.

### Comparing Configuration Files with the J-Web Interface

To compare any two of the past 50 committed configuration files:

1. Select **Config Management > History**. A list of the current and the previous 49 configurations is displayed as Configuration History in the main pane.
2. Select the check boxes to the left of the two configuration versions you want to compare.
3. Click **Compare**.

The main pane displays the differences between the two configuration files at each hierarchy level as follows:

- Lines that have changed are highlighted side by side in green.
- Lines that exist only in the more recent configuration file are displayed in red on the left.
- Lines that exist only in the older configuration file are displayed in blue on the right.

### Downloading a Configuration File with the J-Web Interface

To download a configuration file from the switch to your local system:

1. Select **Config Management > History**. A list of current and previous 49 configurations is displayed as Configuration History in the main pane.
2. In the Action column, click **Download** for the version of the configuration you want to download.
3. Select the options your Web browser provides that allow you to save the configuration file to a target directory on your local system.

The file is saved as an ASCII file.

### Loading a Previous Configuration File with the J-Web Interface

To load (roll back) and commit a previous configuration file stored on the switching platform:

1. Select **Config Management > History**. A list of current and previous 49 configurations is displayed as Configuration History in the main pane.
2. In the Action column, click **Rollback** for the version of the configuration you want to load.

The main pane displays the results of the rollback operation.

**NOTE:** When you click **Rollback**, the switch loads and commits the selected configuration. This behavior is different from the switch's behavior that occurs after you enter the **rollback** configuration mode command from the CLI. In the latter case, the configuration is loaded but not committed.

## Verifying Autoinstallation Status

**Purpose** Display the status of the autoinstallation feature.

**Action** From the CLI, enter the **show system autoinstallation status** command.

## Sample Output

```
user@switch> show system autoinstallation status
Autoinstallation status:
Master state: Active
Last committed file: None
Configuration server of last committed file: 10.25.100.1
Interface:
  Name: ge-0/0/0
  State: Configuration Acquisition
  Acquired:
    Address: 192.168.124.75
    Hostname: host-ge-000
    Hostname source: DNS
    Configuration filename: switch-ge-000.conf
    Configuration filename server: 10.25.100.3
  Address acquisition:
    Protocol: DHCP Client
    Acquired address: None
    Protocol: RARP Client
    Acquired address: None
Interface:
  Name: ge-0/0/1
  State: None
  Address acquisition:
    Protocol: DHCP Client
    Acquired address: None
    Protocol: RARP Client
    Acquired address: None
```

**Meaning** The output shows the settings configured for autoinstallation. Verify that the values displayed are correct for the switch when it is deployed on the network.

## clear log

---

<b>Syntax</b>	<code>clear log <i>filename</i></code> <code>&lt;all&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Remove contents of a log file.
<b>Options</b>	<i>filename</i> —Name of the specific log file to delete.  <code>all</code> —(Optional) Delete the specified log file and all archived versions of it.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show log on page 1249</a></li></ul>
<b>List of Sample Output</b>	<a href="#">clear log on page 646</a>
<b>Output Fields</b>	See <a href="#">file list</a> for an explanation of output fields.

## Sample Output

### clear log

The following sample commands list log file information, clear the contents of a log file, and then display the updated log file information:

```
user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:
-----
-rw-r-----  1 root  wheel          26450 Jun 23 18:47 /var/log/sampled
total 1

user@host> clear log lcc0-re0:sampled
lcc0-re0:
-----

user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:
-----
-rw-r-----  1 root  wheel           57 Sep 15 03:44 /var/log/sampled
total 1
```

## clear system commit

---

<b>Syntax</b>	clear system commit
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Clear any pending commit operation.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	maintenance (or the actual user who scheduled the commit)
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show system commit on page 675</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">clear system commit on page 647</a> <a href="#">clear system commit (None Pending) on page 647</a> <a href="#">clear system commit (User Does Not Have Required Privilege Level) on page 647</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### clear system commit

```
user@host> clear system commit
Pending commit cleared.
```

#### clear system commit (None Pending)

```
user@host> clear system commit
No commit scheduled.
```

#### clear system commit (User Does Not Have Required Privilege Level)

```
user@host> clear system commit
error: Permission denied
```

## file archive

---

<b>Syntax</b>	<code>file archive destination <i>destination</i> source <i>source</i> &lt;compress&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Archive, and optionally compress, one or multiple local system files as a single file, locally or at a remote location.
<b>Options</b>	<p><b>destination <i>destination</i></b>—Destination of the archived file or files. Specify the destination as a URL or filename. The Junos OS adds one of the following suffixes if the destination filename does not already have it:</p> <ul style="list-style-type: none"><li>• For archived files—The suffix <b>.tar</b></li><li>• For archived and compressed files—The suffix <b>.tgz</b></li></ul> <p><b>source <i>source</i></b>—Source of the original file or files. Specify the source as a URL or filename.</p> <p><b>compress</b>—(Optional) Compress the archived file with the GNU zip (gzip) compression utility. The compressed files have the suffix <b>.tgz</b>.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Format for Specifying Filenames and URLs in Junos OS CLI Commands</i></li></ul>
<b>List of Sample Output</b>	<a href="#">file archive (Multiple Files) on page 648</a> <a href="#">file archive (Single File) on page 648</a> <a href="#">file archive (with Compression) on page 649</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file archive (Multiple Files)

The following sample command archives all message files in the local directory `/var/log/messages` as the single file **messages-archive.tar**.

```
user@host> file archive source /var/log/messages* destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.
user@host>
```

### file archive (Single File)

The following sample command archives one message file in the local directory `/var/log/messages` as the single file **messages-archive.tar**.

```
user@host> file archive source /var/log/messages destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.
user@host
```

### file archive (with Compression)

The following sample command archives and compresses all message files in the local directory **/var/log/messages** as the single file **messages-archive.tgz**.

```
user@host> file archive compress source /var/log/messages* destination
/var/log/messages-archive.tgz
/usr/bin/tar: Removing leading / from absolute path names in the archive.
```

## file checksum md5

---

<b>Syntax</b>	<code>file checksum md5 &lt;pathname&gt; filename</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Calculate the Message Digest 5 (MD5) checksum of a file.
<b>Options</b>	<b>pathname</b> —(Optional) Path to a filename. <b>filename</b> —Name of a local file for which to calculate the MD5 checksum.
<b>Required Privilege Level</b>	maintenance

<b>List of Sample Output</b>	<a href="#">file checksum md5 on page 650</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### file checksum md5

```
user@host> file checksum md5 jbundle-5.3R2.4-export-signed.tgz
MD5 (jbundle-5.3R2.4-export-signed.tgz) = 2a3b69e43f9bd4893729cc16f505a0f5
```

## file checksum sha1

<b>Syntax</b>	<code>file checksum sha1 &lt;pathname&gt; filename</code>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 9.5.</p> <p>Command introduced in Junos OS Release 9.5 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Calculate the Secure Hash Algorithm (SHA-1) checksum of a file.
<b>Options</b>	<p><b>pathname</b>—(Optional) Path to a filename.</p> <p><b>filename</b>—Name of a local file for which to calculate the SHA-1 checksum.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring Checksum Hashes for a Commit Script</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li> <li>• <i>Configuring Checksum Hashes for an Event Script</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li> <li>• <i>Configuring Checksum Hashes for an Op Script</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li> <li>• <i>Executing an Op Script from a Remote Site</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li> <li>• <a href="#">file checksum md5 on page 650</a></li> <li>• <a href="#">file checksum sha-256 on page 652</a></li> <li>• <a href="#">op on page 90</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">file checksum sha1 on page 651</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file checksum sha1

```
user@host> file checksum sha1 /var/db/scripts/opscript.slax
```

```
SHA1 (/var/db/scripts/commitscript.slax) = ba9e47120c7ce55cff29afd73eacd370e162c676
```

## file checksum sha-256

---

<b>Syntax</b>	<code>file checksum sha-256 &lt;pathname&gt; filename</code>
<b>Release Information</b>	Command introduced in Junos OS Release 9.5. Command introduced in Junos OS Release 9.5 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Calculate the Secure Hash Algorithm 2 family (SHA-256) checksum of a file.
<b>Options</b>	<b>pathname</b> —(Optional) Path to a filename.  <b>filename</b> —Name of a local file for which to calculate the SHA-256 checksum.
<b>Required Privilege Level</b>	maintenance view view-configuration
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Checksum Hashes for a Commit Script</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• <i>Configuring Checksum Hashes for an Event Script</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• <i>Configuring Checksum Hashes for an Op Script</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• <i>Executing an Op Script from a Remote Site</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• <a href="#">file checksum md5 on page 650</a></li><li>• <a href="#">file checksum sha1 on page 651</a></li><li>• <a href="#">op on page 90</a></li></ul>

```

## file compare

<b>Syntax</b>	<pre>file compare (files <i>filename filename</i>) &lt;context   unified&gt; &lt;ignore-white-space&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	<p>Compare two local files and describe the differences between them in default, context, or unified output styles:</p> <ul style="list-style-type: none"> <li>• <b>Default</b>—In the first line of output, <b>c</b> means lines were changed between the two files, <b>d</b> means lines were deleted between the two files, and <b>a</b> means lines were added between the two files. The numbers preceding this alphabetical marker represent the first file, and the lines after the alphabetical marker represent the second file. A left angle bracket (&lt;) in front of output lines refers to the first file. A right angle bracket (&gt;) in front of output lines refers to the second file.</li> <li>• <b>Context</b>—The display is divided into two parts. The first part is the first file; the second part is the second file. Output lines preceded by an exclamation point (!) have changed. Additions are marked with a plus sign (+), and deletions are marked with a minus sign (-).</li> <li>• <b>Unified</b>—The display is preceded by the line number from the first and the second file (xx,xxx,x). Before the line number, additions to the file are marked with a plus sign (+), and deletions to the file are marked with a minus sign (-). The body of the output contains the affected lines. Changes are viewed as additions plus deletions.</li> </ul>
<b>Options</b>	<p><b>files <i>filename</i></b>—Names of two local files to compare.</p> <p><b>context</b>—(Optional) Display output in context format.</p> <p><b>ignore-white-space</b>—(Optional) Ignore changes in the amount of white space.</p> <p><b>unified</b>—(Optional) Display output in unified format.</p>
<b>Required Privilege Level</b>	none
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Format for Specifying Filenames and URLs in Junos OS CLI Commands</i></li> <li>• <i>Viewing Core Files from Junos OS Processes</i></li> </ul>

## file copy

---

<b>Syntax</b>	<code>file copy <i>source destination</i></code> <code>&lt;source-address <i>address</i>&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. <b>source-address</b> option added in Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for QFX Series switches.
<b>Description</b>	Copy files from one location to another location on the local device or to a location on a remote device reachable by the local device.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Format for Specifying Filenames and URLs in Junos OS CLI Commands</i></li><li>• <i>Default Directories for Junos OS File Storage on the Router or Switch</i></li><li>• <i>Copying a Configuration File from One Routing Engine to the Other</i></li></ul>
<b>List of Sample Output</b>	<a href="#">Copy a File from the Local Device to a Personal Computer on page 656</a> <a href="#">Copy a Configuration File between Routing Engines on page 656</a> <a href="#">Copy a Log File between Routing Engines on page 656</a> <a href="#">Copy a File from a TX Matrix Plus Router to a T1600 Router Connected to the TX Matrix Plus on page 657</a> <a href="#">Copy a File Using File Transfer Protocol on page 657</a> <a href="#">Copy a File Using File Transfer Protocol and Requiring a Password on page 657</a> <a href="#">Copy a File Using Secure Copy Protocol (scp) on page 657</a>

## Sample Output

The following are examples of a variety of file copy scenarios.

### Copy a File from the Local Device to a Personal Computer

```
user@host> file copy /var/tmp/rpd.core.4 mypc:/c/junipero/tmp
...transferring.file..... |           0 KB |    0.3 kB/s | ETA: 00:00:00 | 100%
```

### Copy a Configuration File between Routing Engines

The following sample command copies a configuration file from Routing Engine 0 to Routing Engine 1:

```
user@host> file copy /config/juniper.conf re1:/var/tmp/copied-juniper.conf
```

### Copy a Log File between Routing Engines

The following sample command copies a log file from Routing Engine 0 to Routing Engine 1:

```
user@host> file copy lcc0-re0:/var/log/chassisd lcc0-re1:/var/tmp
```

### Copy a File from a TX Matrix Plus Router to a T1600 Router Connected to the TX Matrix Plus

The following sample command copies a text file from Routing Engine 1 on the switch-fabric chassis sfc0 to Routing Engine 1 on the line-card chassis lcc0:

```
user@host> file copy sfc0-re1:/tmp/sample.txt lcc0-re1:/var/tmp
```

### Copy a File Using File Transfer Protocol

To use anonymous FTP to copy a local file to a remote system, enter the following command:

```
user@host> file copy filename ftp://hostname/filename
```

In the following example, `/config/juniper.conf` is the local file and `hostname` is the FTP server:

```
user@host> file copy /config/juniper.conf ftp://hostname/juniper.conf
Receiving ftp: //hostname/juniper.conf (2198 bytes): 100%
2198 bytes transferred in 0.0 seconds (2.69 MBps)
```

### Copy a File Using File Transfer Protocol and Requiring a Password

To use FTP where you require more privacy and are prompted for a password, enter the following command:

```
root@host> file copy filename ftp://user@hostname/filename
```

In the following example, `/config/juniper.conf` is the local file and `hostname` is the FTP server:

```
root@host> file copy /config/juniper.conf ftp://user@hostname/juniper.conf
Password for user@hostname: *****
Receiving ftp: //user@hostname/juniper.conf (2198 bytes): 100%
2198 bytes transferred in 0.0 seconds (2.69 MBps)
```

### Copy a File Using Secure Copy Protocol (scp)

To use scp to copy a local file to a remote system, enter the following command:

```
root@host> file copy filename scp://user@hostname/path/filename
```

In the following example, `/config/juniper.conf` is the local file, `user` is the username, and `ssh-host` is the scp server:

```
root@host> file copy /config/juniper.conf scp://user@ssh-host/tmp/juniper.conf
user@ssh-host's password: *****
juniper.conf          100%
|*****|
2198          00:00
```

## file delete

---

<b>Syntax</b>	<code>file delete <i>filename</i></code> <code>&lt;purge&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Delete a file on the local router or switch.
<b>Options</b>	<b><i>filename</i></b> —Name of the file to delete. For a routing matrix, include chassis information in the filename if the file to be deleted is not local to the Routing Engine from which the command is issued.  <b><i>purge</i></b> —(Optional) Overwrite regular files before deleting them.
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">file delete on page 658</a> <a href="#">file delete (Routing Matrix) on page 658</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file delete

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file delete /var/tmp/snmpd.core
user@host> file list /var/tmp
dcd.core
rpd.core
```

### file delete (Routing Matrix)

```
user@host> file list lcc0-re0:/var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file delete lcc0-re0:/var/tmp/snmpd.core
user@host> file list /var/tmp
dcd.core
rpd.core
```

## file list

<b>Syntax</b>	file list <detail   recursive> <filename>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display a list of files on the local router or switch.
<b>Options</b>	<p><b>none</b>—Display a list of all files for the current directory.</p> <p><b>detail   recursive</b>—(Optional) Display detailed output or descend recursively through the directory hierarchy, respectively.</p> <p><b>filename</b>—(Optional) Display a list of files. For a routing matrix, the filename must include the chassis information.</p>
<b>Additional Information</b>	The default directory is the home directory of the user logged in to the router or switch. To view available directories, enter a space and then a backslash (/) after the <b>file list</b> command. To view files within a specific directory, include a backslash followed by the directory and, optionally, subdirectory name after the <b>file list</b> command.
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">file list on page 659</a> <a href="#">file list (Routing Matrix) on page 659</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file list

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core
```

### file list (Routing Matrix)

```
user@host> file list lcc0-re0:var/tmp
lcc0-re0:
-----
/var/tmp/:
.gdbinit
.pccardd
Test/
chassisd*
chassisd.nathan*

## file rename

<b>Syntax</b>	<code>file rename <i>source destination</i></code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Rename a file on the local router or switch.
<b>Options</b>	<i>destination</i> —New name for the file.  <i>source</i> —Original name of the file. For a routing matrix, the filename must include the chassis information.
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">file rename on page 661</a> <a href="#">file rename (Routing Matrix) on page 661</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file rename

The following example lists the files in `/var/tmp`, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file rename /var/tmp/dcd.core /var/tmp/dcd.core.990413
user@host> file list /var/tmp
dcd.core.990413
rpd.core
snmpd.core
```

### file rename (Routing Matrix)

The following example lists the files in `/var/tmp`, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list lcc0-re1:/var/tmp
lcc0-re1:
-----

/var/tmp:
.pccardd
sartre.conf
snmpd
syslogd.core-tarball.0.tgz
```

```
user@host> file rename lcc0-re0:/var/tmp/snmpd /var/tmp/snmpd.rr
```

```
user@host> file list lcc0-re1:/var/tmp
```

```
lcc0-re1:
```

```
-----
```

```
/var/tmp:
```

```
.pccardd
```

```
sartre.conf
```

```
snmpd.rr
```

```
syslogd.core-tarball.0.tgz
```

## file show

<b>Syntax</b>	<code>file show filename</code> <encoding (base64   raw)>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the contents of a file.
<b>Options</b>	<b>filename</b> —Name of a file. For a routing matrix, the filename must include the chassis information.  <b>encoding (base64   raw)</b> —(Optional) Encode file contents with base64 encoding or show raw text.
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">file show on page 663</a> <a href="#">file show (Routing Matrix) on page 663</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file show

```
user@host> file show /var/log/messages
Apr 13 21:00:08 romney /kernel: so-1/1/2: loopback suspected; going to standby.
Apr 13 21:00:40 romney /kernel: so-1/1/2: loopback suspected; going to standby.
Apr 13 21:02:48 romney last message repeated 4 times
Apr 13 21:07:04 romney last message repeated 8 times
Apr 13 21:07:13 romney /kernel: so-1/1/0: Clearing SONET alarm(s) RDI-P
Apr 13 21:07:29 romney /kernel: so-1/1/0: Asserting SONET alarm(s) RDI-P
...
```

### file show (Routing Matrix)

```
user@host> file show lcc0-re0:/var/tmp/.gdbinit
lcc0-re0:
-----
#####
# Settings
#####

set print pretty

#####
# Basic stuff
#####

define msgbuf
    printf "%s", msgbufp->msg_ptr
end
```

```
# hex dump of a block of memory
# usage: dump address length
define dump
  p $arg0, $arg1
  set $ch = $arg0
  set $j = 0
  set $n = $arg1
  while ($j < $n)
    #printf "%x %x ",&$ch[$j],$ch[$j]
    printf "%x ",$ch[$j]
    set $j = $j + 1
    if (!($j % 16))
      printf "\n"
    end
  end
end
end
```

## request system configuration rescue delete

<b>Syntax</b>	request system configuration rescue delete
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Delete an existing rescue configuration.
<div>  <b>NOTE:</b> The [edit system configuration] hierarchy is not available on QFabric systems. </div>	
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">request system configuration rescue save on page 666</a></li> <li>• <a href="#">request system software rollback on page 756</a></li> <li>• <a href="#">show system commit on page 675</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">request system configuration rescue delete on page 665</a>
<b>Output Fields</b>	This command produces no output.

### Sample Output

request system configuration rescue delete

```
user@host> request system configuration rescue delete
```

## request system configuration rescue save

---

<b>Syntax</b>	request system configuration rescue save
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Save the most recently committed configuration as the rescue configuration so that you can return to it at any time by using the <b>rollback</b> command.
<div> <b>NOTE:</b> The [edit system configuration] hierarchy is not available on QFabric systems.</div>	
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">request system software delete on page 752</a></li><li>• <a href="#">request system software rollback on page 756</a></li><li>• <a href="#">show system commit on page 675</a></li></ul>

<b>Output Fields</b>	This command produces no output.

### Sample Output

#### request system configuration rescue save

```
user@host> request system configuration rescue save
```

## request system scripts refresh-from commit

<b>Syntax</b>	<code>request system scripts refresh-from commit file <i>file-name</i> url <i>url-path</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 10.1 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Automatically download the initial Junos OS configuration and a set of standard commit scripts during a Junos XML management protocol/NETCONF session when a switch is brought up for the first time.</p> <p>The Junos XML management protocol equivalent for this operational mode command is:</p> <pre>&lt;request-script-refresh-from&gt;   &lt;type&gt;commit&lt;/type&gt;   &lt;file&gt;file-name&lt;/file&gt;   &lt;URL&gt;URL&lt;/URL&gt; &lt;/request-script-refresh-from&gt;</pre>
<b>Options</b>	<p><b>file <i>file-name</i></b>—Name of the file to be downloaded.</p> <p><b>url <i>url-path</i></b>—URL of the file to be downloaded.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding Automatic Refreshing of Scripts on EX Series Switches on page 613</a></li> <li>• <a href="#">Junos OS Junos XML Management Protocol Guide</a></li> <li>• <a href="#">Junos OS NETCONF XML Management Protocol Guide</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">request system scripts refresh-from commit file config.txt url http://host1.juniper.net on page 667</a>

### Sample Output

`request system scripts refresh-from commit file config.txt url http://host1.juniper.net`

```
user@switch> request system scripts refresh-from commit file config.txt url
http://host1.juniper.net
user@switch>
```

## request system scripts refresh-from event

---

<b>Syntax</b>	<code>request system scripts refresh-from event file <i>file-name</i> url <i>url-path</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 10.1 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Automatically download the initial Junos OS configuration and a set of standard event scripts during a Junos XML management protocol/NETCONF session when a switch is brought up for the first time.</p> <p>The Junos XML management protocol equivalent for this operational mode command is:</p> <pre>&lt;request-script-refresh-from&gt;   &lt;type&gt;event&lt;/type&gt;   &lt;file&gt;file-name&lt;/file&gt;   &lt;URL&gt;URL&lt;/URL&gt; &lt;/request-script-refresh-from&gt;</pre>
<b>Options</b>	<p><code>file <i>file-name</i></code>—Name of the file to be downloaded.</p> <p><code>url <i>url-path</i></code>—URL of the file to be downloaded.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Understanding Automatic Refreshing of Scripts on EX Series Switches on page 613</a></li><li>• <a href="#">Junos OS Junos XML Management Protocol Guide</a></li><li>• <a href="#">Junos OS NETCONF XML Management Protocol Guide</a></li></ul>
<b>List of Sample Output</b>	<a href="#">request system scripts refresh-from event file config.txt url http://host1.juniper.net on page 668</a>

### Sample Output

`request system scripts refresh-from event file config.txt url http://host1.juniper.net`

```
user@switch> request system scripts refresh-from event file config.txt url http://host1.juniper.net
user@switch>
```

## request system scripts refresh-from op

<b>Syntax</b>	<code>request system scripts refresh-from op file <i>file-name</i> url <i>url-path</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 10.1 for EX Series switches.
<b>Description</b>	<p>Automatically download the initial Junos OS configuration and a set of standard op scripts during a Junos XML management protocol/NETCONF session when a switch is brought up for the first time.</p> <p>The Junos XML management protocol equivalent for this operational mode command is:</p> <pre>&lt;request-script-refresh-from&gt;   &lt;type&gt;op&lt;/type&gt;   &lt;file&gt;file-name&lt;/file&gt;   &lt;URL&gt;URL&lt;/URL&gt; &lt;/request-script-refresh-from&gt;</pre>
<b>Options</b>	<p><b>file <i>file-name</i></b>—Name of the file to be downloaded.</p> <p><b>url <i>url-path</i></b>—URL of the file to be downloaded.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding Automatic Refreshing of Scripts on EX Series Switches on page 613</a></li> <li>• <a href="#">Junos OS Junos XML Management Protocol Guide</a></li> <li>• <a href="#">Junos OS NETCONF XML Management Protocol Guide</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">request system scripts refresh-from op file config.txt url http://host1.juniper.net on page 669</a>

### Sample Output

`request system scripts refresh-from op file config.txt url http://host1.juniper.net`

```
user@switch> request system scripts refresh-from op file config.txt url http://host1.juniper.net
user@switch>
```

## request system zeroize

---

Syntax	request system zeroize <media> <local>
Release Information	Command introduced before Junos OS Release 9.0. Command introduced in Junos OS Release 11.2 for EX Series switches. Option <b>media</b> added in Junos OS Release 11.4 for EX Series switches. Command introduced in Junos OS Release 12.2 for MX Series routers. Command introduced in Junos OS Release 12.3 for the QFX Series. Option <b>local</b> added in Junos OS Release 14.1.
Description	<div> <b>NOTE:</b> The <b>media</b> option is not available on the QFX Series.</div> <p>Remove all configuration information on the Routing Engines and reset all key values. If the device has dual Routing Engines, the command is broadcast to all Routing Engines on the device. The command removes all data files, including customized configuration and log files, by unlinking the files from their directories. The command removes all user-created files from the system including all plain-text passwords, secrets, and private keys for SSH, local encryption, local authentication, IPsec, RADIUS, TACACS+, and SNMP.</p> <p>This command reboots the device and sets it to the factory default configuration. After the reboot, you cannot access the device through the management Ethernet interface. Log in through the console as <b>root</b> and start the Junos OS CLI by typing <b>cli</b> at the prompt.</p> <p>To completely erase user-created data so that it is unrecoverable, use the <b>media</b> option.</p>
Options	<p><b>media</b>—(Optional) In addition to removing all configuration and log files, causes memory and the media to be scrubbed, removing all traces of any user-created files. Every storage device attached to the system is scrubbed, including disks, flash drives, removable USBs, and so on. The duration of the scrubbing process is dependent on the size of the media being erased. As a result, the <b>request system zeroize media</b> operation can take considerably more time than the <b>request system zeroize</b> operation. However, the critical security parameters are all removed at the beginning of the process.</p> <p><b>local</b>—(Optional) Remove all the configuration information and restore all the key values on the active Routing Engine.</p>
Required Privilege Level	maintenance

rescue 2002-05-10 15:32:03 PDT by root via other
```

### show system commit (At a Particular Time)

```
user@host> show system commit
commit requested by root via cli at Tue May  7 15:59:00 2002
```

### show system commit (At the Next Reboot)

```
user@host> show system commit
commit requested by root via cli at reboot
```

### show system commit (Rollback Pending)

```
user@host> show system commit
0 2005-01-05 15:00:37 PST by root via cli commit confirmed, rollback in 3mins
```

### show system commit (QFX Series)

```
user@switch> show system commit
0 2011-11-25 19:17:49 PST by root via cli
```

## show system configuration archival

---

**Syntax**    show system configuration archival

**Release Information**    Introduced in Junos OS Release 7.6.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Display directory and number of files queued for archival transfer.

**NOTE:** The [edit system configuration] hierarchy is not available on QFabric systems.

---

**Options**    This command has no options.

**Required Privilege Level**    maintenance

**List of Sample Output**    [show system configuration archival on page 678](#)

### Sample Output

show system configuration archival

```
user@host> show system configuration archival

/var/transfer/config/:
total 8
```

## show system configuration rescue

<b>Syntax</b>	show system configuration rescue
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display a rescue configuration, if one exists.

**NOTE:** The [edit system configuration] hierarchy is not available on QFabric systems.

<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show system configuration archival on page 678</a></li> </ul>

+        }
+      }
+    }
+  }
+}
```

## test configuration

<b>Syntax</b>	<code>test configuration <i>filename</i></code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Verify that the syntax of a configuration file is correct. If the configuration contains any syntax or commit check errors, a message is displayed to indicate the line number and column number in which the error was found. This command only accepts text files.
<b>Options</b>	<i>filename</i> —Name of the configuration file.  <b>syntax-only</b> —Check the syntax of a partial configuration file, without checking for commit errors. This option introduced in Junos OS Release 12.1.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">test configuration on page 683</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### test configuration

```

user@host> test configuration terminal
[Type ^D to end input]
system {
host-name bluesky;
paris-23;
login;
}
terminal:3:(8) syntax error: paris
[edit system]
    'paris-23;'
    syntax error
terminal:4:(11) statement must contain additional statements: ;
[edit system login]
    'login ;'
    statement must contain additional statements
configuration syntax failed

```

# Troubleshooting Procedures

- Troubleshooting Loss of the Root Password on page 685

## Troubleshooting Loss of the Root Password

---

**Problem**    **Description:** If you forget the root password for a switch, use the password recovery procedure to reset the root password.

**NOTE:** You need physical access to the switch to recover the root password.

**TIP:** For a video on recovering the root password for routers, see *Recovering the Root Password*. The procedure is similar for switches.

**Solution**    To recover the root password:

1. Power off your switch by unplugging the power cord or turning off the power at the wall switch.
2. Insert one end of the Ethernet cable into the serial port on the management device and connect the other end to the console port on the back of the switch. See [Figure 1 on page 306](#).

Figure 4: Connecting to the Console Port on the EX Series Switch

3. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate COM port to use (for example, COM1).
4. Configure the port settings as follows:
  - Bits per second: 9600
  - Data bits: 8
  - Parity: None
  - Stop bits: 1
  - Flow control: None
5. Power on your switch by plugging in the power cord or turning on the power at the wall switch.
6. When the following prompt appears, press the Spacebar to access the switch's bootstrap loader command prompt:
 

Hit [Enter] to boot immediately, or space bar for command prompt.  
Booting [kernel] in 1 second...

**NOTE:** If the switch is in unattended mode for U-Boot, access to the bootstrap loader command prompt is blocked. If the root password is lost, you must reset the switch to the factory default configuration using the LCD panel. For more information, see [“Reverting to the Default Factory Configuration for the EX Series Switch”](#) on page 620.

7. At the following prompt, type **boot -s** to start up the system in single-user mode:  
**loader> boot -s**
8. At the following prompt, type **recovery** to start the root password recovery procedure:  
**Enter full path name of shell or 'recovery' for root password recovery or RETURN for /bin/sh: recovery**

A series of messages describe consistency checks, mounting of filesystems, and initialization and checkout of management services. Then the CLI prompt appears.

9. Enter configuration mode in the CLI:

```
user@switch> configure
```

10. Set the root password. For example:

```
user@switch# set system root-authentication plain-text-password
```

11. At the following prompt, enter the new root password. For example, juniper1:

```
user@switch# juniper1
```

```
Retype new password:
```

12. At the second prompt, reenter the new root password.

13. If you are finished configuring the network, commit the configuration.

```
root@switch# commit
```

```
commit complete
```

14. Exit configuration mode in the CLI.

```
root@switch# exit
```

15. Exit operational mode in the CLI.

```
root@switch> exit
```

16. At the prompt, enter **y** to reboot the switch.

```
Reboot the system? [y/n] y
```

## Understanding Software Installation on EX Series Switches

A Juniper Networks EX Series Ethernet Switch is delivered with the Juniper Networks Junos operating system (Junos OS) preinstalled. As new features and software fixes become available, you must upgrade your software to use them. You can also downgrade Junos OS to a previous release.

This topic covers:

- [Overview of the Software Installation Process on page 691](#)
- [Software Package Security on page 692](#)
- [Installing Software on a Virtual Chassis on page 692](#)
- [Installing Software on Switches with Redundant Routing Engines on page 692](#)

### Overview of the Software Installation Process

---

An EX Series switch is delivered with a domestic version of Junos OS preinstalled. When you connect power to the switch, it starts (boots) from the installed software.

You upgrade Junos OS on an EX Series switch by copying a software package to your switch or another system on your local network, then use either the J-Web interface or the command-line interface (CLI) to install the new software package on the switch. Finally, you reboot the switch; it boots from the upgraded software. After a successful upgrade, you should back up the new current configuration to a secondary device. You should follow this procedure regardless of whether you are installing a domestic or controlled Junos OS package.

During a successful upgrade, the upgrade package removes all files from `/var/tmp` and completely reinstalls the existing software. It retains configuration files, and similar information, such as secure shell and host keys, from the previous version. The previous software package is preserved in a separate disk partition, and you can manually revert back to it if necessary. If the software installation fails for any reason, such as loss of power during the installation process, the system returns to the originally active installation when you reboot.

---

### Software Package Security

All Junos OS releases are delivered in signed packages that contain digital signatures to ensure official Juniper Networks software. For more information about signed software packages, see the *Junos OS Installation and Upgrade Guide*.

---

### Installing Software on a Virtual Chassis

You can connect individual EX Series switches together to form one unit and manage the unit as a single device, called a Virtual Chassis. The Virtual Chassis operates as a single network entity composed of member switches. Each member switch in a Virtual Chassis must be running the same version of Junos OS. See *EX Series Virtual Chassis Software Features Overview* for a list of switches that can be used in a Virtual Chassis.

For ease of management, a Virtual Chassis provides flexible methods to upgrade software releases. You can deploy a new software release to all member switches of a Virtual Chassis or to only a particular member switch.

You can also upgrade the software on an EX4200, EX4500, mixed EX4200 and EX4500, and EX8200 Virtual Chassis using nonstop software upgrade (NSSU). NSSU takes advantage of graceful Routing Engine switchover (GRES) and nonstop active routing (NSR) to ensure no disruption to the control plane during the upgrade. You can minimize disruption to network traffic by defining link aggregation groups (LAGs) such that the member links of each LAG reside on different line cards (on EX8200 Virtual Chassis) or on different members (on EX4200, EX4500, mixed EX4200 and EX4500 Virtual Chassis). During an NSSU, the line cards and Virtual Chassis members are upgraded one at a time, so that traffic continues to flow through the other line cards or members while that line card or member is being upgraded.

---

### Installing Software on Switches with Redundant Routing Engines

You can install software on a switch with redundant Routing Engines in one of two ways:

- Perform an NSSU—An NSSU upgrades both Routing Engines with a single command and with a minimum of network disruption. An NSSU takes advantage of GRES and NSR to ensure no disruption to the control plane. You can minimize disruption to

network traffic by defining LAGs such that the member links of each LAG reside on different line cards. The line cards are upgraded one at a time, so that traffic continues to flow through the other line cards while a line card is being upgraded.

You cannot use NSSU to downgrade the software running on a switch.

For more information about NSSU, see [“Understanding Nonstop Software Upgrade on EX Series Switches” on page 2488](#). See *EX Series Switch Software Features Overview* for a list of switches that support NSSU.

- Upgrade each Routing Engine manually—You can perform a Junos OS installation on each Routing Engine separately, starting with the backup Routing Engine. You can use this procedure to downgrade the software running on a switch. See *Installing Software on an EX Series Switch with Redundant Routing Engines (CLI Procedure)*.

### Installing Software Using Automatic Software Download

The automatic software download feature uses the DHCP message exchange process to download and install software packages. Users can define a path to a software package on the DHCP server and then the DHCP server communicates this path to EX Series switches acting as DHCP clients as part of the DHCP message exchange process. The DHCP clients that have been configured for automatic software download receive these messages and, when the software package name in the DHCP server message is different from that of the software package that booted the DHCP client switch, download and install the software package. See *Upgrading Software by Using Automatic Software Download*.

### Autoinstalling a Configuration File on an EX2200 or EX3300 Switch from a Disk-on-Key USB Memory Stick

You can use an autoinstallation process to configure the software on an EX2200 or EX3300 switch. You can use a configuration file that is in either text format or XML format. If you want to use an XML-formatted file, you use a Junos Space platform to create the configuration file. You place the configuration file on a Disk-on-Key USB memory stick. See *Autoinstalling a Configuration File from a Disk-on-Key USB Memory Stick onto an EX2200 or EX3300 Switch*.

### Troubleshooting Software Installation

If Junos OS loads but the CLI is not working for any reason, or if the switch has no software installed, you can use the recovery installation procedure to install the software on the switch. See [“Troubleshooting Software Installation” on page 785](#).

**NOTE:** You can also use this procedure to load two versions of Junos OS in separate partitions on the switch.

## Understanding System Snapshot on EX Series Switches

You can create copies of the software running a Juniper Networks EX Series Ethernet Switch using the system snapshot feature. The system snapshot feature takes a “snapshot” of the files currently used to run the switch and copies them to an alternate storage location. You can then use this snapshot to boot the switch at the next bootup or as a backup boot option.

The switch can boot from either internal flash media or external (USB) flash media. The contents of the snapshot vary depending on whether you create the snapshot on the media that the switch booted from or on the media that it did not boot from:

Snapshots are particularly useful for moving files onto USB flash drives. You cannot use the **copy** command or any other file-moving technique to move files from an internal memory source to USB memory on the switch.

- If you create the snapshot on the media that the switch did not boot from, the following partitions on the boot media are included in the snapshot: **root**, **altroot**, **var**, **var/tmp**, **config**.

The **root** partition is the primary boot partition, and the **altroot** partition is the backup boot partition.

- If you create the snapshot on the media that the switch booted from, the root partition that the switch booted from is copied to the alternate root partition. The **var**, **var/tmp**, and **config** partitions are not copied as part of the snapshot because they already exist on the boot media.

The system snapshot feature has the following limitations:

- You cannot use snapshots to move files to any destination outside the switch other than an installed external USB flash drive or switches that are members of the same Virtual Chassis as the switch on which you created the snapshot..
- Snapshot commands, like all commands executed on a Virtual Chassis, are executed on the local member switch. If different member switches request the snapshot, the snapshot command is pushed to the Virtual Chassis member creating the snapshot and is executed on that member, and the output is then returned to the switch that initiated the process. For instance, if the command to create an external snapshot on member 3 is entered on member 1, the snapshot of internal memory on member 3 is taken on external memory on member 3. The output of the process is seen on member 1. No files move between the switches.

Understanding Resilient Dual-Root Partitions on Switches

Resilient dual-root partitioning, introduced on Juniper Networks EX Series Ethernet Switches in Juniper Networks Junos operating system (Junos OS) Release 10.4R3, provides additional resiliency to switches in the following ways:

- Allows the switch to boot transparently from the second (alternate) root partition if the system fails to boot from the primary root partition.
- Provides separation of the root Junos OS file system from the `/var` file system. If corruption occurs in the `/var` file system (a higher probability than in the root file system because of the greater frequency of reads and writes in `/var`), the root file system is insulated from the corruption.

**NOTE:** For instructions on upgrading to a release that supports resilient dual-root partitions from a release that does not, see the release notes. The procedure for upgrading to a resilient dual-root partition release is different from the normal upgrade procedure.

This topic covers:

- [Resilient Dual-Root Partition Scheme \(Junos OS Release 10.4R3 and Later\) on page 695](#)
- [Automatic Fixing of Corrupted Primary Root Partition with the Automatic Snapshot Feature on page 696](#)
- [Earlier Partition Scheme \(Junos OS Release 10.4R2 and Earlier\) on page 697](#)
- [Understanding Upgrading or Downgrading Between Resilient Dual-Root Partition Releases and Earlier Releases on page 697](#)

Resilient Dual-Root Partition Scheme (Junos OS Release 10.4R3 and Later)

EX Series switches that ship with Junos OS Release 10.4R3 or later are configured with a root partition scheme that is optimized for resiliency, as shown in [Table 62 on page 695](#).

Table 62: Resilient Dual-Root Partition Scheme

Slice 1	Slice 2	Slice 3		Slice 4
s1a	s2a	s3e	s3d	s4d
/	/	/var	/var/tmp	/config
(root Junos OS )	(root Junos OS )			

In the resilient dual-root partition scheme, the `/var` file system is contained in a separate slice (Slice 3) from the root file systems; the `/config` directory is contained in its own slice (Slice 4); and switches ship from the factory with identical Junos OS images in Slice 1 and Slice 2. The `/var` file system, which has a greater frequency of reads and writes than the root file systems and is therefore more likely to have corruption issues, is isolated from the root directories and the `/config` directory. If the switch fails to boot from the

active partition, the switch automatically boots from the alternate root partition and triggers an alarm.

### Automatic Fixing of Corrupted Primary Root Partition with the Automatic Snapshot Feature

---

Resilient dual-root partitioning also provides the *automatic snapshot* feature, which allows the switch to automatically fix a corrupt Junos OS file in the primary root partition. If the automatic snapshot feature is enabled, the switch automatically takes a snapshot of the Junos OS root file system in the alternate root partition and copies it onto the primary root partition, thereby repairing the corrupt file in the primary root partition. The automatic snapshot procedure takes place whenever the system reboots from the alternate root partition, regardless of whether the reboot is due to a command or due to corruption of the primary root partition.

---

#### NOTE:

- EX9200 switches do not support the automatic snapshot feature.
  - The automatic snapshot feature is enabled by default on the following EX Series switches:
    - EX4550 switches
    - EX Series switches that ship with Junos OS Release 12.3R1 or later
  - The automatic snapshot feature is disabled by default on EX Series switches (except the EX4550 switches) running Junos OS Release 12.2 or earlier.
  - If the automatic snapshot feature was disabled by default before the switch was upgraded to Junos OS Release 12.3R1 or later, the feature remains disabled (for backward compatibility) by default after the upgrade.
  - If the automatic snapshot feature is enabled in a Virtual Chassis configuration, the automatic snapshot procedure takes place whenever any member of the Virtual Chassis reboots from its alternate root partition.
  - You can enable the automatic snapshot feature by configuring the **auto-snapshot** statement at the **[edit system]** hierarchy level.
- 

The automatic snapshot feature provides an additional layer of fault protection if you maintain the same version of Junos OS in both partitions of resilient dual-root partitions. When **auto-snapshot** is enabled, repair happens automatically. Therefore, the switch does not issue an alarm to indicate that the system has rebooted from the alternate partition. However, it does log the event. You cannot execute a manual snapshot when an automatic snapshot procedure is in process. The login banner indicates that an automatic snapshot operation is in progress and that banner is removed only after the snapshot operation is complete. The next reboot happens from the primary partition.

**NOTE:** EX Series switches that ship with Junos OS Release 10.4R3 or later are configured with identical Junos OS images in the primary root partition (Slice 1) and the alternate root partition (Slice 2).

However, if you do *not* maintain the same version of Junos OS in both partitions, you might want to disable the automatic snapshot feature. If you have an earlier version of Junos OS in the alternate partition and the system reboots from the alternate root partition, the automatic snapshot feature causes the later Junos OS version to be replaced with the earlier version.

When automatic snapshot is disabled and the system reboots from the alternate root partition, it triggers an alarm indicating that the system has rebooted from its alternate partition.

### Earlier Partition Scheme (Junos OS Release 10.4R2 and Earlier)

The partition scheme used in Junos OS 10.4R2 and earlier is shown in [Table 63 on page 697](#).

**Table 63: Earlier Partition Scheme**

Slice 1		Slice 2		Slice 3	
s1a	s1f	s2a	s2f	s3d	s3e
/	/var	(empty until initial software upgrade)	(empty until initial software upgrade)	/var/tmp	/config
(root Junos OS)					

This is the partitioning scheme for a switch shipped with Release 10.4R2 or earlier (or after you reformat the disk during a downgrade from Release 10.4R3 or later to Release 10.4R2 or earlier). In this partitioning scheme, the switch comes from the factory with only one Junos OS image installed in the root Junos OS partition of Slice 1. The first time that you perform a software upgrade, the new Junos OS image is installed in Slice 2. If the switch fails to boot, you must manually trigger it to boot from the alternate partition (rebooting from the alternate partition does not occur automatically).

### Understanding Upgrading or Downgrading Between Resilient Dual-Root Partition Releases and Earlier Releases

Upgrading from Release 10.4R2 or earlier to Release 10.4R3 or later differs from other upgrades in two important ways:

- You must install a new loader software package in addition to installing the new Junos OS image.
- Rebooting after the upgrade reformats the disk from three partitions to four partitions. See [Table 62 on page 695](#).

You can perform all operations for this special software upgrade from the CLI.

**CAUTION:** Back up any important log files because the `/var/log` files are not saved or restored during an upgrade from Release 10.4R2 or earlier to a release that supports resilient dual-root partitions (Release 10.4R3 or later).

We recommend that you also save your `/config` files and any important log files to an external medium because if there is a power interruption during the upgrade process, they might be lost.

## Junos OS Package Names

You upgrade the Juniper Networks Junos operating system (Junos OS) on a Juniper Networks EX Series Ethernet Switch by copying a software package to your switch or another system on your local network, then install the new software package on the switch.

Two versions of a Junos OS image—a controlled version that supports Media Access Control Security (MACsec) and a domestic version that does not support MACsec—are available for EX Series switches. A domestic version of Junos OS is available for all EX Series switches; a controlled version of Junos OS is only available for EX Series switches on Junos OS releases that support MACsec. The domestic version of Junos OS on EX Series switches can be used on any switch in any geography. The controlled version of Junos OS contains encryption and is not available to customers in all geographies.

**NOTE:** The controlled version of Junos OS contains encryption and is, therefore, not available to customers in all geographies. The export and re-export of the controlled version of Junos OS is strictly controlled under United States export laws. The export, import, and use of the controlled version of Junos OS is also subject to controls imposed under the laws of other countries.

If you have questions about acquiring the controlled version of Junos OS in your country, contact the Juniper Networks Trade Compliance group at [compliance\\_helpdesk@juniper.net](mailto:compliance_helpdesk@juniper.net).

**NOTE:** The domestic version of Junos OS on EX Series switches is intended for use on any switch in any worldwide location.

For most Junos packages on other Juniper Networks products, the domestic package is used for products installed in the United States and Canada only while an export package is used for products installed in any worldwide location.

**domestic-signed** indicates the domestic software package.

A domestic software package name is in the following format:

***package-name-m.nZx.y-domestic-signed.tgz***

A controlled software package name is in the following format:

***package-name-m.nZx.y-controlled-signed.tgz***

where:

- ***package-name*** is the name of the package—for example, ***jinstall-ex-4200***.
- ***m.n*** is the software release, with ***m*** representing the major release number and ***n*** representing the minor release number—for example, ***9.5***.
- ***Z*** indicates the type of software release, where ***R*** indicates released software and ***B*** indicates beta-level software.
- ***x.y*** represents the version of the major software release (***x***) and an internal tracking number (***y***)—for example, ***1.6***.
- ***domestic-signed*** indicates the domestic software package.
- ***controlled-signed*** indicates the controlled software package.

A sample EX Series software domestic package name is:

***jinstall-ex-4200-9.5R1.6-domestic-signed.tgz***

A sample EX Series controlled package name is:

***jinstall-ex-4200-13.2X50-D15.3-controlled-signed.tgz***

## Software Overview

---

- [Understanding Software Infrastructure and Processes on page 700](#)

### Understanding Software Infrastructure and Processes

Each switch runs the Juniper Networks Junos operating system (Junos OS) for Juniper Networks EX Series Ethernet Switches on its general-purpose processors. Junos OS includes processes for Internet Protocol (IP) routing and for managing interfaces, networks, and the chassis.

The Junos OS runs on the Routing Engine. The Routing Engine kernel coordinates communication among the Junos OS processes and provides a link to the Packet Forwarding Engine.

With the J-Web interface and the command-line interface (CLI) to the Junos OS, you configure switching features and routing protocols and set the properties of network interfaces on your switch. After activating a software configuration, use either the J-Web or CLI user interface to monitor the switch, manage operations, and diagnose protocol and network connectivity problems.

- [Routing Engine and Packet Forwarding Engine on page 700](#)
- [Junos OS Processes on page 700](#)

### Routing Engine and Packet Forwarding Engine

---

A switch has two primary software processing components:

- Packet Forwarding Engine—Processes packets; applies filters, routing policies, and other features; and forwards packets to the next hop along the route to their final destination.
- Routing Engine—Provides three main functions:
  - Creates the packet forwarding switch fabric for the switch, providing route lookup, filtering, and switching on incoming data packets, then directing outbound packets to the appropriate interface for transmission to the network
  - Maintains the routing tables used by the switch and controls the routing protocols that run on the switch.
  - Provides control and monitoring functions for the switch, including controlling power and monitoring system status.

### Junos OS Processes

---

The Junos OS running on the Routing Engine and Packet Forwarding Engine consists of multiple processes that are responsible for individual functions.

The separation of functions provides operational stability, because each process accesses its own protected memory space. In addition, because each process is a separate software package, you can selectively upgrade all or part of the Junos OS, for added flexibility.

Table 6 on page 30 describes the primary Junos OS processes.

**Table 64: Junos OS Processes**

Process	Name	Description
Chassis process	chassisd	<p>Detects hardware on the system that is used to configure network interfaces.</p> <p>Monitors the physical status of hardware components and field-replaceable units (FRUs), detecting when environment sensors such as temperature sensors are triggered.</p> <p>Relays signals and interrupts—for example, when devices are taken offline, so that the system can close sessions and shut down gracefully.</p>
Ethernet switching process	eswd	<p>Handles Layer 2 switching functionality such as MAC address learning, Spanning Tree protocol and access port security. The process is also responsible for managing Ethernet switching interfaces, VLANs, and VLAN interfaces.</p> <p>Manages Ethernet switching interfaces, VLANs, and VLAN interfaces.</p>
Forwarding process	pfem	<p>Defines how routing protocols operate on the switch. The overall performance of the switch is largely determined by the effectiveness of the forwarding process.</p>
Interface process	dcd	<p>Configures and monitors network interfaces by defining physical characteristics such as link encapsulation, hold times, and keepalive timers.</p>
Management process	mgd	<p>Provides communication between the other processes and an interface to the configuration database.</p> <p>Populates the configuration database with configuration information and retrieves the information when queried by other processes to ensure that the system operates as configured.</p> <p>Interacts with the other processes when commands are issued through one of the user interfaces on the switch.</p> <p>If a process terminates or fails to start when called, the management process attempts to restart it a limited number of times to prevent thrashing and logs any failure information for further investigation.</p>
Routing protocol process	rpd	<p>Defines how routing protocols such as RIP, OSPF, and BGP operate on the device, including selecting routes and maintaining forwarding tables.</p>

## Licenses Overview

- [Understanding Software Licenses for EX Series Switches on page 702](#)

## Understanding Software Licenses for EX Series Switches

To enable and use some of the Juniper Networks operating system (Junos OS) features, you must purchase, install, and manage separate software licenses. If the switch has the appropriate software license, you can configure and use these features.

The Junos OS feature license (that is, the purchased authorization code) is universal. However, to conform to Junos OS feature licensing requirements, you must install a unique license key (a combination of the authorization code and the switch's serial number) on each switch.

For a Virtual Chassis deployment, two license keys are recommended for redundancy—one for the device in the master role and the other for the device in the backup role:

- In an EX8200 Virtual Chassis, the devices in the master and backup roles are always XRE200 External Routing Engines.
- In all other Virtual Chassis, the devices in the master and backup roles are switches.

You do not need additional license keys for Virtual Chassis member switches that are in the linecard role or for the redundant Routing Engine (RE) modules or the redundant Switch Fabric and Routing Engine (SRE) modules in an EX8200 member switch.

This topic describes:

- [Purchasing a Software Feature License on page 702](#)
- [Features Requiring a License on EX2200 Switches on page 703](#)
- [Features Requiring a License on EX3300 Switches on page 704](#)
- [Features Requiring a License on EX4300 Switches on page 705](#)
- [Features Requiring a License on EX4600 Switches on page 706](#)
- [Features Requiring a License on EX3200, EX4200, EX4500, EX4550, EX6200, EX8200, and EX9200 Switches on page 707](#)
- [License Warning Messages on page 708](#)

---

### Purchasing a Software Feature License

The following sections list features that require separate licenses. To purchase a software license, contact your Juniper Networks sales representative (<http://www.juniper.net/us/en/contact-us/sales-offices>). You will be asked to supply the chassis serial number of your switch; you can obtain the serial number by running the **show chassis hardware** command.

**NOTE:** You are required to provide the 12-digit serial number when purchasing a license for an XRE200 External Routing Engine in an EX8200 Virtual Chassis.

The serial number listed on the XRE200 External Routing Engine serial ID label is 16 digits long. Use the last 12 digits of the 16-digit serial number to purchase the license.

You can use the `show chassis hardware` command output to display the 12-digit serial number of the XRE200 External Routing Engine.

### Features Requiring a License on EX2200 Switches

For EX2200 switches, the following features can be added to basic Junos OS by installing an enhanced feature license (EFL):

- Bidirectional Forwarding Detection (BFD)
- Connectivity fault management (IEEE 802.1ag)
- IGMP (Internet Group Management Protocol) version 1 (IGMPv1), IGMPv2, and IGMPv3
- OSPFv1/v2 (with four active interfaces)
- Protocol Independent Multicast (PIM) dense mode, PIM source-specific mode, PIM sparse mode
- Q-in-Q tunneling (IEEE 802.1ad)
- Real-time performance monitoring (RPM)
- Virtual Router
- Virtual Router Redundancy Protocol (VRRP)

Table 65 on page 703 lists the EFLs that you can purchase for EX2200 switch models. If you have the license, you can run all of the enhanced software features mentioned above on your EX2200 switch.

**Table 65: Junos OS EFL Part Number on EX2200 Switches**

Switch Model	EFL Part Number
EX2200-C-12P-2G EX2200-C-12T-2G	EX-12-EFL
EX2200-24T-4G EX2200-24P-4G EX2200-24T-DC-4G	EX-24-EFL
EX2200-48T-4G EX2200-48P-4G	EX-48-EFL

### Features Requiring a License on EX3300 Switches

Two types of licenses are available on EX3300 switches: enhanced feature licenses (EFLs) and advanced feature licenses (AFLs).

To use the following features on the EX3300 switches, you must install an EFL:

- Bidirectional Forwarding Detection (BFD)
- IGMP (Internet Group Management Protocol) version 1 (IGMPv1), IGMPv2, and IGMPv3
- IPv6 routing protocols: Multicast Listener Discovery version 1 and 2 (MLD v1/v2), OSPFv3, PIM multicast, VRRPv6, virtual router support for unicast and filter-based forwarding (FBF)
- OSPFv1/v2
- Protocol Independent Multicast (PIM) dense mode, PIM source-specific mode, PIM sparse mode
- Q-in-Q tunneling (IEEE 802.1ad)
- Virtual Router
- Virtual Router Redundancy Protocol (VRRP)

[Table 66 on page 704](#) lists the EFLs that you can purchase for EX3300 switch models. If you have the license, you can run all of the enhanced software features mentioned above on your EX3300 switch.

**Table 66: Junos OS EFL Part Number on EX3300 Switches**

Switch Model	EFL Part Number
EX3300-24T EX3300-24P EX3300-24T-DC	EX-24-EFL
EX3300-48T EX3300-48T-BF EX3300-48P	EX-48-EFL

To use the following feature on EX3300 switches, you must install an AFL:

- Border Gateway Protocol (BGP) and multiprotocol BGP (MBGP)
- IPv6 routing protocols: IPv6 BGP and IPv6 for MBGP
- Virtual routing and forwarding (VRF) BGP

[Table 67 on page 705](#) lists the AFLs that you can purchase for EX3300 switch models. For EX3300 switches, you must purchase and install a corresponding EFL along with the AFL to enable the advanced license features. If you have both these licenses, you can run all of the advanced software features mentioned above on your EX3300 switch.

**Table 67: Junos OS AFL Part Number on EX3300 Switches**

Switch Model	AFL Part Number
EX3300-24T EX3300-24P EX3300-24T-DC	EX-24-AFL
EX3300-48T EX3300-48T-BF EX3300-48P	EX-48-AFL

### Features Requiring a License on EX4300 Switches

Two types of licenses are available on EX4300 switches: enhanced feature licenses (EFLs) and advanced feature licenses (AFLs).

To use the following features on the EX4300 switches, you must install an EFL:

- Bidirectional Forwarding Detection (BFD)
- Connectivity fault management (IEEE 802.1ag)
- IGMP (Internet Group Management Protocol) version 1 (IGMPv1), IGMPv2, and IGMPv3
- Multicast Source Discovery Protocol (MSDP)
- OSPFv2/v3
- Protocol Independent Multicast (PIM) dense mode, PIM source-specific mode, PIM sparse mode
- Real-time performance monitoring (RPM)
- RIPng (RIP next generation)
- Unicast reverse-path forwarding (RPF)
- Virtual Router
- Virtual Router Redundancy Protocol (VRRP)

[Table 68 on page 705](#) lists the EFLs that you can purchase for EX4300 switch models. If you have the license, you can run all of the enhanced software features mentioned above on your EX4300 switch.

**Table 68: Junos OS EFL Part Number on EX4300 Switches**

Switch Model	EFL Part Number
EX4300-24T EX4300-24P	EX4300-24-EFL
EX4300-48P EX4300-48T EX4300-48T-AFI EX4300-48T-DC EX4300-48T-DC-AFI	EX4300-48-EFL

**Table 68: Junos OS EFL Part Number on EX4300 Switches (*continued*)**

Switch Model	EFL Part Number
EX4300-32F EX4300-32F-DC	EX4300-32F-EFL

To use the following features on EX4300 switches, you must install an AFL:

- Border Gateway Protocol (BGP) and multiprotocol BGP (MBGP)
- Intermediate System-to-Intermediate System (IS-IS)

Table 69 on page 706 lists the AFLs that you can purchase for EX4300 switch models. For EX4300 switches, you must purchase and install a corresponding EFL along with the AFL to enable the advanced license features. If you have both these licenses, you can run all of the advanced software features mentioned above on your EX4300 switch.

**Table 69: Junos OS AFL Part Number on EX4300 Switches**

Switch Model	AFL Part Number
EX4300-24T EX4300-24P	EX4300-24-AFL
EX4300-48P EX4300-48T EX4300-48T-AFI EX4300-48T-DC EX4300-48T-DC-AFI	EX4300-48-AFL
EX4300-32F EX4300-32F-DC	EX4300-32F-AFL

You must download a MACsec feature license to enable MACsec. The MACsec feature license is an independent feature license; the enhanced feature licenses (EFLs) or advanced feature licenses (AFLs) that must be purchased to enable some features on EX Series switches cannot be purchased to enable MACsec.

To purchase a feature license for MACsec, contact your Juniper Networks sales representative (<http://www.juniper.net/us/en/contact-us/sales-offices>). The Juniper sales representative will provide you with a feature license file and a license key.

MACsec is supported on EX4300 switches.

### Features Requiring a License on EX4600 Switches

To use the following features on EX4300 switches, you must install an advanced feature license:

- Border Gateway Protocol (BGP) and multiprotocol BGP (MBGP)
- Intermediate System-to-Intermediate System (IS-IS)
- Multiprotocol Label Switching (MPLS)

[Table 70 on page 707](#) lists the AFLs that you can purchase for EX4300 switch models.

**Table 70: Junos OS AFL Part Number on EX4600 Switches**

Switch Model	AFL Part Number
EX4600-40F	EX4600-AFL

#### Features Requiring a License on EX3200, EX4200, EX4500, EX4550, EX6200, EX8200, and EX9200 Switches

To use the following features on EX3200, EX4200, EX4500, EX4550, EX8200, and EX9200 switches, you must install an advanced feature license (AFL):

- Border Gateway Protocol (BGP) and multiprotocol BGP (MBGP)
- Intermediate System-to-Intermediate System (IS-IS)
- IPv6 routing protocols: IS-IS for IPv6, IPv6 BGP, IPv6 for MBGP
- Logical systems (available only on EX9200 switches)
- MPLS with RSVP-based label-switched paths (LSPs) and MPLS-based circuit cross-connects (CCCs) (Not supported on EX9200 switches)

To use the following features on Juniper Networks EX6200 Ethernet Switches, you must install an advanced feature license (AFL):

- Border Gateway Protocol (BGP)
- Intermediate System-to-Intermediate System (IS-IS)
- IPv6 routing protocols: IS-IS for IPv6, IPv6 BGP

[Table 71 on page 707](#) lists the AFLs that you can purchase for EX3200, EX4200, EX4500, EX4550, EX6200, EX8200, and EX9200 switches. If you have the license, you can run all of the advanced software features mentioned above on your EX3200, EX4200, EX4500, EX4550, EX6200, EX8200, or EX9200 switch.

**Table 71: Junos OS AFL Part Number on EX3200, EX4200, EX4500, EX4550, EX6200, EX8200, and EX9200 Switches**

Switch Model	AFL Part Number
EX3200-24P EX3200-24T EX4200-24F EX4200-24P EX4200-24PX EX4200-24T	EX-24-AFL
EX3200-48P EX3200-48T EX4200-48F EX4200-48P EX4200-48PX EX4200-48T	EX-48-AFL

**Table 71: Junos OS AFL Part Number on EX3200, EX4200, EX4500, EX4550, EX6200, EX8200, and EX9200 Switches (*continued*)**

Switch Model	AFL Part Number
EX4500-40F-BF EX4500-40F-BF-C EX4500-40F-FB EX4500-40F-FB-C	EX-48-AFL
EX4550	EX4550-AFL
EX6210	EX6210-AFL
EX8208	EX8208-AFL
EX8216	EX8216-AFL
EX-XRE200	EX-XRE200-AFL
EX9204	EX9204-AFL
EX9208	EX9208-AFL
EX9214	EX9214-AFL

You must download a MACsec feature license to enable MACsec. The MACsec feature license is an independent feature license; the enhanced feature licenses (EFLs) or advanced feature licenses (AFLs) that must be purchased to enable some features on EX Series switches cannot be purchased to enable MACsec.

To purchase a feature license for MACsec, contact your Juniper Networks sales representative (<http://www.juniper.net/us/en/contact-us/sales-offices>). The Juniper sales representative will provide you with a feature license file and a license key.

MACsec is currently supported on EX4200 and EX4550 switches.

### License Warning Messages

For using features that require a license, you must install and configure a license key. To obtain a license key, use the contact information provided in your certificate.

If you have not purchased the AFL or EFL and installed the license key, you receive warnings when you try to commit the configuration:

```
[edit protocols]
  'bgp'
    warning: requires 'bgp' license
error: commit failed: (statements constraint check failed)
```

The system generates system log (**syslog**) alarm messages notifying you that the feature requires a license—for example:

```
Sep 3 05:59:11 craftd[806]: Minor alarm set, BGP Routing Protocol usage
requires a license
Sep 3 05:59:11 alarmd[805]: Alarm set: License color=YELLOW, class=CHASSIS,
reason=BGP Routing Protocol usage requires a license
Sep 3 05:59:11 alarmd[805]: LICENSE_EXPIRED: License for feature bgp(47) expired
```

Output of the **show system alarms** command displays the active alarms:

```
user@switch> show system alarms
1 alarm currently active
Alarm time          Class  Description
2009-09-03 06:00:11 UTC  Minor  BGP Routing Protocol usage requires a license
```

## Registering the EX Series Switch with the J-Web Interface

---

**NOTE:** This topic applies only to the J-Web Application package.

---

You can register your EX Series switch with the J-Web interface so that you can request technical assistance as and when required. To register an EX Series switch:

1. In the J-Web interface, select **Maintain > Customer Support > Product Registration**. For an EX8200 Virtual Chassis configuration, select the member from the list.  
  
Note the serial number that is displayed.
2. Click **Register**. Enter the serial number in the page that is displayed.

## Booting the Switch

---

- [Booting an EX Series Switch Using a Software Package Stored on a USB Flash Drive on page 712](#)
- [Creating a Snapshot and Using It to Boot an EX Series Switch on page 713](#)

## Booting an EX Series Switch Using a Software Package Stored on a USB Flash Drive

There are two methods of getting Junos OS stored on a USB flash drive before using the software to boot the switch. You can pre-install the software onto the USB flash drive before inserting the USB flash drive into the USB port, or you can use the system snapshot feature to copy files from internal switch memory to the USB flash drive.

To move files into USB flash memory by using a system snapshot and use those files to boot the switch, see [“Creating a Snapshot and Using It to Boot an EX Series Switch” on page 713](#). We recommend that you use this method to boot the switch from a USB flash drive if your switch is running properly.

If you need to pre-install the software onto the USB flash drive, you can use the method described in this topic. Pre-installing Junos OS onto a USB flash drive to boot the switch can be done at any time and is particularly useful when the switch boots to the loader prompt because the switch cannot locate the Junos OS in internal flash memory.

Ensure that you have the following tools and parts available to boot the switch from a USB flash drive:

- A USB flash drive that meets the EX Series switch USB port specifications. See *USB Port Specifications for an EX Series Switch*.
- A computer or other device that you can use to download the software package from the Internet and copy it to the USB flash drive.

To download a Junos OS package onto a USB flash drive before inserting the USB flash drive:

1. Download the Junos OS package that you want to place onto the EX Series switch from the Internet onto the USB flash drive by using your computer or other device. See *Downloading Software Packages from Juniper Networks*.
2. Remove the USB flash drive from the computer or other device.
3. Insert the USB flash drive into the USB port on the switch.
4. This step can be performed only when the prompt for the loader script (**loader>**) is displayed. The loader script starts when the Junos OS loads but the CLI is not working for any reason or if the switch has no software installed.

Install the software package onto the switch:

```
loader> install source
```

where **source** represents the name and location of the Junos OS package on the USB flash drive. The Junos OS package on a flash drive is commonly stored in the root drive as the only file—for example, **file:///jinstall-ex-4200-9.4R1.5-domestic-signed.tgz**.

## Creating a Snapshot and Using It to Boot an EX Series Switch

The system snapshot feature takes a “snapshot” of the files currently used to run the switch and copies them to an alternate storage location. You can then use this snapshot to boot the switch at the next bootup or as a backup boot option.

This topic includes the following tasks:

- [Creating a Snapshot on a USB Flash Drive and Using It to Boot the Switch on page 713](#)
- [Creating a Snapshot on an Internal Flash Drive and Using it to Boot the Switch on page 714](#)
- [Creating a Snapshot on the Alternate Slice of the Boot Media on page 714](#)

### Creating a Snapshot on a USB Flash Drive and Using It to Boot the Switch

You can create a snapshot on USB flash memory after a switch is booted by using files stored in internal memory.

Ensure that you have the following tools and parts available before creating a snapshot on a USB flash drive:

- A USB flash drive that meets the switch USB port specifications. See *USB Port Specifications for an EX Series Switch*.

To create a snapshot on USB flash memory and use it to boot the switch:

1. Place the snapshot into USB flash memory:  

```
user@switch> request system snapshot partition media external
```
2. (Optional) Perform this step if you want to boot the switch now using the snapshot stored on the USB flash drive. If you created the snapshot as a backup, do not perform this step.

- To reboot the switch using the most recently created snapshot:  
user@switch> **request system reboot media external**
- To reboot the switch using a snapshot in a specific partition on the USB flash drive:  
user@switch> **request system reboot media external slice alternate**

### Creating a Snapshot on an Internal Flash Drive and Using it to Boot the Switch

You can create a snapshot in internal memory after a switch is booted by using files stored in external memory.

To create a snapshot in internal memory and use it to boot the switch:

1. Place the snapshot files in internal memory:  
user@switch> **request system snapshot partition media internal**
2. (Optional) Perform this step if you want to boot the switch now using the newly created snapshot. If you created the snapshot as a backup, do not perform this step.
  - To reboot the switch using the most recently created snapshot:  
user@switch> **request system reboot media internal**
  - To reboot the switch using a snapshot in a specific partition in internal memory:  
user@switch> **request system reboot media internal slice alternate**

### Creating a Snapshot on the Alternate Slice of the Boot Media

The alternate slice of the boot media contains a backup software image that the switch can boot from if it is unable to boot from the primary slice. When you upgrade software, the new software image gets copied only to the primary slice of the boot media.

To create a snapshot of the currently booted software image on the backup slice of the boot media:

```
user@switch> request system reboot slice alternate
```

## Managing Licenses

- [Managing Licenses for the EX Series Switch \(CLI Procedure\) on page 714](#)
- [Managing Licenses for the EX Series Switch \(J-Web Procedure\) on page 716](#)

### **Managing Licenses for the EX Series Switch (CLI Procedure)**

To enable and use some Junos OS features on an EX Series switch, you must purchase, install, and manage separate software licenses. Each switch requires one license. For a Virtual Chassis deployment, two licenses are recommended for redundancy. After you

have configured the features, you see a warning message if the switch does not have a license for the feature.

Before you begin managing licenses, be sure that you have:

- Obtained the needed licenses. For information about how to purchase software licenses, contact your Juniper Networks sales representative.
- Understand what makes up a license key. For more information, see [“License Key Components for the EX Series Switch” on page 723](#).

This topic includes the following tasks:

- [Adding New Licenses on page 715](#)
- [Deleting Licenses on page 715](#)
- [Saving License Keys on page 715](#)

### Adding New Licenses

To add one or more new license keys on the switch, with the CLI:

1. Add the license key or keys:
  - To add one or more license keys from a file or URL, specify the filename of the file or the URL where the key is located:  

```
user@switch> request system license add filename | url
```
  - To add a license key from the terminal:  

```
user@switch> request system license add terminal
```
2. When prompted, enter the license key, separating multiple license keys with a blank line.

If the license key you enter is invalid, an error appears in the CLI output when you press Ctrl+d to exit the license entry mode.

### Deleting Licenses

To delete one or more license keys from the switch with the CLI, specify the license ID:

```
user@switch> request system license delete license-id
```

You can delete only one license at a time.

### Saving License Keys

To save the installed license keys to a file (which can be a URL) or to the terminal:

```
user@switch> request system license save filename | url
```

For example, the following command saves the installed license keys to a file named `license.conf`:

```
user@switch> request system license save ftp://user@switch/license.conf
```

## Managing Licenses for the EX Series Switch (J-Web Procedure)

---

**NOTE:** This topic applies only to the J-Web Application package.

---

To enable and use some Junos OS features on an EX Series switch, you must purchase, install, and manage separate software licenses. Each switch requires one license. For a Virtual Chassis deployment, two licenses are recommended for redundancy. After you have configured the features, you see a warning message if the switch does not have a license for the feature.

Before you begin managing licenses, be sure that you have:

- Obtained the needed licenses. For information about how to purchase software licenses, contact your Juniper Networks sales representative.
- Understand what makes up a license key. For more information, see [“License Key Components for the EX Series Switch” on page 723](#).

This topic includes the following tasks:

- [Adding New Licenses on page 716](#)
- [Deleting Licenses on page 716](#)
- [Displaying License Keys on page 717](#)
- [Downloading Licenses on page 717](#)

### Adding New Licenses

---

To add one or more new license keys on the switch, with the J-Web license manager:

1. In the J-Web interface, select **Maintain > Licenses**.
2. Under Installed Licenses, click **Add** to add a new license key or keys.
3. Do *one* of the following, using a blank line to separate multiple license keys:
  - In the License File URL box, type the full URL to the destination file containing the license key or keys to be added.
  - In the License Key Text box, paste the license key text, in plain-text format, for the license to be added.
4. Click **OK** to add the license key or keys.

A list of features that use the license key is displayed. The table also lists the ID, state, and version of the license key.

### Deleting Licenses

---

To delete one or more license keys from a switch with the J-Web license manager:

1. In the J-Web interface, select **Maintain > Licenses**.
2. Select the check box of the license or licenses you want to delete.
3. Click **Delete**.

---

### Displaying License Keys

To display the license keys installed on a switch with the J-Web license manager:

1. In the J-Web interface, select **Maintain > Licenses**.
2. Under Installed Licenses, click **Display Keys** to display all the license keys installed on the switch.

A screen displaying the license keys in text format appears. Multiple licenses are separated by a blank line.

---

### Downloading Licenses

To download the license keys installed on the switch with the J-Web license manager:

1. In the J-Web interface, select **Maintain > Licenses**.
2. Under Installed Licenses, click **Download Keys** to download all the license keys installed on the switch to a single file.
3. Select **Save it to disk** and specify the file to which the license keys are to be written. You can also download the license file to your system.

## Routine Monitoring

---

- [Verifying That a System Snapshot Was Created on an EX Series Switch on page 719](#)
- [Verifying Junos OS and Boot Loader Software Versions on an EX Series Switch on page 720](#)

### Verifying That a System Snapshot Was Created on an EX Series Switch

**Purpose** Verify that a system snapshot was created with the proper files on an EX Series switch.

**Action** View the snapshot:

```
user@switch> show system snapshot media external
Information for snapshot on      external (/dev/dar1s1a) (backup)
Creation date: Mar 19 03:37:18 2012
JUNOS version on snapshot:
  jbase   : ex-12.1I20120111_0048_user
  jcrypto-ex: 12.1I20120111_0048_user
  jdocs-ex: 12.1I20120111_0048_user
  jroute-ex: 12.1I20120111_0048_user
  jswitch-ex: 12.1I20120111_0048_user
  jweb-ex: 12.1I20120111_0048_user
Information for snapshot on      external (/dev/dar1s2a) (primary)
Creation date: Mar 19 03:38:25 2012
JUNOS version on snapshot:
  jbase   : ex-12.2I20120305_2240_user
  jcrypto-ex: 12.2I20120305_2240_user
  jdocs-ex: 12.2I20120305_2240_user
  jroute-ex: 12.2I20120305_2240_user
  jswitch-ex: 12.2I20120305_2240_user
  jweb-ex: 12.2I20120305_2240_user
```

**Meaning** The output shows the date and time when the snapshot was created and the packages that are part of the snapshot. Check to see that the date and time match the time when you created the snapshot.

You can compare the output of this command to the output of the **show system software** command to ensure that the snapshot contains the same packages as the software currently running the switch.

## Verifying Junos OS and Boot Loader Software Versions on an EX Series Switch

Before or after upgrading or downgrading Junos OS, you might need to verify the Junos OS version. You might also need to verify the boot loader software version if you are upgrading to or downgrading from a release that supports resilient dual-root partitions (Junos OS Release 10.4R3 and later).

This topic includes:

- [Verifying the Number of Partitions and File System Mountings on page 720](#)
- [Verifying the Loader Software Version on page 721](#)
- [Verifying Which Root Partition Is Active on page 722](#)
- [Verifying the Junos OS Version in Each Root Partition on page 722](#)

### Verifying the Number of Partitions and File System Mountings

**Purpose** Between Junos OS Release 10.4R2 and Release 10.4R3, upgrades were made to further increase resiliency of root partitions, which required reformatting the disk from three partitions to four partitions. If your switch is running Release 10.4R2 or earlier, it has three partitions, and if it is running Release 10.4R3 or later, it has four partitions.

**Action** Verify how many partitions the disk has, as well as where each file system is mounted, by using the following command:

```
user@switch> show system storage
fpc0:
```

```
-----

```

**Meaning** The presence of the partition name containing **s4d** indicates that there is a fourth slice. If this were a three-slice partition scheme, in place of **s1a**, **s3e**, **s3d**, and **s4d**, you would see **s1a**, **s1f**, **s2a**, **s2f**, **s3d**, and **s3e** and you would not see **s4d**.

### Verifying the Loader Software Version

**Purpose** For the special case of upgrading from Junos OS Release 10.4R2 or earlier to Release 10.4R3 or later, you must upgrade the loader software.

**Action** For EX Series switches except EX8200 switches:

```

user@switch> show chassis firmware
Part          Type      Version
FPC 0         uboot     U-Boot 1.1.6 (Jan  3 2011 - 16:14:58) 1.0.0

              loader   FreeBSD/PowerPC U-Boot bootstrap loader 2.4

```

For EX8200 switches:

```

user@switch> show chassis firmware
Part          Type      Version
FPC 0         uboot     U-Boot 1.1.6 (Jan  3 2011 - 16:14:58) 3.5.0

              loader   FreeBSD/PowerPC U-Boot bootstrap loader 2.4

```

**Meaning** For EX Series switches other than EX8200 switches, with Junos OS Release 10.4R3 or later installed:

- If there is version information following the timestamp for **U-Boot** (**1.0.0** in the preceding example), then the loader software does not require upgrading.
- If there is no version number following the timestamp for **U-boot**, then the loader software requires upgrading.

**NOTE:** If the software version is Release 10.4R2 or earlier, no version number is displayed following the timestamp for **U-boot**, regardless of the loader software version installed. If you do not know whether you have installed the new loader software, we recommend that you upgrade the loader software when you upgrade the software version.

For EX8200 switches, if the version number following the timestamp for **U-Boot** is earlier than **3.5.0**, you must upgrade the loader software when you upgrade the software version.

### Verifying Which Root Partition Is Active

---

**Purpose** Switches running Release 10.4R3 or later have resilient dual-root partition functionality, which includes the ability to boot transparently from the inactive partition if the system fails to boot from the primary root partition.

You can verify which root partition is active using the following command:

**Action** user@switch> **show system storage partitions**  
fpc0:

```
-----  
Boot Media: internal (da0)  
Active Partition: da0s1a  
Backup Partition: da0s2a  
Currently booted from: active (da0s1a)
```

```
Partitions information:  
Partition Size Mountpoint  
s1a      184M /  
s2a      184M altroot  
s3d      369M /var/tmp  
s3e      123M /var  
s4d       62M /config  
s4e             unused (backup config)
```

**Meaning** The **Currently booted from:** field shows which root partition is active.

### Verifying the Junos OS Version in Each Root Partition

---

**Purpose** Each switch contains two root partitions. We recommend that you copy the same Junos OS version in each partition when you upgrade. In Junos OS Release 10.4R2 and earlier, you might choose to have different Junos OS release versions in each partition. You might have different versions during a software upgrade and before you have finished verifying the new software installation. To enable a smooth reboot if corruption is found in the primary root file system, ensure that the identical Junos OS images are in each root partition. For Release 10.4R2 and earlier, you must manually reboot the switch from the backup root partition. However, for Release 10.4R3 and later, the switch reboots automatically from the backup root partition if it fails to reboot from the active root partition.

**Action** Verify whether both root partitions contain the same image by using the following command:

```
user@switch> show system snapshot media internal  
Information for snapshot on      internal (/dev/da0s1a) (backup)  
Creation date: Jan 11 03:02:59 2012  
JUNOS version on snapshot:  
jbase : ex-12.2I20120305_2240_user  
jcrypto-ex: 12.2I20120305_2240_user  
jdocs-ex: 12.2I20120305_2240_user
```

```

jroute-ex: 12.2I20120305_2240_user
jswitch-ex: 12.2I20120305_2240_user
jweb-ex: 12.2I20120305_2240_user
Information for snapshot on      internal (/dev/da0s2a) (primary)
Creation date: Mar 6 02:24:08 2012
JUNOS version on snapshot:
jbase   : ex-12.2I20120305_2240_user
jcrypto-ex: 12.2I20120305_2240_user
jdocs-ex: 12.2I20120305_2240_user
jroute-ex: 12.2I20120305_2240_user
jswitch-ex: 12.2I20120305_2240_user
jweb-ex: 12.2I20120305_2240_user

```

**Meaning** The command shows which Junos OS version is installed on each media partition. Verify that the same version is installed on both partitions.

## Monitoring Licenses

- [License Key Components for the EX Series Switch on page 723](#)
- [Monitoring Licenses for the EX Series Switch on page 724](#)

### License Key Components for the EX Series Switch

When you purchase a license for a Junos OS feature that requires a separate license, you receive a license key.

A license key consists of two parts:

- License ID—Alphanumeric string that uniquely identifies the license key. When a license is generated, it is given a license ID.
- License data—Block of binary data that defines and stores all license key objects.

For example, in the following typical license key, the string **Junos204558** is the license ID, and the trailing block of data is the license data:

```

Junos204558 aeaqea qmijhd amrqha ztfmbu gqzama uqceds
ra32zr lsevik ftvjed o4jy5u fynzzj mgviyl
kgioyf ardb5g sj7wnt rsfkd wbjf5a sg

```

The license data defines the device ID for which the license is valid and the version of the license.

  - [Managing Licenses for the EX Series Switch \(J-Web Procedure\) on page 716](#)

- [Understanding Software Licenses for EX Series Switches on page 702](#)

## Monitoring Licenses for the EX Series Switch

To enable and use some Junos OS features on the EX Series switch, you must purchase, install, and manage the appropriate software licenses. Each switch requires one license. For a Virtual Chassis deployment, two licenses are recommended for redundancy.

To monitor your installed licenses, perform the following tasks:

- [Displaying Installed Licenses and License Usage Details on page 724](#)
- [Displaying Installed License Keys on page 725](#)

### Displaying Installed Licenses and License Usage Details

**Purpose** Verify that the expected license is installed and active on the switch and fully covers the switch configuration.

**Action** From the CLI, enter the **show system license** command. (To display only the **License usage** list, enter the **show system license usage** command. To display only the **Licenses installed** output, enter **show system license installed**.)

```
user@switch> show system license
License usage:
```

Feature name	Licenses	Licenses	Licenses	Expiry
	used	installed	needed	
bgp	1	1	0	permanent
isis	0	1	0	permanent
ospf3	0	1	0	permanent
ripng	0	1	0	permanent
mpls	0	1	0	permanent

Licenses installed:

```
License identifier: JUNOS204558
```

```
License version: 2
```

```
Valid for device: BN0208380000
```

```
Features:
```

```
ex-series - Licensed routing protocols in ex-series
```

```
permanent
```

**Meaning** The output shows the license or licenses (for Virtual Chassis deployments) installed on the switch and license usage. Verify the following information:

- If a feature that requires a license is configured (used), a license is installed on the switch. The **Licenses needed** column must show that no licenses are required.
- The appropriate number of licenses is installed. Each switch requires one license. For a Virtual Chassis deployment, two licenses are recommended for redundancy.
- The expected license is installed.

### Displaying Installed License Keys

**Purpose** Verify that the expected license keys are installed on the switch.

**Action** From the CLI, enter the **show system license keys** command.

```
user@switch> show system license keys
JUNOS204558 abcdef qhijkl mnopqr stuvwxyz efghij
               klmnop qrstuv wxyzab cdefgh ijklmn opqrst
               uvwxyz 61abcd efgh21 31efgh yzabcd
```

**Meaning** The output shows the license key or keys (for Virtual Chassis deployments) installed on the switch. Verify that each expected license key is present.

## request system license add

<b>Syntax</b>	<code>request system license add (<i>filename</i>   terminal)</code>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 9.5 for SRX Series devices.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Add a license key.
<b>Options</b>	<p><b><i>filename</i></b>—License key from a file or URL. Specify the filename or the URL where the key is located.</p> <p><b><i>terminal</i></b>—License key from the terminal.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Adding New Licenses (CLI Procedure)</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">request system license add on page 727</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system license add

```

user@host> request system license add terminal
E408408918 aeaqib qcsbja okbuqe rcmxnq vjocwf uxfsta
           z5ufjb kdrmt6 57bimv 2f3ddp qttcdn 627q4a
           jx4s5x hiri
E408408918: successfully added
add license complete (no errors)

```

## request system license delete

---

<b>Syntax</b>	<code>request system license delete ( <i>license-identifier</i>   license-identifier-list [ <i>licenseid001</i> <i>licenseid002</i> <i>licenseid003</i> ]   all )</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series. Option <b>license-identifier-list</b> introduced in Junos OS Release 13.1.
<b>Description</b>	Delete a license key. You can choose to delete one license at a time, all licenses at once, or a list of license identifiers enclosed in brackets.
<b>Options</b>	<b><i>license-identifier</i></b> —Text string that uniquely identifies a license key.  <b>license-identifier-list [ <i>licenseid001</i> <i>licenseid002</i> <i>licenseid003</i>.... ]</b> —Delete multiple license identifiers as a list enclosed in brackets.  <b>all</b> —Delete all licenses on the device.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Deleting a License (CLI Procedure)</i></li></ul>

## request system license save

---

<b>Syntax</b>	<code>request system license save (<i>filename</i>   terminal)</code>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 9.5 for SRX Series devices.</p>
<b>Description</b>	Save installed license keys to a file or URL.
<b>Options</b>	<p><b><i>filename</i></b>—License key from a file or URL. Specify the filename or the URL where the key is located.</p> <p><b><i>terminal</i></b>—License key from the terminal.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Saving License Keys</i></li> </ul>
<b>List of Sample Output</b>	<a href="#">request system license save on page 729</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system license save

```
user@host> request system license save ftp://user@host/license.conf
```

## request system reboot

<b>Syntax (MX Series Router)</b>	<code>request system reboot</code> <code>&lt;all-members&gt;</code> <code>&lt;at <i>time</i>&gt;</code> <code>&lt;both-routing-engines&gt;</code> <code>&lt;in <i>minutes</i>&gt;</code> <code>&lt;local&gt;</code>

```

<media (external | internal)>
<member member-id>
<message "text">
<other-routing-engine>

```

<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Option <b>other-routing-engine</b> introduced in Junos OS Release 8.0.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Option <b>sfc</b> introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Option <b>both-routing-engines</b> introduced in Junos OS Release 12.1.</p>
<b>Description</b>	Reboot the software.
<b>Options</b>	<p><b>none</b>—Reboot the software immediately.</p> <p><b>all-chassis</b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router or TX Matrix Plus router, reboot all routers connected to the TX Matrix or TX Matrix Plus router, respectively.</p> <p><b>all-lcc</b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router or TX Matrix Plus router, reboot all line card chassis connected to the TX Matrix or TX Matrix Plus router, respectively.</p> <p><b>all-members</b>—(EX4200 switches and MX Series routers only) (Optional) Reboot the software on all members of the Virtual Chassis configuration.</p> <p><b>at <i>time</i></b>—(Optional) Time at which to reboot the software, specified in one of the following ways:</p> <ul style="list-style-type: none"> <li>• <b>now</b>—Stop or reboot the software immediately. This is the default.</li> <li>• <b>+<i>minutes</i></b>—Number of minutes from now to reboot the software.</li> <li>• <b><i>yymmddhhmm</i></b>—Absolute time at which to reboot the software, specified as year, month, day, hour, and minute.</li> <li>• <b><i>hh:mm</i></b>—Absolute time on the current day at which to stop the software, specified in 24-hour time.</li> </ul> <p><b>both-routing-engines</b>—(Optional) Reboot both Routing Engines at the same time.</p> <p><b>in <i>minutes</i></b>—(Optional) Number of minutes from now to reboot the software. This option is an alias for the <b>at +<i>minutes</i></b> option.</p> <p><b>lcc <i>number</i></b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Line-card chassis number.</p> <p>Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"> <li>• 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.</li> <li>• 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.</li> </ul>

- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Reboot the software on the local Virtual Chassis member.

**media (compact-flash | disk | removable-compact-flash | usb)**—(Optional) Boot medium for next boot. (The options **removable-compact-flash** and **usb** pertain to the J Series routers only.)

**media (external | internal)**—(EX Series switches and MX Series routers only) (Optional) Reboot the boot media:

- **external**—Reboot the external mass storage device.
- **internal**—Reboot the internal flash device.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Reboot the software on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

**message "*text*"**—(Optional) Message to display to all system users before stopping or rebooting the software.

**other-routing-engine**—(Optional) Reboot the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is rebooted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is rebooted.

**partition**—(TX Matrix Plus routers only) (Optional) Reboot using the specified partition on the boot media. This option has the following suboptions:

- 1—Reboot from partition 1.
- 2—Reboot from partition 2.
- **alternate**—Reboot from the alternate partition.

**scc**—(TX Matrix routers only) (Optional) Reboot the Routing Engine on the TX Matrix switch-card chassis. If you issue the command from re0, re0 is rebooted. If you issue the command from re1, re1 is rebooted.

**sfc *number***—(TX Matrix Plus routers only) (Optional) Reboot the Routing Engine on the TX Matrix Plus switch-fabric chassis. If you issue the command from re0, re0 is rebooted. If you issue the command from re1, re1 is rebooted. Replace ***number*** with 0.

**slice *slice***—(EX Series switches only) (Optional) Reboot a partition on the boot media. This option has the following suboptions:

- 1—Power off partition 1.
- 2—Power off partition 2.
- **alternate**—Reboot from the alternate partition.

**Additional Information** Reboot requests are recorded in the system log files, which you can view with the **show log** command (see [show log](#)). Also, the names of any running processes that are scheduled to be shut down are changed. You can view the process names with the **show system processes** command (see [show system processes](#)).

On a TX Matrix or TX Matrix Plus router, if you issue the **request system reboot** command on the master Routing Engine, all the master Routing Engines connected to the routing matrix are rebooted. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are rebooted.

**NOTE:** Before issuing the **request system reboot** command on a TX Matrix Plus router with no options or the **all-chassis**, **all-lcc**, **lcc number**, or **sfc** options, verify that master Routing Engine for all routers in the routing matrix are in the same slot number. If the master Routing Engine for a line-card chassis is in a different slot number than the master Routing Engine for a TX Matrix Plus router, the line-card chassis might become logically disconnected from the routing matrix after the **request system reboot** command.

**NOTE:** To reboot a router that has two Routing Engines, reboot the backup Routing Engine (if you have upgraded it) first, and then reboot the master Routing Engine.

**Required Privilege Level** maintenance

**List of Sample Output**

[request system reboot on page 734](#)  
[request system reboot \(at 2300\) on page 734](#)  
[request system reboot \(in 2 Hours\) on page 734](#)  
[request system reboot \(Immediately\) on page 734](#)  
[request system reboot \(at 1:20 AM\) on page 734](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system reboot

```
user@host> request system reboot
Reboot the system ? [yes,no] (no)
```

### request system reboot (at 2300)

```
user@host> request system reboot at 2300 message ?Maintenance time!?
Reboot the system ? [yes,no] (no) yes
```

```
shutdown: [pid 186]
*** System shutdown message from root@berry.network.net ***
System going down at 23:00
```

### request system reboot (in 2 Hours)

The following example, which assumes that the time is 5 PM (17:00), illustrates three different ways to request the system to reboot in two hours:

```
user@host> request system reboot at +120
user@host> request system reboot in 120
user@host> request system reboot at 19:00
```

### request system reboot (Immediately)

```
user@host> request system reboot at now
```

### request system reboot (at 1:20 AM)

To reboot the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

```
user@host> request system reboot at 06060120
request system reboot at 120
Reboot the system at 120? [yes,no] (no) yes
```

## request system reboot

<b>Syntax</b>	<pre>request system reboot &lt;all-members   local   member member-id&gt; &lt;at time&gt; &lt;in minutes&gt; &lt;media (external   internal)&gt; &lt;message "text"&gt; &lt;slice (1   2   alternate)&gt;</pre>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Option <b>partition</b> changed to <b>slice</b> in Junos OS Release 10.0 for EX Series switches.</p>
<b>Description</b>	<p>Reboot the Junos OS.</p> <p>Reboot requests are recorded in the system log files, which you can view with the <b>show log</b> command. You can view the process names with the <b>show system processes</b> command.</p>
<b>Options</b>	<p><b>none</b>—Reboots the software immediately.</p> <p><b>all-members   local   member member-id</b>—(EX4200 switch only) (Optional) Specify which member of the Virtual Chassis to reboot:</p> <ul style="list-style-type: none"> <li>• <b>all-members</b>—Reboots each switch that is a member of the Virtual Chassis.</li> <li>• <b>local</b>—Reboots the local switch, meaning the switch you are logged into, only.</li> <li>• <b>member member-id</b>—Reboots the specified member switch of the Virtual Chassis.</li> </ul> <p><b>at time</b>—(Optional) Time at which to reboot the software, specified in one of the following ways:</p> <ul style="list-style-type: none"> <li>• <b>+minutes</b>—Number of minutes from now to reboot the software.</li> <li>• <b>hh:mm</b>—Absolute time on the current day at which to reboot the software, specified in 24-hour time.</li> <li>• <b>now</b>—Stop or reboot the software immediately. This is the default.</li> <li>• <b>yymmddhhmm</b>—Absolute time at which to reboot the software, specified as year, month, day, hour, and minute.</li> </ul> <p><b>in minutes</b>—(Optional) Number of minutes from now to reboot the software. This option is an alias for the <b>at +minutes</b> option.</p> <p><b>media (external   internal)</b>—(Optional) Boot medium for the next boot. The external option reboots the switch using a software package stored on an external boot source, such as a USB flash drive. The internal option reboots the switch using a software package stored in an internal memory source.</p> <p><b>message "text"</b>—(Optional) Message to display to all system users before rebooting the software.</p>

**slice (1 | 2 | alternate)**—(Optional) Reboot using the specified partition on the boot media. This option has the following suboptions:

- **1**—Reboot from partition 1.
- **2**—Reboot from partition 2.
- **alternate**—Reboot from the alternate partition, which is the partition that did not boot the switch at the last bootup.

**Required Privilege Level** maintenance

**Related Documentation**

- [clear system reboot on page 84](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system reboot

```
user@host> request system reboot
Reboot the system ? [yes,no] (no)
```

### request system reboot (at 2300)

```
user@host> request system reboot at 2300 message ?Maintenance time!?
Reboot the system ? [yes,no] (no) yes

shutdown: [pid 186]
*** System shutdown message from root@berry.network.net ***
System going down at 23:00
```

### request system reboot (in 2 Hours)

The following example, which assumes that the time is 5 PM (17:00), illustrates three different ways to request the system to reboot in two hours:

```
user@host> request system reboot at +120
user@host> request system reboot in 120
user@host> request system reboot at 19:00
```

### request system reboot (Immediately)

```
user@host> request system reboot at now
```

### request system reboot (at 1:20 AM)

To reboot the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

```
user@host> request system reboot at 06060120
request system reboot at 120
Reboot the system at 120? [yes,no] (no) yes
```

## request system snapshot

- Description**
- On the router, back up the currently running and active file system partitions to standby partitions that are not running. Specifically, the root file system (/) is backed up to **/altroot**, and **/config** is backed up to **/altconfig**. The root and **/config** file systems are on the router's flash drive, and the **/altroot** and **/altconfig** file systems are on the router's hard drive.
  - On the switch, take a snapshot of the files currently used to run the switch—the complete contents of the root (/) , **/altroot**, **/config**, **/var**, and **/var-tmp** directories, which include the running Junos OS, the active configuration, and log files.

**CAUTION:** After you run the **request system snapshot** command, you cannot return to the previous version of the software, because the running and backup copies of the software are identical.

**Options** The specific options available depend upon the router or switch:

**none**—Back up the currently running software as follows:

- On the router, back up the currently running and active file system partitions to standby partitions that are not running. Specifically, the root file system (/) is backed up to **/altroot**, and **/config** is backed up to **/altconfig**. The root and **/config** file systems are on the router's flash drive, and the **/altroot** and **/altconfig** file systems are on the router's hard drive.
- On the switch, take a snapshot of the files currently used to run the switch and copy them to the media that the switch did not boot from. If the switch is booted from internal media, the snapshot is copied to external (USB) media. If the switch is booted from external (USB) media, the snapshot is copied to internal media.
- If the snapshot destination is external media but a USB flash drive is not connected, an error message is displayed.
- If the automatic snapshot procedure is already in progress, the command returns the following error: **Snapshot already in progress. Cannot start manual snapshot.** For additional information about the automatic snapshot feature, see [“Understanding Resilient Dual-Root Partitions on Switches” on page 695](#).

**all-chassis | all-lcc | lcc number** —(TX Matrix and TX Matrix Plus router only) (Optional)

- **all-chassis**—On a TX Matrix router, archive data and executable areas for all Routing Engines in the chassis. On a TX Matrix Plus router, archive data and executable areas for all Routing Engines in the chassis.
- **all-lcc**—On a TX Matrix router, archive data and executable areas for all T640 routers (or line-card chassis) connected to a TX Matrix router. On a TX Matrix Plus router, archive data and executable areas for all routers (or line-card chassis) connected to a TX Matrix Plus router.
- **lcc number**—On a TX Matrix router, archive data and executable areas for a specific T640 router (or line-card chassis) that is connected to a TX Matrix router. On a

TX Matrix Plus router, archive data and executable areas for a specific router (line-card chassis) that is connected to a TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**all-members | local | member *member-id***—(EX Series switch Virtual Chassis and MX Series routers only) (Optional) Specify where to place the snapshot (archive data and executable areas) in a Virtual Chassis:

- **all-members**—Create a snapshot (archive data and executable areas) for all members of the Virtual Chassis.
- **local**—Create a snapshot (archive data and executable areas) on the member of the Virtual Chassis that you are currently logged into.
- **member *member-id***—Create a snapshot (archive data and executable areas) for the specified member of the Virtual Chassis.

**config-partition**—(M, MX, T, TX Series routers only) Create a snapshot of the configuration partition only and store it onto the default **/altconfig** on the hard disk device or an **/altconfig** on a USB device.

**media type**—(ACX Series, M320, T640, MX960 routers, and EX Series switches only)(Optional) Specify the boot device the software is copied to:

- **compact-flash**—Copy software to the primary compact flash drive.
- **external**—(Switches only) Copy software to an external mass storage device, such as a USB flash drive. If a USB drive is not connected, the switch displays an error message.
- **internal**—Copy software to an internal flash drive.
- **removable-compact-flash**—Copy software to the removable compact flash drive.
- **usb**—(ACX Series, M320, T640, MX960 routers only) Copy software to the device connected to the USB port.
- **usb0**—(MX104 routers only) Copy software to the device connected to the USB0 port.
- **usb1**—(MX104 routers only) Copy software to the device connected to the USB1 port.

**partition**—(Optional) Repartition the flash drive before a snapshot occurs. If the partition table on the flash drive is corrupted, the **request system snapshot** command fails and reports errors. The partition option is only supported for restoring the software image from the hard drive to the flash drive.

(Routers only) You cannot issue the **request system snapshot** command when you enable flash disk mirroring. We recommend that you disable flash disk mirroring when you upgrade or downgrade the software. For more information, see the *Junos OS Administration Library for Routing Devices*.

(EX Series switches only) If the snapshot destination is the media that the switch did not boot from, you must use the **partition** option.

**re0 | re1 | routing-engine routing-engine-id**—(EX6200 and EX8200 switches only) Specify where to place the snapshot in a redundant Routing Engine configuration.

- **re0**—Create a snapshot on Routing Engine 0.
- **re1**—Create a snapshot on Routing Engine 1.
- **routing-engine routing-engine-id**—Create a snapshot on the specified Routing Engine.

**root-partition**—(M, MX, T, TX Series routers only) Create a snapshot of the root partition only and store it onto the default **/altroot** on the hard disk device or an **/altroot** on a USB device.

**slice alternate**—(EX Series switches only) (Optional) Take a snapshot of the active root partition and copy it to the alternate slice on the boot media.

**scc**—(TX Matrix router only) (Optional) Archive data and executable areas for a TX Matrix router (or switch-card chassis).

**sfc number**—(TX Matrix Plus router only) (Optional) Archive data and executable areas for a TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

#### Additional Information

- (Routers only) Before upgrading the software on the router, when you have a known stable system, issue the **request system snapshot** command to back up the software, including the configuration, to the **/altroot** and **/altconfig** file systems. After you have upgraded the software on the router and are satisfied that the new packages are successfully installed and running, issue the **request system snapshot** command again to back up the new software to the **/altroot** and **/altconfig** file systems.
- (Routers only) You cannot issue the **request system snapshot** command when you enable flash disk mirroring. We recommend that you disable flash disk mirroring when you upgrade or downgrade the software. For more information, see the *Junos OS Administration Library for Routing Devices*.
- (TX Matrix and TX Matrix Plus router only) On a routing matrix, if you issue the **request system snapshot** command on the master Routing Engine, all the master Routing Engines connected to the routing matrix are backed up. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are backed up.

**Required Privilege Level** maintenance

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system snapshot (Routers)

```
user@host> request system snapshot
umount: /altroot: not currently mounted
Copying / to /altroot.. (this may take a few minutes)
umount: /altconfig: not currently mounted
Copying /config to /altconfig.. (this may take a few minutes)

The following filesystems were archived: / /config
```

### request system snapshot (EX Series Switches)

```
user@switch> request system snapshot partition
Clearing current label...
Partitioning external media (/dev/da1) ...
Partitions on snapshot:

  Partition  Mountpoint  Size    Snapshot argument
  s1a       /altroot    179M    none
  s2a       /           180M    none
  s3d       /var/tmp    361M    none
  s3e       /var       121M    none
  s4d       /config     60M     none
Copying '/dev/da0s1a' to '/dev/da1s1a' .. (this may take a few minutes)
Copying '/dev/da0s2a' to '/dev/da1s2a' .. (this may take a few minutes)
Copying '/dev/da0s3d' to '/dev/da1s3d' .. (this may take a few minutes)
Copying '/dev/da0s3e' to '/dev/da1s3e' .. (this may take a few minutes)
Copying '/dev/da0s4d' to '/dev/da1s4d' .. (this may take a few minutes)
The following filesystems were archived: /altroot / /var/tmp /var /config
```

### request system snapshot (When the Partition Flag Is On)

```
user@host> request system snapshot partition
Performing preliminary partition checks ...
Partitioning ad0 ...
umount: /altroot: not currently mounted
Copying / to /altroot.. (this may take a few minutes)

The following filesystems were archived: / /config
```

### request system snapshot (MX104 routers when media device is missing)

```
user@host > request system snapshot media usb0
error: usb0 media missing or invalid
```

### request system snapshot (When Mirroring Is Enabled)

```
user@host> request system snapshot
Snapshot is not possible since mirror-flash-on-disk is configured.
```

### request system snapshot all-lcc (Routing Matrix)

```
user@host> request system snapshot all-lcc
lcc0-re0:

<unlink>
<upgrade-with-config>
<upgrade-with-config-format format>
<validate>
```

**Release Information**

Command introduced before Junos OS Release 7.4.

**best-effort-load** and **unlink** options added in Junos OS Release 7.4.

Command introduced in Junos OS Release 9.0 for EX Series switches.

**sfc** option introduced for the TX Matrix Plus router in Junos OS Release 9.6.

Command introduced in Junos OS Release 11.1 for the QFX Series.

**set [*package-name package-name*]** option added in Junos OS Release 11.1 for EX Series switches.

**set [*package-name package-name*]** option added in Junos OS Release 12.2 for M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways.

**NOTE:** On EX Series switches, the set `[package-name package-name]` option allows you to install only two software packages on a mixed EX4200 and EX4500 Virtual Chassis, whereas, on M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways, the set `[package-name package-name]` option allows you to install multiple software packages and software add-on packages at the same time.

`upgrade-with-config` and `upgrade-with-config-format` *format* options added in Junos OS Release 12.3 for M Series routers, MX Series routers, T Series routers, EX Series Ethernet switches, and QFX Series devices.

#### Description

**NOTE:** We recommend that you always download the software image to `/var/tmp` only. On EX Series and QFX Series switches, you must use the `/var/tmp` directory. Other directories are not supported.

Install a software package or bundle on the router or switch.

**WARNING:** Any configuration changes performed after inputting the `request system software add` command will be lost when the system reboots with an upgraded version of JUNOS.

**Options** `package-name`—Location from which the software package or bundle is to be installed.

For example:

- `/var/tmp/package-name`—For a software package or bundle that is being installed from a local directory on the router or switch.
- `protocol://hostname/pathname/package-name`—For a software package or bundle that is to be downloaded and installed from a remote location. Replace *protocol* with one of the following:
  - **ftp**—File Transfer Protocol.  
Use `ftp://hostname/pathname/package-name`. To specify authentication credentials, use `ftp://<username>:<password>@hostname/pathname/package-name`. To have the system prompt you for the password, specify **prompt** in place of the password. If a password is required, and you do not specify the password or **prompt**, an error message is displayed.
  - **http**—Hypertext Transfer Protocol.  
Use `http://hostname/pathname/package-name`. To specify authentication credentials, use `http://<username>:<password>@hostname/pathname/package-name`. If a password is required and you omit it, you are prompted for it.

- **scp**—Secure copy (available only for Canada and U.S. version).  
Use **scp://hostname/pathname/package-name**. To specify authentication credentials, use  
**scp://<username>:<password>@hostname/pathname/package-name**.

**NOTE:**

- The **pathname** in the protocol is the relative path to the user's home directory on the remote system and not the root directory.
- Do not use the **scp** protocol in the **request system software add** command to download and install a software package or bundle from a remote location. The previous statement does not apply to the QFabric switch. The software upgrade is handled by the MGD process which does not support **scp**.  
Use the **file copy** command to copy the software package or bundle from the remote location to the **/var/tmp** directory on the hard disk:  
**file copy scp://source/package-name /var/tmp**  
Then install the software package or bundle using the **request system software add** command:  
**request system software add /var/tmp/package-name**
- On a J Series Services Router, when you install the software from a remote location, the package is removed at the earliest opportunity in order to make room for the installation to be completed. If you copy the software to a local directory on the router and then install the new package, use the **unlink** option to achieve the same effect and allow the installation to be completed.

---

**best-effort-load**—(Optional) Activate a partial load and treat parsing errors as warnings instead of errors.

**component all**—(QFabric systems only) (Optional) Install software package on all of the QFabric components.

**delay-restart**—(Optional) Install a software package or bundle, but do not restart software processes.

**force**—(Optional) Force the addition of the software package or bundle (ignore warnings).

**force-host**—(Optional) Force the addition of host software package or bundle (ignore warnings) on the QFX5100 device.

**lcc number** —(TX Matrix routers and TX Matrix Plus routers only) (Optional) In a routing matrix based on the TX Matrix router, install a software package or bundle on a T640 router that is connected to the TX Matrix router. In a routing matrix based on the TX Matrix Plus router, install a software package or bundle on a router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**member *member-id***—(MX Series routers only) (Optional) Install a software package on the specified Virtual Chassis member. Replace *member-id* with a value of 0 or 1.

**partition**—(QFX3500 switches only) (Optional) Format and repartition the media before installation.

**scc**—(TX Matrix routers only) (Optional) Install a software package or bundle on a Routing Engine on a TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Install a software package or bundle on a Routing Engine on a TX Matrix Plus router. Replace *number* with 0.

**no-copy**—(Optional) Install a software package or bundle, but do not save copies of the package or bundle files.

**no-validate**—(Optional) When loading a software package or bundle with a different release, suppress the default behavior of the **validate** option.

**re0 | re1**—(Optional) On routers or switches that support dual or redundant Routing Engines, load a software package or bundle on the Routing Engine in slot 0 (re0) or the Routing Engine in slot 1 (re1).

**reboot**—(Optional) After adding the software package or bundle, reboot the system. On a QFabric switch, the software installation is not complete until you reboot the component for which you have installed the software.

**set [*package-name package-name*]**—(Mixed EX4200 and EX4500 Virtual Chassis only) (Optional) Install two software packages—a package for an EX4200 switch and the same release of the package for an EX4500 switch—to upgrade all member switches in a mixed EX4200 and EX4500 Virtual Chassis.

**set [*package-name package-name*]**—(M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways only) (Optional) Install multiple software packages and software add-on packages at the same time.

**unlink**—(Optional) On J Series Services Routers, this option ensures that the software package is removed at the earliest opportunity in order to make room for the installation to be completed. On M Series, T Series, and MX Series routers, use the

**unlink** option to remove the software package from this directory after a successful upgrade is completed.

**upgrade-with-config**—(Optional) Install one or more configuration files.

**upgrade-with-config-format *format***—(Optional) Specify the configuration file format, **text** or **xml**. The default format is **text**.

**NOTE:** The **upgrade-with-config** and **upgrade-with-config-format** options are only available locally on the router or switch. In a routing matrix, the configuration is applied only to the local router and is not propagated to other routers.

The options are validated during the validation process and applied to the router or switch during the upgrade process. If the upgrade process is successful, the options are removed from the configuration. If the upgrade process fails, the configuration file is renamed with the **.failed** suffix.

**validate**—(Optional) Validate the software package or bundle against the current configuration as a prerequisite to adding the software package or bundle. This is the default behavior when the software package or bundle being added is a different release.

**NOTE:** The **validate** option only works on systems that do not have **graceful-switchover (GRES)** enabled. To use the **validate** option on a system with GRES, either disable GRES for the duration of the installation, or install using the command **request system software in-service-upgrade**, which requires nonstop active routing (NSR) to be enabled when using GRES.

#### Additional Information

Before upgrading the software on the router or switch, when you have a known stable system, issue the **request system snapshot** command to back up the software, including the configuration, to the **/altroot** and **/altconfig** file systems. After you have upgraded the software on the router or switch and are satisfied that the new package or bundle is successfully installed and running, issue the **request system snapshot** command again to back up the new software to the **/altroot** and **/altconfig** file systems.

**NOTE:** The **request system snapshot** command is currently not supported on the QFabric system. Also, you cannot add or install multiple packages on a QFabric system.

After you run the **request system snapshot** command, you cannot return to the previous version of the software, because the running and backup copies of the software are identical.

If you are upgrading more than one package at the same time, delete the operating system package, jkernel, last. Add the operating system package, jkernel, first and the routing software package, jroute, last. If you are upgrading all packages at once, delete and add them in the following order:

```
user@host> request system software add /var/tmp/jbase
user@host> request system software add /var/tmp/jkernel
user@host> request system software add /var/tmp/jpfe
user@host> request system software add /var/tmp/jdocs
user@host> request system software add /var/tmp/jroute
user@host> request system software add /var/tmp/jcrypto
```

By default, when you issue the **request system software add *package-name*** command on a TX Matrix master Routing Engine, all the T640 master Routing Engines that are connected to it are upgraded to the same version of software. If you issue the same command on the TX Matrix backup Routing Engine, all the T640 backup Routing Engines that are connected to it are upgraded to the same version of software.

Likewise, when you issue the **request system software add *package-name*** command on a TX Matrix Plus master Routing Engine, all the T1600 or T4000 master Routing Engines that are connected to it are upgraded to the same version of software. If you issue the same command on the TX Matrix Plus backup Routing Engine, all the T1600 or T4000 backup Routing Engines that are connected to it are upgraded to the same version of software.

```

## Sample Output

### request system software add (Mixed EX4200 and EX4500 Virtual Chassis)

```
user@switch> request system software add set
[/var/tmp/jinstall-ex-4200-11.1R1.1-domestic-signed.tgz
/var/tmp/jinstall-ex-4500-11.1R1.1-domestic-signed.tgz]
...
```

**request system software add component all (QFabric Systems)**

```
user@switch> request system software add /pbdata/packages/jinstall-qfabric-12.2X50-D1.3.rpm  
component all  
...
```

## request system software delete

---

<b>List of Syntax</b>	<a href="#">Syntax on page 752</a> <a href="#">Syntax (TX Matrix Router) on page 752</a> <a href="#">Syntax (TX Matrix Plus Router) on page 752</a>
<b>Syntax</b>	<code>request system software delete <i>software-package</i></code> <code>&lt;force&gt;</code> <code>&lt;reboot&gt;</code> <code>&lt;set [<i>package-name package-name</i>]&gt;</code>
<b>Syntax (TX Matrix Router)</b>	<code>request system software delete <i>software-package</i></code> <code>&lt;force&gt;</code> <code>&lt;lcc <i>number</i>   scc&gt;</code> <code>&lt;reboot&gt;</code> <code>&lt;set [<i>package-name package-name</i>]&gt;</code>
<b>Syntax (TX Matrix Plus Router)</b>	<code>request system software delete <i>software-package</i></code> <code>&lt;force&gt;</code> <code>&lt;lcc <i>number</i>   sfc <i>number</i>&gt;</code> <code>&lt;reboot&gt;</code> <code>&lt;set [<i>package-name package-name</i>]&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Option <b>sfc</b> introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series. Option <b>set [<i>package-name package-name</i>]</b> added in Junos OS Release 12.2 for M Series, MX Series, T Series routers, and Branch SRX Services Gateways. Option <b>reboot</b> introduced in Junos OS Release 12.3.
<b>Description</b>	Remove a software package or bundle from the router or switch.

**CAUTION:** Before removing a software package or bundle, make sure that you have already placed the new software package or bundle that you intend to load onto the router or switch.

---

- |                |   |
|----------------|---|
| <b>Options</b> | <p><b><i>software-package</i></b>—Software package or bundle name. You can delete any or all of the following software bundles or packages:</p> <ul style="list-style-type: none"><li>• <b>jbase</b>—(Optional) Junos base software suite</li><li>• <b>jcrypto</b>—(Optional, in domestic version only) Junos security software</li><li>• <b>jdocs</b>—(Optional) Junos online documentation file</li><li>• <b>jkernel</b>—(Optional) Junos kernel software suite</li><li>• <b>jpfe</b>—(Optional) Junos Packet Forwarding Engine support</li></ul> |
|----------------|---|

- **jroute**—(Optional) Junos routing software suite
- **junos**—(Optional) Junos base software

**NOTE:** On EX Series switches, some of the package names are different than those listed. To see the list of packages that you can delete on an EX Series switch, enter the command **show system software**.

**force**—(Optional) Ignore warnings and force removal of the software.

**lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, remove an extension or upgrade package from a specific T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, remove an extension or upgrade package from a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**reboot**—As of Junos OS 12.3 and greater, automatically reboot upon completing the **request system software delete** command.

**scc**—(TX Matrix routers only) (Optional) Remove an extension or upgrade package from the TX Matrix router (or switch-card chassis).

**set [package-name package-name]**—(M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways only) (Optional) Install multiple software packages or software add-on packages at the same time.

**sfc number**—(TX Matrix Plus routers only) (Optional) Remove an extension or upgrade package from the TX Matrix Plus router. Replace *number* with 0.

#### Additional Information

Before upgrading the software on the router or switch, when you have a known stable system, issue the **request system snapshot** command to back up the software, including the configuration, to the `/altroot` and `/altconfig` file systems (on routers) or the `/`, `/altroot`, `/config`, `/var`, and `/var/tmp` file systems (on switches). After you have upgraded the software on the router or switch and are satisfied that the new packages are successfully installed and running, issue the **request system snapshot** command again to back up the new software to the `/altroot` and `/altconfig` file systems (on routers) or the `/`, `/altroot`,

/config, /var, and /var/tmp file systems (on switches). After you run the **request system snapshot** command, you cannot return to the previous version of the software, because the running and backup copies of the software are identical.

**Required Privilege Level** maintenance

## request system software rollback

---

<b>List of Syntax</b>	<a href="#">Syntax on page 756</a> <a href="#">Syntax (EX Series Switches) on page 756</a> <a href="#">Syntax (TX Matrix Router) on page 756</a> <a href="#">Syntax (TX Matrix Plus Router) on page 756</a> <a href="#">Syntax (MX Series Router) on page 756</a>
<b>Syntax</b>	request system software rollback
<b>Syntax (EX Series Switches)</b>	request system software rollback <all-members> <local> <member <i>member-id</i> > <reboot>
<b>Syntax (TX Matrix Router)</b>	request system software rollback <lcc <i>number</i>   scc> <reboot>
<b>Syntax (TX Matrix Plus Router)</b>	request system software rollback <lcc <i>number</i>   sfc <i>number</i> > <reboot>
<b>Syntax (MX Series Router)</b>	request system software rollback <all-members> <local> <member <i>member-id</i> > <reboot>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Option <b>sfc</b> introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series. Command behavior changed in Junos OS Release 12.1. Option <b>reboot</b> introduced in Junos OS Release 12.3.
<b>Description</b>	<p>For all versions of Junos OS up to and including Junos OS 11.4, revert to the software that was loaded at the last successful <b>request system software add</b> command.</p> <p>As of Junos OS 12.1 and greater, revert to the last known good state before the most recent <b>request system software (add   delete)</b> command. For example, using rollback in Junos OS 12.1 after using <b>request system software add</b> restores the system to a known good state prior to using the <b>add</b> command. Similarly, using rollback in Junos OS 12.1 after using <b>request system software delete</b> restores the system to a known good state prior to using the <b>delete</b> command.</p> <p>A software rollback fails if any required package (or a <b>bundle</b> package containing the required package) cannot be found in /var/sw/pkg.</p> <p><i>Additional Information</i></p>

- On M Series and T Series routers, if **request system software add <jinstall> reboot** was used for the previous installation, then **request system software rollback** has no effect. In this case, use **jinstall** to reinstall the required package.
- On M Series and T Series routers, if **request system software add <sdk1>** was used for the previous installation, then **request system software rollback** removes the last installed SDK package (**sdk1** in this example).
- On SRX Series devices with dual root systems, when **request system software rollback** is run, the system switches to the alternate root. Each root can have a different version of Junos OS. Rollback takes each root back to the previously installed image.
- On QFX3500 and QFX3600 devices in a mixed Virtual Chassis, when the **request system software rollback** command is issued, the system does not rollback to the image stored in the alternate partition.
- On QFX5100 switches, the **reboot** option has been removed. To reboot the switch after a software rollback, issue the **request system reboot** command as a separate, secondary command.

**Options** **all-members**—(EX4200 switches and MX Series routers only) (Optional) Attempt to roll back to the previous set of packages on all members of the Virtual Chassis configuration.

**lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, attempt to roll back to the previous set of packages on a T640 router connected to the TX Matrix router. On a TX Matrix Plus router, attempt to roll back to the previous set of packages on a connected router connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Attempt to roll back to the previous set of packages on the local Virtual Chassis member.

**member member-id**—(EX4200 switches and MX Series routers only) (Optional) Attempt to roll back to the previous set of packages on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**none**—For all versions of Junos OS up to and including Junos OS 11.4, revert to the set of software as of the last successful **request system software add**. As of Junos OS 12.1 and greater, revert to the last known good state before the most recent **request system software (add | delete)** command.

**reboot**—As of Junos OS 12.3 and greater, automatically reboot upon completing the **request system software rollback** command.

**scc**—(TX Matrix routers only) (Optional) Attempt to roll back to the previous set of packages on the TX Matrix router (or switch-card chassis).

**sfc number**—(TX Matrix Plus routers only) (Optional) Attempt to roll back to the previous set of packages on the TX Matrix Plus router. Replace *number* with 0.

**Required Privilege Level** maintenance

<b>List of Syntax</b>	<a href="#">Syntax on page 760</a> <a href="#">Syntax (TX Matrix Router) on page 760</a> <a href="#">Syntax (TX Matrix Plus Router) on page 760</a> <a href="#">Syntax (MX Series Router) on page 760</a>
<b>Syntax</b>	<code>request system software validate <i>package-name</i></code> <code>&lt;set [<i>package-name package-name</i>]&gt;</code> <code>&lt;upgrade-with-config&gt;</code> <code>&lt;upgrade-with-config-format <i>format</i>&gt;</code>
<b>Syntax (TX Matrix Router)</b>	<code>request system software validate <i>package-name</i></code> <code>&lt;lcc <i>number</i>   scc&gt;</code> <code>&lt;set [<i>package-name package-name</i>]&gt;</code> <code>&lt;upgrade-with-config&gt;</code> <code>&lt;upgrade-with-config-format <i>format</i>&gt;</code>
<b>Syntax (TX Matrix Plus Router)</b>	<code>request system software validate <i>package-name</i></code> <code>&lt;lcc <i>number</i>   sfc <i>number</i>&gt;</code> <code>&lt;set [<i>package-name package-name</i>]&gt;</code> <code>&lt;upgrade-with-config&gt;</code> <code>&lt;upgrade-with-config-format <i>format</i>&gt;</code>
<b>Syntax (MX Series Router)</b>	<code>request system software validate <i>package-name</i></code> <code>&lt;member <i>member-id</i>&gt;</code> <code>&lt;set [<i>package-name package-name</i>]&gt;</code> <code>&lt;upgrade-with-config&gt;</code> <code>&lt;upgrade-with-config-format <i>format</i>&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series. <b>set [<i>package-name package-name</i>]</b> option added in Junos OS Release 12.2 for M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways. <b>upgrade-with-config</b> and <b>upgrade-with-config-format <i>format</i></b> options added in Junos OS Release 12.3 for M Series routers, MX Series routers, and T Series routers.
<b>Description</b>	Validate candidate software against the current configuration of the router.
<b>Options</b>	<b>lcc <i>number</i></b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, validate the software bundle or package on a specific T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, validate the software bundle or package for a specific router that is connected to the TX Matrix Plus router.  Replace <i>number</i> with the following values depending on the LCC configuration: <ul style="list-style-type: none"><li>• 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.</li><li>• 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.</li></ul>

- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**member *member-id***—(MX Series routers only) (Optional) Validate the software bundle or package on the specified member of the Virtual Chassis configuration. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

***package-name***—Name of the software bundle or package to test.

**scc**—(TX Matrix routers only) (Optional) Validate the software bundle or package for the TX Matrix router (or switch-card chassis).

**set [*package-name package-name*]**—(M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways only) (Optional) Install multiple software packages or software add-on packages at the same time.

**sfc *number***—(TX Matrix Plus routers only) (Optional) Validate the software bundle or package for the TX Matrix Plus router.

**upgrade-with-config**—(Optional) Install one or more configuration files.

**upgrade-with-config-format *format***—(Optional) Specify the configuration file format, **text** or **xml**. The default format is **text**.

**NOTE:** The **upgrade-with-config** and **upgrade-with-config-format** options are only available locally on the router or switch. In a routing matrix, the configuration is applied only to the local router and is not propagated to other routers.

The options are validated during the validation process and applied to the router or switch during the upgrade process. If the upgrade process is successful, the options are removed from the configuration. If the upgrade process fails, the configuration file is renamed with the **.failed** suffix.

**Additional Information** By default, when you issue the **request system software validate** command on a TX Matrix master Routing Engine, all the T640 master Routing Engines that are connected to it are validated. If you issue the same command on the TX Matrix backup Routing Engine, all the T640 backup Routing Engines that are connected to it are upgraded to the same version of software.

Likewise, if you issue the **request system software validate** command on a TX Matrix Plus master Routing Engine, all the T1600 or T4000 master Routing Engines that are connected to it are validated. If you issue the same command on a TX Matrix Plus backup Routing Engine, all the T1600 or T4000 backup Routing Engines that are connected to it are upgraded to the same version of software.

## show system auto-snapshot

<b>Syntax</b>	<b>show system auto-snapshot</b>
<b>Release Information</b>	Command introduced in Junos OS Release 12.3 for EX Series switches. Command introduced in Junos OS Release 12.1X45-D10 for SRX Series devices.
<b>Description</b>	<p>Display automatic snapshot status information. When the automatic snapshot feature is enabled and the system reboots from the alternate root partition, the switch automatically takes a snapshot of the root file system in the alternate root partition and copies it onto the primary root partition. This automatic snapshot procedure takes place whenever the system reboots from the alternate partition, regardless of whether the reboot from the alternate partition is due to a command or due to a corruption of the primary partition.</p> <p>When the automatic snapshot procedure is in progress, you cannot run the manual snapshot command, <b>request system snapshot</b>.</p>
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding Resilient Dual-Root Partitions on Switches on page 695</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show system auto-snapshot on page 764</a>
<b>Output Fields</b>	<a href="#">Table 72 on page 763</a> describes the output fields for the <b>show system auto-snapshot</b> command. Output fields are listed in the approximate order in which they appear.

**Table 72: show system auto-snapshot status Output Fields**

Field Name	Field Description
<b>Auto-snapshot configuration</b>	<p>Status of the configuration:</p> <ul style="list-style-type: none"> <li>• <b>Enabled</b>—If the system reboots from the alternate partition, the automatic snapshot feature automatically takes a snapshot of the alternate partition and copies it onto the primary partition.</li> <li>• <b>Disabled</b>—The system does not automatically take a snapshot of the alternate partition. You must use the manual snapshot command, <b>request system snapshot</b>, to take a snapshot of one partition and copy it onto the other.</li> </ul>
<b>Auto-snapshot state</b>	<p>Status of the automatic snapshot procedure:</p> <ul style="list-style-type: none"> <li>• <b>Completed</b>—The automatic snapshot procedure has completed copying the alternate partition to the primary partition and the alarm has been cleared.</li> <li>• <b>Disabled</b>—The automatic snapshot procedure is inactive.</li> <li>• <b>In progress</b>—The automatic snapshot procedure is in progress. It takes about 10 to 15 minutes to complete, depending upon disk size.</li> </ul>

## Sample Output

### show system auto-snapshot

```
user@switch> show system auto-snapshot
Auto-snapshot Configuration: Enabled
Auto-snapshot State: Disabled
```

## show system boot-messages

<b>List of Syntax</b>	<a href="#">Syntax on page 765</a> <a href="#">Syntax (EX Series Switches) on page 765</a> <a href="#">Syntax (TX Matrix Router) on page 765</a> <a href="#">Syntax (TX Matrix Plus Router) on page 765</a> <a href="#">Syntax (MX Series Router) on page 765</a> <a href="#">Syntax (QFX Series) on page 765</a>
<b>Syntax</b>	show system boot-messages
<b>Syntax (EX Series Switches)</b>	show system boot-messages <all-members> <local> <member <i>member-id</i> >
<b>Syntax (TX Matrix Router)</b>	show system boot-messages <all-chassis   all-lcc   lcc <i>number</i>   scc>
<b>Syntax (TX Matrix Plus Router)</b>	show system boot-messages <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> >
<b>Syntax (MX Series Router)</b>	show system boot-messages <all-members> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	show system boot-messages infrastructure <i>name</i>   interconnect-device <i>name</i>   node-group <i>name</i>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display initial messages generated by the system kernel upon startup. These messages are the contents of <code>/var/run/dmesg.boot</code> .
<b>Options</b>	<b>none</b> —Display all boot time messages.  <b>all-chassis</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display boot time messages for all of the chassis.  <b>all-lcc</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display boot time messages for all T640 routers connected to a TX Matrix router. On a TX Matrix Plus router, display boot time messages for all connected T1600 or T4000 LCCs.  <b>all-members</b> —(EX4200 switches and MX Series routers only) (Optional) Display boot time messages on all members of the Virtual Chassis configuration.

**infrastructure *name***—(QFabric systems only) (Optional) Display boot time messages on the fabric control Routing Engine or fabric manager Routing engines.

**interconnect-device *name***—(QFabric systems only) (Optional) Display boot time messages on the Interconnect device.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display boot time messages for a specific T640 router connected to a TX Matrix router. On a TX Matrix Plus router, display boot time messages for a specific router connected to a TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display boot time messages on the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display boot time messages on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Display boot time messages on the Node group.

**scc**—(TX Matrix routers only) (Optional) Display boot time messages for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display boot time messages for the TX Matrix Plus router. Replace *number* with 0.

**Additional Information** By default, when you issue the **show system boot-messages** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

**Required Privilege Level** view

## show system license

<b>Syntax</b>	show system license <installed   keys   usage>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 13.3 for the MX104 3D Universal Edge Routers.
<b>Description</b>	Display licenses and information about how they are used.
<b>Options</b>	<p><b>none</b>—Display all license information.</p> <p><b>installed</b>—(Optional) Display installed licenses only.</p> <p><b>keys</b>—(Optional) Display a list of license keys. Use this information to verify that each expected license key is present.</p> <p><b>usage</b>—(Optional) Display the state of licensed features.</p>
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">show system license on page 773</a> <a href="#">show system license installed on page 774</a> <a href="#">show system license keys on page 774</a> <a href="#">show system license usage on page 774</a> <a href="#">show system license (MX104 Routers) on page 774</a> <a href="#">show system license installed (MX104 Routers) on page 775</a> <a href="#">show system license keys (MX104 Routers) on page 775</a> <a href="#">show system license usage (MX104 Routers) on page 775</a> <a href="#">show system license (MX104 Routers) on page 775</a> <a href="#">show system license installed (MX104 Routers) on page 776</a> <a href="#">show system license keys (MX104 Routers) on page 776</a> <a href="#">show system license usage (MX104 Routers) on page 776</a> <a href="#">show system license (MX104 Routers) on page 777</a> <a href="#">show system license installed (MX104 Routers) on page 777</a> <a href="#">show system license keys (MX104 Routers) on page 777</a> <a href="#">show system license usage (MX104 Routers) on page 778</a> <a href="#">show system license (QFX Series) on page 778</a>
<b>Output Fields</b>	Table 73 on page 772 lists the output fields for the <b>show system license</b> command. Output fields are listed in the approximate order in which they appear.

**Table 73: show system license Output Fields**

Field Name	Field Description
<b>Feature name</b>	Name assigned to the configured feature. You use this information to verify that all the features for which you installed licenses are present.

Table 73: show system license Output Fields (*continued*)

Field Name	Field Description
<b>Licenses used</b>	<p>Number of licenses used by a router or switch. You use this information to verify that the number of licenses used matches the number configured. If a licensed feature is configured, the feature is considered used.</p> <p><b>NOTE:</b> In Junos OS Release 10.1 and later, the <b>Licenses used</b> column displays the actual usage count based on the number of active sessions or connections as reported by the corresponding feature daemons. This is applicable for scalable license-based features such as Subscriber Access (<b>scale-subscriber</b>), L2TP (<b>scale-l2tp</b>), Mobile IP (<b>scale-mobile-ip</b>), and so on.</p>
<b>Licenses installed</b>	<p>Information about the installed license key:</p> <ul style="list-style-type: none"> <li>• <b>License identifier</b>—Identifier associated with a license key.</li> <li>• <b>State</b>—State of the license key: <b>valid</b> or <b>invalid</b>. An <b>invalid</b> state indicates that the key was entered incorrectly or is not valid for the specific device.</li> <li>• <b>License version</b>—Version of a license. The version indicates how the license is validated, the type of signature, and the signer of the license key.</li> <li>• <b>Valid for device</b>—Device that can use a license key.</li> <li>• <b>Group defined</b>—Group membership of a device.</li> <li>• <b>Features</b>—Feature associated with a license, such as data link switching (DLSw).</li> </ul>
<b>Licenses needed</b>	Number of licenses required for features being used but not yet properly licensed.
<b>Expiry</b>	Amount of time left within the grace period before a license is required for a feature being used.

## Sample Output

### show system license

```
user@host> show system license
```

```
License usage:
```

Feature name	Licenses used	Licenses installed	Licenses needed	Expiry
subscriber-accounting	2	2	0	permanent
subscriber-authentication	1	2	0	permanent
subscriber-address-assignment	2	2	0	permanent
subscriber-vlan	2	2	0	permanent
subscriber-ip	0	2	0	permanent
scale-subscriber	2	3	0	permanent
scale-l2tp	4	5	0	permanent
scale-mobile-ip	1	2	0	permanent

```
Licenses installed:
```

```
License identifier: XXXXXXXXXX
```

```
License version: 2
```

```
Features:
```

```
subscriber-accounting - Per Subscriber Radius Accounting
permanent
subscriber-authentication - Per Subscriber Radius Authentication
permanent
subscriber-address-assignment - Radius/SRC Address Pool Assignment
permanent
subscriber-vlan - Dynamic Auto-sensed Vlan
```

```

    permanent
subscriber-ip    - Dynamic and Static IP
    permanent

```

### show system license installed

```

user@host> show system license installed
License identifier: XXXXXXXXXX
License version: 2
Features:
  subscriber-accounting - Per Subscriber Radius Accounting
    permanent
  subscriber-authentication - Per Subscriber Radius Authentication
    permanent
  subscriber-address-assignment - Radius/SRC Address Pool Assignment
    permanent
  subscriber-vlan - Dynamic Auto-sensed Vlan
    permanent
  subscriber-ip - Dynamic and Static IP
    permanent

```

### show system license keys

```

user@host> show system license keys
XXXXXXXXXX xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx
          xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx
          xxxxxx xxxxxx xxx

```

### show system license usage

```

user@host> show system license usage
License usage:

```

Feature name	Licenses used	Licenses installed	Licenses needed	Expiry
subscriber-accounting	2	2	0	permanent
subscriber-authentication	1	2	0	permanent
subscriber-address-assignment	2	2	0	permanent
subscriber-vlan	2	2	0	permanent
subscriber-ip	0	2	0	permanent
scale-subscriber	2	3	0	permanent
scale-l2tp	4	5	0	permanent
scale-mobile-ip	1	2	0	permanent

### show system license (MX104 Routers)

In the following output, ports 0 and 1 are activated by installing the license to activate the first two built-in ports.

```

user@host> show system license
License usage:

```

Feature name	Licenses used	Licenses installed	Licenses needed	Expiry
scale-subscriber	0	1000	0	permanent
scale-l2tp	0	1000	0	permanent
scale-mobile-ip	0	1000	0	permanent
MX104-2x10Gig-port-0-1	0	1	0	permanent

```

Licenses installed:
License identifier: XXXXXXXXXX
License version: 2
Features:

```

```

MX104-2x10Gig-port-0-1 - MX104 2X10Gig Builtin Port(xe-2/0/0 & xe-2/0/1)
upgrade
    permanent

```

### show system license installed (MX104 Routers)

In the following output, ports 0 and 1 are activated by installing the license to activate the first two built-in ports.

```

user@host > show system license installed
License identifier: XXXXXXXXXX
License version: 2
Features:
MX104-2x10Gig-port-0-1 - MX104 2X10Gig Builtin Port(xe-2/0/0 & xe-2/0/1)
upgrade
    permanent

```

### show system license keys (MX104 Routers)

In the following output, ports 0 and 1 are activated by installing the license to activate the first two built-in ports.

```

user@host > show system license keys

XXXXXXXXXX xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx
          xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx
          xxxxxx xxxx

```

### show system license usage (MX104 Routers)

In the following output, ports 0 and 1 are activated by installing the license to activate the first two built-in ports.

```

user@host > show system license usage

```

Feature name	Licenses used	Licenses installed	Expiry needed	
scale-subscriber	0	1000	0	permanent
scale-l2tp	0	1000	0	permanent
scale-mobile-ip	0	1000	0	permanent
MX104-2x10Gig-port-0-1	0	1	0	permanent

### show system license (MX104 Routers)

In the following output, ports 2 and 3 are activated by installing the license to activate the next two built-in ports after installing the license to activate the first two built-in ports.

```

user@host > show system license
License usage:

```

Feature name	Licenses used	Licenses installed	Licenses needed	Expiry
scale-subscriber	0	1000	0	permanent
scale-l2tp	0	1000	0	permanent
scale-mobile-ip	0	1000	0	permanent
MX104-2x10Gig-port-0-1	0	1	0	permanent
MX104-2x10Gig-port-2-3	0	1	0	permanent

```

Licenses installed:
License identifier: XXXXXXXXXX
License version: 2

```

```

Features:
  MX104-2x10Gig-port-0-1 - MX104 2X10Gig Builtin Port(xe-2/0/0 & xe-2/0/1)
upgrade
  permanent

License identifier: XXXXXXXXXX
License version: 2
Features:
  MX104-2x10Gig-port-2-3 - MX104 2X10Gig Builtin Port(xe-2/0/2 & xe-2/0/3)
upgrade
  permanent

```

### show system license installed (MX104 Routers)

In the following output, ports 2 and 3 are activated by installing the license to activate the next two built-in ports after installing the license to activate the first two built-in ports.

```

user@host > show system license installed
License identifier: XXXXXXXXXX
License version: 2
Features:
  MX104-2x10Gig-port-0-1 - MX104 2X10Gig Builtin Port(xe-2/0/0 & xe-2/0/1)
upgrade
  permanent

License identifier: XXXXXXXXXX
License version: 2
Features:
  MX104-2x10Gig-port-2-3 - MX104 2X10Gig Builtin Port(xe-2/0/2 & xe-2/0/3)
upgrade
  permanent

```

### show system license keys (MX104 Routers)

In the following output, ports 2 and 3 are activated by installing the license to activate the next two built-in ports after installing the license to activate the first two built-in ports.

```

user@host > show system license keys

XXXXXXXXXX xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx
          xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx
          xxxxxx xxxx

XXXXXXXXXX xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx
          xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx xxxxxx
          xxxxxx xxxx

```

### show system license usage (MX104 Routers)

In the following output, ports 2 and 3 are activated by installing the license to activate the next two built-in ports after installing the license to activate the first two built-in ports.

```

user@host > show system license usage

```

Feature name	Licenses used	Licenses installed	Expiry needed	
scale-subscriber	0	1000	0	permanent

<b>Output Fields</b>	<a href="#">Table 75 on page 782</a> describes the output fields for the <b>show system storage partitions</b> command. Output fields are listed in the approximate order in which they appear.

**Table 75: show system storage partitions Output Fields**

Field Name	Field Description
Boot Media	Media (internal or external) from which the switch was booted.
Active Partition	Name of the active root partition.
Backup Partition	Name of the backup (alternate) root partition.
Currently booted from	Partition from which the switch was last booted.
Partitions information	Information about partitions on the boot media: <ul style="list-style-type: none"> <li>• Partition—Partition identifier.</li> <li>• Size—Size of partition.</li> <li>• Mountpoint—Directory on which the partition is mounted.</li> </ul>

## Sample Output

### show system storage partitions

```
user@switch> show system storage partitions
fpc0:
-----
Boot Media: internal (da0)
Active Partition: da0s1a
Backup Partition: da0s2a
Currently booted from: active (da0s1a)

Partitions information:
  Partition  Size  Mountpoint
  s1a        184M  /
  s2a        184M  altroot
  s3d        369M  /var/tmp
  s3e        123M  /var
  s4d         62M  /config
  s4e                unused (backup config)
```

## Troubleshooting Software Installation

---

This topic describes troubleshooting issues with software installations on EX Series switches.

- [Recovering from a Failed Software Upgrade on an EX Series Switch on page 785](#)
- [Rebooting from the Inactive Partition on page 786](#)
- [Freeing Disk Space for Software Installation on page 787](#)
- [Installation from the Boot Loader Generates 'cannot open package' Error on page 787](#)

## Recovering from a Failed Software Upgrade on an EX Series Switch

**Problem**    **Description:** If Junos OS loads but the CLI is not working, or if the switch has no software installed, use this recovery installation procedure to install Junos OS.

**Solution**    If there is already a Junos OS image on the system, you can either install the new Junos OS package in a separate partition and have both Junos OS images remain on the system, or you can wipe the disk clean before the new installation proceeds.

If there is no Junos OS image on the system, follow the instructions in "[Booting an EX Series Switch Using a Software Package Stored on a USB Flash Drive](#)" on page 712 to get an image on the system and boot the switch.

To perform a recovery installation:

1. Power on the switch. The loader script starts.

After the message **Loading /boot/defaults/loader.conf** displays, you are prompted with:

**Hit [Enter] to boot immediately, or space bar for command prompt.**

2. Press the space bar to enter the manual loader. The **loader>** prompt displays.

3. Enter the following command:

```
loader> install [--format] [--external] source
```

where:

- **format**—Use this option to wipe the installation media before installing the software package. If you do not include this option, the system installs the new Junos OS package in a different partition from the partition used by the most recently installed Junos OS package.
- **external**—Use this option to install the software package on an external medium.
- **source**—Represents the name and location of the Junos OS package either on a server on the network or as a file on the USB flash drive:
  - Network address of the server and the path on the server; for example, **tftp://192.171.28/junos/jinstall-ex-4200-9.4R1.5-domestic-signed.tgz**
  - The Junos OS package on a USB device is commonly stored in the root drive as the only file; for example, **file:///jinstall-ex-4200-9.4R1.5-domestic-signed.tgz**

The boot process proceeds as normal and ends with a login prompt.

## Rebooting from the Inactive Partition

**Problem**    **Description:** EX Series switches shipped with Junos OS Release 10.4R2 or earlier have Junos OS loaded on the system disk in partition 1. The first time you upgrade, the new software package is installed in partition 2. When you finish the installation and reboot, partition 2 becomes the active partition. Similarly, subsequent software packages are installed in the inactive partition, which becomes the active partition when you reboot at the end of the installation process.

On switches shipped with Release 10.4R3 and later, the same Junos OS image is loaded in each of the two root partitions, and you should copy the new software image to the alternate partition each time you upgrade.

If you performed an upgrade and rebooted, the system resets the active partition. You can use this procedure to manually boot from the inactive partition.

**NOTE:** If you have completed the installation of the software image but have not yet rebooted, issue the **request system software rollback** command to return to the original software installation package.

**Solution**    Reboot from the inactive partition:

```
user@switch> request system reboot slice alternate
```

**NOTE:** If you cannot access the CLI, you can reboot from the inactive partition using the following procedure from the loader script prompt:

1. Unload and clear the interrupted boot from the active partition:

```
loader> unload
loader> unset vfs.root.mountfrom
```

2. Select the new (inactive) partition to boot from:

```
loader> set currdev=diskxsy:
```

where *x* is either 0 (internal) or 1 (external) and the *y* indicates the number of the inactive partition, either 1 or 2.

You must include the colon (:) at the end of this command.

3. Boot Junos OS from the inactive partition:

```
loader> boot
```

## Freeing Disk Space for Software Installation

**Problem**    **Description:** The software installation process requires a certain amount of unused disk space. If there is not enough space, you might receive an error message such as:

```
fetch: /var/tmp/incoming-package.tgz: No space left on device
```

**Solution**    Identify and delete unnecessary files by using the [request system storage cleanup](#) command.

## Installation from the Boot Loader Generates 'cannot open package' Error

**Problem**    **Description:** When installing a Junos OS software image from the loader prompt, a "cannot open package error" is generated:

```
loader> install - -format
tftp://10.204.33.248/images/Flash_corr/official/jinstall-ex-4200-10.4I2011012-domestic-signed.tgz
Speed: 1000, full duplex
bootp: no reply
No response for RARP request
net_open: RARP failed
cannot open package (error 5)
```

**Solution**    This might be due to the IP address, gateway IP address, netmask address, or server IP address not being properly set. You can set these values either from the shell or from the u-boot prompt.

To set these values from the shell:

```
% nvram setenv ipaddr 10.204.35.235
% nvram setenv netmask 255.255.240.0
```

```
% nvram setenv gatewayip 10.204.47.254
```

```
% nvram setenv serverip 10.204.33.248
```

To set these values from the u-boot prompt, log in to a console connection, reboot, and stop at the u-boot prompt (Cntrl+c):

```
=> setenv ipaddr 10.204.35.235
```

```
=> setenv gatewayip 10.204.47.254
```

```
=> setenv serverip 10.204.33.248
```

```
=> setenv netmask 255.255.240.0
```

```
=> saveenv
```

```
=> printenv Verify whether variables are set properly or not
```

```
=> boot
```

## Troubleshooting a Switch That Has Booted from the Backup Junos OS Image

**Problem** **Description:** The switch boots from the backup root file partition. It is possible that the primary copy of JUNOS OS failed to boot properly, which could indicate that it is corrupted. This event is flagged in two ways:

- Upon login through the console or management port, the following warning message is displayed:

```
WARNING: THIS DEVICE HAS BOOTED FROM THE BACKUP JUNOS IMAGE
```

It is possible that the primary copy of JUNOS failed to boot up properly, and so this device has booted from the backup copy.

Please re-install JUNOS to recover the primary copy in case it has been corrupted.

- The following alarm message is generated:

```
user@switch> show chassis alarms
1 alarms currently active
Alarm time           Class  Description
2011-02-17 05:48:49 PST  Minor  Host 0 Boot from backup root
```

If the switch is in a Virtual Chassis, the switch member number appears in the **Description** field, where the switch is called a host.

**Solution** Install a new Junos OS image on the partition that had the corruption, or take a snapshot (use [request system snapshot](#)) of the currently active partition and use it to replace the image in the alternate partition:

If the switch is a standalone switch or a Virtual Chassis master switch, enter this command:

```
user@switch> request system snapshot slice alternate
```

If the switch is a Virtual Chassis member switch (not the master), enter this command on the Virtual Chassis:

```
user@switch> request system snapshot slice alternate member member-id
```

where *member-id* is the Virtual Chassis member ID number.

## Resilient Dual-Root Partitions Frequently Asked Questions

**NOTE:** This task uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Resilient Dual-Root Partitions Frequently Asked Questions*. For ELS details, see “[Getting Started with Enhanced Layer 2 Software](#)” on page 3.

This FAQ addresses questions regarding resilient dual-root partitions on EX Series switches. The resilient dual-root partition feature was introduced on EX Series switches at Junos OS Release 10.4R3. It provides additional resiliency for EX Series switches.

This FAQ covers the following questions:

- [What Happens to My Files If the System Detects a File System Corruption and Automatic Snapshot is Enabled? on page 789](#)
- [What Happens to My Files If the System Detects a File System Corruption and Automatic Snapshot is Not Enabled? on page 790](#)
- [How Will I Be Informed If My Switch Boots from the Alternate Slice Because of Corruption in the Root File System? on page 791](#)

### What Happens to My Files If the System Detects a File System Corruption and Automatic Snapshot is Enabled?

If the automatic snapshot feature is enabled during a reboot, the system automatically takes a snapshot of Junos OS from the alternate root partition (Slice 2) and copies it onto the primary root partition (Slice 1). The system checks each file system partition for corruption. [Table 76 on page 790](#) shows the action the system takes if corruption is detected and the corrective action that you can take.

**Table 76: Actions If Corrupt Files Are Found and Automatic Snapshot is Enabled**

Slice 1	Slice 2	Slice 3		Slice 4
s1a	s2a	s3e	s3d	s4d
/	/	/var	/var/tmp	/config
(root Junos OS)	(root Junos OS)			
If a root directory (/) is corrupted, the corrupted file system is not mounted. The switch automatically takes a snapshot of the Junos OS root file system and copies it onto the primary root partition. It boots from the alternate slice, but the next reboot happens from the primary slice.		During early boot, the integrity of /var, /var/tmp, and /config files is verified. If they are corrupted, the corrupted slice is reformatted and the file directory in that slice is lost.		
Corrective action: No corrective action is required.		Corrective action: Restore the /var or /config files from the external backup.		

### What Happens to My Files If the System Detects a File System Corruption and Automatic Snapshot is Not Enabled?

During a reboot, the system checks each file system partition for corruption. [Table 77 on page 790](#) shows the action the system takes if corruption is detected and the corrective action that you can take.

**Table 77: Actions If Corrupt Files Are Found**

Slice 1	Slice 2	Slice 3		Slice 4
s1a	s2a	s3e	s3d	s4d
/	/	/var	/var/tmp	/config
(root Junos OS)	(root Junos OS)			
If a root directory (/) is corrupted, the corrupted file system is not mounted and the switch boots from the alternate slice.		During early boot, the integrity of /var, /var/tmp, and /config files is verified. If they are corrupted, the corrupted slice is reformatted and the file directory in that slice is lost.		
Corrective action: Issue a <a href="#">request system snapshot</a> command from the good root directory to the corrupted slice.		Corrective action: Restore the /var or /config files from the external backup.		

## How Will I Be Informed If My Switch Boots from the Alternate Slice Because of Corruption in the Root File System?

If the switch detects corruption in the primary root file system, it boots from the alternate root partition. When this occurs, the type of notification depends on whether you have enabled the automatic snapshot feature or not:

- If the automatic snapshot feature is not enabled:

- If you are logged in through the console port or the management port:

```
WARNING: THIS DEVICE HAS BOOTED FROM THE BACKUP JUNOS IMAGE
```

It is possible that the primary copy of JUNOS failed to boot up properly, and so this device has booted from the backup copy.

Please re-install JUNOS to recover the primary copy in case it has been corrupted.

- The following message is displayed when you issue **show chassis alarms**:

```
user@switch> show chassis alarms
1 alarms currently active
Alarm time          Class  Description
2011-02-17 05:48:49 PST  Minor  Host 0 Boot from backup root
```

- If the automatic snapshot feature is enabled:
  - A banner message appears, indicating that an automatic snapshot operation is in progress. The banner message disappears when the snapshot operation is complete.
  - No alarm is issued to indicate that the switch has been rebooted from the alternate partition. However, the switch does log the event.

## Software Overview

---

- [Understanding Software Infrastructure and Processes on page 795](#)

### Understanding Software Infrastructure and Processes

Each switch runs the Juniper Networks Junos operating system (Junos OS) for Juniper Networks EX Series Ethernet Switches on its general-purpose processors. Junos OS includes processes for Internet Protocol (IP) routing and for managing interfaces, networks, and the chassis.

The Junos OS runs on the Routing Engine. The Routing Engine kernel coordinates communication among the Junos OS processes and provides a link to the Packet Forwarding Engine.

With the J-Web interface and the command-line interface (CLI) to the Junos OS, you configure switching features and routing protocols and set the properties of network interfaces on your switch. After activating a software configuration, use either the J-Web or CLI user interface to monitor the switch, manage operations, and diagnose protocol and network connectivity problems.

- [Routing Engine and Packet Forwarding Engine on page 795](#)
- [Junos OS Processes on page 796](#)

### Routing Engine and Packet Forwarding Engine

---

A switch has two primary software processing components:

- **Packet Forwarding Engine**—Processes packets; applies filters, routing policies, and other features; and forwards packets to the next hop along the route to their final destination.
- **Routing Engine**—Provides three main functions:

- Creates the packet forwarding switch fabric for the switch, providing route lookup, filtering, and switching on incoming data packets, then directing outbound packets to the appropriate interface for transmission to the network
- Maintains the routing tables used by the switch and controls the routing protocols that run on the switch.
- Provides control and monitoring functions for the switch, including controlling power and monitoring system status.

### Junos OS Processes

The Junos OS running on the Routing Engine and Packet Forwarding Engine consists of multiple processes that are responsible for individual functions.

The separation of functions provides operational stability, because each process accesses its own protected memory space. In addition, because each process is a separate software package, you can selectively upgrade all or part of the Junos OS, for added flexibility.

[Table 6 on page 30](#) describes the primary Junos OS processes.

**Table 78: Junos OS Processes**

Process	Name	Description
Chassis process	chassisd	<p>Detects hardware on the system that is used to configure network interfaces.</p> <p>Monitors the physical status of hardware components and field-replaceable units (FRUs), detecting when environment sensors such as temperature sensors are triggered.</p> <p>Relays signals and interrupts—for example, when devices are taken offline, so that the system can close sessions and shut down gracefully.</p>
Ethernet switching process	eswd	<p>Handles Layer 2 switching functionality such as MAC address learning, Spanning Tree protocol and access port security. The process is also responsible for managing Ethernet switching interfaces, VLANs, and VLAN interfaces.</p> <p>Manages Ethernet switching interfaces, VLANs, and VLAN interfaces.</p>
Forwarding process	pfem	<p>Defines how routing protocols operate on the switch. The overall performance of the switch is largely determined by the effectiveness of the forwarding process.</p>
Interface process	dcd	<p>Configures and monitors network interfaces by defining physical characteristics such as link encapsulation, hold times, and keepalive timers.</p>

Table 78: Junos OS Processes (*continued*)

Process	Name	Description
Management process	mgd	<p>Provides communication between the other processes and an interface to the configuration database.</p> <p>Populates the configuration database with configuration information and retrieves the information when queried by other processes to ensure that the system operates as configured.</p> <p>Interacts with the other processes when commands are issued through one of the user interfaces on the switch.</p> <p>If a process terminates or fails to start when called, the management process attempts to restart it a limited number of times to prevent thrashing and logs any failure information for further investigation.</p>
Routing protocol process	rpd	Defines how routing protocols such as RIP, OSPF, and BGP operate on the device, including selecting routes and maintaining forwarding tables.

## Alarms Overview

- [Understanding Alarm Types and Severity Levels on EX Series Switches on page 797](#)

### Understanding Alarm Types and Severity Levels on EX Series Switches

**NOTE:** This topic applies only to the J-Web Application package.

Alarms alert you to conditions that might prevent normal operation of the switch. Before monitoring alarms on a Juniper Networks EX Series Ethernet switch, become familiar with the terms defined in [Table 79 on page 797](#).

Table 79: Alarm Terms

Term	Definition
<b>alarm</b>	Signal alerting you to conditions that might prevent normal operation. On a switch, the alarm signal is the <b>ALM</b> LED lit on the front of the chassis.
<b>alarm condition</b>	Failure event that triggers an alarm.
<b>alarm severity</b>	Seriousness of the alarm. If the Alarm ( <b>ALM</b> ) LED is red, this indicates a major alarm. If the Alarm LED is yellow, this indicates a minor alarm. If the Alarm LED is unlit, there is no alarm or the switch is halted.

Table 79: Alarm Terms (*continued*)

Term	Definition
<b>chassis alarm</b>	Preset alarm triggered by a physical condition on the switch such as a power supply failure, excessive component temperature, or media failure.
<b>system alarm</b>	Preset alarm triggered by a missing rescue configuration or failure to install a license for a licensed software feature.  <b>NOTE:</b> On EX6200 switches, a system alarm can be triggered by an internal link error.

### Alarm Types

The switch supports these alarms:

- Chassis alarms indicate a failure on the switch or one of its components. Chassis alarms are preset and cannot be modified.
- System alarms indicate a missing rescue configuration. System alarms are preset and cannot be modified, although you can configure them to appear automatically in the J-Web interface display or the CLI display.

### Alarm Severity Levels

Alarms on switches have two severity levels:

- Major (red)—Indicates a critical situation on the switch that has resulted from one of the following conditions. A red alarm condition requires immediate action.
  - One or more hardware components have failed.
  - One or more hardware components have exceeded temperature thresholds.
  - An alarm condition configured on an interface has triggered a critical warning.
- Minor (yellow or amber)—Indicates a noncritical condition on the switch that, if left unchecked, might cause an interruption in service or degradation in performance. A yellow alarm condition requires monitoring or maintenance.

A missing rescue configuration generates a yellow system alarm.

- Related Documentation**
- [Checking Active Alarms with the J-Web Interface on page 842](#)
  - [Dashboard for EX Series Switches on page 799](#)

## Dashboard Overview

- [Dashboard for EX Series Switches on page 799](#)

## Dashboard for EX Series Switches

**NOTE:** This topic applies only to the J-Web Application package.

When you log in to the J-Web user interface, the dashboard for the Juniper Networks EX Series Ethernet Switches appears. Use the dashboard to view system information.

The Update Available window appears if there is a latest update of the J-Web Application package available on the Juniper Networks server. This window is enabled by the auto update feature of J-Web.

**NOTE:**

- The Update Available window will *not* appear when you log in, if you have not selected the Check for updates automatically on every login in the *Update Preference* section in the Maintain > Update J-Web side pane. By default, the *Check for update automatically on every login* is selected.
- If you choose *Update Later*, you can update to the latest J-Web Application package by clicking the orange icon next to *Update Available* on the top pane of the J-Web interface or through Maintain > Update J-Web.

The dashboard comprises a graphical chassis viewer and four panels.

This topic describes:

- [Graphical Chassis Viewer on page 799](#)
- [System Information Panel on page 801](#)
- [Health Status Panel on page 803](#)
- [Capacity Utilization Panel on page 805](#)
- [Alarms Panel on page 805](#)
- [File System Usage on page 806](#)
- [Chassis Viewer on page 806](#)

### Graphical Chassis Viewer

The Dashboard panel displays a graphical view of the chassis of a switch. In a Virtual Chassis, it displays a graphical view of each member switch.

In a Virtual Chassis, the default values are shown on the Dashboard panel when no chassis image is clicked. The panel displays the value for a switch if you click its image.

**NOTE:** If the member switch is not present, inactive, or not provisioned, you cannot expand the member switch image.

Table 80 on page 800 lists the details that are displayed on each member switch.

**Table 80: Details of a Virtual Chassis Member Switch**

Details	Example
Model number of the member switch	<b>EX3300</b>
Assigned ID that applies to the entire Virtual Chassis configuration	<b>ID 2</b>  <b>NOTE:</b> If the member switch is not provisioned, the serial number of the switch is displayed instead of its ID.
Role of the member switch	<b>Master</b>  Possible roles are: <b>Master</b> , <b>Backup</b> , or <b>Linecard</b>
Status of the member switch	<b>Prsnt</b>  Possible statuses are: <b>Prsnt</b> , <b>NotPrsnt</b> , <b>Inactive</b> , or <b>Unprvsnd</b>

The status of the member switch is displayed on the image of the switch. If the member switch appears dimmed, it means the switch is not present, is inactive, or is not provisioned in the Virtual Chassis. If the member switch does not appear dimmed, it means the switch is present and is active.

Table 81 on page 800 describes the possible status of a member switch.

**Table 81: Status of a Member Switch in a Virtual Chassis**

If the member switch is	It appears as	It means the member switch
Present	<b>Prsnt</b>	Has established physical and logical connections with Virtual Chassis member switches.
Not present	dimmed and <b>NotPrsnt</b>	Has been disconnected from the existing Virtual Chassis.
Inactive	dimmed and <b>Inactive</b>	Has established physical connections, but is unable to establish logical connections.
Not provisioned	dimmed and <b>Unprvsnd</b>	Cannot synchronize with the existing preprovisioned Virtual Chassis.

Click **Rear View** for a graphical view of the rear panel of the switch.

Click **Preferences** to choose which panels must be displayed and set the refresh interval for chassis viewer information. Click **OK** to save your changes and return to the dashboard or click **Cancel** to return to the dashboard without saving changes.

**NOTE:** You can drag the various panels to different locations in the J-Web window.

### System Information Panel

Table 82: System Information

Field	Description
System name	Indicates the local name of the EX Series switch. The local name of the EX Series switches changes when an individual image is clicked.
Device model	<p>Indicates the model of the EX Series switch. In a Virtual Chassis configuration, to indicate the model of a switch, click the image of that switch.</p> <p><b>NOTE:</b> In a Virtual Chassis setup for an EX6210, EX8208, or EX8216 switch, the Device model field displays details of the master Routing Engine. To view details of a member, select it.</p>

Table 82: System Information (*continued*)

Field	Description
Inventory details	<p>Indicates the following:</p> <ul style="list-style-type: none"> <li>For EX3200 switches; and for EX2200, EX2200-C, EX3300, EX4200, EX4300, EX4500, and EX4550 switches that are not configured as Virtual Chassis, the value displayed in Inventory details field is always 1 FPC. FPC is a legacy term for a slot in a large Juniper Networks chassis; which simply refers to the standalone switch.</li> <li>For EX2200 and EX2200-C switches configured as a Virtual Chassis, the value displayed in the Inventory details field is 1–4 FPC, with the number corresponding to the number of member switches.</li> <li>For EX3300 switches configured as a Virtual Chassis, the value displayed in the Inventory details field is 1–6 FPC, with the number corresponding to the number of member switches.</li> </ul> <p><b>NOTE:</b> For Junos OS Release 14.1X53-D10 and later, EX3300 switches configured as a Virtual Chassis display the value 1–10 FPC in the Inventory details field.</p> <ul style="list-style-type: none"> <li>For EX4200, EX4500, and EX4550 switches configured as a Virtual Chassis, the value displayed in the Inventory details field is 1–10 FPC, with the number corresponding to the number of member switches.</li> <li>For EX6210 switches, the values displayed in the Inventory details field are 1–2 CB and 1–9 FPC. CB, or Control Board, refers to the SRE module. FPC refers to line cards and the FPC within the CB.</li> <li>For an EX8208 switch, the values displayed in Inventory details field are 1–3 CB and 0–8 FPC. CB, or Control Board, refers to SRE and SF modules. FPC refers to line cards.</li> <li>For EX8216 switches, the values displayed in Inventory details field are 1–2 CB and 0–16 FPC. CB, or Control Board, refers to RE modules and FPC refers to line cards.</li> <li>For an XRE200 External Routing Engine in an EX8200 Virtual Chassis, the value displayed in Inventory details is 1 XRE. XRE refers to RE modules. For XRE200 External Routing Engines configured as a Virtual Chassis, the values displayed in Inventory details are 1–2 XRE and 0–4 LCC, where LCC refers to the EX8200 line card chassis.</li> </ul>
Junos image	Indicates the version of the Junos OS image. In a Virtual Chassis configuration, the Junos OS image of the master switch is displayed by default. To display the Junos OS image of a specific switch, click the image of that switch.
Boot image	Indicates the version of the boot image that is used. In a Virtual Chassis configuration, the boot image of the master switch is displayed by default. To display the boot image of a specific switch, click the image of that switch.

Table 82: System Information (*continued*)

Field	Description
Device uptime	Indicates the time since the last reboot. In a Virtual Chassis configuration, to display the uptime of the specific switch, click the image of that switch.
Last configured time	Indicates the time when the switch was last configured.

### Health Status Panel

Table 83: Health Status

Field	Description
<b>EX2200, EX2200-C, EX3200, EX3300, EX4200, and EX4300 Switches</b>	
Memory util.	<p>Indicates the memory used in the Routing Engine. In a Virtual Chassis configuration, the memory utilization value of the master Routing Engine is displayed.</p> <p><b>NOTE:</b> In EX4300 Virtual Chassis, to display the Routing Engine memory utilization of the master or backup, click the respective image.</p>
Flash	<p>Indicates the usage and capacity of internal flash memory and any external USB flash drive.</p> <p><b>NOTE:</b> In EX4300 Virtual Chassis, the flash memory utilization of the master switch is displayed by default. To display the flash memory utilization along with the internal and external flash memory utilization details for each switch or line card, mouse over individual switch or line card images.</p>
Temp.	<p>Indicates the chassis temperature status. Temperatures are listed in Celsius and the corresponding Fahrenheit values.</p> <p><b>NOTE:</b> The <b>Temp</b> field is unavailable for a standalone EX2200-C switch.</p> <p>The <b>Temp</b> field is dynamically available for an EX2200 Virtual Chassis switch based on the model of the member clicked.</p> <p><b>NOTE:</b> In EX4300 Virtual Chassis, the temperature of the master Routing Engine is displayed by default. To display the temperature of the Routing Engine of any switch, click the image of that switch.</p>
CPU load	<p>Indicates the average CPU usage over 15 minutes. In a Virtual Chassis configuration, on loading the master or backup switch, the CPU load for that switch's Routing Engine is displayed by default. To display the CPU load for a specific switch's Routing Engine, click the image of that switch.</p>
Fan status	<p>Indicates the status of the fans in the fan tray. The possible values are <b>OK</b>, <b>Failed</b>, and <b>Absent</b>. In a Virtual Chassis configuration, the fan status of the master switch is displayed by default. To display the fan status for any switch, click the image of that switch.</p> <p><b>NOTE:</b> The <b>Fan status</b> field is unavailable for a standalone EX2200-C switch.</p> <p>The <b>Fan status</b> field is dynamically available for an EX2200 Virtual Chassis switch based on the model of the member clicked.</p>

### EX4500 and EX4550 Switches

Table 83: Health Status (*continued*)

Field	Description
Memory util.	Indicates the memory used in the Routing Engine. In a Virtual Chassis configuration, the memory utilization value of the master Routing Engine is displayed.
Flash	Indicates the usage and capacity of internal flash memory and any external USB flash drive.
Temp.	Indicates the chassis temperature status. Temperatures in the dashboard are listed in Celsius and the corresponding Fahrenheit values.  <b>NOTE:</b> The <b>Temp</b> field is unavailable for an EX4500 switch.
CPU load	Indicates the average CPU usage over 15 minutes.
Fan status	Indicates the status of the fans in the fan tray. The possible values are <b>OK</b> , <b>Failed</b> , and <b>Absent</b> . This field also indicates the direction of airflow of the fan tray. The possible values are <b>Front to back</b> and <b>Back to front</b> .
<b>EX6210 Switches</b>	
Memory util.	Indicates the memory used in the master Routing Engine. Click the <b>backup Routing Engine</b> to view the memory used in the backup Routing Engine.
CPU load	Indicates the average CPU usage over 15 minutes.
Flash	Indicates the usage and capacity of internal flash memory and any external USB flash drive.
Fan status	Indicates the status of the fans in the fan tray. The possible values are <b>OK</b> , <b>Failed</b> , and <b>Absent</b> .
<b>EX8208 Switches</b>	
Memory util.	Indicates the memory used in the external Routing Engine. In an EX8200 Virtual Chassis, the memory utilization value of the XRE200 External Routing Engine in the master role is displayed. Click the <b>XRE200 External Routing Engine</b> in the backup role to view the memory used in the backup external Routing Engine.
CPU load	Indicates the average CPU usage over 15 minutes.
Flash	Indicates the usage and capacity of internal flash memory and any external USB flash drive.
<b>EX8216 Switches</b>	
Memory util.	Indicates the memory used in the external Routing Engine. In an EX8200 Virtual Chassis, the memory utilization value of the XRE200 External Routing Engine in the master role is displayed. Click the <b>XRE200 External Routing Engine</b> in the backup role to view the memory used in the backup external Routing Engine.
CPU load	Indicates the average CPU usage over 15 minutes.
Flash	Indicates the usage and capacity of internal flash memory and any external USB flash drive.
<b>XRE200 External Routing Engines</b>	

Table 83: Health Status (*continued*)

Field	Description
Memory util.	Indicates the memory used in the external Routing Engine. In an EX8200 Virtual Chassis, the memory utilization value of the XRE200 External Routing Engine in the master role is displayed. Click the backup XRE200 External Routing Engine to view the memory used in backup external Routing Engine.
CPU load	Indicates the average CPU usage over 15 minutes.
Flash	Indicates the usage and capacity of internal flash memory and any external USB flash drive.
Fan Status	Indicates the status of the fans in the fan tray. The possible values are <b>OK</b> , <b>Failed</b> , and <b>Absent</b> .

### Capacity Utilization Panel

Table 84: Capacity Utilization

Field	Description
Number of active ports	Indicates the number of active ports in the switch. Configured Virtual Chassis ports (VCPs) are considered as active ports.
Total number of ports	Indicates the number of ports in the switch.  <b>NOTE:</b> In EX3300 Virtual Chassis, the total number of ports of all of the switches is displayed.
Used-up MAC-Table entries	Indicates the number of MAC table entries.
Supported MAC-Table entries	Indicates the maximum number of MAC table entries permitted.
Number of VLANs configured	Indicates the number of VLANs configured.  <b>NOTE:</b> Only tagged VLANs are counted.
Number of VLANs supported	Indicates the maximum number of VLANs supported.

### Alarms Panel

Displays information about the last five alarms raised in the system. For example, if there are 5 major alarms, then details of all 5 major alarms are displayed. If there are 4 major alarms and 3 minor alarms, then details of the 4 major alarms and 1 minor alarm are displayed. Major alarms are displayed in red and minor alarms are displayed in yellow.

In an EX8200 Virtual Chassis, the top 5 alarms for the master external Routing Engine are displayed by default. If you select an EX8200 member switch of the Virtual Chassis, the top 5 alarms for that member switch are displayed.

## File System Usage

To display the file system storage details of a switch in the backup or linecard role, click the image of that switch.

## Chassis Viewer

Click the **Rear View** button to see the back of the chassis image. Click the **Front View** button to see the front of the chassis image. In a Virtual Chassis configuration, the **Rear View** button is disabled if the switch is not selected.

- [Table 85 on page 806](#)—Describes the chassis viewer for EX2200 switches.
- [Table 86 on page 807](#)—Describes the chassis viewer for EX2200-C switches.
- [Table 87 on page 807](#)—Describes the chassis viewer for EX3200, EX3300, and EX4200 switches.
- [Table 88 on page 809](#)—Describes the chassis viewer for EX4300 switches.
- [Table 89 on page 810](#)—Describes the chassis viewer for EX4500 switches.
- [Table 90 on page 811](#)—Describes the chassis viewer for EX4550 switches.
- [Table 91 on page 813](#)—Describes the chassis viewer for EX6210 switches.
- [Table 92 on page 813](#)—Describes the chassis viewer for EX8208 switches.
- [Table 93 on page 815](#)—Describes the chassis viewer for EX8216 switches.
- [Table 94 on page 815](#)—Describes the chassis viewer for the XRE200 External Routing Engines.

**Table 85: Chassis Viewer for EX2200 Switches**

Field	Description
<b>Front View</b>	
Interface status	<p>In the image, the following colors denote the interface status:</p> <ul style="list-style-type: none"> <li>• Green—Interface is up and operational.</li> <li>• Yellow—Interface is up but is nonoperational.</li> <li>• Gray—Interface is down and nonoperational.</li> </ul> <p>Mouse over the interface (port) to view more information.</p>
<b>Rear View</b>	
Management (me0) port	The management port is used to connect the switch to a management device for out-of-band management.
Console port	The console port is used to connect the switch to a management console or to a console server. (You might do this for initial switch configuration.)

Table 85: Chassis Viewer for EX2200 Switches (*continued*)

Field	Description
USB port	Indicates the USB port for the switch.  <b>NOTE:</b> We recommend that you use USB flash drives purchased from Juniper Networks for your EX Series switch.
Fan tray	Mouse over the fan tray icon to display name, status, and description information.
Power supply	Mouse over the power outlet icon to display name, status, and description information.

Table 86: Chassis Viewer for EX2200-C Switches

Field	Description
<b>Front View</b>	
Interface status	In the image, the following colors denote the interface status: <ul style="list-style-type: none"> <li>Green—Interface is up and operational.</li> <li>Yellow—Interface is up but is nonoperational.</li> <li>Gray—Interface is down and nonoperational.</li> </ul> Mouse over the interface (port) to view more information.
Management (me0) port	The management port is used to connect the switch to a management device for out-of-band management.
Console port	The console port is used to connect the switch to a management console or to a console server. (You might do this for initial switch configuration.)
USB port	Indicates the USB port for the switch.  <b>NOTE:</b> We recommend that you use USB flash drives purchased from Juniper Networks for your EX Series switch.
<b>Rear View</b>	
Power supply	Mouse over the power outlet icon to display name, status, and description information.

Table 87: Chassis Viewer for EX3200, EX3300, and EX4200 Switches

Field	Description
<b>Front View</b>	

Table 87: Chassis Viewer for EX3200, EX3300, and EX4200 Switches (*continued*)

Field	Description
Interface status	<p>In the image, the following colors denote the interface status:</p> <ul style="list-style-type: none"> <li>Green—Interface is up and operational.</li> <li>Yellow—Interface is up but is nonoperational.</li> <li>Gray—Interface is down and nonoperational.</li> </ul> <p>Mouse over the interface (port) to view more information.</p> <p>For a Virtual Chassis configuration, select the switch to view the interface status.</p> <p>If an SFP+ uplink module is installed in the switch, mouse over the port icon to display whether the module is configured to operate in 1-gigabit mode or in 10-gigabit mode. If the module is configured to operate in 1-gigabit mode, the tool tip information is displayed for all 4 ports. If the module is configured to operate in 10-gigabit mode, the tool tip information is displayed only for 2 ports.</p> <p>On an EX3300 switch with the 4x GE/XE SFP+ module, mouse over the port icon to display whether the module is configured to operate in 1-gigabit mode or 10-gigabit mode.</p> <p>For SFP, SFP+, and XFP ports, the interfaces appear dimmed if no transceiver is inserted. The chassis viewer displays <b>Transceiver not plugged-in</b> when you mouse over the port icon.</p>
LCD panel	LCD panel configured for the LEDs on the ports. Mouse over the icon to view the current character display.
<b>Rear View of the EX3200 Switch</b>	
Management (me0) port	The management port is used to connect the switch to a management device for out-of-band management.
Console port	The console port is used to connect the switch to a management console or to a console server. (You might do this for initial switch configuration.)
USB port	<p>Indicates the USB port for the switch.</p> <p><b>NOTE:</b> We recommend that you use USB flash drives purchased from Juniper Networks for your EX Series switch.</p>
Fan tray	Mouse over the fan tray icon to display name, status, and description information.
Power supply	Mouse over the power supply icon to display name, status, and description information.
<b>Rear View of the EX3300 and EX4200 Switch</b>	
Fan tray	Mouse over the fan tray icon to display name, status, and description information. For a Virtual Chassis, the status of the fans of the selected member switch is displayed.
Virtual Chassis port	<p>Displayed only when EX4200 switches are configured as a Virtual Chassis. The following colors denote the Virtual Chassis port (VCP) status:</p> <ul style="list-style-type: none"> <li>Green—VCP is up and operational.</li> <li>Yellow—VCP is up but is nonoperational.</li> <li>Gray—VCP is down and nonoperational.</li> </ul>

Table 87: Chassis Viewer for EX3200, EX3300, and EX4200 Switches (*continued*)

Field	Description
USB port	Indicates the USB port for the switch.  <b>NOTE:</b> We recommend that you use USB flash drives purchased from Juniper Networks for your EX Series switch.
Management (me0) port	The management port is used to connect the switch to a management device for out-of-band management.
Console port	The console port is used to connect the switch to a management console or to a console server. (You might do this for initial switch configuration.)
Power supplies	Mouse over the power supply icons to display name, status, and description information.

Table 88: Chassis Viewer for EX4300 Switches

Field	Description
<b>Front View</b>	
Interface status	In the image, the colors listed below denote the interface status for both copper and fiber media type of ports: <ul style="list-style-type: none"> <li>Green—Interface is up and operational.</li> <li>Yellow—Interface is up but is nonoperational.</li> <li>Gray—Interface is down and nonoperational.</li> </ul> Mouse over the interface (port) to view more information.
LCD panel	LCD panel configured for the LEDs on the ports. Mouse over the icon to view the current character display.
Mini USB console	The mini console port is used to connect the switch to the management console.
PIC 2 slot	You can install an uplink module in the PIC 2 slot. Mouse over the ports in the module to view the details of the ports in module.  24-port and 48-port EX4300 switches support the 4-port 10-Gigabit SFP+ uplink module.  EX4300-32F switches support the 2-port 40-Gigabit QSFP+ uplink module and the 8-port 10-Gigabit SFP+ uplink module.  When you install a transceiver in the port, the following colors denote the interface status: <ul style="list-style-type: none"> <li>Green—Interface is up and operational.</li> <li>Yellow—Interface is up but is not operational.</li> <li>Gray—Interface is down and not operational.</li> </ul>

**NOTE:** In EX4300 switches the LEDs are seen in the front panel, these are not active.

#### Rear View of the EX4300 Switch

Management port	The management port is used to connect the switch to a management device for out-of-band management.
-----------------	--

Table 88: Chassis Viewer for EX4300 Switches (*continued*)

Field	Description
Console port	The Console port (RJ-45) is used to connect the switch to a management console or to a console server.
USB port	Indicates the USB port for the switch.  <b>NOTE:</b> We recommend that you use USB flash drives purchased from Juniper Networks for your EX Series switch.
Fan tray	Mouse over the fan tray icons to display name, status, and description information.
Power supplies	Mouse over the power supply icons to display name, status, and description information.
PIC 1 slot	<p>The rear panel of a 24-port and a 48-port EX4300 switch has four (built-in) 40-Gigabit QSFP+ ports, and the rear panel of an EX4300-32F switch has two (built-in) 40-Gigabit QSFP+ ports, in which you can install QSFP+ transceivers. Mouse over the ports to view the details of the ports.</p> <p>After you install a transceiver in the port, the following colors denote the interface status:</p> <ul style="list-style-type: none"> <li>• Green—Interface is up and operational.</li> <li>• Yellow—Interface is up but is not operational.</li> <li>• Gray—Interface is down and not operational.</li> </ul> <p>For QSFP+ ports, the interfaces appear dimmed if no transceiver is inserted. The chassis viewer displays <b>Transceiver not plugged in</b> when you mouse over the port.</p> <p>When a QSFP+ port is configured as a Virtual Chassis Port (VCP), the following colors denote the VCP status:</p> <ul style="list-style-type: none"> <li>• Green—VCP is up and operational.</li> <li>• Yellow—VCP is up but is not operational.</li> <li>• Gray—VCP is down and not operational.</li> </ul>

Table 89: Chassis Viewer for EX4500 Switches

Field	Description
<b>Front View</b>	
Interface status	<p>In the image, the colors listed below denote the interface status:</p> <ul style="list-style-type: none"> <li>• Green—Interface is up and operational.</li> <li>• Yellow—Interface is up but is nonoperational.</li> <li>• Gray—Interface is down and nonoperational.</li> </ul> <p>Mouse over the interface (port) to view more information.</p> <p>For a Virtual Chassis configuration, select the switch to view the interface status.</p> <p>If an SFP+ uplink module is installed in the switch, mouse over the interface (ports) on the module for more information.</p> <p>For SFP and SFP+ ports, the interfaces appear dimmed if no transceiver is inserted. The chassis viewer displays <b>Transceiver not plugged-in</b> when you mouse over the port icon.</p>

Table 89: Chassis Viewer for EX4500 Switches (*continued*)

Field	Description
LCD panel	LCD panel configured for the LEDs on the ports. Mouse over the icon to view the current character display.
Console port	The console port is used to connect the switch to a management console or to a console server.
Management (me0) port	The management port is used to connect the switch to a management device for out-of-band management. Use this port for initial switch configuration.
USB port	Indicates the USB port for the switch.  <b>NOTE:</b> We recommend that you use USB flash drives purchased from Juniper Networks for your EX Series switch.
<b>Rear View of the EX4500 Switch</b>	
Fan tray	Mouse over the fan tray icon to display status of the fans and airflow direction information. For a Virtual Chassis, the status of the fans of the selected member switch is displayed.
Virtual Chassis port	Displayed only when switches are configured as a Virtual Chassis. The colors listed below denote the Virtual Chassis port (VCP) status: <ul style="list-style-type: none"> <li>• Green—VCP is up and operational.</li> <li>• Yellow—VCP is up but is nonoperational.</li> <li>• Gray—VCP is down and nonoperational.</li> </ul>
Power supplies	Mouse over the power supply icons to display name, status, and description information.
Intraconnect module	Mouse over the module to display details of the intraconnect module. The intraconnect module helps the switch achieve line rate on all its ports.
Virtual Chassis module	Mouse over to display details of the switches in the Virtual Chassis configuration.

Table 90: Chassis Viewer for EX4550 Switches

Field	Description
<b>Front View</b>	

Table 90: Chassis Viewer for EX4550 Switches (*continued*)

Field	Description
Interface status	<p>In the image, the colors listed below denote the interface status:</p> <ul style="list-style-type: none"> <li>Green—Interface is up and operational.</li> <li>Yellow—Interface is up but is nonoperational.</li> <li>Gray—Interface is down and nonoperational.</li> </ul> <p>Mouse over the interface (port) to view more information.</p> <p>For a Virtual Chassis configuration, select the switch to view the interface status.</p> <p>If an expansion module or a Virtual Chassis module is installed in the switch, mouse over the interface (ports) on the module for more information.</p> <p>On an EX4550-32F switch, for SFP and SFP+ ports, the interfaces appear dimmed if no transceiver is inserted. The chassis viewer displays <b>Transceiver (1G/10G) not plugged in</b> when you mouse over the port icon.</p>
LCD panel	LCD panel configured for the LEDs on the ports. Mouse over the icon to view the current character display.
Console port	The console port is used to connect the switch to a management console or to a console server.
Mini Console port	The mini console port is used to connect the switch to the management console.
Management (me0) port	The management port is used to connect the switch to a management device for out-of-band management. Use this port for initial switch configuration.
PIC1 slot	You can insert an uplink module or a Virtual Chassis module in the PIC1 slot. Mouse over to display the details of the module inserted (uplink or Virtual Chassis).
USB port	<p>Indicates the USB port for the switch.</p> <p><b>NOTE:</b> We recommend that you use USB flash drives purchased from Juniper Networks for your EX Series switch.</p>
<b>Rear View of the EX4550 Switch</b>	
Fan tray	Mouse over the fan tray icon to display the status of the fans and airflow direction information. For a Virtual Chassis, the status of the fans of the selected member switch is displayed.
Virtual Chassis port	<p>Displayed only when switches are configured as a Virtual Chassis. In the image, the colors listed below denote the Virtual Chassis port (VCP) status:</p> <ul style="list-style-type: none"> <li>Green—VCP is up and operational.</li> <li>Yellow—VCP is up but is nonoperational.</li> <li>Gray—VCP is down and nonoperational.</li> </ul>
Power supplies	Mouse over the power supply icons to display name, status, and description information.
PIC2 slot	You can insert an uplink module or a Virtual Chassis module into the PIC2 slot. Mouse over to display the details of the module inserted (uplink or Virtual Chassis).

Table 91: Chassis Viewer for EX6210 Switches

Field	Description
<b>Front View</b>	
Temperature	Mouse over the temperature icon to display the temperature of the CB or line card.
Interface status	<p>Select the CB or line card.</p> <p>In the image, the colors listed below denote the interface status:</p> <ul style="list-style-type: none"> <li>• Green—Interface is up and operational.</li> <li>• Yellow—Interface is up but is nonoperational.</li> <li>• Gray—Interface is down and nonoperational.</li> </ul> <p>Mouse over the interface (port) to view more information.</p> <p>You can view status for the following ports on the SRE module:</p> <ul style="list-style-type: none"> <li>• USB port—Indicates the USB port for the switch.</li> </ul> <p><b>NOTE:</b> We recommend that you use USB flash drives purchased from Juniper Networks for your EX Series switch.</p> <ul style="list-style-type: none"> <li>• Management (<b>me0</b>) port—The management port is used to connect the switch to a management device for out-of-band management. There are 2 management ports: fiber and copper. The same status is displayed for both the <b>me0</b> ports.</li> <li>• Console port—The console port is used to connect the switch to a management console or to a console server. (You might do this for initial switch configuration.)</li> </ul> <p>CBs support 4 SFP+ uplink ports. Mouse over the interface on the CB for more information.</p> <p>For SFP and SFP+ ports, the interfaces appear dimmed if no transceiver is inserted. The chassis viewer displays <b>Transceiver not plugged-in</b> when you mouse over the port icon.</p>
Power supplies	Mouse over the power supply icons to display name, status, and description information.
LCD panel	LCD panel configured for the LEDs on the ports. Mouse over the icon to view the current character display of the master Routing Engine. The EX6210 switch has 2 LCD panels, one for each Routing Engine. The backup Routing Engine LCD displays <b>Backup</b> .
<b>Rear View of the EX6210 Switch</b>	
Fan tray	Mouse over the fan tray icon to display information regarding the cooling fans.

Table 92: Chassis Viewer for EX8208 Switches

Field	Description
<b>Front View</b>	

Table 92: Chassis Viewer for EX8208 Switches (*continued*)

Field	Description
Interface status	<p>In the image, click any line card, SRE module, or SF module to view the front view of the selected component. In the image, the colors listed below denote the interface status:</p> <ul style="list-style-type: none"> <li>• Green—Interface is up and operational.</li> <li>• Yellow—Interface is up but is nonoperational.</li> <li>• Gray—Interface is down and nonoperational.</li> </ul> <p>Mouse over the interface (port) to view more information.</p> <p>You can view status for the following ports on the SRE module:</p> <ul style="list-style-type: none"> <li>• USB port—Indicates the USB port for the switch.</li> </ul> <p><b>NOTE:</b> We recommend that you use USB flash drives purchased from Juniper Networks for your EX Series switch.</p> <ul style="list-style-type: none"> <li>• Auxiliary port—This port is unavailable.</li> <li>• Management (<b>me0</b>) port—The management port is used to connect the switch to a management device for out-of-band management.</li> <li>• Console port—The console port is used to connect the switch to a management console or to a console server. (You might do this for initial switch configuration.)</li> </ul> <p>Because the SF module has no ports, no status information is displayed.</p>
Slot numbers	<p>Slots on the switch are labeled, from the top of the switch down:</p> <ul style="list-style-type: none"> <li>• 0–3 (line cards)</li> <li>• SRE0, SF, SRE1 (SRE and SF modules)</li> <li>• 4–7 (line cards)</li> </ul>
Temperature	<p>The active slots contain a gray temperature icon. Mouse over the icon to display temperature information for the slot.</p>
Fan status	<p>Mouse over the fan tray icon to display name, status, and description information.</p>
Power supplies	<p>Mouse over the power supply icons to display name, status, and description information.</p>
LCD panel	<p>LCD panel configured for the LEDs on the ports. Mouse over the icon to view the current character display.</p>
Rear View	<p>The EX8208 switch does not have any components on the rear of the chassis.</p>

Table 93: Chassis Viewer for EX8216 Switches

Field	Description
<b>Front View</b>	
Interface status	<p>In the image, click any line card or RE module to display the front view of the selected component. In the image, the colors listed below denote the interface status:</p> <ul style="list-style-type: none"> <li>Green—Interface is up and operational.</li> <li>Yellow—Interface is up but is nonoperational.</li> <li>Gray—Interface is down and nonoperational.</li> </ul> <p>Mouse over the interface (port) to view more information.</p> <p>You can view status for the following ports on the RE module:</p> <ul style="list-style-type: none"> <li>USB port—Indicates the USB port for the switch.</li> </ul> <p><b>NOTE:</b> We recommend that you use USB flash drives purchased from Juniper Networks for your EX Series switch.</p> <ul style="list-style-type: none"> <li>Auxiliary port—This port is unavailable.</li> <li>Management (<b>me0</b>) port—The management port is used to connect the switch to a management device for out-of-band management.</li> <li>Console port—The console port is used to connect the switch to a management console or to a console server. (You might do this for initial switch configuration.)</li> </ul>
Slot numbers	<p>Slots on the switch are labeled, from the top of the switch down:</p> <ul style="list-style-type: none"> <li>RE0 (RE module)</li> <li>RE1 (RE module)</li> <li>0–15 (line cards)</li> </ul>
Temperature	The active slots contain a gray temperature icon. Mouse over the icon to display temperature information for the slot.
Fan status	Mouse over the fan tray icon to display consolidated information about the fans.
Power supplies	Mouse over the power supply icons to display name, status, and description information.
LCD panel	LCD panel configured for the LEDs on the ports. Mouse over the icon to view the current character display.
<b>Rear View</b>	
SF modules	Mouse over the SF module icons in their respective slots to display information. Slots are numbered SF7–SF0, from left to right.

Table 94: Chassis Viewer for XRE200 External Routing Engines

Field	Description
<b>Front View</b>	

Table 94: Chassis Viewer for XRE200 External Routing Engines (*continued*)

Field	Description
Interface status	<p>In the image, the colors listed below denote the interface status:</p> <ul style="list-style-type: none"> <li>Green—Interface is up and operational.</li> <li>Yellow—Interface is up but is nonoperational.</li> <li>Gray—Interface is down and nonoperational.</li> </ul> <p>Mouse over the interface (port) to view more information.</p> <p>For a Virtual Chassis configuration, select the switch to view the interface status.</p>
Console port	The console port is used to connect the switch to a management console or to a console server.
Management (me0) port	The management port is used to connect the switch to a management device for out-of-band management. Use this port for initial switch configuration.
Virtual Chassis port	<p>In the image, the colors listed below denote the Virtual Chassis port (VCP) status:</p> <ul style="list-style-type: none"> <li>Green—VCP is up and operational.</li> <li>Yellow—VCP is up but is nonoperational.</li> <li>Gray—VCP is down and nonoperational.</li> </ul> <p>Mouse over the interface (port) to view more information.</p>
LCD panel	LCD panel configured for the LEDs on the ports. Mouse over the icon to view the current character display.
Temperature	The active slots contain a gray temperature icon. Mouse over the icon to display temperature information for the slot.
USB port	<p>Indicates the USB port for the switch.</p> <p><b>NOTE:</b> We recommend that you use USB flash drives purchased from Juniper Networks for your EX Series switch.</p>
PIC1 slot	You can install a Virtual Chassis module in the PIC1 slot. Mouse over the Virtual Chassis ports to display the port status details.
PIC2 slot	You can install a Virtual Chassis module in the PIC2 slot. Mouse over the Virtual Chassis ports to display the port status details.
<b>Rear View of the XRE200 External Routing Engine</b>	
Fan modules	Mouse over the fan modules to display status of the fans and airflow direction information. For a Virtual Chassis, the status of the fans of the selected member switch is displayed.
Power supplies	Mouse over the power supply icons to display name, status, and description information.

### EX4300 Switch Hardware and CLI Terminology Mapping

This topic describes the hardware terms used in EX4300 switch documentation and the corresponding terms used in the Junos OS CLI. See [Table 95 on page 817](#).

**Table 95: CLI Equivalents of Terms Used in the Documentation for EX4300 Switches**

Hardware Item (CLI)	Description (CLI)	Value	Item In Documentation	Additional Information
Chassis	One of the following: <ul style="list-style-type: none"> <li>• EX4300-24T</li> <li>• EX4300-24P</li> <li>• EX4300-32F</li> <li>• EX4300-48T</li> <li>• EX4300-48P</li> </ul>	–	Switch chassis	<i>Identifying EX4300 Switch Models</i>
Routing Engine (n)	One of the following: <ul style="list-style-type: none"> <li>• EX4300-24T</li> <li>• EX4300-24P</li> <li>• EX4300-32F</li> <li>• EX4300-48T</li> <li>• EX4300-48P</li> </ul>	n is a value in the range 0 through 9. <ul style="list-style-type: none"> <li>• On a standalone switch, the default value is 0.</li> <li>• On a Virtual Chassis configuration, the values correspond to the member IDs of switches configured in the master role and the backup role in the Virtual Chassis.</li> </ul>	Routing Engine	–

Table 95: CLI Equivalents of Terms Used in the Documentation for EX4300 Switches (*continued*)

Hardware Item (CLI)	Description (CLI)	Value	Item In Documentation	Additional Information
FPC ( <i>n</i> )	Abbreviated name of the Flexible PIC Concentrator (FPC)	<i>n</i> is a value in the range 0 through 9.		<a href="#">“Understanding Interface Naming Conventions on EX Series Switches” on page 2580</a>
	One of the following:	On a standalone switch, the default value is 0.	In this case, FPC refers to the switch itself.	
	<ul style="list-style-type: none"> <li>EX4300-24T</li> <li>EX4300-24P</li> <li>EX4300-32F</li> <li>EX4300-48T</li> <li>EX4300-48P</li> </ul>	On a Virtual Chassis configuration, the values correspond to the assigned member IDs of switches in the Virtual Chassis.	In this case, the FPC number refers to the member ID assigned to the switch.	
PIC ( <i>n</i> )	Abbreviated name of the Physical Interface Card (PIC)	<i>n</i> is a value in the range 0 through 2.		<a href="#">“Understanding Interface Naming Conventions on EX Series Switches” on page 2580</a>
	One of the following:	PIC 0	<ul style="list-style-type: none"> <li>In 24-port and 48-port switches—PIC 0 stands for built-in network ports numbered 0 through 23 or 0 or through 47.</li> <li>In 32-port switches—PIC 0 stands for built-in network ports followed by SFP+ uplink ports. In the CLI output, the network ports are numbered 0 through 31 and the SFP+ uplink ports are numbered 32 through 35.</li> </ul>	
	<ul style="list-style-type: none"> <li>For 24-port and 48-port switches: 4x40GE</li> <li>For 32-port switches: 2x40GE</li> </ul>	PIC 1	Built-in QSFP+ ports	
	<ul style="list-style-type: none"> <li>For 24-port and 48-port switches: 4x 1G/10G SFP/SFP+</li> <li>For 32-port switches, one of the following:               <ul style="list-style-type: none"> <li>8x1G/10G SFP/SFP+</li> <li>2x40GE</li> </ul> </li> </ul>	PIC 2	Uplink module installed in the switch	

Table 95: CLI Equivalents of Terms Used in the Documentation for EX4300 Switches (*continued*)

Hardware Item (CLI)	Description (CLI)	Value	Item In Documentation	Additional Information
Xcvr ( <i>n</i> )	Abbreviated name of the transceiver	<i>n</i> is a value equivalent to the number of the port in which the transceiver is installed.	Optical transceivers	<i>Pluggable Transceivers Supported on EX4300 Switches</i>
Power supply ( <i>n</i> )	One of the following: <ul style="list-style-type: none"> <li>JPSU-350-AC-AFO-A</li> <li>JPSU-350-AC-AFI-A</li> <li>JPSU-550-DC-AFO-A</li> <li>JPSU-550-DC-AFI-A</li> <li>JPSU-715-AC-AFO-A</li> <li>JPSU-1100-AC-AFO-A</li> </ul>	<i>n</i> has a value 0 or 1, corresponding to the power supply slot number.	AC power supply or DC power supply	<ul style="list-style-type: none"> <li>AC Power Supply in EX4300 Switches</li> <li>DC Power Supply in EX4300 Switches</li> </ul>
<p><b>CAUTION:</b> Do not mix:</p> <ul style="list-style-type: none"> <li>AC and DC power supplies in the same chassis.</li> <li>Power supplies with different airflow labels (<b>AIR IN (AFI)</b> and <b>AIR OUT (AFO)</b>) in the same chassis.</li> <li>Fan modules with different airflow labels (<b>AIR IN (AFI)</b> and <b>AIR OUT (AFO)</b>) in the same chassis.</li> <li>Power supplies and fan modules with different airflow labels (<b>AIR IN (AFI)</b> and <b>AIR OUT (AFO)</b>) in the same chassis.</li> </ul> <p><b>NOTE:</b> The 32-port EX4300 switches support fan modules and power supplies with the <b>AIR OUT (AFO)</b> label only.</p>				
Fan tray	One of the following: <ul style="list-style-type: none"> <li>Fan Module, Airflow In (AFI)</li> <li>Fan Module, Airflow Out (AFO)</li> </ul>	<i>n</i> has a value 0 or 1, corresponding to the fan module slot number.	Fan module	<i>Cooling System and Airflow in an EX4300 Switch</i>
<p><b>CAUTION:</b> Do not mix:</p> <ul style="list-style-type: none"> <li>Fan modules with different airflow labels (<b>AIR IN (AFI)</b> and <b>AIR OUT (AFO)</b>) in the same chassis.</li> <li>Power supplies with different airflow labels (<b>AIR IN (AFI)</b> and <b>AIR OUT (AFO)</b>) in the same chassis.</li> <li>Power supplies and fan modules with different airflow labels (<b>AIR IN (AFI)</b> and <b>AIR OUT (AFO)</b>) in the same chassis.</li> <li>AC and DC power supplies in the same chassis.</li> </ul> <p><b>NOTE:</b> The 32-port EX4300 switches support fan modules and power supplies with the <b>AIR OUT (AFO)</b> label only.</p>

## file (System Logging)

<b>Syntax</b>	<pre> file <i>filename</i> {     <i>facility severity</i>;     archive {         <i>files number</i>;         <i>size size</i>;         (no-world-readable   world-readable);     }     explicit-priority;     match "<i>regular-expression</i>";     structured-data {         brief;     } } </pre>
<b>Hierarchy Level</b>	[edit system <a href="#">syslog</a> ]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Configure the logging of system messages to a file.
<b>Options</b>	<p><b><i>facility</i></b>—Class of messages to log. To specify multiple classes, include multiple <b><i>facility severity</i></b> statements. For a list of the facilities, see <i>Junos OS System Logging Facilities and Message Severity Levels</i>.</p> <p><b>file <i>filename</i></b>—File in the <b>severity</b> directory in which to log messages from the specified facility. To log messages to more than one file, include more than one <b>file</b> statement.</p> <p><b><i>severity</i></b>—Severity of the messages that belong to the facility specified by the paired <b><i>facility</i></b> name. Messages with severities of the specified level and higher are logged. For a list of the severities, see <i>Junos OS System Logging Facilities and Message Severity Levels</i>.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Directing System Log Messages to a Log File</i></li> <li>• <i>Junos OS System Log Messages Reference</i></li> </ul>

## files

---

<b>Syntax</b>	<code>files <i>number</i>;</code>
<b>Hierarchy Level</b>	[edit system syslog archive], [edit system syslog file <i>filename</i> archive]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for QFX Series switches.
<b>Description</b>	Configure the maximum number of archived log files to retain. When the Junos OS logging utility has written a defined maximum amount of data to a log file <i>logfile</i> , it closes the file, compresses it, and renames it to <i>logfile.0.gz</i> (for information about the maximum file size, see <a href="#">size</a> ). The utility then opens and writes to a new file called <i>logfile</i> . When the new file reaches the maximum size, the <i>logfile.0.gz</i> file is renamed to <i>logfile.1.gz</i> , and the new file is closed, compressed, and renamed <i>logfile.0.gz</i> . By default, the logging facility creates up to ten archive files in this manner. Once the maximum number of archive files exists, each time the active log file reaches the maximum size, the contents of the oldest archive file are lost (overwritten by the next oldest file).
<b>Options</b>	<i>number</i> —Maximum number of archived files. <b>Range:</b> 1 through 1000 <b>Default:</b> 10 files
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Specifying Log File Size, Number, and Archiving Properties</i></li><li>• <i>Junos OS System Log Messages Reference</i></li><li>• <a href="#">size on page 829</a></li></ul>

## host (System)

<b>Syntax</b>	<pre> host (hostname   other-routing-engine) {     facility severity;     exclude-hostname     explicit-priority;     facility-override facility;     log-prefix string;     match "regular-expression";     source-address source-address;     structured-data {         brief;     } } </pre>
<b>QFX Series</b>	<pre> host (hostname {     facility severity;     explicit-priority;     facility-override facility;     log-prefix string;     match "regular-expression";     port;     source-address source-address; } </pre>
<b>TX Matrix Router and EX Series Switches</b>	<pre> host (hostname   other-routing-engine   scc-master) {     facility severity;     explicit-priority;     facility-override facility;     log-prefix string;     match "regular-expression";     port;     source-address source-address; } </pre>
<b>TX Matrix Plus Router</b>	<pre> host (hostname   other-routing-engine   sfc0-master) {     facility severity;     allow-duplicates;     explicit-priority;     facility-override facility;     log-prefix string;     match "regular-expression";     port;     source-address source-address; } </pre>
<b>Hierarchy Level</b>	<pre> [edit logical-systems logical-system-name system syslog], [edit system syslog] </pre>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Configure the logging of system messages to a remote destination.

**Options** *facility*—Class of messages to log. To specify multiple classes, include multiple *facility severity* statements. For a list of the facilities, see *Junos OS System Logging Facilities and Message Severity Levels*.

*hostname*—IPv4 address, IPv6 address, or fully qualified hostname of the remote machine to which to direct messages. To direct messages to multiple remote machines, include a **host** statement for each one.

**other-routing-engine**—Direct messages to the other Routing Engine on a router or switch with two Routing Engines installed and operational.

**NOTE:** The **other-routing-engine** option is not applicable to the QFX Series.

---

**port**—Port number of the remote syslog server that can be modified.

**scc-master**—(TX Matrix routers only) On a T640 router that is part of a routing matrix, direct messages to the TX Matrix router.

*severity*—Severity of the messages that belong to the facility specified by the paired *facility* name. Messages with severities of the specified level and higher are logged. For a list of the severities, see *Junos OS System Logging Facilities and Message Severity Levels*.

**sfc0-master**—(TX Matrix Plus routers only) On a T1600 or T4000 router that is part of a routing matrix, direct messages to the TX Matrix Plus router.

The remaining statements are explained separately.

<b>Required Privilege</b>	system—To view this statement in the configuration.
<b>Level</b>	system-control—To add this statement to the configuration.

## interface (Accounting or Sampling)

<b>Syntax</b>	interface <i>interface-name</i> { engine-id <i>number</i> ; engine-type <i>number</i> ; source-address <i>address</i> ; }
<b>Hierarchy Level</b>	[edit forwarding-options accounting <i>group-name</i> output], [edit forwarding-options sampling family <i>family-name</i> output]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Specify the output interface for sending copies of packets elsewhere to be analyzed.
<b>Options</b>	<b>engine-id <i>number</i></b> —Identity of the accounting interface.  <b>engine-type <i>number</i></b> —Type of this accounting interface.  <b><i>interface-name</i></b> —Name of the accounting interface.  <b>source-address <i>address</i></b> —Address used for generating packets.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring Discard Accounting</i></li> <li>• <i>Configuring the Output File for Traffic Sampling</i></li> </ul>

## log-prefix (System)

<b>Syntax</b>	log-prefix <i>string</i> ;
<b>Hierarchy Level</b>	[edit system syslog host]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Include a text string in each message directed to a remote destination.
<b>Options</b>	<b><i>string</i></b> —Text string to include in each message.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Adding a Text String to System Log Messages Directed to a Remote Destination</i></li> <li>• <i>Junos OS System Log Messages Reference</i></li> </ul>

## match

---

<b>Syntax</b>	<code>match "regular-expression";</code>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> system syslog file <i>filename</i> ], [edit logical-systems <i>logical-system-name</i> system syslog user ( <i>username</i>   *)], [edit system syslog file <i>filename</i> ], [edit system syslog host <i>hostname</i>   other-routing-engine  scc-master)], [edit system syslog user ( <i>username</i>   *)]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify a text string that must (or must not) appear in a message for the message to be logged to a destination.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Using Regular Expressions to Refine the Set of Logged Messages</i></li></ul>

## size (System)

<b>Syntax</b>	<code>size size;</code>
<b>Hierarchy Level</b>	[edit system syslog archive], [edit system syslog file <i>filename</i> archive]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the maximum amount of data that the Junos OS logging utility writes to a log file <b>logfile</b> before archiving it (closing it, compressing it, and changing its name to <b>logfile.0.gz</b> ). The utility then opens and writes to a new file called <b>logfile</b> . For information about the number of archive files that the utility creates in this way, see <a href="#">files</a> .
<b>Options</b>	<p><b>size</b>—Maximum size of each system log file, in kilobytes (KB), megabytes (MB), or gigabytes (GB).</p> <p><b>Syntax:</b> <b>xk</b> to specify the number of kilobytes, <b>xm</b> for the number of megabytes, or <b>xg</b> for the number of gigabytes</p> <p><b>Range:</b> 64 KB through 1 GB</p> <p><b>Default:</b> 1 MB for MX Series routers and the QFX Series</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Specifying Log File Size, Number, and Archiving Properties</i></li> <li>• <i>Junos OS System Log Messages Reference</i></li> <li>• <a href="#">files on page 824</a></li> </ul>

## structured-data

---

<b>Syntax</b>	structured-data { brief; }
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> system syslog file <i>filename</i> ], [edit system syslog file <i>filename</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.3. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Write system log messages to the log file in structured-data format, which complies with Internet draft draft-ietf-syslog-protocol-23, <i>The syslog Protocol</i> ( <a href="http://tools.ietf.org/html/draft-ietf-syslog-protocol-23">http://tools.ietf.org/html/draft-ietf-syslog-protocol-23</a> ).
<div> <b>NOTE:</b> When this statement is included, other statements that specify the format for messages written to the file are ignored (the <code>explicit-priority</code> statement at the [edit system syslog file <i>filename</i>] hierarchy level and the <code>time-format</code> statement at the [edit system syslog] hierarchy level).</div>	
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Logging Messages in Structured-Data Format</i></li><li>• <i>Junos OS System Log Messages Reference</i></li><li>• <i>explicit-priority</i></li><li>• <a href="#">time-format on page 833</a></li></ul>

## syslog (System)

```

Syntax  syslog {
        allow-duplicates;
        archive {
            (binary-data| no-binary-data);
            files number;
            size maximum-file-size;
            start-time "YYYY-MM-DD.hh:mm";
            transfer-interval minutes;
            (world-readable | no-world-readable);
        }
        console {
            facility severity;
        }
        file filename {
            facility severity;
            explicit-priority;
            match "regular-expression";
            archive {
                (binary-data| no-binary-data);
                files number;

                start-time "YYYY-MM-DD.hh:mm";
                transfer-interval minutes;
                (world-readable | no-world-readable);
            }
            structured-data {
                brief;
            }
        }
        host (hostname | other-routing-engine | scc-master) {
            facility severity;
            explicit-priority;
            facility-override facility;
            log-prefix string;
            match "regular-expression";
            source-address source-address;
            structured-data {
                brief;
            }
            port port number;
        }
        log-rotate-frequency frequency;
        server server name;
        source-address source-address;
        time-format (millisecond | year | year millisecond);
        user (username | *) {
            facility severity;
            match "regular-expression";
        }
    }

```

Hierarchy Level [edit system]

<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the types of system log messages to send to files, to a remote destination, to user terminals, or to the system console.  The remaining statements are explained separately.
<b>Options</b>	<b>archive</b> —Define parameters for archiving log messages.  <b>console</b> —Send log messages of a specified class and severity to the console.  <b>file</b> —Send log messages to a named file.  <b>host</b> —Remote location to be notified of specific log messages.  <b>log-rotate-frequency</b> —Configure the interval for checking logfile size and archiving messages.  <b>server</b> —Name of the system log server in the inet.0 routing instance.  <b>source-address</b> —Include a specified address as the source address for log messages.  <b>time-format</b> —Additional information to include in the system log time stamp.  <b>user</b> —Notify a specific user of the log event.
<b>Required Privilege Level</b>	<b>system</b> —To view this statement in the configuration. <b>system-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Junos OS System Log Overview</i></li><li>• <i>Junos OS System Log Messages Reference</i></li><li>• <i>Overview of Single-Chassis System Logging Configuration</i></li></ul>

## time-format

<b>Syntax</b>	<code>time-format (year   millisecond   year millisecond);</code>
<b>Hierarchy Level</b>	<code>[edit system syslog]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Include the year, the millisecond, or both, in the timestamp on every standard-format system log message. The additional information is included for messages directed to each destination configured by a <b>file</b>, <b>console</b>, or <b>user</b> statement at the <code>[edit system syslog]</code> hierarchy level. As of Junos OS Release 11.4, the additional time information is also sent to destinations configured by a <b>host</b> statement.</p> <p>By default, the timestamp specifies the month, date, hour, minute, and second when the message was logged—for example, <b>Aug 21 12:36:30</b>. However, the timestamp for traceoption messages is specified in milliseconds by default, and is independent of the <code>[edit system syslog time-format]</code> statement.</p>
	<p> <b>NOTE:</b> When the <code>structured-data</code> statement is included at the <code>[edit system syslog file filename]</code> hierarchy level, this statement is ignored for the file.</p>
<b>Options</b>	<p><b>millisecond</b>—Include the millisecond in the timestamp.</p> <p><b>year</b>—Include the year in the timestamp.</p>
<b>Required Privilege Level</b>	<p><b>system</b>—To view this statement in the configuration.</p> <p><b>system-control</b>—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Including the Year or Millisecond in Timestamps</i></li> <li>• <i>Junos OS System Log Messages Reference</i></li> <li>• <a href="#">structured-data on page 830</a></li> </ul>

## time-zone

<b>Syntax</b>	<code>time-zone (GMT <i>hour-offset</i>   <i>time-zone</i>);</code>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. <b>GMT <i>hour-offset</i></b> option added in Junos OS Release 7.4.
<b>Description</b>	Set the local time zone. To have the time zone change take effect for all processes running on the router or switch, you must reboot the router or switch.
<b>Default</b>	UTC
<b>Options</b>	<p><b>GMT <i>hour-offset</i></b>—Set the time zone relative to UTC time.</p> <p><b>Range:</b> –14 through +12</p> <p><b>Default:</b> 0</p> <p><b><i>time-zone</i></b>—Specify the time zone as <b>UTC</b>, which is the default time zone, or as a string such as PDT (Pacific Daylight Time), or use one of the following continents and major cities:</p> <p>Africa/Abidjan, Africa/Accra, Africa/Addis_Ababa, Africa/Algiers, Africa/Asmera, Africa/Bamako, Africa/Bangui, Africa/Banjul, Africa/Bissau, Africa/Blantyre, Africa/Brazzaville, Africa/Bujumbura, Africa/Cairo, Africa/Casablanca, Africa/Ceuta, Africa/Conakry, Africa/Dakar, Africa/Dar_es_Salaam, Africa/Djibouti, Africa/Douala, Africa/El_Aaiun, Africa/Freetown, Africa/Gaborone, Africa/Harare, Africa/Johannesburg, Africa/Kampala, Africa/Khartoum, Africa/Kigali, Africa/Kinshasa, Africa/Lagos, Africa/Libreville, Africa/Lome, Africa/Luanda, Africa/Lubumbashi, Africa/Lusaka, Africa/Malabo, Africa/Maputo, Africa/Maseru, Africa/Mbabane, Africa/Mogadishu, Africa/Monrovia, Africa/Nairobi, Africa/Ndjamena, Africa/Niamey, Africa/Nouakchott, Africa/Ouagadougou, Africa/Porto-Novo, Africa/Sao_Tome, Africa/Timbuktu, Africa/Tripoli, Africa/Tunis, Africa/Windhoek</p> <p>America/Adak, America/Anchorage, America/Anguilla, America/Antigua, America/Aruba, America/Asuncion, America/Barbados, America/Belize, America/Bogota, America/Boise, America/Buenos_Aires, America/Caracas, America/Catamarca, America/Cayenne, America/Cayman, America/Chicago, America/Cordoba, America/Costa_Rica, America/Cuiaba, America/Curacao, America/Dawson, America/Dawson_Creek, America/Denver, America/Detroit, America/Dominica, America/Edmonton, America/El_Salvador, America/Ensenada, America/Fortaleza, America/Glace_Bay, America/Godthab, America/Goose_Bay, America/Grand_Turk, America/Grenada, America/Guadeloupe, America/Guatemala, America/Guayaquil, America/Guyana, America/Halifax, America/Havana, America/Indiana/Knox, America/Indiana/Marengo, America/Indiana/Vevay, America/Indianapolis, America/Inuvik, America/Iqaluit, America/Jamaica, America/Jujuy, America/Juneau, America/La_Paz, America/Lima, America/Los_Angeles, America/Louisville, America/Maceio, America/Managua, America/Manaus, America/Martinique, America/Mazatlan, America/Mendoza, America/Menominee, America/Mexico_City, America/Miquelon, America/Montevideo, America/Montreal, America/Montserrat, America/Nassau, America/New_York, America/Nipigon, America/Nome, America/Noronha, America/Panama, America/Pangnirtung, America/Paramaribo, America/Phoenix, America/Port-au-Prince,</p>

## user (System Logging)

---

<b>Syntax</b>	<pre>user (username   *) {     facility severity;     match "regular-expression"; }</pre>
<b>Hierarchy Level</b>	[edit system syslog]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the logging of system messages to user terminals.
<b>Options</b>	<p><b>*</b> (the asterisk)—Log messages to the terminal sessions of all users who are currently logged in.</p> <p><b>facility</b>—Class of messages to log. To specify multiple classes, include multiple <b>facility severity</b> statements. For a list of the facilities, see <i>Junos OS System Logging Facilities and Message Severity Levels</i>.</p> <p><b>severity</b>—Severity of the messages that belong to the facility specified by the paired <b>facility</b> name. Messages with severities the specified level and higher are logged. For a list of the severities, see <i>Junos OS System Logging Facilities and Message Severity Levels</i>.</p> <p><b>username</b>—Junos OS login name of the user whose terminal session is to receive system log messages. To log messages to more than one user's terminal session, include more than one <b>user</b> statement.</p> <p>The remaining statement is explained separately.</p>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.

## Monitoring System Log Messages

### Purpose

**NOTE:** This topic applies only to the J-Web Application package.

Use the monitoring functionality to filter and view system log messages for EX Series switches.

### Action

To view events in the J-Web interface, select **Monitor > Events and Alarms > View Events**.

Apply a filter or a combination of filters to view messages. You can use filters to display relevant events. [Table 96 on page 840](#) describes the different filters, their functions, and the associated actions.

To view events in the CLI, enter the following command:

```
show log
```

Table 96: Filtering System Log Messages

Field	Function	Your Action
System Log File	<p>Specifies the name of a system log file for which you want to display the recorded events.</p> <p>Lists the names of all the system log files that you configure.</p> <p>By default, a log file, <b>messages</b>, is included in the <b>/var/log/</b> directory.</p>	<p>To specify events recorded in a particular file, select the system log filename from the list—for example, <b>messages</b>.</p> <p>Select <b>Include archived files</b> to include archived files in the search.</p>
Process	<p>Specifies the name of the process generating the events you want to display.</p> <p>To view all the processes running on your system, enter the CLI command <b>show system processes</b>.</p> <p>For more information about processes, see the <a href="#">Junos OS Installation and Upgrade Guide</a>.</p>	<p>To specify events generated by a process, type the name of the process.</p> <p>For example, type <b>mgd</b> to list all messages generated by the management process.</p>
Date From To	<p>Specifies the time period in which the events you want displayed are generated.</p> <p>Displays a calendar that allows you to select the year, month, day, and time. It also allows you to select the local time.</p> <p>By default, the messages generated in the last hour are displayed. End Time shows the current time and Start Time shows the time one hour before End Time.</p>	<p>To specify the time period:</p> <ul style="list-style-type: none"> <li>Click the <b>Calendar</b> icon and select the year, month, and date—for example, <b>02/10/2007</b>.</li> <li>Click the <b>Calendar</b> icon and select the year, month, and date—for example, <b>02/10/2007</b>.</li> <li>Click to select the time in hours, minutes, and seconds.</li> </ul>
Event ID	<p>Specifies the event ID for which you want to display the messages.</p> <p>Allows you to type part of the ID and completes the remainder automatically.</p> <p>An event ID, also known as a system log message code, uniquely identifies a system log message. It begins with a prefix that indicates the generating software process or library.</p>	<p>To specify events with a specific ID, type the partial or complete ID—for example, <b>TFTPD_AF_ERR</b>.</p>
Description	<p>Specifies text from the description of events that you want to display.</p> <p>Allows you to use regular expressions to match text from the event description.</p> <p><b>NOTE:</b> Regular expression matching is case-sensitive.</p>	<p>To specify events with a specific description, type a text string from the description with regular expression.</p> <p>For example, type <b>^Initial*</b> to display all messages with lines beginning with the term <i>Initial</i>.</p>
Search	<p>Applies the specified filter and displays the matching messages.</p>	<p>To apply the filter and display messages, click <b>Search</b>.</p>
Reset	<p>Resets all the fields in the Events Filter box.</p>	<p>To reset the field values that are listed in the Events Filter box, click <b>Reset</b>.</p>

Table 96: Filtering System Log Messages (*continued*)

Field	Function	Your Action
Generate Raw Report  <b>NOTE:</b> <ul style="list-style-type: none"> <li>The Generate Raw Report button is enabled once the event log messages start loading in the Events Detail table.</li> <li>After the log messages are completely loaded in the Events Detail table, Generate Raw Report changes to Generate Report.</li> </ul>	Generates a list of event log messages in nontabular format  <b>NOTE:</b> Generate Raw Report is disabled until event log messages start loading in the Events Detail table.	To generate a raw report: <ol style="list-style-type: none"> <li>Click <b>Generate Raw Report</b>.  The <i>Opening filteredEvents.html</i> window appears.</li> <li>Select <b>Open with</b> to open the html file or select <b>Save File</b> to save the file.</li> <li>Click <b>OK</b>.</li> </ol>
Generate Report  <b>NOTE:</b> The Generate Report button appears only after event log messages are completely loaded in the Events Detail table. The Generate Raw Report button is displayed while event log messages are being loaded.	Generates a list of event log messages in tabular format, which shows system details, events filter criteria, and event details.	To generate a formatted report: <ol style="list-style-type: none"> <li>Click <b>Generate Report</b>.  The <i>Opening Report.html</i> window appears.</li> <li>Select <b>Open with</b> to open the html file or select <b>Save File</b> to save the file.</li> <li>Click <b>OK</b>.</li> </ol>

**Meaning** Table 97 on page 841 describes the Event Summary fields.

**NOTE:** By default, the View Events page in the J-Web interface displays the most recent 25 events, with severity levels highlighted in different colors. After you specify the filters, Event Summary displays the events matching the specified filters. Click the **First**, **Next**, **Prev**, and **Last** links to navigate through messages.

Table 97: Viewing System Log Messages

Field	Function	Additional Information
Process	Displays the name and ID of the process that generated the system log message.	The information displayed in this field is different for messages generated on the local Routing Engine than for messages generated on another Routing Engine (on a system with two Routing Engines installed and operational). Messages from the other Routing Engine also include the identifiers <b>re0</b> and <b>re1</b> to identify the Routing Engine.

Table 97: Viewing System Log Messages (*continued*)

Field	Function	Additional Information
Severity	<p>Severity level of a message is indicated by different colors.</p> <ul style="list-style-type: none"> <li>• <b>Unknown</b>—Gray—Indicates no severity level is specified.</li> <li>• <b>Debug/Info/Notice</b>—Green—Indicates conditions that are not errors but are of interest or might warrant special handling.</li> <li>• <b>Warning</b>—Yellow—Indicates conditions that warrant monitoring.</li> <li>• <b>Error</b>—Blue—Indicates standard error conditions that generally have less serious consequences than errors in the emergency, alert, and critical levels.</li> <li>• <b>Critical</b>—Pink—Indicates critical conditions, such as hard-drive errors.</li> <li>• <b>Alert</b>—Orange—Indicates conditions that require immediate correction, such as a corrupted system database.</li> <li>• <b>Emergency</b>—Red—Indicates system panic or other conditions that cause the switch to stop functioning.</li> </ul>	<p>A severity level indicates how seriously the triggering event affects switch functions. When you configure a location for logging a facility, you also specify a severity level for the facility. Only messages from the facility that are rated at that level or higher are logged to the specified file.</p>
Event ID	<p>Displays a code that uniquely identifies the message.</p> <p>The prefix on each code identifies the message source, and the rest of the code indicates the specific event or error.</p>	<p>The event ID begins with a prefix that indicates the generating software process.</p> <p>Some processes on a switch do not use codes. This field might be blank in a message generated from such a process.</p> <p>An event can belong to one of the following type categories:</p> <ul style="list-style-type: none"> <li>• <b>Error</b>—Indicates an error or failure condition that might require corrective action.</li> <li>• <b>Event</b>—Indicates a condition or occurrence that does not generally require corrective action.</li> </ul>
Event Description	Displays a more detailed explanation of the message.	
Time	Displays the time at which the message was logged.

## Checking Active Alarms with the J-Web Interface

### Purpose

**NOTE:** This topic applies only to the J-Web Application package.

Use the monitoring functionality to view alarm information for the EX Series switches including alarm type, alarm severity, and a brief description for each active alarm on the switching platform.

**Action** To view the active alarms:

1. Select **Monitor > Events and Alarms > View Alarms** in the J-Web interface.
2. Select an alarm filter based on alarm type, severity, description, and date range.
3. Click **Go**.

All the alarms matching the filter are displayed.

**NOTE:** When the switch is reset, the active alarms are displayed.

**Meaning** Table 98 on page 843 lists the alarm output fields.

**Table 98: Summary of Key Alarm Output Fields**

Field	Values
Type	Category of the alarm: <ul style="list-style-type: none"> <li>• Chassis—Indicates an alarm condition on the chassis (typically an environmental alarm such as one related to temperature).</li> <li>• System—Indicates an alarm condition in the system.</li> </ul>
Severity	Alarm severity—either major (red) or minor (yellow).
Description	Brief synopsis of the alarm.
Time	Date and time when the failure was detected.

## Monitoring Switch Control Traffic

**Purpose**

**NOTE:** This topic applies only to the J-Web Application package.

Use the packet capture feature when you need to quickly capture and analyze switch control traffic on a switch. The packet capture feature allows you to capture traffic destined for or originating from the Routing Engine.

**Action** To use the packet capture feature in the J-Web interface, select **Troubleshoot > Packet Capture**.

To use the packet capture feature in the CLI, enter the following CLI command:

**monitor traffic**

**Meaning** You can use the packet capture feature to compose expressions with various matching criteria to specify the packets that you want to capture. You can decode and view the captured packets in the J-Web interface as they are captured. The packet capture feature does not capture transient traffic.

**Table 99: Packet Capture Field Summary**

Field	Function	Your Action
Interface	Specifies the interface on which the packets are captured. If you select default, packets on the Ethernet management port 0, are captured.	From the list, select an interface—for example, <b>ge-0/0/0</b> .
Detail level	Specifies the extent of details to be displayed for the packet headers. <ul style="list-style-type: none"> <li>Brief—Displays the minimum packet header information. This is the default.</li> <li>Detail—Displays packet header information in moderate detail.</li> <li>Extensive—Displays the maximum packet header information.</li> </ul>	From the list, select <b>Detail</b> .
Packets	Specifies the number of packets to be captured. Values range from 1 to <b>1000</b> . Default is <b>10</b> . Packet capture stops capturing packets after this number is reached.	From the list, select the number of packets to be captured—for example, <b>10</b> .
Addresses	Specifies the addresses to be matched for capturing the packets using a combination of the following parameters: <ul style="list-style-type: none"> <li>Direction—Matches the packet headers for IP address, hostname, or network address of the source, destination or both.</li> <li>Type—Specifies if packet headers are matched for host address or network address.</li> </ul> You can add multiple entries to refine the match criteria for addresses.	Select address-matching criteria. For example: <ol style="list-style-type: none"> <li>From the Direction list, select <b>source</b>.</li> <li>From the Type list, select <b>host</b>.</li> <li>In the Address box, type <b>10.1.40.48</b>.</li> <li>Click <b>Add</b>.</li> </ol>
Protocols	Matches the protocol for which packets are captured. You can choose to capture TCP, UDP, or ICMP packets or a combination of TCP, UDP, and ICMP packets.	From the list, select a protocol—for example, <b>tcp</b> .
Ports	Matches packet headers containing the specified source or destination TCP or UDP port number or port name.	Select a direction and a port. For example: <ul style="list-style-type: none"> <li>From the Type list, select <b>src</b>.</li> <li>In the Port box, type <b>23</b>.</li> </ul>
Advanced Options		

Table 99: Packet Capture Field Summary (*continued*)

Field	Function	Your Action
Absolute TCP Sequence	Specifies that absolute TCP sequence numbers are to be displayed for the packet headers.	To display absolute TCP sequence numbers in the packet headers, select this check box.
Layer 2 Headers	Specifies that link-layer packet headers are to be displayed.	To include link-layer packet headers while capturing packets, select this check box.
Non-Promiscuous	Specifies not to place the interface in promiscuous mode, so that the interface reads only packets addressed to it. In promiscuous mode, the interface reads every packet that reaches it.	To read all packets that reach the interface, select this check box.
Display Hex	Specifies that packet headers, except link-layer headers, are to be displayed in hexadecimal format.	To display the packet headers in hexadecimal format, select this check box.
Display ASCII and Hex	Specifies that packet headers are to be displayed in hexadecimal and ASCII format.	To display the packet headers in ASCII and hexadecimal formats, select this check box.
Header Expression	Specifies the match condition for the packets to be captured. The match conditions you specify for Addresses, Protocols, and Ports are displayed in expression format in this field.	You can enter match conditions directly in this field in expression format or modify the expression composed from the match conditions you specified for Addresses, Protocols, and Ports. If you change the match conditions specified for Addresses, Protocols, and Ports again, packet capture overwrites your changes with the new match conditions.
Packet Size	Specifies the number of bytes to be displayed for each packet. If a packet header exceeds this size, the display is truncated for the packet header. The default value is 96 bytes.	Type the number of bytes you want to capture for each packet header—for example, <b>256</b> .
Don't Resolve Addresses	Specifies that IP addresses are not to be resolved into hostnames in the packet headers displayed.	To prevent packet capture from resolving IP addresses to hostnames, select this check box.
No Timestamp	Suppresses the display of packet header timestamps.	To stop displaying timestamps in the captured packet headers, select this check box.
Write Packet Capture File	Writes the captured packets to a file in PCAP format in /var/tmp. The files are named with the prefix jweb-pcap and the extension .pcap. If you select this option, the decoded packet headers are not displayed on the packet capture page.	To decode and display the packet headers on the J-Web page, clear this check box.

## Monitoring System Properties

### Purpose

**NOTE:** This topic applies only to the J-Web Application package.

Use the monitoring functionality to view system properties such as the name and IP address of the switch and resource usage.

### Action

To monitor system properties in the J-Web interface, select **Monitor > System View > System Information**.

To monitor system properties in the CLI, enter the following commands:

- **show system uptime**
- **show system users**
- **show system storage**

### Meaning

[Table 100 on page 846](#) summarizes key output fields in the system properties display.

**Table 100: Summary of Key System Properties Output Fields**

Field	Values	Additional Information
<b>General Information</b>		
Serial Number	Serial number for the switch.	
Junos OS Version	Version of Junos OS active on the switch.	
Hostname	The name of switch.	
IP Address	The IP address of the switch.	
Loopback Address	The loopback address.	
Domain Name Server	The address of the domain name server.	
Time Zone	The time zone on the switch.	
<b>Time</b>		
Current Time	Current system time, in Coordinated Universal Time (UTC).	

Table 100: Summary of Key System Properties Output Fields (*continued*)

Field	Values	Additional Information
System Booted Time	Date and time when the switch was last booted and how long it has been running.	
Protocol Started Time	Date and time when the switching protocols were last started and how long they have been running.	
Last Configured Time	Date and time when a configuration was last committed. This field also shows the name of the user who issued the last <b>commit</b> command, through either the J-Web interface or the CLI.	
Load Average	The CPU load average for 1, 5, and 15 minutes.	
<b>Storage Media</b>		
Internal Flash Memory	Memory usage details of internal flash.	
External Flash Memory	Usage details of external flash memory.	
<b>Logged in Users Details</b>		
User	Username of any user logged in to the switching platform.	
Terminal	Terminal through which the user is logged in.	
From	System from which the user has logged in. A hyphen indicates that the user is logged in through the console.	
Login Time	Time when the user logged in.	This is the <b>LOGIN@</b> field in <b>show system users</b> command output.
Idle Time	How long the user has been idle.

## Monitoring Chassis Information

### Purpose

**NOTE:** This topic applies only to the J-Web Application package.

Use the monitoring functionality to view chassis properties such as general switch information, temperature and fan status, and resource information for the EX Series switch.

**Action** To view chassis properties in the J-Web interface, select **Monitor > System View > Chassis Information**. For an EX8200 Virtual Chassis configuration, select the Virtual Chassis member from the list.

To view chassis properties in the CLI, enter the following commands:

- **show chassis environment**
- **show chassis fpc**
- **show chassis hardware**

**Meaning** [Table 101 on page 848](#) gives information about the key output fields for chassis information.

**NOTE:** For an EX2200, EX2200-C, EX3200, or EX4500 switch or an EX4200, EX4300, or EX4550 standalone switch, the FPC slot number refers to the switch itself and is always 0. In a Virtual Chassis configuration, the FPC slot number refers to the member ID.

**Table 101: Summary of the Key Output Fields for Chassis Information**

Field	Values
Routing Engine Details	Select the <b>Master</b> tab to view details about the master Routing Engine or select <b>Backup</b> to view details about the backup Routing Engine.
Name/Value	<p>This table displays the following details of the master Routing Engine:</p> <ul style="list-style-type: none"> <li>• Routing Engine module</li> <li>• Model</li> <li>• Version</li> <li>• Part number</li> <li>• Serial number</li> <li>• Memory utilization</li> <li>• Temperature</li> <li>• Start time</li> <li>• CPU load average for 1, 5, and 15 minutes</li> </ul>
Power and Fan Tray Details	
Power	Select the <b>Power</b> tab to view details of the power supplies.
Name/Value	Displays the status and model number of each power supply.
Fan	Select the <b>Fan</b> tab to view details about the fans.

Table 101: Summary of the Key Output Fields for Chassis Information (*continued*)

Field	Values
Name/Value	Displays the status of each fan in the corresponding FPC.
Chassis Component Details	
Select component	Select an FPC to view general, temperature, resource, and subcomponent details.
General	Select the <b>General</b> tab to view the general information about the chassis components.
Name/Value	Displays general information: <ul style="list-style-type: none"> <li>• Version—Revision level. Supply the version number when reporting hardware problems to customer support.</li> <li>• Part number</li> <li>• Serial number—Supply the serial number when contacting customer support about the switch chassis.</li> <li>• Description—Brief text description.</li> </ul>
Temperature	Select the <b>Temperature</b> tab to view the temperature details of the components in the selected FPC.
Name/Value	Displays the temperature details of the sensors present in the selected FPC.
Resource	Select the <b>Resource</b> tab to view the resource details of the selected FPC.
Name/Value	Displays resource details: <ul style="list-style-type: none"> <li>• State:               <ul style="list-style-type: none"> <li>• <b>Dead</b>—Held in reset because of errors.</li> <li>• <b>Diag</b>—The FPC is running diagnostics.</li> <li>• <b>Dormant</b>—Held in reset.</li> <li>• <b>Empty</b>—No FPC is present.</li> <li>• <b>Online</b>—The FPC is online and running.</li> <li>• <b>Probed</b>—Probe is complete. The FPC is awaiting restart of the Packet Forwarding Engine.</li> <li>• <b>Probe-wait</b>—The FPC is waiting for the probe operation to start.</li> </ul> </li> <li>• <b>Total CPU DRAM</b>—Total DRAM, in megabytes, available to the FPC.</li> <li>• <b>Start time</b>—Date and time the switch was last rebooted.</li> </ul>

## Monitoring System Process Information

### Purpose

**NOTE:** This topic applies only to the J-Web Application package.

Use the monitoring functionality to view the processes running on the switch.

### Action

To view the software processes running on the switch in the J-Web interface, select **Monitor > System View > Process Details**.

To view the software processes running on the switch in the CLI, enter the following command.

```
show system processes
```

### Meaning

[Table 102 on page 850](#) summarizes the output fields in the system process information display.

The display includes the total CPU load and total memory utilization.

**Table 102: Summary of System Process Information Output Fields**

Field	Values	Additional Information
PID	Identifier of the process.	
Name	Owner of the process.	
State	Current state of the process.	
CPU Load	Percentage of the CPU that is being used by the process.	
Memory Utilization	Amount of memory that is being used by the process.	
Start Time	Time of day when the process started.

## Managing Log, Temporary, and Crash Files on the Switch (J-Web Procedure)

**NOTE:** This topic applies only to the J-Web Application package.

You can use the J-Web interface to rotate log files and delete unnecessary log, temporary, and crash files on the switch.

1. [Cleaning Up Files on page 851](#)
2. [Downloading Files on page 851](#)
3. [Deleting Files on page 852](#)

---

### Cleaning Up Files

If you are running low on storage space, use the file cleanup procedure to quickly identify files to delete.

The file cleanup procedure performs the following tasks:

- Rotates log files—Archives the current log files, and creates fresh log files.
- Deletes log files in **/var/log**—Deletes files that are not currently being written to.
- Deletes temporary files in **/var/tmp**—Deletes files that have not been accessed within two days.
- Deletes all crash files in **/var/crash**—Deletes core files that the switch has written during an error.

To rotate log files and delete unnecessary files with the J-Web interface:

1. Select **Maintain > Files**.
2. In the Clean Up Files section, click **Clean Up Files**. The switching platform rotates log files and identifies files that can be safely deleted.

The J-Web interface displays the files that you can delete and the amount of space that will be freed on the file system.

3. Click one of the following options:
  - To delete the files and return to the Files page, click **OK**.
  - To cancel your entries and return to the list of files in the directory, click **Cancel**.

---

### Downloading Files

You can use the J-Web interface to download a copy of an individual log, temporary, or crash file from the switching platform. When you download a file, it is not deleted from the file system.

To download files with the J-Web interface:

1. In the J-Web interface, select **Maintain > Files**.
2. In the Download and Delete Files section, Click one of the following options:
  - Log Files—Log files in the **/var/log** directory on the switch.
  - Temporary Files—Lists the temporary files in the **/var/tmp** directory on the switching platform.

- Jailed Temporary Files (Install, Session, and so on)—Lists the files in the **/var/jail/tmp** directory on the switching platform.
- Crash (Core) Files—Lists the core files in the **/var/crash** directory on the switching platform.

The J-Web interface displays the files located in the directory.

3. Select the files that you want to download and click **Download**.
4. Choose a location for the saved file.

The file is saved as a text file, with a **.txt** file extension.

---

### Deleting Files

You can use the J-Web interface to delete an individual log, temporary, and crash file from the switching platform. When you delete the file, it is permanently removed from the file system.

**CAUTION:** If you are unsure whether to delete a file from the switching platform, we recommend using the Clean Up Files tool described in Cleaning Up Files. This tool determines which files can be safely deleted from the file system.

---

To delete files with the J-Web interface:

1. Select **Maintain > Files**.
2. In the Download and Delete Files section, Click one of the following options:
  - Log Files—Lists the log files in the **/var/log** directory on the switching platform.
  - Temporary Files—Lists the temporary files in the **/var/tmp** directory on the switching platform.
  - Jailed Temporary Files (Install, Session, etc)—Lists the files in the **/var/jail/tmp** directory on the switching platform.
  - Crash (Core) Files—Lists the core files in the **/var/crash** directory on the switching platform.

The J-Web interface displays the files in the directory.

3. Select the box next to each file you plan to delete.
4. Click **Delete**.

The J-Web interface displays the files you can delete and the amount of space that will be freed on the file system.

5. Click one of the following buttons on the confirmation page:
  - To delete the files and return to the Files page, click **OK**.
  - To cancel your entries and return to the list of files in the directory, click **Cancel**.

## clear log

<b>Syntax</b>	<code>clear log <i>filename</i></code> <code>&lt;all&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Remove contents of a log file.
<b>Options</b>	<i>filename</i> —Name of the specific log file to delete.  <code>all</code> —(Optional) Delete the specified log file and all archived versions of it.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show log on page 1249</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">clear log on page 855</a>
<b>Output Fields</b>	See <a href="#">file list</a> for an explanation of output fields.

## Sample Output

### clear log

The following sample commands list log file information, clear the contents of a log file, and then display the updated log file information:

```

user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:
-----

## file archive

---

<b>Syntax</b>	<code>file archive destination <i>destination</i> source <i>source</i> &lt;compress&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Archive, and optionally compress, one or multiple local system files as a single file, locally or at a remote location.
<b>Options</b>	<p><b>destination <i>destination</i></b>—Destination of the archived file or files. Specify the destination as a URL or filename. The Junos OS adds one of the following suffixes if the destination filename does not already have it:</p> <ul style="list-style-type: none"><li>• For archived files—The suffix <b>.tar</b></li><li>• For archived and compressed files—The suffix <b>.tgz</b></li></ul> <p><b>source <i>source</i></b>—Source of the original file or files. Specify the source as a URL or filename.</p> <p><b>compress</b>—(Optional) Compress the archived file with the GNU zip (gzip) compression utility. The compressed files have the suffix <b>.tgz</b>.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Format for Specifying Filenames and URLs in Junos OS CLI Commands</i></li></ul>
<b>List of Sample Output</b>	<a href="#">file archive (Multiple Files) on page 856</a> <a href="#">file archive (Single File) on page 856</a> <a href="#">file archive (with Compression) on page 857</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file archive (Multiple Files)

The following sample command archives all message files in the local directory `/var/log/messages` as the single file `messages-archive.tar`.

```
user@host> file archive source /var/log/messages* destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.
user@host>
```

### file archive (Single File)

The following sample command archives one message file in the local directory `/var/log/messages` as the single file `messages-archive.tar`.

```
user@host> file archive source /var/log/messages destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.
user@host
```

### file archive (with Compression)

The following sample command archives and compresses all message files in the local directory **/var/log/messages** as the single file **messages-archive.tgz**.

```
user@host> file archive compress source /var/log/messages* destination
/var/log/messages-archive.tgz
/usr/bin/tar: Removing leading / from absolute path names in the archive.
```

## file checksum md5

---

<b>Syntax</b>	<code>file checksum md5 &lt;pathname&gt; filename</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Calculate the Message Digest 5 (MD5) checksum of a file.
<b>Options</b>	<b>pathname</b> —(Optional) Path to a filename. <b>filename</b> —Name of a local file for which to calculate the MD5 checksum.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Checksum Hashes for a Commit Script</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• <i>Configuring Checksum Hashes for an Event Script</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• <i>Configuring Checksum Hashes for an Op Script</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• <i>Executing an Op Script from a Remote Site</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• <a href="#">file checksum sha-256 on page 652</a></li><li>• <a href="#">file checksum sha1 on page 651</a></li><li>• <a href="#">op on page 90</a></li></ul>
<b>List of Sample Output</b>	<a href="#">file checksum md5 on page 858</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### file checksum md5

```
user@host> file checksum md5 jbundle-5.3R2.4-export-signed.tgz
MD5 (jbundle-5.3R2.4-export-signed.tgz) = 2a3b69e43f9bd4893729cc16f505a0f5
```

## file checksum sha1

<b>Syntax</b>	<code>file checksum sha1 &lt;pathname&gt; filename</code>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 9.5.</p> <p>Command introduced in Junos OS Release 9.5 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Calculate the Secure Hash Algorithm (SHA-1) checksum of a file.
<b>Options</b>	<p><b>pathname</b>—(Optional) Path to a filename.</p> <p><b>filename</b>—Name of a local file for which to calculate the SHA-1 checksum.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring Checksum Hashes for a Commit Script</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li> <li>• <i>Configuring Checksum Hashes for an Event Script</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li> <li>• <i>Configuring Checksum Hashes for an Op Script</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li> <li>• <i>Executing an Op Script from a Remote Site</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li> <li>• <a href="#">file checksum md5 on page 650</a></li> <li>• <a href="#">file checksum sha-256 on page 652</a></li> <li>• <a href="#">op on page 90</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">file checksum sha1 on page 859</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### file checksum sha1

```
user@host> file checksum sha1 /var/db/scripts/opscript.slax
```

```
SHA1 (/var/db/scripts/commitscript.slax) = ba9e47120c7ce55cff29afd73eacd370e162c676
```

## file checksum sha-256

---

<b>Syntax</b>	<code>file checksum sha-256 &lt;pathname&gt; filename</code>
<b>Release Information</b>	Command introduced in Junos OS Release 9.5. Command introduced in Junos OS Release 9.5 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Calculate the Secure Hash Algorithm 2 family (SHA-256) checksum of a file.
<b>Options</b>	<b>pathname</b> —(Optional) Path to a filename.  <b>filename</b> —Name of a local file for which to calculate the SHA-256 checksum.
<b>Required Privilege Level</b>	maintenance view view-configuration
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Checksum Hashes for a Commit Script</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• <i>Configuring Checksum Hashes for an Event Script</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• <i>Configuring Checksum Hashes for an Op Script</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• <i>Executing an Op Script from a Remote Site</i> in the <i>Junos OS Configuration and Operations Automation Guide</i></li><li>• <a href="#">file checksum md5 on page 650</a></li><li>• <a href="#">file checksum sha1 on page 651</a></li><li>• <a href="#">op on page 90</a></li></ul>
<b>List of Sample Output</b>	<a href="#">file checksum sha-256 on page 860</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### file checksum sha-256

```
user@host> file checksum sha-256 /var/db/scripts/commitscript.slax

SHA256 (/var/db/scripts/commitscript.slax) =
94c2b061fb55399e15babd2529453815601a602b5c98e5c12ed929c9d343dd71
```

## file compare

<b>Syntax</b>	<pre>file compare (files <i>filename filename</i>) &lt;context   unified&gt; &lt;ignore-white-space&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	<p>Compare two local files and describe the differences between them in default, context, or unified output styles:</p> <ul style="list-style-type: none"> <li>• <b>Default</b>—In the first line of output, <b>c</b> means lines were changed between the two files, <b>d</b> means lines were deleted between the two files, and <b>a</b> means lines were added between the two files. The numbers preceding this alphabetical marker represent the first file, and the lines after the alphabetical marker represent the second file. A left angle bracket (&lt;) in front of output lines refers to the first file. A right angle bracket (&gt;) in front of output lines refers to the second file.</li> <li>• <b>Context</b>—The display is divided into two parts. The first part is the first file; the second part is the second file. Output lines preceded by an exclamation point (!) have changed. Additions are marked with a plus sign (+), and deletions are marked with a minus sign (-).</li> <li>• <b>Unified</b>—The display is preceded by the line number from the first and the second file (xx,xxx,x). Before the line number, additions to the file are marked with a plus sign (+), and deletions to the file are marked with a minus sign (-). The body of the output contains the affected lines. Changes are viewed as additions plus deletions.</li> </ul>
<b>Options</b>	<p><b>files <i>filename</i></b>—Names of two local files to compare.</p> <p><b>context</b>—(Optional) Display output in context format.</p> <p><b>ignore-white-space</b>—(Optional) Ignore changes in the amount of white space.</p> <p><b>unified</b>—(Optional) Display output in unified format.</p>
<b>Required Privilege Level</b>	none
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Format for Specifying Filenames and URLs in Junos OS CLI Commands</i></li> <li>• <i>Viewing Core Files from Junos OS Processes</i></li> </ul>
<b>List of Sample Output</b>	<p><a href="#">file compare files on page 862</a></p> <p><a href="#">file compare files context on page 862</a></p> <p><a href="#">file compare files unified on page 862</a></p> <p><a href="#">file compare files unified ignore-white-space on page 862</a></p>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file compare files

```
user@host> file compare files /tmp/one /tmp/two
100c100
<          full-name "File 1";
---
>          full-name "File 2";

## file copy

---

<b>Syntax</b>	<code>file copy <i>source destination</i></code> <code>&lt;source-address <i>address</i>&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. <b>source-address</b> option added in Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for QFX Series switches.
<b>Description</b>	Copy files from one location to another location on the local device or to a location on a remote device reachable by the local device.
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Format for Specifying Filenames and URLs in Junos OS CLI Commands</i></li><li>• <i>Default Directories for Junos OS File Storage on the Router or Switch</i></li><li>• <i>Copying a Configuration File from One Routing Engine to the Other</i></li></ul>
<b>List of Sample Output</b>	<a href="#">Copy a File from the Local Device to a Personal Computer on page 864</a> <a href="#">Copy a Configuration File between Routing Engines on page 864</a> <a href="#">Copy a Log File between Routing Engines on page 864</a> <a href="#">Copy a File from a TX Matrix Plus Router to a T1600 Router Connected to the TX Matrix Plus on page 865</a> <a href="#">Copy a File Using File Transfer Protocol on page 865</a> <a href="#">Copy a File Using File Transfer Protocol and Requiring a Password on page 865</a> <a href="#">Copy a File Using Secure Copy Protocol (scp) on page 865</a>

## Sample Output

The following are examples of a variety of file copy scenarios.

### Copy a File from the Local Device to a Personal Computer

```
user@host> file copy /var/tmp/rpd.core.4 mypc:/c/junipero/tmp
...transferring.file..... |           0 KB |    0.3 kB/s | ETA: 00:00:00 | 100%
```

### Copy a Configuration File between Routing Engines

The following sample command copies a configuration file from Routing Engine 0 to Routing Engine 1:

```
user@host> file copy /config/juniper.conf re1:/var/tmp/copied-juniper.conf
```

### Copy a Log File between Routing Engines

The following sample command copies a log file from Routing Engine 0 to Routing Engine 1:

```
user@host> file copy lcc0-re0:/var/log/chassisd lcc0-re1:/var/tmp
```

### Copy a File from a TX Matrix Plus Router to a T1600 Router Connected to the TX Matrix Plus

The following sample command copies a text file from Routing Engine 1 on the switch-fabric chassis sfc0 to Routing Engine 1 on the line-card chassis lcc0:

```
user@host> file copy sfc0-re1:/tmp/sample.txt lcc0-re1:/var/tmp
```

### Copy a File Using File Transfer Protocol

To use anonymous FTP to copy a local file to a remote system, enter the following command:

```
user@host> file copy filename ftp://hostname/filename
```

In the following example, `/config/juniper.conf` is the local file and `hostname` is the FTP server:

```
user@host> file copy /config/juniper.conf ftp://hostname/juniper.conf
Receiving ftp: //hostname/juniper.conf (2198 bytes): 100%
2198 bytes transferred in 0.0 seconds (2.69 MBps)
```

### Copy a File Using File Transfer Protocol and Requiring a Password

To use FTP where you require more privacy and are prompted for a password, enter the following command:

```
root@host> file copy filename ftp://user@hostname/filename
```

In the following example, `/config/juniper.conf` is the local file and `hostname` is the FTP server:

```
root@host> file copy /config/juniper.conf ftp://user@hostname/juniper.conf
Password for user@hostname: *****
Receiving ftp: //user@hostname/juniper.conf (2198 bytes): 100%
2198 bytes transferred in 0.0 seconds (2.69 MBps)
```

### Copy a File Using Secure Copy Protocol (scp)

To use scp to copy a local file to a remote system, enter the following command:

```
root@host> file copy filename scp://user@hostname/path/filename
```

In the following example, `/config/juniper.conf` is the local file, `user` is the username, and `ssh-host` is the scp server:

```
root@host> file copy /config/juniper.conf scp://user@ssh-host/tmp/juniper.conf
user@ssh-host's password: *****
juniper.conf          100%
|*****|
2198          00:00
```

## file delete

---

<b>Syntax</b>	<code>file delete <i>filename</i></code> <code>&lt;purge&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Delete a file on the local router or switch.
<b>Options</b>	<b><i>filename</i></b> —Name of the file to delete. For a routing matrix, include chassis information in the filename if the file to be deleted is not local to the Routing Engine from which the command is issued.  <b><i>purge</i></b> —(Optional) Overwrite regular files before deleting them.
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">file delete on page 866</a> <a href="#">file delete (Routing Matrix) on page 866</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file delete

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file delete /var/tmp/snmpd.core
user@host> file list /var/tmp
dcd.core
rpd.core
```

### file delete (Routing Matrix)

```
user@host> file list lcc0-re0:/var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file delete lcc0-re0:/var/tmp/snmpd.core
user@host> file list /var/tmp
dcd.core
rpd.core
```

## file list

<b>Syntax</b>	file list <detail   recursive> <filename>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display a list of files on the local router or switch.
<b>Options</b>	<p><b>none</b>—Display a list of all files for the current directory.</p> <p><b>detail   recursive</b>—(Optional) Display detailed output or descend recursively through the directory hierarchy, respectively.</p> <p><b>filename</b>—(Optional) Display a list of files. For a routing matrix, the filename must include the chassis information.</p>
<b>Additional Information</b>	The default directory is the home directory of the user logged in to the router or switch. To view available directories, enter a space and then a backslash (/) after the <b>file list</b> command. To view files within a specific directory, include a backslash followed by the directory and, optionally, subdirectory name after the <b>file list</b> command.
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">file list on page 867</a> <a href="#">file list (Routing Matrix) on page 867</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file list

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core
```

### file list (Routing Matrix)

```
user@host> file list lcc0-re0:var/tmp
lcc0-re0:
-----
/var/tmp/:

## file rename

<b>Syntax</b>	<code>file rename <i>source destination</i></code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Rename a file on the local router or switch.
<b>Options</b>	<i>destination</i> —New name for the file.  <i>source</i> —Original name of the file. For a routing matrix, the filename must include the chassis information.
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">file rename on page 869</a> <a href="#">file rename (Routing Matrix) on page 869</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### file rename

The following example lists the files in `/var/tmp`, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file rename /var/tmp/dcd.core /var/tmp/dcd.core.990413
user@host> file list /var/tmp
dcd.core.990413
rpd.core
snmpd.core
```

#### file rename (Routing Matrix)

The following example lists the files in `/var/tmp`, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list lcc0-re1:/var/tmp
lcc0-re1:
-----

/var/tmp:
.pccardd
sartre.conf
snmpd
syslogd.core-tarball.0.tgz
```

```
user@host> file rename lcc0-re0:/var/tmp/snmpd /var/tmp/snmpd.rr
```

```
user@host> file list lcc0-re1:/var/tmp
```

```
lcc0-re1:
```

```
-----
```

```
/var/tmp:
```

```
.pccardd
```

```
sartre.conf
```

```
snmpd.rr
```

```
syslogd.core-tarball.0.tgz
```

## file show

<b>Syntax</b>	<code>file show <i>filename</i></code> <code>&lt;encoding (base64   raw)&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the contents of a file.
<b>Options</b>	<b><i>filename</i></b> —Name of a file. For a routing matrix, the filename must include the chassis information.  <b><code>encoding (base64   raw)</code></b> —(Optional) Encode file contents with base64 encoding or show raw text.
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">file show on page 871</a> <a href="#">file show (Routing Matrix) on page 871</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### file show

```
user@host> file show /var/log/messages
Apr 13 21:00:08 romney /kernel: so-1/1/2: loopback suspected; going to standby.
Apr 13 21:00:40 romney /kernel: so-1/1/2: loopback suspected; going to standby.
Apr 13 21:02:48 romney last message repeated 4 times
Apr 13 21:07:04 romney last message repeated 8 times
Apr 13 21:07:13 romney /kernel: so-1/1/0: Clearing SONET alarm(s) RDI-P
Apr 13 21:07:29 romney /kernel: so-1/1/0: Asserting SONET alarm(s) RDI-P
...
```

### file show (Routing Matrix)

```
user@host> file show lcc0-re0:/var/tmp/gdbinit
lcc0-re0:
-----
#####
# Settings
#####

set print pretty

#####
# Basic stuff
#####

define msgbuf
    printf "%s", msgbufp->msg_ptr
end
```

```
# hex dump of a block of memory
# usage: dump address length
define dump
  p $arg0, $arg1
  set $ch = $arg0
  set $j = 0
  set $n = $arg1
  while ($j < $n)
    #printf "%x %x ",&$ch[$j],$ch[$j]
    printf "%x ",$ch[$j]
    set $j = $j + 1
    if (!($j % 16))
      printf "\n"
    end
  end
end
end
```

## monitor list

<b>Syntax</b>	monitor list
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Display the status of monitored log and trace files.
<b>Options</b>	This command has no options.
<b>Additional Information</b>	Log files are generated by the routing protocol process or by system logging. The log files generated by system logging are configured with the <b>syslog</b> statement at the <b>[edit system]</b> hierarchy level and the <b>options</b> statement at the <b>[edit routing-options]</b> hierarchy level. The trace files generated by the routing protocol process are those configured with <b>traceoptions</b> statements at the <b>[edit routing-options]</b> , <b>[edit interfaces]</b> , and <b>[edit protocols protocol]</b> hierarchy levels.

<b>List of Sample Output</b>	<a href="#">monitor list on page 873</a>
<b>Output Fields</b>	<a href="#">Table 103 on page 873</a> describes the output fields for the <b>monitor list</b> command. Output fields are listed in the approximate order in which they appear.

Table 103: monitor list Output Fields

Field Name	Field Description
<b>monitor start</b>	Indicates the file is being monitored.
<b>"filename"</b>	Name of the file that is being monitored.
<b>Last changed</b>	Date and time at which the file was last modified.

## Sample Output

### monitor list

```
user@host> monitor list
monitor start "vrrpd" (Last changed Dec 03:11:06 20)
monitor start "cli-commands" (Last changed Nov 07:3)
```

## monitor start

<b>Syntax</b>	<code>monitor start <i>filename</i></code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Start displaying the system log or trace file and additional entries being added to those files.
<b>Options</b>	<i>filename</i> —Specific log or trace file.
<b>Additional Information</b>	Log files are generated by the routing protocol process or by system logging. The log files generated by system logging are configured with the <b>syslog</b> statement at the <b>[edit system]</b> hierarchy level and the <b>options</b> statement at the <b>[edit routing-options]</b> hierarchy level. The trace files generated by the routing protocol process are configured with <b>traceoptions</b> statements at the <b>[edit routing-options]</b> , <b>[edit interfaces]</b> , and <b>[edit protocols protocol]</b> hierarchy levels.

**NOTE:** To monitor a log file within a logical system, issue the **monitor start *logical-system-name/filename*** command.

<b>Required Privilege Level</b>	trace
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">monitor list on page 873</a></li> <li><a href="#">monitor stop on page 876</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">monitor start on page 875</a>
<b>Output Fields</b>	<a href="#">Table 104 on page 874</a> describes the output fields for the <b>monitor start</b> command. Output fields are listed in the approximate order in which they appear.

**Table 104: monitor start Output Fields**

Field Name	Field Description
<b>***<i>filename</i>***</b>	Name of the file from which entries are being displayed. This line is displayed initially and when the command switches between log files.
<b><i>Date and time</i></b>	Timestamp for the log entry.

## Sample Output

### monitor start

```
user@host> monitor start system-log
*** system-log***
Jul 20 15:07:34 hang sshd[5845]: log: Generating 768 bit RSA key.
Jul 20 15:07:35 hang sshd[5845]: log: RSA key generation complete.
Jul 20 15:07:35 hang sshd[5845]: log: Connection from 204.69.248.180 port 912
Jul 20 15:07:37 hang sshd[5845]: log: RSA authentication for root accepted.
Jul 20 15:07:37 hang sshd[5845]: log: ROOT LOGIN as 'root' from trip.jcmax.com
Jul 20 15:07:37 hang sshd[5845]: log: Closing connection to 204.69.248.180
```

## monitor stop

---

<b>Syntax</b>	<code>monitor stop <i>filename</i></code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Stop displaying the system log or trace file.
<b>Options</b>	<i>filename</i> —Specific log or trace file.
<b>Additional Information</b>	Log files are generated by the routing protocol process or by system logging. The log files generated by system logging are those configured with the <b>syslog</b> statement at the <b>[edit system]</b> hierarchy level and the <b>options</b> statement at the <b>[edit routing-options]</b> hierarchy level. The trace files generated by the routing protocol process are those configured with <b>traceoptions</b> statements at the <b>[edit routing-options]</b> , <b>[edit interfaces]</b> , and <b>[edit protocols <i>protocol</i>]</b> hierarchy levels.

## Sample Output

### monitor stop

```
user@host> monitor stop
```

## request chassis cb

<b>List of Syntax</b>	<a href="#">Syntax on page 877</a> <a href="#">Syntax (TX Matrix Router) on page 877</a> <a href="#">Syntax (TX Matrix Plus Router) on page 877</a> <a href="#">Syntax (QFabric System) on page 877</a>
<b>Syntax</b>	<code>request chassis cb (offline   online) slot <i>slot-number</i></code>
<b>Syntax (TX Matrix Router)</b>	<code>request chassis cb (offline   online) &lt;slot <i>slot-number</i>   lcc <i>number</i> slot <i>cb-slot-number</i>   scc <i>number</i> slot <i>cb-slot-number</i>&gt;</code>
<b>Syntax (TX Matrix Plus Router)</b>	<code>request chassis cb (offline   online) &lt;slot <i>slot-number</i>   lcc <i>number</i> slot <i>cb-slot-number</i>   sfc <i>number</i> slot <i>cb-slot-number</i>&gt;</code>
<b>Syntax (QFabric System)</b>	<code>request chassis cb (offline   online) interconnect-device <i>name</i> slot <i>slot-number</i> &lt;interconnect-device <i>name</i> slot <i>slot-number</i> (offline   online)&gt;</code>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS 9.4 for EX Series switches.</p> <p><b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS 11.3 for QFX Series.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p>
<b>Description</b>	(M120, M320, and MX Series routers and T Series routers, QFabric systems, and EX8200 switches only) Control the operation of the Control Board (CB). For information about the meaning of “CBs” on the switches, see <a href="#">“EX Series Switches Hardware and CLI Terminology Mapping” on page 315</a> .
<b>Options</b>	<b>offline</b> —Take the Control Board offline.

**NOTE:** On a QFabric system, to bring the backup Control Board on a QFX3008-I Interconnect device offline, issue the `request chassis cb slot backup-slot-number offline` command.

**NOTE:** Only backup Control Board can be turned offline or online. To turn a Control Board offline or to bring it back online, the Routing Engine should be turned offline first.

**online**—Bring the Control Board online.

**interconnect-device *name***—(QFabric systems only) (Optional) Bring the QFX3008-I Interconnect device Control Board either offline or online:

**slot slot-number**—Control Board slot number:

- (TX Matrix and TX Matrix Plus routers only) On a TX Matrix router, if you specify the number of the T640 router by using the **lcc number** option (the recommended method), replace **cb-slot-number** with a value from 0 through 1.

Likewise, on a TX Matrix Plus router, if you specify the number of the T1600 or T4000 router by using the **lcc number** option (the recommended method), replace **cb-slot-number** with a value from 0 through 1.

- M320 router—Replace **slot-number** with a value from 0 through 1.
- MX480/MX240 routers—Replace **slot-number** with a value from 0 through 1.
- MX960 router—Replace **slot-number** with a value from 0 through 2.
- MX2020 and MX2010 routers—Replace **slot-number** with 0 or 1.
- EX8208 switch—Replace **slot-number** with a value from 0 through 2.
- EX8216 switch—Replace **slot-number** with a value from 0 through 1.
- QFabric System—Replace **slot-number** with a value from 0 through 1.

**lcc number**—(TX Matrix, TX Matrix Plus routers only) (Optional) Line-card chassis number.

Replace **number** with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**sfc number**—(TX Matrix Plus routers only) (Optional) Change the CB status for the TX Matrix Plus router (switch-fabric chassis). Replace **number** with 0.

**Required Privilege Level** maintenance

**Related Documentation**

- [request chassis cb interconnect-device \(QFabric System\) on page 879](#)
- [request chassis cb \(MX2020 Router\) on page 879](#)
- [request chassis cb \(MX2010 Router\) on page 879](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request chassis cb

```
user@host> request chassis cb offline slot 1
Backup CB 1 cannot be set offline, backup RE is online
```

### request chassis cb interconnect-device (QFabric System)

```
user@switch> request chassis cb interconnect-device interconnect1 offline slot 1
Backup CB 1 cannot be set offline, backup RE is online
```

### request chassis cb (MX2020 Router)

```
user@host> request chassis cb offline slot 1
Backup CB 1 cannot be set offline, backup RE is online
```

### request chassis cb (MX2010 Router)

```
user@host> request chassis cb offline slot 1
Backup CB 1 cannot be set offline, backup RE is online
```

## request chassis fabric plane

---

<b>Syntax</b>	<code>request chassis fabric plane <i>plane-number</i> (offline   online)</code>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 8.0.</p> <p>Command introduced in Junos OS Release 9.4 for EX Series switches.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p>
<b>Description</b>	<p>(M120 and MX Series routers and EX8200 switches only) Control the operation of the specified fabric plane.</p> <p>On an MX480 or MX240 series router, you can configure the active control board for redundancy mode or increased bandwidth mode. When running in increased bandwidth mode, MX series routers with Trio chips and the MPC3E will use all eight active fabric planes.</p> <p>To take both plane 0 and plane 1 offline on a MX480 and MX240 series routers with one or more MPC4E MICs installed, a X86 Media Service Blade, and/or 100G PFE, and where redundancy-mode is configured for "increased-bandwidth", Juniper recommends taking plane 1 offline before plane 0. Likewise, when the router is configured for increased-bandwidth mode, taking fabric planes 0, 2, 4, and 6 offline can cause the chassis to run in a reduced fabric bandwidth mode. Plane 7 may remain in a "spare" state (as seen in the "show chassis fabric summary" command output) until plane 3 is taken offline and then brought back up.</p>
<b>Options</b>	<p><b>offline</b>—Take the fabric plane offline. Use the <code>request chassis fabric plane <i>plane-number</i> offline</code> command to clear a <b>FAULT</b> state on a fabric plane. To bring the fabric plane back online, use the <code>request chassis fabric plane <i>plane-number</i> online</code> command.</p> <p><b>online</b>—Bring the fabric plane online.</p> <p><b>plane <i>plane-number</i></b>—Fabric plane number.</p> <ul style="list-style-type: none"><li>• For the M120 router, replace <i>plane-number</i> with a value from 0 through 3.</li><li>• For the MX480 and MX240 routers, replace <i>plane-number</i> with a value from 0 through 7.</li><li>• For the MX2020 and MX2010 routers, replace <i>plane-number</i> with a value from 0 through 7.</li><li>• For the MX960 router, replace <i>plane-number</i> with a value from 0 through 5.</li><li>• For the EX8208 switch, replace <i>plane-number</i> with a value from 0 through 11.</li><li>• For the EX8216 switch, replace <i>plane-number</i> with a value from 0 through 7.</li></ul>
<b>Required Privilege Level</b>	maintenance

Plane 4 is already active
```

## request chassis fpc

---

<b>List of Syntax</b>	<a href="#">Syntax on page 882</a> <a href="#">Syntax (TX Matrix and TX Matrix Plus Routers) on page 882</a> <a href="#">Syntax (MX Series Routers) on page 882</a> <a href="#">Syntax (MX2020 3D Universal Edge Routers) on page 882</a> <a href="#">Syntax (MX2010 3D Universal Edge Routers) on page 882</a> <a href="#">Syntax (QFabric System) on page 882</a> <a href="#">Syntax (PTX Series Packet Transport Routers) on page 882</a>
<b>Syntax</b>	<code>request chassis fpc (offline   online   restart) slot <i>slot-number</i></code>
<b>Syntax (TX Matrix and TX Matrix Plus Routers)</b>	<code>request chassis fpc (offline   online   restart) slot <i>slot-number</i> &lt;fcc <i>number</i>&gt;</code>
<b>Syntax (MX Series Routers)</b>	<code>request chassis fpc (offline   online   restart) slot <i>slot-number</i> &lt;all-members&gt;</code> <code>&lt;local&gt;</code> <code>&lt;member <i>member-id</i>&gt;</code>
<b>Syntax (MX2020 3D Universal Edge Routers)</b>	<code>request chassis fpc (offline   online   restart) slot <i>slot-number</i></code>
<b>Syntax (MX2010 3D Universal Edge Routers)</b>	<code>request chassis fpc (offline   online   restart) slot <i>slot-number</i></code>
<b>Syntax (QFabric System)</b>	<code>request chassis fpc</code> <code>&lt;interconnect-device <i>name</i> slot <i>slot-number</i> (offline   online)&gt;</code> <code>&lt;(offline   online) interconnect-device <i>name</i> slot <i>slot-number</i>&gt;</code> <code>&lt;slot <i>slot-number</i> interconnect-device <i>name</i> (offline   online)&gt;</code>
<b>Syntax (PTX Series Packet Transport Routers)</b>	<code>request chassis fpc (offline   online   restart) slot <i>slot-number</i></code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS 11.3 for QFX Series. Command introduced in Junos OS 12.1x48 for PTX Series Packet Transport Routers. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
<b>Description</b>	(M20, M40, M40e, M120, M160, M320, MX Series, and T Series routers, QFabric systems, EX Series switches, and PTX Series Packet Transport Routers only) Control the operation of the Flexible PIC Concentrator (FPC). For information about the meaning of “FPCs” on the switches, see <a href="#">“EX Series Switches Hardware and CLI Terminology Mapping” on page 315</a> .

**NOTE:** Beginning in Junos OS 12.3, it is possible that FPCs brought offline using the `request chassis fpc slot fpc-slot offline` operational-mode CLI command can come online during a configuration commit or power-supply replacement procedure. As an alternative, use the `set fpc fpc-slot power off` configuration-mode command at the `[edit chassis]` hierarchy level to ensure that the FPCs remain offline.

**Options**    **offline**—Take the FPC offline.

**online**—Bring the FPC online.

**interconnect-device *name***—(QFabric systems only) Bring the Flexible Port Concentrator (FPC) on the QFX3008-I Interconnect device either offline or online:

- (QFabric System) On a QFabric system, specify the name of the QFX3008-I Interconnect device containing the Flexible Port Concentrator (FPC) you want to bring either offline or online.

**restart**—Restart the FPC.

**slot *slot-number***—FPC slot number:

- M20 router—0 through 3.
- M120 router—0 through 5.
- MX240 router—0 through 2. On the MX240 router, slot-number corresponds to the Dense Port Concentrator (DPC) slot number. If an MPC is installed, slot-number corresponds to the MPC slot number.
- MX480 router—0 through 5. On the MX480 router, slot-number corresponds to the Dense Port Concentrator (DPC) slot number. If an MPC is installed, slot-number corresponds to the MPC slot number.
- MX960 router—0 through 11. On the MX960 router, slot-number corresponds to the Dense Port Concentrator (DPC) slot number. If an MPC is installed, slot-number corresponds to the MPC slot number.
- MX2020 router—0 through 19.
- MX2010 router—0 through 9.
- TX Matrix and TX Matrix Plus routers only—On the TX Matrix router, if you specify the number of the T640 router by using the ***lcc number*** option (the recommended method), replace ***slot-number*** with a value from 0 through 7. Otherwise, replace ***slot-number*** with a value from 0 through 31.

Likewise, on a TX Matrix Plus router, if you specify the number of the T1600 or T4000 router by using the ***lcc number*** option (the recommended method), replace ***slot-number*** with a value from 0 through 7. Otherwise, replace ***slot-number*** with a value from 0 through 31. In case of TX Matrix Plus router with 3D SIBs, replace

*slot-number* with a value from 0 through 63. For example, the following commands have the same result:

```
user@host> request chassis fpc lcc 1 slot 1 offline
user@host> request chassis fpc slot 9 offline
```

- Other routers—0 through 7.
- QFabric System—Replace *slot-number* with a value from 0 through 2.
- EX Series switches:
  - EX4200 switches in a Virtual Chassis configuration—Replace *slot-number* with a value from 0 through 9.
  - EX6210 switches—Replace *slot-number* with a value from 0 through 9.

**NOTE:** These commands are not supported for slots 4 and 5 when a Switch Fabric and Routing Engine (SRE) module is installed in those slots. These commands are supported for slots 4 and 5 only if a line card is installed in them.

---

- EX8208 switches—Replace *slot-number* with a value from 0 through 7.
- EX8216 switches—Replace *slot-number* with a value from 0 through 15.
- PTX5000 Packet Transport Router—Replace *slot-number* with a value from 0 through 7.

**all-members**—(MX Series routers only) (Optional) Change FPC status of all members of the Virtual Chassis configuration.

**local**—(MX Series routers only) (Optional) Change FPC status of the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Change FPC status of the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**lcc *number***—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.

- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

<b>List of Sample Output</b>	<a href="#">request system scripts refresh-from commit file config.txt url http://host1.juniper.net on page 888</a>

### Sample Output

`request system scripts refresh-from commit file config.txt url http://host1.juniper.net`

```
user@switch> request system scripts refresh-from commit file config.txt url
http://host1.juniper.net
user@switch>
```

## request system scripts refresh-from event

<b>Syntax</b>	<code>request system scripts refresh-from event file <i>file-name</i> url <i>url-path</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 10.1 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<p>Automatically download the initial Junos OS configuration and a set of standard event scripts during a Junos XML management protocol/NETCONF session when a switch is brought up for the first time.</p> <p>The Junos XML management protocol equivalent for this operational mode command is:</p> <pre>&lt;request-script-refresh-from&gt;   &lt;type&gt;event&lt;/type&gt;   &lt;file&gt;file-name&lt;/file&gt;   &lt;URL&gt;URL&lt;/URL&gt; &lt;/request-script-refresh-from&gt;</pre>
<b>Options</b>	<p><b>file <i>file-name</i></b>—Name of the file to be downloaded.</p> <p><b>url <i>url-path</i></b>—URL of the file to be downloaded.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Understanding Automatic Refreshing of Scripts on EX Series Switches on page 613</a></li> <li>• <a href="#">Junos OS Junos XML Management Protocol Guide</a></li> <li>• <a href="#">Junos OS NETCONF XML Management Protocol Guide</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">request system scripts refresh-from event file config.txt url http://host1.juniper.net on page 889</a>

### Sample Output

`request system scripts refresh-from event file config.txt url http://host1.juniper.net`

```
user@switch> request system scripts refresh-from event file config.txt url http://host1.juniper.net
user@switch>
```

## request system scripts refresh-from op

---

<b>Syntax</b>	<code>request system scripts refresh-from op file <i>file-name</i> url <i>url-path</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 10.1 for EX Series switches.
<b>Description</b>	<p>Automatically download the initial Junos OS configuration and a set of standard op scripts during a Junos XML management protocol/NETCONF session when a switch is brought up for the first time.</p> <p>The Junos XML management protocol equivalent for this operational mode command is:</p> <pre>&lt;request-script-refresh-from&gt;   &lt;type&gt;op&lt;/type&gt;   &lt;file&gt;file-name&lt;/file&gt;   &lt;URL&gt;URL&lt;/URL&gt; &lt;/request-script-refresh-from&gt;</pre>
<b>Options</b>	<p><b>file <i>file-name</i></b>—Name of the file to be downloaded.</p> <p><b>url <i>url-path</i></b>—URL of the file to be downloaded.</p>
<b>Required Privilege Level</b>	maintenance

Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.

**Description** Display information about the conditions that have been configured to trigger alarms.

**Options** **none**—Display information about the conditions that have been configured to trigger alarms.

**all-members**—(MX Series routers only) (Optional) Display information about alarm conditions for all the member routers of the Virtual Chassis configuration.

**interconnect-device *name***—(QFabric systems only) (Optional) Display information about alarm conditions for the Interconnect device.

**lcc *number***—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display information about alarm conditions for the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display information about alarm conditions for the specified member of the Virtual Chassis configuration. Replace *member-id* variable with a value of 0 or 1.

**node-device *name***—(QFabric systems only) (Optional) Display information about alarm conditions for the Node device.

**scc**—(TX Matrix router only) (Optional) Show information about the TX Matrix router (switch-card chassis).

**sfc *number***—(TX Matrix Plus router only) (Optional) Show information about the respective TX Matrix Plus router, which is the switch-fabric chassis. Replace *number* variable with 0.

**Additional Information** You cannot clear the alarms for chassis components. Instead, you must remedy the cause of the alarm. When a chassis alarm LED is lit, it indicates that you are running the router or switch in a manner that we do not recommend.

On routers, you can manually silence external devices connected to the alarm relay contacts by pressing the alarm cutoff button, located on the craft interface. Silencing the device does not remove the alarm messages from the display (if present on the

router) or extinguish the alarm LEDs. In addition, new alarms that occur after you silence an external device reactivate the external device.

In Junos OS release 11.1 and later, alarms for fans also show the slot number of the fans in the CLI output.

In Junos OS Release 11.2 and later, the command output on EX8200 switches shows the detailed location (**Plane/FPC/PFE**) for link errors in the chassis.

In Junos OS Release 10.2 and later, an alarm is shown on T Series routers for a standby sonic clock generator (SCG) that is offline or absent.

You may often see the following error messages, in which only the error code is shown and no other information is provided:

```
Apr 12 08:04:10 send: red alarm set, device FPC 6, reason FPC 6 Major Errors - Error code:
257
Apr 12 08:04:19 send: red alarm set, device FPC 1, reason FPC 1 Major Errors - Error code:
559
```

To understand what CM\_ALARM error codes mean, you need to first identify the structure of the CM Alarm codes. A CM\_ALARM code has the following structure:

Bits:	Error type:
1-31	Major (1)
0	Minor (0)

According to the table above, the LSB (bit 0) identifies the **Error Type** (major alarm, if the bit is set and minor alarm if the bit is unset). The rest of the bits (1 - 31) identify the actual error code.

Take an example of the following error code, which was logged on a T1600:

```
Apr 12 08:04:10 send: red alarm set, device FPC 1, reason FPC 1 Major Errors - Error code:
559
```

First, you have to convert 559 to binary; that is **100010111**. The LSB in this case is 1, which means that this is a major alarm. After removing the LSB, you are left with **10001011**, which is equal to 279 in decimal. This is the actual error code, its meaning can be found from the following list:

Chip Type: L Chip	Code
CMALARM_LCHIP_LOUT_DESRD_PARITY_ERR	1
CMALARM_LCHIP_LOUT_DESRD_UNINIT_ERR	2
CMALARM_LCHIP_LOUT_DESRD_ILLEGALLINK_ERR	3
CMALARM_LCHIP_LOUT_DESRD_ILLEGALSIZE_ERR	4

CMALARM_LCHIP_LOUT_HDRF_TOERR_ERR	5
CMALARM_LCHIP_LOUT_HDRF_PARITY_ERR	6
CMALARM_LCHIP_LOUT_HDRF_UCERR_ERR	7
CMALARM_LCHIP_LOUT_NLIF_CRCDROP_ERR	8
CMALARM_LCHIP_LOUT_NLIF_CRCERR_ERR	9
CMALARM_LCHIP_UCODE_TIMEOUT_ERR	10
CMALARM_LCHIP_LIN_SRCTL_ACCT_DROP_ERR	11
CMALARM_LCHIP_LIN_SRCTL_ACCT_ADDR_SIZE_ERR	12
CMALARM_LCHIP_SRAM_PARITY_ERR	13
CMALARM_LCHIP_UCODE_OVFLW_ERR	14
CMALARM_LCHIP_LOUT_HDRF_MTU_ERR	15

Chip Type: M Chip	Code
CMALARM_MCHIP_ECC_UNCORRECT_ERR	128

Chip Type: N Chip	Code
CMALARM_NCHIP_RDDMA_JBUS_TIMEOUT_ERR	256
CMALARM_NCHIP_RDDMA_FIFO_OVFLW_ERR	257

CMALARM_NCHIP_RODR_OFFSET_OVFLW_ERR	271
CMALARM_NCHIP_PKTR_TMO_CELL_ERR	272
CMALARM_NCHIP_PKTR_TMO_OUTRANGE_ERR	273
CMALARM_NCHIP_PKTR_MD_REQUEST_Q_OVFLW_ERR	274
CMALARM_NCHIP_PKTR_DMA_BUFFER_OVFLW_ERR	275
CMALARM_NCHIP_PKTR_GRT_OVFLW_ERR	276
CMALARM_NCHIP_FRQ_ERR	277
CMALARM_NCHIP_RODR_IN_Q_OVFLW_ERR	278
CMALARM_NCHIP_DBUF_CRC_ERR	279

Chip Type: R Chip	Code
CMALARM_RCHIP_SRAM_PARITY_ERR	512

Chip Type: R Chip	Code
CMALARM_ICHIP_WO_DESRD_ID_ERR	601
CMALARM_ICHIP_WO_DESRD_DATA_ERR	602
CMALARM_ICHIP_WO_DESRD_OFLOW_ERR	603
CMALARM_ICHIP_WO_HDRF_UCERR_ERR	604
CMALARM_ICHIP_WO_HDRF_MTUERR_ERR	605
CMALARM_ICHIP_WO_HDRF_PARITY_ERR	606
CMALARM_ICHIP_WO_HDRF_TOERR_ERR	607
CMALARM_ICHIP_WO_IP_CRC_ERR	608
CMALARM_ICHIP_WO_IP_INTER_ERR	609

CMALARM_ICHIP_WI_WAN_TIMEOUT_ERR	625
CMALARM_ICHIP_WI_FAB_TIMEOUT_ERR	626
CMALARM_ICHIP_RLDRAM_BIST_ERR	630
CMALARM_ICHIP_SDRAM_BIST_ERR	631
CMALARM_ICHIP_RLDRAM_PARITY_ERR	632
CMALARM_ICHIP_SDRAM_UNCORRECT_ERR	633
CMALARM_ICHIP_SDRAM_CORRECT_ERR	634
CMALARM_ICHIP_FUSE_DONE_ERR	635

According to the table above, the **279** error code corresponds to **CMALARM\_NCHIP\_DBUF\_CRC\_ERR**; this means that new CRC errors were seen on the NCHIP of this particular FPC, which is FPC as per the logs.

If you do not want to convert decimal to binary and vice versa, you may use the following shortcut:

For major alarms, the **Actual Error Code = (Error Code - 1)/2**, where **Error Code** is the code that you get in the log message. For example, if you get the following log:

Apr 12 08:04:10 send: red alarm set, device FPC 6, reason FPC 6 Major Errors - Error code: 257

Actual Error Code =  $(257-1)/2 = 128$ . Similarly, for minor alarms, Actual Error Code =  $(\text{Error Code})/2$

```

### show chassis alarms (MX960, MX480, and MX240 Routers showing Major CB Failure)

A Major CB 0 Failure alarm occurs in the event of a bad CB (unknown or mismatched CBs do not trigger this alarm in Junos Release 12.3R9 and later). Following GRES/recovery, if the hardware issue persists, the traffic moves to the good CB and continues. If the alarm was triggered by something transient like a power zone budget on GRES, bringing the CB back online can clear the alarm. Otherwise, replace the bad CB. Note that fabric link speed is not impacted by an offline SCB. The alarm may be raised on CB0, CB1, and CB2.

### show chassis alarms (Alarms on a T4000 Router After the enhanced-mode Statement is Enabled)

To enable improved virtual private LAN service (VPLS) MAC address learning on T4000 routers, you must include the **enhanced-mode** statement at the **[edit chassis network-services]** hierarchy level and reboot the router. When router reboots, only the T4000 Type 5 FPCs are required to be present on the router. If there are any other FPCs (apart from T4000 Type 5 FPCs) on the T4000 router, such FPCs become offline, and FPC misconfiguration alarms are generated. The **show chassis alarm** command output displays FPC misconfiguration (**FPC *fpc-slot* misconfig**) as the reason for the generation of the alarms.

```
user@host> show chassis alarms
2 alarms currently active
Alarm time          Class  Description
2011-10-22 10:10:47 PDT Major  FPC 1 misconfig
2011-10-22 10:10:46 PDT Major  FPC 0 misconfig
```

### show chassis alarms (Backup Routing Engine)

```

### show chassis alarms (Mix of PDUs Alarm on a PTX5000 Packet Transport Router with FPC2-PTX-PIA)

All PDUs installed on a PTX5000 router must be of the same type. The **Mix of PDUs or Power Manager Non Operational** alarm is raised when different types of PDUs are installed on a PTX5000 router.

```
user@host> show chassis alarms
15 alarms currently active
Alarm time          Class Description
2013-03-19 23:03:53 PDT Minor No Redundant Power
2013-03-19 23:03:48 PDT Minor Mix of PDUs
2013-03-19 23:03:47 PDT Minor PDU 1 PSM 3 Absent
2013-03-19 23:03:47 PDT Minor PDU 1 PSM 2 Absent
2013-03-19 23:03:47 PDT Minor PDU 1 PSM 1 Absent
2013-03-19 23:03:47 PDT Minor PDU 1 PSM 0 Absent
2013-03-19 23:03:46 PDT Major No CG Online
```

### show chassis alarms (PDU Converter Failed Alarm on a PTX5000 Packet Transport Router with FPC2-PTX-PIA)

The **PDU Converter Failed** alarm is raised when one or more 36 V booster converter of a DC PDU fails. If two or more 36 V booster converter fails, fan trays fail and the router might get over heated. Therefore, when this alarm is raised, check the PDU and replace it, if required.

```
user@host> show chassis alarms
11 alarms currently active
Alarm time          Class Description
2013-12-11 22:14:13 PST Minor No Redundant Power for System

Release Information	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for QFX Series.</p>

Command introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers.

**monitored** option added in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers.

Command introduced in Junos OS Release 12.1 for T4000 Core Routers.

Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.

Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.

Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.

**pem** option introduced in Junos OS Release 12.3 for ACX4000 Universal Access Routers.

Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.

**Description** Display environmental information about the router or switch chassis, including the temperature and information about the fans, power supplies, and Routing Engine.

In addition, on ACX4000 routers, display temperature information about the different channels of a Modular Interface Card (MIC). The number of channels displayed depends on the type of MIC installed.

Starting with Junos OS Release 14.1, the **show chassis environment cb cb-slot-number | ccg ccg-slot-number | fpc fpc-slot-number | fpm | monitored | pdu pdu-slot-number | routing-engine re-slot-number | sib sib-slot-number** operational mode command output displays environmental information for the the new DC power supply module (PSM) and power distribution unit (PDU) that are added to provide power to the high-density FPC (FPC2-PTX-PIA) and other components in a PTX5000 Packet Transport Router.

**Options** **none**—Display environmental information about the router or switch chassis. On a TX Matrix router, display environmental information about the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display environmental information about the TX Matrix Plus router and its attached routers.

**all-members**—(MX Series routers and EX Series switches only) (Optional) Display chassis environmental information for all the members of the Virtual Chassis configuration.

**adc adc-slot-number**—(MX2020 and MX2010 routers only) (Optional) Display chassis environmental information for the adapter cards. For MX2020 routers, replace **adc-slot-number** with a value from 0 through 19. For MX2010 routers, replace **adc-slot-number** with a value from 0 through 9.

**cb cb-slot-number**—(ACX Series Universal Access Routers, EX Series switches, M120, M320, and M40e routers, MX Series routers, MX2020 routers, MX2010 routers, PTX Series Packet Transport Routers, QFX Series, and T Series routers, and TX Matrix Plus routers only) (Optional) Display chassis environmental information for the Control Board. On devices other than EX Series switches, replace **cb-slot** with 0 or 1. For the EX Series switches, see [“EX Series Switches Hardware and CLI Terminology Mapping” on page 315](#) for information on CB slot numbering.

**cip cip-slot-number**—(TX Matrix Plus routers only) (Optional) Display chassis environmental information for the Connection Interface Panel (CIP). Replace the **cip-slot-number** variable with a value of 0 or 1.

**cb interconnect-device *name***—(QFabric systems only) (Optional) Display chassis environmental information for the Control Board on an Interconnect device.

**cgc *ccg-slot-number***—(PTX Series only) (Optional) Display chassis environmental information for the Centralized Clock Generator. Replace ***cb-slot*** with a value of 0 or 1.

**fpc *fpc-slot***—(EX Series switches, M120, M320, and M40e routers, MX Series routers, MX2010 routers, MX2020 routers, PTX Series Packet Transport Routers, QFX Series, QFX3500 switches, QFabric systems, T Series routers, and TX Matrix Plus routers) (Optional) Display chassis environmental information for a specified Flexible PIC Concentrator. For MX2010 routers, replace ***fpc-slot*** with a value from 0 through 9. For MX2020 routers, replace ***fpc-slot*** with a value from 0 through 19. For information about FPC numbering, see [show chassis environment fpc](#). On a QFabric system, display chassis environmental information for a specified Flexible PIC Concentrator on an Interconnect device. On an EX Series switch, display chassis environmental information for a specified Flexible PIC Concentrator; see [“EX Series Switches Hardware and CLI Terminology Mapping” on page 315](#) for information on FPC numbering. On a TX Matrix Plus router with 3D SIBs replace ***fpc-slot*** with a value from 0 through 63.

**fpm**—(M120, M320, and M40e routers, MX2010 routers, MX2020 routers, PTX Series, Packet Transport Routers, T Series routers, and TX Matrix Plus routers only) (Optional) Display chassis environmental information for the craft interface (FPM).

**interconnect-device *name***—(QFabric systems only) (Optional) Display chassis environmental information for the Interconnect device.

**monitored**—(MX2020 routers and PTX Series Packet Transport Routers only) (Optional) Display chassis environmental information for monitored temperatures only. Temperatures that are not included in temperature alarm computations are not displayed.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers and EX Series switches) (Optional) Display chassis environmental information for the local Virtual Chassis member.

**member *member-id***—(MX Series routers and EX Series switches only) (Optional) Display chassis environmental information for the specified member of the Virtual Chassis configuration. On MX Series routers, replace *member-id* variable with a value of 0 or 1. For EX Series switches, see [member](#) for member ID values.

**node-device *name***—(QFabric systems only) (Optional) Display chassis environmental information for the Node device.

**pdu *pdu-slot-number***—(PTX Series only) (Optional) Display chassis environmental information for the specified power distribution unit.

**pem**—(QFX3500 switches and QFabric systems only) (Optional) Display chassis environmental information for the Power Entry Module on the specified Interconnect device or Node device.

**pem *pem-slot-number***—(ACX Series Universal Access Routers, M120, M320, and M40e routers, MX Series routers, MX104 routers, QFX Series, and T Series routers only) (Optional) Display chassis environmental information for the Power Entry Module on the specified Power Entry Module. For information about the options, see *show chassis environment pem*.

**psm *psm-slot-number***—(MX2020 and MX2010 routers only) (Optional) Display chassis environmental information for the power supply module. For MX2020 routers, replace *psm-slot-number* with a value from 0 through 17. For MX2010 routers, replace *psm-slot-number* with a value from 0 through 8.

**psu *psu-slot-number***—(EX Series switches only) (Optional) Display chassis environmental information for a specified power supply. See [“EX Series Switches Hardware and CLI Terminology Mapping” on page 315](#) for detailed information.

**routing-engine**—(QFX3500 switches and QFabric systems only) (Optional) Display chassis environmental information for the Routing Engine on the specified Interconnect device.

**routing-engine *re-slot-number***—(Optional) Display chassis environmental information for the specified Routing Engine. For information about the options, see [show chassis environment routing-engine](#).

**scg**—(T Series routers only) (Optional) Display chassis environmental information about the SONET Clock Generator.

**scc**—(TX Matrix routers only) (Optional) Display chassis environmental information about the TX Matrix router (switch-card chassis).

**sfb *sfb-slot-number***—(MX2020 and MX2010 routers only) (Optional) Display chassis environmental information for the power supply module. Replace *sfb-slot-number* with a value from 0 through 7.

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display chassis environmental information about the respective TX Matrix Plus router (switch-fabric chassis). Replace *number* variable with 0.

**sib *sib-slot-number***—(M320 routers, PTX Series Packet Transport Routers, and T Series routers only) (Optional) Display chassis environmental information about the specified switch interface board. For information about the options, see *show chassis environment sib*.

**Output Fields** [Table 106 on page 913](#) lists the output fields for the **show chassis environment** command. Output fields are listed in the approximate order in which they appear.

Table 106: show chassis environment Output Fields

Field Name	Field Description
<b>Class</b>	<p>Information about the category or class of chassis component:</p> <ul style="list-style-type: none"> <li>• <b>Power:</b> Power information: <ul style="list-style-type: none"> <li>• (M5, M10, M20, and M40 routers and EX Series switches only) Power supply status: <b>OK</b>, <b>Testing</b>, (during initial power-on), <b>Failed</b>, or <b>Absent</b>.</li> <li>• (M7i, M10i, M40e, M120, M160, M320, and T Series routers and EX Series switches only) Power Entry Modules status: <b>OK</b>, <b>Testing</b>, (during initial power-on), <b>Check</b>, <b>Failed</b>, or <b>Absent</b>.</li> <li>• (PTX Series only) Power information is reported in PDU or PSM combinations. The status is: <b>OK</b>, <b>Testing</b>, (during initial power-on), <b>Check</b>, <b>Failed</b>, or <b>Absent</b>.</li> </ul> </li> <li>• <b>Temp:</b> Temperature of air flowing through the chassis in degrees Celsius (C) and Fahrenheit (F). <ul style="list-style-type: none"> <li>• On PTX Series Packet Transport Routers and MX2010 and MX2020 Routers, multiple cooling zones are supported. FRU temperatures in each zone are coordinated with the fan speed of fan trays in those zones.</li> <li>• EX2200 switches have a side-to-rear cooling system. The <b>Local Intake</b> temperature is measured by the sensor on the right side of the chassis, and the <b>Remote Intake</b> temperature is measured by the sensor on the left side of the chassis.</li> </ul> </li> <li>• <b>Pic:</b> On ACX4000 Routers, multiple temperature channels on a MIC. The status is: <b>OK</b> and the <b>Measurement</b> is in degrees Celsius (C) and Fahrenheit (F).</li> <li>• <b>Fan:</b> Fan status: <b>OK</b>, <b>Testing</b> (during initial power-on), <b>Failed</b>, or <b>Absent</b>. On PTX Series Packet Transport Routers and MX2010 and MX2020 Routers, multiple fan trays are supported. Fan status is reported in Fan Tray or Fan combinations. <b>Measurement</b> indicates actual fan RPM (PTX and MX2010 and MX2020 Routers only).</li> <li>• <b>Misc:</b> Information about other components of the chassis. <ul style="list-style-type: none"> <li>• On some routers, this field indicates the status of one or more additional components.</li> <li>• On the M40e, M160, and M320 router, <b>Misc</b> includes <b>CIP</b> (Connector Interface Panel). <b>OK</b> indicates that the CIP is present. <b>Absent</b> indicates that the CIP is not present.</li> <li>• On T Series routers, <b>Misc</b> includes <b>CIP</b> and <b>SPMB</b> (Switch Processor Mezzanine Board). <b>OK</b> indicates that the <b>CIP</b> or <b>SPMB</b> is present. <b>Absent</b> indicates that the <b>CIP</b> or <b>SPMB</b> is not present.</li> <li>• On PTX Series Packet Transport Routers, <b>Misc</b> includes the <b>SPMB</b> (Switch Processor Mezzanine Board). The SPMB is located on the control boards. <b>OK</b> indicates that the control board is present. <b>Absent</b> indicates that the control board is not present.</li> </ul> </li> </ul>
<b>Item</b>	<p>(MX2010 and MX2020 Routers) Information about the chassis component: Routing Engines, Controls Boards (CBs), Switch Fabric Boards (SFBs), PICs, Flexible PIC Concentrators (FPCs), and Adapter Cards (ADCs).</p> <p>(MX104 Routers) Information about the chassis components: Routing Engines, Control Board (CB), Power Entry Module (PEM), and Compact Forwarding Engine Board (AFEB).</p> <p>(QFabric Systems) Information about the chassis component: Control Boards, Routing Engines, Flexible PIC Concentrators (FPCs), and Power Entry Modules (PEMs), Node Devices, and Interconnect Devices.</p> <p>(QFX Series) Information about the chassis component: Flexible PIC Concentrators (FPCs), and Power Entry Modules (PEMs).</p>

Table 106: show chassis environment Output Fields (*continued*)

Field Name	Field Description
<b>Status</b>	<p>(MX104, MX2010, and MX2020 Routers) Status of the specified chassis component. For example, if the Class is Fan, the fan status can be:</p> <ul style="list-style-type: none"> <li>• <b>OK:</b> The fans are operational.</li> <li>• <b>Testing:</b> The fans are being tested during initial power-on.</li> <li>• <b>Failed:</b> The fans have failed or the fans are not spinning.</li> <li>• <b>Absent:</b> The fan tray is not installed.</li> </ul> <p>If the Class is Power, the power supply status can be:</p> <ul style="list-style-type: none"> <li>• <b>OK:</b> The power component is operational.</li> <li>• <b>Testing:</b> The power component is being tested during initial power-on.</li> <li>• <b>Check:</b> There is insufficient power---that is, fewer than the minimum required feeds are connected.</li> <li>• <b>Failed:</b> The inputs leads have failed.</li> <li>• <b>Absent:</b> The power component is not installed.</li> </ul>
<b>Measurement</b>	<p>(MX104, MX2010, and MX2020 Routers) Dependant on the Class. For example, if the Class is Temp, indicates the temperature in degree Celsius and degrees Fahrenheit. If the Class is Fan, indicates actual fan RPM.</p>

## Sample Output

### show chassis environment (J2300 Router)

```

user@host> show chassis environment
Class Item           Status Measurement
Temp  Routing Engine    OK      40 degrees C / 104 degrees F
Fan   Fan              OK

```

### show chassis environment (J4300 or J6300 Router)

```

user@host> show chassis environment
Class Item           Status Measurement
Temp  Routing Engine    OK      41 degrees C / 105 degrees F
Fan   Fan 0             OK
      Fan 1             OK

```

### show chassis environment (M5 Router)

```

user@host> show chassis environment
Class Item           Status Measurement
Power Power Supply A    OK
      Power Supply B    Absent
Temp  FPC 0             OK      30 degrees C / 86 degrees F
      FEB              OK      33 degrees C / 91 degrees F
      PS Intake         OK      27 degrees C / 80 degrees F
      PS Exhaust        OK      27 degrees C / 80 degrees F
      Routing Engine    OK      34 degrees C / 93 degrees F
Fans  Left Fan 1        OK      Spinning at normal speed
      Left Fan 2        OK      Spinning at normal speed
      Left Fan 3        OK      Spinning at normal speed
      Left Fan 4        OK      Spinning at normal speed
Misc  Craft Interface    OK

```

## show chassis environment (M7i Router)

```

user@host> show chassis environment
Class Item                Status      Measurement
Power Power Supply 0        OK
      Power Supply 1      Absent
Temp  Intake               OK          22 degrees C / 71 degrees F
      FPC 0                OK          23 degrees C / 73 degrees F
      Power Supplies       OK          23 degrees C / 73 degrees F
      CFEB Intake          OK          24 degrees C / 75 degrees F
      CFEB Exhaust         OK          29 degrees C / 84 degrees F
      Routing Engine       OK          26 degrees C / 78 degrees F
Fans  Fan 1                 OK          Spinning at normal speed
      Fan 2                 OK          Spinning at normal speed
      Fan 3                 OK          Spinning at normal speed
      Fan 4                 OK          Spinning at normal speed

```

## show chassis environment (M10 Router)

```

user@host> show chassis environment
Class Item                Status      Measurement
Power Power Supply A        OK
      Power Supply B      Failed
Temp  FPC 0                 OK          36 degrees C / 96 degrees F

<b>Release Information</b>	Command introduced before Junos Release 7.4. Command introduced in Junos OS Release 9.4 for EX Series switches. Command introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers. Command introduced in Junos OS Release 12.1 for T4000 Core Routers. sfc option introduced for the TX Matrix Plus router in Junos Release 9.6. Command introduced in Junos OS Release 11.3 for the QFX Series. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers. Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.
<b>Description</b>	(M120, M320, MX Series, and T Series routers, EX8200 switches, and PTX Series Packet Transport Routers only) Display environmental information about the Control Boards

(CBs). For information about the meaning of “CBs” on the switches, see [“EX Series Switches Hardware and CLI Terminology Mapping” on page 315](#).

**Options** **none**—Display environmental information about all CBs. For a TX Matrix router, display environmental information about all CBs on the TX Matrix router and its attached T640 routers. For a TX Matrix Plus router, display environmental information about all CBs on the TX Matrix Plus router and its attached T1600 or T4000 routers.

**all-members**—(MX Series routers only) (Optional) Display environmental information about the CBs on all the members of the Virtual Chassis configuration.

**interconnect-device**—(QFabric systems only) Display environmental information about CBs on the Interconnect device.

**lcc number**—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display environmental information about the CBs on the local Virtual Chassis member.

**member member-id**—(MX Series routers only) (Optional) Display environmental information about the CBs on the specified member of the Virtual Chassis configuration. Replace **member-id** with a value of 0 or 1.

**scc**—(TX Matrix router only) (Optional) Display environmental information about the CBs in the TX Matrix router (switch-card chassis).

**sfc number**—(TX Matrix Plus router only) (Optional) Display environmental information about the CBs in the TX Matrix Plus router (or switch-fabric chassis).

**slot**—(Optional) Display environmental information about the specified CB. On routers and PTX Series Packet Transport Routers, replace **slot** with 0 or 1. On EX Series switches replace **slot** with 0, 1, or 2. On QFX Series switches, replace **slot** with 0 or 1.

**Output Fields** [Table 107 on page 972](#) lists the output fields for the **show chassis environment cb** command. Output fields are listed in the approximate order in which they appear.

**Table 107: show chassis environment cb Output Fields**

Field Name	Field Description
<b>State</b>	<p>Status of the CB. If two CBs are installed and online, one is functioning as the master, and the other is the standby.</p> <ul style="list-style-type: none"> <li>• <b>Online</b>—CB is online and running.</li> <li>• <b>Offline</b>—CB is powered down.</li> </ul> <p><b>NOTE:</b> On the EX8208 switch, the installation can include three CBs. See <a href="#">“EX Series Switches Hardware and CLI Terminology Mapping” on page 315</a>.</p>
<b>Temperature</b>	<p>Temperature in Celsius (C) and Fahrenheit (F) of the air flowing past the CB.</p> <ul style="list-style-type: none"> <li>• <b>Temperature Intake</b>—Measures the temperature of the air intake to cool the power supplies.</li> <li>• <b>Temperature Exhaust</b>—Measures the temperature of the hot air exhaust.</li> </ul> <p><b>NOTE:</b> On the MX2010 and MX2020 routers, the intake temperature measures the temperature of the air intake to cool the Control Board (CB). The MX2010 and MX2020 routers include intake and exhaust temperatures for multiple zones (<b>Intake A</b>, <b>Intake B</b>, <b>Intake C</b>, <b>Exhaust A</b>, <b>Exhaust B</b>, and <b>TCBC</b>).</p>
<b>Power</b>	<p>Power required and measured on the CB. The left column displays the required power, in volts. The right column displays the measured power, in millivolts.</p>
<b>BUS Revision</b>	<p>Revision level of the generic bus device. (Not on switches.)</p>

Table 107: show chassis environment cb Output Fields (*continued*)

Field Name	Field Description
<b>FPGA Revision</b>	Revision level of the field-programmable gate array (FPGA). (Not on switches.)
<b>PMBus device</b> (on MX240, MX480, and MX960 routers with Enhanced MX SCB)	Enhanced SCB on MX 240, MX480, and MX960 routers allows the system to save power by supplying only the amount of voltage that is required. Configurable PMBus devices are used to provide the voltage for each individual device. There is one PMBus device for each XF ASIC so that the output can be customized to each device. The following PMBus device information is displayed for routers with Enhanced MX SCB: <ul style="list-style-type: none"> <li>• Expected voltage</li> <li>• Measured voltage</li> <li>• Measured current</li> <li>• Calculated power</li> </ul>

## Sample Output

### show chassis environment cb (M120 Router)

```

user@host> show chassis environment cb
CB 0 status:

<b>Syntax (QFX Series)</b>	show chassis environment fpc <fpc-slot> interconnect-device <i>name</i>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for QFX Series. Command introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers. Command introduced in Junos OS Release 12.1 for T4000 Core Routers. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
<b>Description</b>	(M40e, M120, M160, M320, MX Series, T Series routers, EX Series, QFX Series, and PTX Series routers only) Display environmental information about Flexible PIC Concentrators (FPCs).
<b>Options</b>	<b>none</b> —Display environmental information about all FPCs. On a TX Matrix router, display environmental information about all FPCs on the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display environmental information about all FPCs on the TX Matrix Plus router and its attached routers.

**all-members**—(MX Series routers only) (Optional) Display environmental information for the FPCs in all the members of the Virtual Chassis configuration.

**interconnect-device *name***—(QFabric systems only) (Optional) Display chassis environmental information for the Interconnect device.

**lcc *number***—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display environmental information for the FPCs in the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display environmental information for the FPCs in the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**slot or fpc-slot**—(Optional) Display environmental information about an individual FPC:

- (TX Matrix and TX Matrix Plus routers only) On a TX Matrix router, if you specify the number of the T640 router by using only the **lcc *number*** option (the recommended method), replace **slot** with a value from 0 through 7. Similarly, on a TX Matrix Plus router, if you specify the number of the router by using only the **lcc *number*** option (the recommended method), replace **slot** with a value from 0 through 7. Otherwise, replace **slot** with a value from 0 through 31. For example, the following commands have the same result:

```
user@host> show chassis environment fpc 1 lcc 1
user@host> show chassis environment fpc 9
```

- M120 router—Replace **slot** with a value from 0 through 5.
- MX240 router—Replace **slot** with a value from 0 through 2.
- MX480 router—Replace **slot** with a value from 0 through 5.
- MX960 router—Replace **slot** with a value from 0 through 11.
- MX2010 router—Replace **slot** with a value from 0 through 9.
- MX2020 router—Replace **slot** with a value from 0 through 19.
- Other routers—Replace **slot** with a value from 0 through 7.
- EX Series switches:

- EX3200 switches and EX4200 standalone switches—Replace **slot** with 0.
- EX4200 switches in a Virtual Chassis configuration—Replace **slot** with a value from 0 through 9 (switch's member ID).
- EX6210 switches—Replace **slot** with a value from 0 through 3 (line card only), 4 or 5 (line card or Switch Fabric and Rotuing Engine (SRE) module), or 6 through 9 (line card only).
- EX8208 switches—Replace **slot** with a value from 0 through 7 (line card).
- EX8216 switches—Replace **slot** with a value from 0 through 15 (line card).
- QFX3500 switches —Replace **fpc-slot** with 0 through 15.
- PTX5000 Packet Transport Router—Replace **fpc-slot** with 0 through 7.

**Output Fields** [Table 108 on page 991](#) lists the output fields for the **show chassis environment fpc** command. Output fields are listed in the approximate order in which they appear.

**Table 108: show chassis environment fpc Output Fields**

Field Name	Field Description
<b>State</b>	<p>Status of the FPC:</p> <ul style="list-style-type: none"> <li>• <b>Unknown</b>—FPC is not detected by the router.</li> <li>• <b>Empty</b>—No FPC is present.</li> <li>• <b>Present</b>—FPC is detected by the chassis daemon but is either not supported by the current version of the Junos OS, or the FPC is coming up but not yet online.</li> <li>• <b>Ready</b>—FPC is in intermediate or transition state.</li> <li>• <b>Announce online</b>—Intermediate state during which the FPC is coming up but not yet online, and the chassis manager acknowledges the chassisd FPC online initiative.</li> <li>• <b>Online</b>—FPC is online and running.</li> <li>• <b>Offline</b>—FPC is powered down.</li> <li>• <b>Diagnostics</b>—FPC is set to operate in diagnostics mode.</li> </ul>
<b>Temperature</b>	(M40e and M160 routers and QFX Series only) Temperature of the air flowing past the FPC.
<b>PMB Temperature</b>	<p>(PTX Series only) Temperature of the air flowing past the PMB (bottom of the FPC).</p> <p>The PTX5000 Packet Transport Router with FPC2-PTX-PIA include multiple temperatures for PMB (<b>TEMPO</b> and <b>TEMPI</b>).</p>
<b>PMB CPU Temperature</b>	(PTX5000 Packet Transport Router with FPC2-PTX-PIA only) Temperature of the air flowing past the PMB CPU.
<b>Temperature Intake</b>	(M320 routers, MX2010 routers, MX2020 routers, and PTX Series only) Temperature of the air flowing into the chassis.
<b>Temperature Top</b>	(T Series routers only) Temperature of the air flowing past the top of the FPC.
<b>Temperature Exhaust</b>	<p>(M120 and M320 routers, MX2010 routers, MX2020 routers, and PTX Series only) Temperature of the air flowing out of the chassis.</p> <p>The PTX Series Packet Transport Routers, and the MX2010 and MX2020 routers include exhaust temperatures for multiple zones (<b>Exhaust A</b> and <b>Exhaust B</b>).</p>
<b>Temperature Bottom</b>	(T Series routers only) Temperature of the air flowing past the bottom of the FPC.
<b>TL <i>n</i> Temperature</b>	(PTX Series only) Temperature of the air flowing past the specified TL area of the packet forwarding engine (PFE) on the FPC.
<b>TQ <i>n</i> Temperature</b>	(PTX Series only) Temperature of the air flowing past the specified TQ area of the packet forwarding engine (PFE) on the FPC.
<b>Temperature MMBO</b>	(T640 router only) Temperature of the air flowing past the type 3 FPC.

Table 108: show chassis environment fpc Output Fields (*continued*)

Field Name	Field Description
<b>Temperature MMB1</b>	(M320 and T Series routers only) Temperature of the air flowing past the type 1, type 2, and type 3 FPC.
<b>Power</b>	Information about the voltage supplied to the FPC. The left column displays the required power, in volts. The right column displays the measured power, in millivolts.
<b>CMB Revision or BUS revision</b>	Revision level of the chassis management bus device (M Series router) or bus (T Series routers).
