| <b>Description</b>              | <p>Disable IP version 4 (IPv4) routing.</p> <p>Disabling IPv4 routing has the following results:</p> <ul style="list-style-type: none"> <li>• The routing device does not advertise the network layer protocol identifier (NLPID) for IPv4 in the Junos OS link-state PDU fragment zero.</li> <li>• The routing device does not advertise any IPv4 prefixes in Junos OS link-state PDUs.</li> <li>• The routing device does not advertise the NLPID for IPv4 in Junos OS hello packets.</li> <li>• The routing device does not advertise any IPv4 addresses in Junos OS hello packets.</li> <li>• The routing device does not calculate any IPv4 routes.</li> </ul> |
|                                 | <p> <b>NOTE:</b> Note: Even when <code>no-ipv4-routing</code> is configured, an IS-IS traceoptions log can list rejected IPv4 addresses. When a configuration is committed, IS-IS schedules a scan of the routing table to determine whether any routes need to be exported into the IS-IS link state database. The implicit default export policy action is to reject everything. IPv4 addresses from the routing table are examined for export, rejected by the default policy, and the rejections are logged.</p>                                                             |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.5.<br>Statement introduced in Junos OS Release 9.5 for EX Series switches.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.                                                                                                                                                                                                                                  |
| <b>Description</b>              | Enable node-link protection on the specified IS-IS interface. Junos OS creates an alternate loop-free path to the primary next hop for all destination routes that traverse a protected interface. This alternate path avoids the primary next-hop routing device altogether and establishes a path through a different routing device.                                                                                     |

| <b>Description</b>         | <p>Configure the local routing device so that it appears to be overloaded. This statement causes the routing device to continue participating in IS-IS routing, but prevents it from being used for transit traffic. Traffic destined to immediately attached subnets continues to transit the routing device.</p> <p>You can also advertise maximum link metrics in network layer reachability information (NLRI) instead of setting the overload bit.</p> <p>You configure or disable overload mode in IS-IS with or without a timeout. Without a timeout, overload mode is set until it is explicitly deleted from the configuration. With a timeout, overload mode is set if the time elapsed since the IS-IS instance started is less than the specified timeout.</p> <p>A timer is started for the difference between the timeout and the time elapsed since the instance started. If the time elapsed after the IS-IS instance is enabled is less than the specified timeout, overload mode is set. When the timer expires, overload mode is cleared. In overload mode, the routing device IS-IS advertisements are originated with the overload bit set. This causes the transit traffic to take paths around the routing device. However, the overloaded routing device's own links are still accessible.</p> <p>The value of the overload bit depends on these three scenarios:</p> <ol style="list-style-type: none"><li>1. When the overload bit has already been set to a given value and the routing process is restarted: Link-state PDUs are regenerated with the overload bit cleared.</li><li>2. When the overload bit is reset to a lesser value while the routing process is running: Link-state PDUs are regenerated with the overload bit cleared.</li><li>3. When the overload bit is reset to a greater value while the routing process is running: Link-state PDUs are regenerated with the overload bit set to the difference between the old and new value.</li></ol> <p>In overload mode, the routing device advertisement is originated with all the transit routing device links (except stub) set to a metric of 0xFFFF. The stub routing device links are</p> |

advertised with the actual cost of the interfaces corresponding to the stub. This causes the transit traffic to avoid the overloaded routing device and take paths around the routing device.

To understand the reason for setting the overload bit, consider that BGP converges slowly. It is not very good at detecting that a neighbor is down because it has slow-paced keepalive timers. Once the BGP neighbor is determined to be down, it can take up to 2 minutes for a BGP router to declare the neighbor down. IS-IS is much quicker. IS-IS only takes 10-30 seconds to detect absent peers. It is the slowness of BGP, more precisely the slowness of internal BGP (IBGP), that necessitates the use of the overload bit. IS-IS and BGP routing are mutually dependent on each other. If both do not converge at the same time, traffic is dropped without notification (black holed).

You might want to configure the routing device so that it appears to be overloaded when you are restarting routing on the device. Setting the overload bit for a fixed amount of time right after a restart of the routing protocol process (rpd) ensures that the router does not receive transit traffic while the routing protocols (especially IBGP) are still converging.

Setting the overload bit is useful when performing hardware or software maintenance work on a routing device. After the maintenance work, clear the overload bit to carry on forwarding transit traffic. Manual clearing of the overload bit is not always possible. What is needed is an automated way of clearing the overload bit after some amount of time. Most networks use a time value of 300 seconds. This 5-minute value provides a good balance, allowing time to bring up even large internal IBGP meshes, while still relatively quick.

Another appropriate application for setting for the overload bit is on dedicated devices such as BGP route reflectors, which are intentionally not meant to carry any transit traffic. In this case, you would not use the timer.

You can verify that the overload bit is set by running the **show isis database** command.

**Options**    **advertise-high-metrics**—Advertise maximum link metrics in NLRIs instead of setting the overload bit.

The **advertise-high-metric** setting is only valid while the routing device is in overload mode.

When **advertise-high-metric** is configured, IS-IS does not set the overload bit. Rather, it sets the metric to 63 or 16,777,214, depending whether wide metrics are enabled. This allows the overloaded routing device to be used for transit as a last resort.

An L1-L2 router in overload mode stops leaking route information between L1 and L2 levels and clears its attached bit. This is also true when **advertise-high-metrics** is configured.

**allow-route-leaking**—Enable leaking of route information into the network even if the overload bit is set.

**NOTE:** The **allow-route-leaking** option does not work if the routing device is in dynamic overload mode. Dynamic overload can occur if the device has exceeded its resource limits, such as the prefix limit.

---

**timeout seconds**—Number of seconds at which the overloading is reset.

**Range:** 60 through 1800 seconds

**Default:** 0 seconds

**Required Privilege Level**    routing—To view this statement in the configuration.  
                                         routing-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Configure an IS-IS interface to behave like a point-to-point connection.</p> <p>You can use the <b>point-to-point</b> statement to configure a LAN interface to act like a point-to-point interface for IS-IS. You do not need an unnumbered LAN interface, and it has no effect if configured on an interface that is already point-to-point.</p> <p>The <b>point-to-point</b> statement affects only IS-IS protocol procedures on that interface. All other protocols continue to treat the interface as a LAN interface. Only two IS-IS routing devices can be connected to the LAN interface, and both must be configured as point-to-point.</p> |

| <b>Description</b>              | <p>Configure a limit to the number of prefixes exported into IS-IS.</p> <p>By default, there is no limit to the number of prefixes that can be exported into IS-IS. To configure a limit to the number of prefixes that can be exported into IS-IS, include the <b>prefix-export-limit</b> statement. The <b>prefix-export-limit</b> statement protects the rest of the network from a malicious policy by applying a threshold filter for exported routes.</p> <p>The number of prefixes depends on the size of your network. Good design advice is to set it to double the total number of IS-IS Level 1 and Level 2 routing devices in your network.</p> <p>If the number of prefixes exported into IS-IS exceeds the configured limit, the overload bit is set and the overload state is reached. When other routers detect that this bit is set, they do not use this routing device for transit traffic, but they do use it for packets destined to the overloaded routing device's directly connected networks and IP prefixes. The overload state can be cleared by using the <a href="#">clear isis overload</a> command.</p> <p>The <a href="#">show isis overview</a> command displays the prefix export limit when it is configured.</p> |
| <b>Options</b>                  | <p><b><i>number</i></b>—Prefix limit.</p> <p><b>Range:</b> 0 through 4,294,967,295 (<math>2^{32} - 1</math>)</p> <p><b>Default:</b> None</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b>              | <p>Configure the interface's priority for becoming the designated router. The interface with the highest priority value becomes that level's designated router.</p> <p>The priority value is meaningful only on a multiaccess network. It has no meaning on a point-to-point interface.</p> <p>A routing device advertises its priority to become a designated router in its hello packets. On all multiaccess networks, IS-IS uses the advertised priorities to elect a designated router for the network. This routing device is responsible for sending network link-state advertisements, which describe all the routing devices attached to the network. These advertisements are flooded throughout a single area.</p> <p>A routing device's priority for becoming the designated router is indicated by an arbitrary number from 0 through 127. Routing devices with a higher value are more likely to become the designated router.</p> |
| <b>Options</b>                  | <p><i>number</i>—Priority value.</p> <p><b>Range:</b> 0 through 127</p> <p><b>Default:</b> 64</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Description</b>              | <p>Optimize routing based on bandwidth by setting the reference bandwidth used in calculating the default interface cost.</p> <p>All IS-IS interfaces have a cost, which is a routing metric that is used in the IS-IS link-state calculation. Routes with lower total path metrics are preferred over those with higher path metrics. When there are several equal-cost routes to a destination, traffic is distributed equally among them.</p> <p>The cost of a route is described by a single dimensionless metric that is determined using the following formula:</p> $\text{cost} = \text{reference-bandwidth} / \text{bandwidth}$ <p>For example, if you set the reference bandwidth to 1 Gbps (that is, <i>reference-bandwidth</i> is set to 1,000,000,000), a 100-Mbps interface has a routing metric of 10.</p> <p>All IS-IS interfaces have a cost, which is a routing metric that is used in the IS-IS link-state calculation. Routes with lower total path metrics are preferred over those with higher path metrics.</p> |

| <b>Description</b>         | <p>Configure options for running the shortest-path-first (SPF) algorithm.</p> <p>Running the SPF algorithm is usually the beginning of a series of larger system-wide events. For example, the SPF algorithm can lead to interior gateway protocol (IGP) prefix changes, which then lead to BGP nexthop resolution changes. Consider what happens if there are rapid link changes in the network. The local routing device can become overwhelmed. This is why it sometimes makes sense to throttle the scheduling of the SPF algorithm.</p> <p>You can configure the following SPF options:</p> <ul style="list-style-type: none"><li>• The delay in the time between the detection of a topology change and when the SPF algorithm actually runs.</li><li>• The maximum number of times that the SPF algorithm can run in succession before the hold-down timer begins.</li><li>• The time to hold down, or wait, before running another SPF calculation after the SPF algorithm has run in succession the configured maximum number of times.</li></ul> <p>If the network stabilizes during the hold-down period and the SPF algorithm does not need to run again, the system reverts to the configured values for the <b>delay</b> and <b>rapid-runs</b> statements.</p> |
| <b>Options</b>             | <p><b>delay <i>milliseconds</i></b>—Time interval between the detection of a topology change and when the SPF algorithm runs.</p> <p><b>Range:</b> 50 through 1000 milliseconds</p> <p><b>Default:</b> 200 milliseconds</p> <p><b>holddown <i>milliseconds</i></b>—Time interval to hold down, or wait before a subsequent SPF algorithm runs after the SPF algorithm has run the configured maximum number of times in succession.</p> <p><b>Range:</b> 2000 through 10,000 milliseconds</p> <p><b>Default:</b> 5000 milliseconds</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**rapid-runs *number***—Maximum number of times the SPF algorithm can run in succession.  
After the maximum is reached, the holddown interval begins.

**Range:** 1 through 5

**Default:** 3

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## topologies (Protocols IS-IS)

**Syntax**

```
topologies {
  ipv4-multicast;
  ipv6-multicast;
  ipv6-unicast;
}
```

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols *isis*],  
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols *isis*],  
[edit protocols *isis*],  
[edit routing-instances *routing-instance-name* protocols *isis*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description** Configure alternate IS-IS topologies.

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Default</b> | The default IS-IS protocol-level tracing options are those inherited from the routing protocols <b>traceoptions</b> statement included at the <b>[edit routing-options]</b> hierarchy level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Options</b> | <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>name</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks (" "). All files are placed in the directory <b>/var/log</b>. We recommend that you place IS-IS tracing output in the file <b>isis-log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 10 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one flag, include multiple <b>flag</b> statements.</p> <p><b>IS-IS Protocol-Specific Tracing Flags</b></p> |

- **csn**—Complete sequence number PDU (CSNP) packets
- **error**—Errored IS-IS packets
- **graceful-restart**—Graceful restart operation
- **hello**—Hello packets
- **ldp-synchronization**—Synchronization between IS-IS and LDP
- **lsp**—Link-state PDUs
- **lsp-generation**—Link-state PDU generation packets
- **packets**—All IS-IS protocol packets
- **psn**—Partial sequence number PDU (PSNP) packets
- **spf**—Shortest-path-first calculations

#### Global Tracing Flags

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations, including adjacency changes

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information.
- **receive**—Trace the packets being received.
- **send**—Trace the packets being transmitted.

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. Note that if you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 128 KB

**world-readable**—(Optional) Allow any user to read the log file.

| <b>Description</b>              | Configure IS-IS to generate metric values greater than 63 on a per IS-IS level basis.<br><br>Normally, IS-IS metrics can have values up to 63, and IS-IS generates two type, length, and value (TLV) tuples, one for an IS-IS adjacency and the second for an IP prefix. To allow IS-IS to support traffic engineering, a second pair of TLVs has been added to IS-IS, one for IP prefixes and the second for IS-IS adjacency and traffic engineering information. With these TLVs, IS-IS metrics can have values up to 16,777,215 ( $2^{24} - 1$ ).<br><br>To configure IS-IS to generate only the new pair of TLVs and thus to allow the wider range of metric values, include the <b>wide-metrics-only</b> statement. |
| <b>Default</b>                  | By default, Junos OS supports the sending and receiving of wide metrics. Junos OS allows a maximum metric value of 63 and generates both pairs of TLVs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Output Fields</b>                              | See <a href="#">show isis adjacency</a> for an explanation of output fields.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Sample Output

### clear isis adjacency

The following sample output displays IS-IS adjacency database information before and after the **clear isis adjacency** command is entered:

```
user@host> show isis adjacency
IS-IS adjacency database:
Interface      System          L State          Hold (secs) SNPA
```

```
so-1/0/0.0    karaku1      3 Up                26
so-1/1/3.0    1921.6800.5080 3 Up                23
so-5/0/0.0    1921.6800.5080 3 Up                19
```

```
user@host> clear isis adjacency karaku1
```

```
user@host> show isis adjacency
```

```
IS-IS adjacency database:
```

| Interface  | System         | L State        | Hold (secs) | SNPA |
|------------|----------------|----------------|-------------|------|
| so-1/0/0.0 | karaku1        | 3 Initializing | 26          |      |
| so-1/1/3.0 | 1921.6800.5080 | 3 Up           | 24          |      |
| so-5/0/0.0 | 1921.6800.5080 | 3 Up           | 21          |      |

## clear isis database

## Sample Output

### clear isis database

The following sample output displays IS-IS link-state database information before and after the **clear isis database** command is entered:

```
user@host> show isis database
IS-IS level 1 link-state database:
LSP ID                Sequence Checksum Lifetime (secs)
crater.00-00          0x12   0x84dd             1139
  1 LSPs
IS-IS level 2 link-state database:
LSP ID                Sequence Checksum Lifetime (secs)
```

|                      |      |        |      |
|----------------------|------|--------|------|
| crater.00-00         | 0x19 | 0xe92c | 1134 |
| badlands.00-00       | 0x16 | 0x1454 | 985  |
| carlsbad.00-00       | 0x33 | 0x220b | 1015 |
| ranier.00-00         | 0x2e | 0xfc31 | 1007 |

| 1921.6800.5067.00-00 | 0x14 | 0xd9d4 | 939  |

6 LSPs

user@host> clear isis database

user@host> show isis database

IS-IS level 1 link-state database:

| LSP ID | Sequence | Checksum | Lifetime (secs) |
|--------|----------|----------|-----------------|
|--------|----------|----------|-----------------|

IS-IS level 2 link-state database:

| LSP ID | Sequence | Checksum | Lifetime (secs) |
|--------|----------|----------|-----------------|
|--------|----------|----------|-----------------|

## clear isis overload

| Description                                | <p>Reset the IS-IS dynamic overload bit. This command can appear to not work, continuing to display <b>overload</b> after execution. The bit is reset only if the root cause is corrected by configuration remotely or locally.</p> <p>When other routers detect that the overload bit is set, they do not use this routing device for transit traffic, but they do use it for packets destined to the overloaded routing device's directly connected networks and IP prefixes.</p> |

## Sample Output

### clear isis overload

The following sample output displays IS-IS database information before and after the **clear isis overload** command is entered:

```
user@host> show isis database
IS-IS level 1 link-state database:
LSP ID                               Sequence Checksum Lifetime Attributes
```

```
pro3-c.00-00          0x4   0x10db    1185 L1 L2 Overload
```

```
1 LSPs
```

```
IS-IS level 2 link-state database:
```

| LSP ID       | Sequence | Checksum | Lifetime | Attributes            |
|--------------|----------|----------|----------|-----------------------|
| pro3-c.00-00 | 0x5      | 0x429f   | 1185     | L1 L2 <b>Overload</b> |

```
pro2-a.00-00          0x91e  0x2589    874 L1 L2
```

```
pro2-a.02-00          0x1    0xcbc    874 L1 L2
```

```
3 LSPs
```

```
user@host> clear isis overload
```

```
user@host> show isis database
```

```
IS-IS level 1 link-state database:
```

| LSP ID       | Sequence | Checksum | Lifetime | Attributes |
|--------------|----------|----------|----------|------------|

## Sample Output

### show isis adjacency

```

user@host> show isis adjacency
Interface          System      L State      Hold (secs) SNPA
at-2/3/0.0         ranier      3 Up          23

```

### show isis adjacency brief

The output for the **show isis adjacency brief** command is identical to that for the **show isis adjacency** command. For sample output, see [show isis adjacency on page 3152](#).

### show isis adjacency detail

```
user@host> show isis adjacency detail
ranier
  Interface: at-2/3/0.0, Level: 3, State: Up, Expires in 21 secs
  Priority: 0, Up/Down transitions: 1, Last transition: 00:01:09 ago
  Circuit type: 3, Speaks: IP, IPv6
  Topologies: Unicast
  Restart capable: Yes
  IP addresses: 11.1.1.2
```

### show isis adjacency extensive

```
user@host> show isis adjacency extensive
ranier
  Interface: at-2/3/0.0, Level: 3, State: Up, Expires in 22 secs
  Priority: 0, Up/Down transitions: 1, Last transition: 00:01:16 ago
  Circuit type: 3, Speaks: IP, IPv6
  Topologies: Unicast
  Restart capable: Yes
  IP addresses: 11.1.1.2
  Transition log:
    When           State      Event           Down reason
    Wed Nov  8 21:24:25  Up        Seenself
```

## show isis authentication

Table 328: show isis authentication Output Fields (*continued*)

| Field Name            | Field Description                            |
|-----------------------|----------------------------------------------|
| PSN Auth              | Partial sequence number authentication type. |
| L1 LSP Authentication | Layer 1 link-state PDU authentication type.  |
| L2 LSP Authentication | Layer 2 link-state PDU authentication type.  |

## Sample Output

### show isis authentication

```

user@host> show isis authentication
Interface          Level IIH Auth  CSN Auth  PSN Auth
at-2/3/0.0         1      Simple    Simple    Simple
                   2      MD5       MD5       MD5

L1 LSP Authentication: Simple
L2 LSP Authentication: MD5

```

### show isis authentication (With Hitless Authentication Key Rollover Configured)

```

user@host> show isis authentication
Interface          Level IIH Auth  CSN Auth  PSN Auth
so-0/1/3.0         2      hakrhello MD5       MD5

L2 LSP Authentication: MD5

```

| Output Fields               | <a href="#">Table 331 on page 3161</a> lists the output fields for the <b>show isis backup spf results</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

Table 331: show isis backup spf results Output Fields

| Field Name              | Field Description                                                                                  |
|-------------------------|----------------------------------------------------------------------------------------------------|
| <i>node-name</i>        | Name of the destination node.                                                                      |
| <b>Address</b>          | Address of the destination node.                                                                   |
| <b>Primary next-hop</b> | Interface and name of the node of the primary next hop to reach the destination.                   |
| <b>Root</b>             | Name of the next-hop neighbor.                                                                     |
| <b>Metric</b>           | Metric to the node.                                                                                |
| <b>Eligible</b>         | Indicates that the next-hop neighbor has been designated as a backup path to the destination node. |
| <b>Backup next-hop</b>  | Name of the interface of the backup next hop.                                                      |
| <b>SNPA</b>             | Subnetwork point of attachment (MAC address of the next hop).                                      |
| <b>LSP</b>              | Name of the MPLS label-switched path (LSP) designated as a backup path.                            |
| <b>Not eligible</b>     | Indicates that the next-hop neighbor cannot function as a backup path to the destination.          |
| <b>Reason</b>           | Describes why the next-hop neighbor is designated as <b>Not eligible</b> as a backup path.         |

## Sample Output

[show isis database extensive on page 3167](#)

**Output Fields** [Table 332 on page 3165](#) describes the output fields for the **show isis database** command. Output fields are listed in the approximate order in which they appear. Fields that contain internal IS-IS information useful only in troubleshooting obscure problems are not described in the table. For more details about these fields, contact your customer support representative.

**Table 332: show isis database Output Fields**

| Field Name            | Field Description                                                                                                                                                                                                                                                                                                                                                                            | Level of Output         |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Interface name</b> | Name of the interface on which the link-state PDU has been received; always <b>IS-IS</b> for this command.                                                                                                                                                                                                                                                                                   | All levels              |
| level                 | Level of intermediate system: <ul style="list-style-type: none"> <li>• <b>1</b>—Intermediate system routes within an area; when the destination is outside an area, it routes toward a Level 2 system.</li> <li>• <b>2</b>—Intermediate system routes between areas and toward other ASs.</li> </ul>                                                                                         | All levels              |
| LSP ID                | Link-state PDU identifier.                                                                                                                                                                                                                                                                                                                                                                   | All levels              |
| Sequence              | Sequence number of the link-state PDU.                                                                                                                                                                                                                                                                                                                                                       | All levels              |
| Checksum              | Checksum value of the link-state PDU.                                                                                                                                                                                                                                                                                                                                                        | All levels              |
| Lifetime (secs)       | Remaining lifetime of the link-state PDU, in seconds.                                                                                                                                                                                                                                                                                                                                        | All levels              |
| Attributes            | Attributes of the specified database: <b>L1</b> , <b>L2</b> , <b>Overload</b> , or <b>Attached</b> (L1 only).                                                                                                                                                                                                                                                                                | none <b>brief</b>       |
| # LSPs                | Total number of link-state PDUs in the specified link-state database.                                                                                                                                                                                                                                                                                                                        | none <b>brief</b>       |
| IP prefix             | Prefix advertised by this link-state PDU.                                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive</b> |
| IS neighbor           | IS-IS neighbor of the advertising system.                                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive</b> |
| ES neighbor           | (J Series routers only) An ES-IS neighbor of the advertising system.                                                                                                                                                                                                                                                                                                                         | <b>detail extensive</b> |
| IP prefix             | IPv4 prefix advertised by this link-state PDU.                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive</b> |
| V6 prefix             | IPv6 prefix advertised by this link-state PDU.                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive</b> |
| Metric                | Metric of the prefix or neighbor.                                                                                                                                                                                                                                                                                                                                                            | <b>detail extensive</b> |

| <b>System Id</b> | System identifier mapped to the hostname.                                                                                                                                                                                                                                                               |
| <b>Hostname</b>  | Hostname mapped to the system identifier.                                                                                                                                                                                                                                                               |
| <b>Type</b>      | <p>Type of mapping between system identifier and hostname.</p> <ul style="list-style-type: none"> <li><b>Dynamic</b>—Hostname mapping determined as described in RFC 2763, <i>Dynamic Hostname Exchange Mechanism for IS-IS</i>.</li> <li><b>Static</b>—Hostname mapping configured by user.</li> </ul> |

## Sample Output

show isis hostname

```
user@host> show isis hostname
IS-IS hostname database:
System Id      Hostname
1921.6800.4201 isis1
1921.6800.4202 isis2
1921.6800.4203 isis3
```

|                      | Type    |
|----------------------|---------|
| 1921.6800.4201 isis1 | Dynamic |
| 1921.6800.4202 isis2 | Static  |
| 1921.6800.4203 isis3 | Dynamic |

```
show isis interface
```

|                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>remaining</b>                          | If the state is not in sync and the hold time is not infinity, then this field displays the remaining hold time in seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>extensive</b>        |

## Sample Output

### show isis interface

```
user@host> show isis interface
```

IS-IS interface database:

| Interface  | L | CirID | Level 1 DR     | Level 2 DR     | L1/L2 Metric |
|------------|---|-------|----------------|----------------|--------------|
| at-2/3/0.0 | 3 | 0x1   | Point to Point | Point to Point | 10/10        |
| lo0.0      | 3 | 0x1   | Passive        | Passive        | 0/0          |

### show isis interface brief

The output for the **show isis interface brief** command is identical to that for the **show isis interface** command. For sample output, see [show isis interface on page 3180](#).

### show isis interface detail

```
user@host> show isis interface detail
```

| <b>Output Fields</b>                              | <a href="#">Table 335 on page 3182</a> lists the output fields for the <b>show isis overview</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                               |

**Table 335: show isis overview Output Fields**

| Field Name              | Field Description                                                                                                        |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------|
| Instance                | IS-IS routing instance.                                                                                                  |
| Router ID               | Router ID of the routing device.                                                                                         |
| Adjacency holddown      | Adjacency holddown capability: <b>enabled</b> or <b>disabled</b> .                                                       |
| Maximum Areas           | Maximum number of IS-IS areas advertised by the routing device.                                                          |
| LSP life time           | Lifetime of the link-state PDU, in seconds.                                                                              |
| Attached bit evaluation | Attached bit capability: <b>enabled</b> or <b>disabled</b> .                                                             |
| SPF delay               | Delay before performing consecutive shortest-path-first (SPF) calculations.                                              |
| SPF holddown            | Delay before performing additional SPF calculations after the maximum number of consecutive SPF calculations is reached. |

Table 335: show isis overview Output Fields (*continued*)

| Field Name                     | Field Description                                                                                                       |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------|
| SPF rapid runs                 | Maximum number of SPF calculations that can be performed in succession before the holddown timer begins.                |
| Overload bit at startup is set | Overload bit capability is enabled.                                                                                     |
| Overload high metrics          | Overload high metrics capability: <b>enabled</b> or <b>disabled</b> .                                                   |
| Overload timeout               | Time period after which overload is reset and the time that remains before the timer is set to expire.                  |
| Traffic engineering            | Traffic engineering capability: <b>enabled</b> or <b>disabled</b> .                                                     |
| Restart                        | Graceful restart capability: <b>enabled</b> or <b>disabled</b> .                                                        |
| Restart duration               | Time period for complete reacquisition of IS-IS neighbors.                                                              |
| Helper mode                    | Graceful restart helper capability: <b>enabled</b> or <b>disabled</b> .                                                 |
| Level                          | IS-IS level: <ul style="list-style-type: none"> <li>• 1—Level 1 information</li> <li>• 2—Level 2 information</li> </ul> |
| IPv4 is enabled                | IP Protocol version 4 capability is enabled.                                                                            |
| IPv6 is enabled                | IP Protocol version 6 capability is enabled.                                                                            |
| CLNS is enabled                | (J Series routers only) OSI CLNP capability is enabled.                                                                 |
| Internal route preference      | Preference value of internal routes.                                                                                    |
| External route preference      | Preference value of external routes.                                                                                    |
| Prefix export limit            | Number of prefixes allowed to be exported, as configured by the <a href="#">prefix-export-limit</a> statement.          |
| Prefix export count            | Number of prefixes exported.                                                                                            |
| Wide area metrics are enabled  | Wide area metrics capability is enabled.                                                                                |
| Narrow metrics are enabled     | Narrow metrics capability is enabled.                                                                                   |

## Sample Output

### show isis overview

```
user@host> show isis overview
Instance: master
  Router ID: 10.255.107.183
  Adjacency holddown: disabled
  Maximum Areas: 3
  LSP life time: 1200
  Attached bit evaluation: enabled
  SPF delay: 200 msec, SPF holddown: 5000 msec, SPF rapid runs: 3
  IPv4 is enabled, IPv6 is enabled
  Traffic engineering: enabled
  Restart: Disabled
    Helper mode: Enabled
Level 1
  Internal route preference: 15
  External route preference: 160
  Wide metrics are enabled, Narrow metrics are enabled
Level 2
  Internal route preference: 18
  External route preference: 165
  Prefix export limit: 5, Prefix export count: 5
  Wide metrics are enabled
```

Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

Table 336: show isis route Output Fields

| Field Name             | Field Description                                                                                                                          |
|------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Current version</b> | Number of the current version of the IS-IS routing table.                                                                                  |
| <b>L1</b>              | Version of Level 1 SPF that was run.                                                                                                       |
| <b>L2</b>              | Version of Level 2 SPF that was run.                                                                                                       |
| <b>Prefix</b>          | Destination of the route.                                                                                                                  |
| <b>L</b>               | IS-IS level: <ul style="list-style-type: none"> <li>• 1—Level 1 only</li> <li>• 2—Level 2 only</li> <li>• 3—Level 1 and Level 2</li> </ul> |
| <b>Version</b>         | Version of SPF that generated the route.                                                                                                   |
| <b>Metric</b>          | Metric value associated with the route.                                                                                                    |
| <b>Type</b>            | Metric type: <b>int</b> (internal) or <b>ext</b> (external).                                                                               |
| <b>Interface</b>       | Interface to the next hop.                                                                                                                 |
| <b>Via</b>             | System identifier of the next hop, displayed as a name if possible.                                                                        |
| <b>ISO Routes</b>      | ISO routing table entries.                                                                                                                 |
| <b>snpa</b>            | MAC address.                                                                                                                               |

## Sample Output

### show isis route logical-system

```

user@host> show isis route logical-system ls1

| <b>Output Fields</b>               | <p><a href="#">Table 337 on page 3189</a> describes the output fields for the <b>show isis spf</b> command. Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Table 337: show isis spf Output Fields**

| Field Name | Field Description    |
|------------|----------------------|
| Node       | System ID of a node. |

Table 337: show isis spf Output Fields (*continued*)

| Field Name     | Field Description                                                                       |
|----------------|-----------------------------------------------------------------------------------------|
| Metric         | Metric to the node.                                                                     |
| Interface      | Interface of the next hop.                                                              |
| Via            | System ID of the next hop.                                                              |
| SNPA           | Subnetwork point of attachment (MAC address of the next hop).                           |
| Start time     | (log option only) Time that the SPF computation started.                                |
| Elapsed (secs) | (log option only) Length of time, in seconds, required to complete the SPF computation. |
| Count          | (log option only) Number of times the SPF was triggered.                                |
| Reason         | (log option only) Reason that the SPF computation was completed.                        |

## Sample Output

### show isis spf log

```

user@host> show isis spf log logical-system lsl
IS-IS level 1 SPF log:
Start time           Elapsed (secs) Count Reason
Fri Oct 31 12:41:18   0.000069    1 Reconfig
Fri Oct 31 12:41:18   0.000107    3 Updated LSP fix.00-00
Fri Oct 31 12:41:18   0.000050    3 Address change on so-1/2/2.0

| PDU type                    | <p>PDU type:</p> <ul style="list-style-type: none"> <li>• <b>CSNP</b>—Complete sequence number PDUs contain a complete list of all link-state PDUs in the IS-IS database. CSNPs are sent periodically on all links, and the receiving systems use the information in the CSNP to update and synchronize their link-state PDU databases. The designated router multicasts CSNPs on broadcast links in place of sending explicit acknowledgments for each link-state PDU.</li> <li>• <b>IIH</b>—IS-IS hello packets are broadcast to discover the identity of neighboring IS-IS systems and to determine whether the neighbors are Level 1 or Level 2 intermediate systems.</li> <li>• <b>LSP</b>—Link-state PDUs contain information about the state of adjacencies to neighboring IS-IS systems. Link-state PDUs are flooded periodically throughout an area.</li> <li>• <b>PSNP</b>—Partial sequence number PDUs are sent multicast by a receiver when it detects that it is missing a link-state PDU (when its link-state PDU database is out of date). The receiver sends a PSNP to the system that transmitted the CSNP, effectively requesting that the missing link-state PDU be transmitted. That routing device, in turn, forwards the missing link-state PDU to the requesting routing device.</li> <li>• <b>Unknown</b>—The PDU type is unknown.</li> </ul> |
| Received                    | Number of PDUs received since IS-IS started or since the statistics were set to zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

### Understanding IPsec Authentication for OSPF Packets on EX Series Switches

IP Security (IPsec) provides a secure way to authenticate senders and encrypt IP version 4 (IPv4) traffic between network devices. IPsec offers network administrators for Juniper Networks EX Series Ethernet Switches and their users the benefits of data confidentiality, data integrity, sender authentication, and anti-replay services.

IPsec is a framework for ensuring secure private communication over IP networks and is based on standards developed by the International Engineering Task Force (IETF). IPsec provides security services at the network layer of the Open Systems Interconnection (OSI) model by enabling a system to select required security protocols, determine the algorithms to use for the security services, and implement any cryptographic keys required to provide the requested services. You can use IPsec to protect one or more paths between a pair of hosts, between a pair of security gateways (such as switches), or between a security gateway and a host.

OSPF version 3 (OSPFv3), unlike OSPF version 2 (OSPFv2), does not have a built-in authentication method and relies on IPsec to provide this functionality. You can secure specific OSPFv3 interfaces and protect OSPFv3 virtual links.

### Authentication Algorithms

---

Authentication is the process of verifying the identity of the sender. Authentication algorithms use a shared key to verify the authenticity of the IPsec devices. The Juniper Networks Junos operating system (Junos OS) uses the following authentication algorithms:

- Message Digest 5 (MD5) uses a one-way hash function to convert a message of arbitrary length to a fixed-length message digest of 128 bits. Because of the conversion process, it is mathematically infeasible to calculate the original message by computing it backwards from the resulting message digest. Likewise, a change to a single character in the message will cause it to generate a very different message digest number.

To verify that the message has not been tampered with, Junos OS compares the calculated message digest against a message digest that is decrypted with a shared key. Junos OS uses the MD5 hashed message authentication code (HMAC) variant that provides an additional level of hashing. MD5 can be used with an authentication header (AH) and Encapsulating Security Payload (ESP).

- Secure Hash Algorithm 1 (SHA-1) uses a stronger algorithm than MD5. SHA-1 takes a message of less than 264 bits in length and produces a 160-bit message digest. The large message digest ensures that the data has not been changed and that it originates from the correct source. Junos OS uses the SHA-1 HMAC variant that provides an additional level of hashing. SHA-1 can be used with AH, ESP, and Internet Key Exchange (IKE).

### Encryption Algorithms

---

Encryption encodes data into a secure format so that it cannot be deciphered by unauthorized users. As with authentication algorithms, a shared key is used with encryption algorithms to verify the authenticity of IPsec devices. Junos OS uses the following encryption algorithms:

- Data Encryption Standard cipher-block chaining (DES-CBC) is a symmetric secret-key block algorithm. DES uses a key size of 64 bits, where 8 bits are used for error detection and the remaining 56 bits provide encryption. DES performs a series of simple logical operations on the shared key, including permutations and substitutions. CBC takes the first block of 64 bits of output from DES, combines this block with the second block, feeds this back into the DES algorithm, and repeats this process for all subsequent blocks.
- Triple DES-CBC (3DES-CBC) is an encryption algorithm that is similar to DES-CBC but provides a much stronger encryption result because it uses three keys for 168-bit (3 x 56-bit) encryption. 3DES works by using the first key to encrypt the blocks, the second key to decrypt the blocks, and the third key to reencrypt the blocks.

## IPsec Protocols

---

IPsec protocols determine the type of authentication and encryption applied to packets that are secured by the switch. Junos OS supports the following IPsec protocols:

- **AH**—Defined in *RFC 2402*, AH provides connectionless integrity and data origin authentication for IPv4. It also provides protection against replays. AH authenticates as much of the IP header as possible, as well as the upper-level protocol data. However, some IP header fields might change in transit. Because the value of these fields might not be predictable by the sender, they cannot be protected by AH. In an IP header, AH can be identified with a value of 51 in the Protocol field of an IPv4 packet.
- **ESP**—Defined in *RFC 2406*, ESP can provide encryption and limited traffic flow confidentiality or connectionless integrity, data origin authentication, and an anti-replay service. In an IP header, ESP can be identified with a value of 50 in the Protocol field of an IPv4 packet.

## Security Associations

---

An IPsec consideration is the type of security association (SA) that you wish to implement. An SA is a set of IPsec specifications that are negotiated between devices that are establishing an IPsec relationship. These specifications include preferences for the type of authentication, encryption, and IPsec protocol to be used when establishing the IPsec connection. An SA can be either unidirectional or bidirectional, depending on the choices made by the network administrator. An SA is uniquely identified by a Security Parameter Index (SPI), an IPv4 or IPv6 destination address, and a security protocol (AH or ESP) identifier.

## IPsec Modes

---

Junos OS supports the following IPsec modes:

- **Tunnel mode** is supported for both AH and ESP in Junos OS. In tunnel mode, the SA and associated protocols are applied to tunneled IPv4 or IPv6 packets. For a tunnel mode SA, an outer IP header specifies the IPsec processing destination and an inner IP header specifies the ultimate destination for the packet. The security protocol header appears after the outer IP header and before the inner IP header. In addition, there are slight differences for tunnel mode when you implement it with AH and ESP:
  - For AH, portions of the outer IP header are protected, as well as the entire tunneled IP packet.
  - For ESP, only the tunneled packet is protected, not the outer header.

When one side of an SA is a security gateway (such as a switch), the SA must use tunnel mode. However, when traffic (for example, SNMP commands or BGP sessions) is destined for a switch, the system acts as a host. Transport mode is allowed in this case because the system does not act as a security gateway and does not send or receive transit traffic.

**NOTE:** Tunnel mode is not supported for OSPF v3 control packet authentication.

- Transport mode provides an SA between two hosts. In transport mode, the protocols provide protection primarily for upper-layer protocols. A transport mode security protocol header appears immediately after the IP header and any options and before any higher-layer protocols (for example, TCP or UDP). There are slight differences for transport mode when you implement it with AH and ESP:
  - For AH, selected portions of the IP header are protected, as well as selected portions of the extension headers and selected options within the IPv4 header.
  - For ESP, only the higher-layer protocols are protected, not the IP header or any extension headers preceding the ESP header.

## Configuration Tasks

---

- [Configuring an OSPF Network \(J-Web Procedure\) on page 3207](#)
- [Using IPsec to Secure OSPFv3 Networks \(CLI Procedure\) on page 3211](#)

### Configuring an OSPF Network (J-Web Procedure)

---

**NOTE:** This topic applies only to the J-Web Application package.

---

You can use the J-Web interface to create multiarea OSPF networks on an EX Series switch.

To configure a multiarea OSPF network:

1. Select **Configure > Routing > OSPF**.
- 

**NOTE:** After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See [Using the Commit Options to Commit Configuration Changes](#) for details about all commit options.

---

2. Click one of the following options:
  - **Add**—Adds an OSPF area. Enter information into the configuration page as described in [Table 341 on page 3208](#).
  - **Edit**—Modifies an existing OSPF area. Enter information into the configuration page as described in [Table 341 on page 3208](#).
  - **Delete**—Deletes an existing OSPF area.

3. To modify OSPF global settings, click **Edit**. Enter information as described in [Table 342 on page 3209](#).
4. To disable OSPF, click **Disable**.

**Table 341: OSPF Routing Configuration Summary**

| Field                 | Function                                                                                                                                                                                                                                    | Your Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| External Route Preference | Specifies the route preference for external groups.                                                                                                                                                                                                                                                                                     | Type or select and edit the value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Graceful Restart          | Configures graceful restart for OSPF.                                                                                                                                                                                                                                                                                                   | <p>To configure graceful restart:</p> <ol style="list-style-type: none"> <li>1. Specify the estimated time to send out purged grace LSAs over all the interfaces.</li> <li>2. Specified the estimated time to reacquire a full OSPF neighbor from each area.</li> <li>3. To disable <b>No Strict LSA Checking</b>, select the check box.</li> <li>4. To disable graceful restart helper capability, select the check box. Helper mode is enabled by default.</li> <li>5. Click <b>OK</b>.</li> </ol>                               |
| SPF Options               | Configure options for running the shortest-path-first (SPF) algorithm. You can configure a delay for when to run the SPF algorithm after a network topology change is detected, the maximum number of times the SPF algorithm can run in succession, and a hold-down interval after the SPF algorithm runs the maximum number of times. | <p>To configure SPF:</p> <ol style="list-style-type: none"> <li>1. Specify the time interval between the detection of a topology change and when the SPF algorithm runs.</li> <li>2. Specify the time interval to hold down, or wait before a subsequent SPF algorithm runs after the SPF algorithm has run the configured maximum number of times in succession.</li> <li>3. Specify the maximum number of times the SPF algorithm can run in succession. After the maximum is reached, the hold-down interval begins.</li> </ol> |
| <b>Policies tab</b>       |                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Import Policy             | Specifies one or more policies to control which routes learned from an area are used to generate summary link-state advertisements (LSAs) into other areas.                                                                                                                                                                             | <p>Click <b>Add</b> to add an import policy.</p> <p>Click <b>Move up</b> or <b>Move down</b> to move the selected policy up or down the list of policies.</p> <p>Click <b>Remove</b> to remove an import policy.</p>                                                                                                                                                                                                                                                                                                               |
| Export Policy             | Specifies one or more policies to control which summary LSAs are flooded into an area.                                                                                                                                                                                                                                                  | <p>Click <b>Add</b> to add an export policy.</p> <p>Click <b>Move up</b> or <b>Move down</b> to move the selected policy up or down the list of policies.</p> <p>Click <b>Remove</b> to remove an export policy.</p>                                                                                                                                                                                                                                                                                                               |
| <b>Trace Options tab</b>  |                                                                                                                                                                                                                                                                                                                                         |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| File Name                 | Specifies the name of the file to receive the output of the tracing operation.                                                                                                                                                                                                                                                          | Type or select and edit the name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Number of Files           | Specifies the maximum number of trace files.                                                                                                                                                                                                                                                                                            | Type or select and edit the name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| File Size                 | Specifies the maximum size for each trace file.                                                                                                                                                                                                                                                                                         | Type or select and edit the name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

Table 342: Edit OSPF Global Settings (*continued*)

| Field          | Function                                                         | Your Action                                                                                                                          |
|----------------|------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------|
| World Readable | Specifies whether the trace file can be read by any user or not. | Select <b>True</b> to allow any user to read the file.<br><br>Select <b>False</b> to disallow all users being able to read the file. |
| Flags          | Specifies the tracing operation to perform.                      | Select a value from the list.                                                                                                        |

## Using IPsec to Secure OSPFv3 Networks (CLI Procedure)

OSPF version 3 (OSPFv3) does not have a built-in authentication method and relies on IP Security (IPsec) to provide this functionality. You can use IPsec to secure OSPFv3 interfaces on EX Series switches.

This topic includes:

- [Configuring Security Associations on page 3211](#)
- [Securing OPSFv3 Networks on page 3212](#)

### Configuring Security Associations

When you configure a security association (SA), include your choices for authentication, encryption, direction, mode, protocol, and security parameter index (SPI).

To configure a security association:

1. Specify a name for the security association:
 

```
[edit security ipsec]
user@switch# set security-association sa-name
```
2. Specify the mode of the security association:
 

```
[edit security ipsec security-association sa-name]
user@switch# set mode transport
```
3. Specify the type of security association:
 

```
[edit security ipsec security-association sa-name]
user@switch# set type manual
```
4. Specify the direction of the security association:
 

```
[edit security ipsec security-association sa-name]
user@switch# set direction bidirectional
```
5. Specify the value of the security parameter index:
 

```
[edit security ipsec security-association sa-name]
user@switch# set spi spi-value
```
6. Specify the type of authentication to be used:
 

```
[edit security ipsec security-association sa-name]
```

```
user@switch# set authentication algorithm type
```

7. Specify the encryption algorithm and key:

```
[edit security ipsec security-association sa-name]
```

```
user@switch# set encryption algorithm algorithm key type
```

---

## Securing OPSFv3 Networks

You can secure the OPSFv3 network by applying the SA to the OPSFv3 configuration.

To secure the OPSFv3 network:

```
[edit protocols ospf3 area area-number interface interface-name]
```

```
user@switch# set ipsec-sa sa-name
```

```

**Release Information**

Statement introduced before Junos OS Release 7.4.

Statement introduced in Junos OS Release 9.0 for EX Series switches.

Support for the **realm** statement introduced in Junos OS Release 9.2.

Support for the **realm** statement introduced in Junos OS Release 9.2 for EX Series switches.

Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description**

Specify the area identifier for this routing device to use when participating in OSPF routing. All routing devices in an area must use the same area identifier to establish adjacencies.

Specify multiple **area** statements to configure the routing device as an area border router. An area border router does not automatically summarize routes between areas. Use the **area-range** statement to configure route summarization. By definition, an area border router must be connected to the backbone area either through a physical link or through a virtual link. To create a virtual link, include the **virtual-link** statement.

To specify that the routing device is directly connected to the OSPF backbone, include the **area 0.0.0.0** statement.

All routing devices on the backbone must be contiguous. If they are not, use the **virtual-link** statement to create the appearance of connectivity to the backbone.

You can also configure any interface that belongs to one or more topologies to advertise the direct interface addresses without actually running OSPF on that interface. By default, OSPF must be configured on an interface in order for direct interface addresses to be advertised as interior routes.

**NOTE:** If you configure an interface with the `passive` statement, it applies to all the topologies to which the interface belongs. You cannot configure an interface as passive for only one specific topology and have it remain active for any other topologies to which it belongs.

|                                 |                                                                                                                                                                                                                                   |

| <b>Description</b>         | <p>(Area border routers only) For an area, summarize a range of IP addresses when sending summary link advertisements (within an area). To summarize multiple ranges, include multiple <b>area-range</b> statements.</p> <p>For a not-so-stubby area (NSSA), summarize a range of IP addresses when sending NSSA link-state advertisements. The specified prefixes are used to aggregate external routes learned within the area when the routes are advertised to other areas. To specify multiple prefixes, include multiple <b>area-range</b> statements. All external routes learned within the area that do not fall into one of the prefixes are advertised individually to other areas.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Default</b>             | By default, area border routing devices do not summarize routes being sent from one area to other areas, but rather send all routes explicitly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>             | <p><b>exact</b>—(Optional) Summarization of a route is advertised only when an exact match is made with the configured summary range.</p> <p><b>mask-length</b>—Number of significant bits in the network mask.</p> <p><b>network</b>—IP address. **override-metric *metric***—(Optional) Override the metric for the IP address range and configure a specific metric value.

**restrict**—(Optional) Do not advertise the configured summary. This hides all routes that are contained within the summary, effectively creating a route filter.

**Range:** 1 through 16,777,215

| <b>Description</b>         | <p>Specify a set of bandwidth threshold values and associated metric values for an OSPF interface or for a topology on an OSPF interface. When the bandwidth of an interface changes, Junos OS automatically sets the interface metric to the value associated with the appropriate bandwidth threshold value.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**NOTE:** You must also configure a static metric value for the OSPF interface or topology with the metric statement. Junos OS uses this value to calculate the cost of a route from the OSPF interface or topology if the bandwidth for the interface is higher than of any bandwidth threshold values configured for bandwidth-based metrics.

**authentication algorithm**, **authentication key-chain**, and **authentication loose-check** options introduced in Junos OS Release 9.6.

Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description** Configure bidirectional failure detection timers and authentication for OSPF.

The remaining statements are explained separately.

**Options**    **authentication algorithm** *algorithm-name* —Configure the algorithm used to authenticate the specified BFD session: **simple-password**, **keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, or **meticulous-keyed-sha-1**.

**authentication key-chain** *key-chain-name* —Associate a security key with the specified BFD session using the name of the security keychain. The name you specify must match one of the keychains configured in the **authentication-key-chains key-chain** statement at the **[edit security]** hierarchy level.

**authentication loose-check**—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication may not be configured at both ends of the BFD session.

**detection-time threshold** *milliseconds*—Configure a threshold for the adaptation of the BFD session detection time. When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

**full-neighbors-only**—Establish BFD sessions only for OSPF neighbors in the full state. The default behavior is to establish BFD sessions for all OSPF neighbors.

**minimum-interval** *milliseconds*—Configure the minimum interval after which the local routing device transmits a hello packet and then expects to receive a reply from the neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum transmit and receive intervals separately using the **transmit-interval minimum-interval** and **minimum-receive-interval** statements.

**Range:** 1 through 255,000 milliseconds

**minimum-receive-interval** *milliseconds*—Configure the minimum interval after which the routing device expects to receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum receive interval using the **minimum-interval** statement.

**Range:** 1 through 255,000 milliseconds

**multiplier** *number*—Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

**Range:** 1 through 255

**Default:** 3

**no-adaptation**—Specify that BFD sessions should not adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

**transmit-interval threshold** *milliseconds*—Configure the threshold for the adaptation of the BFD session transmit interval. When the transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent. The interval threshold must be greater than the minimum transmit interval.

**Range:** 0 through 4,294,967,295 ( $2^{32} - 1$ )

**transmit-interval minimum-interval** *milliseconds*—Configure the minimum interval at which the routing device transmits hello packets to a neighbor with which it has established

a BFD session. Optionally, instead of using this statement, you can configure the minimum transmit interval using the **minimum-interval** statement.

**Range:** 1 through 255,000

**version**—Configure the BFD version to detect: **1** (BFD version 1) or **automatic** (autodetect the BFD version).

**Default:** **automatic**

| <b>Description</b>              | Specify how long OSPF waits before declaring that a neighboring routing device is unavailable. This is an interval during which the routing device receives no hello packets from the neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b>              | On area border routing devices only, for a stub area, inject a default route with a specified metric value into the area. The default route matches any destination that is not explicitly reachable from within the area.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Description</b>         | <p>Disable OSPF, an OSPF interface, or an OSPF virtual link.</p> <p>By default, control packets sent to the remote end of a virtual link must be forwarded using the default topology. In addition, the transit area path consists only of links that</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

are in the default topology. You can disable a virtual link for a configured topology, but not for a default topology. Include the **disable** statement at the **[edit protocols ospf area *area-id* virtual-link neighbor-id router-id transit-area *area-id* topology *name*]** hierarchy level.

**NOTE:** If you disable the virtual link by including the **disable** statement at the **[edit protocols ospf area *area-id* virtual-link neighbor-id router-id transit-area *area-id*]** hierarchy level, you disable the virtual link for all topologies, including the default topology. You cannot disable the virtual link only in the default topology.

| <b>Description</b>              | Specify a domain ID for a route. The domain ID identifies the OSPF domain from which the route originated.                                                                                                                                                                                                                                                                                                                                                                |
| <b>Options</b>                  | <p><b><i>domain-id</i></b>—You can specify either an IP address or an IP address and a local identifier using the following format: <b><i>ip-address:local-identifier</i></b>. If you do not specify a local identifier with the IP address, the identifier is assumed to have a value of 0.</p> <p><b>Default:</b> If the router ID is not configured in the routing instance, the router ID is derived from an interface address belonging to the routing instance.</p> |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                       |

| <b>Description</b>         | <p>Configure graceful restart for OSPF.</p> <p>Graceful restart allows a routing device to restart with minimal effects to the network, and is enabled for all routing protocols at the [edit routing-options] hierarchy level.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>             | <p><b>disable</b>—Disable graceful restart for OSPF.</p> <p><b>helper-disable (standard   restart-signaling   both)</b>—Disable helper mode for graceful restart. When helper mode is disabled, a device cannot help a neighboring device that is attempting to restart. Beginning with Junos OS Release 11.4, you can configure restart signaling-based helper mode for OSPFv2 graceful restart configurations. The <b>standard</b>, <b>restart-signaling</b>, and <b>both</b> options are only supported for OSPFv2. Specify <b>standard</b> to disable helper mode for standard graceful restart (based on RFC 3623). Specify <b>restart-signaling</b> to disable helper mode for restart signaling-based graceful restart (based on RFC 4811, RFC 4812, and RFC 4813). Specify <b>both</b> to disable helper mode for both standard and restart signaling-based graceful restart. The last committed statement takes precedence over the previously configured statement.</p> <p><b>Default:</b> Helper mode is enabled by default. For OSPFv2, both standard and restart-signaling based helper modes are enabled by default.</p> <p><b>no-strict-lsa-checking</b>—Disable strict OSPF link-state advertisement (LSA) checking to prevent the termination of graceful restart by a helping router. LSA checking is enabled by default.</p> |

**NOTE:** The **helper-disable** statement and the **no-strict-lsa-checking** statement cannot be configured at the same time. If you attempt to configure both

statements at the same time, the routing device displays a warning message when you enter the `show protocols (ospf | ospf3)` command.

.....  
**notify-duration seconds**—Estimated time needed to send out purged grace LSAs over all the interfaces.

**Range:** 1 through 3600 seconds

**Default:** 30 seconds

**restart-duration seconds**—Estimated time needed to reacquire a full OSPF neighbor from each area.

**Range:** 1 through 3600 seconds

**Default:** 180 seconds

| <b>Description</b>              | Specify how often the routing device sends hello packets out the interface. The hello interval must be the same for all routing devices on a shared logical IP network.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b>              | Apply an import policy for OSPFv3 to specify which routes learned from an area are used to generate interarea prefixes into other areas.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Release Information** Statement introduced before Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Support for the **topology** statement introduced in Junos OS Release 9.0.  
 Support for the **topology** statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Support for the **realm** statement introduced in Junos OS Release 9.2.  
 Support for the **realm** statement introduced in Junos OS Release 9.2 for EX Series switches.  
 Support for the **no-interface-state-traps** statement introduced in Junos OS Release 10.3.  
 This statement is supported only for OSPFv2.  
 Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Enable OSPF routing on a routing device interface.

You must include at least one **interface** statement in the configuration to enable OSPF on the routing device.

**Options** *interface-name*—Name of the interface. Specify the interface by IP address or interface name for OSPFv2, or only the interface name for OSPFv3. Using both the interface name and IP address of the same interface produces an invalid configuration. To configure all interfaces, you can specify **all**. Specifying a particular interface and **all** produces an invalid configuration.

**NOTE:** For nonbroadcast interfaces, specify the IP address of the nonbroadcast interface as *interface-name*.

The remaining statements are explained separately.

**NOTE:** You cannot run both OSPF and ethernet-tcc encapsulation between two Juniper Networks routing devices.

**Required Privilege Level** routing—To view this statement in the configuration.  
 routing-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Specify the type of interface.</p> <p>By default, the software chooses the correct interface type based on the type of physical interface. Therefore, you should never have to set the interface type. The exception to this is for NBMA interfaces, which default to an interface type of point-to-multipoint. To have these interfaces explicitly run in Nonbroadcast multiaccess (NBMA) mode, configure the <b>nbma</b> interface type, using the IP address of the local ATM interface.</p> <p>In Junos OS Release 9.3 and later, a point-to-point interface can be an Ethernet interface without a subnet.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Default</b>                  | The software chooses the correct interface type based on the type of physical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>              | <p>Specify the external metric type for the default LSA.</p> <p>The configured metric determines the method used to compute the cost to a destination:</p> <ul style="list-style-type: none"> <li>• The Type 1 external metric is equivalent to the link-state metric. The path cost uses the advertised external path cost and the path cost to the AS boundary router (the route is equal to the sum of all internal costs and the external cost).</li> <li>• The Type 2 external metric uses the cost assigned by the AS boundary router (the route is equal to the external cost alone). By default, OSPF uses the Type 2 external metric.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b>              | Disable compatibility with RFC 1583, <i>OSPF Version 2</i> . If the same external destination is advertised by AS boundary routers that belong to different OSPF areas, disabling compatibility with RFC 1583 can prevent routing loops.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Default</b>                  | Compatibility with RFC 1583 is enabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Description</b>              | <p>Advertise the direct interface addresses on an interface without actually running OSPF on that interface. A passive interface is one for which the address information is advertised as an internal route in OSPF, but on which the protocol does not run.</p> <p>To configure an interface in OSPF passive traffic engineering mode, include the <b>traffic-engineering</b> statement. Configuring OSPF passive traffic engineering mode enables the dynamic discovery of OSPF AS boundary routers.</p> <p>Enable OSPF on an interface by including the <b>interface</b> statement at the [edit protocols (ospf   ospf3) area <i>area-id</i>] or the [edit routing-instances <i>routing-instance-name</i> protocols ospf area <i>area-id</i>] hierarchy levels. Disable it by including the <b>disable</b> statement. To prevent OSPF from running on an interface, include the <b>passive</b> statement. These three states are mutually exclusive.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Description</b>              | Specify the routing device's priority for becoming the designated routing device. The routing device that has the highest priority value on the logical IP network or subnet becomes the network's designated router. You must configure at least one routing device on each logical IP network or subnet to be the designated router. You also should specify a routing device's priority for becoming the designated router on point-to-point interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>                  | <p><b>number</b>—Routing device's priority for becoming the designated router. A priority value of 0 means that the routing device never becomes the designated router. A value of 1 means that the routing device has the least chance of becoming a designated router.</p> <p><b>Range:</b> 0 through 255</p> <p><b>Default:</b> 128</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.2.<br>Statement introduced in Junos OS Release 9.2 for EX Series switches.                                                                                                                                                                                                       |
| <b>Description</b>              | Configure OSPFv3 to advertise address families other than unicast IPv6. Junos OS maps each address family you configure to a separate realm with its own set of neighbors and link-state database.                                                                                                                          |

| <b>Description</b>         | Specify how long the routing device waits to receive a link-state acknowledgment packet before retransmitting link-state advertisements (LSAs) to an interface's neighbors.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**NOTE:** You must configure LSA retransmit intervals to be equal to or greater than 3 seconds to avoid triggering a retransmit trap, because Junos OS delays LSA acknowledgments by up to 2 seconds.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Configure options for running the shortest-path-first (SPF) algorithm. You can configure the following:</p> <ul style="list-style-type: none"><li>• A delay for when to run the SPF algorithm after a network topology change is detected.</li><li>• The maximum number of times the SPF algorithm can run in succession.</li><li>• A hold-down interval after the SPF algorithm runs the maximum number of times.</li></ul> <p>Running the SPF algorithm is usually the beginning of a series of larger system-wide events. For example, the SPF algorithm can lead to interior gateway protocol (IGP) prefix changes, which then lead to BGP nexthop resolution changes. Consider what happens if there are rapid link changes in the network. The local routing device can become overwhelmed. This is why it sometimes makes sense to throttle the scheduling of the SPF algorithm.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Description</b>         | <p>Configure OSPF protocol-level tracing options.</p> <p>To specify more than one tracing operation, include multiple <b>flag</b> statements.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

**NOTE:** The **traceoptions** statement is not supported on QFabric systems.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Default</b> | The default OSPF protocol-level tracing options are those inherited from the routing protocols <b>traceoptions</b> statement included at the <b>[edit routing-options]</b> hierarchy level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b> | <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. We recommend that you place OSPF tracing output in the file <b>ospf-log</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.</p> |

If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

**Range:** 2 through 1000 files

**Default:** 10 files

**flag *flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements.

#### OSPF Tracing Flags

- **database-description**—Database description packets, which are used in synchronizing the OSPF and OSPFv3 topological database.
- **error**—OSPF and OSPFv3 error packets.
- **event**—OSPF and OSPFv3 state transitions.
- **flooding**—Link-state flooding packets.
- **graceful-restart**—Graceful-restart events.
- **hello**—Hello packets, which are used to establish neighbor adjacencies and to determine whether neighbors are reachable.
- **ldp-synchronization**—Synchronization events between OSPF and LDP.
- **lsa-ack**—Link-state acknowledgment packets, which are used in synchronizing the OSPF topological database.
- **lsa-analysis**—Link-state analysis. Specific to the Juniper Networks implementation of OSPF, Junos OS performs LSA analysis before running the shortest-path-first (SPF) algorithm. LSA analysis helps to speed the calculations performed by the SPF algorithm.
- **lsa-request**—Link-state request packets, which are used in synchronizing the OSPF topological database.
- **lsa-update**—Link-state updates packets, which are used in synchronizing the OSPF topological database.
- **nsr-synchronization**—Nonstop routing synchronization events.
- **on-demand**—Trace demand circuit extensions.
- **packet-dump**—Content of selected packet types.
- **packets**—All OSPF packets.
- **restart-signaling**—(OSPFv2 only) Restart-signaling graceful restart events.
- **spf**—Shortest-path-first (SPF) calculations.

#### Global Tracing Flags

- **all**—All tracing operations.
- **general**—A combination of the **normal** and **route** trace operations.
- **normal**—All normal operations. If you do not specify this option, only unusual or abnormal operations are traced.
- **policy**—Policy operations and actions.
- **route**—Routing table changes.
- **state**—State transitions.
- **task**—Routing protocol task processing.
- **timer**—Routing protocol timer processing.

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Detailed trace information.
- **receive**—Packets being received.
- **send**—Packets being transmitted.

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 128 KB

**world-readable**—(Optional) Allow any user to read the log file.

|                                 |                                                                                                 |
|---------------------------------|-------------------------------------------------------------------------------------------------|
| <b>Required Privilege Level</b> | routing and trace—To view this statement in the configuration.                                  |
|                                 | routing-control and trace-control—To add this statement to the configuration.                   |

| <b>Description</b>         | Enable the OSPF traffic engineering features.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Default</b>             | Traffic engineering support is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>             | <p><b>advertise-unnumbered-interfaces</b>—(Optional) (OSPFv2 only) Include the link-local identifier in the link-local traffic-engineering link-state advertisement. This statement must be included on both ends of an unnumbered link to allow an ingress LER to update the link in its traffic engineering database and use it for CSPF calculations. The link-local identifier is then used by RSVP to signal unnumbered interfaces as defined in RFC 3477.</p> <p><b>credibility-protocol-preference</b>—(Optional) (OSPFv2 only) Use the configured preference value for OSPF routes to calculate the traffic engineering database credibility value used to select IGP routes. Use this statement to override the default behavior, in which the traffic engineering database prefers IS-IS routes even if OSPF routes are configured with a lower, that is, preferred, preference value. For example, OSPF routes have a default preference value of 10, whereas IS-IS Level 1 routes have a default preference value of 15. When protocol preference is enabled, the credibility value is determined by deducting the protocol preference value from a base value of 512. Using default protocol preference values, OSPF has a credibility value of 502, whereas IS-IS has a credibility value of 497. Because the traffic engineering database prefers IGP routes with the highest credibility value, OSPF routes are now preferred.</p> |

**multicast-rpf-routes**—(Optional) (OSPFv2 only) Install routes for multicast RPF checks into the **inet.2** routing table. The **inet.2** routing table consists of unicast routes used for multicast RPF lookup. RPF is an antispoofing mechanism used to check whether the packet is coming in on an interface that is also sending data back to the packet source.

**NOTE:** You must enable OSPF traffic engineering shortcuts to use the **multicast-rpf-routes** statement. You must not allow LSP advertisements into OSPF when configuring the **multicast-rpf-routes** statement.

**no-topology**—(Optional) (OSPFv2 only) Disable the dissemination of the link-state topology information.

The remaining statements are explained separately.

**CAUTION:** When the OSPF traffic engineering configuration is considerably modified, the routing table entries are deleted and the routing table is recreated. Changes to configuration that can cause this behavior include enabling or disabling:

- Traffic engineering shortcuts
- IGP shortcuts
- LDP tunneling
- Multiprotocol LSP
- Advertise summary metrics
- Multicast RPF routes

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Flood Type 7 default link-state advertisements (LSAs) if the <b>no-summaries</b> statement is configured.</p> <p>By default, when the <b>no-summaries</b> statement is configured, a Type 3 LSA is injected into not-so-stubby areas (NSSAs) for Junos OS Release 5.0 and later. To support backward compatibility with earlier Junos OS releases, include the <b>type-7</b> statement. This statement enables NSSA ABRs to advertise a Type 7 default LSA into the NSSA if you have also included the <b>no-summaries</b> statement in the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Description</b>              | <p>For backbone areas only, create a virtual link to use in place of an actual physical link. All area border routers and other routing devices on the backbone must be contiguous. If this is not possible and there is a break in OSPF connectivity, use virtual links to create connectivity to the OSPF backbone. When configuring virtual links, you must configure links on the two routing devices that form the end points of the link, and both of these routing devices must be area border routers. You cannot configure links through stub areas.</p> |
| <b>Options</b>                  | <p><b>neighbor-id <i>router-id</i></b>—IP address of the routing device at the remote end of the virtual link.</p> <p><b>transit-area <i>area-id</i></b>—Area identifier of the area through which the virtual link transits. Virtual links are not allowed to transit the backbone area.</p> <p>The remaining statements are explained separately.</p>                                                                                                                                                                                                           |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Routine Monitoring

- [Monitoring OSPF Routing Information on page 3277](#)

### Monitoring OSPF Routing Information

Purpose

**NOTE:** This topic applies only to the J-Web Application package.

Use the monitoring functionality to monitor OSPF routing information on routing devices.

Action

To view OSPF routing information in the J-Web interface, select **Monitor > Routing > OSPF Information**.

To view OSPF routing information in the CLI, enter the following CLI commands:

- `show ospf neighbor`
- `show ospf interface`
- `show ospf statistics`

Meaning

[Table 343 on page 3277](#) summarizes key output fields in the OSPF routing display in the J-Web interface.

Table 343: Summary of Key OSPF Routing Output Fields

| Field           | Values                              | Additional Information |
|-----------------|-------------------------------------|------------------------|
| OSPF Interfaces |                                     |                        |
| Interface       | Name of the interface running OSPF. |                        |

Table 343: Summary of Key OSPF Routing Output Fields (*continued*)

| Field               | Values                                                                                                                                                                     | Additional Information                                                                                                                                                                          |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| State               | State of the interface: <b>BDR</b> , <b>Down</b> , <b>DR</b> , <b>DROther</b> , <b>Loop</b> , <b>PtToPt</b> , or <b>Waiting</b> .                                          | The <b>Down</b> state, indicating that the interface is not functioning, and <b>PtToPt</b> state, indicating that a point-to-point connection has been established, are the most common states. |
| Area                | Number of the area that the interface is in.                                                                                                                               |                                                                                                                                                                                                 |
| DR ID               | Address of the area's designated device.                                                                                                                                   |                                                                                                                                                                                                 |
| BDR ID              | Address of the area's backup designated device.                                                                                                                            |                                                                                                                                                                                                 |
| Neighbors           | Number of neighbors on this interface.                                                                                                                                     |                                                                                                                                                                                                 |
| Adjacency Count     | Number of devices in the area using the same area identifier.                                                                                                              |                                                                                                                                                                                                 |
| Stub Type           | The areas into which OSPF does not flood AS external advertisements                                                                                                        |                                                                                                                                                                                                 |
| Passive Mode        | In this mode the interface is present on the network but does not transmit or receive packets.                                                                             |                                                                                                                                                                                                 |
| Authentication Type | The authentication scheme for the backbone or area.                                                                                                                        |                                                                                                                                                                                                 |
| Interface Address   | The IP address of the interface.                                                                                                                                           |                                                                                                                                                                                                 |
| Address Mask        | The subnet mask or address prefix.                                                                                                                                         |                                                                                                                                                                                                 |
| MTU                 | The maximum transmission unit size.                                                                                                                                        |                                                                                                                                                                                                 |
| Interface Cost      | The path cost used to calculate the root path cost from any given LAN segment is determined by the total cost of each link in the path.                                    |                                                                                                                                                                                                 |
| Hello Interval      | How often the routing device sends hello packets out of the interface.                                                                                                     |                                                                                                                                                                                                 |
| Dead Interval       | The interval during which the routing device receives no hello packets from the neighbor.                                                                                  |                                                                                                                                                                                                 |
| Retransmit Interval | The interval for which the routing device waits to receive a link-state acknowledgment packet before retransmitting link-state advertisements to an interface's neighbors. |                                                                                                                                                                                                 |
| OSPF Statistics     |                                                                                                                                                                            |                                                                                                                                                                                                 |
| Packets tab         |                                                                                                                                                                            |                                                                                                                                                                                                 |

Table 343: Summary of Key OSPF Routing Output Fields (*continued*)

| Field                    | Values                                                                                        | Additional Information                                                                                                                                                                                                                                                                                         |
|--------------------------|-----------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Sent                     | Displays the total number of packets sent.                                                    |                                                                                                                                                                                                                                                                                                                |
| Received                 | Displays the total number of packets received.                                                |                                                                                                                                                                                                                                                                                                                |
| <b>Details tab</b>       |                                                                                               |                                                                                                                                                                                                                                                                                                                |
| Flood Queue Depth        | Number of entries in the extended queue.                                                      |                                                                                                                                                                                                                                                                                                                |
| Total Retransmits        | Number of retransmission entries enqueued.                                                    |                                                                                                                                                                                                                                                                                                                |
| Total Database Summaries | Total number of database description packets.                                                 |                                                                                                                                                                                                                                                                                                                |
| <b>OSPF Neighbors</b>    |                                                                                               |                                                                                                                                                                                                                                                                                                                |
| Address                  | Address of the neighbor.                                                                      |                                                                                                                                                                                                                                                                                                                |
| Interface                | Interface through which the neighbor is reachable.                                            |                                                                                                                                                                                                                                                                                                                |
| State                    | State of the neighbor: <b>Attempt, Down, Exchange, ExStart, Full, Init, Loading, or 2way.</b> | Generally, only the <b>Down</b> state, indicating a failed OSPF adjacency, and the <b>Full</b> state, indicating a functional adjacency, are maintained for more than a few seconds. The other states are transitional states that a neighbor is in only briefly while an OSPF adjacency is being established. |
| ID                       | ID of the neighbor.                                                                           |                                                                                                                                                                                                                                                                                                                |
| Priority                 | Priority of the neighbor to become the designated router.                                     |                                                                                                                                                                                                                                                                                                                |
| Activity Time            | The activity time.                                                                            |                                                                                                                                                                                                                                                                                                                |
| Area                     | Area that the neighbor is in.                                                                 |                                                                                                                                                                                                                                                                                                                |
| Options                  | Option bits received in the hello packets from the neighbor.                                  |                                                                                                                                                                                                                                                                                                                |
| DR Address               | Address of the designated router.                                                             |                                                                                                                                                                                                                                                                                                                |
| BDR Address              | Address of the backup designated router.                                                      |                                                                                                                                                                                                                                                                                                                |
| Uptime                   | Length of time since the neighbor came up.                                                    |                                                                                                                                                                                                                                                                                                                |
| Adjacency                | Length of time since the adjacency with the neighbor was established.                         |                                                                                                                                                                                                                                                                                                                |

                                                           <link-local >  
                                                           <lsa-id *lsa-id* >  
                                                           <netsummary >  
                                                           <network >  
                                                           <nssa >  
                                                           <opaque-area >  
                                                           <purge >  
                                                           <router >

**Release Information**    Command introduced before Junos OS Release 7.4.  
                                   **advertising-router** *router-id*, **netsummary**, **network**, **nssa**, **opaque-area**, and **router** options added in Junos OS Release 8.3. You must use the **purge** command with these options.  
                                   **area** *area-id* option added in Junos OS Release 8.3.  
                                   Command introduced in Junos OS Release 9.0 for EX Series switches.  
                                   **realm** option added in Junos OS Release 9.2.  
                                   **advertising-router** (*router-id* | **self**) option added in Junos OS Release 9.5.  
                                   **advertising-router** (*router-id* | **self**) option introduced in Junos OS Release 9.5 for EX Series switches.  
                                   Command introduced in Junos OS Release 11.3 for the QFX Series.

**purge** option (and all options that are dependent on the **purge** option) hidden in Junos OS Release 13.3.

**Description** With the master Routing Engine, delete entries in the Open Shortest Path First (OSPF) link-state advertisement (LSA) database. With the backup Routing Engine, delete the OSPF LSA database and sync the new database with the master Routing Engine.

**CAUTION:** You can also use the **purge** command with any of the options to **discard** rather than **delete** the specified LSA entries. This command is useful only for testing. Use it with care, because it causes significant network disruption.

**Options** **none**—Delete all LSAs other than the system's own LSAs, which are regenerated. To resynchronize the database, the system destroys all adjacent neighbors that are in the state **EXSTART** or higher. The neighbors are then reacquired and the databases are synchronized.

**advertising-router (router-id | self)**—(Hidden) Discard entries for the LSA entries advertised by the specified routing device or by this routing device.

**area area-id**—(Optional) Discard entries for the LSAs in the specified area.

**asbrsummary**—(Optional) Discard summary AS boundary router LSA entries.

**external**—(Optional) Discard external LSAs.

**instance instance-name**—(Optional) Delete or discard entries for the specified routing instance only.

**inter-area-prefix**—(OSPFv3 only) (Optional) Discard interarea prefix LSAs.

**inter-area-router**—(OSPFv3 only) (Optional) Discard interarea router LSAs.

**intra-area-prefix**—(OSPFv3 only) (Optional) Discard intra-area prefix LSAs.

**logical-system (all | logical-system-name)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**link-local**—(Optional) Delete link-local LSAs.

**lsa-id lsa-id**—(Optional) Discard the LSA entries with the specified LSA identifier.

**netsummary**—(Hidden) Discard summary network LSAs.

**network**—(Hidden) Discard network LSAs.

**nssa**—(Hidden) Discard not-so-stubby area (NSSA) LSAs.

**opaque-area**—(Hidden) Discard opaque area-scope LSAs.

**purge**—(Hidden) Discard all entries in the link-state advertisement database. All link-state advertisements are set to **MAXAGE** and are flooded. The database is repopulated when the originators of the link-state advertisements receive the **MAXAGE** link-state advertisements and reissue them.

**realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)**—(OSPFv3 only) (Optional) Delete the entries for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

**router**—(Hidden) Discard router LSAs.

**Required Privilege Level**

clear

## Sample Output

### clear ospf statistics

The following sample output displays OSPF statistics before and after the **clear ospf statistics** command is entered:

```
user@host> show ospf statistics
```

| Packet type | Total | Last 5 seconds |
|-------------|-------|----------------|
|-------------|-------|----------------|

|          | Sent | Received | Sent | Received |
|----------|------|----------|------|----------|
| Hello    | 3254 | 2268     | 3    | 1        |
| DbD      | 41   | 46       | 0    | 0        |
| LSReq    | 8    | 7        | 0    | 0        |
| LSUpdate | 212  | 154      | 0    | 0        |
| LSAck    | 65   | 98       | 0    | 0        |

|                          |   |                    |   |   |
|--------------------------|---|--------------------|---|---|
| DBDs retransmitted       | : | 3, last 5 seconds  | : | 0 |
| LSAs flooded             | : | 12, last 5 seconds | : | 0 |
| LSAs flooded high-prio   | : | 0, last 5 seconds  | : | 0 |
| LSAs retransmitted       | : | 0, last 5 seconds  | : | 0 |
| LSAs transmitted to nbr: | : | 3, last 5 seconds  | : | 0 |
| LSAs requested           | : | 5, last 5 seconds  | : | 0 |
| LSAs acknowledged        | : | 19, last 5 seconds | : | 0 |

|                      |   |   |
|----------------------|---|---|
| Flood queue depth    | : | 0 |
| Total rexmit entries | : | 0 |
| db summaries         | : | 0 |
| lsreq entries        | : | 0 |

Receive errors:

626 subnet mismatches

**Output Fields** [Table 344 on page 3291](#) lists the output fields for the **show (ospf | ospf3) interface** command. Output fields are listed in the approximate order in which they appear.

**Table 344: show (ospf | ospf3) interface Output Fields**

| Field Name              | Field Description                                                                                                                                                                                    | Level of Output         |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Interface</b>        | Name of the interface running OSPF version 2 or OSPF version 3.                                                                                                                                      | All levels              |
| <b>State</b>            | State of the interface: <b>BDR</b> , <b>Down</b> , <b>DR</b> , <b>DRother</b> , <b>Loop</b> , <b>PtToPt</b> , or <b>Waiting</b> .                                                                    | All levels              |
| <b>Area</b>             | Number of the area that the interface is in.                                                                                                                                                         | All levels              |
| <b>DR ID</b>            | Address of the area's designated router.                                                                                                                                                             | All levels              |
| <b>BDR ID</b>           | Backup designated router for a particular subnet.                                                                                                                                                    | All levels              |
| <b>Nbrs</b>             | Number of neighbors on this interface.                                                                                                                                                               | All levels              |
| <b>Type</b>             | Type of interface: <b>LAN</b> , <b>NBMA</b> , <b>P2MP</b> , <b>P2P</b> , or <b>Virtual</b> .                                                                                                         | <b>detail extensive</b> |
| <b>Address</b>          | IP address of the neighbor.                                                                                                                                                                          | <b>detail extensive</b> |
| <b>Mask</b>             | Netmask of the neighbor.                                                                                                                                                                             | <b>detail extensive</b> |
| <b>Prefix-length</b>    | (OSPFv3) IPv6 prefix length, in bits.                                                                                                                                                                | <b>detail extensive</b> |
| <b>OSPF3-Intf-Index</b> | (OSPFv3) OSPF version 3 interface index.                                                                                                                                                             | <b>detail extensive</b> |
| <b>MTU</b>              | Interface maximum transmission unit (MTU).                                                                                                                                                           | <b>detail extensive</b> |
| <b>Cost</b>             | Interface cost (metric).                                                                                                                                                                             | <b>detail extensive</b> |
| <b>DR addr</b>          | Address of the designated router.                                                                                                                                                                    | <b>detail extensive</b> |
| <b>BDR addr</b>         | Address of the backup designated router.                                                                                                                                                             | <b>detail extensive</b> |
| <b>Adj count</b>        | Number of adjacent neighbors.                                                                                                                                                                        | <b>detail extensive</b> |
| <b>Secondary</b>        | Indicates that this interface is configured as a secondary interface for this area. This interface can belong to more than one area, but can be designated as a primary interface for only one area. | <b>detail extensive</b> |

Table 344: show (ospf | ospf3) interface Output Fields (*continued*)

| Field Name             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                   | Level of Output         |
|------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Flood Reduction</b> | Indicates that this interface is configured with flooding reduction. All self-originated LSAs from this interface are initially sent with the <b>DoNotAge</b> bit set. As a result, LSAs are refreshed only when a change occurs.                                                                                                                                                                                                                                   | <b>extensive</b>        |
| <b>Priority</b>        | Router priority used in designated router (DR) election on this interface.                                                                                                                                                                                                                                                                                                                                                                                          | <b>detail extensive</b> |
| <b>Flood list</b>      | List of link-state advertisements (LSAs) that might be about to flood this interface.                                                                                                                                                                                                                                                                                                                                                                               | <b>extensive</b>        |
| <b>Ack list</b>        | Acknowledgment list. List of pending acknowledgments on this interface.                                                                                                                                                                                                                                                                                                                                                                                             | <b>extensive</b>        |
| <b>Descriptor list</b> | List of packet descriptors.                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>extensive</b>        |
| <b>Hello</b>           | Configured value for the hello timer.                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive</b> |
| <b>Dead</b>            | Configured value for the dead timer.                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive</b> |
| <b>Auth type</b>       | (OSPFv2) Authentication mechanism for sending and receiving OSPF protocol packets: <ul style="list-style-type: none"> <li>• <b>MD5</b>—The MD5 mechanism is configured in accordance with RFC 2328.</li> <li>• <b>None</b>—No authentication method is configured.</li> <li>• <b>Password</b>—A simple password (RFC 2328) is configured.</li> </ul>                                                                                                                | <b>detail extensive</b> |
| <b>Topology</b>        | (Multiarea adjacency) Name of topology: <b>default</b> or <b>name</b> .                                                                                                                                                                                                                                                                                                                                                                                             |                         |
| <b>LDP sync state</b>  | (OSPFv2 and LDP synchronization) Current state of LDP synchronization: <b>in sync</b> , <b>in holddown</b> , and <b>not supported</b> .                                                                                                                                                                                                                                                                                                                             | <b>extensive</b>        |
| <b>reason</b>          | (OSPFv2 and LDP synchronization) Reason for the current state of LDP synchronization. The LDP session might be up or down, or adjacency might be up or down.                                                                                                                                                                                                                                                                                                        | <b>extensive</b>        |
| <b>config holdtime</b> | (OSPFv2 and LDP synchronization) Configured value of the hold timer.<br><br>If the state is not synchronized, and the hold time is not infinity, the <b>remaining</b> field displays the number of seconds that remain until the configured hold timer expires.                                                                                                                                                                                                     | <b>extensive</b>        |
| <b>IPSec SA name</b>   | (OSPFv2) Name of the IPSec security association name.                                                                                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive</b> |
| <b>Active key ID</b>   | (OSPFv2 and MD5) Number from <b>0</b> to <b>255</b> that uniquely identifies an MD5 key.                                                                                                                                                                                                                                                                                                                                                                            | <b>detail extensive</b> |
| <b>Start time</b>      | (OSPFv2 and MD5) Time at which the routing device starts using an MD5 key to authenticate OSPF packets transmitted on the interface on which this key is configured. To authenticate received OSPF protocol packets, the key becomes effective immediately after the configuration is committed. If the start time option is not configured, the key is effective immediately for send and receive and is displayed as <b>Start time 1970 Jan 01 00:00:00 PST</b> . | <b>detail extensive</b> |

Table 344: show (ospf | ospf3) interface Output Fields (*continued*)

| Field Name                   | Field Description                          | Level of Output  |
|------------------------------|--------------------------------------------|------------------|
| ReXmit                       | Configured value for the Retransmit timer. | detail extensive |
| Stub, Not Stub, or Stub NSSA | Type of area.                              | detail extensive |

**Table 345: show (ospf | ospf3) io-statistics Output Fields**

| Field Name      | Field Description                                                                                         |
|-----------------|-----------------------------------------------------------------------------------------------------------|
| Packets read    | Number of OSPF packets read since the last time the routing protocol was started.                         |
| average per run | Total number of packets divided by the total number of times the OSPF read operation is scheduled to run. |
| max run         | Maximum number of packets for a given run among all scheduled runs.                                       |
| Receive errors  | Number of faulty packets received with errors.                                                            |

## Sample Output

### show ospf io-statistics

```
user@host> show ospf io-statistics
```

```
Packets read: 7361, average per run: 1.00, max run: 1  
Receive errors:  
None
```

## show (ospf | ospf3) log

**List of Syntax** [Syntax on page 3298](#)  
[Syntax \(EX Series Switch and QFX Series\) on page 3298](#)

**Syntax** `show (ospf | ospf3) log`  
`<instance instance-name>`  
`<logical-system (all | logical-system-name)>`  
`<realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>`  
`<topology topology-name>`

**Syntax (EX Series Switch and QFX Series)** `show (ospf | ospf3) log`  
`<instance instance-name>`  
`<topology topology-name>`

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
**topology** option introduced in Junos OS Release 9.0.  
**topology** option introduced in Junos OS Release 9.0 for EX Series switches.  
**realm** option introduced in Junos OS Release 9.2.  
 Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Display the entries in the Open Shortest Path First (OSPF) log of SPF calculations.

**Options** **none**—Display entries in the OSPF log of SPF calculations for all routing instances.

**instance *instance-name***—(Optional) Display entries for the specified routing instance.

**logical-system (all | *logical-system-name*)**—(Optional) Perform this operation on all logical systems or on a particular logical system.

**topology *topology-name***—(Optional) (OSPFv2 only) Display entries for the specified topology.

**realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)**—(OSPFv3 only) (Optional) Display entries for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

**Required Privilege Level** view

**List of Sample Output** [show ospf log on page 3299](#)  
[show ospf log topology voice on page 3299](#)

**Output Fields** [Table 346 on page 3298](#) lists the output fields for the **show (ospf | ospf3) log** command. Output fields are listed in the approximate order in which they appear.

**Table 346: show (ospf | ospf3) log Output Fields**

| Field Name  | Field Description                                                                      |
|-------------|----------------------------------------------------------------------------------------|
| <b>When</b> | Time, in weeks ( <b>w</b> ) and days ( <b>d</b> ), since the SPF calculation was made. |

Table 346: show (ospf | ospf3) log Output Fields (*continued*)

| Field Name | Field Description                                                                                                                                                            |
|------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Type       | Type of calculation: Cleanup, External, Interarea, NSSA, Redist, SPF, Stub, Total, or Virtuallink.                                                                           |
| Elapsed    | Amount of time, in seconds, that elapsed during the operation, or the time required to complete the SPF calculation. The start time is the time displayed in the When field. |

## Sample Output

### show ospf log

```

user@host> show ospf log
When          Type          Elapsed
1w4d 17:25:58 Stub          0.000017
1w4d 17:25:58 SPF           0.000070
1w4d 17:25:58 Stub          0.000019
1w4d 17:25:58 Interarea     0.000054
1w4d 17:25:58 External      0.000005
1w4d 17:25:58 Cleanup       0.000203
1w4d 17:25:58 Total         0.000537
1w4d 17:24:48 SPF           0.000125
1w4d 17:24:48 Stub          0.000017
1w4d 17:24:48 SPF           0.000100

## show (ospf | ospf3) neighbor

**List of Syntax**    [Syntax on page 3301](#)  
                          [Syntax \(EX Series Switches and QFX Series\) on page 3301](#)

**Syntax**    `show (ospf | ospf3) neighbor`  
                  `<brief | detail | extensive>`  
                  `<area area-id>`  
                  `<instance (all | instance-name)>`  
                  `<interface interface-name>`  
                  `<logical-system (all | logical-system-name)>`  
                  `<neighbor>`  
                  `<realm (ipv4-multicast | ipv4-unicast | ipv6-multicast)>`

**Syntax (EX Series Switches and QFX Series)**    `show (ospf | ospf3) neighbor`  
                  `<brief | detail | extensive>`  
                  `<area area-id>`  
                  `<instance (all | instance-name)>`  
                  `<interface interface-name>`  
                  `<neighbor>`

**Release Information**    Command introduced before Junos OS Release 7.4.  
                                  Command introduced in Junos OS Release 9.0 for EX Series switches.  
                                  **instance all** option introduced in Junos OS Release 9.1.  
                                  **instance all** option introduced in Junos OS Release 9.1 for EX Series switches.  
                                  **area**, **interface**, and **realm** options introduced in Junos OS Release 9.2.  
                                  **area** and **interface** options introduced in Junos OS Release 9.2 for EX Series switches.  
                                  Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description**    Display information about OSPF neighbors.

CPU utilization might increase while the device learns its OSPF neighbors. We recommend that you use the **show (ospf | ospf3) neighbor** command after the device learns and establishes OSPF neighbor adjacencies. Depending on the size of your network, this might take several minutes. If you receive a “timeout communicating with routing daemon” error when using the **show (ospf | ospf3) neighbor** command, wait several minutes before attempting to use the command again. This is not a critical system error, but you might experience a delay in using the CLI.

**Options**    **none**—Display standard information about all OSPF neighbors for all routing instances.

**brief | detail | extensive**—(Optional) Display the specified level of output.

**area *area-id***—(Optional) Display information about the OSPF neighbors for the specified area.

**instance (all | *instance-name*)**—(Optional) Display all OSPF interfaces for all routing instances or under the named routing instance.

**interface *interface-name***—(Optional) Display information about OSPF neighbors for the specified logical interface.

**logical-system** (**all** | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

**neighbor**—(Optional) Display information about the specified OSPF neighbor.

**realm** (**ipv4-multicast** | **ipv4-unicast** | **ipv6-multicast**)—(OSPFv3 only) (Optional) Display information about the OSPF neighbors for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

**Output Fields** [Table 347 on page 3302](#) lists the output fields for the **show (ospf | ospf3) neighbor** command. Output fields are listed in the approximate order in which they appear.

**Table 347: show (ospf | ospf3) neighbor Output Fields**

| Field Name       | Field Description                                  | Level of Output |
|------------------|----------------------------------------------------|-----------------|
| <b>Address</b>   | Address of the neighbor.                           | All levels      |
| <b>Interface</b> | Interface through which the neighbor is reachable. | All levels      |

Table 347: show (ospf | ospf3) neighbor Output Fields (*continued*)

| Field Name                            | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Level of Output         |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>State</b>                          | <p>State of the neighbor:</p> <ul style="list-style-type: none"> <li>• <b>Attempt</b>—Valid only for neighbors attached to nonbroadcast networks. It indicates that no recent information has been received from the neighbor, but that a more concerted effort must be made to contact the neighbor.</li> <li>• <b>Down</b>—Initial state of a neighbor conversation. It indicates that no recent information has been received from the neighbor. Hello packets might continue to be sent to neighbors in the <b>Down</b> state, although at a reduced frequency.</li> <li>• <b>Exchange</b>—Routing device is describing its entire link-state database by sending database description packets to the neighbor. Each packet has a sequence number and is explicitly acknowledged.</li> <li>• <b>ExStart</b>—First step in creating an adjacency between the two neighboring routing devices. The goal of this step is to determine which routing device is the master, and to determine the initial sequence number.</li> <li>• <b>Full</b>—Neighboring routing devices are fully adjacent. These adjacencies appear in router link and network link advertisements.</li> <li>• <b>Init</b>—A hello packet has recently been sent by the neighbor. However, bidirectional communication has not yet been established with the neighbor. This state might occur, for example, because the routing device itself did not appear in the neighbor's hello packet.</li> <li>• <b>Loading</b>—Link-state request packets are sent to the neighbor to acquire more recent advertisements that have been discovered (but not yet received) in the <b>Exchange</b> state.</li> <li>• <b>2Way</b>—Communication between the two routing devices is bidirectional. This state has been ensured by the operation of the Hello Protocol. This is the most advanced state short of beginning adjacency establishment. The (backup) designated router is selected from the set of neighbors in state <b>2Way</b> or greater.</li> </ul> | All levels              |
| <b>ID</b>                             | Router ID of the neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | All levels              |
| <b>Pri</b>                            | Priority of the neighbor to become the designated router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | All levels              |

| <b>Link state retransmission list</b> | <p>Total number of link-state advertisements retransmitted. For <b>extensive</b> output only, the following information is also displayed:</p> <ul style="list-style-type: none"> <li>• <b>Type</b>—Type of link advertisement: <b>ASBR</b>, <b>Sum</b>, <b>Extern</b>, <b>Network</b>, <b>NSSA</b>, <b>OpagArea</b>, <b>Router</b>, or <b>Summary</b>.</li> <li>• <b>LSA ID</b>—LSA identifier included in the advertisement. An asterisk preceding the identifier marks database entries that originated from the local routing device.</li> <li>• <b>Adv rtr</b>—Address of the routing device that sent the advertisement.</li> <li>• <b>Seq</b>—Link sequence number of the advertisement.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>detail extensive</b> |

Table 347: show (ospf | ospf3) neighbor Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                | Level of Output  |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Neighbor-address</b> | (OSPFv3 only) If the neighbor uses virtual links, the <b>Neighbor-address</b> is the site-local, local, or global address. If the neighbor uses a physical interface, the <b>Neighbor-address</b> is an IPv6 link-local address. | detail extensive |
| <b>area</b>             | Area that the neighbor is in.                                                                                                                                                                                                    | detail extensive |
| <b>OSPF3-Intf-Index</b> | (OSPFv3 only) Displays the OSPFv3 interface index.                                                                                                                                                                               | detail extensive |
| <b>opt</b>              | Option bits received in the hello packets from the neighbor.                                                                                                                                                                     | detail extensive |
| <b>DR or DR-ID</b>      | Address of the designated router.                                                                                                                                                                                                | detail extensive |
| <b>BDR or BDR-ID</b>    | Address of the backup designated router.                                                                                                                                                                                         | detail extensive |
| <b>Up</b>               | Length of time since the neighbor came up.                                                                                                                                                                                       | detail extensive |
| <b>adjacent</b>         | Length of time since the adjacency with the neighbor was established.                                                                                                                                                            | detail extensive |

## Sample Output

Table 348: show ospf overview Output Fields

| Field name                       | Field Description                                                                                                                                                                        | Level of Output |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Instance</b>                  | OSPF routing instance.                                                                                                                                                                   | All levels      |
| <b>Router ID</b>                 | Router ID of the routing device.                                                                                                                                                         | All levels      |
| <b>Route table index</b>         | Route table index.                                                                                                                                                                       | All levels      |
| <b>Configured overload</b>       | Overload capability is enabled. If the overload timer is also configured, display the time that remains before it is set to expire. This field is not displayed after the timer expires. | All levels      |
| <b>Topology</b>                  | Topology identifier.                                                                                                                                                                     | All levels      |
| <b>Prefix export count</b>       | Number of prefixes exported into OSPF.                                                                                                                                                   | All levels      |
| <b>Full SPF runs</b>             | Number of complete Shortest Path First calculations.                                                                                                                                     | All levels      |
| <b>SPF delay</b>                 | Delay before performing consecutive Shortest Path First calculations.                                                                                                                    | All levels      |
| <b>SPF holddown</b>              | Delay before performing additional Shortest Path First (SPF) calculations after the maximum number of consecutive SPF calculations is reached.                                           | All levels      |
| <b>SPF rapid runs</b>            | Maximum number of Shortest Path First calculations that can be performed in succession before the hold-down timer begins.                                                                | All levels      |
| <b>LSA refresh time</b>          | Refresh period for link-state advertisement (in minutes).                                                                                                                                | All levels      |
| <b>Database protection state</b> | Current state of database protection.                                                                                                                                                    | All levels      |
| <b>Warning threshold</b>         | Threshold at which a warning message is logged (percentage of maximum LSA count).                                                                                                        | All levels      |
| <b>Non self-generated LSAs</b>   | Number of LSAs whose router ID is not equal to the local router ID: <b>Current</b> , <b>Warning</b> (threshold), and <b>Allowed</b> .                                                    | All levels      |
| <b>Ignore time</b>               | How long the database has been in the ignore state.                                                                                                                                      | All levels      |
| <b>Reset time</b>                | How long the database must stay out of the ignore or isolated state before it returns to normal operations.                                                                              | All levels      |
| <b>Ignore count</b>              | Number of times the database has been in the ignore state: <b>Current</b> and <b>Allowed</b> .                                                                                           | All levels      |
| <b>Restart</b>                   | Graceful restart capability: <b>enabled</b> or <b>disabled</b> .                                                                                                                         | All levels      |
| <b>Restart duration</b>          | Time period for complete reacquisition of OSPF neighbors.                                                                                                                                | All levels      |
| <b>Restart grace period</b>      | Time period for which the neighbors should consider the restarting routing device as part of the topology.                                                                               | All levels      |

Table 348: show ospf overview Output Fields (*continued*)

| Field name                    | Field Description                                                                                                                                                                                                                                                                                                                     | Level of Output  |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| Graceful restart helper mode  | (OSPFv2) Standard graceful restart helper capability (based on RFC 3623): <b>enabled</b> or <b>disabled</b> .                                                                                                                                                                                                                         | All levels       |
| Restart-signaling helper mode | (OSPFv2) Restart signaling-based graceful restart helper capability (based on RFC 4811, RFC 4812, and RFC 4813): <b>enabled</b> or <b>disabled</b> .                                                                                                                                                                                  | All levels       |
| Helper mode                   | (OSPFv3) Graceful restart helper capability: <b>enabled</b> or <b>disabled</b> .                                                                                                                                                                                                                                                      | All levels       |
| Trace options                 | OSPF-specific trace options.                                                                                                                                                                                                                                                                                                          | <b>extensive</b> |
| Trace file                    | Name of the file to receive the output of the tracing operation.                                                                                                                                                                                                                                                                      | <b>extensive</b> |
| Area                          | Area number. Area 0.0.0.0 is the backbone area.                                                                                                                                                                                                                                                                                       | All levels       |
| Stub type                     | Stub type of area: <b>Normal Stub</b> , <b>Not Stub</b> , or <b>Not so Stubby Stub</b> .                                                                                                                                                                                                                                              | All levels       |
| Authentication Type           | Type of authentication: <b>None</b> , <b>Password</b> , or <b>MD5</b> .<br><br><b>NOTE:</b> The <b>Authentication Type</b> field refers to the authentication configured at the <b>[edit protocols ospf area area-id]</b> level. Any authentication configured for an interface in this area will not affect the value of this field. | All levels       |
| Area border routers           | Number of area border routers.                                                                                                                                                                                                                                                                                                        | All levels       |
| Neighbors                     | Number of autonomous system boundary routers.                                                                                                                                                                                                                                                                                         | All levels       |

## Sample Output

### show ospf overview

```

user@host> show ospf overview
Instance: master
  Router ID: 10.255.245.6
  Route table index: 0
  Configured overload, expires in 118 seconds
  LSA refresh time: 50 minutes
  Restart: Enabled
    Restart duration: 20 sec
    Restart grace period: 40 sec
    Helper mode: enabled
  Area: 0.0.0.0
    Stub type: Not Stub
    Authentication Type: None
    Area border routers: 0, AS boundary routers: 0
    Neighbors
      Up (in full state): 0
  Topology: default (ID 0)
  Prefix export count: 0
  Full SPF runs: 1
  SPF delay: 0.200000 sec, SPF holddown: 5 sec, SPF rapid runs: 3

```

### show ospf overview (With Database Protection)

```
user@host> show ospf overview
Instance: master
  Router ID: 10.255.112.218
  Route table index: 0
  LSA refresh time: 50 minutes
  Traffic engineering
  Restart: Enabled
    Restart duration: 180 sec
    Restart grace period: 210 sec
    Graceful restart helper mode: Enabled
    Restart-signaling helper mode: Enabled
  Database protection state: Normal
    Warning threshold: 70 percent
    Non self-generated LSAs: Current 582, Warning 700, Allowed 1000
    Ignore time: 30, Reset time: 60
    Ignore count: Current 0, Allowed 1
  Area: 0.0.0.0
    Stub type: Not Stub
    Authentication Type: None
    Area border routers: 0, AS boundary routers: 0
  Neighbors
    Up (in full state): 160
  Topology: default (ID 0)
    Prefix export count: 0
    Full SPF runs: 70
    SPF delay: 0.200000 sec, SPF holddown: 5 sec, SPF rapid runs: 3
    Backup SPF: Not Needed
```

### show ospf3 overview (With Database Protection)

```
user@host> show ospf3 overview
Instance: master
  Router ID: 10.255.112.128
  Route table index: 0
  LSA refresh time: 50 minutes
  Database protection state: Normal
    Warning threshold: 80 percent
    Non self-generated LSAs: Current 3, Warning 8, Allowed 10
    Ignore time: 30, Reset time: 60
    Ignore count: Current 0, Allowed 2
  Area: 0.0.0.0
    Stub type: Not Stub
    Area border routers: 0, AS boundary routers: 0
  Neighbors
    Up (in full state): 1
  Topology: default (ID 0)
    Prefix export count: 0
    Full SPF runs: 7
    SPF delay: 0.200000 sec, SPF holddown: 5 sec, SPF rapid runs: 3
    Backup SPF: Not Needed
```

### show ospf overview extensive

```
user@host> show ospf overview extensive
Instance: master
  Router ID: 1.1.1.103
  Route table index: 0
  Full SPF runs: 13, SPF delay: 0.200000 sec
  LSA refresh time: 50 minutes
```

```
Restart: Disabled
Trace options: lsa
Trace file: /var/log/ospf size 131072 files 10
Area: 0.0.0.0
  Stub type: Not Stub
  Authentication Type: None
  Area border routers: 0, AS boundary routers: 0
  Neighbors
    Up (in full state): 1
```

```
show (ospf | ospf3) route
```

- |                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Description</b>                              | Display the entries in the Open Shortest Path First (OSPF) routing table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>                                  | <p><b>none</b>—Display standard information about all entries in the OSPF routing table for all routing instances and all topologies.</p> <p><b><i>destination</i></b>—Display routes to the specified IP address (with optional destination prefix length).</p> <p><b>brief   detail   extensive</b>—(Optional) Display the specified level of output.</p> <p><b>abr</b>—(Optional) Display routes to area border routers.</p> <p><b>asbr</b>—(Optional) Display routes to autonomous system border routers.</p> <p><b>extern</b>—(Optional) Display external routes.</p> <p><b>inter</b>—(Optional) Display interarea routes.</p> |

**intra**—(Optional) Display intra-area routes.

**instance** (**default** | **ipv4-multicast** | *instance-name*)—(Optional) Display entries for the default routing instance, the IPv4 multicast routing instance, or for the specified routing instance.

**logical-system** (**default** | **ipv4-multicast** | *logical-system-name*)—(Optional) Perform this operation on the default logical system, the IPv4 multicast logical system, or on a particular logical system.

**network**—(Optional) Display routes to networks.

**no-backup-coverage**—(Optional) Display routes with no backup coverage.

**realm** (**ipv4-multicast** | **ipv4-unicast** | **ipv6-multicast**)—(OSPFv3 only) (Optional) Display entries in the routing table for the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family for OSPFv3 other than IPv6 unicast, which is the default.

**router**—(Optional) Display routes to all routers.

**topology** (**default** | **ipv4-multicast** | *topology-name*)—(OSPFv2 only) (Optional) Display routes for the default OSPF topology, IPv4 multicast topology, or for a particular topology.

**transit**—(Optional) (OSPFv3 only) Display OSPFv3 routes to pseudonodes.

**Required Privilege Level**

**Output Fields**

[Table 349 on page 3313](#) list the output fields for the **show (ospf | ospf3) route** command. Output fields are listed in the approximate order in which they appear.

**Table 349: show (ospf | ospf3) route Output Fields**

| Field Name      | Field Description         | Output Level |
|-----------------|---------------------------|--------------|
| <b>Topology</b> | Name of the topology.     | All levels   |
| <b>Prefix</b>   | Destination of the route. | All levels   |

Table 349: show (ospf | ospf3) route Output Fields (*continued*)

| Field Name                | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | Output Level |

| <b>NH-addr</b>            | (OSPFv3 only) IPv6 address of the next hop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | All levels   |
| <b>NextHop Interface</b>  | (OSPFv2 only) Interface through which the route's next hop is reachable.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | All levels   |
| <b>Nexthop addr/label</b> | (OSPFv2 only) If the <b>NH Type</b> is <b>IP</b> , then it is the address of the next hop. If the <b>NH Type</b> is <b>LSP</b> , then it is the name of the label-switched path.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | All levels   |
| <b>Area</b>               | Area ID of the route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | detail       |
| <b>Origin</b>             | Router from which the route was learned.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | detail       |
| <b>Type 7</b>             | Route was learned through a not-so-stubby area (NSSA) link-state advertisement (LSA).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | detail       |
| <b>P-bit</b>              | Route was learned through NSSA LSA and the propagate bit was set.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | detail       |
| <b>Fwd NZ</b>             | Forwarding address is nonzero. <b>Fwd NZ</b> is only displayed if the route is learned through an NSSA LSA.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | detail       |

Table 349: show (ospf | ospf3) route Output Fields (*continued*)

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Output Level  |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|
| <b>optional-capability</b> | Optional capabilities propagated in the router LSA. This field is in the output for intra-area router routes only (when <b>Route Type</b> is <b>Area BR</b> , <b>AS BR</b> , <b>Area/AS BR</b> , or <b>Router</b> ), not for interarea router routes or network routes. Three bits in this field are defined as follows: <ul style="list-style-type: none"> <li>• <b>0x4 (V)</b>—Routing device is at the end of a virtual active link.</li> <li>• <b>0x2 (E)</b>—Routing device is an autonomous system boundary router.</li> <li>• <b>0x1 (B)</b>—Routing device is an area border router.</li> </ul> | <b>detail</b> |
| <b>priority</b>            | The priority assigned to the prefix: <ul style="list-style-type: none"> <li>• <b>high</b></li> <li>• <b>medium</b></li> <li>• <b>low</b></li> </ul> <p><b>NOTE:</b> The <b>priority</b> field applies only to routes of type <b>Network</b>.</p>                                                                                                                                                                                                                                                                                                                                                        | <b>detail</b> |

**Release Information**   Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.0 for EX Series switches.  
                              **advertising-router self (address | self)** option introduced in Junos OS Release 9.5.  
                              **advertising-router self (address | self)** option introduced in Junos OS Release 9.5 for EX Series switches.  
                              Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description**   Display the entries in the OSPF version 2 (OSPFv2) link-state database, which contains data about link-state advertisement (LSA) packets.

**Options**   **none**—Display standard information about entries in the OSPFv2 link-state database for all routing instances.

**brief | detail | extensive | summary**—(Optional) Display the specified level of output.

**advertising-router (address | self)**—(Optional) Display the LSAs advertised either by a particular routing device or by this routing device.

**area** *area-id*—(Optional) Display the LSAs in a particular area.

**asbrsummary**—(Optional) Display summary AS boundary router LSA entries.

**external**—(Optional) Display external LSAs.

**instance** *instance-name*—(Optional) Display all OSPF database information under the named routing instance.

**link-local**—(Optional) Display information about link-local LSAs.

**logical-system** (**all** | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

**lsa-id** *lsa-id*—(Optional) Display the LSA with the specified LSA identifier.

**netsummary**—(Optional) Display summary network LSAs.

**network**—(Optional) Display information about network LSAs.

**nssa**—(Optional) Display information about not-so-stubby area (NSSA) LSAs.

**opaque-area**—(Optional) Display opaque area-scope LSAs.

**router**—(Optional) Display information about router LSAs.

**Required Privilege Level**

**Output Fields**

[Table 351 on page 3323](#) describes the output fields for the **show ospf database** command. Output fields are listed in the approximate order in which they appear.

**Table 351: show ospf database Output Fields**

| Field Name     | Field Description                                                                                                                                        | Level of Output |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>area</b>    | Area number. Area 0.0.0.0 is the backbone area.                                                                                                          | All levels      |
| <b>Type</b>    | Type of link advertisement: <b>ASBRSum</b> , <b>Extern</b> , <b>Network</b> , <b>NSSA</b> , <b>OpaqArea</b> , <b>Router</b> , or <b>Summary</b> .        | All levels      |
| <b>ID</b>      | LSA identifier included in the advertisement. An asterisk preceding the identifier marks database entries that originated from the local routing device. | All levels      |
| <b>Adv Rtr</b> | Address of the routing device that sent the advertisement.                                                                                               | All levels      |

Table 351: show ospf database Output Fields (*continued*)

| Field Name                              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Level of Output         |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Seq</b>                              | Link sequence number of the advertisement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | All levels              |
| <b>Age</b>                              | Time elapsed since the LSA was originated, in seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | All levels              |
| <b>Opt</b>                              | Optional OSPF capabilities associated with the LSA.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | All levels              |
| <b>Cksum</b>                            | Checksum value of the LSA.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | All levels              |
| <b>Len</b>                              | Length of the advertisement, in bytes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | All levels              |

**advertising-router** (*address* | *self*)—(Optional) Display the LSAs advertised either by a particular routing device or by this routing device.

**area** *area-id*—(Optional) Display the LSAs in a particular area.

**external**—(Optional) Display external LSAs.

**instance** *instance-name*—(Optional) Display all OSPF database information under the named routing instance.

**inter-area-prefix**—(Optional) Display information about interarea-prefix LSAs.

**inter-area-router**—(Optional) Display information about interarea-router LSAs.

**intra-area-prefix**—(Optional) Display information about intra-area-prefix LSAs.

**link**—(Optional) Display information about link LSAs.

**link-local**—(Optional) Display information about link-local LSAs.

**logical-system** (*all* | *logical-system-name*)—(Optional) Perform this operation on all logical systems or on a particular logical system.

**lsa-id** *lsa-id*—(Optional) Display the LSA with the specified LSA identifier.

**network**—(Optional) Display information about network LSAs.

**nssa**—(Optional) Display information about not-so-stubby area (NSSA) LSAs.

**realm** (*ipv4-multicast* | *ipv4-unicast* | *ipv6-multicast*)—(Optional) Display information about the specified OSPFv3 realm, or address family. Use the **realm** option to specify an address family other than IPv6 unicast, which is the default.

**router**—(Optional) Display information about router LSAs.

## CHAPTER 57

# Overview

- [Layer 3 Protocols on page 3343](#)

## Layer 3 Protocols

- [Layer 3 Protocols Supported on EX Series Switches on page 3343](#)
- [Layer 3 Protocols Not Supported on EX Series Switches on page 3344](#)

## Layer 3 Protocols Supported on EX Series Switches

EX Series switches support the Junos OS Layer 3 features and configuration statements listed in [Table 314 on page 2939](#):

**Table 353: Supported Junos OS Layer 3 Protocol Statements and Features**

| Protocol           | Notes                                                                                                                                            | For More Information                                             |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------|
| BGP                | Fully supported.                                                                                                                                 | <a href="#">Junos OS Routing Protocols Configuration Guide</a>   |
| BFD                | Fully supported.                                                                                                                                 | <a href="#">Junos OS Routing Protocols Configuration Guide</a>   |
| ICMP               | Fully supported.                                                                                                                                 | <a href="#">Junos OS Routing Protocols Configuration Guide</a>   |
| IGMPv1, v2, and v3 | Fully supported.                                                                                                                                 | <a href="#">Junos OS Multicast Protocols Configuration Guide</a> |
| IS-IS              | Supported, with the exceptions noted in " <a href="#">Layer 3 Protocols Not Supported on EX Series Switches</a> " on <a href="#">page 2940</a> . | <a href="#">Junos OS Routing Protocols Configuration Guide</a>   |
| MLD                | Fully supported (MLD versions 1 and 2).                                                                                                          | <a href="#">Junos OS Multicast Protocols Configuration Guide</a> |
| MPLS               | Supported, with the exceptions noted in " <a href="#">Layer 3 Protocols Not Supported on EX Series Switches</a> " on <a href="#">page 2940</a> . | <a href="#">Junos OS MPLS Applications Configuration Guide</a>   |
| OSPFv1, v2 and v3  | Supported, with the exceptions noted in " <a href="#">Layer 3 Protocols Not Supported on EX Series Switches</a> " on <a href="#">page 2940</a> . | <a href="#">Junos OS Routing Protocols Configuration Guide</a>   |
| PIM                | Fully supported.                                                                                                                                 | <a href="#">Junos OS Multicast Protocols Configuration Guide</a> |

Table 353: Supported Junos OS Layer 3 Protocol Statements and Features (*continued*)

| Protocol | Notes                                                                                                | For More Information                                                                                                     |
|----------|------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------|
| PPM      | Supported. See <i>EX Series Switch Software Features Overview</i> for specific platform information. | <a href="#">Junos OS Routing Protocols Configuration Guide</a>                                                           |
| RIP      | Fully supported.                                                                                     | <a href="#">Junos OS Routing Protocols Configuration Guide</a>                                                           |
| RIPng    | Fully supported.                                                                                     | <a href="#">Junos OS Routing Protocols Configuration Guide</a>                                                           |
| SNMP     | Fully supported.                                                                                     | <a href="#">Junos OS Network Management Configuration Guide</a>                                                          |
| VRRP     | Fully supported.                                                                                     | See “Understanding VRRP on EX Series Switches” on page 2501. See also <a href="#">Junos OS High Availability Guide</a> . |

## Configuration Tasks

---

- [Configuring a RIP Network \(J-Web Procedure\) on page 3347](#)

### Configuring a RIP Network (J-Web Procedure)

NOTE: This topic applies only to the J-Web Application package.

You can use the J-Web interface to create RIP networks.

To configure a RIP network:

1. Select **Configure** > **Routing** > **RIP**.

NOTE: After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options** > **Commit**. See [Using the Commit Options to Commit Configuration Changes](#) for details about all commit options.

2. Click one of the following options:
  - **Add**—Configures a RIP instance. Enter information into the RIP Configuration page as described in [Table 355 on page 3348](#).
  - **Edit**—Modifies an existing RIP instance. Enter information into the configuration page for RIP as described in [Table 355 on page 3348](#).
  - **Delete**—Deletes an existing RIP instance.
4. To modify RIP global settings, click **Edit**. Enter information in the configuration as described in [Table 356 on page 3348](#).

Table 355: RIP Routing Configuration Summary

| Field                  | Function                                                                                                              | Your Action                                                                                                                                                                                                          |
|------------------------|-----------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>General tab</b>     |                                                                                                                       |                                                                                                                                                                                                                      |
| Routing instance name  | Specifies a name for the routing instance.                                                                            | Type or select and edit the name.                                                                                                                                                                                    |
| Preference             | Specifies the preference of external routes learned by RIP as compared to those learned from other routing protocols. | Type or select and edit the value.                                                                                                                                                                                   |
| Metric Out             | Specifies the metric value to add to routes transmitted to the neighbor.                                              | Type or select and edit the value.                                                                                                                                                                                   |
| Update interval        | Specifies an update time interval to periodically send out routes learned by RIP to neighbors.                        | Type or select and edit the value.                                                                                                                                                                                   |
| Route timeout          | Specifies the route timeout interval for RIP.                                                                         | Type or select and edit the value.                                                                                                                                                                                   |
| <b>Policies tab</b>    |                                                                                                                       |                                                                                                                                                                                                                      |
| Import Policy          | Applies one or more policies to routes being imported into the local routing device from the neighbors.               | <p>Click <b>Add</b> to add an import policy.</p> <p>Click <b>Move up</b> or <b>Move down</b> to move the selected policy up or down the list of policies.</p> <p>Click <b>Remove</b> to remove an import policy.</p> |
| Export Policy          | Applies a policy to routes being exported to the neighbors.                                                           | <p>Click <b>Add</b> to add an export policy.</p> <p>Click <b>Move up</b> or <b>Move down</b> to move the selected policy up or down the list of policies.</p> <p>Click <b>Remove</b> to remove an export policy.</p> |
| <b>Neighbors tab</b>   |                                                                                                                       |                                                                                                                                                                                                                      |
| RIP-Enabled Interfaces | Selects the interfaces to be associated with the RIP instance.                                                        | <p>To enable RIP on an interface, click the check box next to the interface name.</p> <p>Click Edit if you want to modify an interface's settings.</p>                                                               |

Table 356: Edit RIP Global Settings

| Field                 | Function                                                                                        | Your Action                        |
|-----------------------|-------------------------------------------------------------------------------------------------|------------------------------------|
| <b>General tab</b>    |                                                                                                 |                                    |
| Send                  | Specifies RIP send options.                                                                     | Select a value.                    |
| Receive               | Configure RIP receive options.                                                                  | Select a value.                    |
| Route timeout (sec)   | Specifies the route timeout interval for RIP.                                                   | Type a value.                      |
| Update interval (sec) | Specifies the update time interval to periodically send out routes learned by RIP to neighbors. | Type or select and edit the value. |

Table 356: Edit RIP Global Settings (*continued*)

| Field               | Function                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Your Action                                                                                                                                                                                                          |
|---------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Hold timeout (sec)  | Specifies the time period the expired route is retained in the routing table before being removed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | Type or select and edit the value.                                                                                                                                                                                   |
| Metric in           | Specifies the metric to add to incoming routes when advertising into RIP routes that were learned from other protocols.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Type or select and edit the value.                                                                                                                                                                                   |
| RIB Group           | Specifies a routing table group to install RIP routes into multiple routing tables.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Select and edit the name of the routing table group.                                                                                                                                                                 |
| Message size        | Specifies the number of route entries to be included in every RIP update message.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Type or select and edit the value.                                                                                                                                                                                   |
| Check Zero          | <p>Specifies whether the reserved fields in a RIP packet are zero. Options are:</p> <ul style="list-style-type: none"> <li>• <b>check-zero</b>—Discard version 1 packets that have nonzero values in the reserved fields and version 2 packets that have nonzero values in the fields that must be zero. This default behavior implements the RIP version 1 and version 2 specifications.</li> <li>• <b>no-check-zero</b>—Receive RIP version 1 packets with nonzero values in the reserved fields or RIP version 2 packets with nonzero values in the fields that must be zero. This is in spite of the fact that they are being sent in violation of the specifications in RFC 1058 and RFC 2453.</li> </ul> | Select a value.                                                                                                                                                                                                      |
| Graceful switchover | Configures graceful switchover for OSPF.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <p>To disable graceful restart, select <b>Disable</b>.</p> <p>Type or select and edit the estimated time for the restart to finish, in seconds.</p>                                                                  |
| Authentication Type | <p>Specifies the type of authentication for RIP route queries received on an interface. Options are:</p> <ul style="list-style-type: none"> <li>• None</li> <li>• MD5</li> <li>• Simple</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <p>Select the authentication type.</p> <p>Enter the authentication key for MD5.</p>                                                                                                                                  |

| <b>Description</b>              | <p>Disable strict sender address checks.</p> <p>If the sender of a RIP message does not belong to the subnet of the interface, the message is discarded. This situation might cause problems with dropped packets when RIP is running on point-to-point interfaces, or when the addresses on the interfaces do not fall in the same subnet. You can resolve this by disabling strict address checks on the RIP traffic.</p>                                                                                                                                |

| <b>Description</b>              | Configure the type of authentication for RIP route queries received on an interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Default</b>                  | If you do not include this statement and the <b>authentication-key</b> statement, RIP authentication is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>                  | <p><b>type</b>—Authentication type:</p> <ul style="list-style-type: none"> <li>• <b>md5</b>—Use the MD5 algorithm to create an encoded checksum of the packet. The encoded checksum is included in the transmitted packet. The receiving routing device uses the authentication key to verify the packet, discarding it if the digest does not match. This algorithm provides a more secure authentication scheme.</li> <li>• <b>none</b>—Disable authentication. If <b>none</b> is configured, the configured authentication key is ignored.</li> <li>• <b>simple</b>—Use a simple password. The password is included in the transmitted packet, which makes this method of authentication relatively insecure. The password can be from 1 through 16 contiguous letters or digits long.</li> </ul>                                                                                                                                       |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Description</b>         | Configure bidirectional failure detection timers and authentication.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>             | <p><b>authentication algorithm <i>algorithm-name</i></b>—Configure the algorithm used to authenticate the specified BFD session: <b>simple-password</b>, <b>keyed-md5</b>, <b>keyed-sha-1</b>, <b>meticulous-keyed-md5</b>, or <b>meticulous-keyed-sha-1</b>.</p> <p><b>authentication key-chain <i>key-chain-name</i></b>—Associate a security key with the specified BFD session using the name of the security keychain. The name you specify must match one of the keychains configured in the <b>authentication-key-chains key-chain</b> statement at the <b>[edit security]</b> hierarchy level.</p>                                                                                                                                                                                                                     |

**authentication loose-check**—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication is not configured at both ends of the BFD session.

**detection-time threshold *milliseconds***—Configure a threshold for the adaptation of the BFD session detection time. When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

**minimum-interval *milliseconds***—Configure the minimum interval after which the local routing device transmits a hello packet and then expects to receive a reply from the neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can specify the minimum transmit and receive intervals separately using the **transmit-interval minimum-interval** and **minimum-receive-interval** statements.

**Range:** 1 through 255,000 milliseconds

**minimum-receive-interval *milliseconds***—Configure the minimum interval after which the local routing device expects to receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum receive interval using the **minimum-interval** statement.

**Range:** 1 through 255,000 milliseconds

**multiplier *number***—Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

**Range:** 1 through 255

**Default:** 3

**no-adaptation**—Configure BFD sessions not to adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

**transmit-interval threshold *milliseconds***—Configure the threshold for the adaptation of the BFD session transmit interval. When the transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent. The interval threshold must be greater than the minimum transmit interval.

**Range:** 0 through 4,294,967,295 ( $2^{32} - 1$ )

**transmit-interval minimum-interval *milliseconds***—Configure a minimum interval after which the local routing device transmits hello packets to a neighbor. Optionally, instead of using this statement, you can configure the minimum transmit interval using the **minimum-interval** statement.

**Range:** 1 through 255,000

**version**—Configure the BFD version to detect: **1** (BFD version 1) or **automatic** (autodetect the BFD version).

**Default:** automatic

|                           |                                                             |
|---------------------------|-------------------------------------------------------------|
| <b>Required Privilege</b> | routing—To view this statement in the configuration.        |
| <b>Level</b>              | routing-control—To add this statement to the configuration. |

| <b>Description</b>              | <p>Some of the reserved fields in RIP version 1 packets must be zero, whereas in RIP version 2 packets, most of these reserved fields can contain nonzero values. By default, RIP discards version 1 packets that have nonzero values in the reserved fields and version 2 packets that have nonzero values in the fields that must be zero. This default behavior implements the RIP version 1 and version 2 specifications.</p> <p>If you find that you are receiving RIP version 1 packets with nonzero values in the reserved fields or RIP version 2 packets with nonzero values in the fields that must be zero, you can configure RIP to receive these packets even though they are being sent in violation of the specifications in RFC 1058 and RFC 2453.</p> <p>Check whether the reserved fields in a RIP packet are zero:</p> <ul style="list-style-type: none"> <li>• <b>check-zero</b>—Discard version 1 packets that have nonzero values in the reserved fields and version 2 packets that have nonzero values in the fields that must be zero. This default behavior implements the RIP version 1 and version 2 specifications.</li> <li>• <b>no-check-zero</b>—Receive RIP version 1 packets with nonzero values in the reserved fields or RIP version 2 packets with nonzero values in the fields that must be zero. This is in spite of the fact that they are being sent in violation of the specifications in RFC 1058 and RFC 2453.</li> </ul> |
| <b>Default</b>                  | check-zero                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Description</b>              | Specify the metric to add to incoming routes when the routing device advertises into RIP routes that were learned from other protocols. Use this statement to configure the routing device to prefer RIP routes learned through a specific neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>              | <p>Specify the metric value to add to routes transmitted to the neighbor. Use this statement to control how other routing devices prefer RIP routes sent from this neighbor.</p> <p>If you have included the <b>export</b> statement, RIP exports routes it has learned to the neighbors configured by including the <b>neighbor</b> statement.</p> <p>The metric associated with a RIP route (unless modified by an export policy) is the normal RIP metric. For example, a RIP route with a metric of 5 learned from a neighbor configured with a <b>metric-in</b> value of 2 is advertised with a combined metric of 7 when advertised to RIP neighbors in the same group. However, if this route was learned from a RIP neighbor in a different group or from a different protocol, the route is advertised with the metric value configured for that group with the <b>metric-out</b> statement.</p> <p>The metric for a route can be modified with an export policy. That metric is seen when the route is exported to the next hop.</p> <p>To increase the metric for routes advertised outside a group, include the <b>metric-out</b> statement.</p> |

**Release Information** Statement introduced before Junos OS Release 7.4.  
     Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Configure neighbor-specific RIP parameters, thereby overriding the defaults set for the routing device.

**Options** *neighbor-name*—Name of an interface over which a routing device communicates to its neighbors.

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

---

## preference (Protocols RIP)

---

**Syntax** `preference preference;`

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols rip **group** *group-name*],  
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols  
rip **group** *group-name*],  
[edit protocols rip **group** *group-name*],  
[edit routing-instances *routing-instance-name* protocols rip **group** *group-name*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Specify the preference of external routes learned by RIP as compared to those learned from other routing protocols.

By default, Junos OS assigns a preference of 100 to routes that originate from RIP. When Junos OS determines a route's preference to become the active route, the software selects the route with the lowest preference and installs this route into the forwarding table.

**Options** *preference*—Preference value. A lower value indicates a more preferred route.  
**Range:** 0 through 4,294,967,295 ( $2^{32} - 1$ )  
**Default:** 100

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>              | Configure the route timeout interval for RIP. If a route is not refreshed after being installed in the routing table by the specified timeout interval, the route is marked as invalid and is removed from the routing table after the hold-down period expires.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Description</b>         | Set RIP protocol-level tracing options.                                                                                                                                                                                                                                                                                                                 |

**NOTE:** The `traceoptions` statement is not supported on QFabric systems.

**Default** The default RIP protocol-level trace options are inherited from the global `traceoptions` statement.

**Options** **disable**—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

**file *filename***—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. We recommend that you place RIP tracing output in the file `/var/log/rip-log`.

**files *number***—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

**Range:** 2 through 1000 files

**Default:** 10 files

**flag *flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements.

### RIP Tracing Options

- **auth**—RIP authentication
- **error**—RIP error packets

- **expiration**—RIP route expiration processing
- **holddown**—RIP hold-down processing
- **nsr-synchronization**—Nonstop routing synchronization events
- **packets**—All RIP packets
- **request**—RIP information packets such as request, poll, and poll entry packets
- **trigger**—RIP triggered updates
- **update**—RIP update packets

#### Global Tracing Options

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information.
- **receive**—Trace the packets being received.
- **receive-detail**—Provide detailed trace information for packets being received.
- **send**—Trace the packets being transmitted.
- **send-detail**—Provide detailed trace information for packets being transmitted.

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 128 KB

**world-readable**—(Optional) Allow any user to read the log file.

| <b>Description</b>              | Configure the interval at which routes learned by RIP are sent to neighbors. This timer controls the interval between routing updates. This timer is set to 30 seconds, by default, with a small random amount of time added when the timer is reset. This added time prevents congestion that can happen if all routing devices update their neighbors simultaneously.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Description</b>              | <p>Apply a policy or list of policies to routes being exported to the neighbors.</p> <p>By default, RIPng does not export routes it has learned to its neighbors. To have RIPng export routes, apply one or more export policies. To apply export policies and to filter routes being exported from the local routing device to its neighbors, include the <b>export</b> statement and list the name of the policy to be evaluated.</p> <p>You can define one or more export policies. If no routes match the policies, the local routing device does not export any routes to its neighbors. Export policies override any metric values determined through calculations involving the values configured with the <b>metric-in</b> and <b>metric-out</b> statements.</p> |
| <b>Options</b>                  | <i>policy-names</i> —Name of one or more policies.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Description</b>              | Specify the metric to add to incoming routes when advertising into RIPng routes that were learned from other protocols. Use this statement to configure the routing device to prefer RIPng routes learned through a specific neighbor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Description</b>              | <p>Specify the metric value to add to routes transmitted to the neighbor. Use this statement to control how other routing devices prefer RIPng routes sent from this neighbor.</p> <p>When an export policy is configured, RIPng exports all learned routes to neighbors configured with the <b>neighbor</b> statement.</p> <p>If a route being exported was learned from a member of the same RIPng group, the metric associated with that route (unless modified by an export policy) is the normal RIPng metric. For example, a RIPng route with a metric of 5 learned from a neighbor configured with a <b>metric-in</b> value of 2 is advertised with a combined metric of 7 when advertised to RIPng neighbors in the same group. However, if this route was learned from a RIPng neighbor in a different group or from a different protocol, the route is advertised with the metric value configured for that group with the <b>metric-out</b> statement. The default value for <b>metric-out</b> is 1.</p> <p>To modify the metric for routes advertised outside a group, include the <b>metric-out</b> statement.</p> |
| <b>Options</b>                  | <p><b><i>metric</i></b>—Metric value.</p> <p><b>Range:</b> 1 through 16</p> <p><b>Default:</b> 1</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Description</b>              | <p>Specify the preference of external routes learned by RIPng as compared to those learned from other routing protocols.</p> <p>By default, Junos OS assigns a preference of 100 to routes that originate from RIPng. When Junos OS determines that a route is to become the active route, the software selects the route with the lowest preference and installs this route into the forwarding table.</p> <p>To modify the default RIPng preference value, include the <b>preference</b> statement.</p> |
| <b>Options</b>                  | <p><b>preference</b>—Preference value. A lower value indicates a more preferred route.</p> <p><b>Range:</b> 0 through 4,294,967,295 (<math>2^{32} - 1</math>)</p> <p><b>Default:</b> 100</p>                                                                                                                                                                                                                                                                                                              |

| <b>Description</b>         | Set RIPng protocol-level tracing options.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Default</b>             | The default RIPng protocol-level trace options are inherited from the global <b>traceoptions</b> statement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>             | <p><b>disable</b>—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. We recommend that you place RIPng tracing output in the file <code>/var/log/ripng-log</code>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b><i>trace-file</i></b> reaches its maximum size, it is renamed <b><i>trace-file.0</i></b>, then <b><i>trace-file.1</i></b>, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum number of files, you must also specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 10 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <p><b>RIPng Tracing Options</b></p> <ul style="list-style-type: none"> <li><b>error</b>—RIPng error packets</li> <li><b>expiration</b>—RIPng route expiration processing</li> <li><b>holddown</b>—RIPng hold-down processing</li> <li><b>nsr-synchronization</b>—Nonstop routing synchronization events</li> <li><b>packets</b>—All RIPng packets</li> </ul> |

- **request**—RIPng information packets such as request, poll, and poll entry packets
- **trigger**—RIPng triggered updates
- **update**—RIPng update packets

#### Global Tracing Options

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information.
- **receive**—Trace the packets being received.
- **receive-detail**—Provide detailed trace information for packets being received.
- **send**—Trace the packets being transmitted.
- **send-detail**—Provide detailed trace information for packets being transmitted.

**no-world-readable**—(Optional) Do not allow any user to read the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 128 KB

**world-readable**—(Optional) Allow any user to read the log file.

## Routine Monitoring

- [Monitoring RIP Routing Information on page 3393](#)

### Monitoring RIP Routing Information

Purpose

NOTE: This topic applies only to the J-Web Application package.

Use the monitoring functionality to monitor RIP routing on routing devices.

Action

To view RIP routing information in the J-Web interface, select **Monitor > Routing > RIP Information**.

To view RIP routing information in the CLI, enter the following CLI commands:

- `show rip statistics`
- `show rip neighbor`

Meaning

[Table 357 on page 3393](#) summarizes key output fields in the RIP routing display in the J-Web interface.

Table 357: Summary of Key RIP Routing Output Fields

| Field          | Values                            | Additional Information |
|----------------|-----------------------------------|------------------------|
| RIP Statistics |                                   |                        |
| Protocol Name  | The RIP protocol name.            |                        |
| Port number    | The port on which RIP is enabled. |                        |

Table 357: Summary of Key RIP Routing Output Fields (*continued*)

| Field                    | Values                                                                                 | Additional Information                                                                                                |
|--------------------------|----------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| Hold down time           | The interval during which routes are neither advertised nor updated.                   |                                                                                                                       |
| Global routes learned    | Number of RIP routes learned on the logical interface.                                 |                                                                                                                       |
| Global routes held down  | Number of RIP routes that are not advertised or updated during the hold-down interval. |                                                                                                                       |
| Global request dropped   | Number of requests dropped.                                                            |                                                                                                                       |
| Global responses dropped | Number of responses dropped.                                                           |                                                                                                                       |
| <b>RIP Neighbors</b>     |                                                                                        |                                                                                                                       |
| Neighbor                 | Name of the RIP neighbor.                                                              | This value is the name of the interface on which RIP is enabled. Click the name to see the details for this neighbor. |
| State                    | State of the RIP connection: <b>Up</b> or <b>Dn</b> (Down).                            |                                                                                                                       |
| Source Address           | Local source address.                                                                  | This value is the configured address of the interface on which RIP is enabled.                                        |
| Destination Address      | Destination address.                                                                   | This value is the configured address of the immediate RIP adjacency.                                                  |
| Send Mode                | The mode of sending RIP messages.                                                      |                                                                                                                       |
| Receive Mode             | The mode in which messages are received.                                               |                                                                                                                       |
| In Metric                | Value of the incoming metric configured for the RIP neighbor.                          |                                                                                                                       |

| <b>Output Fields</b>                              | <a href="#">Table 359 on page 3400</a> lists the output fields for the <b>show rip neighbor</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                              |

Table 359: show rip neighbor Output Fields

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Neighbor</b>            | Name of the RIP neighbor.<br><br><b>NOTE:</b> Beginning with Junos OS Release 11.1, when you configure demand circuits, the output displays a demand circuit (DC) flag next to neighbor interfaces configured for demand circuits.<br><br>If you configure demand circuits at the <b>[edit protocols rip group group-name neighbor neighbor-name]</b> hierarchy level, the output shows only the neighboring interface that you specifically configured as a demand circuit. If you configure demand circuits at the <b>[edit protocols rip group group-name]</b> hierarchy level, all of the interfaces in the group are configured as demand circuits. Therefore, the output shows all of the interfaces in that group as demand circuits. |
| <b>State</b>               | State of the connection: <b>Up</b> or <b>Dn</b> (Down).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Source Address</b>      | Address of the port on the local router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Output Fields</b>             | Table 361 on page 3406 lists the output fields for the <b>show ripng general-statistics</b> command. Output fields are listed in the approximate order in which they appear.                 |

**Table 361: show ripng general-statistics Output Fields**

| Field Name  | Field Description                                      |
|-------------|--------------------------------------------------------|
| bad msgs    | Number of invalid messages received.                   |
| no rcv intf | Number of packets received with no matching interface. |
| curr memory | Amount of memory currently used by RIPng.              |
| max memory  | Most memory used by RIPng.                             |

## Sample Output

### show ripng general-statistics

```

user@host> show ripng general-statistics
RIPng I/O info:
  bad msgs      :      0
  no rcv intf   :      0

```

```
curr memory : 0
max memory  : 0
```

## show ripng neighbor

Output fields are listed in the approximate order in which they appear.                                                                                                                                               |

**Table 362: show ripng neighbor Output Fields**

| Field Name                 | Field Description                                                                                          |
|----------------------------|------------------------------------------------------------------------------------------------------------|
| <b>Neighbor</b>            | Name of RIPng neighbor.                                                                                    |
| <b>State</b>               | State of the connection: <b>Up</b> or <b>Dn</b> (Down).                                                    |
| <b>Source Address</b>      | Source address.                                                                                            |
| <b>Destination Address</b> | Destination address.                                                                                       |
| <b>Send</b>                | Send options: <b>broadcast</b> , <b>multicast</b> , <b>none</b> , <b>version 1</b> , or <b>yes</b> .       |
| <b>Recv</b>                | Type of packets to accept: <b>both</b> , <b>none</b> , <b>version 1</b> , or <b>yes</b> .                  |
| <b>In Met</b>              | Metric added to incoming routes when advertising into RIPng routes that were learned from other protocols. |

## Sample Output

show ripng neighbor

```
user@host> show ripng neighbor
```

| Neighbor   | State | Source<br>Address        | Dest<br>Address | Send  | Recv  | In<br>Met |
|------------|-------|--------------------------|-----------------|-------|-------|-----------|
| -----      | ----- | -----                    | -----           | ----- | ----- | -----     |
| fe-0/0/2.0 | Up    | fe80::290:69ff:fe68:b002 | ff02::9         | yes   | yes   | 1         |

## show ripng statistics

### Understanding Distributed Periodic Packet Management on EX Series Switches

Periodic packet management (PPM) is responsible for processing a variety of time-sensitive periodic tasks for particular processes so that other processes on the Juniper Networks EX Series Ethernet Switch can more optimally direct their resources. PPM is responsible for the periodic transmission of packets on behalf of its various client processes, which include the processes that control the Link Aggregation Control Protocol (LACP) and Bidirectional Forwarding Detection (BFD) protocols, and also for receiving packets on behalf of these client processes. PPM also gathers some statistics and sends process-specific packets. PPM cannot be disabled and is always running on any operational switch.

The responsibility for PPM processing on the switch is distributed between the Routing Engine and either the access interfaces (on EX3200, EX4200, and EX4500 switches) or the line cards (on EX6200 and EX8200 switches) for all protocols that use PPM by default. This distributed model provides a faster response time for protocols that use PPM than the response time provided by the nondistributed model.

If distributed PPM is disabled, the PPM process runs on the Routing Engine only.

You can disable distributed PPM for all protocols that use PPM. You can also disable distributed PPM for LACP packets only.

**BEST PRACTICE:** We recommend that, generally, you disable distributed PPM only if Juniper Networks Customer Service advises you to do so. You should disable distributed PPM only if you have a compelling reason to disable it.

## Configuring Static Routing (CLI Procedure)

Static routes are routes that are manually configured and entered into the routing table. Dynamic routes, in contrast, are learned by the EX Series switch and added to the routing table using a protocol such as OSPF or RIP.

The switch uses static routes:

- When the switch does not have a route to a destination that has a better (lower) *preference* value. The preference is an arbitrary value in the range from 0 through 255 that the software uses to rank routes received from different protocols, interfaces, or remote systems. The routing protocol process generally determines the active route by selecting the route with the lowest preference value. In the given range, **0** is the lowest and **255** is the highest.
- When the switch cannot determine the route to a destination.
- When the switch is forwarding unroutable packets.

To configure basic static route options using the CLI:

- To configure the switch's default gateway:

```
[edit]
user@switch# set routing-options static route 0.0.0.0/0 next-hop 10.0.1.1
```

- To configure a static route and specify the next address to be used when routing traffic to the static route:

```
[edit]
user@switch# set routing-options static route 20.0.0.0/24 next-hop 10.0.0.2.1
```

- To always keep the static route in the forwarding table:

```
[edit]
user@switch# set routing-options static route 20.0.0.0/24 retain
```

- To prevent the static route from being readvertised:

```
[edit]
user@switch# set routing-options static route 20.0.0.0/24 no-readvertise
```

- To remove inactive routes from the forwarding table:

```
[edit]
user@switch# set routing-options static route 20.0.0.0/24 active
```

## Configuring Static Routing (J-Web Procedure)

You can use the J-Web interface to configure static routes for EX Series switches.

To configure static routes:

1. Select **Configure > Routing > Static Routing**. The Static Routing page displays details of the configured routes.

**NOTE:** After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See [Using the Commit Options to Commit Configuration Changes](#) for details about all commit options.

2. Click one of the following options:

- **Add**—To configure a route. Enter information into the routing page as described in [Table 366 on page 3423](#).
- **Edit**—To modify an existing route. Enter information into the routing page as described in [Table 366 on page 3423](#).
- **Delete**—To delete an existing route.

**Table 366: Static Routing Configuration Summary**

| Field                | Function                                                                                                                      | Your Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

## Configuring Distributed Periodic Packet Management on an EX Series Switch (CLI Procedure)

Periodic packet management (PPM) is responsible for processing a variety of time-sensitive periodic tasks so that other processes on the EX Series switch can more optimally direct their resources.

The responsibility for PPM processing on the switch is distributed between the Routing Engine and either the access interfaces (on EX3200, EX4200, and EX4500 switches) or the line cards (on EX6200 and EX8200 switches) for all protocols that use PPM by default. This distributed model provides a faster response time for protocols that use PPM than the response time provided by the nondistributed model.

If distributed PPM is disabled, the PPM process runs on the Routing Engine only.

You can disable distributed PPM for all protocols that use PPM. You can also disable distributed PPM for LACP packets only.

**BEST PRACTICE:** We recommend that, generally, you disable distributed PPM only if Juniper Networks Customer Service advises you to do so. You should disable distributed PPM only if you have a compelling reason to disable it.

This topic describes:

- [Disabling or Enabling Distributed Periodic Packet Management Globally on page 3425](#)
- [Disabling or Enabling Distributed Periodic Packet Management for LACP Packets on page 3425](#)

### Disabling or Enabling Distributed Periodic Packet Management Globally

Distributed PPM is enabled by default. Disable distributed PPM if you need to move all PPM processing to the Routing Engine. Enable distributed PPM if it was previously disabled and you need to run distributed PPM.

To disable distributed PPM:

```
[edit routing-options]
user@switch# set ppm no-delegate-processing
```

To enable distributed PPM if it was previously disabled:

```
[edit routing-options]
user@switch# delete ppm no-delegate-processing
```

### Disabling or Enabling Distributed Periodic Packet Management for LACP Packets

Distributed PPM is enabled by default. Disable distributed PPM for only LACP packets if you need to move all PPM processing for LACP packets to the Routing Engine.

To disable distributed PPM for LACP packets:

```
[edit protocols]
user@switch# set lacp ppm centralized
```

To enable distributed PPM for LACP packets if it was previously disabled:

```
[edit protocols]
user@switch# delete lacp ppm centralized
```

| <b>Description</b>              | <p>Determine whether static, aggregate, or generated routes are removed from the routing and forwarding tables when they become inactive. Static routes are only removed from the routing table if the next hop becomes unreachable. This can occur if the local or neighbor interface goes down. Routes that have been configured to remain continually installed in the routing and forwarding tables are marked with <b>reject</b> next hops when they are inactive.</p> <ul style="list-style-type: none"> <li>• <b>active</b>—Remove a route from the routing and forwarding tables when it becomes inactive.</li> <li>• <b>passive</b>—Have a route remain continually installed in the routing and forwarding tables even when it becomes inactive.</li> </ul> <p>Include the <b>active</b> statement when configuring an individual route in the <b>route</b> portion of the <b>static</b> statement to override a <b>passive</b> option specified in the <b>defaults</b> portion of the statement.</p>                                                                                                                                                                                                                                                                                                                                        |

| Description         | Configure aggregate routes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Options             | <p><b>aggregate-options</b>—Additional information about aggregate routes that is included with the route when it is installed in the routing table. Specify zero or more of the following options in <b>aggregate-options</b>. Each option is explained separately.</p> <ul style="list-style-type: none"><li>• (<b>active</b>   <b>passive</b>);</li><li>• <b>as-path</b> &lt;<i>as-path</i>&gt; &lt;origin (egp   igp   incomplete)&gt; &lt;atomic-aggregate&gt; &lt;aggregator <i>as-number</i> <i>ip-address</i>&gt;;</li><li>• (<b>brief</b>   <b>full</b>);</li><li>• <b>community</b> [ <i>community-ids</i> ];</li><li>• <b>discard</b>;</li><li>• (<b>metric</b>   <b>metric2</b>   <b>metric3</b>   <b>metric4</b>) <i>value</i> &lt;type <i>type</i>&gt;;</li><li>• (<b>preference</b>   <b>preference2</b>   <b>color</b>   <b>color2</b>) <i>preference</i> &lt;type <i>type</i>&gt;;</li><li>• <b>tag</b> <i>metric type number</i>;</li></ul> <p><b>defaults</b>—Specify global aggregate route options. These options only set default attributes inherited by all newly created aggregate routes. These are treated as global defaults</p> |

and apply to all the aggregate routes you configure in the **aggregate** statement. This part of the **aggregate** statement is optional.

**route *destination-prefix***—Configure a nondefault aggregate route:

- **default**—For the default route to the destination. This is equivalent to specifying an IP address of **0.0.0.0/0**.
- ***destination-prefix/prefix-length***—***destination-prefix*** is the network portion of the IP address, and ***prefix-length*** is the destination prefix length.

The **policy** statement is explained separately.

| <b>Description</b>         | <p>Associate BGP autonomous system (AS) path information with a static, aggregate, or generated route.</p> <p>In Junos OS Release 9.1 and later, the numeric range for the AS number is extended to provide BGP support for 4-byte AS numbers as defined in RFC 4893, <i>BGP Support for Four-octet AS Number Space</i>. RFC 4893 introduces two new optional transitive BGP attributes, AS4_PATH and AS4_AGGREGATOR. These new attributes are used to propagate 4-byte AS path information across BGP speakers that do not support 4-byte AS numbers. RFC 4893 also introduces a reserved, well-known, 2-byte AS number, AS 23456. This reserved AS number is called AS_TRANS in RFC 4893. All releases of Junos OS support 2-byte AS numbers.</p> <p>In Junos OS Release 9.2 and later, you can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: <i>&lt;16-bit high-order value in decimal&gt;.&lt;16-bit low-order value in decimal&gt;</i>. For example, the 4-byte AS number of 65,546 in plain-number format is represented as 1.10 in the AS-dot notation format. You can specify a value in the range from 0.0 through 65535.65535 in AS-dot notation format.</p>                                                                                                                  |
| <b>Default</b>             | No AS path information is associated with static routes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>             | <p><b>aggregator</b>—(Optional) Attach the BGP <b>aggregator</b> path attribute to the aggregate route. You must specify the last AS number that formed the aggregate route (encoded as two octets) for <b>as-number</b>, followed by the IP address of the BGP system that formed the aggregate route for <b>ip-address</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**as-path**—(Optional) AS path to include with the route. It can include a combination of individual AS path numbers and AS sets. Enclose sets in brackets ( [ ] ). The first AS number in the path represents the AS immediately adjacent to the local AS. Each subsequent number represents an AS that is progressively farther from the local AS, heading toward the origin of the path. You cannot specify a regular expression for **as-path**. You must use a complete, valid AS path.

**atomic-aggregate**—(Optional) Attach the BGP **atomic-aggregate** path attribute to the aggregate route. This path attribute indicates that the local system selected a less specific route instead of a more specific route.

**origin egp**—(Optional) BGP origin attribute that indicates that the path information originated in another AS.

**origin igp**—(Optional) BGP origin attribute that indicates that the path information originated within the local AS.

**origin incomplete**—(Optional) BGP origin attribute that indicates that the path information was learned by some other means.

| <b>Description</b>         | Specify the routing device's AS number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

An autonomous system (AS) is a set of routing devices that are under a single technical administration and that generally use a single interior gateway protocol (IGP) and metrics to propagate routing information within the set of routing devices. An AS appears to other ASs to have a single, coherent interior routing plan and presents a consistent picture of what destinations are reachable through it. ASs are identified by a number that is assigned by the Network Information Center (NIC) in the United States (<http://www.isi.edu>).

If you are using BGP on the routing device, you must configure an AS number.

The AS path attribute is modified when a route is advertised to an EBGP peer. Each time a route is advertised to an EBGP peer, the local routing device prepends its AS number to the existing path attribute, and a value of 1 is added to the AS number.

In Junos OS Release 9.1 and later, the numeric range is extended to provide BGP support for 4-byte AS numbers as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*. RFC 4893 introduces two new optional transitive BGP attributes, AS4\_PATH and AS4\_AGGREGATOR. These new attributes are used to propagate 4-byte AS path information across BGP speakers that do not support 4-byte AS numbers. RFC 4893 also introduces a reserved, well-known, 2-byte AS number, AS 23456. This reserved AS number is called AS\_TRANS in RFC 4893. All releases of Junos OS support 2-byte AS numbers.

In Junos OS Release 9.3 and later, you can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: *<16-bit high-order value in decimal>.<16-bit low-order value in decimal>*. For example, the 4-byte AS number of 65,546 in plain-number format is represented as 1.10 in the AS-dot notation format.

**Options**    ***autonomous-system***—AS number. Use a number assigned to you by the NIC.

**Range:** 1 through 4,294,967,295 ( $2^{32} - 1$ ) in plain-number format for 4-byte AS numbers

In this example, the 4-byte AS number 65,546 is represented in plain-number format:

```
[edit]
routing-options {
  autonomous-system 65546;
}
```

**Range:** 0.0 through 65535.65535 in AS-dot notation format for 4-byte numbers

In this example, 1.10 is the AS-dot notation format for 65,546:

```
[edit]
routing-options {
  autonomous-system 1.10;
}
```

**Range:** 1 through 65,535 in plain-number format for 2-byte AS numbers (this is a subset of the 4-byte range)

In this example, the 2-byte AS number 60,000 is represented in plain-number format:

```
[edit]
routing-options {
  autonomous-system 60000;
}
```

**asdot-notation**—(Optional) Display the configured 4-byte autonomous system number in the AS-dot notation format.

**Default:** Even if a 4-byte AS number is configured in the AS-dot notation format, the default is to display the AS number in the plain-number format.

**loops number**—(Optional) Specify the number of times detection of the AS number in the AS\_PATH attribute causes the route to be discarded or hidden. For example, if you configure **loops 1**, the route is hidden if the AS number is detected in the path one or more times. This is the default behavior. If you configure **loops 2**, the route is hidden if the AS number is detected in the path two or more times.

**Range:** 1 through 10

**Default:** 1

**NOTE:** When you specify the same AS number in more than one routing instance on the local routing device, you must configure the same number of loops for the AS number in each instance. For example, if you configure a value of 3 for the loops statement in a VRF routing instance that uses the same AS number as that of the master instance, you must also configure a value of 3 loops for the AS number in the master instance.

Use the **independent-domain** option if the loops statement must be enabled only on a subset of routing instances.

The remaining statement is explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## backup-pe-group

---

**Syntax** `backup-pe-group group-name {  
    backups [ addresses ];  
    local-address address;  
}`

**Hierarchy Level** [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options multicast],  
[edit logical-systems *logical-system-name* routing-options multicast],  
[edit routing-instances *routing-instance-name* routing-options multicast],  
[edit routing-options multicast]

**Release Information** Statement introduced in Junos OS Release 9.0.  
Statement introduced in Junos OS Release 9.5 for EX Series switches.  
Statement introduced in Junos OS Release 11.3 for the QFX Series.  
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

**Description** Configure a backup provider edge (PE) group for ingress PE redundancy when point-to-multipoint label-switched paths (LSPs) are used for multicast distribution.

**Options** **backups *addresses***—Specify the address of backup PE routers for ingress PE redundancy when point-to-multipoint LSPs are used for multicast distribution.

**local-address *address***—Specify the address of the local PE router for ingress PE redundancy when point-to-multipoint LSPs are used for multicast distribution.

**pe-group-name**—Specify the name for the group of PE routers that provide ingress PE router redundancy for point-to-multipoint LSPs.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## bfd-liveness-detection (Routing Options Static Route)

**Syntax**

```

bfd-liveness-detection {
    authentication {
        algorithm algorithm-name;
        key-chain key-chain-name;
        loose-check;
    }
    detection-time {
        threshold milliseconds;
    }
    holddown-interval milliseconds;
    local-address ip-address;
    minimum-interval milliseconds;
    minimum-receive-interval milliseconds;
    minimum-receive-ttl number;
    multiplier number;
    neighbor address;
    no-adaptation;
    transmit-interval {
        minimum-interval milliseconds;
        threshold milliseconds;
    }
    version (1 | automatic);
}

```

**Hierarchy Level**

```

[edit routing-options static route destination-prefix],

```

[edit routing-options static route *destination-prefix* qualified-next-hop (*interface-name* | *address*)]

- Release Information** Statement introduced before Junos OS Release 7.4.  
**detection-time threshold** and **transmit-interval threshold** options introduced in Junos OS Release 8.2.  
**local-address** statement introduced in Junos OS Release 8.2.  
**minimum-receive-ttl** statement introduced in Junos OS Release 8.2.  
Support for logical routers introduced in Junos OS Release 8.3.  
**holddown-interval** statement introduced in Junos OS Release 8.5.  
**no-adaptation** statement introduced in Junos OS Release 9.0.  
Support for IPv6 static routes introduced in Junos OS Release 9.1.  
**authentication algorithm**, **authentication key-chain**, and **authentication loose-check** statements introduced in Junos OS Release 9.6.  
Statement introduced in Junos OS Release 12.1 for the QFX Series.  
Statement introduced in Junos OS Release 12.3 for ACX Series routers.
- Description** Configure bidirectional failure detection timers and authentication criteria for static routes.

**Options** **authentication algorithm** *algorithm-name*—Configure the algorithm used to authenticate the specified BFD session: **simple-password**, **keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, or **meticulous-keyed-sha-1**.

**authentication key-chain** *key-chain-name*—Associate a security key with the specified BFD session using the name of the security keychain. The name you specify must match one of the keychains configured in the **authentication-key-chains key-chain** statement at the **[edit security]** hierarchy level.

**authentication loose-check**—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication may not be configured at both ends of the BFD session.

**detection-time threshold** *milliseconds*—Configure a threshold for the adaptation of the BFD session detection time. When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

**holddown-interval** *milliseconds*—Configure an interval specifying how long a BFD session must remain up before a state change notification is sent. If the BFD session goes down and then comes back up during the hold-down interval, the timer is restarted.

**Range:** 0 through 255,000

**Default:** 0

**local-address** *ip-address*—Enable a multihop BFD session and configure the source address for the BFD session.

**minimum-interval** *milliseconds*—Configure the minimum interval after which the local routing device transmits a hello packet and then expects to receive a reply from the neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum transmit and receive intervals separately using the **transmit-interval**, **minimum-interval**, and **minimum-receive-interval** statements.

**Range:** 1 through 255,000

**minimum-receive-interval** *milliseconds*—Configure the minimum interval after which the routing device expects to receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum receive interval using the **minimum-interval** statement at the **[edit routing-options static route destination-prefix bfd-liveness-detection]** hierarchy level.

**Range:** 1 through 255,000

**minimum-receive-ttl** *number*—Configure the time to live (TTL) for the multihop BFD session.

**Range:** 1 through 255

**Default:** 255

**multiplier** *number*—Configure number of hello packets not received by the neighbor that causes the originating interface to be declared down.

**Range:** 1 through 255

**Default:** 3

**neighbor address**—Configure a next-hop address for the BFD session for a next hop specified as an interface name.

**no-adaptation**—Specify for BFD sessions not to adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

**transmit-interval threshold milliseconds**—Configure the threshold for the adaptation of the BFD session transmit interval. When the transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent. The interval threshold must be greater than the minimum transmit interval.

**Range:** 0 through 4,294,967,295

**transmit-interval minimum-interval milliseconds**—Configure the minimum interval at which the routing device transmits hello packets to a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum transmit interval using the **minimum-interval** statement at the **[edit routing-options static route destination-prefix bfd-liveness-detection]** hierarchy level.

**Range:** 1 through 255,000

**version**—Configure the BFD version to detect: **1** (BFD version 1) or **automatic** (autodetect the BFD version).

**Default:** automatic

**Release Information** Statement introduced in Junos OS Release 9.5.  
Statement introduced in Junos OS Release 9.5 for EX Series switches.  
Statement introduced in Junos OS Release 12.3 for ACX Series routers.  
Support for BMP version 3 introduced in Junos OS Release 13.3.

**Description** Configure the BGP Monitoring Protocol (BMP), which enables the routing device to collect data from the BGP Adjacency-RIB-In routing tables and periodically send that data to a monitoring station.

**Options** The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

**Related Documentation**

- *Example: Configuring the BGP Monitoring Protocol*

## brief

| <b>Description</b>              | <p>Disable distributed periodic packet management (PPM) processing for Link Aggregation Control Protocol (LACP) packets and run all PPM processing for LACP packets on the Routing Engine.</p> <p>This statement disables distributed PPM processing for only LACP packets. You can disable distributed PPM processing for all packets that use PPM and run all PPM processing on the Routing Engine by configuring the <b>no-delegate-processing</b> statement in the [edit routing-options ppm] hierarchy.</p> |
|                                 | <div><b>BEST PRACTICE:</b> We generally recommend that you disable distributed PPM only if Juniper Networks Customer Service advises you to do so. You should disable distributed PPM only if you have a compelling reason to disable it.</div>                                                                                                                                                                                 |
| <b>Default</b>                  | Distributed PPM processing is enabled for all packets that use PPM.                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Description</b>         | Associate BGP community information with a static, aggregate, or generated route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Default</b>             | No BGP community information is associated with static routes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>             | <p><b><i>community-ids</i></b>—One or more community identifiers. The <b><i>community-ids</i></b> format varies according to the type of attribute that you use.</p> <p>The BGP community attribute format is <b><i>as-number:community-value</i></b>:</p> <ul style="list-style-type: none"> <li>• <b><i>as-number</i></b>—AS number of the community member. It can be a value from 1 through 65,535. The AS number can be a decimal or hexadecimal value.</li> <li>• <b><i>community-value</i></b>—Identifier of the community member. It can be a number from 0 through 65,535.</li> </ul> <p>For more information about BGP community attributes, see the “Configuring the Extended Communities Attribute” section in the <i>Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices</i>.</p> <p>For specifying the BGP community attribute only, you also can specify <b><i>community-ids</i></b> as one of the following well-known community names defined in RFC 1997:</p> <ul style="list-style-type: none"> <li>• <b>no-advertise</b>—Routes containing this community name are not advertised to other BGP peers.</li> <li>• <b>no-export</b>—Routes containing this community name are not advertised outside a BGP confederation boundary.</li> </ul>                                                 |

- **no-export-subconfed**—Routes containing this community are advertised to IBGP peers with the same AS number, but not to members of other confederations.

**NOTE:** Extended community attributes are not supported at the [edit routing-options] hierarchy level. You must configure extended communities at the [edit policy-options] hierarchy level. For information about configuring extended communities, see the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices*.

| <b>Description</b>              | <p>Specify the routing device's confederation AS number.</p> <p>If you administer multiple ASs that contain a very large number of BGP systems, you can group them into one or more <i>confederations</i>. Each confederation is identified by its own AS number, which is called a <i>confederation AS number</i>. To external ASs, a confederation appears to be a single AS. Thus, the internal topology of the ASs making up the confederation is hidden.</p> <p>The BGP path attributes <b>NEXT_HOP</b>, <b>LOCAL_PREF</b>, and <b>MULTI_EXIT_DISC</b>, which normally are restricted to a single AS, are allowed to be propagated throughout the ASs that are members of the same confederation.</p> <p>Because each confederation is treated as if it were a single AS, you can apply the same routing policy to all the ASs that make up the confederation.</p> <p>Grouping ASs into confederations reduces the number of BGP connections required to interconnect ASs.</p> <p>If you are using BGP, you can enable the local routing device to participate as a member of an AS confederation. To do this, include the <b>confederation</b> statement.</p> <p>Specify the AS confederation identifier, along with the peer AS numbers that are members of the confederation.</p> <p>Note that peer adjacencies do not form if two BGP neighbors disagree about whether an adjacency falls within a particular confederation.</p> |

| <b>Description</b>              | <p>Do not forward packets addressed to this destination. Instead, drop the packets, do not send ICMP unreachable messages to the packets' originators, and install a reject route for this destination into the routing table.</p> <p>To propagate static routes into the routing protocols, include the <b>discard</b> statement when you define the route, along with a routing policy.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|                                 | <p> <b>NOTE:</b> In other vendors' software, a common way to propagate static routes into routing protocols is to configure the routes so that the next-hop routing device is the loopback address (commonly, 127.0.0.1). However, configuring static routes in this way (by including a statement such as <b>route address/mask-length next-hop 127.0.0.1</b>) does not propagate the static routes, because the forwarding table ignores static routes whose next-hop routing device is the loopback address.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Default</b>                  | When an aggregate route becomes active, it is installed in the routing table with a reject next hop, which means that ICMP unreachable messages are sent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Description</b>         | <p>Specify the name of the routing table from which Junos OS should export routing information. For any individual RIB group, only one table can be specified in the <b>export-rib</b> statement.</p>                                                                                                                                                                                                                                                          |

The **export-rib** statement specifies the source table from which routing information is advertised.

One common use of the **export-rib** statement is interdomain routing. The export RIB is the table used when BGP extracts routes to advertise to peers. In multicast interdomain routing, for example, the export RIB is likely to be inet.2.

Another use of **export-rib** is dynamic route leaking between the global routing table (inet.0) and a VRF routing table (*instance.inet.0*). For example, you can use a RIB group to copy routes learned in the VRF into the global routing table, inet.0, or copy routes learned in inet.0 into a VRF. You define the use of this RIB group in the VRF's BGP configuration. In a routing policy you can do dynamic filtering of routes. For instance, you can use an import policy to only copy routes with certain communities into the global routing table.

For example:

```
rib-groups {
  rib-interface-routes-v4 {
    import-rib [ inet.0 VRF.inet.0 ];
  }
  rib-import-VRF-routes-to-inet0-v4 {
    export-rib VRF.inet.0;
    import-rib [ VRF.inet.0 inet.0 ];
    import-policy rib-import-VRF-routes-to-inet0-v4;
  }
  rib-import-inet0-routes-to-VRF-v4 {
    export-rib inet.0;
    import-rib [ inet.0 VRF.inet.0 ];
    import-policy rib-import-inet0-routes-to-VRF-v4;
  }
}
routing-options {
  interface-routes {
    rib-group {
```

```

        inet rib-interface-routes-v4;
    }
}
protocols {
    bgp {
        group iBGP-peers {
            type internal;
            family inet {
                unicast {
                    rib-group rib-import-inet0-routes-to-VRF-v4;
                }
            }
        }
    }
}
routing-instances {
    VRF {
        routing-options {
            interface-routes {
                rib-group {
                    inet rib-interface-routes-v4;
                }
            }
        }
        protocols {
            bgp {
                group peersin-VRF {
                    family inet {
                        unicast {
                            rib-group rib-import-VRF-routes-to-inet0-v4;
                        }
                    }
                }
            }
        }
    }
}
}

```

**Options** *routing-table-name*—Routing table group name.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 11.3 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>              | <p>Specify a backup path in case the primary path becomes unusable.</p> <p>You specify one or more objects with common characteristics within a group. All objects are treated as /32 host addresses. The objects can be a LAN interface, a router ID, or a point-to-point link. Sequence is insignificant.</p> <p>Changing the fate-sharing database does not affect existing established LSPs until the next CSPF reoptimization. The fate-sharing database does affect fast-reroute detour path computations.</p>                                                                                                                                                                                                                                                                 |
| <b>Options</b>                  | <p><b>cost <i>value</i></b>—Cost assigned to the group.<br/> <b>Range:</b> 1 through 65,535<br/> <b>Default:</b> 1</p> <p><b>from <i>address</i></b>—Address of the router or address of the LAN/NBMA interface. For example, an Ethernet network with four hosts in the same fate-sharing group would require you to list all four of the separate <b>from</b> addresses in the group.</p> <p><b>group <i>group-name</i></b>—Each fate-sharing group must have a name, which can have a maximum of 32 characters, including letters, numbers, periods (.), and hyphens (-). You can define up to 512 groups.</p> <p><b>to <i>address</i></b>—(Optional) Address of egress router. For point-to-point link objects, you must specify both a <b>from</b> and a <b>to</b> address.</p> |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Description</b>         | <p>Configure multicast forwarding cache properties. These properties include threshold suppression and reuse limits, the threshold at which a warning message is logged, and timeout values.</p> <p>Specify a value for the threshold at which to suppress new multicast forwarding cache entries and an optional reuse value for the threshold at which the router begins to create new multicast forwarding cache entries. The range for both is from 1 through 200,000. If configured, the reuse value should be less than the suppression threshold value. The suppression value is mandatory. If you do not specify the optional reuse value, then the number of multicast forwarding cache entries is limited to the suppression value. A new entry is created as soon as the number of multicast forwarding cache entries falls below the suppression value.</p> <p>You can configure the thresholds globally for the multicast forwarding cache or individually for the IPv4 and IPv6 multicast forwarding caches. Configuring the <b>threshold</b> statement globally for the multicast forwarding cache or including the <b>family</b> statement to configure the thresholds for the IPv4 and IPv6 multicast forwarding caches are mutually exclusive.</p> |
| <b>Default</b>             | By default, there are no limits on the number of multicast forwarding cache entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>             | <p><b>family (inet   inet6)</b>—(Optional) Apply the configured thresholds to either IPv4 or IPv6 multicast forwarding cache entries.</p> <p><b>Default:</b> By default, the configured thresholds are applied to both IPv4 and IPv6 multicast forwarding cache entries.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## import (Routing Options)

---

**Syntax** `import [ policy-names ];`

**Hierarchy Level** [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options resolution [rib](#)],  
[edit logical-systems *logical-system-name* routing-options resolution [rib](#)],  
[edit routing-instances *routing-instance-name* routing-options resolution [rib](#)],  
[edit routing-options resolution [rib](#)]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Specify one or more import policies to use for route resolution.

**Options** *policy-names*—Name of one or more import policies.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>                                                                                                                                                                                                                   | <p>Specify the name of the routing table into which Junos OS should import routing information. The first routing table name you enter is the primary routing table. Any additional names you enter identify secondary routing tables. When a protocol imports routes, it imports them into the primary and any secondary routing tables. If the primary route is deleted, the secondary route also is deleted. For IPv4 import routing tables, the primary routing table must be <b>inet.0</b> or <b>routing-instance-name.inet.0</b>. For IPv6 import routing tables, the primary routing table must be <b>inet6.0</b>.</p> <p>In Junos OS Release 9.5 and later, you can configure an IPv4 import routing table that includes both IPv4 and IPv6 routing tables. Including both types of routing tables permits you, for example, to populate an IPv6 routing table with IPv6 addresses that are compatible with IPv4. In releases prior to Junos OS Release 9.5, you could configure an import routing table with only either IPv4 or IPv6 routing tables.</p> |
| <div>  <p><b>NOTE:</b> On EX Series switches, only dynamically learned routes can be imported from one routing table group to another.</p> </div> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

This statement is implemented on the Packet Forward Engine to speed up forwarding information base (FIB) updates. Configuring this statement significantly speeds convergence times. The only downside of configuring this statement is that some additional FIB memory overhead is required. Unless routes have an extremely high number of next hops, this increased memory usage should not be noticeable. |
| <div>  <b>NOTE:</b> <ul style="list-style-type: none"> <li>When virtual private LAN service (VPLS) is configured on the routing device, the <code>indirect-next-hop</code> statement is configurable at the [edit routing-options <code>forwarding-table</code>] hierarchy level. However, this configuration is not applicable to indirect nexthops specific to VPLS routing instances.</li> <li>By default, the Junos Trio Modular Port Concentrator (MPC) chipset on MX Series routers is enabled with indirectly connected next hops, and this cannot be disabled using the <code>no-indirect-next-hop</code> statement.</li> <li>By default, indirectly connected next hops are enabled on PTX Series routers.</li> </ul> </div> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Description</b>              | Configure whether Junos OS installs all static routes into the forwarding table. Even if you configure a route so it is not installed in the forwarding table, the route is still eligible to be exported from the routing table to other protocols.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>                  | <b>install</b> —Explicitly install all static routes into the forwarding table. Include this statement when configuring an individual route in the <b>route</b> portion of the <b>static</b> statement to override a <b>no-install</b> option specified in the <b>defaults</b> portion of the statement.<br><br><b>no-install</b> —Do not install the route into the forwarding table, even if it is the route with the lowest preference.<br><br><b>Default:</b> install                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Description</b>              | <p>Enable multicast traffic on an interface.</p> <p>By default, multicast packets are forwarded by enabling Protocol Independent Multicast (PIM) on an interface. PIM adds multicast routes into the routing table.</p> <p>You can also configure multicast packets to be forwarded over a static route, such as a static route associated with an LSP next hop. Multicast packets are accepted on an interface and forwarded over a static route in the forwarding table. This is useful when you want to enable multicast traffic on a specific interface without configuring PIM on the interface.</p> <p>You cannot enable multicast traffic on an interface and configure PIM on the same interface simultaneously.</p> <p>Static routes must be configured before you can enable multicast on an interface. Configuring the <b>interface</b> statement alone does not install any routes into the routing table. This feature relies on the static route configuration.</p> |
| <b>Options</b>                  | <p><b><i>interface-names</i></b>—Name of one or more interfaces on which to enable multicast traffic.</p> <p>The remaining statements are explained separately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Required Privilege Level</b> | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Release Information</b> | <p>Statement introduced in Junos OS Release 8.3.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.3 for the QFX Series.</p>                                                                                                                                              |
| <b>Description</b>         | Enable multicast traffic on an interface.                                                                                                                                                                                                                                                                                                              |

**TIP:** You cannot enable multicast traffic on an interface by using the `routing-options multicast interface` statement and configure PIM on the interface.

[edit routing-instances *routing-instance-name* routing-options],  
[edit routing-options]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.3 for the QFX Series.

**NOTE:** On EX Series switches, only dynamically learned routes can be imported from one routing table group to another.

---

**Description** Associate a routing table group with the routing device's interfaces, and specify routing table groups into which interface routes are imported.

By default, IPv4 interface routes (also called direct routes) are imported into routing table **inet.0**, and IPv6 interface routes are imported into routing table **inet6.0**. If you are configuring alternate routing tables for use by some routing protocols, it might be necessary to import the interface routes into the alternate routing tables. To define the routing tables into which interface routes are imported, you create a routing table group and associate it with the routing device's interfaces.

To create the routing table groups, include the **passive** statement at the **[edit routing-options]** hierarchy level.

If you have configured a routing table, configure the OSPF primary instance at the **[edit protocols ospf]** hierarchy level with the statements needed for your network so that routes are installed in **inet.0** and in the forwarding table. Make sure to include the routing table group.

To export local routes, include the **export** statement.

To export LAN routes, include the **lan** option. To export point-to-point routes, include the **point-to-point** option.

Only local routes on point-to-point interfaces configured with a destination address are exportable.

- Options**
- inet**—Specify the IPv4 address family.
  - inet6**—Specify the IPv6 address family.
  - lan**—Export LAN routes.
  - point-to-point**—Export point-to-point routes.

The remaining statements are explained separately.

- Required Privilege Level**
- routing—To view this statement in the configuration.
  - routing-control—To add this statement to the configuration.

[edit routing-options multicast backup-pe-group group-name]
```

**Release Information**

Statement introduced in Junos OS Release 9.0.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Configure the address of the local PE for ingress PE redundancy when point-to-multipoint LSPs are used for multicast distribution.

**Options** **address**—Address of local PEs in the backup group.

**Required Privilege Level**

- routing—To view this statement in the configuration.
- routing-control—To add this statement to the configuration.

- Related Documentation**

| <b>Release Information</b> | Statement introduced in Junos OS Release 8.0.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 11.3 for the QFX Series.                                                                                                  |
| <b>Description</b>         | Configure a limit for the number of routes installed in a routing table based upon the route path.                                                                                                                                                                                          |

**NOTE:** The `maximum-paths` statement is similar to the `maximum-prefixes` statement. The `maximum-prefixes` statement limits the number of unique destinations in a routing instance. For example, suppose a routing instance has the following routes:

```
OSPF 10.10.10.0/24
ISIS 10.10.10.0/24
```

These are two routes, but only one destination (prefix). The `maximum-paths` limit applies the total number of routes (two). The `maximum-prefixes` limit applies to the total number of unique prefixes (one).

|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Options</b> | <p><code>log-interval <i>seconds</i></code>—(Optional) Minimum time interval (in seconds) between log messages.</p> <p><b>Range:</b> 5 through 86,400</p> <p><code>log-only</code>—(Optional) Sets the route limit as an advisory limit. An advisory limit triggers only a warning, and additional routes are not rejected.</p> <p><code><i>path-limit</i></code>—Maximum number of routes. If this limit is reached, a warning is triggered and additional routes are rejected.</p> <p><b>Range:</b> 1 through 4,294,967,295 (<math>2^{32} - 1</math>)</p> <p><b>Default:</b> No default</p> <p><code>threshold <i>value</i></code>—(Optional) Percentage of the maximum number of routes that starts triggering a warning. You can configure a percentage of the <code><i>path-limit</i></code> value that starts triggering the warnings.</p> <p><b>Range:</b> 1 through 100</p> |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

**NOTE:** When the number of routes reaches the **threshold** value, routes are still installed into the routing table while warning messages are sent. When the number of routes reaches the *path-limit* value, then additional routes are rejected.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Release Information</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Statement introduced in Junos OS Release 8.0.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 11.3 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <p>Configure a limit for the number of routes installed in a routing table based upon the route prefix.</p> <p>Using a prefix limit, you can curtail the number of prefixes received from a CE router in a VPN. Prefix limits apply only to dynamic routing protocols and are not applicable to static or interface routes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <div>  <p><b>NOTE:</b> The <code>maximum-prefixes</code> statement is similar to the <code>maximum-paths</code> statement. The <code>maximum-prefixes</code> statement limits the number of unique destinations in a routing instance. For example, suppose a routing instance has the following routes:</p> <pre> OSPF 10.10.10.0/24 ISIS 10.10.10.0/24 </pre> <p>These are two routes, but only one destination (prefix). The <code>maximum-paths</code> limit applies the total number of routes (two). The <code>maximum-prefixes</code> limit applies to the total number of unique prefixes (one).</p> </div> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Options</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <p><b>log-interval <i>seconds</i></b>—(Optional) Minimum time interval (in seconds) between log messages.</p> <p><b>Range:</b> 5 through 86,400</p> <p><b>log-only</b>—(Optional) Sets the prefix limit as an advisory limit. An advisory limit triggers only a warning, and additional routes are not rejected.</p> <p><b><i>prefix-limit</i></b>—Maximum number of route prefixes. If this limit is reached, a warning is triggered and any additional routes are rejected.</p> <p><b>Range:</b> 1 through 4,294,967,295</p> <p><b>Default:</b> No default</p> <p><b>threshold <i>value</i></b>—(Optional) Percentage of the maximum number of prefixes that starts triggering a warning. You can configure a percentage of the <i>prefix-limit</i> value that starts triggering the warnings.</p> |

**Range:** 1 through 100

**NOTE:** When the number of routes reaches the threshold value, routes are still installed into the routing table while warning messages are sent. When the number of routes reaches the *prefix-limit* value, then additional routes are rejected.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## med-igp-update-interval

**Syntax** med-igp-update-interval *minutes*;

**Hierarchy Level** [edit routing-options]

**Release Information** Statement introduced in Junos OS Release 9.0  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Configure a timer for how long to delay updates for the multiple exit discriminator (MED) path attribute for BGP groups and peers configured with the **metric-out igp offset delay-med-update** statement. The timer delays MED updates for the interval configured unless the MED is lower than the previously advertised attribute or another attribute associated with the route has changed or if the BGP peer is responding to a refresh route request.

**Options** *minutes*—Interval to delay MED updates.  
**Range:** 10 through 600  
**Default:** 10 minutes

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## multicast (Routing Options)

**Syntax**

```
multicast {
  forwarding-cache {
    threshold suppress value <reuse value>;
  }
  interface interface-name {
    enable;
  }
  scope scope-name {
    interface [ interface-names ];
    prefix destination-prefix;
  }
  ssm-groups {
    address;
  }
}
```

**Hierarchy Level** [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* routing-options],  
[edit logical-systems *logical-system-name* routing-options],  
[edit routing-instances *routing-instance-name* routing-options],  
[edit routing-options]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.3 for the QFX Series.  
Statement introduced in Junos OS Release 12.3 for ACX Series routers.

**Description** Configure generic multicast properties.

**NOTE:** You cannot apply a scoping policy to a specific routing instance. All scoping policies are applied to all routing instances. However, you can apply the `scope` statement to a specific routing instance.

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Configure the rendezvous point (RP) routing device that resides between a customer edge-facing Protocol Independent Multicast (PIM) domain and a core-facing PIM domain to translate PIM join or prune messages into corresponding Internet Group Management Protocol (IGMP) report or leave messages. The routing device then transmits the report or leave messages by proxying them to one or two upstream interfaces that you configure on the RP routing device. Including the <b>pim-to-igmp-proxy</b> statement enables you to use IGMP to forward IPv4 multicast traffic across the PIM sparse mode domains.</p> <p>The remaining statement is explained separately.</p> |

| <b>Description</b>              | <p>Configure the rendezvous point (RP) routing device that resides between a customer edge-facing Protocol Independent Multicast (PIM) domain and a core-facing PIM domain to translate PIM join or prune messages into corresponding Multicast Listener Discovery (MLD) report or leave messages. The routing device then transmits the report or leave messages by proxying them to one or two upstream interfaces that you configure on the RP routing device. Including the <b>pim-to-mld-proxy</b> statement enables you to use MLD to forward IPv6 multicast traffic across the PIM sparse mode domains.</p> <p>The remaining statement is explained separately.</p> |

| <b>Description</b>         | <p>Associate a routing policy when configuring an aggregate or generated route's destination prefix in the <b>routes</b> part of the <b>aggregate</b> or <b>generate</b> statement. This provides the equivalent of an import routing policy filter for the destination prefix. That is, each potential contributor to an aggregate route, along with any aggregate options, is passed through the policy filter. The policy then can accept or reject the route as a contributor to the aggregate route.</p> <p>If the contributor is accepted, the policy can modify the default preferences. The contributor with the numerically smallest prefix becomes the most preferred, or <i>primary</i>, contributor. A rejected contributor still can contribute to a less specific aggregate route. If you do not specify a policy filter, all candidate routes contribute to an aggregate route.</p> <p>The following algorithm is used to compare two generated contributing routes in order to determine which one is the primary or preferred contributor:</p> <ol style="list-style-type: none"> <li>1. Compare the protocol's <b>preference</b> of the contributing routes. The lower the preference, the better the route. This is similar to the comparison that is done while determining the best route for the routing table.</li> <li>2. Compare the protocol's <b>preference2</b> of the contributing routes. The lower <b>preference2</b> value is better. If only one route has <b>preference2</b>, then this route is preferred.</li> <li>3. The preference values are the same. Proceed with a numerical comparison of the prefixes' values. <ol style="list-style-type: none"> <li>a. The primary contributor is the numerically smallest prefix value.</li> <li>b. If the two prefixes are numerically equal, the primary contributor is the route that has the smallest prefix length value.</li> </ol> </li> </ol> |

At this point, the two routes are the same. The primary contributor does not change. An additional next hop is available for the existing primary contributor.

A rejected contributor still can contribute to less specific generated route. If you do not specify a policy filter, all candidate routes contribute to a generated route.

| <b>Description</b>              | <p>(M120, M320, MX Series, T Series, TX Matrix routers, M7i and M10i routers with Enhanced CFEB [CFEB-E], EX Series switches, and QFX Series only) Disable distributed periodic packet management (PPM) to the Packet Forwarding Engine (on routers), to access ports (on EX3200 and EX4200 switches, and QFX Series), or to line cards (on EX6200 and EX8200 switches).</p> <p>After you disable PPM, PPM processing continues to run on the Routing Engine.</p> <p>In Junos OS Release 8.2, PPM was moved from the Routing Engine to the Packet Forwarding Engine, access ports, or line cards. The <b>no-delegate-processing</b> statement disables the default behavior and restores the legacy behavior.</p> |
| <b>Default</b>                  | Distributed PPM processing is enabled for all protocols that use PPM.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                  | <b>no-delegate-processing</b> —Disable PPM to the Packet Forwarding Engine, access ports, or line cards. Distributed PPM is enabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
