<b>List of Syntax</b>	<a href="#">Syntax on page 1014</a> <a href="#">Syntax (TX Matrix Routers) on page 1014</a> <a href="#">Syntax (TX Matrix Plus Routers) on page 1014</a> <a href="#">Syntax (MX104, MX2010, and MX2020 3D Universal Edge Routers) on page 1014</a> <a href="#">Syntax (MX Series Routers) on page 1014</a> <a href="#">Syntax (QFX Series) on page 1014</a>
<b>Syntax</b>	show chassis environment routing-engine <slot>
<b>Syntax (TX Matrix Routers)</b>	show chassis environment routing-engine <lcc number   scc> <slot>
<b>Syntax (TX Matrix Plus Routers)</b>	show chassis environment routing-engine <lcc number   sfc number> <slot>
<b>Syntax (MX104, MX2010, and MX2020 3D Universal Edge Routers)</b>	show chassis environment routing-engine <slot>
<b>Syntax (MX Series Routers)</b>	show chassis environment routing-engine <slot> <all-members> <local> <member member-id>
<b>Syntax (QFX Series)</b>	show chassis environment routing-engine interconnect-device <i>name</i>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series. Command introduced in Junos OS Release 12.1 for the PTX Series Packet Transport Routers. Command introduced in Junos OS Release 12.1 for the T4000 Core Routers. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers. Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.
<b>Description</b>	Display Routing Engine environmental status information.
<b>Options</b>	<b>none</b> —Display environmental information about all Routing Engines. For a TX Matrix router, display environmental information about all Routing Engines on the TX Matrix router and its attached T640 routers. For a TX Matrix Plus router, display

environmental information about all Routing Engines on the TX Matrix Plus router and its attached routers.

**all-members**—(MX Series routers only) (Optional) Display environmental information about the Routing Engines in all member routers in the Virtual Chassis configuration.

**interconnect-device *name***—(QFabric systems only) (Optional) Display environmental information about the Routing Engines for the Interconnect device.

**lcc *number***—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display environmental information about the Routing Engines in the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display environmental information about the Routing Engines in the specified member in the Virtual Chassis configuration. Replace *member-id* with the value of 0 or 1.

**scc**—(TX Matrix router only) (Optional) Display environmental information about the Routing Engine in the TX Matrix router (switch-card chassis).

**sfc**—(TX Matrix Plus router only) (Optional) Display environmental information about the Routing Engine in the TX Matrix Plus router (or switch-fabric chassis).

**slot**—(Optional) Display environmental information about an individual Routing Engine. On M10i, M20, M40e, M120, M160, M320, MX Series, MX104 routers, MX2010 routers, MX2020 routers, and T Series routers, replace *slot* with **0** or **1**. On M5, M7i, M10, and M40 routers and on the J Series router, replace *slot* with **0**. On EX3200 and EX4200 standalone switches, replace *slot* with **0**. On EX4200 switches in a Virtual Chassis configuration and on EX8208 and EX8216 switches, replace *slot* with **0** or **1**. On the QFX3500 switch, there is only one Routing Engine, so you do not need to specify the slot number. On PTX Series Packet Transport Routers, replace *slot* with **0** or **1**.

**Output Fields** Table 109 on page 1016 lists the output fields for the **show chassis environment routing-engine** command. Output fields are listed in the approximate order in which they appear.

Table 109: show chassis environment routing-engine Output Fields

Field Name	Field Description
Routing engine <i>slot</i> status	Number of the Routing Engine slot: 0 or 1.
State	Status of the Routing Engine: <ul style="list-style-type: none"> <li>• <b>Online Master</b>—Routing Engine is online, operating as Master.</li> <li>• <b>Online Standby</b>—Routing Engine is online, operating as Standby.</li> <li>• <b>Offline</b>—Routing Engine is offline.</li> </ul>
Temperature	Temperature of the air flowing past the Routing Engine.
CPU Temperature	(PTX Series and T4000 Core Routers only) Temperature of the air flowing past the Routing Engine CPU.

## Sample Output

### show chassis environment routing-engine (Nonredundant)

```
user@host> show chassis environment routing-engine
Routing Engine 0 status:
  State                Online Master
  Temperature          27 degrees C / 80 degrees
```

### show chassis environment routing-engine (Redundant)

```
user@host> show chassis environment routing-engine
Route Engine 0 status:
  State:                Online Master
  Temperature:          26 degrees C / 78 degrees F
Route Engine 1 status:
  State:                Online Standby
  Temperature:          26 degrees C / 78 degrees F
```

**show chassis environment routing-engine (MX104 Router)**

```

user@ host >show chassis environment routing-engine
Routing Engine 0 status:
  State           Online Master
  Temperature      34 degrees C / 93 degrees F
  CPU Temperature  43 degrees C / 109 degrees F
Routing Engine 1 status:
  State           Online Standby
  Temperature      33 degrees C / 91 degrees F
  CPU Temperature  39 degrees C / 102 degrees F

```

**show chassis environment routing-engine (MX2010 Router)**

```

user@host> show chassis environment routing-engine
Routing Engine 0 status:
  State           Online Master
  Temperature      37 degrees C / 98 degrees F
  CPU Temperature  37 degrees C / 98 degrees F
Routing Engine 1 status:
  State           Online Standby
  Temperature      35 degrees C / 95 degrees F
  CPU Temperature  34 degrees C / 93 degrees F

```

**show chassis environment routing-engine (MX2020 Router)**

```

user@host> show chassis environment routing-engine
Routing Engine 0 status:
  State           Online Master
  Temperature      35 degrees C / 95 degrees F
  CPU Temperature  34 degrees C / 93 degrees F
Routing Engine 1 status:
  State           Online Standby
  Temperature      44 degrees C / 111 degrees F
  CPU Temperature  43 degrees C / 109 degrees F

```

**show chassis environment routing-engine (TX Matrix Plus Router)**

```

user@host> show chassis environment routing-engine
sfc0-re0:
-----
Routing Engine 0 status:
  State           Online Master
  Temperature      26 degrees C / 78 degrees F
Routing Engine 1 status:
  State           Online Standby
  Temperature      28 degrees C / 82 degrees F

lcc0-re0:
-----
Routing Engine 0 status:
  State           Online Master
  Temperature      30 degrees C / 86 degrees F
Routing Engine 1 status:
  State           Online Standby
  Temperature      29 degrees C / 84 degrees F

```

**show chassis environment routing-engine (T4000 Core Router)**

```

user@host> show chassis environment routing-engine

```

```
Routing Engine 0 status:
  State           Online Master
  Temperature      33 degrees C / 91 degrees F
  CPU Temperature  50 degrees C / 122 degrees F
Routing Engine 1 status:
  State           Online Standby
  Temperature      33 degrees C / 91 degrees F
  CPU Temperature  46 degrees C / 114 degrees F
```

#### show chassis environment routing-engine (QFX Series)

```
user@switch> show chassis environment routing-engine
Routing Engine 0 status:
  State           Online Master
  Temperature      42 degrees C / 107 degrees F
```

#### show chassis environment routing-engine interconnect-device (QFabric System)

```
user@switch> show chassis environment routing-engine interconnect-device interconnect1
routing-engine interconnect-device interconnect1
Routing Engine 0 status:
  State           Online Standby
  Temperature      52 degrees C / 125 degrees F
Routing Engine 1 status:
  State           Online Master
  Temperature      57 degrees C / 134 degrees F
```

#### show chassis environment routing-engine (PTX5000 Packet Transport Router)

```
user@switch> show chassis environment routing-engine
Routing Engine 0 status:
  State           Online Master
  Temperature      55 degrees C / 131 degrees F
  CPU Temperature  66 degrees C / 150 degrees F
Routing Engine 1 status:
  State           Online Standby
  Temperature      52 degrees C / 125 degrees F
  CPU Temperature  64 degrees C / 147 degrees F
```

<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.4 for EX Series switches. sfc option introduced in Junos OS Release 9.6 for the TX Matrix Plus router. Command introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.

- Description** (M10i, M40e, M120, M160, M320, MX Series, and T Series routers and EX8200 and PTX Series routers only) Display information about the ports on the Control Board (CB) Ethernet switch.
- Options**
- none**—Display information about each connected port on the Ethernet switch. On a TX Matrix router, display information about each connected port on the Ethernet switch on the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display information about each connected port on the Ethernet switch on the TX Matrix Plus router and its attached routers.
  - all-members**—(MX Series routers only) (Optional) Display information about the ports on the CB Ethernet switch on all the members of the Virtual Chassis configuration.
  - errors**—(Optional) Display the numbers and types of errors accumulated on all ports of the Ethernet switch.
  - errors *port***—(Optional) Display the numbers and types of errors accumulated on the specified port (0 through 15) of the Ethernet switch. On the TX Matrix router, replace ***port*** with a value from 0 through 15. On the TX Matrix Plus router and EX8200 switch, replace ***port*** with a value from 0 through 27. On the PTX Series Packet Transport Routers, replace ***port*** with a value from 0 through 25. On the T4000 routers, MX2020 routers, and MX2010 routers, replace ***port*** with a value from 0 through 27.
  - errors switch *number***—(TX Matrix Plus router only) (Optional) Display the numbers and types of errors accumulated on the specified switch. Replace ***number*** with a value from 0 through 2.
  - lcc *number***—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.  
Replace ***number*** with the following values depending on the LCC configuration:
    - 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
    - 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
    - 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
    - 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
  - local**—(MX Series routers only) (Optional) Display information about the ports on the CB Ethernet switch on the local Virtual Chassis member.
  - member *member-id***—(MX Series routers only) (Optional) Display information about the ports on the CB Ethernet switch on the specified member of the Virtual Chassis configuration. Replace ***member-id*** with a value of 0 or 1.

**old-rom-packet-count**—(MX 2020 Routers only) (Optional) Display information about installed linecards. A non-zero number indicates that the bootrom on that linecard needs to be updated.

**port-state**—(PTX Series only) (Optional) Display information about current port operation (**Blocking**, **Listening**, or **Disabled**).

**scc**—(TX Matrix router only) (Optional) Display information about the ports on the CB's Ethernet switch on the TX Matrix router (switch-card chassis).

**sfc number**—(TX Matrix Plus router only) (Optional) Display information about the ports on the CB's Ethernet switch on the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with **0**.

**statistics**—(Optional) Display traffic statistics for each connected port on the Ethernet switch.

**statistics port**—(Optional) Display traffic statistics for the specified port on the Ethernet switch. On the TX Matrix router, replace *port* with a value from **0** through **25**. On the TX Matrix Plus router or EX8200 switch, replace *port* with a value from **0** through **27**. On the PTX Series Packet Transport Routers, replace *port* with a value from **0** through **25**. On the T4000 routers, MX2020 routers, and MX2010 routers, replace *port* with a value from **0** through **27**.

**statistics switch number**—(TX Matrix Plus routers and EX8200 switch only) (Optional) Display traffic statistics for the specified Ethernet switch number. On the TX Matrix Plus router and EX8216 switch, replace *number* with a value from **0** through **2**. On the EX8208 switch, replace *number* with a value from **0** through **1**.

**Output Fields** [Table 110 on page 1022](#) lists the output fields for the **show chassis ethernet-switch** command. Output fields are listed in the approximate order in which they appear.

**Table 110: show chassis ethernet-switch Output Fields**

Field Name	Field Description
Link is good on port <i>n</i> connected to device	Information about the link between each port on the CB's Ethernet switch and one of the following devices:
or	<ul style="list-style-type: none"> <li>FPC0 (Flexible PIC Concentrator 0) through FPC7</li> <li>Local controller</li> </ul>
Link is good on Fast Ethernet port <i>n</i> connected to device	<ul style="list-style-type: none"> <li>Routing Engine</li> <li>Other Routing Engine (on a system with two Routing Engines)</li> <li>SPMB (Switch Processor Mezzanine Board)</li> </ul>
or	<ul style="list-style-type: none"> <li>(TX Matrix router only) LCC0 (line-card chassis 0) through LCC3</li> </ul>
Link is good on Gigabit Ethernet port <i>n</i> connected to device	
or	
Link is down on Gigabit Ethernet port connected to device	
Speed is	Speed at which the Ethernet link is running: <b>10 Mb</b> or <b>100 Mb</b> . When the device is <b>RE</b> or <b>Other RE</b> on the TX Matrix router, the speed is <b>1000 Mb</b> .  <b>NOTE:</b> Irrespective of the device, the speed is <b>1000 Mb</b> on the MX2010 and MX2020 routers.
Duplex is	Duplex type of the Ethernet link: <b>full</b> or <b>half</b> .
Autonegotiate is Enabled (or Disabled)	By default, built-in Fast Ethernet ports on a PIC autonegotiate whether to operate at 10 Mbps or 100 Mbps. All other interfaces automatically choose the correct speed based on the PIC type and whether the PIC is configured to operate in multiplexed mode (using the <b>no-concatenate</b> statement at the <b>[edit chassis]</b> hierarchy level, as described in the <i>Junos OS System Basics Configuration Guide</i> ).
Flow Control TX is Enabled (or Disabled)	(MX2010 routers, MX2020 routers, and PTX Series) Flow control in the transmit direction is enabled (or disabled). Flow control regulates the flow of packets from the switch to the remote side of the connection.
Flow Control RX is Enabled (or Disabled)	(MX2010 routers, MX2020 routers, and PTX Series) Flow control in the receive direction is enabled (or disabled). Flow control regulates the flow of packets from the remote side of the connection to the switch.
MLT3	Number of multilevel threshold-3 (MLT-3) Fast Ethernet errors detected.
<b>Accumulated error counts for port <i>n</i> connected to device FPC<i>n</i>: (error output only)</b>	
Lock	Number of lock errors detected.
Xmit	Number of transmission errors detected.

Table 110: show chassis ethernet-switch Output Fields (*continued*)

Field Name	Field Description
<b>ESD</b>	Number of electrostatic discharge (ESD) errors detected.
<b>False Carrier</b>	Number of false carrier errors detected. This number is increased by one if a FRU is removed.
<b>Disconnects</b>	Number of disconnect errors detected.
<b>FX mode</b>	Number of errors detected on an Ethernet link over optical fiber.
<b>Statistics for port <i>n</i> connected to device FPC<i>n</i> (statistics output only)</b>	
<b>TX Packets 64 Octets</b>	(MX2010 and MX2020 routers) Number of packets of size 64 octets transmitted.
<b>TX Packets 65 - 127 Octets</b>	(MX2010 and MX2020 routers) Number of packets of size 65 through 127 octets transmitted.
<b>TX Packets 128 - 255 Octets</b>	(MX2010 and MX2020 routers) Number of packets of size 128 through 255 octets transmitted.
<b>TX Packets 256 - 511 Octets</b>	(MX2010 and MX2020 routers) Number of packets of size 256 through 511 octets transmitted.
<b>TX Packets 512 - 1023 Octets</b>	(MX2010 and MX2020 routers) Number of packets of size 512 through 1023 octets transmitted.
<b>TX Packets 1024 - 1518 Octets</b>	(MX2010 and MX2020 routers) Number of packets of size 1024 through 1518 octets transmitted.
<b>TX Packets 1519 - 2047 Octets</b>	(MX2010 and MX2020 routers) Number of packets of size 1519 through 2047 octets transmitted.
<b>TX Packets 2048 - 4095 Octets</b>	(MX2010 and MX2020 routers) Number of packets of size 2048 through 4095 octets transmitted.
<b>TX Packets 4096 - 9216 Octets</b>	(MX2010 and MX2020 routers) Number of packets of size 4096 through 9216 octets transmitted.
<b>TX 1519 - 1522 Good Vlan frms</b>	(MX2010 and MX2020 routers) Number of transmitted frames of size 1519 through 1522 octets that are good VLAN frames.
<b>TX Octets</b>	Number of octets sent.
<b>TX Unicast packets</b>	Number of unicast packets sent.
<b>TX Multicast packets</b>	Number of multicast packets sent.
<b>TX Broadcast packets</b>	Number of broadcast packets sent.
<b>TX Single Collision frames</b>	(MX2010 and MX2020 routers) Number of packets sent after one collision.

Table 110: show chassis ethernet-switch Output Fields (*continued*)

Field Name	Field Description
<b>TX Mult. Collision frames</b>	(MX2010 and MX2020 routers) Number of packets sent after multiple collisions.
<b>TX Late collisions</b>	Number of packets aborted during sending because of collisions after 64 bytes.
<b>TX Excessive collisions</b>	Number of packets not sent because of too many collisions.
<b>TX Dropped packets</b>	Number of transmitted packets that were dropped.
<b>TX PAUSEMAC Ctrl Frames</b>	Number of Media Access Control (MAC) frames containing PAUSE commands that were sent.
<b>TX Oversize Packets</b>	Number of oversize packets that were sent.
<b>TX FCS Error Counter</b>	Number of packets discarded because of frame check sequence errors.
<b>TX Fragment Counter</b>	Number of fragmented packets sent.
<b>TX Byte Counter</b>	Number of bytes sent.
<b>TX Packet OK Counter</b>	Number of viable packets sent.
<b>TX Pause Packet Counter</b>	Number of PAUSE packets sent.
<b>RX Packets 64 Octets</b>	(MX2010 and MX2020 routers) Number of packets of size 64 octets received.
<b>RX Packets 65 - 127 Octets</b>	(MX2010 and MX2020 routers) Number of packets of size 65 through 127 octets received.
<b>RX Packets 128 - 255 Octets</b>	(MX2010 and MX2020 routers) Number of packets of size 128 through 255 octets received.
<b>RX Packets 256 - 511 Octets</b>	(MX2010 and MX2020 routers) Number of packets of size 256 through 511 octets received.
<b>RX Packets 512 - 1023 Octets</b>	(MX2010 and MX2020 routers) Number of packets of size 512 through 1023 octets received.
<b>RX Packets 1024 - 1518 Octets</b>	(MX2010 and MX2020 routers) Number of packets of size 1024 through 1518 octets received.
<b>RX Packets 1519 - 2047 Octets</b>	(MX2010 and MX2020 routers) Number of packets of size 1519 through 2047 octets received.
<b>RX Packets 2048 - 4095 Octets</b>	(MX2010 and MX2020 routers) Number of packets of size 2048 through 4095 octets received.

Table 110: show chassis ethernet-switch Output Fields (*continued*)

Field Name	Field Description
<b>RX Packets 4096 - 9216 Octets</b>	(MX2010 and MX2020 routers) Number of packets of size 4096 through 9216 octets received.
<b>RX Octets</b>	Number of octets received.
<b>RX Unicast packets</b>	Number of unicast packets received.
<b>RX Multicast packets</b>	Number of multicast packets received.
<b>RX Broadcast packets</b>	Number of broadcast packets received.
<b>RX FCS Errors</b>	Number of packets discarded because of frame check sequence errors.
<b>RX Alignment Errors</b>	Number of incomplete octets received.
<b>RX Dropped Packets</b>	Number of incoming packets that were dropped.
<b>RX Fragments</b>	Number of fragmented packets received.
<b>RX Symbol Errors</b>	Number of symbols received that the router did not correctly decode.
<b>RX MAC Control</b>	Number of Media Access Control (MAC) packets received.
<b>RX Oversize Packets</b>	Number of oversize packets received.
<b>RX Undersize Packets</b>	Number of undersize packets received.
<b>RX Jabbers</b>	Total number of frames received that exceed the maximum byte count and contain CRC errors .
<b>RX Control Frame Counter</b>	Number of control frames received.
<b>RX Pause Frame Counter</b>	Number of pause frames received.
<b>RX FCS Errors</b>	Number of packets discarded because of frame check sequence errors.
<b>RX Fragments</b>	Number of fragmented packets received.
<b>RX Byte Counter</b>	Number of bytes received.
<b>RX Packet OK Counter</b>	Number of viable packets received.

## Sample Output

### show chassis ethernet-switch

```
user@host> show chassis ethernet-switch
Link is good on port 0 connected to device: FPC0
  Speed is 100 MB
  Duplex is full

Link is good on port 1 connected to device: FPC1
  Speed is 100 MB
  Duplex is full

Link is good on port 2 connected to device: FPC2
  Speed is 100 MB
  Duplex is full

Link is good on port 3 connected to device: FPC3
  Speed is 100 MBb
  Duplex is full

Link is good on port 7 connected to device: Local controller
  Speed is 100 MB
  Duplex is full

Link is good on port 9 connected to device: SPMB
  Speed is 100 MB
  Duplex is full

Link is good on port 13 connected to device: FPC5
  Speed is 100 MB
  Duplex is full
```

### show chassis ethernet-switch (MX480 Router with MPC4E)

```

<b>Syntax</b>	show chassis fabric fpcs <fcc number>
<b>Syntax (MX Series Routers)</b>	show chassis fabric fpcs <all-members> <local> <member member-id>
<b>Syntax (MX2010 and MX2020 3D Universal Edge Routers)</b>	show chassis fabric fpcs
<b>Syntax (T4000 Core Router)</b>	show chassis fabric fpcs
<b>Syntax (PTX Series Packet Transport Routers)</b>	show chassis fabric fpcs <slot fpc-slot>
<b>Syntax (TX Matrix Plus Router)</b>	show chassis fabric fpcs <fcc number>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.4 for EX Series switches.</p> <p>Command introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p>
<b>Description</b>	(M320, MX Series, and T Series routers, EX8200 switches, and PTX Series Packet Transport Routers only) Display the state of the electrical switch fabric links between the Flexible PIC Concentrators (FPCs) and the Switch Interface Boards (SIBs).
<b>Options</b>	<p><b>none</b>—Display the switch fabric link state. On a TX Matrix router, display the switching fabric link states for the FPCs in all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display the switching fabric link states for the FPCs in all routers connected to the TX Matrix Plus router.</p> <p><b>all-members</b>—(MX Series routers only) (Optional) Display the switching fabric link states for the FPCs in all members of the Virtual Chassis configuration.</p> <p><b>fcc number</b>—(TX Matrix router and TX Matrix Plus router only) (Optional) On a TX Matrix router, display the switch fabric link state for the FPCs in the specified T640 router</p>

(line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display the switch fabric link state for the FPCs in the specified router (line-card chassis) that is connected to the TX Matrix Plus router. Replace *number* with a following value depending on the LCC configurations:

- From **0** through **3** on a T640 router on the routing matrix with TX Matrix routers.
- From **0** through **3** on a T1600 router on the routing matrix with TX Matrix Plus routers.
- From **0** through **7** on a T1600 router in a routing matrix with TX Matrix Plus router with 3D SIBs.
- **0, 2, 4, 6** on a T4000 router in a routing matrix with TX Matrix Plus router with 3D SIBs.

**local**—(MX Series routers only) (Optional) Display the switching fabric link states for the FPCs in the local Virtual Chassis member.

**member member-id**—(MX Series routers only) (Optional) Display the switching fabric link states for the FPCs in the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**slot fpc-slot**—(PTX Series Packet Transport Routers only) (Optional) Display the fabric state of the specified FPC slot. If no value is provided, display the status of all FPCs.

**Output Fields** [Table 111 on page 1066](#) lists the output fields for the **show chassis fabric fpcs** command. Output fields are listed in the approximate order in which they appear.

Table 111: show chassis fabric fpcs Output Fields

Field Name	Field Description
<b>Fabric management FPC state</b>	<p>Switching fabric link (link from SIB to FPC) state for each FPC:</p> <ul style="list-style-type: none"> <li>• <b>Unused</b>—FPC is not present. (On MX240 and MX480 routers with AS- MLC modular carrier card or MPC4E only) the fabric plane from the pair that share physical links (1 and 5, and 3 and 7) is inactive.</li> <li>• <b>Destination error on PFEs <i>list of PFE numbers</i></b>—Destination errors to the listed Packet Forwarding Engines. Indicates that the link is not carrying traffic to the listed Packet Forwarding Engines.  <b>NOTE:</b> In Junos OS Release 9.6 and later, the list of Packet Forwarding Engines with destination errors is displayed in the output.  In Junos OS Releases before 9.6, the output only indicates that there are destination errors. However, the list of Packet Forwarding Engines with destination errors is not displayed.</li> <li>• <b>Links ok</b>—Link between the spare SIB and FPC is eligible to carry traffic.</li> <li>• <b>Link error</b>—Link between the SIB and FPC has CRC errors. However, the link is still eligible to carry traffic.</li> <li>• <b>Plane disabled</b>—Fabric plane has been disabled for the following reasons: <ul style="list-style-type: none"> <li>• Destination errors have exceeded the thresholds.</li> <li>• Run-time link errors have exceeded the thresholds.</li> <li>• Initialization time link errors detected, and link training was unsuccessful.</li> <li>• <b>Plane Disabled, Links Error</b> (PTX Series Packet Transport Routers only)—The plane is disabled because of link errors detected at the FPC RX.</li> </ul> </li> <li>• <b>Plane Disabled, Links Down</b> (PTX Series Packet Transport Routers only)—The plane is disabled because of link errors detected at the SIB RX.</li> <li>• <b>Plane enabled</b>—Link between the active SIB and FPC is eligible to carry traffic.  <b>NOTE:</b> On the Enhanced MX SCB with MPC, a maximum of 4 planes are operational and running. On all the other SCBs with MPC, all the planes are operational and running.</li> <li>• <b>Plane Enabled, Links OK</b> (PTX Series Packet Transport Routers only)—The FPC CCL RX link is eligible to carry traffic.</li> <li>• <b>Plane Enabled, Links OK</b> (TX Matrix and TX Matrix Plus routers only)—The FPC HSL RX link is eligible to carry traffic.</li> </ul>

## Sample Output

### show chassis fabric fpcs (M320 Router)

## show chassis fabric map

<b>List of Syntax</b>	<a href="#">Syntax on page 1101</a> <a href="#">Syntax (MX Series Router) on page 1101</a>
<b>Syntax</b>	<pre>show chassis fabric map plane &lt;plane-number&gt;</pre>
<b>Syntax (MX Series Router)</b>	<pre>show chassis fabric map &lt;all-members&gt; &lt;local&gt; &lt;member member-id&gt; &lt;plane plane-number&gt;</pre>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 8.0.</p> <p>Command introduced in Junos OS Release 9.4 for EX Series switches.</p>
<b>Description</b>	<p>(M120 and MX Series routers and EX8200 switches only) On the M120 router, display the state of the switching fabric map for connections from the Forwarding Engine Boards (FEBs) to the ports on the fabric planes, as interpreted by the fabric plane. On the MX Series router and the EX8200 switch, display the state of the switching fabric map for connections from each Packet Forwarding Engine on the Dense Port Concentrators (DPCs) to the ports on the fabric planes, as interpreted by the fabric plane. For information about the meaning of “fabric plane”, “DPCs”, and “SIBs” on the switches, see <a href="#">“EX Series Switches Hardware and CLI Terminology Mapping” on page 315</a>.</p>
<b>Options</b>	<p><b>none</b>—Display the switching fabric map state for the M120 or MX Series router or EX8200 switch.</p> <p><b>all-members</b>—(MX Series routers only) (Optional) Display the switching fabric map state for all the members of the Virtual Chassis configuration.</p> <p><b>local</b>—(MX Series routers only) (Optional) Display the switching fabric map state for the local Virtual Chassis member.</p> <p><b>member <i>member-id</i></b>—(MX Series routers only) (Optional) Display the switching fabric map state for the specified member of the Virtual Chassis configuration. Replace the <i>member-id</i> with a value of 0 or 1.</p> <p><b>plane <i>plane-number</i></b>—(Optional) Display the state of the fabric link for the specified plane number.</p> <ul style="list-style-type: none"> <li>For the M120 router, replace <i>plane-number</i> with a value from 0 through 3.</li> <li>For the MX480 and MX240 routers, replace <i>plane-number</i> with a value from 0 through 7.</li> <li>For the MX960 router, replace <i>plane-number</i> with a value from 0 through 5.</li> <li>For the EX8208 switch, replace <i>plane-number</i> with a value from 0 through 11.</li> <li>For the EX8216 switch, replace <i>plane-number</i> with a value from 0 through 7.</li> </ul>

**Required Privilege Level** view

**List of Sample Output** [show chassis fabric map \(M120 Router\) on page 1102](#)  
[show chassis fabric map \(MX Series Routers\) on page 1102](#)  
[show chassis fabric map plane 1 \(EX8200 Switch\) on page 1106](#)

**Output Fields** [Table 112 on page 1102](#) lists the output fields for the **show chassis fabric map** command. Output fields are listed in the approximate order in which they appear.

**Table 112: show chassis fabric map Output Fields**

Field Name	Field Description
<b>in-links</b>	Fabric map for receive side links.
<b>out-links</b>	Fabric map for transmit side links.
<b>state</b>	State of the fabric link: <ul style="list-style-type: none"> <li>• <b>RESET</b>—Link between SIB and FPC/DPC is powered down on purpose. This is done in all non-dual PFE based boards.</li> <li>• <b>UP</b>—Link between SIB and FPC/DPC is up and running.</li> <li>• <b>DOWN</b>—Link between SIB and FPC/DPC is powered down.</li> <li>• <b>FAULT</b>—SIB is in alarmed state where the SIB's plane is not operational for the following reasons: <ul style="list-style-type: none"> <li>• On-board F-chip is not operational.</li> <li>• Fiber optic connector faults.</li> <li>• FPC connector faults.</li> <li>• SIB midplane connector faults.</li> </ul> </li> </ul>

## Sample Output

### show chassis fabric map (M120 Router)

```
user@host> show chassis fabric map

<b>Syntax (MX Series Routers)</b>	show chassis fabric plane <detail   extensive   terse> <all-members> <local> <member <i>member-id</i> >
<b>Syntax (MX2010 and MX2020 3D Universal Edge Routers)</b>	show chassis fabric plane
<b>Release Information</b>	Command introduced in Junos OS Release 8.0. Command introduced in Junos OS Release 9.4 for EX Series switches. <b>detail</b> , <b>extensive</b> , <b>lcc</b> , <b>sfc</b> , and <b>terse</b> options introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
<b>Description</b>	(TX Matrix Plus router, T4000, T1600, M120, and MX Series routers and EX8200 switches only) On the M120 router, display the state of all fabric plane connections to the Forwarding Engine Boards (FEBs). On MX Series routers, display the state of all fabric plane connections to the Dense Port Concentrators (DPCs) and Packet Forwarding Engines (PFEs) on the Flexible PIC Concentrators (FPCs). On the TX Matrix Plus router, and on T1600 or T4000 routers in a routing matrix, display the state of the fabric management plane and the logical planes on the switch-fabric chassis (SFC) and line-card chassis (LCC). On EX8200 switches, display the state of all fabric planes. This command can be used on the master Routing Engine only.
<b>Options</b>	<b>none</b> —(MX2010 and MX2020 Routers only) (Optional) Display the state of the fabric management plane.  <b>detail</b> —(TX Matrix Plus routers, T1600 or T4000 routers in a routing matrix, and MX Series routers only) (Optional) Display detailed output for the fabric management plane. Show Switch Interface Board (SIB) states for the TXP-F13 SIB and the TXP-F2S SIB.  <b>extensive</b> —(TX Matrix Plus routers, T1600 or T4000 routers in a routing matrix, and MX Series routers only) (Optional) Display extensive output for the fabric management plane.

**terse**—(TX Matrix Plus routers and MX Series routers only) (Optional) Display terse output for the fabric management plane.

**all-members**—(MX Series routers only) (Optional) Display the state of all fabric plane connections on all members of the Virtual Chassis configuration.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display the state of all fabric plane connections on the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display the state of all fabric plane connections on the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**sfc *number***—(TX Matrix Plus router only) (Optional) Show information about the TX Matrix Plus router (SFC). Replace *number* with 0.

**Output Fields** Table 113 on page 1110 lists the output fields for the **show chassis fabric plane** command. Output fields are listed in the approximate order in which they appear.

**Table 113: show chassis fabric plane Output Fields**

Field Name	Field Description	Level of output
<b>Plane</b>	(TX Matrix Plus, MX Series routers, M120 routers, and EX8200 switches only) Number of the plane.	none
<b>Plane state</b>	<p>(MX Series and M120 routers and EX8200 switches only) State of each plane:</p> <ul style="list-style-type: none"> <li>• <b>ACTIVE</b>—SIB is operational and running.</li> </ul> <p><b>NOTE:</b> On the Enhanced MX SCB with MPCs, a maximum of 4 planes are operational and running. On all the other SCBs with MPCs, all the planes are operational and running.</p> <ul style="list-style-type: none"> <li>• <b>FAULTY</b>— SIB is in alarmed state where the SIB's plane is not operational for the following reasons: <ul style="list-style-type: none"> <li>• On-board fabric ASIC is not operational.</li> <li>• Fiber optic connector faults.</li> <li>• FPC connector faults.</li> <li>• SIB midplane connector faults.</li> </ul> </li> </ul> <p>(MX2010 and MX2020 Routers only) State of each plane:</p> <ul style="list-style-type: none"> <li>• <b>ACTIVE</b>—SFB is operational and running.</li> <li>• <b>OFFLINE</b>— SFB is in offline.</li> </ul>	none
<b>FEB</b>	<p>(M120 routers only) FEB number and state of links to each FEB:</p> <ul style="list-style-type: none"> <li>• <b>Link error</b>—Link between SIB and FPC is not operational.</li> <li>• <b>Links ok</b>—Link between SIB and FPC is active.</li> <li>• <b>Unused</b>—No FPC is present.</li> </ul>	none

Table 113: show chassis fabric plane Output Fields (*continued*)

Field Name	Field Description	Level of output
FPC	(MX Series routers only) Slot number of each Dense Port Concentrator (DPC) or Flexible PIC Concentrator (FPC). An FPC occupies two DPC slots on an MX Series router. The interface corresponds to the lowest numbered DPC slot for which the FPC is installed.	none
PFE	<p>(MX Series and M120 routers only) Slot number of each Packet Forwarding Engine and the state of the links to the DCP: <b>Links ok</b>, <b>Link error</b>, or <b>Unused</b>. Each DPC includes four Packet Forwarding Engines.</p> <ul style="list-style-type: none"> <li>• <b>Links ok</b>: Link between SIB and FPC is active.</li> <li>• <b>Link error</b>: Link between SIB and FPC is not operational.</li> <li>• <b>Unused</b>: No FPC is present.</li> </ul> <p>(On MX240 and MX480 routers with AS MLC modular carrier card and MPC4E only) Indicates that the link between the fabric plane and the hardware link on the modular carrier card or MPC4E is not operational.</p> <p>(MX2010 and MX2020 routers only) Slot number of each Packet Forwarding Engine and the state of the links to the DPC: <b>Links ok</b>, <b>Link error</b>, or <b>Unused</b>. Each DPC includes four Packet Forwarding Engines.</p> <ul style="list-style-type: none"> <li>• <b>Links ok</b>: Link between SFB and FPC is active.</li> <li>• <b>Link error</b>: Link between SFB and FPC is not operational.</li> <li>• <b>Unused</b>: No FPC is present.</li> </ul>	none

Table 113: show chassis fabric plane Output Fields (*continued*)

Field Name	Field Description	Level of output
<b>State</b>	<p>(TX Matrix Plus, and T1600 or T4000 routers in a routing matrix only)—State of the fabric plane:</p> <ul style="list-style-type: none"> <li>• <b>Online</b>: Fabric plane is operational and running and links on the SIB are operational.</li> <li>• <b>Offline</b>: Fabric plane state is <b>Offline</b> because the plane does not have four or more F2S and one F13 online.</li> <li>• <b>Empty</b>: Fabric plane state is <b>Empty</b> if all SIBs in the plane are absent.</li> <li>• <b>Spare</b>: Fabric plane is redundant and can be operational if the operational fabric plane encounters an error.</li> <li>• <b>Check</b>: Fabric plane is in alarmed state due to the following reason and the cause of the error must be resolved: <ul style="list-style-type: none"> <li>• One or more SIBs (belonging to the fabric plane) in the <b>Online</b> or <b>Spare</b> states has transitioned to the <b>Check</b> state. <b>Check</b> state of the SIB can be caused by link errors or destination errors.</li> </ul> </li> <li>• <b>Fault</b>: Fabric plane is in alarmed state if one or more SIBs belonging to the plane are in the <b>Fault</b> state. A SIB can be in the <b>Fault</b> state because of the following reasons: <ul style="list-style-type: none"> <li>• On-board fabric ASIC is not operational.</li> <li>• Fiber optic connector faults.</li> <li>• FPC connector faults.</li> <li>• SIB midplane connector faults.</li> <li>• Link errors have exceeded the threshold.</li> </ul> </li> </ul>	none
<b>Link Errors</b>	(TX Matrix Plus routers with 3D SIBs only) indicate the number of links which are marked faulty because the errors on them have crossed threshold.	none
<b>Cable Errors</b>	(TX Matrix Plus routers with 3D SIBs only) Indicate the number of mandatory cables that are not connected, or in up state for that plane	none
<b>Destination Errors</b>	(TX Matrix Plus routers with 3D SIBs only) Indicates the number of destinations that are not reachable on this plane.	none
<b>Uptime</b>	(TX Matrix Plus, and T1600 or T4000 routers in a routing matrix only)—Time the fabric plane has been up and running.	none

Fabric Management Plane State Output Fields for the show chassis fabric plane extensive Command on a TX Matrix Plus Router

Table 113: show chassis fabric plane Output Fields (*continued*)

Field Name	Field Description	Level of output
<b>PLANE number</b>	<p>State of the fabric plane:</p> <ul style="list-style-type: none"> <li>• <b>Online</b>: Fabric plane is operational and running and links on the SIB are operational.</li> <li>• <b>Offline</b>: Fabric plane state is <b>Offline</b> because the plane does not have 4 or more F2S and 1 F13 online.</li> <li>• <b>Empty</b>: Fabric plane state is <b>Empty</b> if all SIBs in the plane are absent.</li> <li>• <b>Spare</b>: Fabric plane is redundant and can be operational if the operational fabric plane encounters an error.</li> <li>• <b>Check</b>: Fabric plane is in alarmed state due to the following reasons and the cause of the error must be resolved: <ul style="list-style-type: none"> <li>• One or more SIBs (belonging to the fabric plane) in the <b>Online</b> or <b>Spare</b> states has transitioned to the <b>Check</b> state. <b>Check</b> state of the SIB can be caused because of link errors or destination errors.</li> </ul> </li> <li>• <b>Fault</b>: Fabric plane is in alarmed state if one or more SIBs belonging to the plane are in the <b>Fault</b> state. A SIB can be in the <b>Fault</b> state because of the following reasons: <ul style="list-style-type: none"> <li>• On-board fabric ASIC is not operational.</li> <li>• Fiber optic connector faults.</li> <li>• FPC connector faults.</li> <li>• SIB midplane connector faults.</li> <li>• Link errors have exceeded the threshold.</li> </ul> </li> </ul>	<b>extensive</b>
<b>SIB F13/F2S slot-number</b>	<p>State of the TXP-F13 SIB or TXP-F2S SIB:</p> <ul style="list-style-type: none"> <li>• <b>Activating</b>—Transitional state when the SIB is transitioning to the <b>Online</b> or <b>Spare</b> state.</li> <li>• <b>Deactivating</b>—Transitional state when the SIB is going offline.</li> <li>• <b>Online</b>—SIB is operational and running.</li> <li>• <b>Offline</b>—SIB is powered down.</li> <li>• <b>Spare</b>—SIB is redundant and will move to active state if one of the working SIBs fails to pass traffic.</li> <li>• <b>Empty</b>—No SIB is present.</li> <li>• <b>Fault</b>—SIB is in alarmed state because of the following reasons and the cause of the error must be resolved: <ul style="list-style-type: none"> <li>• On-board fabric ASIC is not operational.</li> <li>• Fiber optic connector faults.</li> <li>• FPC connector faults.</li> <li>• SIB midplane connector faults.</li> <li>• Link errors have exceeded the threshold</li> </ul> </li> <li>• <b>Check</b>—SIB is in alarmed state where the SIB is partially operational because of link or destination errors. Only a SIB that is <b>Online</b> or <b>Spare</b> can transition to the <b>Check</b> state.</li> </ul> <p><b>NOTE:</b> If a SIB is not inserted properly, the SIB cannot transition to the <b>Online</b> or <b>Spare</b> state, and therefore cannot transition to the <b>Check</b> state.</p>	<b>extensive</b>

Table 113: show chassis fabric plane Output Fields (*continued*)

Field Name	Field Description	Level of output
<b>SIB F13 slot-number Odd/Even</b>	State of the TXP-F13 SIB even and odd port connection optical links from the TX Matrix Plus router (SFC) to the router (LCC) in the routing matrix. The left four ports on the SFC are labeled <b>Even</b> and provide connections to one even-numbered LCC—LCC0 or LCC2. The right four ports on the SFC are labeled <b>Odd</b> and provide connections to one odd-numbered LCC—LCC1 or LCC3.	<b>extensive</b>
<b>LCC number, SIB slot-number</b>	<p>State of the SIB on the LCC that is connected to the <b>Even</b> or <b>Odd</b> port on the TXP-F13 SIB faceplate:</p> <ul style="list-style-type: none"> <li>• <b>Links ok</b>—Links between the TXP-F13 SIB on the SFC and the LCC are active.</li> <li>• <b>Links error</b>—One or more links between the TXP-F13 SIB on the SFC and the LCC, have experienced an error, but the affected links remain operational.</li> <li>• <b>Unused</b>—No SIB is present.</li> </ul>	<b>extensive</b>
<b>SG number Port number</b>	<p>State of the SG chip ports on the LCC:</p> <ul style="list-style-type: none"> <li>• <b>Links ok</b>—Link is active.</li> <li>• <b>Link error</b>—Link is operational with errors.</li> <li>• <b>Link error crc saturated</b>—CRC has exceeded the rate threshold and reached saturation without optical issues—that is, a cable has not been cut, removed, or otherwise experienced an error.</li> <li>• <b>Link error crc saturated with optical errors</b>—CRC has exceeded the rate threshold and reached saturation with optical issues—that is, a cable has been cut, removed, or otherwise experienced an error.</li> <li>• <b>Unused</b>—Port is not in use.</li> </ul>	<b>extensive</b>
<b>SIB F2S slot-number</b>	State of the intra-chassis links between the TXP-F2S and TXP-F13 SIBs.	<b>extensive</b>

Fabric Management SIB State Output Fields for the show chassis fabric plane extensive Command on a TX Matrix Plus Router

Table 113: show chassis fabric plane Output Fields (*continued*)

Field Name	Field Description	Level of output
<i>SIB slot-number</i>	<p>State of the SIBs on the T1600/T4000 router (LCC) in the routing matrix:</p> <ul style="list-style-type: none"> <li>• <b>Activating</b>—Transitional state when the SIB is coming online.</li> <li>• <b>Deactivating</b>—Transitional state when the SIB is going offline.</li> <li>• <b>Connected</b>—SIBs on an LCC are connected and trained, but are either not online or are spare, because the plane on the the TX Matrix Plus router (SFC) is still offline. The LCC SIB transitions to the <b>Connected</b> state when the F13 SIB to which it connects is online but the SFC plane (to which the LCC SIB connects) is offline for some reason; for instance, when there are insufficient number of F2 SIBs in the plane.</li> <li>• <b>Disconnected</b>—If an F13 SIB on the TX Matrix Plus router (SFC) goes offline, then the SIBs on the LCCs connected to the F13 SIB get disconnected. On the TX Matrix Plus router with 3D SIBs, the LCC SIB is also disconnected if the F13 SIB is online, but none of the cables are connected or trained. The <b>Disconnected</b> state is valid only for SIBs on an LCC. An LCC SIB transitions to the <b>Disconnected</b> state when the F13 SIB to which it connects goes <b>Offline</b>, irrespective of the state of the SFC plane. <b>SFC Error</b>—If an F13 SIB on the TX Matrix Plus router (SFC) transitions to the <b>Fault</b> state (because of link errors, for instance), and if an LCC SIB connected to the F13 SIB comes online, the LCC SIB transitions to the <b>SFC Error</b> state. This state indicates that the F13 SIB to which the LCC SIB is connected has errors. <b>NOTE:</b> The <b>Connected</b>, <b>Disconnected</b>, and <b>SFC Error</b> states are applicable only to the SIBs on an LCC.</li> <li>• <b>Online</b>—SIB is operational and running.</li> <li>• <b>Offline</b>—SIB is powered down.</li> <li>• <b>Spare</b>—SIB is redundant and will move to active state if one of the working SIBs fails to pass traffic.</li> <li>• <b>Empty</b>—No SIB is present.</li> <li>• <b>Fault</b>—SIB is in alarmed state where the SIB's plane is not operational for the following reasons: <ul style="list-style-type: none"> <li>• On-board fabric ASIC is not operational.</li> <li>• Fiber optic connector faults.</li> <li>• FPC connector faults.</li> <li>• SIB midplane connector faults.</li> <li>• Link errors have exceeded the threshold</li> </ul> </li> <li>• <b>Check</b>—SIB is in alarmed state where the SIB is partially operational because of link or destination errors. Only a SIB that is <b>Online</b> or <b>Spare</b> can transition to the <b>Check</b> state. <b>NOTE:</b> If a SIB is not inserted properly, the SIB cannot transition to the <b>Online</b> or <b>Spare</b> state, and therefore cannot transition to the <b>Check</b> state.</li> </ul>	<b>extensive</b>

Table 113: show chassis fabric plane Output Fields (*continued*)

Field Name	Field Description	Level of output
<b>LCC SIB Link State</b>	State of the LCC SIB link: <ul style="list-style-type: none"> <li>• <b>Links ok</b>—Link is active.</li> <li>• <b>Links error</b>—A link error has occurred, but the link remains operational.</li> <li>• <b>Unused</b>—SIB is not in use.</li> </ul>	<b>extensive</b>
<b>SG number Port number</b>	State of the SG chip ports on the LCC: <ul style="list-style-type: none"> <li>• <b>Links ok</b>—Link is active.</li> <li>• <b>Link error</b>—Link is operational with errors.</li> <li>• <b>Link error crc saturated</b>—CRC has exceeded the rate threshold and reached saturation without optical issues—that is, a cable has not been cut, removed, or otherwise experienced an error.</li> <li>• <b>Link error crc saturated with optical errors</b>—CRC has exceeded the rate threshold and reached saturation with optical issues—that is, a cable has been cut, removed, or otherwise experienced an error.</li> <li>• <b>Unused</b>—Port is not in use.</li> </ul>	<b>extensive</b>

## Sample Output

### show chassis fabric plane (M120 Router)

```

user@host> show chassis fabric plane

## show chassis fabric plane-location

---

<b>List of Syntax</b>	<a href="#">Syntax on page 1150</a> <a href="#">Syntax (MX Series Routers) on page 1150</a> <a href="#">Syntax (MX2010 3D Universal Edge Routers) on page 1150</a> <a href="#">Syntax (MX2020 3D Universal Edge Routers) on page 1150</a> <a href="#">Syntax (TX Matrix Plus Router) on page 1150</a>
<b>Syntax</b>	show chassis fabric plane-location
<b>Syntax (MX Series Routers)</b>	show chassis fabric plane-location <all-members> <local> <member <i>member-id</i> >
<b>Syntax (MX2010 3D Universal Edge Routers)</b>	show chassis fabric plane-location
<b>Syntax (MX2020 3D Universal Edge Routers)</b>	show chassis fabric plane-location
<b>Syntax (TX Matrix Plus Router)</b>	show chassis fabric plane-location
<b>Release Information</b>	Command introduced in Junos OS Release 8.0. Command introduced in Junos OS Release 9.4 for EX Series switches. Command introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers. Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers. Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.
<b>Description</b>	(M120, MX Series routers, and EX8200 switches only) Display the Control Board (CB) location of each plane. This command can be used on the master Routing Engine or the backup Routing Engine. For information about the meaning of “CBs” and “fabric plane” on the switches, see <a href="#">“EX Series Switches Hardware and CLI Terminology Mapping” on page 315</a> .  (TX Matrix Plus routers only) Display the SIB location of each fabric plane.  (PTX Series Packet Transport Routers only) Display the fabric plane location of each SIB.  (MX2010 and MX2020 Routers only) Display the fabric plane location of each Switch Fabric Board (SFB).
<b>Options</b>	<b>all-members</b> —(MX Series routers only) (Optional) Display the CB location of each fabric plane on the Routing Engines in all member routers in the Virtual Chassis configuration.

**local**—(MX Series routers only) (Optional) Display the CB location of each fabric plane on the Routing Engines in the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display the CB location of each fabric plane on the Routing Engines in the specified member in the Virtual Chassis configuration. Replace ***member-id*** with a value of 0 or 1.

**Required Privilege Level** view

**Output Fields** [Table 114 on page 1151](#) lists the output fields for the **show chassis fabric plane-location** command. Output fields are listed in the approximate order in which they appear.

**Table 114: show chassis fabric plane-location Output Fields**

Field Name	Field Description
<b>Plane <i>n</i></b>	Plane number.  (PTX Series Packet Transport Routers only) Plane numbers associated with the SIB.  (MX2010 and MX2020 Routers only) Plane numbers associated with the SFB.
<b>Control Board <i>n</i></b>	Control board number.
<b>SFC ABS-SIB-F13</b>	(TX Matrix Plus routers only) Switch Interface Board (SIB) slot number on the F13 SIB.
<b>SFC ABS-SIB-F2S</b>	(TX Matrix Plus routers only) SIB slot number on the F2S SIB.
<b>LCC ST-SIB-L</b>	(TX Matrix Plus routers only) Line-card chassis (LCC) SIB slot number.
<b>SFC SIB F13</b>	(TX Matrix Plus routers with 3D SIBs only) Switch Interface Board (SIB) slot number on the F13 SIB.
<b>SFC SIB F2S</b>	(TX Matrix Plus routers with 3D SIBs only) SIB slot number on the F2S SIB.
<b>LCC SIB</b>	(TX Matrix Plus routers with 3D SIBs only) Line-card chassis (LCC) SIB slot number.

Table 114: show chassis fabric plane-location Output Fields (*continued*)

Field Name	Field Description
SIB	(PTX Series Packet Transport Routers only) SIB number.
Switch Fabric Board <i>n</i>	(MX2010 and MX2020 Routers only) SFB number.

## Sample Output

### show chassis fabric plane-location (M120 Router)

```

user@host> show chassis fabric plane-location
-----Fabric Plane Locations-----
Plane 0                Control Board 0
Plane 1                Control Board 0
Plane 2                Control Board 1
Plane 3                Control Board 1

```

### show chassis fabric plane-location (MX240 and MX480 Routers)

```

user@host> show chassis fabric plane-location
-----Fabric Plane Locations-----
Plane 0                Control Board 0
Plane 1                Control Board 0
Plane 2                Control Board 0
Plane 3                Control Board 0
Plane 4                Control Board 1
Plane 5                Control Board 1
Plane 6                Control Board 1
Plane 7                Control Board 1

```

### show chassis fabric plane-location (MX960 Router)

```

user@host> show chassis fabric plane-location
-----Fabric Plane Locations-----
Plane 0                Control Board 0
Plane 1                Control Board 0
Plane 2                Control Board 1
Plane 3                Control Board 1
Plane 4                Control Board 2
Plane 5                Control Board 2

```

### show chassis fabric plane-location (MX2010 Router)

```

user@host> show chassis fabric plane-location
-----Fabric Plane Locations-----
Plane 0                Switch Fabric Board 0
Plane 1                Switch Fabric Board 1
Plane 2                Switch Fabric Board 2
Plane 3                Switch Fabric Board 3
Plane 4                Switch Fabric Board 4
Plane 5                Switch Fabric Board 5
Plane 6                Switch Fabric Board 6
Plane 7                Switch Fabric Board 7

```

### show chassis fabric plane-location (MX2020 Router)

```

user@host> show chassis fabric plane-location

```

```

-----Fabric Plane Locations-----
Plane 0          Switch Fabric Board 0

## show chassis fabric summary

<b>Syntax</b>	show chassis fabric summary
<b>Release Information</b>	<p>Command introduced in Junos OS Release 8.4.</p> <p>Command introduced in Junos OS Release 9.4 for EX Series switches.</p> <p>Command introduced in Junos OS Release 12.1X48 for PTX Series Packet Transport Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.</p> <p>Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.</p>
<b>Description</b>	(MX Series routers and EX8200 switches only) Display the state of all fabric planes and the elapsed uptime.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<p><a href="#">show chassis fabric summary (MX240 Router) on page 1157</a></p> <p><a href="#">show chassis fabric summary (MX480 Router) on page 1157</a></p> <p><a href="#">show chassis fabric summary (MX480 Router with MPC4E) on page 1157</a></p> <p><a href="#">show chassis fabric summary (MX960 Router) on page 1157</a></p> <p><a href="#">show chassis fabric summary (MX2010 Router) on page 1158</a></p> <p><a href="#">show chassis fabric summary (MX2020 Router) on page 1158</a></p> <p><a href="#">show chassis fabric summary (MX2020 Router with MPC4E) on page 1158</a></p> <p><a href="#">show chassis fabric summary (EX8200 Switch) on page 1158</a></p> <p><a href="#">show chassis fabric summary (PTX Series Packet Transport Router) on page 1159</a></p>
<b>Output Fields</b>	<p><a href="#">Table 115 on page 1155</a> lists the output fields for the <b>show chassis fabric summary</b> command. Output fields are listed in the approximate order in which they appear.</p>

**Table 115: show chassis fabric summary Output Fields**

Field Name	Field Description
Plane	(MX Series, MX2020 and MX2010 Routers only) Plane number.

Table 115: show chassis fabric summary Output Fields (*continued*)

Field Name	Field Description
<b>State</b>	<p>(MX Series) State of the SIB or FPC:</p> <ul style="list-style-type: none"> <li>• <b>Online</b>—Switch Interface Board (SIB) is operational and running.</li> </ul> <p><b>NOTE:</b> On the Enhanced MX SCB with Trio MPC, a maximum of 4 planes are operational and running. On all the other SCBs with Trio MPC, all the planes are operational and running.</p> <ul style="list-style-type: none"> <li>• <b>Empty</b>—SIB is powered down.</li> <li>• <b>Check</b>—SIB is in the <b>Check</b> state because of the following reasons: <ul style="list-style-type: none"> <li>• SIB is not inserted properly.</li> <li>• Some destination errors are detected on the SIB. In this case, the Packet Forwarding Engine stops using the SIB to send traffic to the affected destination Packet Forwarding Engine.</li> <li>• Some link errors are detected on the channel between the SIB and a Packet Forwarding Engine. Link errors can be detected at initialization time or runtime: <ul style="list-style-type: none"> <li>• Link errors caused by a link training failure at initialization time—The Packet Forwarding Engine does not use the SIB to send traffic. The <b>show chassis fabric fpcs</b> command shows <b>Plane disabled</b> as status for this link.</li> <li>• Link errors caused by CRC errors detected at runtime—The Packet Forwarding Engine continues to use the SIB to send traffic. The <b>show chassis fabric fpcs</b> command shows <b>Link error</b> as the status for this link.</li> </ul> </li> </ul> </li> </ul> <p><b>NOTE:</b> The <b>Check</b> state does not apply to PTX Series Packet Transport Routers because there are no SIBs in the Check state.</p> <p>For information about link and destination errors, issue the <b>show chassis fabric fpcs</b> commands.</p> <ul style="list-style-type: none"> <li>• <b>Spare</b>—SIB is redundant and will move to active state if one of the working SIBs fails.</li> </ul> <p><b>NOTE:</b> <b>Spare</b> does not apply to PTX Series Packet Transport Routers because there are no spare SIBs in the device.</p> <p>(MX2010 and MX2020 Routers) State of the SFB.</p> <ul style="list-style-type: none"> <li>• <b>Online</b>—Switch Fabric Board (SFB) is operational and running.</li> <li>• <b>Offline</b>—Switch Fabric Board (SFB) is powered down.</li> <li>• <b>Check</b>—Switch Fabric Board (SFB) is in the check state.</li> </ul>
<b>Errors</b>	<p>(PTX Series only) Indicates whether there is any error on the SIB.</p> <ul style="list-style-type: none"> <li>• <b>None</b>—No errors</li> <li>• <b>Link Errors</b>—Fabric link errors were found on the SIB RX link.</li> <li>• <b>Cell drops</b>—Fabric cell drops were found on the SIB ASIC.</li> <li>• <b>Link, Cell drops</b>—Both Link errors and cell drops were detected on at least one of the FPC's fabric links.</li> </ul> <p><b>NOTE:</b> The <b>Errors</b> column is empty only when the FPC or SIB is offline.</p>

Table 115: show chassis fabric summary Output Fields (*continued*)

Field Name	Field Description
<b>Uptime</b>	(MX Series, MX2010 and MX2020 Routers) Elapsed time the plane has been online.

## Sample Output

### show chassis fabric summary (MX240 Router)

```
user@host> show chassis fabric summary
Plane  State  Uptime
0      Online 23 hours, 26 minutes, 54 seconds
1      Online 23 hours, 26 minutes, 54 seconds
2      Check 18 hours, 33 minutes, 42 seconds
3      Online 23 hours, 26 minutes, 54 seconds
4      Spare 23 hours, 26 minutes, 54 seconds
5      Spare 23 hours, 26 minutes, 54 seconds
6      Spare 23 hours, 26 minutes, 54 seconds
7      Spare 23 hours, 26 minutes, 54 seconds
```

### show chassis fabric summary (MX480 Router)

```
user@host> show chassis fabric summary
Plane  State  Uptime
0      Online 8 hours, 45 minutes, 29 seconds
1      Online 8 hours, 45 minutes, 28 seconds
2      Online 8 hours, 45 minutes, 28 seconds
3      Online 8 hours, 45 minutes, 28 seconds
4      Spare 8 hours, 45 minutes, 28 seconds
5      Spare 8 hours, 45 minutes, 28 seconds
6      Spare 8 hours, 45 minutes, 28 seconds
7      Check 6 hours, 10 minutes, 12 seconds
```

### show chassis fabric summary (MX480 Router with MPC4E)

```
user@host > show chassis fabric summary
Plane  State  Uptime
0      Online 6 hours, 57 minutes, 44 seconds
1      Online 6 hours, 57 minutes, 40 seconds
2      Online 6 hours, 57 minutes, 39 seconds
3      Online 6 hours, 57 minutes, 34 seconds
4      Spare 6 hours, 57 minutes, 34 seconds
5      Spare 6 hours, 57 minutes, 29 seconds
6      Spare 6 hours, 57 minutes, 29 seconds
7      Spare 6 hours, 57 minutes, 24 seconds

Note:
For FPC slots with MPC Type 4 or MCC:
Fabric planes 1 and 5, 3 and 7 use shared physical links.
Those slots may run in a reduced bandwidth in case both
plane 1 and 5, or both 3 and 7 are active.
```

### show chassis fabric summary (MX960 Router)

```
user@host> show chassis fabric summary
Plane  State  Uptime
0      Online 3 hours, 7 minutes, 9 seconds
1      Online 3 hours, 7 minutes, 4 seconds
```

2	Online	3 hours, 6 minutes, 59 seconds
3	Online	3 hours, 6 minutes, 54 seconds
4	Empty	
5	Empty	

#### show chassis fabric summary (MX2010 Router)

```
user@host> show chassis fabric summary
```

Plane	State	Uptime
0	Online	1 day, 13 hours, 20 minutes, 10 seconds
1	Online	1 day, 13 hours, 19 minutes, 59 seconds
2	Online	1 day, 13 hours, 19 minutes, 49 seconds
3	Offline	
4	Online	1 day, 13 hours, 19 minutes, 28 seconds
5	Check	1 day, 13 hours, 19 minutes, 17 seconds
6	Online	1 day, 13 hours, 19 minutes, 6 seconds
7	Online	1 hour, 43 minutes, 5 seconds

#### show chassis fabric summary (MX2020 Router)

```
user@host> show chassis fabric summary
```

Plane	State	Uptime
0	Online	8 hours, 24 minutes, 1 second
1	Online	8 hours, 47 minutes, 54 seconds
2	Online	8 hours, 47 minutes, 44 seconds
3	Online	8 hours, 47 minutes, 33 seconds
4	Online	8 hours, 47 minutes, 22 seconds
5	Online	8 hours, 47 minutes, 12 seconds
6	Online	8 hours, 47 minutes, 1 second
7	Online	8 hours, 46 minutes, 50 seconds

#### show chassis fabric summary (MX2020 Router with MPC4E)

```
user@host > show chassis fabric summary
```

Plane	State	Uptime
0	Online	3 days, 6 hours, 58 minutes, 29 seconds
1	Online	3 days, 6 hours, 58 minutes, 18 seconds
2	Online	3 days, 6 hours, 58 minutes, 8 seconds
3	Online	3 days, 6 hours, 57 minutes, 57 seconds
4	Online	3 days, 6 hours, 57 minutes, 46 seconds
5	Online	3 days, 6 hours, 57 minutes, 36 seconds
6	Online	3 days, 6 hours, 57 minutes, 25 seconds
7	Online	3 days, 6 hours, 57 minutes, 14 seconds

#### show chassis fabric summary (EX8200 Switch)

```
user@host> show chassis fabric summary
```

Plane	State	Uptime
0	Online	12 days, 50 minutes, 54 seconds
1	Online	12 days, 50 minutes, 53 seconds
2	Online	12 days, 50 minutes, 53 seconds
3	Online	12 days, 50 minutes, 52 seconds
4	Spare	12 days, 50 minutes, 49 seconds
5	Spare	12 days, 50 minutes, 47 seconds
6	Spare	12 days, 50 minutes, 47 seconds
7	Spare	12 days, 50 minutes, 46 seconds
8	Online	12 days, 50 minutes, 52 seconds
9	Online	12 days, 50 minutes, 50 seconds
10	Online	12 days, 50 minutes, 50 seconds
11	Online	12 days, 50 minutes, 49 seconds

**show chassis fabric summary (PTX Series Packet Transport Router)**

<b>Release Information</b>	Command introduced before Junos OS Release 7.4.

Command introduced in Junos OS Release 9.0 for EX Series switches.

Command introduced in Junos OS Release 11.1 for QFX Series.

Command introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers.

Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.

Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.

Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.

Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.

**Description** Display status information about the installed Flexible PIC Concentrators (FPCs) and PICs.

**Options** **none**—Display status information for all FPCs. On a TX Matrix router, display status information for all FPCs on the attached T640 routers in the routing matrix. On a TX Matrix Plus router, display status information for all FPCs on the attached routers in the routing matrix.

**NOTE:** In EX8200 switches, line cards initialize Packet Forwarding Engine during startup. If an error occurs during hardware initialization, the FPCs with bad hardware parts power down after transferring the debug information to the Routing Engine. The Routing Engine marks the FPC offline, logs the error in system log messages (/var/log/messages), and generates an alarm to inform the user.

See the following sample output:

```
user@host> show chassis fpc
```

Utilization (%)	Temp	CPU	Utilization (%)	Memory
Slot State	(C)	Total	Interrupt	DRAM (MB) Heap
Buffer				
0 Empty				
1 Empty				
2 Empty				
3 Empty				
4 Empty				
5 Offline	---	Hard FPC error---		
6 Empty				
7 Online	26	4	0	1024 0
32				

The following sample output shows the alarm raised for the failed FPCs.

```
user@host > show chassis alarms
4 alarms currently active
```

Alarm time	Class	Description
2011-03-24 00:52:51 UTC	Major	FPC 5 Hard errors
2011-03-24 00:52:31 UTC	Major	Fan Tray Failure
2011-03-24 00:52:31 UTC	Major	Fan Tray Failure
2011-03-24 00:51:26 UTC	Minor	Loss of communication with Backup RE

**NOTE:** On T4000 routers, when you include the enhanced-mode statement at the [edit chassis network-services] hierarchy level and reboot the system, only the T4000 Type 5 FPCs present on the router become online while the remaining FPCs are offline, and FPC misconfiguration alarms are generated. The show chassis alarm command output displays FPC misconfiguration (FPC *fpc-slot* misconfig) as the reason for the generation the alarms.

The following sample output shows the FPC status after the enhanced-mode statement is configured on the T4000 router. The T4000 Type 5 FPC present in slot 5 becomes online while the remaining FPCs are offline.

```
user@host> show chassis fpc
```

	Temp	CPU Utilization (%)	Memory
Utilization (%)			
Slot State	(C)	Total	Interrupt
Buffer			DRAM (MB) Heap
0 offline	---	FPC misconfiguration---	
1 offline	---	FPC misconfiguration---	
2 offline	---	FPC misconfiguration---	
3 Empty			
4 Empty			
5 Online	66	50	0
27			2816 29

The following sample output shows FPC misconfiguration alarms.

```
user@host > show chassis alarms
3 alarms currently active
Alarm time      Class  Description

```

**detail**—(Optional) Display detailed status information for all FPCs or for the FPC in the specified slot (see *fpc-slot* or *slot*).

**all-members**—(MX Series routers and EX Series switches only) (Optional) Display status information for all FPCs on all members of the Virtual Chassis configuration.

**interconnect-device name**—(QFabric systems only) (Optional) Display status information for all FPCs on the Interconnect device.

**fpc-slot**—(Optional) FPC slot number:

- (TX Matrix and TX Matrix Plus router only)—On a TX Matrix router, if you specify the number of the T640 router (line-card chassis) by using the **lcc number** option (the recommended method), replace *fpc-slot* with a value from 0 through 7. Otherwise, replace *fpc-slot* with a value from 0 through 31. Likewise, on a TX Matrix Plus router, if you specify the number of the specified router (line-card chassis) by using the **lcc number** option (the recommended method), replace *fpc-slot* with

a value from 0 through 7. Otherwise, replace *fpc-slot* with a value from 0 through 31. For example, the following commands have the same result:

```
user@host> show chassis fpc detail 1 lcc 1
user@host> show chassis fpc detail 9
```

- M120 router—Replace *fpc-slot* with a value from 0 through 5.
- MX80 router—Replace *fpc-slot* with a value from 0 through 1.
- MX104 router—Replace *fpc-slot* with a value from 0 through 2.
- MX240 router—Replace *fpc-slot* with a value from 0 through 2.
- MX480 router—Replace *fpc-slot* with a value from 0 through 5.
- MX-960 router—Replace *fpc-slot* with a value from 0 through 11.
- MX2010 router—Replace *fpc-slot-number* with a value from 0 through 9.
- MX2020 router—Replace *fpc-slot-number* with a value from 0 through 19.
- Other routers—Replace *fpc-slot* with a value from 0 through 7.
- EX Series switches:
  - EX3200 switches and EX4200 standalone switches—Replace *fpc-slot* with 0.
  - EX4200 switches in a Virtual Chassis configuration—Replace *fpc-slot* with a value from 0 through 9.
  - EX6210 switches—Replace *fpc-slot* with a value from 0 through 9.
  - EX8208 switches—Replace *fpc-slot* with a value from 0 through 7.
  - EX8216 switches—Replace *fpc-slot* with a value from 0 through 15.
- QFX Series:
  - QFX3500 switches—Replace *fpc-slot* with 0.
  - QFabric systems—Replace *fpc-slot* with 0 through 31 on the Interconnect device.
- PTX Series Packet Transport Routers:
  - PTX5000 Packet Transport Router—Replace *fpc-slot* with a value from 0 through 7.
- ACX Series Universal Access Routers:
  - ACX1000 and ACX2000 Universal Access Routers—Replace *fpc-slot* with 0.

**local**—(MX Series routers and EX Series switches only) (Optional) Display status information for all FPCs on the local Virtual Chassis member.

**member *member-id***—(MX Series routers and EX Series switches only) (Optional) Display status information for all FPCs on the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**node-device name**—(QFabric systems only) (Optional) Display status information for each Node device. Each Node device is equivalent to an FPC.

**pic-status**—(Optional) Display status information for all PICs or for the PIC in the specified slot (see *fpc-slot*).

**NOTE:** On T1600 routers, Type 4 FPCs with ASICs based on the SL2.0 chipset do not support the 10-Gigabit Ethernet LAN/WAN PIC with SFP+ (10x10GE [LAN/WAN] SFPP). If you issue the `show chassis fpc` command with the `pic-status` option, the CLI displays the string “Not Supported” for 10x10GE (LAN/WAN) SFPP PICs installed on such FPCs. The following is a sample output:

```
user@host> show chassis fpc pic-status
Slot 0  Online      E2-FPC Type 1
  PIC 0  Online      1x G/E SFP, 1000 BASE
  PIC 1  Online      Adaptive Services-II
  PIC 2  Online      1x G/E IQ, 1000 BASE
  PIC 3  Online      1x G/E IQ, 1000 BASE
Slot 1  Online      FPC Type 3-ES
  PIC 0  Present     UNUSED- Not Supported
Slot 2  Online      FPC Type 4-ES
  PIC 0  Offline     4x OC-192 SONET XFP
  PIC 1  Present     10x10GE(LAN/WAN) SFPP- Not Supported
<<<<<<
Slot 4  Offline     FPC Type 1-ES
Slot 5  Offline     FPC Type 2-ES
Slot 6  Online      E2-FPC Type 3
  PIC 0  Online      1x OC-192 SONET XFP
  PIC 1  Online      4x OC-48 SONET
  PIC 2  Online      4x OC-48 SONET
  PIC 3  Online      MultiServices 500
Slot 7  Online      FPC Type 4-ES
  PIC 0  Online      4x 10GE (LAN/WAN) XFP
  PIC 1  Online      4x 10GE (LAN/WAN) XFP
```

In addition, an entry is logged in the system log messages (/var/log/messages) that the PIC is not supported. The following is a sample message logged in the system log:

```
Apr  5 08:47:36 router1 chassisd[2770]: CHASSISD_UNSUPPORTED_PIC:
  PIC 1 in FPC 2 (type 763, version 257) is not supported
```

If you see this issue, contact Juniper Networks Technical Assistance Center (JTAC) for a possible fix. For more information about this issue and a possible solution, see [PSN-2010-03-696](https://www.juniper.net/psn/2010-03-696).

**NOTE:** When there is a double-bit ECC error in a network processor's memory, the Channelized OC3/STM1 (Multi-Rate) Circuit Emulation MIC with SFP or Channelized E1/T1 Circuit Emulation MIC is switched to the offline state.

```
user@host> show chassis fpc pic-status
Slot 1   Online           MPC Type 2 3D Q
PIC 0    Offline          1xC0C12/4xC0C3 CH-CE- ECC error detected
```

**lcc number**—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**Output Fields** Table 116 on page 1167 lists the output fields for the **show chassis fpc** command. Output fields are listed in the approximate order in which they appear.

**Table 116: show chassis fpc Output Fields**

Field Name	Field Description	Level of Output
<b>Slot or Slot State</b>	<p>Slot number and state. The state can be one of the following conditions:</p> <ul style="list-style-type: none"> <li>• <b>Dead</b>—Held in reset because of errors.</li> <li>• <b>Diag</b>—Slot is being ignored while the FPC is running diagnostics.</li> <li>• <b>Dormant</b>—Held in reset.</li> <li>• <b>Empty</b>—No FPC is present.</li> <li>• <b>Offline</b>—(PTX Series Packet Transport Routers only) One of the following two states is displayed: <ul style="list-style-type: none"> <li>• <b>FPC offlined due to unreachable destinations</b></li> <li>• <b>FPC Offlined due to degraded FPC action</b></li> </ul> </li> <li>• <b>Online</b>—FPC is online and running.</li> <li>• <b>Present</b>—FPC is detected by the chassis daemon but either is not supported by the current version of Junos OS or is inserted in the wrong slot. The output also states either <b>Hardware Not Supported</b> or <b>Hardware Not In Right Slot</b>. The FPC is coming up but not yet online.</li> <li>• <b>Probed</b>—Probe is complete; awaiting restart of the Packet Forwarding Engine.</li> <li>• <b>Probe-wait</b>—Waiting to be probed.</li> </ul>	all levels
<b>Logical slot</b>	Slot number.	all levels
<b>Temp (C) or Temperature</b>	Temperature of the air passing by the FPC, in degrees Celsius or in both Celsius and Fahrenheit.	all levels all levels

Table 116: show chassis fpc Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Temperature (PTX Series)</b>	On PTX Series Packet Transport Routers, temperature details are provided in degrees Celsius and Fahrenheit. Output includes: <ul style="list-style-type: none"> <li>• Temperature (PMB)—Temperature of the air passing by the Processor Mezzanine Board (PMB) at the bottom of the FPC.</li> <li>• Temperature (Intake)—Temperature of the air flowing into the chassis.</li> <li>• Temperature (Exhaust)—Exhaust temperatures for multiple zones (Exhaust A and Exhaust B).</li> <li>• Temperature (TLn)—Temperature of the specified Lookup ASIC (TL) of the packet forwarding engine on the FPC.</li> <li>• Temperature (TQn)—Temperature of the specified Queuing and Memory Interface ASIC (TQ) of the packet forwarding engine on the FPC.</li> </ul>	<b>detail</b>
<b>Total CPU Utilization (%)</b>	Total percentage of CPU being used by the FPC's processor.	all levels
<b>Interrupt CPU Utilization (%)</b>	Of the total CPU being used by the FPC's processor, the percentage being used for interrupts.	none specified
<b>Memory DRAM (MB)</b>	Total DRAM, in megabytes, available to the FPC's processor.	none specified
<b>Heap Utilization (%)</b>	Percentage of heap space (dynamic memory) being used by the FPC's processor. If this number exceeds 80 percent, there may be a software problem (memory leak).  <b>NOTE:</b> On MX Series routers and EX Series switches in a broadband edge environment, heap utilization levels higher than 70 percent can affect unified ISSU, router stability, or scaling capability.	none specified
<b>Buffer Utilization (%)</b>	Percentage of buffer space being used by the FPC's processor for buffering internal messages.	none specified
<b>Total CPU DRAM</b>	Amount of DRAM available to the FPC's CPU.	<b>detail</b>
<b>Total RLDRAM</b>	Amount of reduced latency dynamic random access memory (RLDRAM) available to the FPC CPU.	<b>detail</b>
<b>Total DDR DRAM</b>	Amount of double data rate dynamic random access memory (DDR DRAM) available to the FPC CPU.	<b>detail</b>
<b>Total SRAM</b>	Amount of static RAM (SRAM) used by the FPC's CPU.	<b>detail</b>
<b>Total SDRAM</b>	Total amount of memory used for storing packets and notifications.	<b>detail</b>
<b>I/O Manager ASICs information</b>	I/O Manager version number, manufacturer, and part number.	<b>detail</b>
<b>Start time</b>	Time when the Routing Engine detected that the FPC was running.	<b>detail</b>

Table 116: show chassis fpc Output Fields (*continued*)

Field Name	Field Description	Level of Output
Uptime	How long the Routing Engine has been connected to the FPC and, therefore, how long the FPC has been up and running.	detail
PIC type	(pic-status output only) Type of PIC.	none specified

## show chassis led

<b>List of Syntax</b>	<a href="#">show chassis led (EX Series) on page 1197</a> <a href="#">show chassis led (QFX Series) on page 1197</a>
<b>show chassis led (EX Series)</b>	<pre>show chassis led &lt;fpc-slot &lt;fpc-slot-number&gt;&gt;</pre>
<b>show chassis led (QFX Series)</b>	<pre>show chassis led &lt;fpc-slot &lt;fpc-slot-number&gt;&gt; interconnect-device name node-device name</pre>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 10.1 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	<p>Display the status and colors of the chassis LEDs on the front panel of the switch. A major alarm (red) indicates a critical error condition that requires immediate action. A minor alarm (yellow) indicates a noncritical condition that requires monitoring or maintenance. A minor alarm that is left unchecked might cause interruption in service or performance degradation.</p>
<b>Options</b>	<p><b>none</b>—Display the status of the chassis status LEDs (for EX4200 switches configured as a Virtual Chassis, display the information for all Virtual Chassis members).</p> <p><b>fpc-slot &lt;fpc-slot-number&gt;</b>—(Optional) (Not on EX2200 switches) Display the information as follows:</p> <ul style="list-style-type: none"> <li>(EX3200, standalone EX4200, standalone QFX3500, and EX4500 switches) Display the status of the chassis status LEDs for either an FPC slot with no <b>fpc-slot-number</b> value specified or for the FPC slot specified by <b>fpc-slot 0</b>. <b>fpc-slot 0</b> refers to the switch itself and <b>0</b> is the only valid value for <b>fpc-slot-number</b>. Output for these options is the same as for the <b>none</b> option.</li> <li>(EX4200 switches in a Virtual Chassis with two or more members) If no <b>fpc-slot-number</b> value is specified, display the status of the chassis status LEDs for all members of the Virtual Chassis. Output for this option is the same as for the <b>none</b> option. If the <b>fpc-slot-number</b> value is specified (it equals the <b>member-id</b> value), display the status of the chassis status LEDs for the specified member.</li> <li>(EX8200 switches)—Display the status of the chassis status LEDs for the line card in the line-card slot specified by the <b>fpc-slot-number</b> value.</li> </ul> <p><b>interconnect-device name</b>—</p> <p>— (QFabric systems only) (Optional) Display the status of the chassis and interface status LEDs for the Interconnect device.</p> <p><b>node-device name</b>— (QFabric systems only) (Optional) Display the status of the chassis and interface status LEDs for the Node device.</p>

**Output Fields** [Table 117 on page 1198](#) lists the output fields for the **show chassis led** command. Output fields are listed in the approximate order in which they appear.

**Table 117: show chassis led Output Fields**

Field Name	Field Description
<b>Front panel contents for slot</b>	FPC slot number of the device whose content is being displayed. The number is always 0, except for EX4200 switches in a Virtual Chassis, where it is the member ID value.
<b>Front panel contents</b> (EX8200 Switches)	
<b>Front Panel Module Information</b> (QFabric system QFX3008-I Interconnect device)	On EX8200 switches, no slot number is displayed.
<b>Front panel contents for</b> (QFabric system Node devices and QFX3600-I Interconnect devices)	On QFabric system Node devices, the name of the Node device whose content is being displayed.

Table 117: show chassis led Output Fields (*continued*)

Field Name	Field Description
<b>Alarms LED</b>	<p>(EX Series switches only) Displays status of the ALM LED:</p> <ul style="list-style-type: none"> <li>• Off—No alarm has been configured.</li> <li>• Green—No alarm has been triggered.</li> <li>• Red—Major alarm.</li> <li>• Yellow—Minor alarm</li> </ul>
<b>System LED</b>	<p>(EX Series switches only) Displays status of the SYS LED:</p> <ul style="list-style-type: none"> <li>• Off—Switch is powered off.</li> <li>• Green—Switch is operating normally.</li> <li>• Yellow—Switch is booting.</li> </ul>
<b>Master LED:</b>	<p>Displays status of the MST LED (on EX3200, EX4200, and EX8200 switches):</p> <ul style="list-style-type: none"> <li>• Green—On an EX4200 Virtual Chassis switch, indicates the switch is the master in the Virtual Chassis configuration. On other switches, indicates that the Routing Engine is operational.</li> <li>• Off <ul style="list-style-type: none"> <li>• On an EX4200 Virtual Chassis switch, indicates that this switch is not the master in the Virtual Chassis configuration.</li> <li>• On EX3200, standalone EX4200, and EX8200 switches, indicates that the Routing Engine is not operational.</li> </ul> </li> </ul>
<b>Mode LED:</b>	<p>(EX Series switches only) On an EX2200 switch only, displays the currently selected port parameter of the Status LED:</p> <ul style="list-style-type: none"> <li>• <b>ADM</b>—Administrative</li> <li>• <b>SPD</b>—Speed</li> <li>• <b>DPX</b>—Duplex</li> <li>• <b>POE</b>—Power over Ethernet</li> </ul>
<b>Status/Beacon LED</b>	<p>(QFX Series only) Displays the system status as indicated by the Status LED on the chassis. For more information, see:</p> <ul style="list-style-type: none"> <li>• <i>Chassis Status LEDs on a QFX3500 Device</i></li> <li>• <i>Chassis Status LEDs in the QFX3600 and QFX3600-I Device</i></li> </ul>
<b>LINK/SPEED LED</b>	<p>(QFX Series only) Displays the link status and speed of a management port. For more information, see:</p> <ul style="list-style-type: none"> <li>• <i>Management Port LEDs on a QFX3500 Device</i></li> <li>• <i>Management Port LEDs in the QFX3600 and QFX3600-I Device</i></li> </ul>
<b>ACTIVITY LED</b>	<p>(QFX Series only) Displays the activity status of a management port. For more information, see:</p> <ul style="list-style-type: none"> <li>• <i>Management Port LEDs on a QFX3500 Device</i></li> <li>• <i>Management Port LEDs in the QFX3600 and QFX3600-I Device</i></li> </ul>

Table 117: show chassis led Output Fields (*continued*)

Field Name	Field Description
<b>STATUS LED</b>	<p>(QFX Series only) Displays the link status of an interface as indicated by the ST LED. For more information, see:</p> <ul style="list-style-type: none"> <li>Control Board LEDs on a QFX3008-I Interconnect Device</li> <li>Access Port and Uplink Port LEDs on a QFX3500 Device</li> <li>Access Port and Uplink Port LEDs on a QFX3600 or QFX3600-I Device</li> </ul>
<b>LINK/ACTIVITY LED</b>	<p>(QFX Series only) Displays link activity or faults on an interface as indicated by the LA LED. For more information, see:</p> <ul style="list-style-type: none"> <li>Access Port and Uplink Port LEDs on a QFX3500 Device</li> <li>Access Port and Uplink Port LEDs on a QFX3600 or QFX3600-I Device</li> </ul>
<b>Status LED</b>	<p>(QFX3008-I Interconnect device only)</p> <ul style="list-style-type: none"> <li>Displays the system status as indicated by the STATUS LED on the front panel of the chassis. For more information, see <i>Chassis Status LEDs on a QFX3008-I Interconnect Device</i>.</li> <li>Displays the status of a Control Board as indicated by the STATUS LED on the Control Board. For more information, see <i>Control Board LEDs on a QFX3008-I Interconnect Device</i>.</li> </ul>
<b>Power LED</b>	<p>(QFX3008-I Interconnect device only) Displays the status of system power on the device. For more information, see <i>Chassis Status LEDs on a QFX3008-I Interconnect Device</i>.</p>
<b>Major Alarm LED</b>	<p>(QFX3008-I Interconnect device only) Displays whether a critical error condition that requires immediate action exists on the device. For more information, see <i>Chassis Status LEDs on a QFX3008-I Interconnect Device</i>.</p>
<b>Minor Alarm LED</b>	<p>(QFX3008-I Interconnect device only) Displays whether a noncritical condition that requires monitoring or maintenance exists on the device. For more information, see <i>Chassis Status LEDs on a QFX3008-I Interconnect Device</i>.</p>
<b>Fan 0 LED</b>	<p>(QFX3008-I Interconnect device only) Displays the status of fan trays on the device. For more information, see <i>Chassis Status LEDs on a QFX3008-I Interconnect Device</i>.</p>
<b>Fan 1 LED</b>	
<b>Fan 2 LED</b>	
<b>Fan 3 LED</b>	
<b>Fan 4 LED</b>	
<b>Fan 5 LED</b>	
<b>Fan 6 LED</b>	
<b>Fan 7 LED</b>	
<b>Fan 8 LED</b>	

Table 117: show chassis led Output Fields (*continued*)

Field Name	Field Description
PEM 0 LED	(QFX3008-I Interconnect device only) Displays the status of power supplies on the device. For more information, see <i>Chassis Status LEDs on a QFX3008-I Interconnect Device</i> .
PEM 1 LED	
PEM 2 LED	
PEM 3 LED	
PEM 4 LED	
LED info for	(QFX3008-I Interconnect device only) Displays the LED information for a Control Board.
Mastership LED	(QFX3008-I Interconnect device only) Displays status of the MASTER LED on a Control Board. For more information, see <i>Control Board LEDs on a QFX3008-I Interconnect Device</i> .
Interface	Names of the interfaces on the device.
LED (ADM/SPD/DPX/POE)	<p>(EX Series switches only) State of the currently selected port parameter of the Status LED for the interface. The Status LED port parameters are:</p> <p><b>NOTE:</b> EX4500 and EX8200 switches do not have the POE port parameter.</p> <ul style="list-style-type: none"> <li>• <b>ADM</b>—Administrative</li> <li>• <b>SPD</b>—Speed</li> <li>• <b>DPX</b>—Duplex</li> <li>• <b>POE</b>—Power over Ethernet</li> </ul>

<b>List of Syntax</b>	<a href="#">Syntax on page 1207</a> <a href="#">Syntax (TX Matrix Router) on page 1207</a> <a href="#">Syntax (TX Matrix Plus Router) on page 1207</a> <a href="#">Syntax (MX Series Router) on page 1207</a> <a href="#">Syntax (QFX Series) on page 1207</a>
<b>Syntax</b>	show chassis location
<b>Syntax (TX Matrix Router)</b>	show chassis location <fpc   interface (by-name <i>name</i>   by-slot fpc number lcc number)   lcc number   scc>
<b>Syntax (TX Matrix Plus Router)</b>	show chassis location <fpc   interface (by-name <i>name</i>   by-slot fpc number lcc number)   lcc number   sfc number>
<b>Syntax (MX Series Router)</b>	show chassis location <all-members> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	show chassis location <interconnect-device <i>name</i> > <node-device <i>name</i> >
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display the physical location of the chassis. This command can only be used on the master Routing Engine.
<b>Options</b>	<p><b>none</b>—Display all information about the physical location of the chassis. On a TX Matrix router, display all information about the physical location of the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display all information about the physical location of the TX Matrix Plus router and its attached routers.</p> <p><b>all-members</b>—(MX Series routers only) (Optional) Display the physical location of the chassis for all the member routers in the Virtual Chassis configuration.</p> <p><b>fpc</b>—(TX Matrix router and TX Matrix Plus router only) (Optional) Display the physical location of all Flexible PIC Concentrators (FPCs).</p> <p><b>interconnect-device <i>name</i></b>—(QFabric systems only) (Optional) Display the physical location of the Interconnect device.</p> <p><b>interface by-name <i>name</i></b>—(TX Matrix and TX Matrix Plus routers only) (Optional) Display the physical location of a specified interface name. On a TX Matrix router, this option displays the FPC number and T640 router (line-card chassis) number associated</p>

with the specified interface. On a TX Matrix Plus router, this option displays the FPC number and router (line-card chassis) number associated with the specified interface.

**interface by-slot fpc *number* lcc *number***—(TX Matrix and TX Matrix Plus router only)

(Optional) On a TX Matrix router, display the global FPC number of an interface by specifying its local FPC number and T640 router (line-card chassis) number. On a TX Matrix Plus router, display the global FPC number of an interface by specifying its local FPC number and router (line-card chassis) number.

- The global FPC number is the FPC slot number when all the FPC slots in the routing matrix are considered: **0** through **31**. On TX Matrix Plus router with 3D SIBs, the value is **0** through **63**. The local FPC number is the FPC slot number on a particular T640 router.
- For **fpc**, replace *number* with a value from **0** through **7**.
- For **lcc**, replace *number* with a value from **0** through **7**.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display the physical location of a specified T640 router (line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display the physical location of a specified router (line-card chassis) that is connected to a TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display the physical location of the chassis for the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display the physical location of the chassis for the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**node-device *name***—(QFabric systems only) (Optional) Display the physical location of the Node device.

**scc**—(TX Matrix routers only) (Optional) Display the physical location of the TX Matrix router (switch-card chassis).

**sfc**—(TX Matrix Plus routers only) (Optional) Display the physical location of the TX Matrix Plus router (or switch-fabric chassis).

**Required Privilege Level** view

**Output Fields** Table 118 on page 1209 lists the output fields for the **show chassis location** command. Output fields are listed in the approximate order in which they appear.

**Table 118: show chassis location Output Fields**

Field Name	Field Description
country-code	Country code information.
postal-code	Postal code information.
Building	Building information.
Floor	Floor information.
Global FPC	Global FPC number. The FPC slot number, when all FPC slots in the routing matrix are considered. The range of values is 0 through 31. On TX Matrix Plus router with 3D SIBs the value is 0 through 63.
LATA	Local access transport area information.
LCC	Line-card chassis number. On a TX Matrix router, the number of a particular T640 router connected to the TX Matrix router. On a TX Matrix Plus router, the number of a particular router connected to the TX Matrix Plus router.
Local FPC	Local FPC number. On a TX Matrix router, the FPC slot number on a particular T640 router. On a TX Matrix Plus router, the FPC slot number on a particular router.

## Sample Output

**show chassis location**

```
user@host> show chassis location

<b>Description</b>	Display status information about the PIC installed in the specified Flexible PIC Concentrator (FPC) and PIC slot.
<b>Options</b>	<b>fpc-slot <i>slot-number</i></b> —Display information about the PIC in this particular FPC slot:

- On a TX Matrix router, if you specify the number of the T640 router by using the **lcc number** option (the recommended method), replace **slot-number** with a value from 0 through 7. Otherwise, replace **slot-number** with a value from 0 through 31.

Likewise, on a TX Matrix Plus router, if you specify the number of the T1600 router by using the **lcc number** option (the recommended method), replace **slot-number** with a value from 0 through 7. Otherwise, replace **slot-number** with a value from 0 through 31. For example, the following commands have the same result:

```
user@host> show chassis pic fpc-slot 1 lcc 1 pic-slot 1
user@host> show chassis pic fpc-slot 9 pic-slot 1
```

- M120 routers only—Replace **slot-number** with a value from 0 through 5.
- MX80 routers only—Replace **slot-number** with a value from 0 through 1.
- MX104 routers only—Replace **slot-number** with a value from 0 through 2.
- MX240 routers only—Replace **slot-number** with a value from 0 through 2.
- MX480 routers only—Replace **slot-number** with a value from 0 through 5.
- MX960 routers only—Replace **slot-number** with a value from 0 through 11.
- MX2010 routers only—Replace **slot-number** with a value from 0 through 9.
- MX2020 routers only—Replace **slot-number** with a value from 0 through 19.
- Other routers—Replace **slot-number** with a value from 0 through 7.
- EX Series switches:
  - EX3200 switches and EX4200 standalone switches—Replace **slot-number** with 0.
  - EX4200 switches in a Virtual Chassis configuration—Replace **slot-number** with a value from 0 through 9 (switch's member ID).
  - EX8208 switches—Replace **slot-number** with a value from 0 through 7 (line card).
  - EX8216 switches—Replace **slot-number** with a value from 0 through 15 (line card).
- QFX Series:
  - QFX3500 and QFX5100 standalone switches—Replace **slot-number** with 0. In the command output, FPC refers to a line card. The FPC number equals the slot number for the line card.
  - QFabric systems—Replace **slot-number** with any number between 0 and 15. In the command output, FPC refers to a line card. The FPC number equals the slot number for the line card.

**all-members**—(MX Series routers and EX Series switches only) (Optional) Display PIC information for all member routers in the Virtual Chassis configuration.

**interconnect-device *name***—(QFabric systems only) (Optional) Display PIC information for a specified Interconnect device.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display PIC information for a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display PIC information for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers and EX Series switches only) (Optional) Display PIC information for the local Virtual Chassis member.

**member *member-id***—(MX Series routers and EX Series switches only) (Optional) Display PIC information for the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**node-device *name***—(QFabric systems only) (Optional) Display PIC information for a specified Node device.

**pic-slot *slot-number***—Display information about the PIC in this particular PIC slot. For routers, replace *slot-number* with a value from 0 through 3. For EX3200 and EX4200 switches, replace *slot-number* with 0 for built-in network interfaces and 1 for interfaces on uplink modules. For EX8208 and EX8216 switches, replace *slot-number* with 0. For the QFX3500 standalone switch and the QFabric system, replace *slot-number* with 0 or 1.

**transport**—Display PIC information for optical transport network.

**Output Fields** Table 119 on page 1215 lists the output fields for the **show chassis pic** command. Output fields are listed in the approximate order in which they appear.

**Table 119: show chassis pic Output Fields**

Field Name	Field Description
<b>Type</b>	<p>PIC type.</p> <p><b>NOTE:</b> On the 1-port OC192/STM64 MICs with the SDH framing mode, the type is displayed as <b>MIC-3D-1STM64-XFP</b> and with the SONET framing mode, the type is displayed as <b>MIC-3D-1OC192-XFP</b>. By default, the 1-port OC192/STM64 MICs displays the type as <b>MIC-3D-1OC192-XFP</b>.</p>
<b>Account Layer2 Overhead</b>	(MX Series routers) Indicates whether functionality to count the Layer 2 overhead bytes in the interface statistics at the PIC level is enabled or disabled.
<b>ASIC type</b>	Type of ASIC on the PIC.
<b>State</b>	<p>Status of the PIC. State is displayed only when a PIC is in the slot.</p> <ul style="list-style-type: none"> <li>• <b>Online</b>— PIC is online and running.</li> <li>• <b>Offline</b>—PIC is powered down.</li> </ul>
<b>PIC version</b>	PIC hardware version.
<b>Uptime</b>	How long the PIC has been online.
<b>Package</b>	(Multiservices PICs only) Services package supported: <b>Layer-2</b> or <b>Layer-3</b> .
<b>Port Number</b>	Port number for the PIC.
<b>Cable Type</b>	Type of cable connected to the port: <b>LH</b> , <b>LX</b> , or <b>SX</b> .
<b>PIC Port Information (MX480 Router 100-Gigabit Ethernet CFP)</b>	<p>Port-level information for the PIC.</p> <ul style="list-style-type: none"> <li>• Port—Port number</li> <li>• Cable type—Type of optical transceiver installed.</li> <li>• Fiber type—Type of fiber. SM is single-mode.</li> <li>• Xcvr vendor—Transceiver vendor name.</li> <li>• Xcvr vendor part number—Transceiver vendor part number.</li> <li>• Wavelength—Wavelength of the transmitted signal. Uplinks and downlinks are always 1550 nm. There is a separate fiber for each direction</li> </ul>

Table 119: show chassis pic Output Fields (*continued*)

Field Name	Field Description
<b>PIC Port Information (MX960 Router Bidirectional Optics )</b>	<p>Port-level information for the PIC.</p> <ul style="list-style-type: none"> <li>Port—Port number</li> <li>Cable type—Type of small form-factor pluggable (SFP) optical transceiver installed. Uplink interfaces display -U. Down link interfaces display -D.</li> <li>Fiber type—Type of fiber. SM is single-mode.</li> <li>Xcvr vendor—Transceiver vendor name.</li> <li>Xcvr vendor part number—Transceiver vendor part number. <ul style="list-style-type: none"> <li>BX10-10-km bidirectional optics.</li> <li>BX40-40-km bidirectional optics.</li> <li>SFP-LX-40-km SFP optics.</li> </ul> </li> <li>Wavelength—Wavelength of the transmitted signal. Uplinks are always 1310 nm. Downlinks are either 1490 nm or 1550 nm.</li> </ul>
<b>PIC Port Information (Next-Generation SONET/SDH SFP)</b>	<p>Port-level information for the next-generation SONET/SDH SFP PIC.</p> <ul style="list-style-type: none"> <li>Port—Port number.</li> <li>Cable type—Type of small form-factor pluggable (SFP) optical transceiver installed.</li> <li>Fiber type—Type of fiber: <b>SM</b> (single-mode) or <b>MM</b> (multimode).</li> <li>Xcvr vendor—Transceiver vendor name.</li> <li>Xcvr vendor part number—Transceiver vendor part number.</li> <li>Wavelength—Wavelength of the transmitted signal. Next-generation SONET/SDH SFPs use 1310 nm.</li> </ul>
<b>Pic port information (MX104 router)</b>	<p>Port-level information for the PIC.</p> <ul style="list-style-type: none"> <li>Port—Port number</li> <li>Cable type—Type of optical transceiver installed.</li> <li>Fiber type—Type of fiber. SM is single-mode.</li> <li>Xcvr vendor—Transceiver vendor name.</li> <li>Xcvr vendor part number—Transceiver vendor part number.</li> <li>Wavelength—Wavelength of the transmitted signal.</li> <li>Xcvr Firmware—Firmware version of the transceiver.</li> </ul>
<b>Multirate Mode</b>	Rate-selectability status for the MIC: <b>Enabled</b> or <b>Disabled</b> .
<b>Channelization</b>	Indicates whether channelization is enabled or disabled on the DS3/E3 MIC.

## Sample Output

### show chassis pic fpc-slot pic-slot

**Syntax**    show chassis routing-engine  
                  <bios | *slot*>

**Syntax (EX Series Switches)**    show chassis routing-engine  
    <*slot*>

**Syntax (T Series routers)**    show chassis routing-engine  
    <bios | *slot*>

**Syntax (TX Matrix Routers)**    show chassis routing-engine  
    <bios | *slot*>  
    <lcc *number* | scc>

**Syntax (TX Matrix Plus Routers)**    show chassis routing-engine  
    <bios | *slot*>  
    <lcc *number* | sfc *number*>

**Syntax (QFX Series)**    show chassis routing-engine  
                                  <interconnect-device *name*>  
                                  <node-device *name*>

**Syntax (MX Series Routers)**    show chassis routing-engine  
                                  <bios | *slot*>  
                                  <all-members>  
                                  <local>  
                                  <member *member-id*>

**Syntax (MX2010 3D Universal Edge Routers)**    show chassis routing-engine  
                                  <bios | *slot*>

**Syntax (MX2020 3D Universal Edge Routers)**    show chassis routing-engine  
                                  <bios | *slot*>

**Syntax (MX104 3D Universal Edge Routers)**    show chassis routing-engine

**Syntax (ACX Series Universal Access Routers)** `show chassis routing-engine`

**Release Information** Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
**sfc** option introduced for the TX Matrix Plus router in Junos OS Release in 9.6.  
Command introduced in Junos OS Release 11.1 for QFX Series.  
Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.  
Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.  
Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.  
Command introduced in Junos OS Release 13.2 for MX104 3D Univesral Edge Routers.

**Description** Display the status of the Routing Engine.

**Options** **none**—Display information about one or more Routing Engines. On a TX Matrix router, display information about all Routing Engines on the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display information about all Routing Engines on the TX Matrix Plus router and its attached routers.

**all-members**—(MX Series routers only) (Optional) Display Routing Engine information for all members of the Virtual Chassis configuration.

**bios**—(Optional) Display the (BIOS) firmware version.

**interconnect-device *number***—(QFabric systems only) (Optional) Display Routing Engine information for a specified Interconnect device.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display Routing Engine information for a specified T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, display Routing Engine information for a specified router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display Routing Engine information for the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display Routing Engine information for the specified member of the Virtual Chassis configuration. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-device *number***—(QFabric systems only) (Optional) Display Routing Engine information for a specified Node device.

**scc**—(TX Matrix routers only) (Optional) Display Routing Engine information for the TX Matrix router (switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display Routing Engine information for the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

**slot**—(Systems with multiple Routing Engines) (Optional) Display information for an individual Routing Engine. Replace *slot* with 0 or 1. For QFX3500 switches, there is only one Routing Engine, so you do not need to specify the slot number.

**Output Fields** [Table 120 on page 1230](#) lists the output fields for the **show chassis routing-engine** command. Output fields are listed in the approximate order in which they appear.

**Table 120: show chassis routing-engine Output Fields**

Field Name	Field Description
<b>Slot</b>	(Systems with single and multiple Routing Engines) Slot number.
<b>Current state</b>	(Systems with multiple Routing Engines) Current state of the Routing Engine: <b>Master</b> , <b>Backup</b> , or <b>Disabled</b> .
<b>Election priority</b>	(Systems with multiple Routing Engines) Election priority for the Routing Engine: <b>Master</b> or <b>Backup</b> .
<b>Temperature</b>	Temperature of the air flowing past the Routing Engine.
<b>CPU Temperature</b>	Temperature of the CPU.
<b>DRAM</b>	Total DRAM available to the Routing Engine's processor.  Starting with Junos OS Release 12.3R1, the DRAM field displays both available memory and installed memory.
<b>Memory utilization</b>	Percentage of Routing Engine memory being used.
<b>CPU utilization</b>	Information about the Routing Engine's CPU utilization: <ul style="list-style-type: none"> <li>• <b>User</b>—Percentage of CPU time being used by user processes.</li> <li>• <b>Background</b>—Percentage of CPU time being used by background processes.</li> <li>• <b>Kernel</b>—Percentage of CPU time being used by kernel processes.</li> <li>• <b>Interrupt</b>—Percentage of CPU time being used by interrupts.</li> <li>• <b>Idle</b>—Percentage of CPU time that is idle.</li> </ul>
<b>Model</b>	Routing Engine model number.
<b>Serial ID</b>	(Systems with multiple Routing Engines) Identification number of the Routing Engine in this slot.
<b>Start time</b>	Time at which the Routing Engine started running.
<b>Uptime</b>	How long the Routing Engine has been running.
<b>Routing Engine BIOS Version</b>	BIOS version being run by the Routing Engine.

Table 120: show chassis routing-engine Output Fields (*continued*)

Field Name	Field Description
Last reboot reason	<p>Reason for last reboot, including:</p> <ul style="list-style-type: none"> <li><b>power cycle/failure</b>—Halt of the Routing Engine using the <b>halt</b> command, powering down using the power button on the chassis or any other method (such as removal of the control board or Routing Engine), and then powering back the Routing Engine. A halt of the operating system also occurs if you enter the <b>request system halt</b> command. You can enter this command to halt the system operations on the chassis or specific Routing Engines. To restart the software, press any key on the keyboard.</li> <li><b>watchdog</b>—Reboot due to a hardware watchdog. A watchdog is a hardware monitoring process that examines the health and performance of the router to enable the device to recover from failures. A watchdog checks for problems at certain intervals, and reboots the routing engine if a problem is encountered.</li> <li><b>reset-button reset</b>—(Not available on the J Series router or EX Series switch) Reboot due to pressing of the reset button on the Routing Engine.</li> <li><b>power-button hard power off</b>—Reboot due to pressing of the power button on the chassis. A powering down of the software also occurs if you enter the <b>request system power-off</b> command. You can enter this command to power down the chassis or specific Routing Engines; you can then restart the software.</li> <li><b>misc hardware reason</b>—Reboot due to miscellaneous hardware reasons.</li> <li><b>thermal shutdown</b>—Reboot due to the router or switch reaching a critical temperature at which point it is unsafe to continue operations.</li> <li><b>hard disk failure</b>—Reboot due to a hard disk or solid-state drive (SSD) failure.</li> <li><b>reset from debugger</b>—Reboot due to reset from the debugger.</li> <li><b>chassis control reset</b>—Restart the chassis process that manages PICs, FPCs, and other hardware components. The chassis control module that runs the Routing Engine performs management and monitoring functions, and it provides a single access point for operational and maintenance functions. A reset of the chassis management process occurs when you enter the <b>restart chassis-control</b> command.</li> <li><b>bios auto recovery reset</b>—Reboot due to a BIOS auto-recovery reset.</li> <li><b>could not be determined</b>—Reboot due to an undetermined reason.</li> <li><b>Router rebooted after a normal shutdown</b>—Reboot due to a normal shutdown. This reason is displayed if the Routing Engine is powered down by pushing and holding the online/offline button on the Routing Engine faceplate for 30 seconds, and then powered back. A reboot of the software also occurs if you enter the <b>request system reboot</b> command. You can enter this command to reboot the chassis or specific Routing Engines.</li> </ul>
Load averages	Routing Engine load averages for the last 1, 5, and 15 minutes.

## Sample Output

### show chassis routing-engine (M5 Router)

```

user@host> show chassis routing-engine
Routing Engine status:
  Temperature                25 degrees C / 77 degrees F
  DRAM                       768 MB
  Memory utilization         21 percent
  CPU utilization:
    User                      0 percent
    Background                0 percent
    Kernel                    0 percent
    Interrupt                  0 percent

```

Idle	100 percent
Model	RE-2.0
Serial ID	31000007349bf701
Start time	2003-12-04 09:42:17 PST
Uptime	26 days, 1 hour, 12 minutes, 27 seconds
Last reboot reason	Router rebooted after a normal shutdown
Load averages:	1 minute 5 minute 15 minute
	0.00 0.01 0.00

#### show chassis routing-engine (M10 Router)

```
user@host> show chassis routing-engine
Routing Engine status:
  Temperature          25 degrees C / 77 degrees F
  DRAM                 768 MB
  Memory utilization    21 percent
  CPU utilization:
    User               0 percent
    Background         0 percent
    Kernel             0 percent

<b>List of Syntax</b>	<a href="#">Syntax on page 1249</a> <a href="#">Syntax (QFabric System) on page 1249</a> <a href="#">Syntax (TX Matrix Routers) on page 1249</a>
<b>Syntax</b>	<pre>show log &lt;filename   user &lt;username&gt;&gt;</pre>
<b>Syntax (QFabric System)</b>	<pre>show log filename &lt;device-type (device-id   device-alias)&gt;</pre>
<b>Syntax (TX Matrix Routers)</b>	<pre>show log &lt;all-lcc   lcc number   scc&gt; &lt;filename   user &lt;username&gt;&gt;</pre>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Option <i>device-type (device-id   device-alias)</i> is introduced in Junos OS Release 13.1 for the QFX Series.</p>
<b>Description</b>	List log files, display log file contents, or display information about users who have logged in to the router or switch.
<b>Options</b>	<p><b>none</b>—List all log files.</p> <p><b>&lt;all-lcc   lcc number   scc&gt;</b>—(TX Matrix routers only) (Optional) Display logging information about all T640 routers (or line-card chassis) or a specific T640 router (replace <i>number</i> with a value from 0 through 3) connected to a TX Matrix router. Or, display logging information about the TX Matrix router (or switch-card chassis).</p> <p><b>device-type</b>—(QFabric system only) (Optional) Display log messages for only one of the following device types:</p> <ul style="list-style-type: none"> <li>• <b>director-device</b>—Display logs for Director devices.</li> <li>• <b>infrastructure-device</b>—Display logs for the logical components of the QFabric system infrastructure, including the diagnostic Routing Engine, fabric control Routing Engine, fabric manager Routing Engine, and the default network Node group and its backup (NW-NG-0 and NW-NG-0-backup).</li> <li>• <b>interconnect-device</b>—Display logs for Interconnect devices.</li> <li>• <b>node-device</b>—Display logs for Node devices.</li> </ul>

**NOTE:** If you specify the *device-type* optional parameter, you must also specify either the *device-id* or *device-alias* optional parameter.

**(device-id | device-alias)**—If a device type is specified, display logs for a device of that type. Specify either the device ID or the device alias (if configured).

**filename**—(Optional) Display the log messages in the specified log file. For the routing matrix, the filename must include the chassis information.

**NOTE:** The *filename* parameter is mandatory for the QFabric system. If you did not configure a syslog filename, specify the default filename of messages.

**user <username>**—(Optional) Display logging information about users who have recently logged in to the router or switch. If you include *username*, display logging information about the specified user.

**Required Privilege Level** trace

**Output Fields** Table 121 on page 1254 lists the output fields for the **show pfe next hop** command. Output fields are listed in the approximate order in which they appear.

**Table 121: show pfe next-hop Output Fields**

Field Name	Field Description
ID	The next-hop ID for the entry.
Type	The next-hop type for the entry.
Interface	The interface to which the next-hop entry is assigned.
Protocol	The protocol type for the next-hop entry.
Encap	Encapsulation type for the next-hop entry.
Next Hop Addr	Next-hop address for the next-hop entry.
MTU	MTU value for the nexthop entry.

<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p>Command introduced in Junos OS Release 13.3 for the MX Series.</p> <p>Command option <b>hw</b> introduced in Junos OS Release 14.1X53-D10 for the QFX Series.</p>
<b>Description</b>	<p>Display the routes in the Packet Forwarding Engine forwarding table. The Packet Forwarding Engine forwards packets between input and output interfaces.</p>

**NOTE:** The Routing Engine maintains a master copy of the forwarding table. It copies the forwarding table to the Packet Forwarding Engine, which is the part of the router or switch responsible for forwarding packets. To display the routes in the Routing Engine forwarding table, use the **show route forwarding table** command. For more information, see the [CLI Explorer](#).

**Options** **none**—Display all Packet Forwarding Engine forwarding table information.

**clnp**—(Optional) Show International Standards Organization (ISO) connectionless-mode network protocol (CLNP) route table information.

**dhcp**—(Optional) Display Packet Forwarding Engine DHCP-Snooping route table information.

**fpc slot**—(TX Matrix and TX Matrix Plus routers only) (Optional) Show the next hops for a Flexible PIC Concentrator (FPC) slot.

- On a TX Matrix router, if you specify the number of a T640 router by using the **lcc number** option (the recommended method), replace **slot** with a value from **0** through **7**. Otherwise, replace **slot** with a value from **0** through **31**.
- On a TX Matrix Plus router, if you specify the number of a T1600 router by using the **lcc number** option (the recommended method), replace **slot** with a value from **0** through **7**. Otherwise, replace **slot** with a value from **0** through **31**.
- On a TX Matrix Plus router in the TXP-T1600-3D, TXP-T4000-3D, or TXP-Mixed-LCC-3D configuration, if you specify the number of a T1600 or T4000 router by using the **lcc number** option (the recommended method), replace **slot** with a value from **0** through **7**. Otherwise, replace **slot** with a value from **0** through **63**.

For example, the following commands have the same result:

```
user@host> show pfe route fpc 1 lcc 1
user@host> show pfe route fpc 9
```

**host**—(QFX standalone switches, pure mode QFX5100-only VCF and VC, and pure mode QFX3500-only VC) (Optional) Display host routes installed in the on-chip hardware table.

**hw**—(QFX standalone switches, pure mode QFX5100-only VCF and VC, and pure mode QFX3500-only VC) (Optional) Display routes installed in the on-chip hardware table (as opposed to displaying routes from the routing table and the PFE forwarding table before they are installed in the hardware).

**index index**—(Optional) Display table index.

**inet6**—(Optional) Display Packet Forwarding Engine IPv6 routes.

**ip**—(Optional) Display Packet Forwarding Engine IPv4 routes.

**iso**—(Optional) Display ISO version routing tables.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, the slot number of the T640 router (or line-card chassis) that houses the FPC. On a TX Matrix Plus router, the slot number of the router (line-card chassis) that houses the FPC.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**lpm**—(QFX standalone switches, pure mode QFX5100-only VCF and VC, and pure mode QFX3500-only VC) (Optional) Display longest prefix match (LPM) routes installed in the on-chip hardware table.

**mpls**—(Optional) Display Packet Forwarding Engine MPLS information.

**multicast**—(QFX standalone switches, pure mode QFX5100-only VCF and VC, and pure mode QFX3500-only VC) (Optional) Display multicast routes installed in the on-chip hardware table.

**prefix *prefix***—(Optional) IPv4 or IPv6 prefix for which to show table entries.

**summary**—(Optional) Display summary of Packet Forwarding Engine information.

**table <*table-name*>**—(Optional) Display table information.

**Required Privilege Level**

admin

**Output Fields** [Table 122 on page 1260](#) lists the output fields for the **show pfe route** command. Output fields are listed in the approximate order in which they appear.

**Table 122: show pfe route Output Fields**

Field Name	Field Description
<b>Destination</b>	Destination address for the entry.
<b>NH IP Addr</b>	Next-hop IP address for the entry.
<b>Type</b>	Next-hop type for the entry
<b>NH ID</b>	Next-hop ID for the entry
<b>Encap</b>	Encapsulation type for the next-hop entry.
<b>Interface</b>	Interface to which the next-hop entry is assigned.

[Table 123 on page 1260](#) lists the output fields for the QFX Series **show pfe route** hardware table (**hw**) commands. Output fields are listed in the approximate order in which they appear.

**Table 123: QFX Series show pfe route Hardware Table Output Fields**

Field Name	Field Description
<b>Max</b>	Maximum routing entries per route type.
<b>Used</b>	Number of routing entries consumed per route type.
<b>Free</b>	Number of unused routing entries per route type.
<b>% Free</b>	Percentage of unused routing entries per route type.
<b>Rtt</b>	Internal routing engine index number of the route table.
<b>VRF</b>	Internal hardware index number for the corresponding route table.
<b>Destination</b>	Destination address for the entry.
<b>Type</b>	( <b>show pfe route summary hw</b> )—Route type for the entry: IPv4 or IPv6 route, and host, LPM, or multicast route.  ( <b>show pfe route (ip   inet6) hw</b> )—Next-hop type for the entry.
<b>NH ID</b>	Next-hop ID for the entry
<b>Interface</b>	Interface to which the next-hop entry is assigned.

Table 123: QFX Series show pfe route Hardware Table Output Fields (*continued*)

Field Name	Field Description
HW NH-ID	Internal hardware index number of the next-hop.
Src-MAC-Address	Source MAC address.
Port	Port number.
Dst-MAC-Address	Destination MAC address.
VLAN	ID of the multicast group VLAN.
GROUP	Internal hardware index number of the multicast group next-hop.
CLASS	Internal class number of the multicast group.

## Sample Output

### show pfe route ip

```
user@host> show pfe route ip
```

```

## show system alarms

<b>Syntax</b>	show system alarms
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Display active system alarms.
<b>Options</b>	This command has no options.
<b>Additional Information</b>	<p>System alarms are preset. They include a <i>configuration</i> alarm that appears when no rescue configuration alarm is set and a <i>license</i> alarm that appears when a software feature is configured and no valid license is configured for the feature. On EX6200 switches, an alarm can be triggered by an internal link error. For more information about system alarms, see the <i>Junos OS Administration Library for Routing Devices</i>.</p> <p>In Junos OS release 11.1 and later, alarms for fans also show the slot number of the malfunctioning fans in the CLI output.</p> <p>Starting with Junos OS Release 13.2, you can view degraded fabric alarms on a routing matrix based on TX Matrix Plus router with 3D SIBs. The alarm indicates that the source FPC is running with a degraded fabric condition. This alarm is an early warning of a possible fabric black-hole condition. When the degraded fabric alarm is raised on the source FPC, you can take remedial action to avoid a fabric black-hole condition. The degraded fabric alarm is raised on the source FPC if both the following conditions are met:</p> <ul style="list-style-type: none"> <li>• The active Packet Forwarding Engine destinations are reachable on one or no active switching planes.</li> <li>• At least one of the inactive switching planes has a fault that causes the destination Packet Forwarding Engine to become unreachable.</li> </ul>
<b>Required Privilege Level</b>	admin
<b>List of Sample Output</b>	<p><a href="#">show system alarms on page 1269</a></p> <p><a href="#">show system alarms (Fan Tray) on page 1269</a></p> <p><a href="#">show system alarms (QFX Series) on page 1269</a></p> <p><a href="#">show system alarms (EX6200) on page 1269</a></p> <p><a href="#">show system alarms (TX Matrix Plus router with 3D SIBs) on page 1269</a></p>
<b>Output Fields</b>	Table 124 on page 1268 lists the output fields for the <b>show system alarms</b> command. Output fields are listed in the approximate order in which they appear.

**Table 124: show system alarms Output Fields**

Field Name	Field Description
Alarm time	Date and time the alarm was first recorded.

Table 124: show system alarms Output Fields (*continued*)

Field Name	Field Description
<b>Class</b>	Severity class for this alarm: <b>Minor</b> or <b>Major</b> .
<b>Description</b>	Information about the alarm.

## Sample Output

### show system alarms

<b>Syntax (TX Matrix Plus Router)</b>	show system audit <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> > <root-only>
<b>Syntax (QFX Series)</b>	show system audit <infrastructure <i>name</i>   interconnect-device <i>name</i>   node-group <i>name</i>   root-only>
<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Display the state and checksum values for file systems.
<b>Options</b>	<p><b>none</b>—Display the state and checksum values for all file systems.</p> <p><b>all-chassis</b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display file system MD5 hash and permissions information for all of the chassis.</p> <p><b>all-lcc</b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display file system MD5 hash and permissions information for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display file system MD5 hash and permissions information for all T1600 or T4000 routers connected to the TX Matrix Plus router.</p> <p><b>all-members</b>—(EX4200 switch, QFX Series, and MX Series routers only) (Optional) Display file system MD5 hash and permissions information on all members of the Virtual Chassis configuration.</p> <p><b>lcc <i>number</i></b>—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display file system MD5 hash and permissions information for a specific T640 router</p>

that is connected to the TX Matrix router. On a TX Matrix Plus router, display file system MD5 hash and permissions information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**infrastructure *name***—(QFabric systems only) (Optional) Display file system MD5 hash and permissions information for a fabric control Routing Engine or a fabric control Routing Engine.

**interconnect-device *name***—(QFabric systems only) (Optional) Display file system MD5 hash and permissions information for the Interconnect device.

**local**—(EX4200 switch, QFX Series, and MX Series routers only) (Optional) Display file system MD5 hash and permissions information on the local Virtual Chassis member.

**member *member-id***—(EX4200 switch, QFX Series, and MX Series routers only) (Optional) Display file system MD5 hash and permissions information on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Display file system MD5 hash and permissions information for the Node group

**root-only**—(Optional) Check only the root (/) file system. On a QFabric system, you can check the root (/) file system on the infrastructure (fabric manager Routing Engine and fabric control Routing Engine), Interconnect device, or Node group.

**scc**—(TX Matrix routers only) (Optional) Display file system MD5 hash and permissions information for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display file system MD5 hash and permissions information for the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

**Additional Information** To redirect the output to a file, issue the following command:

***ssh device-name 'show system audit root-only' > output-file***

If you save the output of the **show system audit root-only** command to a file, you can compare it to subsequent output from the command to determine whether anything has changed.

By default, when you issue the **show system audit** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

<b>Syntax</b>	show system buffers
<b>Syntax (EX Series)</b>	show system buffers <all-members> <local> <member <i>member-id</i> >
<b>Syntax (TX Matrix Router)</b>	show system buffers <all-chassis   all-lcc   lcc <i>number</i>   scc>
<b>Syntax (TX Matrix Plus Router)</b>	show system buffers <all-chassis   all-lcc   lcc <i>number</i>   sfc <i>number</i> >
<b>Syntax (MX Series Router)</b>	show system buffers <all-members> <local> <member <i>member-id</i> >
<b>Syntax (QFX Series)</b>	show system buffers <infrastructure <i>name</i>   interconnect-device <i>name</i>   node-group <i>name</i>   root-only (infrastructure <i>name</i>   interconnect-device <i>name</i>   node-group <i>name</i> )>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. <b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display information about the buffer pool that the Routing Engine uses for local traffic. Local traffic is the routing and management traffic that is exchanged between the Routing Engine and the Packet Forwarding Engine within the router or switch, as well as the routing and management traffic from IP (that is, from OSPF, BGP, SNMP, ping operations, and so on).
<b>Options</b>	<b>none</b> —Show all buffer statistics.  <b>all-lcc</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show buffer statistics for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, show buffer statistics for all routers connected to the TX Matrix Plus router.  <b>all-chassis</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) Show buffer statistics for all of the chassis.

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Show buffer statistics for all members of the Virtual Chassis configuration.

**infrastructure *name***—(QFabric systems only) (Optional) Show buffer statistics for a fabric control Routing Engine or a fabric control Routing Engine.

**interconnect-device *name***—(QFabric systems only) (Optional) Show buffer statistics for the Interconnect device.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show buffer statistics for a specific T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, show buffer statistics for a specific router (line-card chassis) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Show buffer statistics for the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Show buffer statistics for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Show buffer statistics for the Node group

**sfc**—(TX Matrix Plus routers only) (Optional) Show buffer statistics for the TX Matrix Plus router. Replace *number* with 0.

**Additional Information** By default, when you issue the **show system buffers** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

A special type of memory buffer called a *cluster* is 2 KB in size. For more information, see *The Design and Implementation of the 4.4BSD Operation System* by McKusic, Bostic, Karels, and Quarterman.

Output Fields	<a href="#">Table 125 on page 1282</a> describes the output fields for the <b>show system buffers</b> command. Output fields are listed in the approximate order in which they appear.

Table 125: show system buffers Output Fields

Field Name	Field Description
<b>mbufs in use</b>	Memory buffers (mbufs) are 128-byte buffers that are used for various purposes inside the kernel. Each memory buffer has a type, and the output itemizes the amount allocated for each type. Types with no memory buffers allocated are not displayed.
<b>mbufs allocated to packet headers</b>	Number of memory buffers currently holding packet headers
<b>mbufs allocated to control blocks</b>	Number of memory buffers currently holding the state for sockets.
<b>mbufs allocated to send data</b>	Number of memory buffers currently holding socket send data.
<b>mbufs allocated to pfe refill data</b>	Number of memory buffers currently holding Packet Forwarding Engine refill data.
<b>mbufs allocated to fxp data</b>	Number of memory buffers currently holding fxp data.
<b>mbufs allocated to socket names and addresses</b>	Number of memory buffers currently holding addresses for sockets.
<b>mbuf clusters in use</b>	Allocation statistics for memory buffer clusters.
<b>allocated to network</b>	Total amount of memory in use by the networking and interprocess communication (IPC) code.
<b>requests for memory denied</b>	Number of times a memory allocation request within the IPC and networking code failed.
<b>requests for memory delayed</b>	Number of times a memory allocation request within the IPC and networking code was postponed.
<b>calls to protocol drain routines</b>	Number of times a memory allocation request within the IPC and networking code triggered a memory reclamation attempt.

## Sample Output

### show system buffers

```

user@host> show system buffers
397/893/1290 mbufs in use (current/cache/total)
395/331/726/30000 mbuf clusters in use (current/cache/total/max)
384/256 mbuf+clusters out of packet secondary zone in use (current/cache)
0/0/0/0 4k (page size) jumbo clusters in use (current/cache/total/max)
0/0/0/0 9k jumbo clusters in use (current/cache/total/max)
0/0/0/0 16k jumbo clusters in use (current/cache/total/max)
889K/885K/1774K bytes allocated to network (current/cache/total)
0/0/0 requests for mbufs denied (mbufs/clusters/mbuf+clusters)
0/0/0 requests for jumbo clusters denied (4k/9k/16k)
0/5/1024 sfbufs in use (current/peak/max)

```

```

0 requests for sbufs denied
0 requests for sbufs delayed
0 requests for I/O initiated by sendfile
0 calls to protocol drain routines

```

#### show system buffers scc (TX Matrix Router)

```

user@host> show system buffers scc
213 mbufs in use:
    11 mbufs allocated to packet headers
    26 mbufs allocated to socket names and addresses
    2 mbufs allocated to socket options
    17 mbufs allocated to socket send data
    2 mbufs allocated to pfe data
    155 mbufs allocated to fxp data (rx)
    511 mbufs allocated to <mbuf type 86>
    256 mbufs allocated to <mbuf type 92>
924/1162 mbuf clusters in use
2788 Kbytes allocated to network (75% in use)
0 requests for memory denied
0 requests for memory delayed
0 calls to protocol drain routines

```

#### show system buffers sfc (TX Matrix Plus Router)

```

user@host> show system buffers sfc 0

<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.

**sfc** option introduced for the TX Matrix Plus router in Junos OS Release 9.6.  
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Display information about the active IP sockets on the Routing Engine. Use this command to verify which servers are active on a system and what connections are currently in progress.

**Options** **none**—Display information about all active IP sockets on the Routing Engine.

**extensive**—(Optional) Display exhaustive system process information, which, for TCP connections, includes the TCP control block. This option is useful for debugging TCP connections.

**all-chassis**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display system connection activity for all the routers in the chassis.

**all-lcc**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system connection activity for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display system connection activity for all connected T1600 or T4000 LCCs

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Display system connection activity for all members of the Virtual Chassis configuration.

**inet | inet6**—(Optional) Display IPv4 connections or IPv6 connections, respectively.

**infrastructure name**—(QFabric systems only) (Optional) Display system connection activity for the fabric control Routing Engines or fabric manager Routing Engines.

**interconnect-device name**—(QFabric systems only) (Optional) Display system connection activity for the Interconnect device.

**lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system connection activity for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system connection activity for a specific router that is connected to the TX Matrix Plus router. Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display system connection activity for the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display system connection activity for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Display system connection activity for the Node group.

**scc**—(TX Matrix routers only) (Optional) Display system connection activity for the TX Matrix router (or switch-card chassis).

**sfc**—(TX Matrix routers only) (Optional) Display system connection activity for the TX Matrix Plus router.

**show-routing-instances**—(Optional) Display routing instances.

**Additional Information** By default, when you issue the **show system connections** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

**Output Fields** [Table 126 on page 1288](#) describes the output fields for the **show system connections** command. Output fields are listed in the approximate order in which they appear.

**Table 126: show system connections Output Fields**

Field Name	Field Description
<b>Proto</b>	Protocol of the socket: IP, TCP, or UDP for IPv4 or IPv6.
<b>Recv-Q</b>	Number of input packets received by the protocol and waiting to be processed by the application.
<b>Send-Q</b>	Number of output packets sent by the application and waiting to be processed by the protocol.

Table 126: show system connections Output Fields (*continued*)

Field Name	Field Description
Local Address	Local address and port of the socket, separated by a period. An asterisk (*) indicates that the bound address is the wildcard address. Server sockets typically have the wildcard address and a well-known port bound to them.
Foreign Address	Foreign address and port of the socket, separated by a period. An asterisk (*) indicates that the address or port is a wildcard.
Routing Instance	(Displayed only when the <b>show-routing-instance</b> option is used.) Routing instances associated with active IP sockets on the Routing Engine.
(state)	For TCP, the protocol state of the socket.

## Sample Output

<b>Release Information</b>	<p>Command introduced before Junos OS Release 8.5.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p> <p><b>re0</b>, <b>re1</b>, and <b>routing-engine</b> options introduced for dual routing engines in Junos OS Release 13.1.</p>

**Description** Show core files on all routers or switches running Junos OS. You can use the **show system core-dumps** command to show a list of system core files created when the router or switch has failed. This command can be useful for diagnostic purposes. Each list item includes the file permissions, number of links, owner, group, size, modification date, and path and filename. If dual routing engines are present, you can view core-dump files for either routing engine or both routing engines together. On a QFabric system, you can view core-dump files on individual QFabric system devices as well as on the entire QFabric system.

You can use the option **core-filename** and its options **core-file-info**, **brief**, and **detail** to display more information about the specified core-dump files.

**Options** **none**—Display a list of all existing core-dump files.

**NOTE:** If dual routing engines are present, lists only the core-dump files for the active routing engine.

**all-chassis**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a routing matrix based on a TX Matrix router, display system core files for the TX Matrix router switch-card chassis [SCC] and all the T640 routers [LCCs] connected to the TX Matrix router.

On a routing matrix based on a TX Matrix Plus router, display system core files for the TX Matrix Plus router (switch-fabric chassis [SFC]) and all the T1600 routers [LCCs] connected to the TX Matrix Plus router.

**<all-lcc | lcc number>**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a routing matrix based on the TX Matrix router, display core dump files for all T640 routers (line-card chassis [LCCs]) or a specific T640 router [LCC] connected to the TX Matrix router.

On a routing matrix based on the TX Matrix Plus router, display logging information for all T1600 routers (line-card chassis [LCCs]) or a specific T1600 router (LCC) connected to the TX Matrix Plus router. When using the **lcc number** option, replace **number** with a value from 0 through 3.

**NOTE:** The **all-chassis** option displays system core files for the SCC or SFC and the LCCs connected to the SCC or SFC in the routing matrix while the **all-lcc** option only displays system core files for the LCCs in the routing matrix.

**all-members**—(EX4200 switches) (Optional) Display system core files on all members of the Virtual Chassis configuration.

**brief**—(Optional) View details of a binary file.

**component** (*UUID | serial number | all*)—(QFabric systems only) (Optional) Display a list of core-dump files located on individual QFabric system device or on the entire QFabric system.

**core-file-info**—(Optional) Display the stack trace of a core file.

**core-filename**—(Optional) Name of a specific core file to display.

**detail**—(Optional) View stack trace with details of the binary file.

**display-order** (*timestamp-sort | alphanumeric-sort*)—(QFabric systems only) (Optional) Display list of debug artifacts generated within the specified period—for example, within the last hour, within the last 20 minutes, or within the last 32 seconds—or according to their filename.

**display-period** (*hours | minutes | seconds*)—(QFabric systems only) (Optional) Display core-dump files generated within the specified period—for example, within the last hour, within the last 20 minutes, or within the last 32 seconds.

**kernel-crashinfo component** (*UUID | serial number*)—(QFabric systems only) (Optional) Display kernel crash information from the EEPROM on a QFabric system device.

**local**—(EX4200 switches only) (Optional) Display system core files on the local Virtual Chassis member.

**member member-id**—(EX4200 switches only) (Optional) Display system core files on the specified member of the Virtual Chassis configuration. Replace *member-id* with a value from 0 through 9.

**re0**—(Dual routing engines only) Display the core-dump files on re0.

**re1**—(Dual routing engines only) Display the core-dump files on re1.

**repository** (*core | log*)—(QFabric systems only) (Optional) Specify either the core or log repository in which to view core-dump files.

**routing-engine** (*backup | both | local | master | other*)—(Dual routing engines only) Display a list of core-dump files for either the backup, local, master, or other routing engine or both routing engines.

**scc**—(TX Matrix routers only) (Optional) Display system core files on the TX Matrix router (or switch-card chassis).

**sfc**—(TX Matrix Plus routers only) (Optional) Display system core files on the TX Matrix Plus router (or switch-fabric chassis).

**Required Privilege Level**

**Output Fields** Table 127 on page 1308 describes the output fields for the **show system core-dumps** command. Output fields are listed in the approximate order in which they appear.

**Table 127: show system core-dumps Output Fields**

Field Name	Field Description
<i>Permissions</i>	Read/write permissions for the file named.
<i>Links</i>	Number of links to the file.
<i>Owner</i>	Name of the file owner.
<i>Group</i>	Name of the group with file access.
<i>File size</i>	File size in bytes.
<i>Modified</i>	Last file modification date and time.
<i>Path/filename</i>	File path where the file resides and the filename.
<b>Repository scope:</b>	Repository where core-dump files and log files are stored. The core-dump files are located in the <b>core</b> repository, and the log files are located in the <b>log</b> repository. The default <b>Repository scope</b> is shared since both the <b>core</b> and <b>log</b> repositories are shared by all of the QFabric system devices.
<b>Repository head:</b>	Path to the top-level repository location.
<b>Repository name:</b>	Name of the repository: <b>core</b> or <b>log</b> .
<b>List of nodes for core repository:</b>	List of core-dump files associated with a particular QFabric system device located in the core repository.
<b>Node Group</b>	Name of the QFabric system device.
<b>Node Identifier</b>	UUID or serial number of the QFabric system device.
<b>Num</b>	Number of core-dump and log files.

Table 127: show system core-dumps Output Fields (*continued*)

Field Name	Field Description
<b>Model</b>	Model number of the QFabric system device.
<b>Usage</b>	Usage of the repository in megabytes.
<b>Total usage of core repository:</b>	Total usage of core-dump files associated with a particular QFabric system device located in the core repository. Usage is specified in megabytes and as a percentage.
<b>Total usage of log repository:</b>	Total usage of log files associated with a particular QFabric system device located in the log repository. Usage is specified in megabytes and as a percentage.
<b>List of nodes for core repository:</b>	List of core-dump files associated with a particular QFabric system device located in the core repository.
<b>List of nodes for log repository:</b>	List of log files associated with a particular QFabric system device located in the log repository.
<b>Filename</b>	Name of the core-dump file.
<b>Date</b>	Last core-dump file modification date and time.
<b>Size</b>	Size of the core-dump file.
<b>Core filename</b>	Filename of the core-dump file.
<b>Process name</b>	Name of the process that is generating a core-dump file or log file.
<b>Release</b>	Junos OS release.
<b>Build server</b>	Junos OS build server.
<b>Build date</b>	Junos OS build date.
<b>Stack trace</b>	Stack trace of the core-dump file.

## Sample Output

### show system core-dumps

This example shows the command output if core files exist.

```
user@switcht> show system core-dumps
-rw----- 1 root wheel 268369920 Jun 18 17:59 /var/crash/vmcore.0
-rw-rw---- 1 root field 3371008 Jun 18 17:53 /var/tmp/rpd.core.0
-rw-r--r-- 1 root wheel 27775914 Jun 18 17:59 /var/crash/kernel.0
```

### show system core-dumps

This example shows the command output if core files do not exist.

```
user@host> show system core-dumps
/var/crash/*core*: No such file or directory
/var/tmp/*core*: No such file or directory
/var/crash/kernel.*: No such file or directory
```

### show system core-dumps routing-engine both

This example shows the command output if dual routing engines are present.

```
user@host> show system core-dumps routing-engine both

<b>Release Information</b>	<p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 9.0 for EX Series switches.</p> <p><b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Display directory usage information.
<b>Options</b>	<b>none</b> —Display all directory usage information.

**all-chassis**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display directory usage information about all the T640 routers (in a routing matrix based on a TX Matrix router). Display directory usage information about all the T1600 or T4000 routers (in a routing matrix based on a TX Matrix Plus router) in the chassis.

**all-lcc**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display directory information for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display directory information for all connected T1600 or T4000 LCCs.

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Display directory information for all members of the Virtual Chassis configuration.

**depth *number***—(Optional) Depth of the directory to traverse. This option is useful when you want to limit the output shown for a large file system.

**infrastructure *name***— (QFabric systems only) (Optional) Display directory information for the fabric control Routing Engines and fabric manager Routing Engines.

**interconnect-device *name***— (QFabric systems only) (Optional) Display directory information for the Interconnect device.

**node-group *name***— (QFabric systems only) (Optional) Display directory information for the Node group.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display directory information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display directory information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display directory information for the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display directory information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

***path***—(Optional) Path or root directory to traverse.

**scc**—(TX Matrix router only) (Optional) Display directory information for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display directory information for the TX Matrix Plus router. Replace *number* with 0.

<wide>

<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Option <b>sfc</b> introduced for the TX Matrix Plus router in Junos OS Release 9.6. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display information about software processes that are running on the router or switch and that have controlling terminals.
<b>Options</b>	<p><b>none</b>—Display standard information about system processes.</p> <p><b>brief   detail   extensive   summary</b>—(Optional) Display the specified level of detail.</p> <p><b>adaptive-services</b>—(Optional) Display the configuration management process that manages the configuration for stateful firewall, Network Address Translation (NAT), intrusion detection services (IDS), and IP Security (IPsec) services on the Adaptive Services PIC.</p> <p><b>alarm-control</b>—(Optional) Display the process to configure the system alarm.</p> <p><b>all-chassis</b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display standard system process information about all the T640 routers (in a routing matrix based on the TX Matrix router) or all the T1600 or T4000 routers (in a routing matrix based on the TX Matrix Plus router) in the chassis.</p> <p><b>all-lcc</b>—(TX Matrix routers and TX Matrix Plus router only) (Optional) Display standard system process information for all T640 routers (or line-card chassis) connected to the TX Matrix router. Display standard system process information for all connected T1600 or T4000 LCCs.</p> <p><b>all-members</b>—(EX4200 switches and MX Series routers only) (Optional) Display standard system process information for all members of the Virtual Chassis configuration.</p> <p><b>ancpd-service</b>—Display the Access Node Control Protocol (ANCP) process, which works with a special Internet Group Management Protocol (IGMP) session to collect outgoing interface mapping events in a scalable manner.</p> <p><b>application-identification</b>—Display the process that identifies an application using intrusion detection and prevention (IDP) to allow or deny traffic based on applications running on standard or nonstandard ports.</p> <p><b>audit-process</b>—(Optional) Display the RADIUS accounting process.</p> <p><b>auto-configuration</b>—Display the Interface Auto-Configuration process.</p> <p><b>bootp</b>—Display the process that enables a router, switch, or interface to act as a Dynamic Host Configuration Protocol (DHCP) or bootstrap protocol (BOOTP) relay agent. DHCP relaying is disabled.</p>

**captive-portal-content-delivery**—Display the HTTP redirect service by specifying the location to which a subscriber's initial Web browser session is redirected, enabling initial provisioning and service selection for the subscriber.

**ce-l2tp-service**—(Optional) (M10, M10i, M7i, and MX Series routers only) Display the Universal Edge Layer 2 Tunneling Protocol (L2TP) process, which establishes L2TP tunnels and Point-to-Point Protocol (PPP) sessions through L2TP tunnels.

**cfm**—Display Ethernet Operations, Administration, and Maintenance (OAM) connectivity fault management (CFM) process, which can be used to monitor the physical link between two switches.

**chassis-control**—(Optional) Display the chassis management process.

**class-of-service**—(Optional) Display the class-of-service (CoS) process, which controls the router's or switch's CoS configuration.

**clksyncd-service**—Display the external clock synchronization process, which uses synchronous Ethernet (SyncE).

**craft-control**—Display the process for the I/O of the craft interface.

**database-replication**—(EX Series switches and MX Series routers only) (Optional) Display the database replication process.

**datapath-trace-service**—Display the packet path tracing process.

**dhcp-service**—(EX Series switches and MX Series routers only) (Optional) Display the Dynamic Host Configuration Protocol process, which enables a DHCP server to allocate network IP addresses and deliver configuration settings to client hosts without user intervention.

**diameter-service**—(Optional) Display the diameter process.

**disk-monitoring**—(Optional) Display the disk monitoring process, which checks the health of the hard disk drive on the Routing Engine.

**dynamic-flow-capture**—(Optional) Display the dynamic flow capture (DFC) process, which controls DFC configurations on Monitoring Services III PICs.

**ecc-error-logging**—(Optional) Display the error checking and correction (ECC) process, which logs ECC parity errors in memory on the Routing Engine.

**ethernet-connectivity-fault-management**— Display the process that provides IEEE 802.1ag OAM connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.

**ethernet-link-fault-management**—(EX Series switches and MX Series routers only) (Optional) Display the process that provides the OAM link fault management (LFM) information for Ethernet interfaces.

**event-processing**—(Optional) Display the event process (eventd).

**firewall**—(Optional) Display the firewall management process, which manages the firewall configuration and enables accepting or rejecting packets that are transiting an interface on a router or switch.

**general-authentication-service**—(EX Series switches and MX Series routers only)  
(Optional) Display the general authentication process.

**health (pid *process-identifier* | process-name *process-name*)**—(Optional) Display process health information, either by process id (PID) or by process name.

**host-processes**—Display process information of processes running on the host system.

**iccp-service**—Display the Inter-Chassis Communication Protocol (ICCP) process.

**idp-policy**—Display the intrusion detection and prevention (IDP) protocol process.

**ilmi**—Display the Integrated Local Management Interface (ILMI) protocol process, which provides bidirectional exchange of management information between two ATM interfaces across a physical connection.

**inet-process**—Display the IP multicast family process.

**init**—Display the process that initializes the USB modem.

**interface-control**—(Optional) Display the interface process, which controls the router's or switch's physical interface devices and logical interfaces.

**kernel-replication**—(Optional) Display the kernel replication process, which replicates the state of the backup Routing Engine when graceful Routing Engine switchover (GRES) is configured.

**l2-learning**—(Optional) Display the Layer 2 address flooding and learning process.

**l2cpd-service**—Display the Layer 2 Control Protocol process, which enables features such as Layer 2 protocol tunneling and nonstop bridging.

**lACP**—(Optional) Display the Link Aggregation Control Protocol (LACP) process. LACP provides a standardized means for exchanging information between partner systems on a link to allow their link aggregation control instances to reach agreement on the identity of the LAG to which the link belongs, and then to move the link to that LAG, and to enable the transmission and reception processes for the link to function in an orderly manner.

**lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display standard system process information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display standard system process information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display standard system process information for the local Virtual Chassis member.

**local-policy-decision-function**—Display the process for the Local Policy Decision Function, which regulates collection of statistics related to applications and application groups and tracking of information about dynamic subscribers and static interfaces.

**logical-system-mux**—Display the logical router multiplexer process (lrmuxd), which manages the multiple instances of the routing protocols process (rpd) on a machine running logical routers.

**mac-validation**—Display the MAC validation process, which configures MAC address validation for subscriber interfaces created on demux interfaces in dynamic profiles on MX Series routers.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display standard system process information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**mib-process**—(Optional) Display the MIB II process, which provides the router's MIB II agent.

**mobile-ip**—(Optional) Display the Mobile IP process, which configures Junos OS Mobile IP features.

**moundd-service**—(EX Series switches and MX Series routers only) (Optional) Display the service for NFS mounts requests.

**mpls-traceroute**—(Optional) Display the MPLS Periodic Traceroute process.

**mspd**—(Optional) Display the Multiservice process.

**multicast-snooping**—(EX Series switches and MX Series routers only) (Optional) Display the multicast snooping process, which makes Layer 2 devices such as VLAN switches aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.

**named-service**—(Optional) Display the DNS Server process, which is used by a router or a switch to resolve hostnames into addresses.

**neighbor-liveness**—Display the process, which specifies the maximum length of time that the router waits for its neighbor to re-establish an LDP session.

**nfsd-service**—(Optional) Display the Remote NFS Server process, which provides remote file access for applications that need NFS-based transport.

**ntp**—Display the Network Time Protocol (NTP) process, which provides the mechanisms to synchronize time and coordinate time distribution in a large, diverse network.

**packet-triggered-subscribers**—Display the packet-triggered subscribers and policy control (PTSP) process, which allows the application of policies to dynamic subscribers that are controlled by a subscriber termination device.

**peer-selection-service**—(Optional) Display the Peer Selection Service process.

**periodic-packet-services**—Display the Periodic packet management process, which is responsible for processing a variety of time-sensitive periodic tasks so that other processes can more optimally direct their resources.

**pfe**—Display the Packet Forwarding Engine management process.

**pgcp-service**—(Optional) Display the pgcpd service process running on the Routing Engine.

**pgm**—Display the Pragmatic General Multicast (PGM) protocol process, which enables a reliable transport layer for multicast applications.

**pic-services-logging**—(Optional) Display the logging process for some PICs. With this process, also known as fsad (the file system access daemon), PICs send special logging information to the Routing Engine for archiving on the hard disk.

**ppp**—(Optional) Display the Point-to-Point Protocol (PPP) process, which is the encapsulation protocol process for transporting IP traffic across point-to-point links.

**ppp-service**—Display the Universal edge PPP process, which is the encapsulation protocol process for transporting IP traffic across universal edge routers.

**pppoe**—(Optional) Display the Point-to-Point Protocol over Ethernet (PPPoE) process, which combines PPP that typically runs over broadband connections with the Ethernet link-layer protocol that allows users to connect to a network of hosts over a bridge or access concentrator.

**process-monitor**—Display the process health monitor process (pmond).

**providers**—(Optional) Display provider processes.

**redundancy-interface-process**—(Optional) Display the ASP redundancy process.

**remote-operations**—(Optional) Display the remote operations process, which provides the ping and traceroute MIBs.

**resource-cleanup**—Display the resource cleanup process.

**resource-limits (brief | detail) process-name**—(Optional) Display process resource limits.

**routing**—(Optional) Display the routing protocol process.

**sampling**—(Optional) Display the sampling process, which performs packet sampling based on particular input interfaces and various fields in the packet header.

**sbc-configuration-process**—Display the session border controller (SBC) process of the border signaling gateway (BSG).

**scc**—(TX Matrix routers only) (Optional) Display standard system process information for the TX Matrix router (or switch-card chassis).

**sdk-service**—Display the SDK Service process, which runs on the Routing Engine and is responsible for communications between the SDK application and Junos OS. Although the SDK Service process is present on the router, it is turned off by default.

**secure-neighbor-discovery**—(EX Series switches and MX Series routers only) (Optional) Display the secure Neighbor Discovery Protocol (NDP) process, which provides support for protecting NDP messages.

**send**—(Optional) Display the Secure Neighbor Discovery Protocol (SEND) process, which provides support for protecting Neighbor Discovery Protocol (NDP) messages.

**service-deployment**—(Optional) Display the service deployment process, which enables Junos OS to work with the Session and Resource Control (SRC) software.

**sfc number**—(TX Matrix Plus routers only) (Optional) Display system process information for the TX Matrix Plus router. Replace **number** with 0.

**snmp**—Display the SNMP process, which enables the monitoring of network devices from a central location and provides the router's or switch's SNMP master agent.

**sonet-aps**—Display the SONET Automatic Protection Switching (APS) process, which monitors any SONET interface that participates in APS.

**static-subscribers**—(Optional) Display the Static subscribers process, which associates subscribers with statically configured interfaces and provides dynamic service activation and activation for these subscribers.

**tunnel-oamd**—(Optional) Display the Tunnel OAM process, which enables the Operations, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol tunneling (L2PT) allows service providers to send Layer 2 protocol data units (PDUs) across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.

**vrrp**—(EX Series switches and MX Series routers only) (Optional) Display the Virtual Router Redundancy Protocol (VRRP) process, which enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.

**watchdog**—Display the watchdog timer process, which enables the watchdog timer when Junos OS encounters a problem.

**wide**—(Optional) Display process information that might be wider than 80 columns.

**Additional Information** By default, when you issue the **show system processes** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

**Output Fields** [Table 129 on page 1330](#) describes the output fields for the **show system processes** command. Output fields are listed in the approximate order in which they appear.

**Table 129: show system processes Output Fields**

Field Name	Field Description	Level of Output
<b>last pid</b>	Last process identifier assigned to the process.	brief extensive summary
<b>load averages</b>	Three load averages followed by the current time.	brief extensive summary
<b>processes</b>	Number of existing processes and the number of processes in each state ( <b>sleeping</b> , <b>running</b> , <b>starting</b> , <b>zombies</b> , and <b>stopped</b> ).	brief extensive summary
<b>Mem</b>	Information about physical and virtual memory allocation.	brief extensive summary
<b>Swap</b>	Information about physical and virtual memory allocation.	brief extensive summary

Table 129: show system processes Output Fields (*continued*)

Field Name	Field Description	Level of Output
PID	Process identifier.	detail extensive summary
TT	Control terminal name.	none detail
STAT	<p>Symbolic process state. The state is given by a sequence of letters. The first letter indicates the run state of the process:</p> <ul style="list-style-type: none"> <li>• <b>D</b>—In disk or other short-term, uninterruptible wait</li> <li>• <b>I</b>—Idle (sleeping longer than about 20 seconds)</li> <li>• <b>R</b>—Runnable</li> <li>• <b>S</b>—Sleeping for less than 20 seconds</li> <li>• <b>T</b>—Stopped</li> <li>• <b>Z</b>—Dead (zombie)</li> <li>• <b>+</b> —The process is in the foreground process group of its control terminal.</li> <li>• <b>&lt;</b>—The process has raised CPU scheduling priority.</li> <li>• <b>&gt;</b>—The process has specified a soft limit on memory requirements and is currently exceeding that limit; such a process is not swapped.</li> <li>• <b>A</b>—The process requested random page replacement.</li> <li>• <b>E</b>—The process is trying to exit.</li> <li>• <b>L</b>—The process has pages locked in core.</li> <li>• <b>N</b>—The process has reduced CPU scheduling priority.</li> <li>• <b>S</b>—The process requested first-in, first-out (FIFO) page replacement.</li> <li>• <b>s</b>—The process is a session leader.</li> <li>• <b>V</b>—The process is temporarily suspended.</li> <li>• <b>W</b>—The process is swapped out.</li> <li>• <b>X</b>—The process is being traced or debugged.</li> </ul>	none detail
UID	User identifier.	detail
USERNAME	Process owner.	extensive summary
PPID	Parent process identifier.	detail
CPU	<p>(D)—Short-term CPU usage.</p> <p>(E and S)—Raw (unweighted) CPU usage. The value of this field is used to sort the processes in the output.</p>	detail extensive summary
RSS	Resident set size.	detail
WCHAN	Symbolic name of the wait channel.	detail
STARTED	Local time when the process started running.	detail
PRI	Current priority of the process. A lower number indicates a higher priority.	detail extensive summary

Table 129: show system processes Output Fields (*continued*)

Field Name	Field Description	Level of Output
NI or NICE	UNIX "niceness" value. A lower number indicates a higher priority.	detail extensive summary
SIZE	Total size of the process (text, data, and stack), in kilobytes.	extensive summary
RES	Current amount of resident memory, in kilobytes.	extensive summary
STATE	Current state of the process (for example, <b>sleep</b> , <b>wait</b> , <b>run</b> , <b>idle</b> , <b>zombie</b> , or <b>stop</b> ).	extensive summary
TIME	(S)—Number of system and user CPU seconds that the process has used.  (None, D, and E)—Total amount of time that the command has been running.	detail extensive summary
WCPU	Weighted CPU usage.	extensive summary
COMMAND	Command that is currently running.	detail extensive summary
THR	Number of threads in the process	extensive

### Understanding Software Infrastructure and Processes

Each switch runs the Juniper Networks Junos operating system (Junos OS) for Juniper Networks EX Series Ethernet Switches on its general-purpose processors. Junos OS includes processes for Internet Protocol (IP) routing and for managing interfaces, networks, and the chassis.

The Junos OS runs on the Routing Engine. The Routing Engine kernel coordinates communication among the Junos OS processes and provides a link to the Packet Forwarding Engine.

With the J-Web interface and the command-line interface (CLI) to the Junos OS, you configure switching features and routing protocols and set the properties of network interfaces on your switch. After activating a software configuration, use either the J-Web or CLI user interface to monitor the switch, manage operations, and diagnose protocol and network connectivity problems.

- [Routing Engine and Packet Forwarding Engine on page 1353](#)
- [Junos OS Processes on page 1354](#)

### Routing Engine and Packet Forwarding Engine

---

A switch has two primary software processing components:

- **Packet Forwarding Engine**—Processes packets; applies filters, routing policies, and other features; and forwards packets to the next hop along the route to their final destination.

- Routing Engine—Provides three main functions:
  - Creates the packet forwarding switch fabric for the switch, providing route lookup, filtering, and switching on incoming data packets, then directing outbound packets to the appropriate interface for transmission to the network
  - Maintains the routing tables used by the switch and controls the routing protocols that run on the switch.
  - Provides control and monitoring functions for the switch, including controlling power and monitoring system status.

### Junos OS Processes

The Junos OS running on the Routing Engine and Packet Forwarding Engine consists of multiple processes that are responsible for individual functions.

The separation of functions provides operational stability, because each process accesses its own protected memory space. In addition, because each process is a separate software package, you can selectively upgrade all or part of the Junos OS, for added flexibility.

[Table 6 on page 30](#) describes the primary Junos OS processes.

**Table 130: Junos OS Processes**

Process	Name	Description
Chassis process	chassisd	<p>Detects hardware on the system that is used to configure network interfaces.</p> <p>Monitors the physical status of hardware components and field-replaceable units (FRUs), detecting when environment sensors such as temperature sensors are triggered.</p> <p>Relays signals and interrupts—for example, when devices are taken offline, so that the system can close sessions and shut down gracefully.</p>
Ethernet switching process	eswd	<p>Handles Layer 2 switching functionality such as MAC address learning, Spanning Tree protocol and access port security. The process is also responsible for managing Ethernet switching interfaces, VLANs, and VLAN interfaces.</p> <p>Manages Ethernet switching interfaces, VLANs, and VLAN interfaces.</p>
Forwarding process	pfem	<p>Defines how routing protocols operate on the switch. The overall performance of the switch is largely determined by the effectiveness of the forwarding process.</p>
Interface process	dcd	<p>Configures and monitors network interfaces by defining physical characteristics such as link encapsulation, hold times, and keepalive timers.</p>

Table 130: Junos OS Processes (*continued*)

Process	Name	Description
Management process	mgd	<p>Provides communication between the other processes and an interface to the configuration database.</p> <p>Populates the configuration database with configuration information and retrieves the information when queried by other processes to ensure that the system operates as configured.</p> <p>Interacts with the other processes when commands are issued through one of the user interfaces on the switch.</p> <p>If a process terminates or fails to start when called, the management process attempts to restart it a limited number of times to prevent thrashing and logs any failure information for further investigation.</p>
Routing protocol process	rpd	Defines how routing protocols such as RIP, OSPF, and BGP operate on the device, including selecting routes and maintaining forwarding tables.

## Extended DHCP Local Server Overview

Junos OS includes an extended DHCP local server that enhances traditional DHCP server operation by providing additional address assignment and client configuration functionality and flexibility in a subscriber-aware environment. The extended DHCP local server enables service providers to take advantage of external address-assignment pools and integrated RADIUS-based configuration capabilities in addition to the continued support of traditional local address pools. The address-assignment pools are considered external because they are external to the DHCP local server. The pools are managed independently of the DHCP local server, and can be shared by different client applications, such as DHCP or PPPoE access. [Table 131 on page 1357](#) provides a comparison of the extended DHCP local server and a traditional DHCP local server.

The extended DHCP local server provides an IP address and other configuration information in response to a client request. The server supports the attachment of dynamic profiles and also interacts with the local AAA Service Framework to use back-end authentication servers, such as RADIUS, to provide DHCP client authentication. You can configure the dynamic profile and authentication support on a global basis or for a specific group of interfaces.

**Table 131: Comparing the Extended DHCP Local Server to the Traditional DHCP Local Server**

Feature	Extended DHCP Local Server	Traditional DHCP Local Server
Local address pools	X	X
External, centrally-managed address pools	X	—
Local configuration	X	X
External configuration using information from address-assignment pools or RADIUS servers	X	—
Dynamic-profile attachment	X	—
RADIUS-based subscriber authentication, and configuration using RADIUS attributes and Juniper Networks VSAs	X	—
IPv6 client support	X	—
Default minimum client configuration	X	X

You can also configure the extended DHCP local server to support IPv6 clients. Both DHCP local server and DHCPv6 local server support the specific address request feature, which enables you to assign a particular address to a client.

**NOTE:** If you delete the DHCP server configuration, DHCP server bindings might still remain. To ensure that DHCP bindings are removed, issue the `clear dhcp server binding` command before you delete the DHCP server configuration.

This overview covers:

- [Interaction Among the DHCP Client, Extended DHCP Local Server, and Address-Assignment Pools on page 1358](#)
- [Providing DHCP Client Configuration Information on page 1358](#)
- [Minimal Configuration for Clients on page 1360](#)
- [DHCP Local Server and Address-Assignment Pools on page 1360](#)

### [Interaction Among the DHCP Client, Extended DHCP Local Server, and Address-Assignment Pools](#)

---

The pattern of interaction between the DHCP local server, the DHCP client, and address-assignment pools is the same regardless of whether you are using a router or a switch. However, there are some differences in the details of usage.

- On routers—In a typical carrier edge network configuration, the DHCP client is on the subscriber's computer or customer premises equipment (CPE), and the DHCP local server is configured on the router.
- On switches—In a typical network configuration, the DHCP client is on an access device, such as a personal computer, and the DHCP local server is configured on the switch.

The following steps provide a high-level description of the interaction among the DHCP local server, DHCP client, and address-assignment pools:

1. The DHCP client sends a discover packet to one or more DHCP local servers in the network to obtain configuration parameters and an IP address for the subscriber (or DHCP client).
2. Each DHCP local server that receives the discover packet then searches its address-assignment pool for the client address and configuration options. Each local server creates an entry in its internal client table to keep track of the client state, then sends a DHCP offer packet to the client.
3. On receipt of the offer packet, the DHCP client selects the DHCP local server from which to obtain configuration information and sends a request packet indicating the DHCP local server selected to grant the address and configuration information.
4. The selected DHCP local server sends an acknowledgement packet to the client that contains the client address lease and configuration parameters. The server also installs the host route and ARP entry, and then monitors the lease state.

### [Providing DHCP Client Configuration Information](#)

---

When the extended DHCP application receives a response from an external authentication server, the response might include information in addition to the IP address and subnet

mask. The extended DHCP application uses the information from the authentication grant for the response the DHCP application sends to the DHCP client. The DHCP application can either send the information in its original form or the application might merge the information with local configuration specifications. For example, if the authentication grant includes an address pool name and a local configuration specifies DHCP attributes for that pool (such as, DNS server address), the extended DHCP application merges the authentication results and the attributes in the reply that the server sends to the client.

A local configuration is optional — a client can be fully configured by the external authentication service. However, if the external authentication service does not provide client configuration, you might need to configure the local address-assignment pool to provide the configuration information, such as DNS server, for the client. When a local configuration specifies options, the extended DHCP application adds the local configuration options to the offer PDU the server sends to the client. If the two sets of options overlap, the options in the authentication response from the external service take precedence.

When you use RADIUS to provide the authentication, the additional information might be in the form of RADIUS attributes and Juniper Networks VSAs. [Table 132 on page 1359](#) lists the information that RADIUS might include in the authentication grant. See *RADIUS Attributes and Juniper Networks VSAs Supported by the AAA Service Framework* for a complete list of RADIUS attributes and Juniper Networks VSAs that the extended DHCP applications supports for subscriber access management or DHCP management.

**Table 132: Information in Authentication Grant**

Attribute Number	Attribute Name	Description
RADIUS attribute 8	Framed-IP-Address	Client IP address
RADIUS attribute 9	Framed-IP-Netmask	Subnet mask for client IP address (DHCP option 1)
Juniper Networks VSA 26-4	Primary-DNS	Primary domain server (DHCP option 6)
Juniper Networks VSA 26-5	Secondary-DNS	Secondary domain server (DHCP option 6)
Juniper Networks VSA 26-6	Primary-WINS	Primary WINS server (DHCP option 44)
Juniper Networks VSA 26-7	Secondary-WINS	Secondary WINS server (DHCP option 44)
RADIUS attribute 27	Session-Timeout	Lease time
RADIUS attribute 88	Framed-Pool	Address assignment pool name
Juniper Networks VSA 26-109	DHCP-Guided-Relay-Server	DHCP relay server

### Minimal Configuration for Clients

---

The extended DHCP local server provides a minimal configuration to the DHCP client if the client does not have DHCP option 55 configured. The server provides the subnet mask of the address-assignment pool that is selected for the client. In addition to the subnet mask, the server provides the following values to the client if the information is configured in the selected address-assignment pool:

- **router**—A router located on the client's subnet. This statement is the equivalent of DHCP option 3.
- **domain name**—The name of the domain in which the client searches for a DHCP server host. This is the default domain name that is appended to hostnames that are not fully qualified. This is equivalent to DHCP option 15.
- **domain name server**—A Domain Name System (DNS) name server that is available to the client to resolve hostname-to-client mappings. This is equivalent to DHCP option 6.

### DHCP Local Server and Address-Assignment Pools

---

In the traditional DHCP server operation, the client address pool and client configuration information reside on the DHCP server. With the extended DHCP local server, the client address and configuration information reside in external address-assignment pools (external to the DHCP local server). The external address-assignment pools are managed by the **authd** process, independently of the DHCP local server, and can be shared by different client applications.

The extended DHCP local server also supports advanced pool matching and the use of named address ranges. You can also configure the local server to use DHCP option 82 information in the client PDU to determine which named address range to use for a particular client. The client configuration information, which is configured in the address-assignment pool, includes user-defined options, such as boot server, grace period, and lease time.

Configuring the DHCP environment that includes the extended DHCP local server requires two independent configuration operations, which you can complete in any order. In one operation, you configure the extended DHCP local server on the router and specify how the DHCP local server determines which address-assignment pool to use. In the other operation, you configure the address-assignment pools used by the DHCP local server. The address-assignment pools contain the IP addresses, named address ranges, and configuration information for DHCP clients.

**NOTE:** The extended DHCP local server and the address-assignment pools used by the server must be configured in the same logical system and routing instance.

---

## DHCPv6 Local Server Overview

The DHCPv6 local server enhances the extended DHCP local server by providing support for IPv6. When a DHCPv6 client logs in, the DHCPv6 local server can optionally use the AAA service framework to interact with the RADIUS server. The RADIUS server, which is configured independently of DHCP, authenticates the client and supplies the IPv6 prefix and client configuration parameters.

You can configure DHCPv6 local server to communicate the following attributes to the AAA service framework and RADIUS at login time:

- Client username
- Client password

**NOTE:** The client username, which uniquely identifies a subscriber or a DHCP client, must be present in the configuration in order for DHCPv6 local server to use RADIUS authentication.

Based on the attributes that the DHCPv6 local server provides, RADIUS returns the information listed in [Table 133 on page 1361](#) to configure the client:

**Table 133: RADIUS Attributes and VSAs for DHCPv6 Local Server**

Attribute Number	Attribute Name	Description
27	Session-Timeout	Lease time, in seconds. If not supplied, the lease does not expire

**Table 133: RADIUS Attributes and VSAs for DHCPv6 Local Server (*continued*)**

Attribute Number	Attribute Name	Description
123	Delegated-IPv6-Prefix	Prefix that is delegated to the client
26-143	Max-Clients-Per-Interface	Maximum number of clients allowed per interface

The DHCPv6 local server is compatible with the extended DHCP local server and the extended DHCP relay agent, and can be enabled on the same interface as either the extended DHCP local server or DHCP relay agent.

The DHCPv6 local server provides many of the same features as the extended DHCP local server, including:

- Configuration for a specific interface or for a group of interfaces
- Site-specific usernames and passwords
- Numbered Ethernet interfaces
- Statically configured CoS and filters
- AAA directed login
- Use of the IA\_NA option to assign a specific address to a client

To configure the extended DHCPv6 local server on the router (or switch), you include the **dhcpv6** statement at the **[edit system services dhcp-local-server]** hierarchy level. See the *[edit system services dhcp-local-server] Hierarchy Level* for the complete DHCP local server syntax, including the DHCPv6 syntax.

You can also include the **dhcpv6** statement at the following hierarchy levels:

- **[edit logical-systems *logical-system-name* system services dhcp-local-server]**
- **[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* system services dhcp-local-server]**
- **[edit routing-instances *routing-instance-name* system services dhcp-local-server]**

## DHCP Local Server Handling of Client Information Request Messages

DHCP clients that already have externally provided addresses may solicit further configuration information from a DHCP server by sending a DHCP information request that indicates what information is desired. By default, DHCP local server and DHCPv6 local server ignore any DHCP information requests that they receive. You can override this default behavior to enable processing of these messages.

If you enable processing of information requests, DHCP local server responds to the client with a DHCP acknowledgment message that includes the requested information—if it is available. DHCPv6 local server responds in the same manner but uses a DHCP reply message. No subscriber management or DHCP-management is applied as a result of the DHCP information request message.

By default, DHCP relay and DHCP relay proxy automatically forward DHCP information request messages without modification if the messages are received on an interface configured for a DHCP server group. DHCP relay and relay proxy drop information request messages received on any other interfaces. You cannot disable this default DHCP relay and relay proxy behavior.

The information requested by these clients has typically been configured with the **dhcp-attributes** statement for an address pool defined by the **address-assignment pool pool-name** statement at the **[edit access]** hierarchy level.

When you enable processing of DHCP information requests, you can optionally specify the name of the pool from which the local server retrieves the requested configuration information for the client. If you do not specify a local pool, then the local server requests that AAA selects and returns only the name of the relevant pool.

**NOTE:** PPP interfaces are not supported on EX Series switches.

When DHCPv6 is configured over PPP interfaces, the PPP RADIUS authentication data can be used to select the pool from which the response information is taken. Additionally other RADIUS attributes can also be inserted into the DHCPv6 reply message. If an overlap exists between RADIUS attributes and local pool attributes, the RADIUS values are used instead of the local configuration data. If no RADIUS information is received from the underlying PPP interface, then the behavior is the same as described previously for non-PPP interfaces.

### Related Documentation

- [Overriding Default DHCP Local Server Configuration Settings on page 1423](#)
- [Enabling Processing of Client Information Requests on page 1427](#)

## Configuring Group-Specific DHCP Local Server Options

You can include the following statements at the **[edit system services dhcp-local-server group group-name]** hierarchy level to set group-specific DHCP local server configuration options. Statements configured at the **[edit system services dhcp-local-server group group-name]** hierarchy level apply only to the named group of interfaces, and override any global DHCP local server settings configured with the same statements at the **[edit system services dhcp-local-server]** hierarchy level.

DHCPv6 local server supports the same set of statements with the exception of the **dynamic-profile** statement.

- **authentication**—Configure the parameters the router sends to the external AAA server.
- **dynamic-profile**—Specify the dynamic profile that is attached to a group of interfaces.
- **interface**—Specify one or more interfaces, or a range of interfaces, that are within the specified group.
- **overrides**—Override the default configuration settings for the extended DHCP local server. For information, see “[Overriding Default DHCP Local Server Configuration Settings](#)” on page 1423.

## Understanding Dynamic Reconfiguration of Extended DHCP Local Server Clients

Dynamic reconfiguration of clients enables the extended DHCP local server to initiate a client update without waiting for the client to initiate a request.

### Default Client/Server Interaction

---

Typically the DHCP client initiates all of the basic DHCP client/server interactions. The DHCP server sends information to a client only in response to a request from that client. This behavior does not enable a client to be quickly updated with its network address and configuration in the event of server changes:

**NOTE:** Technically, the DHCP client/server interactions are the same on routers and switches. However, the primary usage of this technology on the routers is for subscriber management. The switches are not used for subscriber management. Therefore, this topic provides two sample scenarios. The actions are the same, but the implementation details are different.

- On routers—Suppose a service provider restructures its addressing scheme or changes the server IP addresses that it provided to clients. Without dynamic reconfiguration, the service provider typically clears the DHCP server binding table, but cannot inform the DHCP clients that their bindings have been cleared. Consequently, the DHCP client operates as though its IP address is still valid, but it is now unable to communicate over the access network, resulting in an outage. The DHCP local server needs to wait

for the client to send a message to renew its lease or rebind to the server. In response, the server sends a NAK message to the client to force it to begin the DHCP connection process again. Alternatively, the provider can wait for customers to make a service call about the network failures and then instruct them to power cycle their customer premises equipment to reinitiate the connection. Neither of these actions is timely or convenient for customers.

- On switches—Suppose you restructure the addressing scheme or change the server IP addresses that the DHCP server provides to clients. Without dynamic reconfiguration, the network typically clears the DHCP server binding table, but cannot inform the DHCP clients that their bindings have been cleared. Consequently, the DHCP client operates as though its IP address is still valid, but it is now unable to communicate over the access network, resulting in an outage. The DHCP local server needs to wait for the client to send a message to renew its lease or rebind to the server. In response, the server sends a NAK message to the client to force it to begin the DHCP connection process again. Alternatively, you can wait for users to notify you of the network failures and then instruct them to power cycle their equipment to reinitiate the connection. Neither of these actions is timely or convenient for users.

#### Dynamic Client/Server Interaction for DHCPv4

Dynamic reconfiguration for DHCPv4 is available through a partial implementation of RFC 3203, *DHCP Reconfigure Extension* for DHCPv4. It enables the DHCPv4 local server to send a message to the client to force reconfiguration.

The server sends a `forcerenew` message to a DHCPv4 client, initiating a message exchange. In response, DHCPv4 clients that support the `forcerenew` message then send a lease renewal message to the server. The server rejects the lease renewal request and sends a NAK to the client, causing the client to reinitiate the DHCP connection. A successful reconnection results in the reconfiguration of the DHCP client. Only the exchange of `forcerenew`, `renew`, and NAK messages is supported from RFC 3202. DHCP relay and DHCP relay proxy do not participate in the client reconfiguration or react to `forcerenew` messages other than to forward them to the client.

When the local server state machine starts the reconfiguration process on a bound client, the client transitions to the reconfiguring state and the local server sends a `forcerenew` message to the client. Because the client was in the bound state before entering the reconfiguring state, all subscriber services or DHCP-managed services, such as forwarding and statistics, continue to work. Client statistics are not maintained in the interval between a successful reconfiguration and the subsequent client binding. When the server responds to the client renewal request with a NAK, the client entry is removed from the binding table and final statistics are reported. New statistics are collected when the client sends a discover message to establish a new session.

#### Dynamic Client/Server Interaction for DHCPv6

Dynamic reconfiguration for DHCPv6 is available through a partial implementation of RFC 3315, *Dynamic Host Configuration Protocol for IPv6 (DHCPv6)*. It enables the DHCPv6 local server to send a message to the client to force reconfiguration.

DHCPv6 servers send reconfigure messages to DHCPv6 clients, initiating a message exchange. In response, DHCPv6 clients that support the reconfigure message transition to the renewing state and send a renew message to the server. The server returns a reply message with a lifetime of zero (0). The client transitions to the init state and sends a solicit message. The server sends an advertise message to indicate that it is available for service. The client sends a request for configuration parameters, which the server then includes in its reply. DHCP relay and DHCP relay proxy do not participate in the client reconfiguration or react to reconfigure messages other than to forward them to the client.

When a DHCPv6 server is triggered to initiate reconfiguration on a bound DHCPv6 client, the client transitions to the reconfigure state. All subscriber services, such as forwarding and statistics, continue to work. The server then sends the reconfigure message to the client. If the DHCPv6 client is already in the reconfigure state, the DHCPv6 server ignores the reconfiguration trigger. For clients in any state other than bound or reconfigure, the server clears the binding state of the client, as if the **clear dhcpv6 server binding** command had been issued.

### Manually Forcing the Local Server to Initiate the Reconfiguration Process

You can force the local server to initiate the reconfiguration process for clients by issuing the **request dhcp server reconfigure** command for DHCPv4 clients, and the **request dhcpv6 server reconfigure** command for DHCPv6 clients. Command options determine whether reconfiguration is then attempted for all clients or specified clients.

### Action Taken for Events That Occur During a Reconfiguration

Events that take place while a reconfiguration is in process take precedence over the reconfiguration. [Table 134 on page 1366](#) lists the actions taken in response to several different events.

**Table 134: Action Taken for Events That Occur During a Reconfiguration**

Event	Action
Server receives a discover (DHCPv4) or solicit (DHCPv6) message from the client.	Server drops packet and deletes client.
Server receives a request, renew, rebind, or init-reboot message from the client.	DHCPv4—Server sends NAK message and deletes client.  DHCPv6—Server drops packet and deletes client. Server replies to renew message with lease time of zero (0).
Server receives a release or decline message from the client.	Server deletes client.
The client lease times out.	Server deletes client.
The <b>clear dhcp server binding</b> command is issued.	Server deletes client.
The <b>request dhcp server reconfigure</b> (DHCPv4) or <b>request dhcpv6 server reconfigure</b> (DHCPv6) command is issued.	Command is ignored.

**Table 134: Action Taken for Events That Occur During a Reconfiguration (*continued*)**

Event	Action
GRES or DHCP restart occurs.	Reconfiguration process is halted.

## DHCP Snooping Support

DHCP snooping provides DHCP security on the router or switch by filtering incoming messages. When DHCP snooping is enabled, the router differentiates between trusted and untrusted interfaces, and forwards messages from trusted sources while rejecting the untrusted messages.

In Junos OS, DHCP snooping is enabled in a routing instance when you configure either the **dhcp-relay** statement at the **[edit forwarding-options]** hierarchy level, or the **dhcp-local-server** statement at the **[edit system services]** hierarchy level in that routing instance. The router discards snooped packets by default. To enable normal processing of snooped packets, you must explicitly configure the **allow-snooped-clients** statement at the **[edit forwarding-options dhcp-relay]** hierarchy level.

You can configure DHCP snooping support for the following:

- DHCPv4 relay agent—Override the router's (or switch's) default snooping configuration and specify that DHCP snooping is enabled or disabled globally, for a named group of interfaces, or for a specific interface within a named group.

In a separate procedure, you can set a global configuration to specify whether the DHCPv4 relay agent forwards or drops snooped packets for all interfaces, only configured interfaces, or only nonconfigured interfaces. The router also uses the global DHCP relay agent snooping configuration to determine whether to forward or drop snooped BOOTREPLY packets.

- DHCPv6 relay agent—As you can with snooping support for the DHCPv4 relay agent, you can override the default DHCPv6 relay agent snooping configuration on the router to explicitly enable or disable snooping support globally, for a named group of interfaces, or for a specific interface with a named group of interfaces.

In multi-relay topologies where more than one DHCPv6 relay agent is between the DHCPv6 client and the DHCPv6 server, snooping enables intervening DHCPv6 relay agents between the client and the server to correctly receive and process the unicast traffic from the client and forward it to the server. The DHCPv6 relay agent snoops incoming unicast DHCPv6 packets by setting up a filter with UDP port 547 (the DHCPv6 UDP server port) on a per-forwarding table basis. The DHCPv6 relay agent then processes the packets intercepted by the filter and forwards the packets to the DHCPv6 server.

Unlike the DHCPv4 relay agent, the DHCPv6 relay agent does not support global configuration of forwarding support for DHCPv6 snooped packets.

- DHCP local server—Configure whether DHCP local server forwards or drops snooped packets for all interfaces, only configured interfaces, or only nonconfigured interfaces.

## DHCP Auto Logout Overview

This topic provides an introduction to the DHCP auto logout feature and includes the following sections:

- [Auto Logout Overview on page 1368](#)
- [How DHCP Identifies and Releases Clients on page 1368](#)
- [Option 60 and Option 82 Requirements on page 1369](#)

### Auto Logout Overview

---

Auto logout is supported for DHCP local server and DHCP relay agent. It improves the efficiency of DHCP IP address assignment by allowing IP addresses to be immediately released and returned to the address pool when DHCP clients are no longer using the addresses. DHCP can then assign the addresses to other clients. Without auto logout, an IP address is blocked for the entire lease period, and DHCP must wait until the address lease time expires before reusing the address.

Auto logout is particularly useful when DHCP uses long lease times for IP address assignments and to help avoid allocating duplicate IP addresses for a single client.

For example, you might have an environment that includes set-top boxes (STB) that are often upgraded or replaced. Each time a STB is changed, the new STB repeats the DHCP discover process to obtain client configuration information and an IP address. DHCP views the new STB as a completely new client and assigns a new IP address—the previous IP address assigned to the client (the old STB) remains blocked and unavailable until the lease expires. If auto logout is configured in this situation, DHCP recognizes that the new STB is actually the same client and then immediately releases the original IP address. DHCP relay agent acts as a proxy client for auto logout and sends a DHCP release message to the DHCP server.

### How DHCP Identifies and Releases Clients

---

The auto logout feature requires that DHCP explicitly identify clients. By default, DHCP local server and DHCP relay agent identify clients based on MAC address or Client Identifier, and subnet. However, in some cases this type of identification might not be

sufficient. For example, in the previous STB example, each STB has a different MAC address, so DHCP incorrectly assumes that an upgraded or replacement STB is a new client.

In order to explicitly identify clients, auto logout uses a secondary identification method when the primary identification method is unsuccessful—the primary method is considered unsuccessful if the MAC address or Client Identifier does not match that of an existing client. Subscriber management supports two secondary identification methods that you can configure.

- Incoming interface method—DHCP views a new client connection on the interface as if it comes from the same client. DHCP deletes the existing client binding before creating a binding for the newly connected device. This method allows only one client device to connect on the interface.

**NOTE:** The incoming interface method differs from the `overrides interface-client-limit 1` statement, which retains the existing binding and rejects the newly connected client.

- Option 60 and option 82 method—DHCP considers two clients as different if they have the same option 60 and option 82 information, but different subnets.

DHCP local server and DHCP relay agent perform the following operations when auto logout is enabled and the secondary identification method identifies a duplicate client (that is, the Discover packet is from an existing client).

- DHCP local server immediately releases the existing address.
- DHCP relay agent immediately releases the existing client and then sends a DHCP release packet to the DHCP server. Sending the release packet ensures that DHCP relay and the DHCP server are synchronized.

If the DHCP relay receives a Discover message from an existing client, the DHCP relay forwards the Discover message to the DHCP server. The DHCP relay preserves the binding if the client's existing IP address is returned by the DHCP server. This behavior is not applicable if the proxy-mode override or client-discover-match functionality are enabled.

**NOTE:** If the DHCP relay agent is in snoop mode, DHCP relay releases the client but does not send a release packet to the DHCP server if the discover packet is for a passive client (a client added as a result of snooped packets) or if the discover packet is a snooped packet.

### Option 60 and Option 82 Requirements

DHCP local server requires that the received discover packet include both DHCP option 60 and option 82. If either option is missing, DHCP local server cannot perform the secondary identification method and auto logout is not used.

DHCP relay agent requires that the received discover packet contain DHCP option 60. DHCP relay determines the option 82 value based on the guidelines provided in [“How DHCP Relay Agent Uses Option 82 for Auto Logout” on page 1454](#).

## Address-Assignment Pools Overview

The address-assignment pool feature supports subscriber management and DHCP management functionality by enabling you to create centralized IPv4 and IPv6 address pools independently of the client applications that use the pools. The **authd** process manages the pools and the address allocation, whether the addresses come from local pools or from a RADIUS server. For example, multiple client applications, such as DHCP, can use the same address-assignment pool to provide addresses for their particular clients. Client applications can acquire addresses for either authenticated or unauthenticated clients.

Address-assignment pools support both dynamic and static address assignment. In dynamic address assignment, a client is automatically assigned an address from the address-assignment pool. In static address assignment, which is supported for IPv4 pools only, you reserve an address that is then always used by a particular client. Addresses that are reserved for static assignment are removed from the dynamic address pool and cannot be assigned to other clients.

You can configure named address ranges within an address-assignment pool. A named range is a subset of the overall address range. A client application can use named ranges to manage address assignment based on client-specific criteria. For example, for IPv4 address-assignment pools, you might create a named range that is based on a specific DHCP option 82 value. Then, when a DHCP client request matches the specified option 82 value, an address from the specified range is assigned to the client.

You can link address-assignment pools together to provide backup pools for address assignment. When the primary pool is fully allocated, the router or switch automatically switches to the linked, or secondary, pool and begins allocating addresses from that pool.

You can also explicitly identify that an address-assignment pool is used for ND/RA.

## Assign a Specific IP Address to a Client Using DHCP Option 50 and DHCPv6 IA\_NA Option

Subscriber management or DHCP management enables you to specify that DHCP local server assign a particular address to a client. For example, if a client is disconnected, you might use this capability to assign the same address that the client was using prior to being disconnected. If the requested address is available, DHCP assigns it to the client. If the address is unavailable, the DHCP local server offers another address, based on the address allocation process.

Both DHCP local server and DHCPv6 local server support the specific address request feature. DHCP local server uses DHCP option 50 in DHCP DISCOVER messages to request a particular address, while DHCPv6 local server uses the IA\_NA option (Identity Association for Non-Temporary Addresses) in DHCPv6 SOLICIT messages.

**NOTE:** Subscriber management (DHCP management) supports only one address for each of the DHCPv6 IA\_NA or IA\_PD address types. If the DHCPv6 client requests more than one address for a given type, the DHCPv6 local server uses only the first address and ignores the other addresses.

## Multiple Address Assignment for DHCPv6 Clients

Subscriber management (on the routers) or DHCP management (on the switches) enables you to assign multiple addresses to a single DHCPv6 client. Multiple address support is enabled by default, and is activated when the DHCPv6 local server receives a DHCPv6 Solicit message from a subscriber (or DHCP client) that contains multiple addresses.

For example, if you are implementing this feature on the routers, you might use the multiple address assignment feature in a networking environment in which a customer premises equipment (CPE) device requires a host address and a delegated prefix. In such an environment, you can configure subscriber management to assign both a DHCPv6 IA\_NA (Identity Association for Non-Temporary Addresses) and an IA\_PD (Identity Association for Prefix Delegation) address to the client (the CPE device).

- [Multiple Address Assignment Using Local Address Pools or RADIUS on page 1371](#)
- [Junos OS Predefined Variable for Multiple DHCPv6 Address Assignment on page 1372](#)

### Multiple Address Assignment Using Local Address Pools or RADIUS

You can use either local address pools or RADIUS when assigning multiple addresses to a DHCP client. When at least one address is successfully allocated, the router or switch creates a subscriber (or DHCP client) entry and binds the entry to the assigned address. If both addresses are successfully allocated, the router (or switch) creates a single subscriber (or DHCP client) entry and binds both addresses to that entry.

You can also configure a delegated address pool, which explicitly specifies the address pool that subscriber management (or DHCP management) uses to assign IPv6 prefixes for subscribers (or DHCP clients).

### Junos OS Predefined Variable for Multiple DHCPv6 Address Assignment

---

**NOTE:** EX Series switches do not support demux.

---

(On the routers only) Subscriber management provides a predefined variable that you can use to dynamically configure DHCPv6 multiple address assignment. You apply the Junos OS predefined variable, **\$junos-subscriber-ipv6-multi-address**, as a demux source address in a dynamic profile. When the dynamic profile is attached to a subscriber, the variable is expanded to include both the host and prefix addresses. You use this variable instead of the **\$junos-subscriber-ipv6-address** variable, which supports a single IPv6 address.

You include the **\$junos-subscriber-ipv6-multi-address** variable at the **[edit dynamic-profile profile-name interfaces interface-name unit logical-unit-number family inet6 demux-source]** hierarchy level.

## Centrally Configured Opaque DHCP Options

Subscriber management (on the routers) or DHCP management (on the switches) enables you to centrally configure DHCP options on a RADIUS server and then distribute the options on a per-subscriber or per DHCP-client basis. This method results in RADIUS-sourced DHCP options—the DHCP options originate at the RADIUS server and are sent to the subscriber (or DHCP client). This differs from the traditional client-sourced method (also called DHCP-sourced) of configuring DHCP options, in which the options originate at the client and are sent to the RADIUS server. The subscriber management (DHCP management) RADIUS-sourced DHCP options are also considered to be *opaque*, because DHCP local server performs minimal processing and error checking for the DHCP options string before passing the options to the subscriber (DHCP client).

Subscriber management (or DHCP management) uses Juniper Networks VSA 26-55 (DHCP-Options) to distribute the RADIUS-sourced DHCP options. The RADIUS server includes VSA 26-55 in the Access-Accept message that the server returns during subscriber authentication or DHCP client authentication. The RADIUS server sends the Access-Accept message to the RADIUS client, and then on to DHCP local server for return to the DHCP subscriber. The RADIUS server can include multiple instances of VSA 26-55 in a single Access-Accept message. The RADIUS client concatenates the multiple instances and uses the result as a single instance.

There is no CLI configuration required to enable subscriber management (DHCP management) to use the centrally configured DHCP options—the procedure is triggered by the presence of VSA 26-55 in the RADIUS Access-Accept message.

When building the offer packet for the DHCP client, DHCP local server uses the following sequence:

1. Processes any RADIUS-configured parameters that are passed as separate RADIUS attributes; for example, RADIUS attribute 27 (Session Timeout).
2. Processes any client-sourced parameters; for example, RADIUS attributes 53 (DHCP Message Type) and 54 (Server Identifier).
3. Appends (without performing any processing) the opaque DHCP options string contained in the VSA 26-55 received from the RADIUS server.

In addition to supporting central configuration of DHCP options directly on the RADIUS server (RADIUS-sourced options), subscriber management (DHCP management) also supports the traditional client-sourced options configuration, in which the router's (switch's) DHCP component sends the options to the RADIUS server. The client-sourced DHCP options method is supported for both DHCP local server and DHCP relay agent; however, the RADIUS-sourced central configuration method is supported on DHCP local server only. Both the RADIUS-sourced and client-sourced methods support DHCPv4 and DHCPv6 subscribers (clients).

**NOTE:** You can use the RADIUS-sourced and client-sourced methods simultaneously on DHCP local server. However, you must ensure that the central configuration method does not include options that override client-sourced DHCP options, because this can create unpredictable results.

---

- [Data Flow for RADIUS-Sourced DHCP Options on page 1375](#)
- [Multiple VSA 26-55 Instances Configuration on page 1376](#)
- [DHCP Options That Cannot Be Centrally Configured on page 1376](#)

### Data Flow for RADIUS-Sourced DHCP Options

Figure 5 on page 1375 shows the procedure subscriber management (DHCP management) uses when configuring DHCP options for subscribers (DHCP clients).

**Figure 5: DHCP Options Data Flow**

The following general sequence describes the data flow when subscriber management (DHCP management) uses RADIUS-sourced DHCP options and VSA 26-55 to configure a DHCP subscriber (client):

1. The subscriber (DHCP client) sends a DHCP discover message (or DHCPv6 solicit message) to the DHCP local server. The message includes client-sourced DHCP options.
2. The DHCP local server initiates authentication with the Junos OS RADIUS client.
3. The RADIUS client sends an Access-Request message on behalf of the subscriber (DHCP client) to the external RADIUS server. The message includes the subscriber's (DHCP client's) client-sourced DHCP options.
4. The external RADIUS server responds by sending an Access-Accept message to the RADIUS client. The Access-Accept message includes the RADIUS-sourced opaque DHCP options in VSA 26-55.
5. The RADIUS client sends the DHCP options string to DHCP local server. If there are multiple VSA 26-55 instances, the RADIUS client first assembles them into a single options string.
6. DHCP local server processes all options into the DHCP offer (or DHCPv6 reply) message, except for the RADIUS-sourced VSA 26-55 DHCP options. After processing all other options, DHCP local server then appends the unmodified VSA 26-55 DHCP options to the message and sends the message to the subscriber (DHCP client).

7. The subscriber (DHCP client) is configured with the DHCP options.
8. The following operations occur after the subscriber (DHCP client) receives the DHCP options:
  - Accounting—The RADIUS client sends Acct-Start and Interim-Accounting requests to the RADIUS server, including the RADIUS-sourced DHCP options in VSA 26-55. By default, the DHCP options are included in accounting requests.
  - Renewal—When the subscriber (DHCP client) renews, the cached DHCP options value is returned in the DHCP renew (or DHCPv6 ACK) message. The originally assigned DHCP options cannot be modified during a renew cycle.
  - Logout—When the subscriber (DHCP client) logs out, the RADIUS client sends an Acct-Stop message to the RADIUS server, including the RADIUS-sourced VSA 26-55.

### Multiple VSA 26-55 Instances Configuration

---

VSA 26-55 supports a maximum size of 247 bytes. If your RADIUS-sourced DHCP options field is greater than 247 bytes, you must break the field up and manually configure multiple instances of VSA 26-55 for the RADIUS server to return. When using multiple instances for an options field, you must place the instances in the packet in the order in which the fragments are to be reassembled by the RADIUS client. The fragments can be of any size of 247 bytes or less.

**BEST PRACTICE:** For ease of configuration and management of your DHCP options, you might want to have one DHCP option per VSA 26-55 instance, regardless of the size of the option field.

When the RADIUS client returns a reassembled opaque options field in an accounting request to the RADIUS server, the client uses 247-byte fragments. If you had originally created instances of fewer than 247 bytes, the returned fragments might not be the same as you originally configured on the RADIUS server.

**NOTE:** If you are configuring Steel-Belted Radius (SBR) to support multiple VSA 26-55 instances, ensure that you specify VSA 26-55 with the RO flags in the Subscriber Management RADIUS dictionary file. The R value indicates a multivalued reply attribute and the O value indicates an ordered attribute.

### DHCP Options That Cannot Be Centrally Configured

---

Table 135 on page 1377 shows the DHCP options that you must not centrally configure on the RADIUS server.

Table 135: Unsupported Opaque DHCP Options

DHCP Option	Option Name	Comments
Option 0	Pad Option	Not supported.
Option 51	IP Address Lease Time	Value is provided by RADIUS attribute 27 (Session-Timeout).
Option 52	Option Overload	Not supported.
Option 53	DHCP Message Type	Value is provided by DHCP local server.
Option 54	Server Identifier	Value is provided by DHCP local server.
Option 55	Parameter Request List	Value is provided by DHCP local server.
Option 255	End	Value is provided by DHCP local server.
–	DHCP magic cookie	Not supported.

## Port Number Requirements for DHCP Firewall Filters

When you configure a firewall filter to perform some action on DHCP packets at the Routing Engine, such as protecting the Routing Engine by allowing only proper DHCP packets, you must specify both port 67 (bootps) and port 68 (bootpc) for both the source and destination. The firewall filter acts at both the line cards and the Routing Engine.

This requirement applies to both DHCP local server and DHCP relay, but it applies only when DHCP is provided by the `jdhcpd` process. MX Series routers, M120 routers, and M320 routers use `jdhcpd`. For DHCP relay, that means the configuration is required only at the `[edit forwarding-options dhcp-relay]` hierarchy level and not at the `[edit forwarding-options helpers bootp]` hierarchy level.

DHCP packets received on the line cards are encapsulated by `jdhcpd` with a new UDP header where their source and destination addresses are set to port 68 before being forwarded to the Routing Engine.

For DHCP relay and DHCP proxy, packets sent to the DHCP server from the router have both the source and destination UDP ports set to 67. The DHCP server responds using the same ports. However, when the line card receives these DHCP response packets, it changes both port numbers from 67 to 68 before passing the packets to the Routing Engine. Consequently the filter needs to accept port 67 for packets relayed from the client to the server, and port 68 for packets relayed from the server to the client.

Failure to include both port 67 and port 68 as described here results in most DHCP packets not being accepted.

For information about firewall filters, see *Firewall Filters Overview*.

## DHCP Relay Agent

---

- [Extended DHCP Relay Agent Overview on page 1379](#)
- [DHCP Relay Proxy Overview on page 1382](#)
- [DHCPv6 Relay Agent Overview on page 1384](#)
- [Configuring Group-Specific DHCP Relay Options on page 1384](#)
- [DHCP Snooping Support on page 1385](#)
- [DHCP Auto Logout Overview on page 1387](#)

## Extended DHCP Relay Agent Overview

You can configure extended DHCP relay options on the router or on the switch and enable the router (or switch) to function as a DHCP relay agent. A DHCP relay agent forwards DHCP request and reply packets between a DHCP client and a DHCP server.

DHCP relay supports the attachment of dynamic profiles and also interacts with the local AAA Service Framework to use back-end authentication servers, such as RADIUS, to provide subscriber authentication or DHCP client authentication. You can attach dynamic profiles and configure authentication support on a global basis or for a specific group of interfaces.

**NOTE:** The PTX Series Packet Transport Routers do not support authentication for DHCP relay agents.

On the routers, you can use DHCP relay in carrier edge applications such as video/IPTV to obtain configuration parameters, including an IP address, for your subscribers. For information about how to use the DHCP relay agent in a video/IPTV application, see *Broadband Subscriber Management Edge Router Overview*.

On the switches, you can use DHCP relay to obtain configuration parameters including an IP address for DHCP clients.

**NOTE:** The extended DHCP relay agent options configured with the `dhcp-relay` statement are incompatible with the DHCP/BOOTP relay agent options configured with the `bootp` statement. As a result, you cannot enable both the extended DHCP relay agent and the DHCP/BOOTP relay agent on the router at the same time.

For information about the DHCP/BOOTP relay agent, see *Configuring Routers, Switches, and Interfaces as DHCP and BOOTP Relay Agents*.

You can also configure the extended DHCP relay agent to support IPv6 clients. See “[DHCPv6 Relay Agent Overview](#)” on [page 1384](#) for information about the DHCPv6 relay agent feature.

To configure the extended DHCP relay agent on the router (or switch), include the `dhcp-relay` statement at the `[edit forwarding-options]` hierarchy level. See the `[edit forwarding-options dhcp-relay]` *Hierarchy Level* for the complete DHCP relay agent syntax.

You can also include the `dhcp-relay` statement at the following hierarchy levels:

- `[edit logical-systems logical-system-name forwarding-options]`
- `[edit logical-systems logical-system-name routing-instances routing-instance-name forwarding-options]`
- `[edit routing-instances routing-instance-name forwarding-options]`

This overview covers:

- [Interaction Among the DHCP Relay Agent, DHCP Client, and DHCP Servers on page 1380](#)
- [DHCP Liveness Detection on page 1381](#)

### **Interaction Among the DHCP Relay Agent, DHCP Client, and DHCP Servers**

The pattern of interaction among the DHCP Relay agent, DHCP client, and DHCP servers is the same regardless of whether the software installation is on a router or a switch. However, there are some difference in the details of usage.

On routers—In a typical carrier edge network configuration, the DHCP client is on the subscriber's computer, and the DHCP relay agent is configured on the router between the DHCP client and one or more DHCP servers.

On switches—In a typical network configuration, the DHCP client is on an access device such as a personal computer and the DHCP relay agent is configured on the switch between the DHCP client and one or more DHCP servers.

The following steps describe, at a high level, how the DHCP client, DHCP relay agent, and DHCP server interact in a configuration that includes two DHCP servers.

1. The DHCP client sends a discover packet to find a DHCP server in the network from which to obtain configuration parameters for the subscriber (or DHCP client), including an IP address.
2. The DHCP relay agent receives the discover packet and forwards copies to each of the two DHCP servers. The DHCP relay agent then creates an entry in its internal client table to keep track of the client's state.
3. In response to receiving the discover packet, each DHCP server sends an offer packet to the client. The DHCP relay agent receives the offer packets and forwards them to the DHCP client.
4. On receipt of the offer packets, the DHCP client selects the DHCP server from which to obtain configuration information. Typically, the client selects the server that offers the longest lease time on the IP address.
5. The DHCP client sends a request packet that specifies the DHCP server from which to obtain configuration information.
6. The DHCP relay agent receives the request packet and forwards copies to each of the two DHCP servers.
7. The DHCP server requested by the client sends an acknowledgement (ACK) packet that contains the client's configuration parameters.
8. The DHCP relay agent receives the ACK packet and forwards it to the client.
9. The DHCP client receives the ACK packet and stores the configuration information.
10. If configured to do so, the DHCP relay agent installs a host route and Address Resolution Protocol (ARP) entry for this client.
11. After establishing the initial lease on the IP address, the DHCP client and the DHCP server use unicast transmission to negotiate lease renewal or release. The DHCP relay

agent “snoops” on all of the packets unicast between the client and the server that pass through the router (or switch) to determine when the lease for this client has expired or been released. This process is referred to as *lease shadowing* or *passive snooping*.

### DHCP Liveness Detection

Liveness detection for DHCP subscriber or DHCP client IP sessions utilizes an active liveness detection protocol to institute liveness detection checks for relevant clients. Clients are expected to respond to liveness detection requests within a specified amount of time. If the responses are not received within that time for a given number of consecutive attempts, then the liveness detection check fails and a failure action is implemented.

**NOTE:** DHCP liveness detection either globally or per DHCP group.

## DHCP Relay Proxy Overview

DHCP relay proxy mode is an enhancement to extended DHCP relay. DHCP relay proxy supports all DHCP relay features while providing additional features and benefits.

Normally, extended DHCP relay operates as a helper application for DHCP operations. Except for the ability to add DHCP relay agent options and the gateway address (giaddr) to DHCP packets, DHCP relay is transparent to DHCP clients and DHCP servers, and simply forwards messages between DHCP clients and servers.

When you configure DHCP relay to operate in proxy mode, the relay is no longer transparent. In proxy mode, DHCP relay conceals DHCP server details from DHCP clients, which interact with a DHCP relay in proxy mode as though it is the DHCP server. For DHCP servers there is no change, because proxy mode has no effect on how the DHCP server interacts with the DHCP relay.

DHCP relay proxy provides the following benefits:

- DHCP server isolation and DoS protection—DHCP clients are unable to detect the DHCP servers, learn DHCP server addresses, or determine the number of servers that are providing DHCP support. Server isolation also provides denial-of-service (DoS) protection for the DHCP servers.
- Multiple lease offer selection—DHCP relay proxy receives lease offers from multiple DHCP servers and selects a single offer to send to the DHCP client, thereby reducing traffic in the network. Currently, the DHCP relay proxy selects the first offer received.
- Support for both numbered and unnumbered Ethernet interfaces—For DHCP clients connected through Ethernet interfaces, when the DHCP client obtains an address, the DHCP relay proxy adds an access internal host route specifying that interface as the outbound interface. The route is automatically removed when the lease time expires or when the client releases the address.
- Logical system support—DHCP relay proxy can be configured in a logical system, whereas a non-proxy mode DHCP relay cannot.

**NOTE:** You cannot configure both DHCP relay proxy and extended DHCP local server on the same interface.

---

## Interaction Among DHCP Relay Proxy, DHCP Client, and DHCP Servers

---

The DHCP relay agent is configured on the router (or switch), which operates between the DHCP client and one or more DHCP servers.

The following steps provide a high-level description of how DHCP relay proxy interacts with DHCP clients and DHCP servers.

1. The DHCP client sends a discover packet to locate a DHCP server in the network from which to obtain configuration parameters for the subscriber.
2. The DHCP relay proxy receives the discover packet from the DHCP client and forwards copies of the packet to each supporting DHCP server. The DHCP relay proxy then creates a client table entry to keep track of the client state.
3. In response to the discover packet, each DHCP server sends an offer packet to the client, which the DHCP relay proxy receives. The DHCP relay proxy does the following:
  - a. Selects the first offer received as the offer to sent to the client
  - b. Replaces the DHCP server address with the address of the DHCP relay proxy
  - c. Forwards the offer to the DHCP client.
4. The DHCP client receives the offer from the DHCP relay proxy.
5. The DHCP client sends a request packet that indicates the DHCP server from which to obtain configuration information—the request packet specifies the address of the DHCP relay proxy.
6. The DHCP relay proxy receives the request packet and forwards copies, which include the address of selected server, to all supporting DHCP servers.
7. The DHCP server requested by the client sends an acknowledgement (ACK) packet that contains the client configuration parameters.
8. The DHCP relay proxy receives the ACK packet, replaces the DHCP server address with its own address, and forwards the packet to the client.
9. The DHCP client receives the ACK packet and stores the configuration information.
10. If configured to do so, the DHCP relay proxy installs a host route and Address Resolution Protocol (ARP) entry for the DHCP client.
11. After the initial DHCP lease is established, the DHCP relay proxy receives all lease renewals and lease releases from the DHCP client and forwards them to the DHCP server.

## DHCPv6 Relay Agent Overview

The DHCPv6 relay agent enhances the extended DHCP relay agent by providing support in an IPv6 network. The DHCPv6 relay agent passes messages between the DHCPv6 client and the DHCPv6 server, similar to the way DHCP relay agent supports an IPv4 network.

When a DHCPv6 client logs in, the DHCPv6 relay agent uses the AAA service framework to interact with the RADIUS server to provide authentication and accounting. The RADIUS server, which is configured independently of DHCP, authenticates the client and supplies the IPv6 prefix and client configuration parameters, such as session timeout and the maximum number of clients allowed per interface.

**NOTE:** The PTX Series Packet Transport Routers do not support authentication for DHCPv6 relay agents.

The DHCPv6 relay agent is compatible with the extended DHCP local server and the extended DHCP relay agent, and can be enabled on the same interface as either the extended DHCP local server or DHCP relay agent.

To configure the DHCPv6 relay agent on the router (or switch), you include the **dhcpcv6** statement at the **[edit forwarding-options dhcp-relay]** hierarchy level.

You can also include the **dhcpcv6** statement at the following hierarchy levels:

- **[edit logical-systems *logical-system-name* forwarding-options dhcp-relay]**
- **[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* forwarding-options dhcp-relay]**
- **[edit routing-instances *routing-instance-name* forwarding-options dhcp-relay]**

## Configuring Group-Specific DHCP Relay Options

You can include the following statements at the **[edit forwarding-options dhcp-relay group *group-name*]** hierarchy level to set group-specific DHCP relay agent configuration

options. Group-specific statements apply only to the named group of interfaces, and override any global DHCP relay agent settings for the same statement.

Include the statements at the **[edit forwarding-options dhcp-relay dhcpv6 group group-name]** hierarchy level to configure group-specific options for DHCPv6 relay agent.

- **active-server-group**—Configure an active server group to apply a common DHCP relay agent configuration to a named group of DHCP server addresses. For information, see [“Configuring Active Server Groups” on page 1469](#).
- **authentication**—Configure the parameters the router (or switch) sends to the external AAA server.
- **dynamic-profile**—Specify the dynamic profile that is attached to a group of interfaces.
- **interface**—Specify one or more interfaces, or a range of interfaces, that are within the specified group.
- **liveness-detection**—Configure bidirectional failure detection timers and authentication criteria for static routes. For more information, see [“DHCP Liveness Detection Overview” on page 1472](#).
- **overrides**—Override the default configuration settings for the extended DHCP relay agent. For information, see [“Overriding the Default DHCP Relay Configuration Settings” on page 1447](#).
- **relay-agent-interface-id**—(DHCPv6 only) Insert the DHCPv6 Relay Agent Interface-ID option (option 18) in DHCPv6 packets destined for the DHCPv6 server.
- **relay-agent-remote-id**—(DHCPv6 only) Insert the DHCPv6 Relay Agent Remote-ID option (option 37) in DHCPv6 packets destined for the DHCPv6 server.
- **relay-option**—Configure selective processing, which uses DHCP options in client packets to identify and filter client traffic, and to specify the action DHCP relay agent takes with the traffic. For more information, see [Using DHCP Option Information to Selectively Process DHCP Client Traffic](#).
- **relay-option-82**—(DHCPv4 only) Enable or disable the insertion of option 82 information in packets destined for a DHCP server. For information, see [“Using DHCP Relay Agent Option 82 Information” on page 1464](#).
- **service-profile**—Specify the default subscriber service, (or default profile) which is activated when the subscriber (or DHCP client) logs in and no other service is activated by a RADIUS server or a provisioning server. For more information, see [Default Subscriber Service Overview](#).

## DHCP Snooping Support

DHCP snooping provides DHCP security on the router or switch by filtering incoming messages. When DHCP snooping is enabled, the router differentiates between trusted and untrusted interfaces, and forwards messages from trusted sources while rejecting the untrusted messages.

In Junos OS, DHCP snooping is enabled in a routing instance when you configure either the **dhcp-relay** statement at the **[edit forwarding-options]** hierarchy level, or the **dhcp-local-server** statement at the **[edit system services]** hierarchy level in that routing instance. The router discards snooped packets by default. To enable normal processing of snooped packets, you must explicitly configure the **allow-snooped-clients** statement at the **[edit forwarding-options dhcp-relay]** hierarchy level.

You can configure DHCP snooping support for the following:

- DHCPv4 relay agent—Override the router's (or switch's) default snooping configuration and specify that DHCP snooping is enabled or disabled globally, for a named group of interfaces, or for a specific interface within a named group.

In a separate procedure, you can set a global configuration to specify whether the DHCPv4 relay agent forwards or drops snooped packets for all interfaces, only configured interfaces, or only nonconfigured interfaces. The router also uses the global DHCP relay agent snooping configuration to determine whether to forward or drop snooped BOOTREPLY packets.

- DHCPv6 relay agent—As you can with snooping support for the DHCPv4 relay agent, you can override the default DHCPv6 relay agent snooping configuration on the router to explicitly enable or disable snooping support globally, for a named group of interfaces, or for a specific interface with a named group of interfaces.

In multi-relay topologies where more than one DHCPv6 relay agent is between the DHCPv6 client and the DHCPv6 server, snooping enables intervening DHCPv6 relay agents between the client and the server to correctly receive and process the unicast traffic from the client and forward it to the server. The DHCPv6 relay agent snoops incoming unicast DHCPv6 packets by setting up a filter with UDP port 547 (the DHCPv6 UDP server port) on a per-forwarding table basis. The DHCPv6 relay agent then processes the packets intercepted by the filter and forwards the packets to the DHCPv6 server.

Unlike the DHCPv4 relay agent, the DHCPv6 relay agent does not support global configuration of forwarding support for DHCPv6 snooped packets.

- DHCP local server—Configure whether DHCP local server forwards or drops snooped packets for all interfaces, only configured interfaces, or only nonconfigured interfaces.

## DHCP Auto Logout Overview

This topic provides an introduction to the DHCP auto logout feature and includes the following sections:

- [Auto Logout Overview on page 1387](#)
- [How DHCP Identifies and Releases Clients on page 1387](#)
- [Option 60 and Option 82 Requirements on page 1388](#)

### Auto Logout Overview

Auto logout is supported for DHCP local server and DHCP relay agent. It improves the efficiency of DHCP IP address assignment by allowing IP addresses to be immediately released and returned to the address pool when DHCP clients are no longer using the addresses. DHCP can then assign the addresses to other clients. Without auto logout, an IP address is blocked for the entire lease period, and DHCP must wait until the address lease time expires before reusing the address.

Auto logout is particularly useful when DHCP uses long lease times for IP address assignments and to help avoid allocating duplicate IP addresses for a single client.

For example, you might have an environment that includes set-top boxes (STB) that are often upgraded or replaced. Each time a STB is changed, the new STB repeats the DHCP discover process to obtain client configuration information and an IP address. DHCP views the new STB as a completely new client and assigns a new IP address—the previous IP address assigned to the client (the old STB) remains blocked and unavailable until the lease expires. If auto logout is configured in this situation, DHCP recognizes that the new STB is actually the same client and then immediately releases the original IP address. DHCP relay agent acts as a proxy client for auto logout and sends a DHCP release message to the DHCP server.

### How DHCP Identifies and Releases Clients

The auto logout feature requires that DHCP explicitly identify clients. By default, DHCP local server and DHCP relay agent identify clients based on MAC address or Client Identifier, and subnet. However, in some cases this type of identification might not be sufficient. For example, in the previous STB example, each STB has a different MAC address, so DHCP incorrectly assumes that an upgraded or replacement STB is a new client.

In order to explicitly identify clients, auto logout uses a secondary identification method when the primary identification method is unsuccessful—the primary method is considered unsuccessful if the MAC address or Client Identifier does not match that of an existing client. Subscriber management supports two secondary identification methods that you can configure.

- Incoming interface method—DHCP views a new client connection on the interface as if it comes from the same client. DHCP deletes the existing client binding before creating a binding for the newly connected device. This method allows only one client device to connect on the interface.

**NOTE:** The incoming interface method differs from the overrides `interface-client-limit 1` statement, which retains the existing binding and rejects the newly connected client.

- Option 60 and option 82 method—DHCP considers two clients as different if they have the same option 60 and option 82 information, but different subnets.

DHCP local server and DHCP relay agent perform the following operations when auto logout is enabled and the secondary identification method identifies a duplicate client (that is, the Discover packet is from an existing client).

- DHCP local server immediately releases the existing address.
- DHCP relay agent immediately releases the existing client and then sends a DHCP release packet to the DHCP server. Sending the release packet ensures that DHCP relay and the DHCP server are synchronized.

If the DHCP relay receives a Discover message from an existing client, the DHCP relay forwards the Discover message to the DHCP server. The DHCP relay preserves the binding if the client's existing IP address is returned by the DHCP server. This behavior is not applicable if the proxy-mode override or client-discover-match functionality are enabled.

**NOTE:** If the DHCP relay agent is in snoop mode, DHCP relay releases the client but does not send a release packet to the DHCP server if the discover packet is for a passive client (a client added as a result of snooped packets) or if the discover packet is a snooped packet.

---

### Option 60 and Option 82 Requirements

DHCP local server requires that the received discover packet include both DHCP option 60 and option 82. If either option is missing, DHCP local server cannot perform the secondary identification method and auto logout is not used.

DHCP relay agent requires that the received discover packet contain DHCP option 60. DHCP relay determines the option 82 value based on the guidelines provided in [“How DHCP Relay Agent Uses Option 82 for Auto Logout”](#) on page 1454.

## Public Key Cryptography Overview

- [Understanding Public Key Cryptography on Switches on page 1389](#)

## Understanding Public Key Cryptography on Switches

Cryptography describes the techniques related to the following aspects of information security:

- Privacy or confidentiality
- Integrity of data
- Authentication
- Nonrepudiation or nonrepudiation of origin—Nonrepudiation of origin means that signers cannot claim that they did not sign a message while claiming that their private key remains secret. In some nonrepudiation schemes used in digital signatures, a timestamp is attached to the digital signature, so that even if the private key is exposed, the signature remains valid. Public and private keys are described in the following text.

In practice, cryptographic methods protect the data transferred from one system to another over public networks by encrypting the data using an encryption key. Public key cryptography (PKC), which is used on Juniper Networks EX Series Ethernet Switches, uses a pair of encryption keys: a public key and a private key. The public and private keys are created simultaneously using the same encryption algorithm. The private key is held by a user secretly and the public key is published. Data encrypted with a public key can be decrypted only with the corresponding private key and vice versa. When you generate a public/private key pair, the switch automatically saves the key pair in a file in the certificate store, from which it is subsequently used in certificate request commands. The generated key pair is saved as ***certificate-id.priv***.

**NOTE:** The default RSA and DSA key size is 1024 bits. If you are using the Simple Certificate Enrollment Protocol (SCEP), Juniper Networks Junos operating system (Junos OS) supports RSA only.

This topic describes:

- [Public Key Infrastructure \(PKI\) and Digital Certificates on page 1389](#)

### Public Key Infrastructure (PKI) and Digital Certificates

Public key infrastructure (PKI) allows the distribution and use of the public keys in public key cryptography with security and integrity. PKI manages the public keys by using digital certificates. A digital certificate provides an electronic means of verifying the identity of an individual, an organization, or a directory service that can store digital certificates.

A PKI typically consists of a Registration Authority (RA) that verifies the identities of entities, authorizes their certificate requests, and generates unique asymmetric key pairs (unless the users' certificate requests already contain public keys); and a Certificate Authority (CA) that issues corresponding digital certificates for the requesting entities. Optionally, you can use a Certificate Repository that stores and distributes certificates and a certificate revocation list (CRL) identifying the certificates that are no longer valid.

Each entity possessing the authentic public key of a CA can verify the certificates issued by that CA.

Digital signatures exploit the public key cryptographic system as follows:

1. A sender digitally signs data by applying a cryptographic operation, involving its private key, on a digest of the data.
2. The resulting signature is attached to the data and sent to the receiver.
3. The receiver obtains the digital certificate of the sender, which provides the sender's public key and confirmation of the link between its identity and the public key. The sender's certificate is often attached to the signed data.
4. The receiver either trusts this certificate or attempts to verify it. The receiver verifies the signature on the data by using the public key contained in the certificate. This verification ensures the authenticity and integrity of the received data.

As an alternative to using a PKI, an entity can distribute its public key directly to all potential signature verifiers, so long as the key's integrity is protected. The switch does it by using a self-signed certificate as a container for the public key and the corresponding entity's identity.

**Related  
Documentation**

- [Understanding Self-Signed Certificates on EX Series Switches on page 1390](#)

---

## Self-Signed Certificates Overview

---

- [Understanding Self-Signed Certificates on EX Series Switches on page 1390](#)

### Understanding Self-Signed Certificates on EX Series Switches

When you initialize a Juniper Networks EX Series Ethernet Switch with the factory default configuration, the switch generates a self-signed certificate, allowing secure access to the switch through the Secure Sockets Layer (SSL) protocol. Hypertext Transfer Protocol over Secure Sockets Layer (HTTPS) and XML Network Management over Secure Sockets Layer (XNM-SSL) are the two services that can make use of the self-signed certificates.

**NOTE:** Self-signed certificates do not provide additional security as do those generated by Certificate Authorities (CAs). This is because a client cannot verify that the server he or she has connected to is the one advertised in the certificate.

The switches provide two methods for generating a self-signed certificate:

- Automatic generation

In this case, the creator of the certificate is the switch. An automatically generated (also called “system-generated”) self-signed certificate is configured on the switch by default.

After the switch is initialized, it checks for the presence of an automatically generated self-signed certificate. If it does not find one, the switch generates one and saves it in the file system.

A self-signed certificate that is automatically generated by the switch is similar to an SSH host key. It is stored in the file system, not as part of the configuration. It persists when the switch is rebooted, and it is preserved when a **request system snapshot** command is issued.

The switch uses the following distinguished name for the automatically generated certificate:

**"CN=<device serial number>, CN=system generated, CN=self-signed"**

If you delete the system-generated self-signed certificate on the switch, the switch generates a self-signed certificate automatically.

- **Manual generation**

In this case, you create the self-signed certificate for the switch. At any time, you can use the CLI to generate a self-signed certificate. Manually generated self-signed certificates are stored in the file system, not as part of the configuration.

Self-signed certificates are valid for five years from the time they are generated. When the validity of an automatically generated self-signed certificate expires, you can delete it from the switch so that the switch generates a new self-signed certificate.

System-generated self-signed certificates and manually generated self-signed certificates can coexist on the switch.

### DHCP Local Server Examples

---

- [Example: Minimum Extended DHCP Local Server Configuration on page 1393](#)
- [Example: Extended DHCP Local Server Configuration with Optional Pool Matching on page 1394](#)
- [Example: Configuring Group Liveness Detection for DHCP Local Server Clients on page 1395](#)

#### Example: Minimum Extended DHCP Local Server Configuration

This example shows the minimum configuration you need to use for the extended DHCP local server on the router or switch:

```
[edit system services]
dhcp-local-server {
  group group_one {
    interface fe-0/0/2.0;
  }
}
```

**NOTE:** The interface type in this topic is just an example. The fe- interface type is not supported by EX Series switches.

This example creates the server group named **group\_one**, and specifies that the DHCP local server is enabled on interface **fe-0/0/2.0** within the group. The DHCP local server uses the default pool match configuration of **ip-address-first**.

**NOTE:** If you delete the DHCP server configuration, DHCP server bindings might still remain. To ensure that DHCP bindings are removed, issue the **clear dhcp server binding** command before you delete the DHCP server configuration.

**Related  
Documentation**

- [Extended DHCP Local Server Overview on page 1356](#)

### Example: Extended DHCP Local Server Configuration with Optional Pool Matching

This example shows an extended DHCP local server configuration that includes optional IPv4 address-assignment pool matching and interface groups. For pool matching, this configuration specifies that the DHCP local server first check the response from an external authentication authority (for example, RADIUS) and use the Framed-IPv6-Pool attribute to determine the address-assignment pool to use for the client address. If no external authority match is found, the DHCP local server then uses **ip-address-first** matching together with the option 82 information to match the named address range for client IPv4 address assignment. The option 82 matching must also be included in the address-assignment pool configuration.

```
[edit system services]
dhcp-local-server {
  group group_one {
    interface fe-0/0/2.0;
    interface fe-0/0/2.1;
  }
  group group_two {
    interface fe-0/0/3.0;
    interface fe-0/0/3.1;
  }
  pool-match-order {
    external-authority
    ip-address-first;
    option-82;
  }
}
```

**NOTE:** The interface type in this topic is just an example. The **fe-** interface type is not supported by EX Series switches.

## Example: Configuring Group Liveness Detection for DHCP Local Server Clients

This example shows how to configure group liveness detection for DHCP local server subscribers or DHCP clients using Bidirectional Forwarding Detection (BFD) as the liveness detection method.

- [Requirements on page 1395](#)
- [Overview on page 1395](#)
- [Configuration on page 1395](#)

### Requirements

- Juniper Networks MX Series routers
- Juniper Networks EX Series switches
- Configure DHCP local server. See "[Extended DHCP Local Server Overview](#)" on page 1356.

### Overview

In this example, you configure group liveness detection for DHCP local server subscribers (clients) by completing the following operations:

1. Enable liveness detection for DHCP local server subscriber (or DHCP client) groups.
2. Specify BFD as the liveness detection method for all dynamically created DHCP local server subscribers (clients).
3. Configure BFD-specific statements to define how the protocol behaves.
4. Configure the action the router (switch) takes when a liveness detection failure occurs.

**NOTE:** This example explains how to configure liveness detection for a DHCPv4 network. Liveness detection is also supported for DHCPv6 configurations. To configure DHCPv6 liveness detection, include the [liveness-detection](#) statement, and any subsequent configuration statements, at the `[edit system services dhcp-local-server dhcpv6]` or `[edit system services dhcp-local-server dhcpv6 group group-name]` hierarchy level.

### Configuration

#### Step-by-Step Procedure

To configure group liveness detection for DHCP local server:

1. Specify that you want to configure liveness detection.  

```
[edit system services dhcp-local-server ]
user@host# edit liveness-detection
```
2. Specify that you want to configure liveness detection for a specific DHCP local server group.  

```
[edit system services dhcp-local-server liveness-detection]
user@host# edit group local_group_1
```

3. Specify that you want to configure the liveness detection method.  

```
[edit system services dhcp-local-server group local_group_1 liveness-detection]  
user@host# edit method
```
4. Specify BFD as the liveness detection method that you want DHCP to use.  

```
[edit system services dhcp-local-server group local_group_1 liveness-detection  
method]  
user@host# edit bfd
```
5. Configure the detection time threshold (in milliseconds) at which a trap is produced.  

```
[edit system services dhcp-local-server group local_group_1 liveness-detection  
method bfd]  
user@host# set detection-time threshold 30000
```
6. Configure the time (in milliseconds) for which BFD holds a session up notification.  

```
[edit system services dhcp-local-server group local_group_1 liveness-detection  
method bfd]  
user@host# set holddown-interval 50
```
7. Configure the BFD minimum transmit and receive interval (in milliseconds).

**NOTE:** You do not need to configure the BFD minimum transmit and receive interval if you configure the minimum-interval for the BFD transmit-interval statement and the minimum-receive-interval.

```
[edit system services dhcp-local-servergroup local_group_1 liveness-detection method  
bfd]  
user@host# set minimum-interval 45000
```

8. Configure the minimum receive interval (in milliseconds).

**NOTE:** You do not need to configure the BFD minimum receive interval if you configure the BFD minimum transmit and receive interval.

```
[edit system services dhcp-local-server group local_group_1 liveness-detection  
method bfd]  
user@host# set minimum-receive-interval 60000
```

9. Configure a multiplier value for the detection time.  

```
[edit system services dhcp-local-server group local_group_1 liveness-detection  
method bfd]  
user@host# set multiplier 100
```
10. Disable the ability for BFD interval timers to change or adapt to network situations.  

```
[edit system services dhcp-local-server group local_group_1 liveness-detection  
method bfd]  
user@host# set no-adaptation
```
11. Configure the BFD session mode.

```
[edit system services dhcp-local-server group local_group_1 liveness-detection
method bfd]
```

```
user@host# set session-mode automatic
```

12. Configure the threshold and minimum interval for the BFD transmit interval.

**NOTE:** You do not need to configure the transmit interval values if you have already configured the minimum transmit and receive interval for BFD.

```
[edit system services dhcp-local-server group local_group_1 liveness-detection
method bfd]
```

```
user@host# set transmit-interval threshold 60000 minimum-interval 45000
```

13. Configure the BFD protocol version you want to detect.

```
[edit system services dhcp-local-server group local_group_1 liveness-detection
method bfd]
```

```
user@host# set version automatic
```

14. Configure the action the router (switch) takes when a liveness detection failure occurs. In this example, the failure action is to clear the client session only when a liveness detection failure occurs and the local interface is detected as being up.

```
[edit system services dhcp-local-server group local_group_1 liveness-detection]
user@host# edit failure-action action
```

**Results** From configuration mode, confirm your configuration by entering the **show system** command. If the output does not display the intended configuration, repeat the instructions in this example to correct it.

```
[edit]

## DHCP Relay Agent Examples

- [Example: Minimum DHCP Relay Agent Configuration on page 1398](#)
- [Example: Configuring DHCP Relay Agent Selective Traffic Processing Based on DHCP Option Strings on page 1399](#)
- [Example: Configuring DHCP Snooping Support for DHCP Relay Agent on page 1403](#)

### Example: Minimum DHCP Relay Agent Configuration

This example shows the minimum configuration you need to use the extended DHCP relay agent on the router or switch:

```
[edit forwarding-options]  
dhcp-relay {  
  server-group {  
    test 10.0.2.1;  
  }  
  active-server-group test;  
  group all {  
    interface fe-0/0/2.0;  
  }  
}
```

**NOTE:** The interface type in this topic is just an example. The **fe-** interface type is not supported by EX Series switches.

---

This example creates a server group and an active server group named **test** with IP address 10.0.2.1. The DHCP relay agent configuration is applied to a group named **all**. Within this group, the DHCP relay agent is enabled on interface fe-0/0/2.0.

**Related  
Documentation**

## Example: Configuring DHCP Relay Agent Selective Traffic Processing Based on DHCP Option Strings

This example shows how to configure DHCP relay agent to use DHCP option strings to selectively identify, filter, and process client traffic.

- [Requirements on page 1399](#)
- [Overview on page 1399](#)
- [Configuration on page 1400](#)
- [Verification on page 1401](#)

### Requirements

---

This example uses the following hardware and software components:

- MX Series 3D Universal Edge Routers or EX Series Switches

Before you configure DHCP relay agent selective processing support, be sure you:

- Configure DHCP relay agent.

See [“Extended DHCP Relay Agent Overview” on page 1379](#).

- (Optional) Configure a named DHCP local server group if you want to forward client traffic to a server group.

See [“Grouping Interfaces with Common DHCP Configurations” on page 1421](#).

### Overview

---

In this example, you configure DHCP relay agent to use DHCP option strings in client packets to selectively identify, filter, and process client traffic. To configure selective processing, you perform the following procedures:

1. Identify the client traffic—Specify the DHCP option that DHCP relay agent uses to identify the client traffic you want to process. The option you specify matches the option in the client traffic.
2. Configure a default action—Specify the default processing action, which DHCP relay uses for identified client traffic that does not satisfy any configured match criteria.
3. Create match filters and associate an action with each filter—Specify match criteria that filter the client traffic. The criteria can be an exact match or a partial match with the option string in the client traffic. Associate a processing action with each match criterion.

## Configuration

---

To configure DHCP relay agent selective processing based on DHCP option information, perform these tasks:

- [Configuring DHCP Relay Agent To Selectively Process Client Traffic Based on DHCP Option Strings on page 1400](#)
- [Results on page 1401](#)

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the command into the CLI at the **[edit]** hierarchy level.

```
set forwarding-options dhcp-relay relay-option option-number 60
set forwarding-options dhcp-relay relay-option equals ascii video-gold forward-only
set forwarding-options dhcp-relay relay-option equals ascii video-bronze local-server-group
  servergroup-15
set forwarding-options dhcp-relay relay-option starts-with hexadecimal ffff
  local-server-group servergroup-east
set forwarding-options dhcp-relay relay-option default-action drop
```

### *Configuring DHCP Relay Agent To Selectively Process Client Traffic Based on DHCP Option Strings*

### Step-by-Step Procedure

To configure DHCP relay selective processing:

1. Specify that you want to configure DHCP relay agent support.  

```
[edit forwarding-options]
user@host# edit dhcp-relay
```
2. Specify the DHCP option that DHCP relay agent uses to identify incoming client traffic.  

```
[edit forwarding-options dhcp-relay]
user@host# set relay-option option-number 60
```
3. Configure a default action, which DHCP relay agent uses when the incoming client traffic does not satisfy any configured match criteria.  

```
[edit forwarding-options dhcp-relay]
user@host# set relay-option default-action drop
```
4. Configure an exact match condition and associated action that DHCP relay uses to process the identified client traffic.  

```
[edit forwarding-options dhcp-relay]
user@host# set relay-option equals ascii video-gold forward-only
```
5. Configure a second exact match condition and associated action that DHCP relay uses to process client traffic.  

```
[edit forwarding-options dhcp-relay]
user@host# set relay-option equals ascii video-bronze local-server-group
  servergroup-15
```

6. Configure a partial match criteria and associated action that DHCP relay uses to process client traffic.

```
[edit forwarding-options dhcp-relay]
user@host# set relay-option starts-with hexadecimal ffff local-server-group
servergroup-east
```

### Results

From configuration mode, confirm the results of your configuration by issuing the **show** statement at the **[edit forwarding-options]** hierarchy level. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

```
[edit forwarding-options]
user@host# show
dhcp-relay {
  relay-option {
    option-number 60;
    equals {
      ascii video-gold {
        forward-only;
      }
    }
    equals {
      ascii video-bronze {
        local-server-group servergroup-15;
      }
    }
    default-action {
      drop;
    }
    starts-with {
      hexadecimal ffff {
        local-server-group servergroup-east;
      }
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

To verify the status of DHCP relay agent selective traffic processing, perform this task:

- [Verifying the Status of DHCP Relay Agent Selective Traffic Processing on page 1401](#)

#### *Verifying the Status of DHCP Relay Agent Selective Traffic Processing*

**Purpose** Verify the DHCP relay agent selective traffic processing status.

**Action** Display statistics for DHCP relay agent.

```
user@host> show dhcp relay statistics
Packets dropped:
  Total                30
  Bad hardware address  1
  Bad opcode           1
  Bad options          3
  Invalid server address 5
  No available addresses 1
  No interface match    2
  No routing instance match 9
  No valid local address 4
  Packet too short      2
  Read error            1
  Send error            1
  Option 60             1
  Option 82             2

Messages received:
  BOOTREQUEST          116
  DHCPDECLINE           0
  DHCPDISCOVER          11
  DHCPINFORM            0
  DHCPRELEASE           0
  DHCPREQUEST          105

Messages sent:
  BOOTREPLY             0
  DHCPOFFER             2
  DHCPACK               1
  DHCPNAK                0
  DHCPFORCERENEW        0

Packets forwarded:
  Total                4
  BOOTREQUEST           2
  BOOTREPLY             2
```

**Meaning** The **Packets forwarded** field in the **show dhcp relay statistics** command output displays the number of client packets that have been forwarded as a result of the selective traffic processing configuration. In this example, the output indicates the total number of packets that DHCP relay agent has forwarded, as well as a breakdown for the number of **BOOTREQUEST** and **BOOTREPLY** packets forwarded.

## Example: Configuring DHCP Snooping Support for DHCP Relay Agent

This example shows how to configure DHCP snooping support for DHCP relay agent.

- [Requirements on page 1403](#)
- [Overview on page 1403](#)
- [Configuration on page 1403](#)

### Requirements

- Configure DHCP relay agent. See “[Extended DHCP Relay Agent Overview](#)” on page 1379.

### Overview

In this example, you configure DHCP snooping support for DHCP relay agent by completing the following operations:

- Override the default DHCP snooping configuration and enable DHCP snooping support for the interfaces in group **frankfurt**.
- Configure DHCP relay agent to forward snooped packets to only configured interfaces.

**NOTE:** By default, DHCP snooping is disabled globally.

### Configuration

#### Step-by-Step Procedure

To configure DHCP relay support for DHCP snooping:

1. Specify that you want to configure DHCP relay agent.  

```
[edit]
user@host# edit forwarding-options dhcp-relay
```
2. Specify the named group of interfaces on which DHCP snooping is supported.  

```
[edit forwarding-options dhcp-relay]
user@host# edit group frankfurt
```
3. Specify the interfaces that you want to include in the group. DHCP relay agent considers these as the configured interfaces when determining whether to forward or drop traffic.  

```
[edit forwarding-options dhcp-relay group frankfurt]
user@host# set interface fe-1/0/1.3 upto fe-1/0/1.9
```
4. Specify that you want to override the default configuration for the group.  

```
[edit forwarding-options dhcp-relay group frankfurt]
user@host# edit overrides
```
5. Enable DHCP snooping support for the group.  

```
[edit forwarding-options dhcp-relay group frankfurt overrides]
user@host# set allow-snooped-clients
```

6. Return to the **[edit forwarding-options dhcp-relay]** hierarchy level to configure the forwarding action and specify that DHCP relay agent forward snooped packets on only configured interfaces:

```
[edit forwarding-options dhcp-relay group frankfurt overrides]
user@host# up 2
```

7. Enable DHCP snooped packet forwarding for DHCP relay agent.

```
[edit forwarding-options dhcp-relay]
user@host# edit forward-snooped-clients
```

8. Specify that snooped packets are forwarded on only configured interfaces (the interfaces in group **frankfurt**).

```
[edit forwarding-options dhcp-relay forward-snooped-clients]
user@host# set configured-interfaces
```

**Results** From configuration mode, confirm your configuration by entering the **show forwarding-options** command. If the output does not display the intended configuration, repeat the instructions in this example to correct it. The following output also shows a range of configured interfaces in group **frankfurt**.

```
[edit]
regress@montag# show forwarding-options
dhcp-relay {
  forward-snooped-clients configured-interfaces;
  group frankfurt {
    overrides {
      allow-snooped-clients;
    }
    interface fe-1/0/1.3 {
      upto fe-1/0/1.9;
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

### Configuring DHCP Services (J-Web Procedure) on EX Series Switches

**NOTE:** This topic applies only to the J-Web Application package.

Use the J-Web DHCP Configuration pages to configure DHCP pools for subnets and static bindings for DHCP clients on an ACX Series Universal Access Gateway router or an EX Series Ethernet Switch. If DHCP pools or static bindings are already configured, use the [Configure Global DHCP Parameters Configuration](#) page to add settings for these pools and static bindings. Settings that have been previously configured for DHCP pools or static bindings are not overridden when you use the [Configure Global DHCP Parameters Configuration](#) page.

To configure the DHCP server:

1. Select **Configure > Services > DHCP**
2. Access a DHCP Configuration page:
  - To configure a DHCP pool for a subnet, click **Add** in the DHCP Pools box.
  - To configure a static binding for a DHCP client, click **Add** in the DHCP Static Binding box.
  - To globally configure settings for existing DHCP pools and static bindings, click **Configure Global DHCP Parameters**.
3. Enter information into the DHCP Service Configuration pages as described in [Table 136 on page 1406](#)
4. To apply the configuration, click **Apply**.

**NOTE:** After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See [Using the Commit Options to Commit Configuration Changes](#) for details about all commit options.

Table 136: DHCP Service Configuration Pages Summary

Field	Function	Your Action
<b>DHCP Pool Information</b>		
DHCP Subnet (required)	Specifies the subnet on which DHCP is configured.	Type an IP address prefix.
Address Range (Low) (required)	Specifies the lowest address in the IP address pool range.	Type an IP address that is part of the subnet specified in DHCP Subnet field .
Address Range (High) (required)	Specifies the highest address in the IP address pool range.	Type an IP address that is part of the subnet specified in DHCP Subnet. This address must be greater than the address specified in the Address Range (Low) field.
Exclude Addresses	Specifies addresses to exclude from the IP address pool.	<ul style="list-style-type: none"> <li>To add an excluded address, type the address next to the <b>Add</b> button, and click <b>Add</b>.</li> <li>To delete an excluded address, select the address in the Exclude Addresses box, and click <b>Delete</b>.</li> </ul>
<b>Lease Time</b>		
Maximum Lease Time (Seconds)	Specifies the maximum length of time a client can hold a lease. (Dynamic BOOTP lease lengths can exceed this maximum time.)	Type a number from 60 through 4,294,967,295 (seconds). You can also type <b>infinite</b> to specify a lease that never expires.
Default Lease Time (Seconds)	Specifies the length of time a client can hold a lease for clients that do not request a specific lease length.	Type a number from 60 through 2,147,483,647 (seconds). You can also type <b>infinite</b> to specify a lease that never expires.
<b>Server Information</b>		
Server Identifier	Specifies the IP address of the DHCP server reported to a client.	Type the IP address of the server. If you do not specify a server identifier, the primary address of the interface on which the DHCP exchange occurs is used.
Domain Name	Specifies the domain name that clients must use to resolve hostnames.	Type the name of the domain.
Domain Search	Specifies the order—from top to bottom—in which clients must append domain names when resolving hostnames using DNS.	<ul style="list-style-type: none"> <li>To add a domain name, type the name next to the <b>Add</b> button, and click <b>Add</b>.</li> <li>To delete a domain name, select the name in the Domain Search box, and click <b>Delete</b>.</li> </ul>
DNS Name Servers	Defines a list of DNS servers that the client can use, in the specified order—from top to bottom.	<ul style="list-style-type: none"> <li>To add a DNS server, type an IP address next to the <b>Add</b> button, and click <b>Add</b>.</li> <li>To remove a DNS server, select the IP address in the DNS Name Servers box, and click <b>Delete</b>.</li> </ul>

Table 136: DHCP Service Configuration Pages Summary (*continued*)

Field	Function	Your Action
Gateway Routers	Defines a list of relay agents on the subnet, in the specified order—from top to bottom.	<ul style="list-style-type: none"> <li>To add a relay agent, type an IP address next to the <b>Add</b> button, and click <b>Add</b>.</li> <li>To remove a relay agent, select the IP address in the Gateway Routers box, and click <b>Delete</b>.</li> </ul>
WINS Servers	Defines a list of NetBIOS name servers, in the specified order—from top to bottom.	<ul style="list-style-type: none"> <li>To add a NetBIOS name server, type an IP address next to the <b>Add</b> button, and click <b>Add</b>.</li> <li>To remove a NetBIOS name server, select the IP address in the WINS Servers box, and click <b>Delete</b>.</li> </ul>
<b>Boot Options</b>		
Boot File	Specifies the path and filename of the initial boot file to be used by the client.	Type a path and filename.
Boot Server	Specifies the Trivial File Transfer Protocol (TFTP) server that the client uses to obtain the client configuration file.	Type the IP address or hostname of the TFTP server.
<b>DHCP Static Binding Information</b>		
DHCP MAC Address (required)	Specifies the MAC address of the client to be permanently assigned a static IP address.	Type the hexadecimal MAC address of the client.
Fixed IP Addresses (required)	Defines a list of IP addresses permanently assigned to the client. A static binding must have at least one fixed address assigned to it, but multiple addresses are also allowed.	<ul style="list-style-type: none"> <li>To add an IP address, type it next to the <b>Add</b> button, and click <b>Add</b>.</li> <li>To remove an IP address, select it in the Fixed IP Addresses box, and click <b>Delete</b>.</li> </ul>
Host Name	Specifies the name of the client used in DHCP messages exchanged between the server and the client. The name must be unique to the client within the subnet on which the client resides.	Type a client hostname.
Client Identifier	Specifies the name of the client used by the DHCP server to index its database of address bindings. The name must be unique to the client within the subnet on which the client resides.	Type a client identifier in string form.
Hexadecimal Client Identifier	Specifies the name of the client, in hexadecimal form, used by the DHCP server to index its database of address bindings. The name must be unique to the client within the subnet on which the client resides.	Type a client identifier in hexadecimal form.

### Configuring DHCP Services on EX4300 Switches (J-Web Procedure)

On EX4300 switches, use the DHCP Configuration page to create DHCP pools and set the DHCP parameters for them and to configure DHCP settings for existing DHCP pools and static bindings.

To configure the DHCP services on EX4300 switches:

1. Select **Configure > Services > DHCP**
2. Access a DHCP Configuration page:
  - To configure a DHCP pool for a subnet, click **Add** in the DHCP Pools box.
  - To configure DHCP groups, click **Add** in the DHCP Groups box.
  - To globally configure settings for existing DHCP pools and static bindings, click **Configure Global DHCP Parameters**.
3. Enter information into the DHCP Service Configuration pages as described in [Table 137 on page 1408](#)
4. To apply the configuration, click **OK**.

**NOTE:** After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See [Using the Commit Options to Commit Configuration Changes](#) for details about all commit options.

**Table 137: DHCP Service Configuration Pages Summary for EX4300 Switches**

Field	Function	Your Action
<b>DHCP Groups</b>		
Group Name	Specifies the name of the group.	Enter the name of the group.
Interfaces	Family inet interface is listed, only if it is already configured with family inet.	Select the interface for the specific group.
<b>DHCP Pool Information</b>		
Pool Name	Specifies the name of an address-assignment pool.	Type the pool name.
Link Pool	Specifies the pool name to which it is linked.	Select the option from the list.
<b>Network Address</b>		
IP Address	Specifies the IP address pool range.	Type an IP address that is part of the subnet specified in the DHCP Subnet field.

Table 137: DHCP Service Configuration Pages Summary for EX4300 Switches (*continued*)

Field	Function	Your Action
Subnet mask	Specifies the subnet specified in DHCP Subnet.	Type a subnet mask that is specified in the DHCP Subnet field.
<b>DHCP Pool Attributes</b>		
Pool Name	Displays the name of an address-assignment pool.	The pool name is displayed.
Server Identifier	Specifies the IP address of the DHCP server reported to a client.	Type the IP address of the server. If you do not specify a server identifier, the primary address of the interface on which the DHCP exchange occurs is used.
TFTP Server	Specifies the Trivial File Transfer Protocol (TFTP) server that the client uses to obtain the client configuration file.	Enter the IP address of the TFTP server.
Maximum Lease Time (Seconds)	Specifies the maximum length of time a client can hold a lease. (Dynamic BOOTP lease lengths can exceed this maximum time.)	Type a number.
Boot File	Specifies the path and filename of the initial boot file to be used by the client.	Type a path and filename.
Boot Server	Specifies the TFTP server that provides the initial boot file to the client.	Type the IP address or hostname of the TFTP server.
Grace Period	Specifies the grace period for which a client can hold a lease.	Type the grace period in seconds.
DNS Name Servers	Defines a list of DNS servers the client can use.	<ul style="list-style-type: none"> <li>To add a DNS server, click <b>Add</b>. Type an IP address in the <b>Add IP Address</b> pop-up window.</li> <li>Click <b>OK</b>.</li> <li>To remove a DNS server, select the IP address in the DNS Name Servers box, and click <b>Remove</b>.</li> </ul>
WINS Servers	Defines a list of NetBIOS name servers.	<ul style="list-style-type: none"> <li>To add a NetBIOS name server, click <b>Add</b>. Type an IP address in the <b>Add IP Address</b> pop-up window.</li> <li>Click <b>OK</b>.</li> <li>To remove a NetBIOS name server, select the IP address in the WINS Servers box, and click <b>Remove</b>.</li> </ul>
Domain Name	Specifies the domain name that clients must use to resolve hostnames.	Type the name of the domain.
NetBIOS Node Type	Specifies the NetBOIS node that provides the initial node file to the client.	Select the type from the list.

Table 137: DHCP Service Configuration Pages Summary for EX4300 Switches (*continued*)

Field	Function	Your Action
Gateway Routers	Defines a list of relay agents on the subnet, in the specified order—from top to bottom.	<ul style="list-style-type: none"> <li>To add a relay agent, click <b>Add</b>. Type an IP address in the <b>Add IP Address</b> pop-up window.</li> <li>Click <b>OK</b>.</li> <li>To remove a relay agent, select the IP address in the Gateway Routers box, and click <b>Remove</b>.</li> </ul>
Option	Specifies the DHCP options.	<ul style="list-style-type: none"> <li>To add a DHCP option, click <b>Add</b>. The Add DHCP Option pop-up window is displayed. Enter the following: <ul style="list-style-type: none"> <li>Enter the DHCP <b>Code</b> in the Code box.</li> <li>Select the DHCP type from the <b>Type</b> list.</li> <li>Select the DHCP subtype from the <b>Sub Type</b> list.</li> <li>Enter the DHCP value in the <b>Value</b> box.</li> </ul> </li> <li>Click <b>OK</b>.</li> <li>To remove a DHCP option, select the option in the Option box, and click <b>Remove</b>.</li> </ul>
Option-82		
Circuit Identifier	Identifies the circuit (interface or VLAN or both) on the switch on which the request was received.	Type the circuit identifier.
Ranges	Specifies the circuit identifier range.	Type the range for the circuit identifier.
Remote Identifier	By default, the remote ID is the MAC address of the switch	Type the remote identifier.
Ranges	Specifies the remote identifier range.	Type the range for the remote identifier.
Address Range		
Range Name	Specifies the name of the range.	Click <b>Add</b> . The Add Address Range pop-up window is displayed: <ul style="list-style-type: none"> <li>Type the range name in the <b>Range Name</b> box.</li> </ul>
Address Range		
Address Range (Low)	Specifies the lowest address in the IP address pool range.	Type an IP address that is part of the subnet specified in DHCP Subnet
Address Range (High)	Specifies the highest address in the IP address pool range.	Type an IP address that is part of the subnet specified in DHCP Subnet. This address must be greater than the address specified in Address Range (Low).

Table 137: DHCP Service Configuration Pages Summary for EX4300 Switches (*continued*)

Field	Function	Your Action
Static Bindings		
Host Name	Specifies the name of the client used in DHCP messages exchanged between the server and the client. The name must be unique to the client within the subnet on which the client resides.	Type a client hostname.
MAC Address	Specifies the MAC address of the client to be permanently assigned a static IP address.	Type the hexadecimal MAC address of the client.
Fixed IP Address	Specifies the IP address of the client.	Type the IP address.
Global Settings		
General		
Duplicate clients on interface	Specifies the DHCP local server to include the client subinterface when distinguishing between duplicate DHCP clients (clients with the same MAC address or client ID) in the same subnet.	To enable this option, select the check box.
Pool Match Order	Specifies the order in which the DHCP local server uses information in the DHCP client PDU to determine how to obtain an address for the client.	Select the pool match order.
Authentication		
Password	Specifies the password that is sent to the external AAA authentication server for subscriber authentication.	Type the password.
Username-include		
Circuit Type	Specifies the circuit type that is linked with the username.	To enable this option, select the check box.
Interface Name	Name of the interface.	To enable this option, select the check box.
Mac Address	Specifies the MAC address of the client PDU that is linked with the username during the subscriber authentication process.	To enable this option, select the check box.
Logical System Name	Specifies that the logical system name that is linked with the username during the subscriber authentication process.	To enable this option, select the check box.

Table 137: DHCP Service Configuration Pages Summary for EX4300 Switches (*continued*)

Field	Function	Your Action
Option-60	Specifies the payload of Option 60 (Vendor Class Identifier) from the client PDU be linked with the username during the subscriber authentication process.	To enable this option, select the check box.
Routing Instance Name	Specifies the routing instance name that is linked with the username during the subscriber authentication process.	To enable this option, select the check box.
Option-82		
Circuit Identifier	Specifies the name of the client used by the DHCP server to index its database of address bindings. The name must be unique to the client within the subnet on which the client resides.	To enable this option, select the check box.
Remote Identifier	Specifies the remote ID option in the client.	To enable this option, select the check box.
Domain Name	Specifies the domain name that clients must use to resolve hostnames.	Type the domain name.
User Prefix	Specifies the prefix to the username as defined by the user.	Type the prefix.
Delimiter	Specifies a character that separates components that make up the username.	Type the delimiter.

  - [Monitoring DHCP Services on page 1691](#)

## Configuring a DHCP SIP Server (CLI Procedure)

You can use the **sip-server** statement on the EX Series switch to configure option 120 on a DHCP server. The DHCP server sends configured option values—Session Initiation Protocol (SIP) server addresses or names—to DHCP clients when they request them. Previously, you were only allowed to specify a SIP server by address using **[edit system services dhcp option 120]**. You specify either an IPv4 address or a fully qualified domain name to be used by SIP clients to locate a SIP server. You cannot specify both an address and name in the same statement.

To configure a SIP server using the **address** option:

```
[edit system services dhcp]
user@switch# set sip-server address
```

For example, to configure one address:

```
[edit system services dhcp]
user@switch set sip-server 172.168.0.11
```

To configure a SIP server using the *name* option:

```
[edit system services dhcp]
user@switch# set sip-server name
```

For example, to configure a name:

```
[edit system services dhcp]
user@switch set sip-server abc.example.com
```

- [Configuring a DHCP Client \(CLI Procedure\) on page 1413](#)
  - [Understanding DHCP Services for Switches](#)

## Configuring a DHCP Client (CLI Procedure)

A Dynamic Host Configuration Protocol (DHCP) server can provide many valuable TCP/IP network services. DHCP can dynamically allocate IP parameters, such as an IP address, to clients, and it can also deliver software upgrades to clients.

DHCP configuration consists of two components, configuration of DHCP clients and configuration of a DHCP server. Client configuration determines how clients send a message requesting an IP address, whereas a DHCP server configuration enables the server to send an IP address configuration back to the client. This topic describes configuring a DHCP client. For directions for configuring a DHCP server, see *Configuring a DHCP Server on Switches (CLI Procedure)*.

You can change DHCP client configurations from the switch, using client identifiers to indicate which clients you want to configure.

To configure a DHCP client, you configure an interface to belong to the DHCP family and specify additional attributes, as desired:

```
[edit]
user@switch# set interfaces interface-name unit number family inet dhcp
configuration-statement
```

The options that you can configure are listed in [Table 138 on page 1413](#). Replace the variable *configuration-statement* with one or more of the statements listed in this table. If you do not explicitly configure these options, the switch uses default values for them.

**Table 138: DHCP Client Settings**

Configuration Statement	Description
<b>client-identifier</b>	Unique client ID—By default this consists of the hardware type (01 for Ethernet) and the MAC address (a.b.c.d). For this example, the value would be 01abcd.
<b>lease-time</b>	Ttime in seconds that a client holds the lease for an IP address assigned by a DHCP server. If a client does not request a specific lease time, then the server sends the default lease time. The default lease time on a Junos OS DHCP server is 1 day.
<b>retransmission-attempt</b>	Number of times the client attempts to retransmit a DHCP packet.

Table 138: DHCP Client Settings (*continued*)

Configuration Statement	Description
<code>retransmission-interval</code>	Time between transmission attempts.
<code>server-address</code>	IP address of the server that the client queries for an IP address.
<code>update-server</code>	TCP/IP settings learned from an external DHCP server to the DHCP server running on the switch are propagated.
<code>vendor-option</code>	Vendor class ID (CPU's manufacturer ID string) for the DHCP client.

## Configuring a DHCP Server on Switches (CLI Procedure)

**NOTE:** This topic applies to Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see [Configuring a DHCP Server on Switches \(CLI Procedure\)](#). For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 3](#).

A Dynamic Host Configuration Protocol (DHCP) server can provide two valuable TCP/IP network services. DHCP can dynamically allocate IP parameters, such as an IP address, to clients and it can also deliver software upgrades to clients.

A DHCP configuration consists of two components—an optional reconfiguration of default settings on DHCP clients and the configuration of a DHCP server. This topic covers configuration of the DHCP server. For information about reconfiguring a DHCP client, see [“Configuring a DHCP Client \(CLI Procedure\)” on page 1413](#).

**NOTE:** Junos OS for EX Series switches with support for ELS does not support the DHCP legacy server version.

This topic includes the following tasks:

1. [Configuring an Extended DHCP Server on a Switch on page 1415](#)

### Configuring an Extended DHCP Server on a Switch

To configure an extended DHCP server, you must configure a DHCP pool, indicate IP addresses for the pool, and create a server group. Additional configurations are optional.

Do not assign addresses that are already in use in the network to address pools. The extended DHCP server does not check whether addresses are already in use before it assigns them to clients.

1. Create an address pool for DHCP IP addresses:

```
[edit]
user@switch# set access address-pool address-pool
```

2. Configure an address-assignment pool that can be used by different client applications for DHCP dynamic assignment:

```
[edit access address-assignment]
user@switch# set pool address-pool-name
```

3. Create a server group on the switch, providing a group name and an interface name for DHCP:

```
[edit system services dhcp-local-server]
user@switch# set group group-name interface interface-name
```

4. (Optional) Process the information protocol data units (PDUs):

```
[edit system services dhcp-local-server]
user@switch# set overrides process-inform
```

5. (Optional) Redefine the order of attribute matching for pool selection:

```
[edit system services dhcp-local-server]
user@switch# set pool-match-order ip-address-first
```

6. (Optional) Enable dynamic reconfiguration triggered by the DHCP extended server for all DHCP clients or only for the DHCP clients serviced by the specified group of interfaces:

```
[edit system services dhcp-local-server]
user@switch# set reconfigure

[edit system services dhcp-local-server group group-name]
user@switch# set reconfigure
```

#### Related Documentation

## Configuring an Extended DHCP Relay Server on EX Series Switches (CLI Procedure)

You can configure an EX Series switch to act as an extended DHCP relay agent. This means that a locally attached host can issue a DHCP request as a broadcast message and the switch configured for DHCP relay relays the message to a specified DHCP server. Configure a switch to be a DHCP relay agent if you have locally attached hosts and a remote DHCP server.

Before you begin:

- Ensure that the switch can connect to the DHCP server.

To configure a switch to act as an extended DHCP relay agent server:

1. Create at least one DHCP server group, which is a group of 1 through 5 DHCP server IP addresses:

```
[edit forwarding-options dhcp-relay]
user@switch# set server-group server-group-name ip-address
```

2. Set the global active DHCP server group. The DHCP relay server relays DHCP client requests to the DHCP servers defined in the active server group:

```
[edit forwarding-options dhcp-relay]
user@switch# set active-server-group server-group-name
```

3. Create a DHCP relay group that includes at least one interface. DHCP relay runs on the interfaces defined in DHCP groups:

```
[edit forwarding-options dhcp-relay]
user@switch# set group group-name interface interface-name
```

4. (Optional) Configure overrides of default DHCP relay behaviors, at the global level. See the override options in the [overrides](#) statement.

```
[edit forwarding-options dhcp-relay]
user@switch# set overrides
```

5. (Optional) Configure DHCP relay to use the DHCP vendor class identifier option (option 60) in DHCP client packets, at the global level:

```
[edit forwarding-options dhcp-relay]
user@switch# set relay-option option-number 60
```

6. (Optional) Configure settings for a DHCP relay group that override the settings at the global level, using these statements:

```
[edit forwarding-options dhcp-relay group group-name]
user@switch# set active-server-group server-group-name
user@switch# set overrides
user@switch# set relay-option option-number 60
```

7. (Optional) Configure settings for a DHCP relay group interface that override the settings at the global and **group** levels, using these statements:

```
[edit forwarding-options dhcp-relay group group-name interface interface-name]
user@switch# exclude
user@switch# set overrides
```

```
user@switch# set trace
user@switch# set upto upto-interface-name
```

## Enabling HTTPS and XNM-SSL Services on Switches Using Self-Signed Certificates (CLI Procedure)

You can use the system-generated self-signed certificate or a manually generated self-signed certificate to enable Web management HTTPS and XNM-SSL services.

- To enable HTTPS services using the automatically generated self-signed certificate:

```
[edit]
user@switch# set system services web-management https system-generated-certificate
```

- To enable HTTPS services using a manually generated self-signed certificate:

```
[edit]
user@switch# set system services web-management https pki-local-certificate
certificate-id-name
```

**NOTE:** The value of the *certificate-id-name* must match the name you specified when you generated the self-signed certificate manually.

- To enable XNM-SSL services using a manually generated self-signed certificate:

```
[edit]
user@switch# set system services xnm-ssl local-certificate certificate-id-name
```

**NOTE:** The value of the *certificate-id-name* must match the name you specified when you generated the self-signed certificate manually.

#### Related Documentation

- [Manually Generating Self-Signed Certificates on Switches \(CLI Procedure\) on page 1417](#)
- [Understanding Self-Signed Certificates on EX Series Switches on page 1390](#)

## Manually Generating Self-Signed Certificates on Switches (CLI Procedure)

EX Series switches allow you to generate custom self-signed certificates and store them in the file system. The certificate you generate manually can coexist with the automatically generated self-signed certificate on the switch. To enable secure access to the switch

over SSL, you can use either the system-generated self-signed certificate or a certificate you have generated manually.

To generate self-signed certificates manually, you must complete the following tasks:

- [Generating a Public-Private Key Pair on Switches on page 1418](#)
- [Generating Self-Signed Certificates on Switches on page 1418](#)

### Generating a Public-Private Key Pair on Switches

---

A digital certificate has an associated cryptographic key pair that is used to sign the certificate digitally. The cryptographic key pair comprises a public key and a private key. When you generate a self-signed certificate, you must provide a public-private key pair that can be used to sign the self-signed certificate. Therefore, you must generate a public-private key pair before you can generate a self-signed certificate.

To generate a public-private key pair:

```
user@switch> request security pki generate-key-pair certificate-id certificate-id-name
```

**NOTE:** Optionally, you can specify the encryption algorithm and the size of the encryption key. If you do not specify the encryption algorithm and encryption key size, default values are used. The default encryption algorithm is RSA, and the default encryption key size is 1024 bits.

After the public-private key pair is generated, the switch displays the following:

```
generated key pair certificate-id-name, key size 1024 bits
```

### Generating Self-Signed Certificates on Switches

---

To generate the self-signed certificate manually, include the certificate ID name, the subject of the distinguished name (DN), the domain name, the IP address of the switch, and the e-mail address of the certificate holder:

```
user@switch> request security pki local-certificate generate-self-signed certificate-id  
certificate-id-name domain-name domain-name email email-address ip-address switch-ip-address  
subject subject-of-distinguished-name
```

The certificate you have generated is stored in the switch's file system. The certificate ID you have specified while generating the certificate is a unique identifier that you can use to enable the HTTPS or XNM-SSL services.

To verify that the certificate was generated and loaded properly, enter the **show security pki local-certificate** operational command.

#### Related Documentation

- [Enabling HTTPS and XNM-SSL Services on Switches Using Self-Signed Certificates \(CLI Procedure\) on page 1417](#)
- [Understanding Self-Signed Certificates on EX Series Switches on page 1390](#)

## Deleting Self-Signed Certificates (CLI Procedure)

You can delete a self-signed certificate that is automatically or manually generated from the EX Series switch. When you delete the automatically generated self-signed certificate, the switch generates a new self-signed certificate and stores it in the file system.

- To delete the automatically generated certificate and its associated key pair from the switch:

```
user@switch> clear security pki local-certificate system-generated
```

- To delete a manually generated certificate and its associated key pair from the switch:

```
user@switch> clear security pki local-certificate certificate-id certificate-id-name
```

- To delete all manually generated certificates and their associated key pairs from the switch:

```
user@switch> clear security pki local-certificate all
```

## Using External AAA Authentication Services with DHCP

The extended DHCP local server, including DHCPv6 local server, and the extended DHCP relay agent, including DHCPv6 relay agent, support the use of external AAA authentication services, such as RADIUS, to authenticate DHCP clients. When the extended DHCP local server or relay agent receives a discover PDU from a client, the extended DHCP application contacts the AAA server to authenticate the DHCP client. The extended DHCP application can obtain client addresses and DHCP configuration options from the external AAA authentication server.

**NOTE:** This section uses the term *extended DHCP application* to refer to both the extended DHCP local server and the extended DHCP relay agent.

The external authentication feature also supports AAA directed logout. If the external AAA service supports a user logout directive, the extended DHCP application honors the logout and responds as though it were requested by a CLI management command. All of the client state information and allocated resources are deleted at logout. The extended DHCP application supports directed logout using the list of configured authentication servers you specify with the **authentication-server** statement at the **[edit access profile profile-name]** hierarchy level.

You can configure either global authentication support or group-specific support.

You must configure the **username-include** statement to enable the use of authentication. The **password** statement is not required and does not cause DHCP to use authentication if the **username-include** statement is not included.

To configure DHCP local server and DHCP relay agent authentication support:

1. Specify that you want to configure authentication options.

- For DHCP local server:

```
[edit system services dhcp-local-server]
user@host# edit authentication
```

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay]
user@host# edit authentication
```

- For DHCPv6 local server:

```
[edit system services dhcp-local-server dhcpv6]
user@host# edit authentication
```

- For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6]
user@host# edit authentication
```

2. (Optional) Configure a password that authenticates the username to the external authentication service.

See “Configuring Passwords for Usernames” on page 1439.

3. (Optional) Configure optional features to create a unique username.

See “Creating Unique Usernames for DHCP Clients” on page 1439.

#### Related Documentation

## Grouping Interfaces with Common DHCP Configurations

You use the group feature to group a set of interfaces and then apply a common DHCP configuration to the named interface group. The extended DHCP local server, DHCPv6 local server, DHCP relay agent, and DHCPv6 relay agent all support interface groups.

The following steps create a DHCP local server group; the steps are similar for the DHCPv6 local server, DHCP relay agent, and DHCPv6 relay agent.

To configure a DHCP local server interface group:

1. Specify that you want to configure DHCP local server.

```
[edit system services]
user@host# edit dhcp-local-server
```

2. Create the group and assign a name.

```
[edit system services dhcp-local-server]
user@host# edit group boston
```

3. Specify the names of one or more interfaces on which the extended DHCP application is enabled. You can repeat the `interface interface-name` statement to specify multiple interfaces within the group, but you cannot use the same interface in more than one group.

```
[edit system services dhcp-local-server group boston]
user@host# set interface fe-1/0/1.1
user@host# set interface fe-1/0/1.2
```

4. (Optional) You can use the `upto` option to specify a range of interfaces for a group.

```
[edit system services dhcp-local-server group boston]
user@host# set interface fe-1/0/1.3 upto fe-1/0/1.9
```

5. (Optional) You can use the `exclude` option to exclude a specific interface or a specified range of interfaces from the group. For example:

```
[edit system services dhcp-local-server group boston]
user@host# set interface fe-1/0/1.1 upto fe-1/0/1.102
user@host# set interface fe-1/0/1.6 exclude
user@host# set interface fe-1/0/1.70 upto fe-1/0/1.80 exclude
```

**Related  
Documentation**

- [Configuring Group-Specific DHCP Local Server Options on page 1364](#)
- [Configuring Group-Specific DHCP Relay Options on page 1384](#)
- [Guidelines for Configuring Interface Ranges for Groups of DHCP Interfaces on page 1422](#)

## Guidelines for Configuring Interface Ranges for Groups of DHCP Interfaces

This topic describes guidelines to consider when configuring interface ranges for named interface groups for DHCP local server and DHCP relay. The guidelines refer to the following configuration statement:

```
user@host# set interface interface-name upto upto-interface-name
```

- The start subunit, **interface *interface-name***, serves as the key for the stanza. The remaining configuration settings are considered attributes.
- If the subunit is not included, an implicit **.0** subunit is enforced. The implicit subunit is applied to all interfaces when autoconfiguration is enabled. For example, **interface ge-2/2/2** is treated as **interface ge-2/2/2.0**.
- Ranged entries contain the **upto** option, and the configuration applies to all interfaces within the specified range. The start of a ranged entry must be less than the end of the range. Discrete entries apply to a single interface, except in the case of autoconfiguration, in which a **0** (zero) subunit acts as a wildcard.
- Interface stanzas defined within the same router or switch context are dependent and can constrain each other—both DHCP local server and DHCP relay are considered. Interface stanzas defined across different router (switch) contexts are independent and do not constrain one another.
- Each interface stanza, whether discrete or ranged, has a unique start subunit across a given router context. For example, the following configuration is not allowed within the same group because **ge-1/0/0.10** is the start subunit for both.

```
interface ge-1/0/0.10 upto ge-1/0/0.30
interface ge-1/0/0.10
```

- Two groups cannot share interface space. For example, the following configuration is not allowed because the three stanzas share the same space and interfere with one another—interface **ge-1/0/0.26** is common to all three.

```
dhcp-relay group diamond interface ge-1/0/0.10 upto ge-1/0/0.30
dhcp-local-server group ruby interface ge-1/0/0.26
```

```
dhcp-relay group sapphire interface ge-1/0/0.25 upto ge-1/0/0.35
```

- Two ranges cannot overlap, either within a group or across groups. Overlapping occurs when two interface ranges share common subunit space but neither range is a proper subset of the other. The following ranges overlap:

```
interface ge-1/0/0.10 upto ge-1/0/0.30
interface ge-1/0/0.20 upto ge-1/0/0.40
```

- A range can contain multiple nested ranges. A nested range is a proper subset of another range. When ranges are nested, the smallest matching range applies.

In the following example, the three ranges nest properly:

```
interface ge-1/0/0.10 upto ge-1/0/0.30
interface ge-1/0/0.12 upto ge-1/0/0.15 exclude
interface ge-1/0/0.25 upto ge-1/0/0.29 exclude
```

- Discrete interfaces take precedence over ranges. In the following example, interface `ge-1/0/0.20` takes precedence and enforces an interface client limit of 5.

```
interface ge-1/0/0.10 upto ge-1/0/0.30
interface ge-1/0/0.15 upto ge-1/0/0.25 exclude
interface ge-1/0/0.20 overrides interface-client-limit 5
```

## Overriding Default DHCP Local Server Configuration Settings

Subscriber management enables you to override certain default DHCP and DHCPv6 local server configuration settings. You can override settings at the global level, for a named group of interfaces, or for a specific interface within a named group.

- To override global default DHCP local server configuration options, include the **overrides** statement and its subordinate statements at the **[edit system services dhcp-local-server]** or **[edit system services dhcp-local-server dhcpv6]** hierarchy level.
- To override DHCP local server configuration options for a named group of interfaces, include the statements at the **[edit system services dhcp-local-server group group-name]** or **[edit system services dhcp-local-server dhcpv6 group]** hierarchy level.
- To override DHCP local server configuration options for a specific interface within a named group of interfaces, include the statements at the **[edit system services dhcp-local-server group group-name interface]** or **[edit system services dhcp-local-server dhcpv6 group group-name interface]** hierarchy level.

To override default DHCP local server configuration settings:

- Specify that you want to configure override options.

Global override:

```
[edit system services dhcp-local-server]
user@host# edit overrides
```

Group level override:

```
[edit system services dhcp-local-server]
user@host# edit group boston overrides
```

Per-interface override:

```
[edit system services dhcp-local-server]
user@host# edit group boston overrides interface fe-1/0/1.1
```

2. (Optional) Override the maximum number of DHCP clients allowed per interface.  
See [“Specifying the Maximum Number of DHCP Clients Per Interface” on page 1424](#).
3. (Optional) Configure DHCP client auto logout.  
See [“Automatically Logging Out DHCP Clients” on page 1426](#).
4. (Optional) Enable processing of information requests from clients.  
See [“Enabling Processing of Client Information Requests” on page 1427](#).
5. (Optional, DHCPv6 only) Specify a delegated pool name to use for DHCPv6 multiple address assignment.  
See [“Specifying the Delegated Address Pool for IPv6 Prefix Assignment” on page 1428](#).
6. (Optional, DHCPv6 only) Enable DHCPv6 rapid commit support.  
See [“Enabling DHCPv6 Rapid Commit Support” on page 1428](#).
7. (Optional, DHCPv6 only) Specify that DHCPv6 local server return DNS server addresses as IA\_NA or IA\_PD suboptions rather than as a global DHCPv6 option..  
*See Overriding How the DNS Server Address Is Returned in a DHCPv6 Multiple Address Environment.*
8. (Optional) Delete DHCP override settings.  
See [“Deleting DHCP Local Server and DHCP Relay Override Settings” on page 1429](#).

**Related  
Documentation**

- [Configuring Group-Specific DHCP Local Server Options on page 1364](#)
- [Deleting DHCP Local Server and DHCP Relay Override Settings on page 1429](#)

## Specifying the Maximum Number of DHCP Clients Per Interface

By default, there is no limit to the number of DHCP local server or DHCP relay clients allowed on an interface. However, you can override the default setting and specify the maximum number of clients allowed per interface, in the range 1 through 500,000. When the number of clients on the interface reaches the specified limit, no additional DHCP Discover PDUs or DHCPv6 Solicit PDUs are accepted. When the number of clients subsequently drops below the limit, new clients are again accepted.

**NOTE:** The maximum number of DHCP (and DHCPv6) local server clients or DHCP (and DHCPv6) relay clients can also be specified by Juniper Networks VSA 26-143 during client login. The VSA-specified value always takes precedence if the `interface-client-limit` statement specifies a different number.

If the VSA-specified value differs with each client login, DHCP uses the largest limit set by the VSA until there are no clients on the interface.

To configure the maximum number of DHCP clients allowed per interface:

1. Specify that you want to configure override options.

- For DHCP local server:

```
[edit system services dhcp-local-server]
user@host# edit overrides
```

- For DHCPv6 local server:

```
[edit system services dhcp-local-server dhcpv6]
user@host# edit overrides
```

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

- For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6]
user@host# edit overrides
```

2. Configure the maximum number of clients allowed per interface. (DHCP local server, DHCPv6 local server, DHCP relay agent and DHCPv6 relay agent all support the `interface-client-limit` statement.)

```
[edit system services dhcp-local-server overrides]
user@host# set interface-client-limit number
```

**NOTE:** For DHCP local server and DHCP relay agent, you can use either the `interface-client-limit` statement or the `client-discover-match incoming-interface` statement to set a limit of one client per interface. The `interface-client-limit` statement with a value of 1 retains the existing client and rejects any new client connections. The `client-discover-match incoming-interface` statement deletes the existing client and allows a new client to connect.

#### Related Documentation

- [Extended DHCP Relay Agent Overview on page 1379](#)

## Automatically Logging Out DHCP Clients

You can configure the extended DHCP local server and extended DHCP relay to automatically log out DHCP clients. Auto logout immediately releases an existing client when DHCP receives a discover packet from a client whose identity matches an existing client. DHCP then releases the existing client IP address without waiting for the normal lease expiration.

**NOTE:** When the existing client is released, the new client undergoes the normal authentication process. The new client might not receive the same IP address as the original client.

To configure DHCP client auto logout:

1. Specify that you want to configure override options.

- For DHCP local server:

```
[edit system services dhcp-local-server]
user@host# edit overrides
```

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

2. Enable auto logout and specify the secondary identification method you want to use when the primary identification method is unsuccessful.

- For example, to configure DHCP local server to use the incoming interface method:

```
[edit system services dhcp-local-server overrides]
user@host# set client-discover-match incoming-interface
```

- For example, to configure DHCP relay agent to use the option 60 and option 82 method:

```
[edit forwarding-options dhcp-relay overrides]
user@host# set client-discover-match option60-and-option82
```

**NOTE:** If you change the auto logout configuration, existing clients continue to use the auto logout setting that was configured when they logged in. New clients use the new setting.

## Enabling Processing of Client Information Requests

By default, DHCP local server and DHCPv6 local server do not respond to information request messages from the client. You can enable DHCP local server and DHCPv6 local server to process these messages and respond to them with an acknowledgment (ack or reply message, respectively) and the requested information.

DHCP relay agent automatically forwards the information request messages without modification to the configured server group by means of the interfaces configured for the respective server group. The messages are dropped if they are received on an unconfigured interface. DHCP relay proxy also supports forwarding these messages. You cannot disable forwarding of the information request messages.

Configure one or more local address pools if you want to use a local pool rather than one provided by AAA. See *Configuring an Address-Assignment Pool Name and Addresses*. For processing information request messages, the address configuration is not necessary. For DHCP local server, you must specify the IPv4 family; for DHCPv6 local server, you must specify the IPv6 family.

See *Configuring DHCP Client-Specific Attributes Applied When Clients Obtain an Address* for details about how to configure the information sought by clients that send information request messages.

To enable processing of DHCP client information request messages:

1. Specify that you want to configure override options.
  - For DHCP local server:
 

```
[edit system services dhcp-local-server overrides]
user@host# set process-inform
```
  - For DHCPv6 local server:
 

```
[edit system services dhcp-local-server dhcpv6 overrides]
user@host# set process-inform
```
2. (Optional) Specify a pool name from which DHCP information is returned to the client.
  - For DHCP local server:
 

```
[edit system services dhcp-local-server overrides process-inform]
user@host# set pool pool-name
```
  - For DHCPv6 local server:
 

```
[edit system services dhcp-local-server dhcpv6 overrides process-inform]
user@host# set pool pool-name
```

## Specifying the Delegated Address Pool for IPv6 Prefix Assignment

You can explicitly specify a delegated address pool:

- On routers—Subscriber management uses the pool to assign IPv6 prefixes for subscribers. You can specify the delegated address pool globally, for a specific group of interfaces, or for a particular interface.
- On switches—DHCP management uses the pool to assign IPv6 prefixes for DHCP clients. You can specify the delegated address pool globally, for a specific group of interfaces, or for a particular interface.

**NOTE:** You can also use by Juniper Networks VSA 26-161 to specify the delegated address pool. The VSA-specified value always takes precedence over the **delegated-address** statement.

To configure the delegated address pool for DHCPv6 local server:

1. Specify that you want to configure override options.

```
[edit system services dhcp-local-server dhcpv6]
user@host# edit overrides
```

2. Configure the delegated address pool.

```
[edit system services dhcp-local-server dhcpv6 overrides]
user@host# set delegated-pool paris-cable-12
```

## Enabling DHCPv6 Rapid Commit Support

You can configure the extended DHCPv6 local server to support the DHCPv6 Rapid Commit option (DHCPv6 option 14). When rapid commit is enabled on the extended DHCPv6 local server, the server recognizes the Rapid Commit option in Solicit messages sent from the DHCPv6 client. (DHCPv6 clients are configured separately to include the DHCPv6 Rapid Commit option in the Solicit messages.) The server and client then use a two-message exchange (Solicit and Reply) to configure clients, rather than the default four-method exchange (Solicit, Advertise, Request, and Reply). The two-message exchange provides faster client configuration, and is beneficial in environments in which networks are under a heavy load.

You can configure the DHCPv6 local server to support the Rapid Commit option globally, for a specific group, or for a specific interface. By default, rapid commit support is disabled on the DHCPv6 local server.

To configure the DHCPv6 local server to support the DHCPv6 Rapid Commit option:

1. Specify that you want to configure the **overrides** options.

```
[edit system services dhcp-local-server dhcpv6]
user@host# edit overrides
```

2. Enable rapid commit support.

```
[edit system services dhcp-local-server dhcpv6 overrides]
user@host# set rapid-commit
```

## Deleting DHCP Local Server and DHCP Relay Override Settings

You can delete override settings for DHCP local server and DHCP relay globally, for a named group, or for a specific interface within a named group. You can delete a specific override setting or all overrides.

- To delete a specific DHCP override setting at a particular hierarchy level, include the **overrides** statement with the appropriate subordinate statements. For example, to delete the DHCP local server override **interface-client-limit** setting for a group named **marin20**:

```
[edit system services dhcp-local-server]
user@host# delete group marin20 overrides interface-client-limit
```

- To delete all DHCP override settings at a hierarchy level, include the **overrides** statement without any subordinate statements. For example, to delete all DHCP relay overrides for interface **fxp0.0**, which is in group **marin20**:

```
[edit forwarding-options dhcp-relay]
user@host# delete group marin20 interface fxp0.0 overrides
```

## Configuring Dynamic Client Reconfiguration of Extended Local Server Clients

The DHCP local server can initiate reconfiguration of its clients to avoid extended outages because of server configuration changes. You can enable dynamic reconfiguration for all DHCP clients or only the DHCP clients serviced by a specified group of interfaces, and you can modify the behavior accordingly.

You can modify the behavior of the reconfiguration process by including the appropriate statements at the **[edit system services dhcp-local-server reconfigure]** hierarchy level for all DHCPv4 clients, and at the **[edit system services dhcp-local-server dhcpv6 reconfigure]** hierarchy level for all DHCPv6 clients. To override this global configuration for only the DHCP clients serviced by a specified group of interfaces, you can include the statements with different values at the **[edit system services dhcp-local-server group *group-name* reconfigure]** hierarchy level for DHCPv4 clients, and at the **[edit system services dhcp-local-server dhcpv6 group *group-name* reconfigure]** hierarchy level for DHCPv6 clients.

To configure dynamic reconfiguration of DHCP clients:

1. Enable dynamic reconfiguration with default values for all clients.

For DHCPv4:

```
[edit system services dhcp-local-server]
user@host# set reconfigure
```

For DHCPv6:

```
[edit system services dhcp-local-server dhcpv6]
user@host# set reconfigure
```

2. (Optional) Enable dynamic reconfiguration for only the DHCP clients serviced by a group of interfaces.

For DHCPv4:

```
[edit system services dhcp-local-server group-name]
user@host# set reconfigure
```

For DHCPv6:

```
[edit system services dhcp-local-server dhcpv6 group group-name]
user@host# set reconfigure
```

3. (Optional) Configure an authentication token. The DHCP local server then includes this token inside the authentication option when it sends forcerenew or reconfigure messages. If the service provider has previously configured the DHCP client with this token, then the client can compare that token against the newly received token, and reject the message if the tokens do not match. This functionality corresponds to RFC 3118, *Authentication for DHCP Messages*, section 4.

- a. For all clients:

For DHCPv4:

```
[edit system services dhcp-local-server reconfigure]
user@host# set token token-value
```

For DHCPv6:

```
[edit system services dhcp-local-server dhcpv6 reconfigure]
user@host# set token token-value
```

- b. For only the DHCP clients serviced by a group of interfaces:

For DHCPv4:

```
[edit system services dhcp-local-server group-name reconfigure]
user@host# set token token-value
```

For DHCPv6:

```
[edit system services dhcp-local-server dhcpv6 group group-name reconfigure]
user@host# set token token-value
```

4. For the DHCPv6 server only, you can include the **strict** statement. By default, the server accepts solicit messages from clients that do not support server-initiated reconfiguration. Including this statement causes the server to discard solicit messages from nonsupporting clients; consequently the server does not bind these clients.

For all DHCPv6 clients:

```
[edit system services dhcp-local-server dhcpv6 reconfigure]
user@host# set strict
```

For only the DHCPv6 clients serviced by a group of interfaces:

```
[edit system services dhcp-local-server dhcpv6 group group-name reconfigure]
user@host# set strict
```

5. (Optional) Configure how the server attempts reconfiguration.  
See [“Configuring Dynamic Reconfiguration Attempts for DHCP Clients” on page 1432](#).
6. (Optional) Configure the response to a failed reconfiguration.  
See [“Configuring Deletion of the Client When Dynamic Reconfiguration Fails” on page 1433](#).
7. (Optional) Configure the behavior in response to a RADIUS-initiated disconnect.  
See [“Configuring Reconfiguration of the Client on Receipt of RADIUS-Initiated Disconnect” on page 1433](#).
8. (Optional) Configure a token for rudimentary server authentication.  
See [“Configuring a Token for DHCP Local Server Authentication” on page 1434](#).
9. (Optional) Initiate reconfiguration of some or all client bindings.  
See [“Requesting DHCP Local Server to Initiate Reconfiguration of Client Bindings” on page 1435](#).
10. (Optional) Prevent DHCPv6 clients from binding if they do not support reconfigure messages.  
See [“Preventing Binding of Clients That Do Not Support Reconfigure Messages” on page 1434](#).

## Configuring Dynamic Reconfiguration Attempts for DHCP Clients

You can configure how many attempts the local server makes to initiate reconfiguration of the DHCP client by sending `forcerenew` or `reconfigure` messages. You can also specify how long the server waits between attempts. By default, eight attempts are made and the initial interval is two seconds.

Each successive attempt doubles the interval between attempts. For example, if the first value is 2, the first retry is attempted 2 seconds after the first attempt fails. The second retry is attempted 4 seconds after the first retry fails. The third retry is attempted 8 seconds after the second retry fails, and so on. A group configuration takes precedence over a DHCP local server configuration.

(Optional) To configure DHCP local server reconfiguration behavior for all DHCP clients:

1. Specify the number of reconfiguration attempts.

For DHCPv4:

```
[edit system services dhcp-local-server reconfigure]
user@host# set attempts 5
```

For DHCPv6:

```
[edit system services dhcp-local-server dhcpv6 reconfigure]
user@host# set attempts 5
```

2. Specify the interval between reconfiguration attempts.

For DHCPv4:

```
[edit system services dhcp-local-server reconfigure]
user@host# set timeout 8
```

For DHCPv6:

```
[edit system services dhcp-local-server dhcpv6 reconfigure]
user@host# set timeout 8
```

To override the global configuration for a particular group of clients, include the statements at the `[edit system services dhcp-local-server group group-name reconfigure]` hierarchy level or the `[edit system services dhcpv6 dhcp-local-server group group-name reconfigure]` hierarchy level.

### Related Documentation

- [Configuring Dynamic Client Reconfiguration of Extended Local Server Clients on page 1429](#)

## Configuring Deletion of the Client When Dynamic Reconfiguration Fails

You can configure the local server to delete the client when the maximum number of reconfiguration attempts has been made without success. By default, the client's original configuration is restored.

(Optional) To configure the DHCP local server to delete the client when reconfiguration is not successful, for all clients:

- Specify the client deletion.

For DHCPv4:

```
[edit system services dhcp-local-server reconfigure]
user@host# set clear-on-abort
```

For DHCPv6:

```
[edit system services dhcp-local-server dhcpv6 reconfigure]
user@host# set clear-on-abort
```

To override the global configuration for a particular group of clients, include the statement at the `[edit system services dhcp-local-server group group-name reconfigure]` hierarchy level or the `[edit system services dhcpv6 dhcp-local-server group group-name reconfigure]` hierarchy level.

### Related Documentation

- [Configuring Dynamic Client Reconfiguration of Extended Local Server Clients on page 1429](#)
- [clear-on-abort on page 1481](#)

## Configuring Reconfiguration of the Client on Receipt of RADIUS-Initiated Disconnect

You can configure the local server to reconfigure the client when the client receives a RADIUS-initiated disconnect. By default, the client is deleted when a RADIUS-initiated disconnect is received.

(Optional) To configure the DHCP local server to reconfigure the client instead of deleting the client when a RADIUS-initiated disconnect is received, for all clients:

- Specify the RADIUS-initiated disconnect trigger.

For DHCPv4:

```
[edit system services dhcp-local-server reconfigure trigger]
user@host# set radius-disconnect
```

For DHCPv6:

```
[edit system services dhcp-local-server dhcpv6 reconfigure trigger]
user@host# set radius-disconnect
```

To override the global configuration for a particular group of clients, include the statement at the `[edit system services dhcp-local-server group group-name reconfigure trigger]` hierarchy level or the `[edit system services dhcpv6 dhcp-local-server group group-name reconfigure trigger]` hierarchy level.

- Related Documentation**
- [Configuring Dynamic Client Reconfiguration of Extended Local Server Clients on page 1429](#)
  - [radius-disconnect on page 1527](#)
  - [trigger on page 1544](#)

## Configuring a Token for DHCP Local Server Authentication

You can configure the local server to include a constant, unencoded token in the DHCP forcerenew message as part of the authentication option it sends to clients. The client compares the received token with a token already configured on the client. If the tokens do not match, the DHCP client discards the forcerenew message. Use of the token provides rudimentary protection against inadvertently instantiated DHCP servers.

(Optional) To configure the DHCP local server to include a token in the forcerenew message sent to the client, for all clients:

- Specify the token.

For DHCPv4:

```
[edit system services dhcp-local-server reconfigure]
user@host# set token 8ysIU9E32k8r
```

For DHCPv6:

```
[edit system services dhcp-local-server dhcpv6 reconfigure]
user@host# set token 8ysIU9E32k8r
```

To override the global configuration for a particular group of clients, include the statement at the `[edit system services dhcp-local-server group group-name reconfigure]` hierarchy level or the `[edit system services dhcpv6 dhcp-local-server group group-name reconfigure]` hierarchy level.

- Related Documentation**
- [Configuring Dynamic Client Reconfiguration of Extended Local Server Clients on page 1429](#)
  - [token on page 1539](#)

## Preventing Binding of Clients That Do Not Support Reconfigure Messages

The DHCPv6 client and server negotiate the use of reconfigure messages. When the client can accept reconfigure messages from the server, then the client includes the Reconfigure Accept option in both solicit and request messages sent to the server.

By default, the DHCPv6 server accepts solicit messages from clients regardless of whether they support reconfiguration. You can specify that the server require clients to accept reconfigure messages. In this case, the DHCPv6 server includes the Reconfigure Accept option in both advertise and reply messages when reconfiguration is configured for the client interface. Solicit messages from nonsupporting clients are discarded and the clients are not allowed to bind.

(Optional) To configure the DHCPv6 local server to require that all clients accept reconfiguration:

- Specify strict reconfiguration.

```
[edit system services dhcp-local-server dhcpv6 reconfigure]
user@host# set strict
```

To override the global configuration for a particular group of clients, include the statement at the `[edit system services dhcp-local-server dhcpv6 group group-name reconfigure]` hierarchy level.

The `show dhcpv6 server statistics` command displays a count of solicit messages that the server has discarded.

#### Related Documentation

- [Configuring Dynamic Client Reconfiguration of Extended Local Server Clients on page 1429](#)
- [strict on page 1535](#)

## Requesting DHCP Local Server to Initiate Reconfiguration of Client Bindings

You can request that the DHCP local server initiate reconfiguration of all of clients or only specified clients.

To request reconfiguration of all clients:

- Specify the `all` option.

For DHCPv4:

```
user@host> request dhcp server reconfigure all
```

For DHCPv6:

```
user@host> request dhcpv6 server reconfigure all
```

You can use any of the following methods to request reconfiguration of specific clients:

- Specify the IP address of the DHCP client.

For DHCPv4:

```
user@host> request dhcp server reconfigure 192.168.27.3
```

For DHCPv6:

```
user@host> request dhcpv6 server reconfigure 2001:bd8:1111:2222::
```

- Specify the client ID of a DHCPv6 client.

```
user@host> request dhcpv6 server reconfigure
LL_TIME0x1-0x2e159c0-00:10:94:00:00:02
```

- Specify the session ID of a DHCPv6 client.

```
user@host> request dhcpv6 server reconfigure 5
```

- Specify the MAC address of a DHCPv4 client.

```
user@host> request dhcp server reconfigure 12:23:34:45:56:67
```

- Specify an interface; reconfiguration is attempted for all clients on this interface.

```
user@host> request dhcp server reconfigure interface fe-0/0/0.100
```

- Specify a logical system; reconfiguration is attempted for all clients or the specified clients in this logical system.

```
user@host> request dhcp server reconfigure all logical-system ls-bldg5
```

- Specify a routing instance; reconfiguration is attempted for all clients or the specified clients in this routing instance.

```
user@host> request dhcp server reconfigure all routing-instance ri-boston
```

**Related  
Documentation**

- [request dhcp server reconfigure on page 1707](#)

## Configuring Detection of DHCP Local Server Client Connectivity

Liveness detection for DHCP subscriber IP sessions or DHCP client IP sessions utilizes an active liveness detection protocol to institute liveness detection checks for relevant clients. Clients must respond to liveness detection requests within a specified amount of time. If the responses are not received within that time for a given number of consecutive attempts, then the liveness detection check fails and a failure action is implemented.

**NOTE:** You can also configure DHCP liveness detection for DHCP relay.

To configure liveness detection for DHCP local server:

1. Specify that you want to configure liveness detection.

- For DHCP global configuration:

```
[edit system services dhcp-local-server]  
user@host# edit liveness-detection
```

- For DHCP group configuration:

```
[edit system services dhcp-local-server group group-name]  
user@host# edit liveness-detection
```

**NOTE:** Liveness detection is also supported for DHCPv6 configurations. To configure DHCPv6 liveness detection, include the [liveness-detection](#) statement, and any subsequent configuration statements, at the `[edit system services dhcp-local-server dhcpv6]` or `[edit system services dhcp-local-server dhcpv6 group group-name]` hierarchy level.

2. Specify that you want to configure the liveness detection method.

- For DHCP global configuration:

```
[edit system services dhcp-local-server liveness-detection]
user@host# edit method
```

- For DHCP group configuration:

```
[edit system services dhcp-local-server group group-name liveness-detection]
user@host# edit method
```

3. Specify the liveness detection method that you want DHCP to use.

**NOTE:** The only method supported for liveness detection is Bidirectional Forwarding Detection (BFD).

- For DHCP global configuration:

```
[edit system services dhcp-local-server liveness-detection method]
user@host# edit bfd
```

- For DHCP group configuration:

```
[edit system services dhcp-local-server group group-name liveness-detection method]
user@host# edit bfd
```

4. Configure the liveness detection method as desired.

See [“Example: Configuring Group Liveness Detection for DHCP Local Server Clients” on page 1395](#) for an example of how to configure DHCPv4 groups for DHCP local server liveness detection.

5. Configure the action the router takes when a liveness detection failure occurs.

- For DHCP global configuration:

```
[edit system services dhcp-local-server liveness-detection]
user@host# edit failure-action action
```

- For DHCP group configuration:

```
[edit system services dhcp-local-server group group-name liveness-detection]
user@host# edit failure-action action
```

## Configuring DHCP Snooped Packets Forwarding Support for DHCP Local Server

You can configure how DHCP local server handles DHCP snooped packets. Depending on the configuration, DHCP local server either forwards or drops the snooped packets it receives.

Table 139 on page 1438 indicates the action the router takes for DHCP local server snooped packets.

**NOTE:** Configured interfaces are those interfaces that have been configured with the `group` statement in the `[edit system services dhcp-local-server]` hierarchy. Non-configured interfaces are those that are in the logical system/routing instance but have not been configured by the `group` statement.

**Table 139: Actions for DHCP Local Server Snooped Packets**

forward-snooped-clients Configuration	Action on Configured Interfaces	Action on Non-Configured Interfaces
<code>forward-snooped-clients</code> not configured	dropped	dropped
<code>all-interfaces</code>	forwarded	forwarded
<code>configured-interfaces</code>	forwarded	dropped
<code>non-configured-interfaces</code>	dropped	forwarded

To configure DHCP snooped packet forwarding for DHCP local server:

1. Specify that you want to configure DHCP local server.

```
[edit]
user@host# edit system services dhcp-local-server
```

2. Enable DHCP snooped packet forwarding for DHCP local server.

```
[edit system services dhcp-local-server]
user@host# edit forward-snooped-clients
```

3. Specify the interfaces that are supported for snooped packet forwarding.

```
[edit system services dhcp-local-server forward-snooped-clients]
user@host# set (all-interfaces | configured-interfaces | non-configured-interfaces)
```

For example, to configure DHCP local server to forward DHCP snooped packets on only configured interfaces:

```
[edit]
system {
  services {
    dhcp-local-server {
      forward-snooped-clients configured-interfaces;
    }
  }
}
```

- [DHCP Snooping Support on page 1367](#)

## Configuring Passwords for Usernames

You can configure an optional password that the extended DHCP application presents to the external AAA authentication service to authenticate the specified username.

To configure a password that authenticates the username:

1. Specify that you want to configure authentication options.

- For DHCP local server:

```
[edit system services dhcp-local-server]
user@host# edit authentication
```

- For DHCPv6 local server:

```
[edit system services dhcp-local-server dhcpv6]
user@host# edit authentication
```

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay]
user@host# edit authentication
```

2. Configure the password. (DHCP local server, DHCPv6 local server, and DHCP relay agent all support the **password** statement.)

```
[edit system services dhcp-local-server authentication]
user@host# set password myPassword1234
```

### Related Documentation

## Creating Unique Usernames for DHCP Clients

You can configure the extended DHCP application to include additional information in the username that is passed to the external AAA authentication service when the DHCP client logs in. This additional information enables you to construct usernames that uniquely identify subscribers (DHCP clients).

**NOTE:** If you do not include a username in the authentication configuration, the router (or switch) does not perform authentication; however, the IP address is provided by the local pool if it is configured.

When you use the DHCPv6 local server, you must configure authentication and the client username; otherwise client login fails.

The following list describes the optional information that you can include as part of the username:

- **circuit-type**—The circuit type used by the DHCP client, for example **enet**.
- **client-id**—The client identifier option (option 1). (DHCPv6 local server DHCPv6 relay agent only)
- **delimiter**—The delimiter character that separates components that make up the concatenated username. The default delimiter is a period (.). The semicolon (;) is not supported as a delimiter character.
- **domain-name**—The client domain name as a string. The router adds the @ delimiter to the username.
- **interface-name**—The interface name, including the interface device and associated VLAN IDs.
- **logical-system-name**—The name of the logical system, if the receiving interface is in a logical system.
- **mac-address**—The client MAC address, in a string of the format *xxxx.xxxx.xxxx*. (Not supported for DHCPv6 local server)
- **option-60**—The portion of the option 60 payload that follows the length field. (Not supported for DHCPv6 local server)
- **option-82 <circuit-id> <remote-id>**—The specified contents of the option 82 payload. (Not supported for DHCPv6 local server)
  - **circuit-id**—The payload of the Agent Circuit ID suboption.
  - **remote-id**—The payload of the Agent Remote ID suboption.
  - Both **circuit-id** and **remote-id**—The payloads of both suboptions, in the format: **circuit-id[delimiter]remote-id**.
  - Neither **circuit-id** or **remote-id**—The raw payload of the option 82 from the PDU is concatenated to the username.

**NOTE:** For DHCP relay agent, the option 82 value used in creating the username is based on the option 82 value that is encoded in the outgoing (relayed) PDU.

---

- **relay-agent-interface-id**—The Interface-ID option (option 18). (DHCPv6 local server or relay agent)
- **relay-agent-remote-id**—The DHCPv6 Relay Agent Remote-ID option (option 37). (DHCPv6 local server or relay agent)
- **relay-agent-subscriber-id**—(On routers only) The DHCPv6 Relay Agent Subscriber-ID option (option 38). (DHCPv6 local server or relay agent)

- **routing-instance-name**—The name of the routing instance, if the receiving interface is in a routing instance.
- **user-prefix**—A string indicating the user prefix.

The router (switch) creates the unique username by including the specified additional information in the following order, with the fields separated by a delimiter.

For DHCP local server and DHCP relay agent:

```
user-prefix[delimiter]mac-address[delimiter]logical-system-name[delimiter]
routing-instance-name[delimiter]circuit-type[delimiter]interface-name[delimiter]option-82[delimiter]
option-60@domain-name
```

For DHCPv6 local server:

```
user-prefix[delimiter]logical-system-name[delimiter]routing-instance-name[delimiter]
circuit-type[delimiter]interface-name[delimiter]relay-agent-remote-id[delimiter]
relay-agent-subscriber-id[delimiter]relay-agent-interface-id[delimiter]client-id@domain-name
```

To configure a unique username:

1. Specify that you want to configure authentication.

- For DHCP local server:

```
[edit system services dhcp-local-server]
user@host# edit authentication
```

- For DHCPv6 local server:

```
[edit system services dhcp-local-server dhcpv6]
user@host# edit authentication
```

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay]
user@host# edit authentication
```

2. Specify that you want to include optional information in the username. (DHCP local server, DHCPv6 local server, and DHCP relay agent all support the **username-include** statement.)

```
[edit system services dhcp-local-server authentication]
user@host# set username-include
```

3. (Optional) Specify the optional information you want to include in the username.

```
[edit system services dhcp-local-server authentication username-include]
user@host# set username-include circuit-type
user@host# set username-include domain-name isp55.com
user@host# set username-include mac-address
user@host# set username-include user-prefix wallybrown
```

The previous **username-include** configuration produces this unique username:

```
wallybrown.0090.1a01.1234.enet@isp55.com
```

## Configuring How the Extended DHCP Local Server Determines Which Address-Assignment Pool to Use

You can specify the match order in which the extended DHCP local server uses the client data to determine the address-assignment pool that provides the IP address and configuration for a DHCP client. You use the **pool-match-order** statement to specify the match order. If you do not specify the **pool-match-order**, the router (or switch) uses the default **ip-address-first** matching to select the address pool. After DHCP local server determines the address assignment pool to use, the server performs the matching based on the criteria you specified in the pool configuration.

In the default **ip-address-first** matching, the server selects the address-assignment pool to use by matching the IP address in the client DHCP request with the network address of the address-assignment pool. If the client request contains the gateway IP address (giaddr), the local server matches the giaddr to the address-assignment pool's address. If there is no giaddr in the request, then the DHCP local server matches the IP address of the receiving interface to the address of the address-assignment pool.

In **external-authority** matching, the DHCP local server receives the address assignment from an external authority, such as RADIUS or Diameter. If RADIUS is the external authority, the DHCP local server uses the Framed-IPv6-Pool attribute (RADIUS attribute 100) to select the pool. If Diameter is the external authority, the server uses the Diameter counterpart of the Framed-IPv6-Pool attribute to determine the pool.

For IPv4 address-assignment pools, you can optionally configure the extended DHCP local server to match the DHCP relay agent information option (option 82) in the client DHCP packets to a named range in the address-assignment pool used for the client. Named ranges are subsets within the overall address-assignment pool address range, which you can configure when you create the address-assignment pool.

**NOTE:** To use the DHCP local server option 82 matching feature with an IPv4 address-assignment pool, you must ensure that the **option-82** statement is included in the **dhcp-attributes** statement for the address-assignment pool.

---

To configure the matching order the extended DHCP local server uses to determine the address-assignment pool used for a client:

1. Access the **pool-match-order** configuration.

```
[edit system services dhcp-local-server]  
user@host# edit pool-match-order
```

2. Specify the pool matching methods in the order in which the router (switch) performs the methods. You can specify the methods in any order. All methods are optional—the router (switch) uses the **ip-address-first** method by default.

- Configure the router (switch) to use an external addressing authority.

```
[edit system services dhcp-local-server pool-match-order]
user@host# set external-authority
```

- Configure the router (switch) to use the ip-address-first method.

```
[edit system services dhcp-local-server pool-match-order]
user@host# set ip-address-first
```

- (IPv4 address-assignment pools only) Specify the option 82 matching method.

```
[edit system services dhcp-local-server pool-match-order]
user@host# set option-82
```

## Using External AAA Authentication Services with DHCP

The extended DHCP local server, including DHCPv6 local server, and the extended DHCP relay agent, including DHCPv6 relay agent, support the use of external AAA authentication services, such as RADIUS, to authenticate DHCP clients. When the extended DHCP local server or relay agent receives a discover PDU from a client, the extended DHCP application contacts the AAA server to authenticate the DHCP client. The extended DHCP application can obtain client addresses and DHCP configuration options from the external AAA authentication server.

**NOTE:** This section uses the term *extended DHCP application* to refer to both the extended DHCP local server and the extended DHCP relay agent.

The external authentication feature also supports AAA directed logout. If the external AAA service supports a user logout directive, the extended DHCP application honors the logout and responds as though it were requested by a CLI management command. All of the client state information and allocated resources are deleted at logout. The extended DHCP application supports directed logout using the list of configured authentication servers you specify with the **authentication-server** statement at the **[edit access profile profile-name]** hierarchy level.

You can configure either global authentication support or group-specific support.

You must configure the **username-include** statement to enable the use of authentication. The **password** statement is not required and does not cause DHCP to use authentication if the **username-include** statement is not included.

To configure DHCP local server and DHCP relay agent authentication support:

1. Specify that you want to configure authentication options.

- For DHCP local server:

```
[edit system services dhcp-local-server]
user@host# edit authentication
```

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay]
user@host# edit authentication
```

- For DHCPv6 local server:

```
[edit system services dhcp-local-server dhcpv6]
user@host# edit authentication
```

- For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6]
user@host# edit authentication
```

2. (Optional) Configure a password that authenticates the username to the external authentication service.

See [“Configuring Passwords for Usernames” on page 1439](#).

3. (Optional) Configure optional features to create a unique username.

See [“Creating Unique Usernames for DHCP Clients” on page 1439](#).

#### Related Documentation

## Grouping Interfaces with Common DHCP Configurations

You use the group feature to group a set of interfaces and then apply a common DHCP configuration to the named interface group. The extended DHCP local server, DHCPv6 local server, DHCP relay agent, and DHCPv6 relay agent all support interface groups.

The following steps create a DHCP local server group; the steps are similar for the DHCPv6 local server, DHCP relay agent, and DHCPv6 relay agent.

To configure a DHCP local server interface group:

1. Specify that you want to configure DHCP local server.

```
[edit system services]
user@host# edit dhcp-local-server
```

2. Create the group and assign a name.

```
[edit system services dhcp-local-server]
user@host# edit group boston
```

3. Specify the names of one or more interfaces on which the extended DHCP application is enabled. You can repeat the `interface interface-name` statement to specify multiple interfaces within the group, but you cannot use the same interface in more than one group.

```
[edit system services dhcp-local-server group boston]
```

```
user@host# set interface fe-1/0/1.1
user@host# set interface fe-1/0/1.2
```

4. (Optional) You can use the **upto** option to specify a range of interfaces for a group.

```
[edit system services dhcp-local-server group boston]
user@host# set interface fe-1/0/1.3 upto fe-1/0/1.9
```

5. (Optional) You can use the **exclude** option to exclude a specific interface or a specified range of interfaces from the group. For example:

```
[edit system services dhcp-local-server group boston]
user@host# set interface fe-1/0/1.1 upto fe-1/0/1.102
user@host# set interface fe-1/0/1.6 exclude
user@host# set interface fe-1/0/1.70 upto fe-1/0/1.80 exclude
```

- [Configuring Group-Specific DHCP Relay Options on page 1384](#)
- [Guidelines for Configuring Interface Ranges for Groups of DHCP Interfaces on page 1422](#)

## Guidelines for Configuring Interface Ranges for Groups of DHCP Interfaces

This topic describes guidelines to consider when configuring interface ranges for named interface groups for DHCP local server and DHCP relay. The guidelines refer to the following configuration statement:

```
user@host# set interface interface-name upto upto-interface-name
```

- The start subunit, **interface *interface-name***, serves as the key for the stanza. The remaining configuration settings are considered attributes.
- If the subunit is not included, an implicit **.0** subunit is enforced. The implicit subunit is applied to all interfaces when autoconfiguration is enabled. For example, **interface ge-2/2/2** is treated as **interface ge-2/2/2.0**.
- Ranged entries contain the **upto** option, and the configuration applies to all interfaces within the specified range. The start of a ranged entry must be less than the end of the range. Discrete entries apply to a single interface, except in the case of autoconfiguration, in which a **0** (zero) subunit acts as a wildcard.
- Interface stanzas defined within the same router or switch context are dependent and can constrain each other—both DHCP local server and DHCP relay are considered. Interface stanzas defined across different router (switch) contexts are independent and do not constrain one another.

- Each interface stanza, whether discrete or ranged, has a unique start subunit across a given router context. For example, the following configuration is not allowed within the same group because **ge-1/0/0.10** is the start subunit for both.

```
interface ge-1/0/0.10 upto ge-1/0/0.30
interface ge-1/0/0.10
```

- Two groups cannot share interface space. For example, the following configuration is not allowed because the three stanzas share the same space and interfere with one another—interface **ge-1/0/0.26** is common to all three.

```
dhcp-relay group diamond interface ge-1/0/0.10 upto ge-1/0/0.30
dhcp-local-server group ruby interface ge-1/0/0.26
dhcp-relay group sapphire interface ge-1/0/0.25 upto ge-1/0/0.35
```

- Two ranges cannot overlap, either within a group or across groups. Overlapping occurs when two interface ranges share common subunit space but neither range is a proper subset of the other. The following ranges overlap:

```
interface ge-1/0/0.10 upto ge-1/0/0.30
interface ge-1/0/0.20 upto ge-1/0/0.40
```

- A range can contain multiple nested ranges. A nested range is a proper subset of another range. When ranges are nested, the smallest matching range applies.

In the following example, the three ranges nest properly:

```
interface ge-1/0/0.10 upto ge-1/0/0.30
interface ge-1/0/0.12 upto ge-1/0/0.15 exclude
interface ge-1/0/0.25 upto ge-1/0/0.29 exclude
```

- Discrete interfaces take precedence over ranges. In the following example, interface **ge-1/0/0.20** takes precedence and enforces an interface client limit of 5.

```
interface ge-1/0/0.10 upto ge-1/0/0.30
interface ge-1/0/0.15 upto ge-1/0/0.25 exclude
interface ge-1/0/0.20 overrides interface-client-limit 5
```

## Overriding the Default DHCP Relay Configuration Settings

You can override the default DHCP and DHCPv6 relay agent configuration settings at the global level, for a named group of interfaces, or for a specific interface within a named group.

- To override global default DHCP relay agent configuration options, include the **overrides** statement and its subordinate statements at the **[edit forwarding-options dhcp-relay]** hierarchy level.
- To override DHCP relay configuration options for a named group of interfaces, include the statements at the **[edit forwarding-options dhcp-relay group group-name]** hierarchy level.

- To override DHCP relay configuration options for a specific interface within a named group of interfaces, include the statements at the **[edit forwarding-options dhcp-relay group *group-name* interface]** hierarchy level.
- To configure overrides for DHCPv6 relay, use the supported statements at the **[edit forwarding-options dhcp-relay dhcpv6]** hierarchy level.

To override default DHCP relay agent configuration settings:

1. Specify that you want to configure override options.

Global override:

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

Group-level override:

```
[edit forwarding-options dhcp-relay]
user@host# edit group boston overrides
```

Per-interface override:

```
[edit forwarding-options dhcp-relay]
user@host# edit group boston interface fe-1/0/1.2 overrides
```

2. (DHCPv4 only) Enable DHCP relay proxy mode.  
See [“Enabling DHCP Relay Proxy Mode” on page 1470](#).
3. (DHCPv4 only) Overwrite the giaddr in DHCP packets that the DHCP relay agent forwards.  
See [“Changing the Gateway IP Address \(giaddr\) Field to the giaddr of the DHCP Relay Agent” on page 1449](#).
4. (DHCPv4 only) Replace the IP source address in DHCP relay request and release packets with the gateway IP address (giaddr).  
See [“Replacing the DHCP Relay Request and Release Packet Source Address” on page 1450](#).
5. (DHCPv4 only) Override the DHCP relay agent information option (option 82) in DHCP packets.  
See [“Overriding Option 82 Information” on page 1450](#).
6. (DHCPv4 only) Override the setting of the broadcast bit in DHCP request packets and use the Layer 2 unicast transmission method.  
See [“Using Layer 2 Unicast Transmission for DHCP Packets” on page 1451](#).
7. (DHCPv4 only) Trust DHCP client packets that have a giaddr of 0 and that contain option 82 information.  
See [“Trusting Option 82 Information” on page 1451](#).
8. (DHCPv4 and DHCPv6) Override the maximum number of DHCP clients allowed per interface.  
See [“Specifying the Maximum Number of DHCP Clients Per Interface” on page 1424](#).

9. (DHCPv4 only) Configure client auto logout.  
See [“DHCP Auto Logout Overview” on page 1368](#).
10. (DHCPv4 and DHCPv6) Enable or disable support for DHCP snooped clients on interfaces.  
See [“Enabling and Disabling DHCP Snooped Packets Support for DHCP Relay Agent” on page 1455](#).
11. (DHCPv4 and DHCPv6) Delay authentication of subscribers until the DHCP client sends a Request packet.  
See the *delay-authentication* statement.
12. (DHCPv4 and DHCPv6) Send release messages to the DHCP server when clients are deleted.  
See [“Sending Release Messages When Clients Are Deleted” on page 1462](#).
13. (DHCPv4 only) Disable the DHCP relay agent on specific interfaces.  
See [“Disabling DHCP Relay” on page 1474](#).
14. (DHCPv4 and DHCPv6) Disable automatic binding of stray DHCP requests.  
See [“Disabling Automatic Binding of Stray DHCP Requests” on page 1463](#).

  - [Deleting DHCP Local Server and DHCP Relay Override Settings on page 1429](#)

## Changing the Gateway IP Address (giaddr) Field to the giaddr of the DHCP Relay Agent

You can configure the DHCP relay agent to change the gateway IP address (giaddr) field in packets that it forwards between a DHCP client and a DHCP server.

To overwrite the giaddr of every DHCP packet with the giaddr of the DHCP relay agent before forwarding the packet to the DHCP server:

1. Specify that you want to configure override options.  

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```
2. Specify that the giaddr of DHCP packets is overwritten.  

```
[edit forwarding-options dhcp-relay overrides]
user@host# set always-write-giaddr
```

- Related Documentation**
- [Extended DHCP Relay Agent Overview on page 1379](#)
  - [Overriding the Default DHCP Relay Configuration Settings on page 1447](#)

## Replacing the DHCP Relay Request and Release Packet Source Address

You can configure the DHCP relay agent to replace request and release packets with the gateway IP address (giaddr) before forwarding the packet to the DHCP server.

To replace the source address with giaddr:

1. Specify that you want to configure override options.

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

2. Specify that you want to replace the IP source address in DHCP relay request and release packets with the gateway IP address (giaddr).

```
[edit forwarding-options dhcp-relay overrides]
user@host# set replace-ip-source-with giaddr
```

### Related Documentation

- [Extended DHCP Relay Agent Overview on page 1379](#)
- [Overriding the Default DHCP Relay Configuration Settings on page 1447](#)

## Overriding Option 82 Information

You can configure the DHCP relay agent to add or remove the DHCP relay agent information option (option 82) in DHCP packets.

This feature causes the DHCP relay agent to perform one of the following actions, depending on the configuration:

- If the DHCP relay agent is configured to add option 82 information to DHCP packets, it clears the existing option 82 values from the DHCP packets and inserts the new values before forwarding the packets to the DHCP server.
- If the DHCP relay agent is not configured to add option 82 information to DHCP packets, it clears the existing option 82 values from the packets, but does not add any new values before forwarding the packets to the DHCP server.

To override the default option 82 information in DHCP packets destined for a DHCP server:

1. Specify that you want to configure override options.

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

2. Specify that the option 82 information in DHCP packets is overwritten.

```
[edit forwarding-options dhcp-relay overrides]
user@host# set always-write-option-82
```

### Related Documentation

- [Extended DHCP Relay Agent Overview on page 1379](#)
- [Overriding the Default DHCP Relay Configuration Settings on page 1447](#)

## Using Layer 2 Unicast Transmission for DHCP Packets

You can configure the DHCP relay agent to override the setting of the broadcast bit in DHCP request packets. DHCP relay agent then instead uses the Layer 2 unicast transmission method to send DHCP Offer reply packets and DHCP ACK reply packets from the DHCP server to DHCP clients during the discovery process.

To override the default setting of the broadcast bit in DHCP request packets:

1. Specify that you want to configure override options.

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

2. Specify that the DHCP relay agent uses the Layer 2 unicast transmission method.

```
[edit forwarding-options dhcp-relay overrides]
user@host# set layer2-unicast-replies
```

### Related Documentation

- [Extended DHCP Relay Agent Overview on page 1379](#)
- [Overriding the Default DHCP Relay Configuration Settings on page 1447](#)

## Trusting Option 82 Information

By default, the DHCP relay agent treats client packets with a giaddr of 0 (zero) and option 82 information as if the packets originated at an untrusted source, and drops them without further processing. You can override this behavior and specify that the DHCP relay agent process DHCP client packets that have a giaddr of 0 (zero) and contain option 82 information.

To configure DHCP relay agent to trust option 82 information:

1. Specify that you want to configure override options.

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

2. Specify that the DHCP relay agent process DHCP client packets with a giaddr of 0 and that contain option 82 information.

```
[edit forwarding-options dhcp-relay overrides]
user@host# set trust-option-82
```

### Related Documentation

- [Extended DHCP Relay Agent Overview on page 1379](#)
- [Overriding the Default DHCP Relay Configuration Settings on page 1447](#)

## Specifying the Maximum Number of DHCP Clients Per Interface

By default, there is no limit to the number of DHCP local server or DHCP relay clients allowed on an interface. However, you can override the default setting and specify the maximum number of clients allowed per interface, in the range 1 through 500,000. When the number of clients on the interface reaches the specified limit, no additional DHCP

Discover PDUs or DHCPv6 Solicit PDUs are accepted. When the number of clients subsequently drops below the limit, new clients are again accepted.

**NOTE:** The maximum number of DHCP (and DHCPv6) local server clients or DHCP (and DHCPv6) relay clients can also be specified by Juniper Networks VSA 26-143 during client login. The VSA-specified value always takes precedence if the `interface-client-limit` statement specifies a different number.

If the VSA-specified value differs with each client login, DHCP uses the largest limit set by the VSA until there are no clients on the interface.

To configure the maximum number of DHCP clients allowed per interface:

1. Specify that you want to configure override options.

- For DHCP local server:

```
[edit system services dhcp-local-server]
user@host# edit overrides
```

- For DHCPv6 local server:

```
[edit system services dhcp-local-server dhcpv6]
user@host# edit overrides
```

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

- For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6]
user@host# edit overrides
```

2. Configure the maximum number of clients allowed per interface. (DHCP local server, DHCPv6 local server, DHCP relay agent and DHCPv6 relay agent all support the `interface-client-limit` statement.)

```
[edit system services dhcp-local-server overrides]
user@host# set interface-client-limit number
```

**NOTE:** For DHCP local server and DHCP relay agent, you can use either the `interface-client-limit` statement or the `client-discover-match incoming-interface` statement to set a limit of one client per interface. The `interface-client-limit` statement with a value of 1 retains the existing client and rejects any new client connections. The `client-discover-match incoming-interface` statement deletes the existing client and allows a new client to connect.

#### Related Documentation

- [Extended DHCP Relay Agent Overview on page 1379](#)

## Automatically Logging Out DHCP Clients

You can configure the extended DHCP local server and extended DHCP relay to automatically log out DHCP clients. Auto logout immediately releases an existing client when DHCP receives a discover packet from a client whose identity matches an existing client. DHCP then releases the existing client IP address without waiting for the normal lease expiration.

**NOTE:** When the existing client is released, the new client undergoes the normal authentication process. The new client might not receive the same IP address as the original client.

To configure DHCP client auto logout:

1. Specify that you want to configure override options.
  - For DHCP local server:
 

```
[edit system services dhcp-local-server]
user@host# edit overrides
```
  - For DHCP relay agent:
 

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```
2. Enable auto logout and specify the secondary identification method you want to use when the primary identification method is unsuccessful.
  - For example, to configure DHCP local server to use the incoming interface method:
 

```
[edit system services dhcp-local-server overrides]
user@host# set client-discover-match incoming-interface
```
  - For example, to configure DHCP relay agent to use the option 60 and option 82 method:
 

```
[edit forwarding-options dhcp-relay overrides]
user@host# set client-discover-match option60-and-option82
```

**NOTE:** If you change the auto logout configuration, existing clients continue to use the auto logout setting that was configured when they logged in. New clients use the new setting.

## How DHCP Relay Agent Uses Option 82 for Auto Logout

Table 140 on page 1454 indicates how the DHCP relay agent determines the option 82 value used for the client auto logout feature. Depending on the configuration settings, DHCP relay agent takes the action indicated in the right column.

**Table 140: DHCP Relay Agent Option 82 Value for Auto Logout**

DHCP Relay Agent Configuration Settings				gladdr in non-snooped packet	Action Taken
DHCP Relay Configured with Option 82	Discover Packet Contains Option 82	Override "trust-option-82"	Override "always-write-option-82"		
No	No	—	—	—	No secondary search performed
No	Yes	Yes	—	—	Use option 82 from packet
No	Yes	No	—	Zero	Drop packet
No	Yes	No	—	Non-zero	Use option 82 from packet
Yes	No	—	—	—	Use configured option 82
Yes	Yes	No	—	Zero	Drop packet
Yes	Yes	No	No	Non-zero	Use option 82 from packet
Yes	Yes	No	Yes	Non-zero	Overwrite the configured option 82
Yes	Yes	Yes	No	—	Use option 82 from packet
Yes	Yes	Yes	Yes	—	Overwrite the configured option 82

## Configuring DHCP Snooping for DHCP Relay Agent

DHCP relay agent uses a two-part configuration to determine how to handle DHCP snooped packets. First, you enable or disable snooping support for DHCP relay agent and, optionally, override the default snooping configuration. Then you configure the forwarding action for snooped clients, which specifies whether DHCP relay agent forwards or drops snooped traffic.

To configure DHCP snooping for DHCP relay agent:

1. (DHCPv4 and DHCPv6) Enable or disable DHCP snooping. You can configure DHCP snooping globally, for a named group of interfaces, or for a specific interface.  
See [“Enabling and Disabling DHCP Snooped Packets Support for DHCP Relay Agent” on page 1455](#).
2. (DHCPv4 only) Configure snooped packets forwarding support.  
See [“Configuring DHCP Snooped Packets Forwarding Support for DHCP Relay Agent” on page 1460](#).

- Related Documentation**
- [DHCP Snooping Support on page 1367](#)
  - [Enabling and Disabling DHCP Snooped Packets Support for DHCP Relay Agent on page 1455](#)
  - [Configuring DHCP Snooped Packets Forwarding Support for DHCP Relay Agent on page 1460](#)

## Enabling and Disabling DHCP Snooped Packets Support for DHCP Relay Agent

DHCP relay agent uses a two-part configuration to determine how to handle DHCP snooped packets. This topic describes the first procedure, in which you enable or disable snooping support for DHCP relay agent and, optionally, override the default snooping configuration.

The second procedure, which applies only to DHCPv4 relay agent, is described in [“Configuring DHCP Snooped Packets Forwarding Support for DHCP Relay Agent” on page 1460](#), and configures the forwarding action for snooped clients, which specifies whether DHCP relay agent forwards or drops snooped traffic.

You can enable or disable DHCP globally for DHCP relay, for a group of interfaces, or for a specific interface in a group.

By default, DHCP snooping is disabled for DHCP relay. To enable or disable DHCP snooping support globally:

1. Specify that you want to configure DHCP relay agent.

- For DHCP relay agent:

```
[edit]
user@host# edit forwarding-options dhcp-relay
```

- For DHCPv6 relay agent:

```
[edit]
user@host# edit forwarding-options dhcp-relay dhcpv6
```

2. Specify that you want to override the default configuration.

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

- For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6]
user@host# edit overrides
```

3. Enable or disable DHCP snooping support.

- To enable DHCP snooping:

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay overrides]
user@host# set allow-snooped-clients
```

- For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6 overrides]
user@host# set allow-snooped-clients
```

- To disable DHCP snooping:

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay overrides]
user@host# set no-allow-snooped-clients
```

- For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6 overrides]
user@host# set no-allow-snooped-clients
```

For example, to enable global DHCP snooping support :

```
forwarding-options {
  dhcp-relay {
    overrides {
      allow-snooped-clients;
    }
  }
}
```

To enable or disable DHCP snooping support for a group of interfaces:

1. Specify that you want to configure DHCP relay agent.

- For DHCP relay agent:

```
[edit]
user@host# edit forwarding-options dhcp-relay
```

- For DHCPv6 relay agent:

```
[edit]
user@host# edit forwarding-options dhcp-relay dhcpv6
```

2. Specify the named group.

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay]
user@host# edit group group-name
```

- For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6]
user@host# edit group group-name
```

3. Specify that you want to override the default configuration.

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay group group-name]
user@host# edit overrides
```

- For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6 group group-name]
user@host# edit overrides
```

4. Enable or disable DHCP snooping support.

- To enable DHCP snooping:

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay group group-name overrides]
user@host# set allow-snooped-clients
```

- For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6 group group-name overrides]
user@host# set allow-snooped-clients
```

- To disable DHCP snooping:

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay group group-name overrides]
user@host# set no-allow-snooped-clients
```

- For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6 group group-name overrides]
user@host# set no-allow-snooped-clients
```

For example, to enable DHCP snooping support on all interfaces in group **boston**:

```
forwarding-options {  
  dhcp-relay {  
    group boston {  
      overrides {  
        allow-snooped-clients;  
      }  
    }  
  }  
}
```

To enable or disable DHCP snooping support on a specific interface:

1. Specify that you want to configure DHCP relay agent.

- For DHCP relay agent:

```
[edit]  
user@host# edit forwarding-options dhcp-relay
```

- For DHCPv6 relay agent:

```
[edit]  
user@host# edit forwarding-options dhcp-relay dhcpv6
```

2. Specify the named group containing the interface.

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay]  
user@host# edit group group-name
```

- For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6]  
user@host# edit group group-name
```

3. Specify the interface for which you want to configure DHCP snooping.

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay group group-name]  
user@host# edit interface interface-name
```

- For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6 group group-name]  
user@host# edit interface interface-name
```

4. Specify that you want to override the default configuration on the interface.

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay group group-name interface interface-name]  
user@host# edit overrides
```

- For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6 group group-name interface  
  interface-name]  
user@host# edit overrides
```

5. Enable or disable DHCP snooping support.

- To enable DHCP snooping:
  - For DHCP relay agent:
 

```
[edit forwarding-options dhcp-relay group group-name interface interface-name
overrides]
user@host# set allow-snooped-clients
```
  - For DHCPv6 relay agent:
 

```
[edit forwarding-options dhcp-relay dhcpv6 group group-name interface
interface-name overrides]
user@host# set allow-snooped-clients
```
- To disable DHCP snooping:
  - For DHCP relay agent:
 

```
[edit forwarding-options dhcp-relay group group-name interface interface-name
overrides]
user@host# set no-allow-snooped-clients
```
  - For DHCPv6 relay agent:
 

```
[edit forwarding-options dhcp-relay dhcpv6 group group-name interface
interface-name overrides]
user@host# set no-allow-snooped-clients
```

For example, to disable DHCP snooping support on interface **ge-2/1/8.0** in group **boston**:

```
forwarding-options {
  dhcp-relay {
    group boston {
      interface ge-2/1/8.0 {
        overrides {
          no-allow-snooped-clients;
        }
      }
    }
  }
}
```

To enable DHCPv6 snooping support on interface **ge-3/2/1.1** in group **sunnyvale**:

```
forwarding-options {
  dhcp-relay {
    dhcpv6 {
      group sunnyvale {
        interface ge-3/2/1.1 {
          overrides {
            allow-snooped-clients;
          }
        }
      }
    }
  }
}
```

- Related Documentation**
- [DHCP Snooping Support on page 1367](#)
  - [Configuring DHCP Snooped Packets Forwarding Support for DHCP Relay Agent on page 1460](#)
  - [Example: Configuring DHCP Snooping Support for DHCP Relay Agent on page 1403](#)
  - [Overriding the Default DHCP Relay Configuration Settings on page 1447](#)

## Configuring DHCP Snooped Packets Forwarding Support for DHCP Relay Agent

You can configure how DHCP relay agent handles DHCP snooped packets. Depending on the configuration, DHCP relay agent either forwards or drops the snooped packets it receives.

DHCP relay uses a two-part configuration to determine how to handle DHCP snooped packets. This topic describes how you use the **forward-snooped-clients** statement to manage whether DHCP relay agent forwards or drops snooped packets, depending on the type of interface on which the packets are snooped. In the other part of the DHCP relay agent snooping configuration, which is described in “[Enabling and Disabling DHCP Snooped Packets Support for DHCP Relay Agent](#)” on page 1455, you enable or disable the DHCP relay snooping feature.

[Table 141 on page 1460](#) shows the action the router or switch takes on snooped packets when DHCP snooping is enabled by the **allow-snooped-clients** statement.

[Table 142 on page 1461](#) shows the action the router (or switch) takes on snooped packets when DHCP snooping is disabled by the **no-allow-snooped-clients** statement.

The router or switch also uses the configuration of the DHCP relay agent forwarding support to determine how to handle snooped BOOTREPLY packets. [Table 143 on page 1461](#) shows the action the router (or switch) takes for the snooped BOOTREPLY packets.

**NOTE:** Configured interfaces have been configured with the **group** statement in the **[edit forwarding-options dhcp-relay]** hierarchy. Non-configured interfaces are in the logical system/routing instance but have not been configured by the **group** statement.

**Table 141: Actions for DHCP Relay Agent Snooped Packets When DHCP Snooping Is Enabled**

forward-snooped-clients Configuration	Action on Configured Interfaces	Action on Non-Configured Interfaces
<b>forward-snooped-clients</b> not configured	snooped packets result in subscriber (DHCP client) creation	dropped
<b>all-interfaces</b>	forwarded	forwarded
<b>configured-interfaces</b>	forwarded	dropped

Table 141: Actions for DHCP Relay Agent Snooped Packets When DHCP Snooping Is Enabled (*continued*)

forward-snooped-clients Configuration	Action on Configured Interfaces	Action on Non-Configured Interfaces
non-configured-interfaces	snooped packets result in subscriber (DHCP client) creation	forwarded

Table 142: Actions for DHCP Relay Agent Snooped Packets When DHCP Snooping Is Disabled

forward-snooped-clients Configuration	Action on Configured Interfaces	Action on Non-Configured Interfaces
forward-snooped-clients not configured	dropped	dropped
all-interfaces	dropped	forwarded
configured-interfaces	dropped	dropped
non-configured-interfaces	dropped	forwarded

Table 143: Actions for Snooped BOOTREPLY Packets

forward-snooped-clients Configuration	Action
forward-snooped-clients not configured	snooped <b>BOOTREPLY</b> packets dropped if client is not found
forward-snooped-clients all configurations	snooped <b>BOOTREPLY</b> packets forwarded if client is not found

To configure DHCP snooped packet forwarding and BOOTREPLY snooped packet forwarding for DHCP relay agent:

- Specify that you want to configure DHCP relay agent.  

```
[edit]
user@host# edit forwarding-options dhcp-relay
```
- Enable DHCP snooped packet forwarding.  

```
[edit forwarding-options dhcp-relay]
user@host# edit forward-snooped-clients
```
- Specify the interfaces that are supported for snooped packet forwarding.  

```
[edit forwarding-options dhcp-relay forward-snooped-clients]
user@host# set (all-interfaces | configured-interfaces | non-configured-interfaces)
```

For example, to configure DHCP relay agent to forward DHCP snooped packets on only configured interfaces:

```
[edit]
forwarding-options {
  dhcp-relay {
    forward-snooped-clients configured-interfaces;
  }
}
```

- Related Documentation**

  - [Enabling and Disabling DHCP Snooped Packets Support for DHCP Relay Agent on page 1455](#)

## Sending Release Messages When Clients Are Deleted

By default, when DHCP relay and relay proxy delete a client, they do not send a release message to the DHCP server. You can override the default behavior and configure DHCP relay and relay proxy to send a release message whenever they delete a client. The release message sent by DHCP relay and relay proxy includes option 82 information.

**NOTE:** You must include the `send-release-on-delete` statement to configure DHCP relay and relay proxy to send the release message when the `client-discover-match` statement is included.

You can use the `[edit forwarding-options dhcp-relay dhcpv6]` hierarchy level to override the default behavior for DHCPv6 relay agent.

To send a release message:

1. Specify that you want to configure override options.

- For DHCP relay agent:

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

- For DHCPv6 relay agent:

```
[edit forwarding-options dhcp-relay dhcpv6]
user@host# edit overrides
```

2. Specify that you want DHCP relay and relay proxy (or DHCPv6 relay agent) to send a release message when clients are deleted.

```
[edit forwarding-options dhcp-relay overrides]
user@host# set send-release-on-delete
```

- Related Documentation**

  - [Overriding the Default DHCP Relay Configuration Settings on page 1447](#)

## Disabling Automatic Binding of Stray DHCP Requests

DHCP requests that are received but have no entry in the database are known as stray requests. By default, DHCP relay, DHCP relay proxy, and DHCPv6 relay agent attempt to bind the requesting client by creating a database entry and forwarding the request to the DHCP server. If the server responds with an ACK, the client is bound and the ACK is forwarded to the client. If the server responds with a NAK, the database entry is deleted and the NAK is forwarded to the client. This behavior occurs regardless of whether authentication is configured.

You can override the default configuration at the global level, for a named group of interfaces, or for a specific interface within a named group. Overriding the default causes DHCP relay, DHCP relay proxy, and DHCPv6 relay agent to drop all stray requests instead of attempting to bind the clients.

**NOTE:** Automatic binding of stray requests is enabled by default.

- To disable automatic binding behavior, include the **no-bind-on-request** statement when you configure DHCP overrides at the global, group, or interface level.

```
[edit forwarding-options dhcp-relay overrides]
user@host# set no-bind-on-request
```

- To override the default behavior for DHCPv6 relay agent, configure the override at the **[edit forwarding-options dhcp-relay dhcpv6]** hierarchy level.

```
[edit forwarding-options dhcp-relay dhcpv6 overrides]
user@host# set no-bind-on-request
```

The following two examples show a configuration that disables automatic binding of stray requests for a group of interfaces and a configuration that disables automatic binding on a specific interface.

To disable automatic binding of stray requests on a group of interfaces:

- Specify the named group.

```
[edit forwarding-options dhcp-relay]
user@host# edit group boston
```

- Specify that you want to configure overrides.

```
[edit forwarding-options dhcp-relay group boston]
user@host# edit overrides
```

- Disable automatic binding for the group.

```
[edit forwarding-options dhcp-relay group boston overrides]
user@host# set no-bind-on-request
```

To disable automatic binding of stray requests on a specific interface:

- Specify the named group of which the interface is a member.

```
[edit forwarding-options dhcp-relay]
```

```
user@host# edit group boston
```

2. Specify the interface on which you want to disable automatic binding.

```
[edit forwarding-options dhcp-relay group boston]
```

```
user@host# edit interface fe-1/0/1.2
```

3. Specify that you want to configure overrides.

```
[edit forwarding-options dhcp-relay group boston interface fe-1/0/1.2]
```

```
user@host# edit overrides
```

4. Disable automatic binding on the interface.

```
[edit forwarding-options dhcp-relay group boston interface fe-1/0/1.2 overrides]
```

```
user@host# set no-bind-on-request
```

## Using DHCP Relay Agent Option 82 Information

Subscriber management enables you to configure DHCP relay agent to include additional option 82 information in the DHCP packets that the relay receives from clients and forwards to a DHCP server. The DHCP server uses the additional information to determine the IP address to assign to the client. The server might also use the information for other purposes; for example, to determine which services to grant the client, or to provide additional security against threats such as address spoofing. The DHCP server sends its reply back to the DHCP relay agent, and the agent removes the option 82 information from the message and forwards the packet to the client.

To configure support for the DHCP relay agent information option 82, you use the **relay-option-82** statement. You can configure the DHCP relay agent to include the following suboptions in the packet the relay sends to the DHCP server:

- Agent Circuit ID (suboption 1)—An ASCII string that identifies the interface on which the client DHCP packet is received.
- Agent Remote ID (suboption 2)—An ASCII string assigned by the DHCP relay agent that securely identifies the client.

You can configure the option 82 support globally or for a named group of interfaces.

To restore the default behavior, in which option 82 information is not inserted into DHCP packets, you use the **delete relay-option-82** statement.

**NOTE:** The DHCPv6 relay agent provides similar Agent Circuit ID and Agent Remote ID support for DHCPv6 clients. For DHCPv6, subscriber management uses DHCPv6 option 18 to include the circuit ID in the packets that the relay sends to a DHCPv6 server, and option 37 to include the remote ID in the packets. See *DHCPv6 Relay Agent Options*.)

The following sections describe the option 82 operations you can configure:

- [Configuring Option 82 Information on page 1465](#)
- [Including a Prefix in DHCP Options on page 1466](#)
- [Including a Textual Description in DHCP Options on page 1468](#)

### Configuring Option 82 Information

You use the **relay-option-82** statement to configure DHCP relay agent to insert option 82 information in DHCP packets that the relay receives from clients and forwards to a DHCP server. When you configure option 82, you also include at least one of the suboption statements to specify the type of information you want to include in the DHCP packets. Use the **circuit-id** statement to include the Agent Circuit ID (suboption 1) in the packets, or the **remote-id** statement to include the Agent Remote ID (suboption 2).

You can optionally configure DHCP relay agent to include a prefix or the interface description as part of the suboption information. If you specify the **circuit-id** or **remote-id** statement without including either of the optional **prefix** or **use-interface-description** statements, the format of the Agent Circuit ID or Agent Remote ID information for Fast Ethernet (**fe**) or Gigabit Ethernet (**ge**) interfaces is one of the following, depending on your network configuration:

- For Fast Ethernet or Gigabit Ethernet interfaces that do not use virtual local area networks (VLANs) or stacked VLANs (S-VLANs):

`(fe | ge)-fpc/pic/port`

- For Fast Ethernet or Gigabit Ethernet interfaces that use VLANs:

`(fe | ge)-fpc/pic/port:vlan-id`

- For Fast Ethernet or Gigabit Ethernet interfaces that use S-VLANs:

`(fe | ge)-fpc/pic/port:svlan-id-vlan-id`

To enable insertion of option 82 information:

1. Specify that you want to configure option 82 support.

```
[edit forwarding-options dhcp-relay]
user@host# edit relay-option-82
```

2. Configure DHCP relay agent to insert the Agent Circuit ID suboption, the Agent Remote ID suboption, or both.

```
[edit forwarding-options dhcp-relay relay-option-82]
user@host# set circuit-id
```

3. (Optional) Configure a prefix that is used in the option 82 information in the DHCP packets

See [“Including a Prefix in DHCP Options” on page 1466](#).

4. (Optional) Configure DHCP relay agent to include the interface’s textual description instead of interface identifier in the option 82 information.

See [“Including a Textual Description in DHCP Options” on page 1468](#).

---

### Including a Prefix in DHCP Options

When you configure DHCPv4 or DHCPv6 relay agent to include DHCP options in the packets the relay agent sends to a DHCP server, you can specify that the relay agent add a prefix to the DHCP option. You can add a prefix to the following DHCP options:

- DHCPv4 Option 82 Agent Circuit ID (suboption 1)
- DHCPv4 Option 82 Agent Remote ID (suboption 2)
- DHCPv6 Relay Agent Interface-ID (option 18)
- DHCPv6 Relay Agent Remote-ID (option 37)

The prefix is separated from the DHCP option information by a colon (:), and can include any combination of the **host-name**, **logical-system-name**, and **routing-instance-name** options. The DHCP relay agent obtains the values for the **host-name**, **logical-system-name**, and **routing-instance-name** as follows:

- If you include the **host-name** option, the DHCP relay agent uses the hostname of the router configured with the **host-name** statement at the **[edit system]** hierarchy level.
- If you include the **logical-system-name** option, the DHCP relay agent uses the logical system name configured with the **logical-system** statement at the **[edit logical-system]** hierarchy level.
- If you include the **routing-instance-name** option, the DHCP relay agent uses the routing instance name configured with the **routing-instance** statement at the **[edit routing-instances]** hierarchy level or at the **[edit logical-system logical-system-name routing-instances]** hierarchy level.

If you include the hostname and either or both of the logical system name and the routing instance name in the prefix, the hostname is followed by a forward slash (/). If you include both the logical system name and the routing instance name in the prefix, these values are separated by a semicolon (;).

The following examples show several possible formats for the DHCP option information when you specify the **prefix** statement for Fast Ethernet (**fe**) or Gigabit Ethernet (**ge**) interfaces with S-VLANs.

- If you include only the hostname in the prefix for Fast Ethernet or Gigabit Ethernet interfaces with S-VLANs:

*hostname:(fe | ge)-fpc/pic/port:svlan-id-vlan-id*

- If you include only the logical system name in the prefix for Fast Ethernet or Gigabit Ethernet interfaces with S-VLANs:

*logical-system-name:(fe | ge)-fpc/pic/port:svlan-id-vlan-id*

- If you include only the routing instance name in the prefix for Fast Ethernet or Gigabit Ethernet interfaces with S-VLANs:

*routing-instance-name:(fe | ge)-fpc/pic/port:svlan-id-vlan-id*

- If you include both the hostname and the logical system name in the prefix for Fast Ethernet or Gigabit Ethernet interfaces with S-VLANs:

*host-name/logical-system-name:(fe | ge)-fpc/pic/port:svlan-id-vlan-id*

- If you include both the logical system name and the routing instance name in the prefix for Fast Ethernet or Gigabit Ethernet interfaces with S-VLANs:

*logical-system-name;routing-instance-name:(fe | ge)-fpc/pic/port:svlan-id-vlan-id*

- If you include the hostname, logical system name, and routing instance name in the prefix for Fast Ethernet or Gigabit Ethernet interfaces with S-VLANs:

*host-name/logical-system-name;routing-instance-name:(fe | ge)-fpc/pic/port:svlan-id-vlan-id*

For Fast Ethernet or Gigabit Ethernet interfaces that use VLANs but not S-VLANs, only the **vlan-id** value appears in the DHCP option format. For Fast Ethernet or Gigabit Ethernet interfaces that do not use VLANs or S-VLANs, neither the **vlan-id** value nor the **svlan-id** value appears.

(DHCPv4) To configure a prefix with the option 82 information:

1. Specify that you want to configure option 82 support.

```
[edit forwarding-options dhcp-relay]
user@host# edit relay-option-82
```

2. Configure DHCP relay agent to insert the Agent Circuit ID, the Agent Remote ID, or both.

```
[edit forwarding-options dhcp-relay relay-option-82]
user@host# edit circuit-id
```

3. Specify that the prefix is included in the option 82 information. In this example, the prefix includes the hostname and logical system name

```
[edit forwarding-options dhcp-relay relay-option-82 circuit-id]
user@host# set prefix host-name logical-system-name
```

(DHCPv6) To use a prefix with the DHCPv6 option 18 or option 37 information:

1. Specify that you want to configure DHCPv6 relay agent support.

```
[edit forwarding-options dhcp-relay]
user@host# edit dhcpv6
```

2. Configure DHCPv6 relay agent to insert option 18 (Relay Agent Interface-ID), option 37 (Relay Agent Remote-ID), or both.

```
[edit forwarding-options dhcp-relay dhcpv6]
```

```
user@host# edit relay-agent-interface-id
```

3. Specify that the prefix is included in the option information. In this example, the prefix includes the hostname and logical system name

```
[edit forwarding-options dhcp-relay dhcpv6 relay-agent-interface-id]  
user@host# set prefix host-name logical-system-name
```

---

### Including a Textual Description in DHCP Options

By default, when DHCPv4 or DHCPv6 relay agent inserts agent circuit ID or agent remote ID option information in the packets sent to a DHCP server, the options include the interface identifier. However, you can configure the DHCP relay agent to include the textual description that is configured for the interface instead of the interface identifier. You can use the textual description for either the logical interface or the device interface.

You can include the textual interface description in the agent circuit ID or agent remote ID options for static interfaces.

The textual description is configured separately, using the **description** statement at the **[edit interfaces interface-name]** hierarchy level. If you specify that the textual description is used and no description is configured for the interface, DHCP relay defaults to using the interface identifier.

You can use the textual description with the following DHCP options:

- DHCPv4 Option 82 Agent Circuit ID (suboption 1)
- DHCPv4 Option 82 Agent Remote ID (suboption 2)
- DHCPv6 Relay Agent Interface-ID (option 18)
- DHCPv6 Relay Agent Remote-ID (option 37)

(DHCPv4) To configure the DHCP relay option 82 suboption to include the textual interface description:

1. Specify that you want to configure option 82 support.

```
[edit forwarding-options dhcp-relay]  
user@host# edit relay-option-82
```

2. Configure DHCP relay agent to insert the Agent Circuit ID, Agent Remote ID, or both.

```
[edit forwarding-options dhcp-relay relay-option-82]  
user@host# edit circuit-id
```

3. Specify that the textual description is included in the option 82 information. In this example, the option 82 information includes the description used for the device interface.

```
[edit forwarding-options dhcp-relay relay-option-82 circuit-id]  
user@host# set use-interface-description device
```

(DHCPv6) To use a textual description with the DHCPv6 option 18 or option 37 information:

1. Specify that you want to configure DHCPv6 relay agent support.

```
[edit forwarding-options dhcp-relay]
user@host# edit dhcpv6
```

2. Configure DHCPv6 relay agent to insert option 18 (Relay Agent Interface-ID), option 37 (Relay Agent Remote-ID), or both.

```
[edit forwarding-options dhcp-relay dhcpv6]
user@host# edit relay-agent-interface-id
```

3. Specify that the textual description is included in the option information. In this example, the option 37 information includes the description used for the device interface.

```
[edit forwarding-options dhcp-relay dhcpv6 relay-agent-interface-id]
user@host# set use-interface-description device
```

## Configuring Server Groups

You can configure a named group of DHCP servers for use by the extended DHCP relay agent on the router or switch.

You specify the name of the DHCP server group and the IP addresses of one or more DHCP servers that belong to this group. You can configure a maximum of five IP addresses per named server group.

To configure a named server group:

1. Specify the name of the server group.

```
[edit forwarding-options dhcp-relay]
user@host# set server-group myServerGroup
```

2. Add the IP addresses of the DHCP servers belonging to the group.

```
[edit forwarding-options dhcp-relay server-group myServerGroup]
user@host# set 192.168.100.50
user@host# set 192.168.100.75
```

**Related Documentation**

- [Extended DHCP Relay Agent Overview on page 1379](#)

## Configuring Active Server Groups

You can configure an active server group. Using an active server group enables you to apply a common DHCP relay agent configuration to a named group of DHCP server addresses.

Use the statement at the **[edit ... dhcpv6]** hierarchy levels to configure DHCPv6 support.

To configure an active server group:

- Specify the name of the active server group.

```
[edit forwarding-options dhcp-relay]
user@host# set active-server-group myServerGroup
```

To create an active server group as a global DHCP relay agent configuration option, include the **active-server-group** statement at the **[edit forwarding-options dhcp-relay]** hierarchy level. To have the group apply only to a named group of interfaces, include the **active-server-group** statement at the **[edit forwarding-options dhcp-relay group group-name]** hierarchy level.

Including the **active-server-group** statement at the **[edit forwarding-options dhcp-relay group group-name]** hierarchy level (as a group-specific option) overrides the effect of including the **active-server-group** statement at the **[edit forwarding-options dhcp-relay]** hierarchy level as a global option.

**Related  
Documentation**

- [Extended DHCP Relay Agent Overview on page 1379](#)
- [Grouping Interfaces with Common DHCP Configurations on page 1421](#)

## Enabling DHCP Relay Proxy Mode

You can enable DHCP relay proxy mode on all interfaces or a group of interfaces.

To enable DHCP relay proxy mode:

1. Specify that you want to configure override options.

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

2. Enable DHCP relay proxy mode.

```
[edit forwarding-options dhcp-relay overrides]
user@host# set proxy-mode
```

**Related  
Documentation**

- [DHCP Relay Proxy Overview on page 1382](#)

## Inserting DHCPv6 Interface-ID Option (Option 18) In DHCPv6 Packets

You can configure DHCPv6 relay agent to insert the DHCPv6 Interface-ID (option 18) in the packets that the relay sends to a DHCPv6 server. You can configure the option 18 support at either the DHCPv6 global or group level.

When you configure option 18 support, you can optionally include the following additional information:

- Prefix—Specify the **prefix** option to add a prefix to the interface identifier. The prefix can be any combination of hostname, logical system name, and routing instance name.
- Interface description—Specify the **use-interface-description** option to include the textual interface description instead of the interface identifier. You can include either the device interface description or the logical interface description.

- Option 82 Agent Circuit ID suboption (suboption 1)—Specify the **use-option-82** option to include the DHCPv4 Option 82 Agent Circuit ID suboption (suboption 1). This configuration is useful in a dual-stack environment, which has both DHCPv4 and DHCPv6 subscribers that reside over the same underlying logical interface. The router checks for the option 82 suboption 1 value and inserts it into the outgoing packets. If no DHCPv4 binding exists or if the binding does not have an option 82 suboption 1 value, the router sends the packets without adding an option 18.

**NOTE:** If you specify one of the optional configurations, and the specified information does not exist (for example, there is no interface description), DHCPv6 relay ignores the optional configuration and inserts the default interface identifier in the packets.

To insert the DHCPv6 Interface-ID option (option 18) in DHCPv6 packets:

1. Configure the DHCPv6 relay to include option 18.

```
[edit forwarding-options dhcp-relay dhcpv6]
user@host# edit relay-agent-interface-id
```

2. (Optional) Specify the prefix to include in option 18.

```
[edit forwarding-options dhcp-relay dhcpv6 relay-agent-interface-id]
user@host# set prefix prefix
```

3. (Optional) Specify that option 18 include the textual description of the interface. You can specify either the **logical** interface description or the **device** interface description.

```
[edit forwarding-options dhcp-relay dhcpv6 relay-agent-interface-id]
user@host# set use-interface-description (logical | device)
```

4. (Optional) Specify that option 18 use the DHCPv4 Option 82 Agent Circuit ID suboption (suboption 1) value.

```
[edit forwarding-options dhcp-relay dhcpv6 relay-agent-interface-id]
user@host# set use-option-82
```

## DHCP Liveness Detection Overview

Unlike PPP, DHCP does not define a native keepalive mechanism as part of either the DHCPv4 or DHCPv6 protocols. Without a keepalive mechanism, DHCP local server, DHCP relay, or DHCP relay proxy is unable to quickly detect if it has lost connectivity with a subscriber or a DHCP client; and it must rely on standard DHCP subscriber session or DHCP client session termination messages.

DHCP clients often do not send DHCP release messages prior to exiting the network. The discovery of their absence is dependent on existing DHCP lease time and release request mechanisms. These mechanisms are often considered insufficient when serving as session health checks for clients in a DHCP subscriber access or a DHCP-managed network. Because DHCP lease times are typically too long to provide an adequate response time for a session health failure, and configuring short DHCP lease times can pose an undue burden on control plane processing, implementing a DHCP liveness detection mechanism enables better monitoring of bound DHCP clients. When configured with a liveness detection protocol, if a given subscriber (or client) fails to respond to a configured number of consecutive liveness detection requests, the subscriber (or client) binding is deleted and its resources released.

DHCP liveness detection for DHCP subscriber IP or DHCP client IP sessions utilizes an active liveness detection protocol to institute liveness detection checks for relevant clients. Clients must respond to liveness detection requests within a specified amount of time. If the responses are not received within that time for a given number of consecutive attempts, then the liveness detection check fails and a failure action is implemented.

Using DHCP liveness detection, IP sessions are acted upon as soon as liveness detection checks fail. This faster response time serves to:

- Provide more accurate time-based accounting of subscriber (or DHCP client) sessions.
- Better preserve router (switch) resources.
- Help to reduce the window of vulnerability to some security attacks.

Examples of liveness detection protocols include Bidirectional Forwarding Detection (BFD) for both DHCPv4 and DHCPv6 subscribers, IPv4 Address Resolution Protocol (ARP) for DHCPv4 subscribers, and IPv6 Neighbor Unreachability Detection for DHCPv6 subscribers.

**NOTE:** Only BFD for DHCPv4 and DHCPv6 liveness detection is supported.

---

When configuring BFD liveness detection, keep the following in mind:

- You can configure DHCPv4 and DHCPv6 liveness detection either globally or per DHCPv4 or DHCPv6 group.
- DHCPv4 or DHCPv6 subscriber access clients that do not support BFD are not affected by the liveness detection configuration. These clients can continue to access the

network (once validated) even if BFD liveness detection is enabled on the router (or switch).

- When configured, DHCPv4 or DHCPv6 initiates liveness detection checks for relevant clients (that is, clients that support BFD) when those clients enter a bound state.
- After protocol-specific messages are initiated for a BFD client, they are periodically sent to the subscriber (or client) IP address of the client and responses to those liveness detection requests are expected within a configured amount of time.
- If liveness detection responses are not received from clients that support BFD within the configured amount of time for a configured number of consecutive attempts, the liveness detection check is deemed to have failed and a configured failure action is implemented.

## Configuring Detection of DHCP Relay or DHCP Relay Proxy Client Connectivity

Liveness detection for DHCP subscriber IP or DHCP client IP sessions utilizes an active liveness detection protocol to institute liveness detection checks for relevant clients. Clients must respond to liveness detection requests within a specified amount of time. If the responses are not received within that time for a given number of consecutive attempts, then the liveness detection check fails and a failure action is implemented.

To configure liveness detection for DHCP relay:

1. Specify that you want to configure liveness detection.

- For DHCP global configuration:

```
[edit forwarding-options dhcp-relay]
user@host# edit liveness-detection
```

- For DHCP group configuration:

```
[edit forwarding-options dhcp-relay group group-name]
user@host# edit liveness-detection
```

**NOTE:** Liveness detection is also supported for DHCPv6 configurations. To configure DHCPv6 liveness detection, include the **liveness-detection** statement, and any subsequent configuration statements, at the **[edit forwarding-options dhcp-relay dhcpv6]** or **[edit forwarding-options dhcp-relay dhcpv6 group *group-name*]** hierarchy level.

2. (Optional) Specify that you want to use DHCP relay proxy mode.

```
[edit forwarding-options dhcp-relay group group-name]
user@host# set overrides proxy-mode
```

3. Specify that you want to configure the liveness detection method.

- For DHCP global configuration:

```
[edit forwarding-options dhcp-relay liveness-detection]  
user@host# edit method
```

- For DHCP group configuration:

```
[edit forwarding-options dhcp-relay group group-name liveness-detection]  
user@host# edit method
```

4. Specify the liveness detection method that you want DHCP to use.

**NOTE:** The only method supported for liveness detection is Bidirectional Forwarding Detection (BFD).

- For DHCP global configuration:

```
[edit forwarding-options dhcp-relay liveness-detection method]  
user@host# edit bfd
```

- For DHCP group configuration:

```
[edit forwarding-options dhcp-relay group group-name liveness-detection method]  
user@host# edit bfd
```

5. Configure the liveness detection method as desired.

See *Example: Configuring Global Liveness Detection for DHCP Relay Agent Clients* for an example of how to globally configure DHCP relay liveness detection.

6. Configure the action the router takes when a liveness detection failure occurs.

- For DHCP global configuration:

```
[edit forwarding-options dhcp-relay liveness-detection]  
user@host# edit failure-action action
```

- For DHCP group configuration:

```
[edit forwarding-options dhcp-relay group group-name liveness-detection]  
user@host# edit failure-action action
```

## Disabling DHCP Relay

You can disable DHCP relay on all interfaces or a group of interfaces.

To disable DHCP relay agent:

1. Specify that you want to configure override options.

```
[edit forwarding-options dhcp-relay]
user@host# edit overrides
```

2. Disable the DHCP relay agent.

```
[edit forwarding-options dhcp-relay overrides]
user@host# set disable-relay
```

## client-discover-match (DHCP Local Server)

<b>Syntax</b>	client-discover-match (option60-and-option82   incoming-interface);
<b>Hierarchy Level</b>	<p>[edit system services dhcp-local-server <a href="#">overrides</a>],</p> <p>[edit system services dhcp-local-server group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit system services dhcp-local-server group <i>group-name</i> interface <i>interface-name</i> <a href="#">overrides</a>]</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server ... <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server ...<a href="#">overrides</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server ...<a href="#">overrides</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.4.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p> <p>Option <b>incoming-interface</b> introduced in Junos OS Release 13.3.</p>
<b>Description</b>	Configure the match criteria DHCP local server uses to uniquely identify DHCP subscribers or clients when primary identification fails. The options are mutually exclusive.
<b>Options</b>	<p><b>incoming-interface</b>—Allow only one client device to connect on the interface. If the client device changes, the router deletes the existing client binding and creates a binding for the newly connected device.</p>
<div style="display: flex; align-items: flex-start;"> <div style="flex: 1; text-align: center; margin-right: 10px;">  </div> <div> <p><b>NOTE:</b> The <b>overrides client-discover-match incoming-interface</b> configuration deletes and replaces the existing binding when a new device connects. This action differs from the <b>overrides interface-client-limit 1</b> statement, which retains the existing binding and rejects the newly connected client.</p> </div> </div>	
<p><b>option60-and-option82</b>—Use option 60 and option 82 information to identify subscribers.</p>	
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Extended DHCP Local Server Overview on page 1356</a></li> <li>• <a href="#">Overriding Default DHCP Local Server Configuration Settings on page 1423</a></li> <li>• <a href="#">DHCP Auto Logout Overview on page 1368</a></li> <li>• <a href="#">Allowing Only One DHCP Client Per Interface</a></li> </ul>

## client-id (DHCP Local Server)

<b>Syntax</b>	client-id;
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 authentication <a href="#">username-include</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit system services dhcp-local-server dhcpv6 authentication <a href="#">username-include</a>],</p> <p>[edit system services dhcp-local-server dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.6.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	Specify that the DHCPv6 Client-ID option (option 1) in the client PDU name is concatenated with the username during the subscriber authentication or client authentication process.
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Creating Unique Usernames for DHCP Clients on page 1439</a></li> </ul>

## delegated-pool (DHCP Local Server)

---

<b>Syntax</b>	<code>delegated-pool <i>pool-name</i>;</code>
<b>Hierarchy Level</b>	<code>[edit system services dhcp-local-server <a href="#">dhcpv6 overrides</a>],</code> <code>[edit system services dhcp-local-server dhcpv6 <a href="#">group group-name overrides</a>],</code> <code>[edit system services dhcp-local-server dhcpv6 <a href="#">group group-name</a> interface <i>interface-name</i></code> <code><a href="#">overrides</a>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system</code> <code>services dhcp-local-server <a href="#">dhcpv6</a> ...],</code> <code>[edit logical-systems <i>logical-system-name</i> system services system services dhcp-local-server</code> <code><a href="#">dhcpv6</a> ...],</code> <code>[edit routing-instances <i>routing-instance-name</i> system services system services</code> <code>dhcp-local-server <a href="#">dhcpv6</a> ...]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 11.4. Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
<b>Description</b>	Specify the address pool that assigns the IA_PD address. A pool specified by RADIUS VSA 26-161 takes precedence over the pool specified by this <b>delegated-pool</b> statement.
<b>Options</b>	<b><i>pool-name</i></b> —Name of the address-assignment pool.
<b>Required Privilege Level</b>	<b>system</b> —To view this statement in the configuration. <b>system-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Specifying the Delegated Address Pool for IPv6 Prefix Assignment on page 1428</a></li><li>• <a href="#">Overriding Default DHCP Local Server Configuration Settings on page 1423</a></li></ul>

## delimiter (DHCP Local Server)

<b>Syntax</b>	<code>delimiter <i>delimiter-character</i>;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services <b>dhcp-local-server authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services <b>dhcp-local-server dhcpv6 authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services <b>dhcp-local-server dhcpv6 group group-name authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services <b>dhcp-local-server group group-name authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services <b>dhcp-local-server authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services <b>dhcp-local-server dhcpv6 authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services <b>dhcp-local-server dhcpv6 group group-name authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services <b>dhcp-local-server group group-name authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services <b>dhcp-local-server authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services <b>dhcp-local-server dhcpv6 authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services <b>dhcp-local-server dhcpv6 group group-name authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services <b>dhcp-local-server group group-name authentication username-include</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services <b>dhcp-local-server authentication username-include</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services <b>dhcp-local-server dhcpv6 authentication username-include</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services <b>dhcp-local-server dhcpv6 group group-name authentication username-include</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services <b>dhcp-local-server group group-name authentication username-include</b>],</p> <p>[edit system services <b>dhcp-local-server authentication username-include</b>],</p> <p>[edit system services <b>dhcp-local-server dhcpv6 authentication username-include</b>],</p> <p>[edit system services <b>dhcp-local-server dhcpv6 group group-name authentication username-include</b>],</p> <p>[edit system services <b>dhcp-local-server group group-name authentication username-include</b>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.1.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	Specify the character used as the delimiter between the concatenated components of the username.
<b>Options</b>	<b><i>delimiter-character</i></b> —Character that separates components that make up the concatenated username. You cannot use the semicolon (;) as a delimiter.
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>

**Hierarchy Level** [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* system services],  
[edit logical-systems *logical-system-name* system services],  
[edit routing-instances *routing-instance-name* system services],  
[edit system services]

**Release Information** Statement introduced in Junos OS Release 9.0.  
Statement introduced in Junos OS Release 12.1 for EX Series switches.  
Statement introduced in Junos OS Release 13.2X51 for the QFX Series.

**Description** Configure Dynamic Host Configuration Protocol (DHCP) local server options on the router or switch and enable the router or switch to function as an extended DHCP local server. The DHCP local server receives DHCP request and reply packets from DHCP clients and then responds with an IP address and other optional configuration information to the client.

The DHCP local server and the DHCP/BOOTP relay server, which are configured under the **[edit forwarding-options helpers]** hierarchy level, cannot both be enabled on the router or switch at the same time. The extended DHCP local server is fully compatible with the extended DHCP relay feature.

The **dhcpx6** stanza configures the router or switch to support Dynamic Host Configuration Protocol for IPv6 (DHCPv6). The DHCPv6 local server is fully compatible with the extended DHCP local server and the extended DHCP relay feature.

**NOTE:** When you configure the **dhcp-local-server** statement at the routing instance hierarchy level, you must use a routing instance type of **virtual-router**.

---

The remaining statements are explained separately.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

 [edit routing-instances *routing-instance-name* system services [dhcp-local-server](#)],  
 [edit system services [dhcp-local-server](#)]

**Release Information** Statement introduced in Junos OS Release 9.6.  
 Statement introduced in Junos OS Release 12.3 for EX Series switches.

**Description** Configure DHCPv6 local server options on the router or switch and enable the router or switch to function as a server for the DHCP protocol for IP version 6 (IPv6). The DHCPv6 local server sends and receives packets using the IPv6 protocol and informs IPv6 of the routing requirements of router clients. The local server works together with the AAA service framework to control subscriber access (or DHCP client access) and accounting.

The DHCPv6 local server is fully compatible with the extended DHCP local server and DHCP relay agent.

The remaining statements are explained separately.

**Required Privilege Level** system—To view this statement in the configuration.  
 system-control—To add this statement to the configuration.

## dynamic-profile (DHCP Local Server)

<b>Syntax</b>	dynamic-profile <i>profile-name</i> { aggregate-clients (merge   replace); use-primary <i>primary-profile-name</i> ; }
<b>Hierarchy Level</b>	[edit system services <a href="#">dhcp-local-server</a> ], [edit system services dhcp-local-server <a href="#">dhcpv6</a> ], [edit system services dhcp-local-server dhcpv6 group <i>group-name</i> <a href="#">interface</a> <i>interface-name</i> ], [edit system services dhcp-local-server <a href="#">group</a> <i>group-name</i> ], [edit system services dhcp-local-server group <i>group-name</i> <a href="#">interface</a> <i>interface-name</i> ], [edit logical-systems <i>logical-system-name</i> system services <a href="#">dhcp-local-server</a> ...], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services <a href="#">dhcp-local-server</a> ...], [edit routing-instances <i>routing-instance-name</i> system services <a href="#">dhcp-local-server</a> ...]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.2. Statement introduced in Junos OS Release 12.3R2 for EX Series switches. Options <b>aggregate-clients</b> and <b>use-primary</b> introduced in Junos OS Release 9.3. Support at the [edit ... <a href="#">interface</a> ] hierarchy levels introduced in Junos OS Release 11.2.
<b>Description</b>	Specify the dynamic profile that is attached to all interfaces, a named group of interfaces, or a specific interface.
<b>Options</b>	<b><i>profile-name</i></b> —Name of the dynamic profile.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Attaching Dynamic Profiles to DHCP Subscriber Interfaces or DHCP Client Interfaces</a></li> <li>• <a href="#">Configuring a Default Subscriber Service</a></li> </ul>

## external-authority

---

<b>Syntax</b>	external-authority;
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server <a href="#">pool-match-order</a> ], [edit logical-systems <i>logical-system-name</i> system services dhcp-local-server <a href="#">pool-match-order</a> ], [edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server <a href="#">pool-match-order</a> ], [edit system services dhcp-local-server <a href="#">pool-match-order</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.0. Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
<b>Description</b>	<p>Specify that an external authority (for example, RADIUS or Diameter) provides the address assignment.</p> <p>When RADIUS is the external authority, the router uses the Framed-IPv6-Pool attribute (RADIUS attribute 100) to select the pool. When Diameter is the external authority, the router uses the Diameter counterpart of RADIUS Framed-IPv6-Pool attribute.</p>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring How the Extended DHCP Local Server Determines Which Address-Assignment Pool to Use on page 1442</a></li><li>• <a href="#">Extended DHCP Local Server Overview on page 1356</a></li><li>• <a href="#">Address-Assignment Pools Overview on page 1370</a></li></ul>

## failure-action

<b>Syntax</b>	failure-action (clear-binding   clear-binding-if-interface-up   log-only);
<b>Hierarchy Level</b>	[edit system services dhcp-local-server <a href="#">liveness-detection</a> ], [edit system services dhcp-local-server dhcpv6 <a href="#">liveness-detection</a> ], [edit forwarding-options dhcp-relay <a href="#">liveness-detection</a> ], [edit forwarding-options dhcp-relay dhcpv6 <a href="#">liveness-detection</a> ], [edit system services dhcp-local-server group <i>group-name</i> <a href="#">liveness-detection</a> ], [edit system services dhcp-local-server dhcpv6 group <i>group-name</i> <a href="#">liveness-detection</a> ], [edit forwarding-options dhcp-relay group <i>group-name</i> <a href="#">liveness-detection</a> ], [edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> <a href="#">liveness-detection</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1. Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
<b>Description</b>	Configure the action the router (or switch) takes when a liveness detection failure occurs.
<b>Options</b>	<p><b>clear-binding</b>—The client session is cleared when a liveness detection failure occurs.</p> <p><b>clear-binding-if-interface-up</b>—The client session is cleared only when a liveness detection failure occurs and the local interface is detected as being up.</p> <p><b>log-only</b>—A message is logged to indicate the event; no action is taken and DHCP is left to manage the failure.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">DHCP Liveness Detection Overview on page 1472</a></li> <li>• <a href="#">Configuring Detection of DHCP Local Server Client Connectivity on page 1436</a></li> <li>• <a href="#">Configuring Detection of DHCP Relay or DHCP Relay Proxy Client Connectivity on page 1473</a></li> <li>• <a href="#">Example: Configuring Group Liveness Detection for DHCP Local Server Clients on page 1395</a></li> <li>• <a href="#">Example: Configuring Global Liveness Detection for DHCP Relay Agent Clients</a></li> </ul>

## forward-snooped-clients (DHCP Local Server)

---

<b>Syntax</b>	forward-snooped-clients (all-interfaces   configured-interfaces   non-configured-interfaces);
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services <a href="#">dhcp-local-server</a> ], [edit logical-systems <i>logical-system-name</i> system services <a href="#">dhcp-local-server</a> ], [edit routing-instances <i>routing-instance-name</i> system services <a href="#">dhcp-local-server</a> ], [edit system services <a href="#">dhcp-local-server</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.4. Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
<b>Description</b>	Configure how the DHCP local server handles DHCP snooped packets on specific interfaces.
<b>Options</b>	<b>all-interfaces</b> —Perform the action on all interfaces.  <b>configured-interfaces</b> —Perform the action only on configured interfaces.  <b>non-configured-interfaces</b> —Perform the action only on nonconfigured interfaces.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">DHCP Snooping Support on page 1367</a></li><li>• <a href="#">Configuring DHCP Snooped Packets Forwarding Support for DHCP Local Server on page 1437</a></li></ul>

## group (DHCP Local Server)

```

Syntax  group group-name {
        authentication {
            password password-string;

## holddown-interval

<b>Syntax</b>	<code>holddown-interval <i>milliseconds</i>;</code>
<b>Hierarchy Level</b>	[edit system services dhcp-local-server liveness-detection method <a href="#">bfd</a> ], [edit system services dhcp-local-server dhcpv6 liveness-detection method <a href="#">bfd</a> ], [edit forwarding-options dhcp-relay liveness-detection method <a href="#">bfd</a> ], [edit forwarding-options dhcp-relay dhcpv6 liveness-detection method <a href="#">bfd</a> ], [edit system services dhcp-local-server group <i>group-name</i> liveness-detection method <a href="#">bfd</a> ], [edit system services dhcp-local-server dhcpv6 group <i>group-name</i> liveness-detection method <a href="#">bfd</a> ], [edit forwarding-options dhcp-relay group <i>group-name</i> liveness-detection method <a href="#">bfd</a> ], [edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> liveness-detection method <a href="#">bfd</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1. Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
<b>Description</b>	Configure the time (in milliseconds) for which Bidirectional Forwarding Detection (BFD) holds a session up notification.
<b>Options</b>	<b><i>milliseconds</i></b> —Interval specifying how long a BFD session must remain up before a state change notification is sent. <b>Range:</b> 0 through 255,000 <b>Default:</b> 0
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Group Liveness Detection for DHCP Local Server Clients on page 1395</a></li> <li>• <i>Example: Configuring Global Liveness Detection for DHCP Relay Agent Clients</i></li> </ul>

## interface (DHCP Local Server)

**Syntax** interface *interface-name* {  
 exclude;  
 overrides {  
   client-discover-match (option60-and-option82 | incoming-interface);  
   interface-client-limit *number*;  
   rapid-commit;  
 }  
 service-profile *dynamic-profile-name*;  
 trace;  
 upto *upto-interface-name*;  
}

**Hierarchy Level** [edit system services dhcp-local-server *group group-name*],  
 [edit system services dhcp-local-server *dhcpv6 group group-name*],  
 [edit logical-systems *logical-system-name* routing-instances *routing-instance-name* system  
 services *dhcp-local-server ...*],  
 [edit logical-systems *logical-system-name* system services *dhcp-local-server ...*],  
 [edit routing-instances *routing-instance-name* system services *dhcp-local-server ...*]

**Release Information** Statement introduced in Junos OS Release 9.0.  
 Statement introduced in Junos OS Release 12.3R2 for EX Series switches.  
 Options **upto** and **exclude** introduced in Junos OS Release 9.1.

**Description** Specify one or more interfaces, or a range of interfaces, that are within a specified group on which the DHCP local server is enabled. You can repeat the **interface *interface-name*** statement to specify multiple interfaces within a group, but you cannot specify the same interface in more than one group. Also, you cannot use an interface that is being used by the DHCP relay agent.

**NOTE:** DHCP values are supported in Integrated Routing and Bridging (IRB) configurations. When you configure an IRB interface in a network that is using DHCP, the DHCP information (for example, authentication, address assignment, and so on) is propagated in the associated bridge domain. This enables the DHCP server to configure client IP addresses residing within the bridge domain. IRB currently only supports static DHCP configurations. For additional information about how to configure IRB, see *Configuring Integrated Routing and Bridging for Bridge Domains*.

**Options** **exclude**—Exclude an interface or a range of interfaces from the group. This option and the **overrides** option are mutually exclusive.

***interface-name***—Name of the interface. You can repeat this option multiple times.

***upto-interface-name***—Upper end of the range of interfaces; the lower end of the range is the *interface-name* entry. The interface device name of the ***upto-interface-name*** must be the same as the device name of the ***interface-name***.

The remaining statements are explained separately.

<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.

## interface-client-limit (DHCP Local Server)

<b>Syntax</b>	<code>interface-client-limit <i>number</i>;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server <a href="#">dhcpv6 overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 <a href="#">group group-name overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server <a href="#">dhcpv6 overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 <a href="#">group group-name overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server <a href="#">dhcpv6 overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 <a href="#">group group-name overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server <a href="#">overrides</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server <a href="#">dhcpv6 overrides</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 <a href="#">group group-name overrides</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit system services dhcp-local-server <a href="#">overrides</a>],</p> <p>[edit system services dhcp-local-server <a href="#">dhcpv6 overrides</a>],</p> <p>[edit system services dhcp-local-server dhcpv6 <a href="#">group group-name overrides</a>],</p> <p>[edit system services dhcp-local-server dhcpv6 <a href="#">group</a> interface <i>interface-name</i> <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit system services dhcp-local-server group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit system services dhcp-local-server group <i>group-name</i> interface <i>interface-name</i> <a href="#">overrides</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.2.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	Set the maximum number of DHCP subscribers or DHCP clients per interface allowed for a specific group or for all groups. A group specification takes precedence over a global specification for the members of that group.
<b>Default</b>	No limit
<b>Options</b>	<i>number</i> —Maximum number of clients allowed.

**Range:** 1 through 500,000

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

**Related Documentation**

- [Specifying the Maximum Number of DHCP Clients Per Interface on page 1424](#)
- [Overriding Default DHCP Local Server Configuration Settings on page 1423](#)

## interface-delete (Subscriber Management or DHCP Client Management)

**Syntax** interface-delete;

**Hierarchy Level** [edit system services subscriber-management maintain-subscriber]

**Release Information** Statement introduced in Junos OS Release 11.1.  
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description** On router—Configure the router to maintain, rather than log out, subscribers when the subscriber interface is deleted. By default, the router logs out subscribers when the subscriber interface is deleted.

On switch—Configure the switch to maintain rather than log out DHCP clients when the client interface is deleted. By default, the switch logs out DHCP clients when the client interface is deleted.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

**Related Documentation**

## interface-name (DHCP Local Server)

---

<b>Syntax</b>	interface-name;
<b>Hierarchy Level</b>	[edit system services <b>dhcp-local-server authentication username-include</b> ], [edit system services dhcp-local-server <b>dhcpv6 authentication username-include</b> ], [edit system services dhcp-local-server dhcpv6 <b>group group-name authentication username-include</b> ], [edit system services dhcp-local-server <b>group group-name authentication username-include</b> ] [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services <b>dhcp-local-server ...</b> ], [edit logical-systems <i>logical-system-name</i> system services <b>dhcp-local-server ...</b> ], [edit routing-instances <i>routing-instance-name</i> system services <b>dhcp-local-server ...</b> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.4. Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
<b>Description</b>	Specify that the interface name is concatenated with the username during the subscriber authentication or DHCP client authentication process. Use the statement at the <b>[edit ... dhcpv6]</b> hierarchy levels to configure DHCPv6 support.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Creating Unique Usernames for DHCP Clients on page 1439</a></li></ul>

## ip-address-first

<b>Syntax</b>	ip-address-first;
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server <a href="#">pool-match-order</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server <a href="#">pool-match-order</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server <a href="#">pool-match-order</a>],</p> <p>[edit system services <a href="#">dhcp-local-server pool-match-order</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.0.</p> <p>Statement introduced in Junos OS Release 12.1 for EX Series switches.</p>
<b>Description</b>	<p>Configure the extended DHCP local server to use the IP address method to determine which address-assignment pool to use. The local server uses the IP address in the gateway IP address if one is present in the DHCP client PDU. If no gateway IP address is present, the local server uses the IP address of the receiving interface to find the address-assignment pool. The DHCP local server uses this method by default when no method is explicitly specified.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring How the Extended DHCP Local Server Determines Which Address-Assignment Pool to Use on page 1442</a></li> <li>• <a href="#">Extended DHCP Local Server Overview on page 1356</a></li> <li>• <a href="#">Address-Assignment Pools Overview on page 1370</a></li> <li>• <i>Configuring a DHCP Server on Switches (CLI Procedure)</i></li> </ul>

## liveness-detection

<b>Syntax</b>	<pre> liveness-detection {   failure-action (clear-binding   clear-binding-if-interface-up   log-only);   method {     bfd {       version (0   1   automatic);       minimum-interval milliseconds;       minimum-receive-interval milliseconds;       multiplier number;       no-adaptation;       transmit-interval {         minimum-interval milliseconds;         threshold milliseconds;       }       detection-time {         threshold milliseconds;       }       session-mode (automatic   multihop   singlehop);       holddown-interval milliseconds;     }   } } </pre>
<b>Hierarchy Level</b>	<pre> [edit system services dhcp-local-server], [edit system services dhcp-local-server dhcpv6], [edit forwarding-options dhcp-relay], [edit forwarding-options dhcp-relay dhcpv6], [edit system services dhcp-local-server group group-name], [edit system services dhcp-local-server dhcpv6 group group-name], [edit forwarding-options dhcp-relay group group-name], [edit forwarding-options dhcp-relay dhcpv6 group group-name] </pre>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 12.1.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	<p>Configure bidirectional failure detection timers and authentication criteria for static routes.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">DHCP Liveness Detection Overview on page 1472</a></li> <li>• <a href="#">Configuring Detection of DHCP Local Server Client Connectivity on page 1436</a></li> <li>• <a href="#">Configuring Detection of DHCP Relay or DHCP Relay Proxy Client Connectivity on page 1473</a></li> <li>• <a href="#">Example: Configuring Group Liveness Detection for DHCP Local Server Clients on page 1395</a></li> </ul>

- *Example: Configuring Global Liveness Detection for DHCP Relay Agent Clients*

## mac-address (DHCP Local Server)

<b>Syntax</b>	mac-address;
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services <b>dhcp-local-server authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server <b>group group-name authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services <b>dhcp-local-server authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server <b>group group-name authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services <b>dhcp-local-server authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server <b>group group-name authentication username-include</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services <b>dhcp-local-server authentication username-include</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server <b>group group-name authentication username-include</b>],</p> <p>[edit system services <b>dhcp-local-server authentication username-include</b>],</p> <p>[edit system services dhcp-local-server <b>group group-name authentication username-include</b>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.1.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	Specify that the MAC address from the client PDU be concatenated with the username during the subscriber authentication or DHCP client authentication process.
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Using External AAA Authentication Services with DHCP on page 1420</a></li> </ul>

## method

---

<b>Syntax</b>	<pre>method {   bfd {     version (0   1   automatic);     minimum-interval milliseconds;     minimum-receive-interval milliseconds;     multiplier number;     no-adaptation;     transmit-interval {       minimum-interval milliseconds;       threshold milliseconds;     }     detection-time {       threshold milliseconds;     }     session-mode (automatic   multihop   singlehop);     holddown-interval milliseconds;   } }</pre>
<b>Hierarchy Level</b>	<pre>[edit system services dhcp-local-server <a href="#">liveness-detection</a>], [edit system services dhcp-local-server dhcpv6 <a href="#">liveness-detection</a>], [edit forwarding-options dhcp-relay <a href="#">liveness-detection</a>], [edit forwarding-options dhcp-relay dhcpv6 <a href="#">liveness-detection</a>], [edit system services dhcp-local-server group <i>group-name</i> <a href="#">liveness-detection</a>], [edit system services dhcp-local-server dhcpv6 group <i>group-name</i> <a href="#">liveness-detection</a>], [edit forwarding-options dhcp-relay group <i>group-name</i> <a href="#">liveness-detection</a>], [edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> <a href="#">liveness-detection</a>]</pre>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 12.1.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	<p>Configure the liveness detection method.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Group Liveness Detection for DHCP Local Server Clients on page 1395</a></li><li>• <a href="#">Example: Configuring Global Liveness Detection for DHCP Relay Agent Clients</a></li></ul>

## minimum-interval

<b>Syntax</b>	<code>minimum-interval <i>milliseconds</i>;</code>
<b>Hierarchy Level</b>	<p>[edit system services dhcp-local-server liveness-detection method <a href="#">bfd</a>],  [edit system services dhcp-local-server liveness-detection method bfd <a href="#">transmit-interval</a>],  [edit system services dhcp-local-server dhcpv6 liveness-detection method <a href="#">bfd</a>],  [edit system services dhcp-local-server dhcpv6 liveness-detection method bfd <a href="#">transmit-interval</a>],  [edit forwarding-options dhcp-relay liveness-detection method <a href="#">bfd</a>],  [edit forwarding-options dhcp-relay liveness-detection method bfd <a href="#">transmit-interval</a>],  [edit forwarding-options dhcp-relay dhcpv6 liveness-detection method <a href="#">bfd</a>],  [edit forwarding-options dhcp-relay dhcpv6 liveness-detection method bfd <a href="#">transmit-interval</a>],  [edit system services dhcp-local-server group <i>group-name</i> liveness-detection method <a href="#">bfd</a>],  [edit system services dhcp-local-server group <i>group-name</i> liveness-detection method bfd <a href="#">transmit-interval</a>],  [edit system services dhcp-local-server dhcpv6 group <i>group-name</i> liveness-detection method <a href="#">bfd</a>],  [edit system services dhcp-local-server dhcpv6 group <i>group-name</i> liveness-detection method bfd <a href="#">transmit-interval</a>],  [edit forwarding-options dhcp-relay group <i>group-name</i> liveness-detection method <a href="#">bfd</a>],  [edit forwarding-options dhcp-relay group <i>group-name</i> liveness-detection method bfd <a href="#">transmit-interval</a>],  [edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> liveness-detection method <a href="#">bfd</a>],  [edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> liveness-detection method bfd <a href="#">transmit-interval</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 12.1.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	<p>Configure the minimum intervals at which the local routing device transmits hello packets and then expects to receive a reply from a neighbor with which it has established a BFD session. This value represents the minimum interval at which the local routing device transmits hello packets as well as the minimum interval that the routing device expects to receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can specify the minimum transmit and receive intervals separately using the <a href="#">transmit-interval</a> <a href="#">minimal-interval</a> and <a href="#">minimum-receive-interval</a> statements.</p>
<b>Options</b>	<p><i>milliseconds</i> — Specify the minimum interval value for BFD liveliness detection.</p> <p><b>Range:</b> 1 through 255,000</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Group Liveness Detection for DHCP Local Server Clients on page 1395</a></li> <li>• <a href="#">Example: Configuring Global Liveness Detection for DHCP Relay Agent Clients</a></li> </ul>

## minimum-receive-interval

---

<b>Syntax</b>	<code>minimum-receive-interval <i>milliseconds</i>;</code>
<b>Hierarchy Level</b>	<code>[edit system services dhcp-local-server liveness-detection method <a href="#">bfd</a>],</code> <code>[edit system services dhcp-local-server dhcpv6 liveness-detection method <a href="#">bfd</a>],</code> <code>[edit forwarding-options dhcp-relay liveness-detection method <a href="#">bfd</a>], [edit forwarding-options</code> <code>  dhcp-relay dhcpv6 liveness-detection method <a href="#">bfd</a>],</code> <code>[edit system services dhcp-local-server group <i>group-name</i> liveness-detection method <a href="#">bfd</a>],</code> <code>[edit system services dhcp-local-server dhcpv6 group <i>group-name</i> liveness-detection method</code> <code>  <a href="#">bfd</a>],</code> <code>[edit forwarding-options dhcp-relay group <i>group-name</i> liveness-detection method <a href="#">bfd</a>],</code> <code>[edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> liveness-detection method</code> <code>  <a href="#">bfd</a>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1. Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
<b>Description</b>	Configure the minimum interval at which the local routing device (or switch) must receive a reply from a neighbor with which it has established a BFD session.
<b>Options</b>	<i>milliseconds</i> — Specify the minimum receive interval value. <b>Range:</b> 1 through 255,000
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Group Liveness Detection for DHCP Local Server Clients on page 1395</a></li><li>• <a href="#">Example: Configuring Global Liveness Detection for DHCP Relay Agent Clients</a></li></ul>

## multiplier

<b>Syntax</b>	<code>multiplier <i>number</i>;</code>
<b>Hierarchy Level</b>	<p>[edit system services dhcp-local-server liveness-detection method <a href="#">bfd</a>],  [edit system services dhcp-local-server dhcpv6 liveness-detection method <a href="#">bfd</a>],  [edit forwarding-options dhcp-relay liveness-detection method <a href="#">bfd</a>],  [edit forwarding-options dhcp-relay dhcpv6 liveness-detection method <a href="#">bfd</a>],  [edit system services dhcp-local-server group <i>group-name</i> liveness-detection method <a href="#">bfd</a>],  [edit system services dhcp-local-server dhcpv6 group <i>group-name</i> liveness-detection method <a href="#">bfd</a>],  [edit forwarding-options dhcp-relay group <i>group-name</i> liveness-detection method <a href="#">bfd</a>],  [edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> liveness-detection method <a href="#">bfd</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 12.1.  Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	Configure the number of hello packets not received by the neighbor before Bidirectional Forwarding Detection (BFD) declares the neighbor down.
<b>Options</b>	<p><b>number</b>—Maximum allowable number of hello packets missed by the neighbor.  <b>Range:</b> 1 through 255  <b>Default:</b> 3</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.  routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Group Liveness Detection for DHCP Local Server Clients on page 1395</a></li> <li>• <a href="#">Example: Configuring Global Liveness Detection for DHCP Relay Agent Clients</a></li> </ul>

## no-adaptation

---

<b>Syntax</b>	no-adaptation;
<b>Hierarchy Level</b>	[edit system services dhcp-local-server liveness-detection method <a href="#">bfd</a> ], [edit system services dhcp-local-server dhcpv6 liveness-detection method <a href="#">bfd</a> ], [edit forwarding-options dhcp-relay liveness-detection method <a href="#">bfd</a> ], [edit forwarding-options dhcp-relay dhcpv6 liveness-detection method <a href="#">bfd</a> ], [edit system services dhcp-local-server group <i>group-name</i> liveness-detection method <a href="#">bfd</a> ], [edit system services dhcp-local-server dhcpv6 group <i>group-name</i> liveness-detection method <a href="#">bfd</a> ], [edit forwarding-options dhcp-relay group <i>group-name</i> liveness-detection method <a href="#">bfd</a> ], [edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> liveness-detection method <a href="#">bfd</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1. Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
<b>Description</b>	Configure Bidirectional Forwarding Detection (BFD) sessions to not adapt to changing network conditions.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Group Liveness Detection for DHCP Local Server Clients on page 1395</a></li><li>• <i>Example: Configuring Global Liveness Detection for DHCP Relay Agent Clients</i></li></ul>

## option-60 (DHCP Local Server)

<b>Syntax</b>	option-60;
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server authentication <a href="#">username-include</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit system services dhcp-local-server authentication <a href="#">username-include</a>],</p> <p>[edit system services dhcp-local-server group <i>group-name</i> authentication <a href="#">username-include</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.1.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	Specify that the payload of Option 60 (Vendor Class Identifier) from the client PDU be concatenated with the username during the subscriber authentication or DHCP client authentication process.
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Using External AAA Authentication Services with DHCP on page 1420</a></li> </ul>

## option-82 (DHCP Local Server Authentication)

---

<b>Syntax</b>	<code>option-82 &lt;circuit-id&gt; &lt;remote-id&gt;;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server authentication <a href="#">username-include</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit system services dhcp-local-server authentication <a href="#">username-include</a>],</p> <p>[edit system services dhcp-local-server group <i>group-name</i> authentication <a href="#">username-include</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.1.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	<p>Specify the type of Option 82 information from the client PDU that is concatenated with the username during the subscriber authentication or DHCP client authentication process. You can specify either, both, or neither of the Agent Circuit ID and Agent Remote ID suboptions. If you specify both, the Agent Circuit ID is supplied first, followed by a delimiter, and then the Agent Remote ID. If you specify that neither suboption is supplied, the raw payload of Option 82 from the PDU is concatenated to the username.</p>
<b>Options</b>	<p><b>circuit-id</b>—(Optional) Agent Circuit ID suboption (suboption 1).</p> <p><b>remote-id</b>—(Optional) Agent Remote ID suboption (suboption 2).</p>
<b>Required Privilege Level</b>	<p><b>system</b>—To view this statement in the configuration.</p> <p><b>system-control</b>—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Using External AAA Authentication Services with DHCP on page 1420</a></li></ul>

## option-82 (DHCP Local Server Pool Matching)

<b>Syntax</b>	option-82;
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server <a href="#">pool-match-order</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server <a href="#">pool-match-order</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server <a href="#">pool-match-order</a>],</p> <p>[edit system services dhcp-local-server <a href="#">pool-match-order</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.0.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	<p>Configure the extended DHCP local server to use the option 82 value in the DHCP client DHCP PDU together with the ip-address-first method to determine which address-assignment pool to use. You must configure the <b>ip-address-first</b> statement before configuring the <b>option-82</b> statement. The DHCP local server first determines which address-assignment pool to use based on the ip-address-first method. Then, the local server matches the option 82 value in the client PDU with the option 82 configuration in the address-assignment pool. This statement is supported for IPv4 address-assignment pools only.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring How the Extended DHCP Local Server Determines Which Address-Assignment Pool to Use on page 1442</a></li> <li>• <a href="#">Extended DHCP Local Server Overview on page 1356</a></li> <li>• <a href="#">Address-Assignment Pools Overview on page 1370</a></li> </ul>

## overrides (DHCP Local Server)

---

**Syntax** `overrides {  
 client-discover-match (option60-and-option82 | incoming-interface);  
 delegated-pool;  
 interface-client-limit number;  
 multi-address-embedded-option-response;  
 process-inform {  
 pool pool-name;  
 }  
 rapid-commit;  
}`

**Hierarchy Level** `[edit system services dhcp-local-server],  
[edit system services dhcp-local-server dhcpv6],  
[edit system services dhcp-local-server dhcpv6 group group-name],  
[edit system services dhcp-local-server dhcpv6 group group-name interface interface-name],  
[edit system services dhcp-local-server group group-name],  
[edit system services dhcp-local-server group group-name interface interface-name],  
[edit logical-systems logical-system-name routing-instances routing-instance-name system  
services dhcp-local-server ...],  
[edit logical-systems logical-system-name system services dhcp-local-server ...],  
[edit routing-instances routing-instance-name system services dhcp-local-server ...]`

**Release Information** Statement introduced in Junos OS Release 9.2.  
Statement introduced in Junos OS Release 12.1 for EX Series switches.

**Description** Override the default configuration settings for the extended DHCP local server. Specifying the **overrides** statement with no subordinate statements removes all DHCP local server overrides at that hierarchy level.

- To override global DHCP local server configuration options, include the **overrides** statement and its subordinate statements at the `[edit system services dhcp-local-server]` hierarchy level.
- To override configuration options for a named group of interfaces, include the statements at the `[edit system services dhcp-local-server group group-name]` hierarchy level.
- To override configuration options for a specific interface within a named group of interfaces, include the statements at the `[edit system services dhcp-local-server group group-name interface interface-name]` hierarchy level.
- Use the `[edit system services dhcp-local-server dhcpv6]` hierarchy level to override DHCPv6 configuration options.

The remaining statements are explained separately.

The **interface-client-limit** statement is not supported in the `[edit system services dhcp-local-server dhcpv6]` hierarchy level.

The [delegated-pool](#), [multi-address-embedded-option-response](#), and the [rapid-commit](#) statements are supported in the `[edit system services dhcp-local-server dhcpv6 ...]` hierarchy level only.

<b>Required Privilege</b>	system—To view this statement in the configuration.
<b>Level</b>	system-control—To add this statement to the configuration.

**Release Information** Statement introduced in Junos OS Release 11.4.  
 Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

<b>Description</b>	Configure DHCP or DHCPv6 local server to reply to DHCP information request messages (DHCPINFORM for DHCPv4 and INFORMATION-REQUEST for DHCPv6) with information taken from the specified pool without interacting with AAA.
<b>Options</b>	<b>pool-name</b> —Name of the address pool, which must be configured within <b>family inet</b> for DHCP local server and within <b>family inet6</b> for DHCPv6 local server.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Enabling Processing of Client Information Requests on page 1427</a></li><li>• <a href="#">Overriding Default DHCP Local Server Configuration Settings on page 1423</a></li></ul>

---

## pool-match-order

---

<b>Syntax</b>	<pre>pool-match-order {   external-authority;   ip-address-first;   option-82; }</pre>
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services <b>dhcp-local-server</b> ], [edit logical-systems <i>logical-system-name</i> system services <b>dhcp-local-server</b> ], [edit routing-instances <i>routing-instance-name</i> system services <b>dhcp-local-server</b> ], [edit system services <b>dhcp-local-server</b> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0. Statement introduced in Junos OS Release 12.1.
<b>Description</b>	Configure the order in which the DHCP local server uses information in the DHCP client PDU to determine how to obtain an address for the client.  The remaining statements are explained separately.
<b>Default</b>	DHCP local server uses the <b>ip-address-first</b> method to determine which address pool to use.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring How the Extended DHCP Local Server Determines Which Address-Assignment Pool to Use on page 1442</a></li><li>• <a href="#">Extended DHCP Local Server Overview on page 1356</a></li><li>• <a href="#">Configuring a DHCP Server on Switches (CLI Procedure)</a></li></ul>

## process-inform

<b>Syntax</b>	<pre>process-inform {     pool pool-name; }</pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> interface <i>interface-name</i> <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server group <i>group-name</i> interface <i>interface-name</i> <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> interface <i>interface-name</i> <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server group <i>group-name</i> interface <i>interface-name</i> <a href="#">overrides</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server <a href="#">overrides</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 <a href="#">overrides</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> interface <i>interface-name</i> <a href="#">overrides</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server group <i>group-name</i> interface <i>interface-name</i> <a href="#">overrides</a>],</p> <p>[edit system services dhcp-local-server <a href="#">overrides</a>],</p> <p>[edit system services dhcp-local-server dhcpv6 <a href="#">overrides</a>],</p> <p>[edit system services dhcp-local-server dhcpv6 group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit system services dhcp-local-server dhcpv6 group <i>group-name</i> interface <i>interface-name</i> <a href="#">overrides</a>],</p> <p>[edit system services dhcp-local-server group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit system services dhcp-local-server group <i>group-name</i> interface <i>interface-name</i> <a href="#">overrides</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 11.4.</p> <p>Statement introduced in Junos OS Release 12.1 for EX Series switches.</p>
<b>Description</b>	<p>Enable the processing of DHCP information request messages (DHCPINFORM for DHCPv4 and INFORMATION-REQUEST for DHCPv6) sent from the client to request DHCP options. For DHCP local servers, the messages are also passed to the configured server list.</p>

The remaining statement is explained separately.

**Default** Information request messages are not processed.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

## radius-disconnect (DHCP Local Server)

<b>Syntax</b>	radius-disconnect;
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server reconfigure <a href="#">trigger</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 reconfigure <a href="#">trigger</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server group <i>group-name</i> reconfigure <a href="#">trigger</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> reconfigure <a href="#">trigger</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server reconfigure <a href="#">trigger</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 reconfigure <a href="#">trigger</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server group <i>group-name</i> reconfigure <a href="#">trigger</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> reconfigure <a href="#">trigger</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server reconfigure <a href="#">trigger</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 reconfigure <a href="#">trigger</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server group <i>group-name</i> reconfigure <a href="#">trigger</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> reconfigure <a href="#">trigger</a>],</p> <p>[edit system services dhcp-local-server reconfigure <a href="#">trigger</a>],</p> <p>[edit system services dhcp-local-server dhcpv6 reconfigure <a href="#">trigger</a>],</p> <p>[edit system services dhcp-local-server group <i>group-name</i> reconfigure <a href="#">trigger</a>],</p> <p>[edit system services dhcp-local-server dhcpv6 group <i>group-name</i> reconfigure <a href="#">trigger</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 10.0.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p> <p>Support at the <b>[edit ... dhcpv6 ...]</b> hierarchy levels introduced in Junos OS Release 10.4.</p>
<b>Description</b>	Configure all DHCP clients or only the DHCP clients serviced by the specified group of interfaces to be reconfigured when a RADIUS-initiated disconnect is received by the DHCP client or group of clients. A group configuration takes precedence over a DHCP local server configuration.
<b>Default</b>	The client is deleted when a RADIUS-initiated disconnect is received.
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Dynamic Client Reconfiguration of Extended Local Server Clients on page 1429</a></li> <li>• <a href="#">Configuring Reconfiguration of the Client on Receipt of RADIUS-Initiated Disconnect on page 1433</a></li> </ul>

## rapid-commit (DHCPv6 Local Server)

---

<b>Syntax</b>	rapid-commit;
<b>Hierarchy Level</b>	[edit system services dhcp-local-server <a href="#">dhcpv6 overrides</a> ], [edit system services dhcp-local-server dhcpv6 <a href="#">group group-name overrides</a> ], [edit system services dhcp-local-server dhcpv6 <a href="#">group group-name interface interface-name overrides</a> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services <a href="#">dhcp-local-server dhcpv6 ...</a> ], [edit logical-systems <i>logical-system-name</i> system services <a href="#">dhcp-local-server dhcpv6 ...</a> ], [edit routing-instances <i>routing-instance-name</i> system services <a href="#">dhcp-local-server dhcpv6 ...</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1. Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
<b>Description</b>	Configure DHCPv6 local server to recognize the Rapid Commit option (DHCPv6 option 14) in DHCPv6 solicit messages sent from the DHCPv6 client. When rapid commit is enabled for both DHCPv6 local server and the DHCPv6 client, a two-message handshake is used instead of the standard four-message handshake. You can enable rapid commit support on DHCPv6 local server globally, for a named group, or for a specific interface.
<b>Default</b>	Rapid commit support is not enabled.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Enabling DHCPv6 Rapid Commit Support on page 1428</a></li><li>• <a href="#">Overriding Default DHCP Local Server Configuration Settings on page 1423</a></li></ul>

## reconfigure (DHCP Local Server)

<b>Syntax</b>	<pre>reconfigure {     attempts <i>attempt-count</i>;     clear-on-abort;     strict;     timeout <i>timeout-value</i>;     token <i>token-value</i>;     trigger {         radius-disconnect;     } }</pre>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services <b>dhcp-local-server</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server <b>dhcpv6</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services <b>dhcp-local-server</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server <b>dhcpv6</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server <b>group</b> <i>group-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 <b>group</b> <i>group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services <b>dhcp-local-server</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server <b>dhcpv6</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server <b>group</b> <i>group-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 <b>group</b> <i>group-name</i>],</p> <p>[edit system services <b>dhcp-local-server</b>],</p> <p>[edit system services dhcp-local-server <b>dhcpv6</b>],</p> <p>[edit system services dhcp-local-server <b>group</b> <i>group-name</i>],</p> <p>[edit system services dhcp-local-server dhcpv6 <b>group</b> <i>group-name</i>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 10.0.</p> <p>Support at the [edit ... <b>dhcpv6</b> ...] hierarchy levels introduced in Junos OS Release 10.4.</p> <p>Statement introduced in Junos OS Release 12.1 for EX Series switches.</p>
<b>Description</b>	<p>Enable dynamic reconfiguration triggered by the DHCP local server of all DHCP clients or only the DHCP clients serviced by the specified group of interfaces. A group configuration takes precedence over a DHCP local server configuration. The <b>strict</b> statement is available only for DHCPv6.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>

## relay-agent-interface-id (DHCP Local Server)

---

<b>Syntax</b>	relay-agent-interface-id;
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 authentication <a href="#">username-include</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit system services dhcp-local-server dhcpv6 authentication <a href="#">username-include</a>],</p> <p>[edit system services dhcp-local-server dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.6.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	Specify that the DHCPv6 Relay Agent Interface-ID option (option 18) in the client PDU name is concatenated with the username during the subscriber authentication or DHCP client authentication process.
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Creating Unique Usernames for DHCP Clients on page 1439</a></li></ul>

## relay-agent-remote-id (DHCP Local Server)

<b>Syntax</b>	relay-agent-remote-id;
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 authentication <a href="#">username-include</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit system services dhcp-local-server dhcpv6 authentication <a href="#">username-include</a>],</p> <p>[edit system services dhcp-local-server dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.6.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p> <p>For MX Series routers only, <b>enterprise-id</b> and <b>remote-id</b> options introduced in Junos OS Release 12.3R3.</p> <p>For MX Series routers only, the <b>enterprise-id</b> and <b>remote-id</b> options are obsoleted starting in Junos OS Releases 12.3R7, 13.2R4, 13.3R2, and 14.1R1.</p>
<b>Description</b>	Specify that the DHCPv6 Relay Agent Remote-ID option (option 37) in the client PDU name is concatenated with the username during the subscriber authentication or DHCP client authentication process. In order to generate an ASCII version of the username, the router concatenates only the remote-id portion of option 37 to the username, and ignores the enterprise number.
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Creating Unique Usernames for DHCP Clients on page 1439</a></li> </ul>

## routing-instance-name (DHCP Local Server)

<b>Syntax</b>	routing-instance-name;
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services <b>dhcp-local-server authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server <b>dhcpv6 authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 <b>group group-name authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server <b>group group-name authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services <b>dhcp-local-server authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server <b>dhcpv6 authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 <b>group group-name authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server <b>group group-name authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services <b>dhcp-local-server authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server <b>dhcpv6 authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 <b>group group-name authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server <b>group group-name authentication username-include</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services <b>dhcp-local-server authentication username-include</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server <b>dhcpv6 authentication username-include</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 <b>group group-name authentication username-include</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server <b>group group-name authentication username-include</b>],</p> <p>[edit system services <b>dhcp-local-server authentication username-include</b>],</p> <p>[edit system services dhcp-local-server <b>dhcpv6 authentication username-include</b>],</p> <p>[edit system services dhcp-local-server dhcpv6 <b>group group-name authentication username-include</b>],</p> <p>[edit system services dhcp-local-server <b>group group-name authentication username-include</b>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.1.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	Specify that the routing instance name be concatenated with the username during the subscriber authentication or DHCP client authentication process. No routing instance name is concatenated if the configuration is in the default routing instance.
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>

## service-profile (DHCP Local Server)

<b>Syntax</b>	<code>service-profile <i>dynamic-profile-name</i>;</code>
<b>Hierarchy Level</b>	<p>[edit system services <a href="#">dhcp-local-server</a>],  [edit system services dhcp-local-server <a href="#">dhcpv6</a>],  [edit system services dhcp-local-server dhcpv6 group <i>group-name</i>],  [edit system services dhcp-local-server dhcpv6 group <i>group-name</i> <a href="#">interface</a> <i>interface-name</i>],  [edit system services dhcp-local-server <a href="#">group</a> <i>group-name</i>],  [edit system services dhcp-local-server group <i>group-name</i> <a href="#">interface</a> <i>interface-name</i>],  [edit logical-systems <i>logical-system-name</i> system services <a href="#">dhcp-local-server</a> ...],  [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services <a href="#">dhcp-local-server</a> ...],  [edit routing-instances <i>routing-instance-name</i> system services <a href="#">dhcp-local-server</a> ...]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 11.2.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	<p>Specify the default subscriber service or DHCP client management service, which is activated when the subscriber or client logs in and no other service is activated by a RADIUS server or a provisioning server.</p> <ul style="list-style-type: none"> <li>• To specify the default service for all DHCP local server clients, include the <b>service-profile</b> statement at the <b>[edit system services dhcp-local-server]</b> hierarchy level.</li> <li>• To specify the default service for a named group of interfaces, include the <b>service-profile</b> statement at the <b>[edit system services dhcp-local-server group <i>group-name</i>]</b> hierarchy level.</li> <li>• To specify the default service for a particular interface within a named group of interfaces, include the <b>service-profile</b> statement at the <b>[edit system services dhcp-local-server group <i>group-name</i> interface <i>interface-name</i>]</b> hierarchy level.</li> <li>• For DHCPv6 clients, use the <b>service-profile</b> statement at the <b>[edit system services dhcp-local-server dhcpv6]</b> hierarchy level.</li> </ul>
<b>Options</b>	<b><i>dynamic-profile-name</i></b> —Name of the dynamic profile that defines the service.
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Extended DHCP Local Server Overview on page 1356</a></li> <li>• <a href="#">Default Subscriber Service Overview</a></li> <li>• <a href="#">Configuring a Default Subscriber Service</a></li> </ul>

## session-mode

---

<b>Syntax</b>	session-mode (automatic   multihop   singlehop);
<b>Hierarchy Level</b>	[edit system services dhcp-local-server liveness-detection method <a href="#">bfd</a> ], [edit system services dhcp-local-server dhcpv6 liveness-detection method <a href="#">bfd</a> ], [edit forwarding-options dhcp-relay liveness-detection], [edit forwarding-options dhcp-relay dhcpv6 liveness-detection method <a href="#">bfd</a> ], [edit system services dhcp-local-server group <i>group-name</i> liveness-detection method <a href="#">bfd</a> ], [edit system services dhcp-local-server dhcpv6 group <i>group-name</i> liveness-detection method <a href="#">bfd</a> ], [edit forwarding-options dhcp-relay group <i>group-name</i> liveness-detection method <a href="#">bfd</a> ], [edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> liveness-detection method <a href="#">bfd</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1. Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
<b>Description</b>	Configure the session mode.
<b>Options</b>	<b>automatic</b> —Configure single-hop BFD sessions if the peer is directly connected to the router interface and multihop BFD sessions if the peer is not directly connected to the router interface.  <b>multihop</b> —Configure multihop BFD sessions.  <b>single-hop</b> —Configure single hop BFD sessions.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Group Liveness Detection for DHCP Local Server Clients on page 1395</a></li><li>• <i>Example: Configuring Global Liveness Detection for DHCP Relay Agent Clients</i></li></ul>

## strict (DHCP Local Server)

<b>Syntax</b>	strict;
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 <a href="#">reconfigure</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> <a href="#">reconfigure</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 <a href="#">reconfigure</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> <a href="#">reconfigure</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 <a href="#">reconfigure</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> <a href="#">reconfigure</a>],</p> <p>[edit system services dhcp-local-server dhcpv6 <a href="#">reconfigure</a>],</p> <p>[edit system services dhcp-local-server dhcpv6 group <i>group-name</i> <a href="#">reconfigure</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 10.4.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	Specify whether the server denies a client to bind when the client does not indicate that it accepts reconfigure messages. This feature is available only for DHCPv6.
<b>Default</b>	Accept solicit messages from clients that do not support reconfiguration and permit them to bind.
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Dynamic Client Reconfiguration of Extended Local Server Clients on page 1429</a></li> <li>• <a href="#">Preventing Binding of Clients That Do Not Support Reconfigure Messages on page 1434</a></li> </ul>

## threshold (detection-time)

<b>Syntax</b>	<code>threshold <i>milliseconds</i>;</code>
<b>Hierarchy Level</b>	<p>[edit system services dhcp-local-server liveness-detection method bfd <a href="#">detection-time</a>],</p> <p>[edit system services dhcp-local-server dhcpv6 liveness-detection method bfd <a href="#">detection-time</a>],</p> <p>[edit forwarding-options dhcp-relay liveness-detection method bfd <a href="#">detection-time</a>],</p> <p>[edit forwarding-options dhcp-relay dhcpv6 liveness-detection method bfd <a href="#">detection-time</a>],</p> <p>[edit system services dhcp-local-server group <i>group-name</i> liveness-detection method bfd <a href="#">detection-time</a>],</p> <p>[edit system services dhcp-local-server dhcpv6 group <i>group-name</i> liveness-detection method bfd <a href="#">detection-time</a>],</p> <p>[edit forwarding-options dhcp-relay group <i>group-name</i> liveness-detection method bfd <a href="#">detection-time</a>],</p> <p>[edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> liveness-detection method bfd <a href="#">detection-time</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 12.1.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	Specify the threshold for the adaptation of the detection time. When the BFD session detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.
<div>  <p><b>NOTE:</b> The threshold time must be greater than or equal to the <code>minimum-interval</code> or the <code>minimum-receive-interval</code>.</p> </div>	
<b>Options</b>	<p><i>milliseconds</i>— Value for the detection time adaptation threshold.</p> <p><b>Range:</b> 1 through 255,000</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Group Liveness Detection for DHCP Local Server Clients on page 1395</a></li> <li>• <a href="#">Example: Configuring Global Liveness Detection for DHCP Relay Agent Clients</a></li> </ul>

## threshold (transmit-interval)

<b>Syntax</b>	<code>threshold <i>milliseconds</i>;</code>
<b>Hierarchy Level</b>	<p>[edit system services dhcp-local-server liveness-detection method bfd <a href="#">transmit-interval</a>],</p> <p>[edit system services dhcp-local-server dhcpv6 liveness-detection method bfd <a href="#">transmit-interval</a>],</p> <p>[edit forwarding-options dhcp-relay liveness-detection method bfd <a href="#">transmit-interval</a>],</p> <p>[edit forwarding-options dhcp-relay dhcpv6 liveness-detection method bfd <a href="#">transmit-interval</a>],</p> <p>[edit system services dhcp-local-server group <i>group-name</i> liveness-detection method bfd <a href="#">transmit-interval</a>],</p> <p>[edit system services dhcp-local-server dhcpv6 group <i>group-name</i> liveness-detection method bfd <a href="#">transmit-interval</a>],</p> <p>[edit forwarding-options dhcp-relay group <i>group-name</i> liveness-detection method bfd <a href="#">transmit-interval</a>],</p> <p>[edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> liveness-detection method bfd <a href="#">transmit-interval</a>]</p>
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1.
<b>Description</b>	Specify the threshold for detecting the adaptation of the transmit interval. When the BFD session transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent.
<b>Options</b>	<p><i>milliseconds</i> — Threshold value.</p> <p><b>Range:</b> 0 through 4,294,967,295 (<math>2^{32} - 1</math>)</p>
<div>  <p><b>NOTE:</b> The threshold value specified in the <code>threshold</code> statement must be greater than the value specified in the <code>minimum-interval</code> statement for the <code>transmit-interval</code> statement.</p> </div>	
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Group Liveness Detection for DHCP Local Server Clients on page 1395</a></li> <li>• <a href="#">Example: Configuring Global Liveness Detection for DHCP Relay Agent Clients</a></li> </ul>

## timeout (DHCP Local Server)

<b>Syntax</b>	<code>timeout <i>timeout-value</i>;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server <a href="#">reconfigure</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 <a href="#">reconfigure</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server group <i>group-name</i> <a href="#">reconfigure</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> <a href="#">reconfigure</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server <a href="#">reconfigure</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 <a href="#">reconfigure</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server group <i>group-name</i> <a href="#">reconfigure</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> <a href="#">reconfigure</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server <a href="#">reconfigure</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 <a href="#">reconfigure</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server group <i>group-name</i> <a href="#">reconfigure</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> <a href="#">reconfigure</a>],</p> <p>[edit system services dhcp-local-server <a href="#">reconfigure</a>],</p> <p>[edit system services dhcp-local-server dhcpv6 <a href="#">reconfigure</a>],</p> <p>[edit system services dhcp-local-server group <i>group-name</i> <a href="#">reconfigure</a>],</p> <p>[edit system services dhcp-local-server dhcpv6 group <i>group-name</i> <a href="#">reconfigure</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 10.0.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p> <p>Support at the [edit ... dhcpv6 ...] hierarchy levels introduced in Junos OS Release 10.4.</p>
<b>Description</b>	Configure the initial value in seconds between attempts to reconfigure all DHCP clients or only the DHCP clients serviced by the specified group of interfaces.
<b>Options</b>	<p><b><i>timeout-value</i></b>—Initial retry timeout value.</p> <p><b>Range:</b> 1 through 10 seconds</p> <p><b>Default:</b> 2 seconds</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">Configuring Dynamic Client Reconfiguration of Extended Local Server Clients on page 1429</a></li> <li><a href="#">Configuring Dynamic Reconfiguration Attempts for DHCP Clients on page 1432</a></li> </ul>

## token (DHCP Local Server)

<b>Syntax</b>	<code>token <i>token-value</i>;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server <a href="#">reconfigure</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 <a href="#">reconfigure</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server group <i>group-name</i> <a href="#">reconfigure</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> <a href="#">reconfigure</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server <a href="#">reconfigure</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 <a href="#">reconfigure</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server group <i>group-name</i> <a href="#">reconfigure</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> <a href="#">reconfigure</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server <a href="#">reconfigure</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 <a href="#">reconfigure</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server group <i>group-name</i> <a href="#">reconfigure</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 group <i>group-name</i> <a href="#">reconfigure</a>],</p> <p>[edit system services dhcp-local-server <a href="#">reconfigure</a>],</p> <p>[edit system services dhcp-local-server dhcpv6 <a href="#">reconfigure</a>],</p> <p>[edit system services dhcp-local-server group <i>group-name</i> <a href="#">reconfigure</a>],</p> <p>[edit system services dhcp-local-server dhcpv6 group <i>group-name</i> <a href="#">reconfigure</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 10.0.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p> <p>Support at the [edit ... dhcpv6 ...] hierarchy levels introduced in Junos OS Release 10.4.</p>
<b>Description</b>	<p>Configure a plain-text token for all DHCP clients or only the DHCP clients serviced by the specified group of interfaces. The token enables rudimentary entity authentication to protect against inadvertently instantiated DHCP servers. A null token (empty string) indicates that the configuration token functionality is not enabled. A group configuration takes precedence over a DHCP local server configuration. For more information about tokens, see RFC 3118, <i>Authentication for DHCP Messages</i>, section 4.</p>
<b>Options</b>	<p><b><i>token-value</i></b>—Plain-text alphanumeric string.</p> <p><b>Default:</b> null (empty string)</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Dynamic Client Reconfiguration of Extended Local Server Clients on page 1429</a></li> <li>• <a href="#">Configuring a Token for DHCP Local Server Authentication on page 1434</a></li> </ul>

## traceoptions (DHCP Server)

---

<b>Syntax</b>	<pre>traceoptions {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;match <i>regex</i>&gt; &lt;size <i>size</i>&gt; &lt;world-readable       no-world-readable&gt;;     flag <i>flag</i>; }</pre>
<b>Hierarchy Level</b>	[edit system services dhcp]
<b>Release Information</b>	Statement for tracing J Series Services Router DHCP processes introduced in Junos OS Release 8.0. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Define tracing operations for DHCP processes for J Series Services Routers and EX Series switches.
<b>Options</b>	<p><b>file <i>filename</i></b>—Name of the file that receives the output of the tracing operation. Enclose the name in quotation marks. All files are placed in the directory <i>/var/log</i>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b><i>trace-file</i></b> reaches its maximum size, it is renamed <b><i>trace-file.0</i></b>, then <b><i>trace-file.1</i></b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option and a filename.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"><li>• <b>all</b>—All tracing operations</li><li>• <b>binding</b>—Trace binding operations</li><li>• <b>config</b>—Log reading of configuration</li><li>• <b>conflict</b>—Trace user-detected conflicts for IP addresses</li><li>• <b>event</b>—Trace important events</li><li>• <b>ifdb</b>—Trace interface database operations</li><li>• <b>io</b>— Trace I/O operations</li><li>• <b>lease</b>—Trace lease operations</li><li>• <b>main</b>—Trace main loop operations</li><li>• <b>misc</b>— Trace miscellaneous operations</li><li>• <b>packet</b>—Trace DHCP packets</li></ul>

- **options**—Trace DHCP options
- **pool**—Trace address pool operations
- **protocol**—Trace protocol operations
- **rtsock**—Trace routing socket operations
- **scope**—Trace scope operations
- **signal**—Trace DHCP signal operations
- **trace**—All tracing operations
- **ui**—Trace user interface operations

**match *regex***—(Optional) Refine the output to include lines that contain the regular expression.

- **all**—All tracing operations
- **binding**—Trace binding operations
- **config**—Log reading of configuration
- **conflict**—Trace user-detected conflicts for IP addresses
- **event**—Trace important events
- **ifdb**—Trace interface database operations
- **io**—Trace I/O operations
- **lease**—Trace lease operations
- **main**—Trace main loop operations
- **match *regex***—Refine the output to include lines that contain the regular expression.
- **misc**—Trace miscellaneous operations
- **packet**—Trace DHCP packets
- **options**—Trace DHCP options
- **pool**—Trace address pool operations
- **protocol**—Trace protocol operations
- **rtsock**—Trace routing socket operations
- **scope**—Trace scope operations
- **signal**—Trace DHCP signal operations
- **trace**—All tracing operations
- **ui**—Trace user interface operations

**no-world-readable**—(Optional) Disable unrestricted file access.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option and filename.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through 1 GB

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.

## use-primary (DHCP Local Server)

<b>Syntax</b>	<code>use-primary <i>primary-profile-name</i>;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server <b>dynamic-profile</b> <i>profile-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server group <i>group-name</i> <b>dynamic-profile</b> <i>profile-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server <b>dynamic-profile</b> <i>profile-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server group <i>group-name</i> <b>dynamic-profile</b> <i>profile-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server <b>dynamic-profile</b> <i>profile-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server group <i>group-name</i> <b>dynamic-profile</b> <i>profile-name</i>],</p> <p>[edit system services dhcp-local-server <b>dynamic-profile</b> <i>profile-name</i>],</p> <p>[edit system services dhcp-local-server group <i>group-name</i> <b>dynamic-profile</b> <i>profile-name</i>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.3.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	Specify the dynamic profile to configure as the primary dynamic profile. The primary dynamic profile is instantiated when the first subscriber or DHCP client logs in. Subsequent subscribers (or clients) are not assigned the primary dynamic profile; instead, they are assigned the dynamic profile specified for the interface. When the first subscriber (or client) logs out, the next subscriber (or client) that logs in is assigned the primary dynamic profile.
<b>Options</b>	<b><i>primary-profile-name</i></b> —Name of the dynamic profile to configure as the primary dynamic profile
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Attaching Dynamic Profiles to DHCP Subscriber Interfaces or DHCP Client Interfaces</i></li> </ul>

## user-prefix (DHCP Local Server)

<b>Syntax</b>	<code>user-prefix <i>user-prefix-string</i>;</code>
<b>Hierarchy Level</b>	<p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services <b>dhcp-local-server authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server <b>dhcpv6 authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 <b>group group-name authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server <b>group group-name authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services <b>dhcp-local-server authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server <b>dhcpv6 authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server dhcpv6 <b>group group-name authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> system services dhcp-local-server <b>group group-name authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services <b>dhcp-local-server authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server <b>dhcpv6 authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 <b>group group-name authentication username-include</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> system services dhcp-local-server <b>group group-name authentication username-include</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services <b>dhcp-local-server authentication username-include</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server <b>dhcpv6 authentication username-include</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server dhcpv6 <b>group group-name authentication username-include</b>],</p> <p>[edit routing-instances <i>routing-instance-name</i> system services dhcp-local-server <b>group group-name authentication username-include</b>],</p> <p>[edit system services <b>dhcp-local-server authentication username-include</b>],</p> <p>[edit system services dhcp-local-server <b>dhcpv6 authentication username-include</b>],</p> <p>[edit system services dhcp-local-server dhcpv6 <b>group group-name authentication username-include</b>],</p> <p>[edit system services dhcp-local-server <b>group group-name authentication username-include</b>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.1.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	Specify the user prefix that is concatenated with the username during the subscriber authentication or DHCP client authentication process.
<b>Options</b>	<i>user-prefix-string</i> —User prefix string.
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>

## **[edit forwarding-options dhcp-relay] Configuration Statement Hierarchy for EX Series Switches**

This topic lists supported and unsupported configuration statements in the **[edit forwarding-options dhcp-relay]** hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.
- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.

- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see [Feature Explorer](#).

This topic lists:

- [Supported Statements in the \[edit forwarding-options dhcp-relay\] Hierarchy Level on page 1551](#)
- [Unsupported Statements in the \[edit forwarding-options dhcp-relay\] Hierarchy Level on page 1555](#)

### Supported Statements in the [edit forwarding-options dhcp-relay] Hierarchy Level

The following hierarchy shows the **[edit forwarding-options dhcp-relay]** configuration statements supported on EX Series switches:

```
forwarding-options {
  dhcp-relay {
    active-server-group server-group-name;
    arp-inspection;
    authentication {
      ...
    }
  }
  authentication {
    password password-string;
  }
  username-include {
    circuit-type;
    client-id;
    delimiter delimiter-character;
    domain-name domain-name-string;
    interface-name;
    mac-address;
    option-60;
    option-82 <circuit-id> <remote-id>;
    relay-agent-interface-id;
    relay-agent-remote-id;
    relay-agent-subscriber-id;
    routing-instance-name;
    user-prefix user-prefix-string;
  }
  dhcpv6 {
    active-server-group server-group-name;
    authentication {
      ...
    }
    dynamic-profile profile-name {
      aggregate-clients (merge | replace);
      use-primary primary-profile-name;
    }
    group group-name {
      ...
    }
  }
}
```

```
}
liveness-detection {
  failure-action (clear-binding | clear-binding-if-interface-up | log-only);
  method {
    ...
  }
}
}
overrides {
  ...
}
relay-agent-interface-id;
relay-option {
  ...
}
server-group {
  server-group-name {
    server-ip-address;
  }
}
service-profile dynamic-profile-name;
OBSOLETE – duplicate-clients-on-interface;
dynamic-profile profile-name {
  aggregate-clients (merge | replace);
  use-primary primary-profile-name;
}
forward-snooped-clients (all-interfaces | configured-interfaces |
non-configured-interfaces);
group group-name {
  active-server-group server-group-name;
  authentication {
    ...
  }
  dynamic-profile profile-name {
    aggregate-clients (merge | replace);
    use-primary primary-profile-name;
  }
  interface interface-name {
    exclude;
    liveness-detection {
      ...
    }
  }
  overrides {
    ...
  }
  service-profile dynamic-profile-name;
  trace;
  upto upto-interface-name;
}
overrides {
  allow-snooped-clients;
  always-write-giaddr;
  always-write-option-82;
  client-discover-match <option60-and-option82>;
```

```

disable-relay;
interface-client-limit number;
layer2-unicast-replies;
no-allow-snooped-clients;
no-bind-on-request;
proxy-mode;
replace-ip-source-with;
send-release-on-delete;
trust-option-82;
}
relay-agent-interface-id {
    prefix prefix;
    use-interface-description (logical | device);
}
relay-option {

### Unsupported Statements in the [edit forwarding-options dhcp-relay] Hierarchy Level

All statements in the [edit forwarding-options dhcp-relay] hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented with the following exceptions:

**Table 144: Unsupported [edit forwarding-options] Configuration Statements on EX Series Switches**

Statement	Hierarchy Level
-----------	-----------------

**NOTE:** Variables, such as *filename*, are not shown in the statements or hierarchies.

logical-system-name	[edit forwarding-options dhcp-relay authentication]
---------------------	---

## access (Dynamic Access Routes)

---

Syntax	<pre>access {   route <i>prefix</i> {     <i>next-hop</i> <i>next-hop</i>;     metric <i>route-cost</i>;     <i>preference</i> <i>route-distance</i>;     tag <i>route-tag</i>;   } }</pre>
Hierarchy Level	[edit dynamic-profiles <i>profile-name</i> routing-instances \$junos-routing-instance routing-options], [edit dynamic-profiles <i>profile-name</i> routing-instances \$junos-routing-instance routing-options rib <i>routing-table-name</i> ], [edit dynamic-profiles <i>profile-name</i> routing-options]
Release Information	Statement introduced in Junos OS Release 9.5. Support at the [edit dynamic-profiles <i>profile-name</i> routing-instances \$junos-routing-instance routing-options] and [edit dynamic-profiles <i>profile-name</i> routing-instances \$junos-routing-instance routing-options rib <i>routing-table-name</i> ] hierarchy levels introduced in Junos OS Release 10.1.
Description	Dynamically configure access routes.
<div> <b>BEST PRACTICE:</b> We recommend that you always include the <code>access-internal</code> stanza in the dynamic-profile when the <code>access</code> stanza is present for framed-route support.</div>	
Options	The remaining statements are explained separately.
Required Privilege Level	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li><i>Configuring Dynamic Access Routes for Subscriber Management</i></li></ul>

## access-internal (Dynamic Access-Internal Routes)

<b>Syntax</b>	<pre>access-internal {   route <i>subscriber-ip-address</i> {     qualified-next-hop <i>underlying-interface</i> {       mac-address <i>address</i>;     }   } }</pre>
<b>Hierarchy Level</b>	<p>[edit dynamic-profiles <i>profile-name</i> routing-instances \$junos-routing-instance routing-options],</p> <p>[edit dynamic-profiles <i>profile-name</i> routing-instances \$junos-routing-instance routing-options rib <i>routing-table-name</i>],</p> <p>[edit dynamic-profiles routing-options]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.5.</p> <p>Support at the [edit dynamic-profiles <i>profile-name</i> routing-instances \$junos-routing-instance routing-options] and [edit dynamic-profiles <i>profile-name</i> routing-instances \$junos-routing-instance routing-options rib <i>routing-table-name</i>] hierarchy levels introduced in Junos OS Release 10.1.</p>
<b>Description</b>	<p>Dynamically configure access-internal routes. Access-internal routes are optional, but are used instead of access routes if the next-hop address is not specified in the Framed-Route Attribute [22] for IPv4 or the Framed-IPv6-Route attribute [99] for IPv6.</p>

**BEST PRACTICE:** We recommend that you always include the `access-internal` stanza in the dynamic-profile when the `access` stanza is present for framed-route support.

The remaining statements are explained separately.

<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring Dynamic Access-Internal Routes for DHCP Subscriber Management</i></li> <li>• <i>Configuring Dynamic Access-Internal Routes for PPP Subscriber Management</i></li> </ul>

## active-server-group

<b>Syntax</b>	<code>active-server-group <i>server-group-name</i>;</code>
<b>Hierarchy Level</b>	<pre> [edit forwarding-options dhcp-relay], [edit forwarding-options dhcp-relay <b>dhcpv6</b>], [edit forwarding-options dhcp-relay <b>group</b> <i>group-name</i>], [edit forwarding-options dhcp-relay <b>group</b> <i>group-name</i> <b>dhcpv6</b>], [edit logical-systems <i>logical-system-name</i> forwarding-options <b>dhcp-relay</b>], [edit logical-systems <i>logical-system-name</i> forwarding-options <b>dhcp-relay</b> <b>dhcpv6</b>], [edit logical-systems <i>logical-system-name</i> forwarding-options <b>group</b> <i>group-name</i>], [edit logical-systems <i>logical-system-name</i> forwarding-options <b>group</b> <i>group-name</i> <b>dhcpv6</b>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i>   forwarding-options <b>dhcp-relay</b>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i>   forwarding-options <b>dhcp-relay</b> <b>dhcpv6</b>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i>   forwarding-options dhcp-relay <b>group</b> <i>group-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i>   forwarding-options dhcp-relay <b>group</b> <i>group-name</i> <b>dhcpv6</b>], [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay] [edit routing-instances <i>routing-instance-name</i> forwarding-options <b>dhcp-relay</b> <b>dhcpv6</b>], [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay <b>group</b>   <i>group-name</i>], [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 <b>group</b>   <i>group-name</i>] </pre>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.3.</p> <p>Support at the <b>[edit ... dhcpv6]</b> hierarchy levels introduced in Junos OS Release 11.4.</p> <p>Statement introduced in Junos OS Release 12.1 for EX Series switches.</p>
<b>Description</b>	<p>Apply a DHCP relay agent configuration to the named group of DHCP server addresses. Use the statement at the <b>[edit ... dhcpv6]</b> hierarchy levels to configure DHCPv6 support.</p> <p>A group-specific configuration overrides a global option.</p>
<b>Options</b>	<b><i>server-group-name</i></b> —Name of the group of DHCP or DHCPv6 server addresses to which the DHCP or DHCPv6 relay agent configuration applies.
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Extended DHCP Relay Agent Overview on page 1379</a></li> <li>• <a href="#">Configuring Active Server Groups on page 1469</a></li> <li>• <a href="#">Configuring Group-Specific DHCP Relay Options on page 1384</a></li> <li>• <a href="#">dhcp-relay on page 1570</a></li> </ul>

## allow-snooped-clients

<b>Syntax</b>	allow-snooped-clients;
<b>Hierarchy Level</b>	<p>[edit forwarding-options dhcp-relay <b>dhcpv6</b> group <i>group-name</i> interface <i>interface-name</i> <b>overrides</b>],</p> <p>[edit forwarding-options dhcp-relay <b>dhcpv6</b> group <i>group-name</i> <b>overrides</b>],</p> <p>[edit forwarding-options dhcp-relay <b>dhcpv6</b> <b>overrides</b>],</p> <p>[edit forwarding-options dhcp-relay group <i>group-name</i> interface <i>interface-name</i> <b>overrides</b>],</p> <p>[edit forwarding-options dhcp-relay group <i>group-name</i> <b>overrides</b>],</p> <p>[edit forwarding-options dhcp-relay <b>overrides</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options <b>dhcp-relay</b> ...],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options <b>dhcp-relay</b> ...],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options <b>dhcp-relay</b> ...]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 10.2.</p> <p>Support at the [edit ... <b>dhcpv6</b>] hierarchy levels introduced in Junos OS Release 12.1.</p>
<b>Description</b>	<p>Explicitly enable DHCP snooping support on the router.</p> <p>Use the statement at the [edit ... <b>dhcpv6</b>] hierarchy levels to explicitly enable snooping support on the router for DHCPv6 relay agent.</p>
<div>  <b>NOTE:</b> DHCP snooping is <i>disabled</i> by default.         </div>	
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Extended DHCP Relay Agent Overview on page 1379</a></li> <li>• <a href="#">Overriding the Default DHCP Relay Configuration Settings on page 1447</a></li> <li>• <a href="#">DHCP Snooping Support on page 1367</a></li> </ul>

## always-write-giaddr

---

<b>Syntax</b>	<code>always-write-giaddr;</code>
<b>Hierarchy Level</b>	<code>[edit forwarding-options dhcp-relay <a href="#">overrides</a>],</code> <code>[edit forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>],</code> <code>[edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay <a href="#">overrides</a>],</code> <code>[edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay <a href="#">overrides</a>],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>],</code> <code>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay <a href="#">overrides</a>],</code> <code>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>],</code> <code>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> interface <i>interface-name</i> <a href="#">overrides</a>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 8.3. Statement introduced in Junos OS Release 12.1 for EX Series switches.
<b>Description</b>	Overwrite the gateway IP address (giaddr) of every DHCP packet with the giaddr of the DHCP relay agent before forwarding the packet to the DHCP server.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Extended DHCP Relay Agent Overview on page 1379</a></li><li>• <a href="#">dhcp-relay on page 1570</a></li></ul>

## always-write-option-82

<b>Syntax</b>	<code>always-write-option-82;</code>
<b>Hierarchy Level</b>	<p>[edit forwarding-options dhcp-relay <a href="#">overrides</a>],  [edit forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>],  [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay <a href="#">overrides</a>],  [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>],  [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay <a href="#">overrides</a>],  [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>],  [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay <a href="#">overrides</a>],  [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>],  [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> interface <i>interface-name</i> <a href="#">overrides</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.3.  Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	<p>Override the DHCP relay agent information option (option 82) in DHCP packets destined for a DHCP server. The use of this option causes the DHCP relay agent to perform one of the following actions, depending on how it is configured:</p> <ul style="list-style-type: none"> <li>• If the DHCP relay agent is configured to add option 82 information to DHCP packets, it clears the existing option 82 values from the DHCP packets and inserts the new values before forwarding the packets to the DHCP server.</li> <li>• If the DHCP relay agent is not configured to add option 82 information to DHCP packets, it clears the existing option 82 values from the packets, but does not add any new values before forwarding the packets to the DHCP server.</li> </ul>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.  interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Extended DHCP Relay Agent Overview on page 1379</a></li> </ul>

## authentication (DHCP Relay Agent)

---

Syntax	<pre>authentication {   password <i>password-string</i>;   username-include {     circuit-type;     client-id;     delimiter <i>delimiter-character</i>;     domain-name <i>domain-name-string</i>;     interface-name;     logical-system-name;     mac-address;     option-60;     option-82 &lt;circuit-id&gt; &lt;remote-id&gt;;     relay-agent-interface-id;     relay-agent-remote-id;     relay-agent-subscriber-id;     routing-instance-name;     user-prefix <i>user-prefix-string</i>;   } }</pre>
Hierarchy Level	<pre>[edit forwarding-options dhcp-relay], [edit forwarding-options dhcp-relay <b>dhcpv6</b>], [edit forwarding-options dhcp-relay dhcpv6 <b>group</b> <i>group-name</i>], [edit forwarding-options dhcp-relay <b>group</b> <i>group-name</i>], [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay ...], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i>   forwarding-options dhcp-relay ...], [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay ...]</pre>
Release Information	<p>Statement introduced in Junos OS Release 9.1.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p> <p>Support at the <b>[edit ... dhcpv6]</b> hierarchy levels introduced in Junos OS Release 11.4.</p>
Description	<p>Configure the parameters the router sends to the external AAA server. A group configuration takes precedence over a global DHCP relay configuration. Use the statement at the <b>[edit...dhcpv6]</b> hierarchy levels to configure DHCPv6 support.</p> <p>The remaining statements are explained separately.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">dhcp-relay on page 1570</a></li><li>• <a href="#">Using External AAA Authentication Services with DHCP on page 1420</a></li></ul>

## bfd

<b>Syntax</b>	<pre> bfd {   version (0   1   automatic);   minimum-interval <i>milliseconds</i>;   minimum-receive-interval <i>milliseconds</i>;   multiplier <i>number</i>;   no-adaptation;   transmit-interval {     minimum-interval <i>milliseconds</i>;     threshold <i>milliseconds</i>;   }   detection-time {     threshold <i>milliseconds</i>;   }   session-mode (automatic   multihop   singlehop);   holddown-interval <i>milliseconds</i>; } </pre>
<b>Hierarchy Level</b>	<p>[edit system services dhcp-local-server liveness-detection <a href="#">method</a>],  [edit system services dhcp-local-server dhcpv6 liveness-detection <a href="#">method</a>],  [edit forwarding-options dhcp-relay liveness-detection <a href="#">method</a>],  [edit forwarding-options dhcp-relay dhcpv6 liveness-detection <a href="#">method</a>],  [edit system services dhcp-local-server group <i>group-name</i> liveness-detection <a href="#">method</a>],  [edit system services dhcp-local-server dhcpv6 group <i>group-name</i> liveness-detection <a href="#">method</a>],  [edit forwarding-options dhcp-relay group <i>group-name</i> liveness-detection <a href="#">method</a>],  [edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> liveness-detection <a href="#">method</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 12.1.  Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	<p>Configure Bidirectional Forwarding Detection (BFD) as the liveness detection method.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.  routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Group Liveness Detection for DHCP Local Server Clients on page 1395</a></li> <li>• <a href="#">Example: Configuring Global Liveness Detection for DHCP Relay Agent Clients</a></li> </ul>

## circuit-id (DHCP Relay Agent)

<b>Syntax</b>	<pre> circuit-id {   prefix <i>prefix</i>;   use-interface-description (logical   device);   use-vlan-id; } </pre>
<b>Hierarchy Level</b>	<pre> [edit forwarding-options dhcp-relay <a href="#">relay-option-82</a>], [edit forwarding-options dhcp-relay group <i>group-name</i> <a href="#">relay-option-82</a>], [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay <a href="#">relay-option-82</a>], [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">relay-option-82</a>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay <a href="#">relay-option-82</a>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">relay-option-82</a>], [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay <a href="#">relay-option-82</a>], [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">relay-option-82</a>] </pre>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.3.</p> <p>Statement introduced in Junos OS Release 12.3 for EX Series switches.</p>
<b>Description</b>	<p>Specify the Agent Circuit ID suboption (suboption 1) of the DHCP relay agent information option (option 82) to include in DHCP packets destined for a DHCP server. Optionally specify that the suboption includes a prefix or textual description, or VLAN tag.</p> <p>The format of the Agent Circuit ID information for Fast Ethernet or Gigabit Ethernet interfaces that do not use virtual LANs (VLANs) or stacked VLANs (S-VLANs) is as follows:</p> <pre>(fe   ge)-<i>fpc/pic/port</i></pre> <p>The format of the Agent Circuit ID information for Fast Ethernet or Gigabit Ethernet interfaces that use VLANs is as follows:</p> <pre>(fe   ge)-<i>fpc/pic/port:vlan-id</i></pre> <p>The format of the Agent Circuit ID information for Fast Ethernet or Gigabit Ethernet interfaces that use S-VLANs is as follows:</p> <pre>(fe   ge)-<i>fpc/pic/port:svlan-id-vlan-id</i></pre> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Using DHCP Relay Agent Option 82 Information on page 1464</a></li> <li>• <a href="#">Configuring Option 82 Information on page 1465</a></li> </ul>

## circuit-type (DHCP Relay Agent)

<b>Syntax</b>	circuit-type;
<b>Hierarchy Level</b>	<p>[edit forwarding-options dhcp-relay authentication <a href="#">username-include</a>],</p> <p>[edit forwarding-options dhcp-relay dhcpv6 authentication <a href="#">username-include</a>],</p> <p>[edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit forwarding-options dhcp-relay group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options <a href="#">dhcp-relay ...</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options <a href="#">dhcp-relay ...</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options <a href="#">dhcp-relay ...</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.1.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p> <p>Support at the <a href="#">[edit ... dhcpv6]</a> hierarchy levels introduced in Junos OS Release 11.4.</p>
<b>Description</b>	Specify that the circuit type is concatenated with the username during the subscriber authentication or client authentication process. Use the statement at the <a href="#">[edit ... dhcpv6]</a> hierarchy levels to configure DHCPv6 support.
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Using External AAA Authentication Services with DHCP on page 1420</a></li> <li>• <a href="#">Creating Unique Usernames for DHCP Clients on page 1439</a></li> </ul>

## client-discover-match (DHCP Relay Agent)

<b>Syntax</b>	client-discover-match (option60-and-option82   incoming-interface);
<b>Hierarchy Level</b>	<p>[edit forwarding-options dhcp-relay <a href="#">overrides</a>],</p> <p>[edit forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit forwarding-options dhcp-relay group <i>group-name</i> interface <i>interface-name</i> <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay ... <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay ... <a href="#">overrides</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group ... <a href="#">overrides</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.4.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p> <p>Option <b>incoming-interface</b> introduced in Junos OS Release 13.3.</p>
<b>Description</b>	Configure the match criteria DHCP relay uses to uniquely identify DHCP subscribers or clients when primary identification fails. The options are mutually exclusive.
<b>Options</b>	<p><b>incoming-interface</b>—Allow only one client device to connect on the interface. If the client device changes, the router deletes the existing client binding and creates a binding for the newly connected device.</p>
<div>  <p><b>NOTE:</b> The <b>overrides client-discover-match incoming-interface</b> configuration deletes and replaces the existing binding when a new device connects. This action differs from the <b>overrides interface-client-limit 1</b> statement, which retains the existing binding rejects the newly connected client.</p> </div>	
<p><b>option60-and-option82</b>—Use option 60 and option 82 information to identify subscribers.</p>	
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Extended DHCP Relay Agent Overview on page 1379</a></li> <li>• <a href="#">Overriding the Default DHCP Relay Configuration Settings on page 1447</a></li> <li>• <a href="#">DHCP Auto Logout Overview on page 1368</a></li> <li>• <a href="#">Allowing Only One DHCP Client Per Interface</a></li> </ul>

## client-id (DHCP Relay Agent)

<b>Syntax</b>	client-id;
<b>Hierarchy Level</b>	[edit forwarding-options dhcp-relay dhcpv6 authentication <a href="#">username-include</a> ], [edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a> ], [edit logical-systems <i>logical-system-name</i> forwarding-options <a href="#">dhcp-relay dhcpv6</a> ...], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options <a href="#">dhcp-relay dhcpv6</a> ...], [edit routing-instances <i>routing-instance-name</i> forwarding-options <a href="#">dhcp-relay dhcpv6</a> ...]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.4. Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
<b>Description</b>	Specify that the client ID is concatenated with the username during the subscriber authentication or client authentication process.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Using External AAA Authentication Services with DHCP on page 1420</a></li> <li>• <a href="#">Creating Unique Usernames for DHCP Clients on page 1439</a></li> </ul>

## delete-binding-on-renegotiation

<b>Syntax</b>	delete-binding-on-renegotiation;
<b>Hierarchy Level</b>	[edit forwarding-options dhcp-relay <a href="#">overrides</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 13.2 for EX Series switches.
<b>Description</b>	Configure the DHCP relay agent to delete binding information for a specific client when a DHCP DISCOVER packet is received from the client while the client already has a binding on the relay that is in BOUND state. A DHCP client sends discover messages to renegotiate the lease for an IP address.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Extended DHCP Relay Agent Overview on page 1379</a></li> </ul>

## delimiter (DHCP Relay Agent)

<b>Syntax</b>	<code>delimiter <i>delimiter-character</i>;</code>
<b>Hierarchy Level</b>	<p>[edit forwarding-options dhcp-relay authentication <a href="#">username-include</a>],</p> <p>[edit forwarding-options dhcp-relay dhcpv6 authentication <a href="#">username-include</a>],</p> <p>[edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit forwarding-options dhcp-relay group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay dhcpv6 authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay authentication <a href="#">username-include</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 authentication <a href="#">username-include</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> authentication <a href="#">username-include</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.1.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p> <p>Support at the <a href="#">[edit ... dhcpv6]</a> hierarchy levels introduced in Junos OS Release 11.4.</p>
<b>Description</b>	Specify the character used as the delimiter between the concatenated components of the username. Use the statement at the <a href="#">[edit ... dhcpv6]</a> hierarchy levels to configure DHCPv6 support.
<b>Options</b>	<b><i>delimiter-character</i></b> —Character that separates components that make up the concatenated username. You cannot use the semicolon (;) as a delimiter.
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Using External AAA Authentication Services with DHCP on page 1420</a></li> <li>• <a href="#">Creating Unique Usernames for DHCP Clients on page 1439</a></li> </ul>

## detection-time

<b>Syntax</b>	<pre> detection-time {     threshold milliseconds; } </pre>
<b>Hierarchy Level</b>	<p>[edit system services dhcp-local-server <a href="#">liveness-detection</a> method <a href="#">bfd</a>],  [edit system services dhcp-local-server dhcpv6 <a href="#">liveness-detection</a> method <a href="#">bfd</a>],  [edit forwarding-options dhcp-relay <a href="#">liveness-detection</a> method <a href="#">bfd</a>], [edit forwarding-options  dhcp-relay dhcpv6 <a href="#">liveness-detection</a> method <a href="#">bfd</a>],  [edit system services dhcp-local-server group <i>group-name</i> <a href="#">liveness-detection</a> method <a href="#">bfd</a>],  [edit system services dhcp-local-server dhcpv6 group <i>group-name</i> <a href="#">liveness-detection</a> method  <a href="#">bfd</a>],  [edit forwarding-options dhcp-relay group <i>group-name</i> <a href="#">liveness-detection</a> method <a href="#">bfd</a>],  [edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> <a href="#">liveness-detection</a> method  <a href="#">bfd</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 12.1.  Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	<p>Enable failure detection. The BFD failure detection timers are adaptive and can be adjusted to be faster or slower. For example, the timers can adapt to a higher value if the adjacency fails, or a neighbor can negotiate a higher value for a timer than the one configured.</p> <p>The remaining statement is explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.  routing-control—To add this statement to the configuration.</p>

[edit routing-instances *routing-instance-name* forwarding-options dhcp-relay]

**Release Information** Statement introduced in Junos OS Release 11.4.  
Statement introduced in Junos OS Release 12.3 for EX Series switches.

**Description** Configure DHCPv6 relay options on the router or switch and enable the router or switch to function as a DHCPv6 relay agent. A DHCPv6 relay agent forwards DHCPv6 request and reply packets between a DHCPv6 client and a DHCPv6 server.

The DHCPv6 relay agent server is fully compatible with the extended DHCP local server and DHCP relay agent. However, the options configured with the **dhcpv6** statement are incompatible with the DHCP/BOOTP relay agent options configured with the **bootp** statement. As a result, the DHCPv6 relay agent and the DHCP/BOOTP relay agent cannot be enabled on the router or switch at the same time.

The remaining statements are explained separately.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## disable-relay

<b>Syntax</b>	disable-relay;
<b>Hierarchy Level</b>	<p>[edit forwarding-options dhcp-relay <a href="#">overrides</a>],</p> <p>[edit forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay <a href="#">overrides</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> interface <i>interface-name</i> <a href="#">overrides</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.3.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	Disable DHCP relay on specific interfaces in a group.
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Extended DHCP Relay Agent Overview on page 1379</a></li> </ul>

## domain-name (DHCP Relay Agent)

<b>Syntax</b>	<code>domain-name <i>domain-name-string</i>;</code>
<b>Hierarchy Level</b>	<p>[edit forwarding-options dhcp-relay authentication <a href="#">username-include</a>],</p> <p>[edit forwarding-options dhcp-relay dhcpv6 authentication <a href="#">username-include</a>],</p> <p>[edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit forwarding-options dhcp-relay group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay dhcpv6 authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay authentication <a href="#">username-include</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 authentication <a href="#">username-include</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.1.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p> <p>Support at the <a href="#">[edit ... dhcpv6]</a> hierarchy levels introduced in Junos OS Release 11.4.</p>
<b>Description</b>	Specify the domain name that is concatenated with the username during the subscriber authentication or client authentication process. Use the statement at the <a href="#">[edit ... dhcpv6]</a> hierarchy levels to configure DHCPv6 support.
<b>Options</b>	<i>domain-name-string</i> —Domain name formatted string.
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Using External AAA Authentication Services with DHCP on page 1420</a></li> <li>• <a href="#">Creating Unique Usernames for DHCP Clients on page 1439</a></li> </ul>

## drop (DHCP Relay Agent Option)

<b>Syntax</b>	drop;
<b>Hierarchy Level</b>	<p>[edit forwarding-options dhcp-relay relay-option (default-action   equals   starts-with)],</p> <p>[edit forwarding-options dhcp-relay dhcpv6 relay-option (default-action   equals   starts-with)],</p> <p>[edit forwarding-options dhcp-relay group <i>group-name</i> relay-option (default-action   equals   starts-with)],</p> <p>[edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> relay-option (default-action   equals   starts-with)],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options <a href="#">dhcp-relay</a> ...],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options <a href="#">dhcp-relay</a> ...],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options <a href="#">dhcp-relay</a> ...]</p>
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3.
<b>Description</b>	Drop (discard) specified DHCP client packets when you use DHCP relay agent selective processing. You can configure the drop operation globally or for a group of interfaces, and for either DHCP or DHCPv6 relay agent.
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Using DHCP Option Information to Selectively Process DHCP Client Traffic</i></li> </ul>

## dynamic-profile (DHCP Relay Agent)

---

<b>Syntax</b>	<pre>dynamic-profile <i>profile-name</i> {     aggregate-clients (merge   replace);     use-primary <i>primary-profile-name</i>; }</pre>
<b>Hierarchy Level</b>	<pre>[edit forwarding-options dhcp-relay], [edit forwarding-options <b>dhcp-relay dhcpv6</b>], [edit forwarding-options dhcp-relay dhcpv6 <b>group group-name</b>], [edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> <b>interface interface-name</b>], [edit forwarding-options dhcp-relay <b>group group-name</b>], [edit forwarding-options dhcp-relay group <i>group-name</i> <b>interface interface-name</b>], [edit logical-systems <i>logical-system-name</i> forwarding-options <b>dhcp-relay ...</b>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i>     forwarding-options <b>dhcp-relay ...</b>], [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay ...]</pre>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.2.</p> <p>Support at the <b>[edit ... dhcpv6]</b> hierarchy levels introduced in Junos OS Release 11.4.</p> <p>Statement introduced in Junos OS Release 12.1 for EX Series switches.</p>
<b>Description</b>	<p>Specify the dynamic profile that is attached to all interfaces, to a named group of interfaces, or to a specific interface.</p> <p>M120 and M320 routers do not support DHCPv6.</p>
<b>Options</b>	<p><b><i>profile-name</i></b>—Name of the dynamic profile.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">dhcp-relay on page 1570</a></li><li>• <i>Attaching Dynamic Profiles to DHCP Subscriber Interfaces or DHCP Client Interfaces</i></li><li>• <a href="#">Grouping Interfaces with Common DHCP Configurations on page 1421</a></li><li>• <i>Configuring a Default Subscriber Service</i></li></ul>

## failure-action

<b>Syntax</b>	failure-action (clear-binding   clear-binding-if-interface-up   log-only);
<b>Hierarchy Level</b>	[edit system services dhcp-local-server <a href="#">liveness-detection</a> ], [edit system services dhcp-local-server dhcpv6 <a href="#">liveness-detection</a> ], [edit forwarding-options dhcp-relay <a href="#">liveness-detection</a> ], [edit forwarding-options dhcp-relay dhcpv6 <a href="#">liveness-detection</a> ], [edit system services dhcp-local-server group <i>group-name</i> <a href="#">liveness-detection</a> ], [edit system services dhcp-local-server dhcpv6 group <i>group-name</i> <a href="#">liveness-detection</a> ], [edit forwarding-options dhcp-relay group <i>group-name</i> <a href="#">liveness-detection</a> ], [edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> <a href="#">liveness-detection</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1. Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
<b>Description</b>	Configure the action the router (or switch) takes when a liveness detection failure occurs.
<b>Options</b>	<p><b>clear-binding</b>—The client session is cleared when a liveness detection failure occurs.</p> <p><b>clear-binding-if-interface-up</b>—The client session is cleared only when a liveness detection failure occurs and the local interface is detected as being up.</p> <p><b>log-only</b>—A message is logged to indicate the event; no action is taken and DHCP is left to manage the failure.</p>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">DHCP Liveness Detection Overview on page 1472</a></li> <li>• <a href="#">Configuring Detection of DHCP Local Server Client Connectivity on page 1436</a></li> <li>• <a href="#">Configuring Detection of DHCP Relay or DHCP Relay Proxy Client Connectivity on page 1473</a></li> <li>• <a href="#">Example: Configuring Group Liveness Detection for DHCP Local Server Clients on page 1395</a></li> <li>• <a href="#">Example: Configuring Global Liveness Detection for DHCP Relay Agent Clients</a></li> </ul>

## forward-snooped-clients (DHCP Relay Agent)

---

<b>Syntax</b>	forward-snooped-clients (all-interfaces   configured-interfaces   non-configured-interfaces);
<b>Hierarchy Level</b>	[edit forwarding-options <a href="#">dhcp-relay</a> ], [edit logical-systems <i>logical-system-name</i> forwarding-options <a href="#">dhcp-relay</a> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options <a href="#">dhcp-relay</a> ], [edit routing-instances <i>routing-instance-name</i> forwarding-options <a href="#">dhcp-relay</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.4. Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
<b>Description</b>	<p>Configure how DHCP relay agent handles DHCP snooped packets on specific interfaces. The router or switch determines the DHCP snooping action to perform based on a combination of the <b>forward-snooped-clients</b> configuration and the configuration of either the <b>allow-snooped-clients</b> statement or the <b>no-allow-snooped-clients</b> statement.</p> <p>The router (or switch) also uses this statement to determine how to handle snooped BOOTREPLY packets received on nonconfigured interfaces.</p>
<b>Options</b>	<p><b>all-interfaces</b>—Perform the action on all interfaces.</p> <p><b>configured-interfaces</b>—Perform the action only on configured interfaces.</p> <p><b>non-configured-interfaces</b>—Perform the action only on nonconfigured interfaces.</p>
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">DHCP Snooping Support on page 1367</a></li><li>• <a href="#">Configuring DHCP Snooping for DHCP Relay Agent on page 1455</a></li></ul>

## group (DHCP Relay Agent)

```
Syntax  group group-name {
        active-server-group server-group-name;
        authentication {
            password password-string;
            username-include {
                circuit-type;
                client-id;
                delimiter delimiter-character;
                domain-name domain-name-string;
                logical-system-name;
                mac-address;
                option-60;
                option-82 [circuit-id] [remote-id];
                relay-agent-interface-id;
                relay-agent-remote-id;
                relay-agent-subscriber-id;
                routing-instance-name;
                user-prefix user-prefix-string;
            }
        }
        dynamic-profile profile-name {
            aggregate-clients (merge | replace);
            use-primary primary-profile-name;
        }

## holddown-interval

---

<b>Syntax</b>	<code>holddown-interval <i>milliseconds</i>;</code>
<b>Hierarchy Level</b>	<code>[edit system services dhcp-local-server liveness-detection method <a href="#">bfd</a>],</code> <code>[edit system services dhcp-local-server dhcpv6 liveness-detection method <a href="#">bfd</a>],</code> <code>[edit forwarding-options dhcp-relay liveness-detection method <a href="#">bfd</a>], [edit forwarding-options</code> <code>  dhcp-relay dhcpv6 liveness-detection method <a href="#">bfd</a>],</code> <code>[edit system services dhcp-local-server group <i>group-name</i> liveness-detection method <a href="#">bfd</a>],</code> <code>[edit system services dhcp-local-server dhcpv6 group <i>group-name</i> liveness-detection method</code> <code>  <a href="#">bfd</a>],</code> <code>[edit forwarding-options dhcp-relay group <i>group-name</i> liveness-detection method <a href="#">bfd</a>],</code> <code>[edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> liveness-detection method</code> <code>  <a href="#">bfd</a>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1. Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
<b>Description</b>	Configure the time (in milliseconds) for which Bidirectional Forwarding Detection (BFD) holds a session up notification.
<b>Options</b>	<b><i>milliseconds</i></b> —Interval specifying how long a BFD session must remain up before a state change notification is sent. <b>Range:</b> 0 through 255,000 <b>Default:</b> 0
<b>Required Privilege Level</b>	<b>routing</b> —To view this statement in the configuration. <b>routing-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Group Liveness Detection for DHCP Local Server Clients on page 1395</a></li><li>• <a href="#">Example: Configuring Global Liveness Detection for DHCP Relay Agent Clients</a></li></ul>

## interface (DHCP Relay Agent)

<b>Syntax</b>	<pre> interface <i>interface-name</i> {   exclude;   overrides {     allow-snooped-clients;     always-write-giaddr;     always-write-option-82;     client-discover-match (option60-and-option82   incoming-interface);     disable-relay;     interface-client-limit <i>number</i>;     layer2-unicast-replies;     no-allow-snooped-clients;     proxy-mode;     replace-ip-source-with;     send-release-on-delete;     trust-option-82;   }   service-profile <i>dynamic-profile-name</i>;   trace;   upto <i>upto-interface-name</i>; } </pre>
<b>Hierarchy Level</b>	<pre> [edit forwarding-options dhcp-relay dhcpv6 <b>group</b> <i>group-name</i>], [edit forwarding-options dhcp-relay <b>group</b> <i>group-name</i>], [edit logical-systems <i>logical-system-name</i> forwarding-options <b>dhcp-relay</b> ...], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i>  forwarding-options <b>dhcp-relay</b> ...], [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay ...] </pre>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.3.</p> <p>Options <b>upto</b> and <b>exclude</b> introduced in Junos OS Release 9.1.</p> <p>Support at the <b>[edit ... dhcpv6]</b> hierarchy levels introduced in Junos OS Release 11.4.</p> <p>Statement introduced in Junos OS Release 12.1 for EX Series switches.</p>
<b>Description</b>	<p>Specify one or more interfaces, or a range of interfaces, that are within a specified group on which the DHCP or DHCPv6 relay agent is enabled. You can repeat the <b>interface <i>interface-name</i></b> statement to specify multiple interfaces within a group, but you cannot specify the same interface in more than one group. Also, you cannot use an interface that is being used by the DHCP local server. Use the statement at the <b>[edit ... dhcpv6]</b> hierarchy levels to configure DHCPv6 support.</p> <p>EX Series switches do not support DHCPv6.</p>

**NOTE:** DHCP values are supported in Integrated Routing and Bridging (IRB) configurations. When you configure an IRB interface in a network that is using DHCP, the DHCP information (for example, authentication, address assignment, and so on) is propagated in the associated bridge domain. This enables the DHCP server to configure client IP addresses residing within the bridge domain. IRB currently only supports static DHCP configurations. For

additional information about how to configure IRB, see *Configuring Integrated Routing and Bridging for Bridge Domains*.

.....

**Options**    **exclude**—Exclude an interface or a range of interfaces from the group. This option and the **overrides** option are mutually exclusive.

**interface-name**—Name of the interface. You can repeat this option multiple times.

**overrides**—Override the specified default configuration settings for the interface. The **overrides** statement is described separately.

**upto-interface-name**—Upper end of the range of interfaces; the lower end of the range is the interface-name entry. The interface device name of the **upto-interface-name** must be the same as the device name of the **interface-name**.

The remaining statements are explained separately.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                     interface-control—To add this statement to the configuration.

## interface-client-limit (DHCP Relay Agent)

<b>Syntax</b>	<code>interface-client-limit <i>number</i>;</code>
<b>Hierarchy Level</b>	<p>[edit forwarding-options dhcp-relay dhcpv6 <a href="#">overrides</a>],</p> <p>[edit forwarding-options dhcp-relay <a href="#">overrides</a>],</p> <p>[edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay dhcpv6 <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 <a href="#">overrides</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay <a href="#">overrides</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> interface <i>interface-name</i> <a href="#">overrides</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.2.</p> <p>Support at the <b>[edit ... dhcpv6]</b> hierarchy levels introduced in Junos OS Release 11.4.</p> <p>Statement introduced in Junos OS Release 12.1 for EX Series switches.</p>
<b>Description</b>	<p>Set the maximum number of DHCP (or DHCPv6) subscribers or clients per interface allowed for a specific group or for all groups. A group specification takes precedence over a global specification for the members of that group. Use the statement at the <b>[edit ... dhcpv6]</b> hierarchy levels to configure DHCPv6 support.</p> <p>M120 and M320 routers do not support DHCPv6.</p>
<b>Default</b>	No limit
<b>Options</b>	<p><i>number</i>—Maximum number of clients allowed.</p> <p><b>Range:</b> 1 through 500,000</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

---

## interface-delete (Subscriber Management or DHCP Client Management)

---

<b>Syntax</b>	interface-delete;
<b>Hierarchy Level</b>	[edit system services subscriber-management maintain-subscriber]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.1. Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
<b>Description</b>	<p>On router—Configure the router to maintain, rather than log out, subscribers when the subscriber interface is deleted. By default, the router logs out subscribers when the subscriber interface is deleted.</p> <p>On switch—Configure the switch to maintain rather than log out DHCP clients when the client interface is deleted. By default, the switch logs out DHCP clients when the client interface is deleted.</p>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	• <a href="#">Configuring the Router to Maintain DHCP Subscribers During Interface Delete Events</a>

## interface-name (DHCP Relay Agent)

<b>Syntax</b>	interface-name;
<b>Hierarchy Level</b>	<p>[edit forwarding-options dhcp-relay authentication <a href="#">username-include</a>],  [edit forwarding-options dhcp-relay dhcpv6 authentication <a href="#">username-include</a>],  [edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>],  [edit forwarding-options dhcp-relay group <i>group-name</i> authentication <a href="#">username-include</a>],  [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay ...],  [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay ...],  [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay ...]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 11.4</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	Specify that the interface name is concatenated with the username during the subscriber authentication or client authentication process. Use the statement at the [edit ... dhcpv6] hierarchy levels to configure DHCPv6 support.
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Creating Unique Usernames for DHCP Clients on page 1439</a></li> </ul>

## layer2-unicast-replies

---

<b>Syntax</b>	layer2-unicast-replies;
<b>Hierarchy Level</b>	[edit forwarding-options dhcp-relay <a href="#">overrides</a> ], [edit forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a> ], [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay <a href="#">overrides</a> ], [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay <a href="#">overrides</a> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a> ], [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay <a href="#">overrides</a> ], [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a> ], [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> interface <i>interface-name</i> <a href="#">overrides</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.3. Statement introduced in Junos OS Release 12.1 for EX Series switches.
<b>Description</b>	Override the setting of the broadcast bit in DHCP request packets and instead use the Layer 2 unicast transmission method to transmit DHCP Offer reply packets and DHCP ACK reply packets from the DHCP server to DHCP clients during the discovery process.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Extended DHCP Relay Agent Overview on page 1379</a></li><li>• <a href="#">dhcp-relay on page 1570</a></li></ul>

## liveness-detection

<b>Syntax</b>	<pre> liveness-detection {   failure-action (clear-binding   clear-binding-if-interface-up   log-only);   method {     bfd {       version (0   1   automatic);       minimum-interval <i>milliseconds</i>;       minimum-receive-interval <i>milliseconds</i>;       multiplier <i>number</i>;       no-adaptation;       transmit-interval {         minimum-interval <i>milliseconds</i>;         threshold <i>milliseconds</i>;       }       detection-time {         threshold <i>milliseconds</i>;       }       session-mode (automatic   multihop   singlehop);       holddown-interval <i>milliseconds</i>;     }   } } </pre>
<b>Hierarchy Level</b>	<pre> [edit system services <a href="#">dhcp-local-server</a>], [edit system services dhcp-local-server <a href="#">dhcpv6</a>], [edit forwarding-options <a href="#">dhcp-relay</a>], [edit forwarding-options dhcp-relay <a href="#">dhcpv6</a>], [edit system services dhcp-local-server <a href="#">group group-name</a>], [edit system services dhcp-local-server dhcpv6 <a href="#">group group-name</a>], [edit forwarding-options dhcp-relay <a href="#">group group-name</a>], [edit forwarding-options dhcp-relay dhcpv6 <a href="#">group group-name</a>] </pre>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 12.1.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	<p>Configure bidirectional failure detection timers and authentication criteria for static routes.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">DHCP Liveness Detection Overview on page 1472</a></li> <li>• <a href="#">Configuring Detection of DHCP Local Server Client Connectivity on page 1436</a></li> <li>• <a href="#">Configuring Detection of DHCP Relay or DHCP Relay Proxy Client Connectivity on page 1473</a></li> <li>• <a href="#">Example: Configuring Group Liveness Detection for DHCP Local Server Clients on page 1395</a></li> </ul>

- *Example: Configuring Global Liveness Detection for DHCP Relay Agent Clients*

## local-server-group (DHCP Relay Agent Option)

---

<b>Syntax</b>	<code>local-server-group <i>local-server-group</i>;</code>
<b>Hierarchy Level</b>	[edit forwarding-options dhcp-relay relay-option (default-action   equals   starts-with)], [edit forwarding-options dhcp-relay group <i>group-name</i> relay-option (default-action   equals   starts-with)], [edit logical-systems <i>logical-system-name</i> forwarding-options <a href="#">dhcp-relay</a> ...], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options <a href="#">dhcp-relay</a> ...], [edit routing-instances <i>routing-instance-name</i> forwarding-options <a href="#">dhcp-relay</a> ...]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3. Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
<b>Description</b>	<p>Forward DHCP client packets to the specified group of DHCP local servers when you use the DHCP relay selective processing feature. You can configure the forwarding operation globally or for a group of interfaces.</p> <p>The <b>local-server-group</b> option is not supported for DHCPv6 relay agent.</p>
<b>Options</b>	<b><i>local-server-group</i></b> —Name of DHCP local server group.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Using DHCP Option Information to Selectively Process DHCP Client Traffic</i></li></ul>

## mac-address (DHCP Relay Agent)

<b>Syntax</b>	mac-address;
<b>Hierarchy Level</b>	<p>[edit forwarding-options dhcp-relay authentication <a href="#">username-include</a>],</p> <p>[edit forwarding-options dhcp-relay group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay authentication <a href="#">username-include</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> authentication <a href="#">username-include</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.1.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	Specify that the MAC address from the client PDU be concatenated with the username during the subscriber authentication or client authentication process.
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Using External AAA Authentication Services with DHCP on page 1420</a></li> </ul>

## method

---

<b>Syntax</b>	<pre>method {   bfd {     version (0   1   automatic);     minimum-interval <i>milliseconds</i>;     minimum-receive-interval <i>milliseconds</i>;     multiplier <i>number</i>;     no-adaptation;     transmit-interval {       minimum-interval <i>milliseconds</i>;       threshold <i>milliseconds</i>;     }     detection-time {       threshold <i>milliseconds</i>;     }     session-mode (automatic   multihop   singlehop);     holddown-interval <i>milliseconds</i>;   } }</pre>
<b>Hierarchy Level</b>	<pre>[edit system services dhcp-local-server <i>liveness-detection</i>], [edit system services dhcp-local-server dhcpv6 <i>liveness-detection</i>], [edit forwarding-options dhcp-relay <i>liveness-detection</i>], [edit forwarding-options dhcp-relay dhcpv6 <i>liveness-detection</i>], [edit system services dhcp-local-server group <i>group-name</i> <i>liveness-detection</i>], [edit system services dhcp-local-server dhcpv6 group <i>group-name</i> <i>liveness-detection</i>], [edit forwarding-options dhcp-relay group <i>group-name</i> <i>liveness-detection</i>], [edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> <i>liveness-detection</i>]</pre>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 12.1.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	<p>Configure the liveness detection method.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Group Liveness Detection for DHCP Local Server Clients on page 1395</a></li><li>• <a href="#">Example: Configuring Global Liveness Detection for DHCP Relay Agent Clients</a></li></ul>

## minimum-interval

<b>Syntax</b>	<code>minimum-interval <i>milliseconds</i>;</code>
<b>Hierarchy Level</b>	<p>[edit system services dhcp-local-server liveness-detection method <a href="#">bfd</a>],  [edit system services dhcp-local-server liveness-detection method bfd <a href="#">transmit-interval</a>],  [edit system services dhcp-local-server dhcpv6 liveness-detection method <a href="#">bfd</a>],  [edit system services dhcp-local-server dhcpv6 liveness-detection method bfd <a href="#">transmit-interval</a>],  [edit forwarding-options dhcp-relay liveness-detection method <a href="#">bfd</a>],  [edit forwarding-options dhcp-relay liveness-detection method bfd <a href="#">transmit-interval</a>],  [edit forwarding-options dhcp-relay dhcpv6 liveness-detection method <a href="#">bfd</a>],  [edit forwarding-options dhcp-relay dhcpv6 liveness-detection method bfd <a href="#">transmit-interval</a>],  [edit system services dhcp-local-server group <i>group-name</i> liveness-detection method <a href="#">bfd</a>],  [edit system services dhcp-local-server group <i>group-name</i> liveness-detection method bfd <a href="#">transmit-interval</a>],  [edit system services dhcp-local-server dhcpv6 group <i>group-name</i> liveness-detection method <a href="#">bfd</a>],  [edit system services dhcp-local-server dhcpv6 group <i>group-name</i> liveness-detection method bfd <a href="#">transmit-interval</a>],  [edit forwarding-options dhcp-relay group <i>group-name</i> liveness-detection method <a href="#">bfd</a>],  [edit forwarding-options dhcp-relay group <i>group-name</i> liveness-detection method bfd <a href="#">transmit-interval</a>],  [edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> liveness-detection method <a href="#">bfd</a>],  [edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> liveness-detection method bfd <a href="#">transmit-interval</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 12.1.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	<p>Configure the minimum intervals at which the local routing device transmits hello packets and then expects to receive a reply from a neighbor with which it has established a BFD session. This value represents the minimum interval at which the local routing device transmits hello packets as well as the minimum interval that the routing device expects to receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can specify the minimum transmit and receive intervals separately using the <a href="#">transmit-interval</a> <a href="#">minimal-interval</a> and <a href="#">minimum-receive-interval</a> statements.</p>
<b>Options</b>	<p><i>milliseconds</i> — Specify the minimum interval value for BFD liveliness detection.</p> <p><b>Range:</b> 1 through 255,000</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Group Liveness Detection for DHCP Local Server Clients on page 1395</a></li> <li>• <a href="#">Example: Configuring Global Liveness Detection for DHCP Relay Agent Clients</a></li> </ul>

## minimum-receive-interval

---

<b>Syntax</b>	<code>minimum-receive-interval <i>milliseconds</i>;</code>
<b>Hierarchy Level</b>	<code>[edit system services dhcp-local-server liveness-detection method <a href="#">bfd</a>],</code> <code>[edit system services dhcp-local-server dhcpv6 liveness-detection method <a href="#">bfd</a>],</code> <code>[edit forwarding-options dhcp-relay liveness-detection method <a href="#">bfd</a>], [edit forwarding-options</code> <code>  dhcp-relay dhcpv6 liveness-detection method <a href="#">bfd</a>],</code> <code>[edit system services dhcp-local-server group <i>group-name</i> liveness-detection method <a href="#">bfd</a>],</code> <code>[edit system services dhcp-local-server dhcpv6 group <i>group-name</i> liveness-detection method</code> <code>  <a href="#">bfd</a>],</code> <code>[edit forwarding-options dhcp-relay group <i>group-name</i> liveness-detection method <a href="#">bfd</a>],</code> <code>[edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> liveness-detection method</code> <code>  <a href="#">bfd</a>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1. Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
<b>Description</b>	Configure the minimum interval at which the local routing device (or switch) must receive a reply from a neighbor with which it has established a BFD session.
<b>Options</b>	<i>milliseconds</i> — Specify the minimum receive interval value. <b>Range:</b> 1 through 255,000
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Group Liveness Detection for DHCP Local Server Clients on page 1395</a></li><li>• <a href="#">Example: Configuring Global Liveness Detection for DHCP Relay Agent Clients</a></li></ul>

## multiplier

<b>Syntax</b>	<code>multiplier <i>number</i>;</code>
<b>Hierarchy Level</b>	<p>[edit system services dhcp-local-server liveness-detection method <a href="#">bfd</a>],  [edit system services dhcp-local-server dhcpv6 liveness-detection method <a href="#">bfd</a>],  [edit forwarding-options dhcp-relay liveness-detection method <a href="#">bfd</a>],  [edit forwarding-options dhcp-relay dhcpv6 liveness-detection method <a href="#">bfd</a>],  [edit system services dhcp-local-server group <i>group-name</i> liveness-detection method <a href="#">bfd</a>],  [edit system services dhcp-local-server dhcpv6 group <i>group-name</i> liveness-detection method <a href="#">bfd</a>],  [edit forwarding-options dhcp-relay group <i>group-name</i> liveness-detection method <a href="#">bfd</a>],  [edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> liveness-detection method <a href="#">bfd</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 12.1.  Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	Configure the number of hello packets not received by the neighbor before Bidirectional Forwarding Detection (BFD) declares the neighbor down.
<b>Options</b>	<p><b>number</b>—Maximum allowable number of hello packets missed by the neighbor.  <b>Range:</b> 1 through 255  <b>Default:</b> 3</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.  routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Group Liveness Detection for DHCP Local Server Clients on page 1395</a></li> <li>• <a href="#">Example: Configuring Global Liveness Detection for DHCP Relay Agent Clients</a></li> </ul>

## next-hop (Dynamic Access-Internal Routes)

---

<b>Syntax</b>	<code>next-hop <i>next-hop</i>;</code>
<b>Hierarchy Level</b>	<code>[edit dynamic-profiles <i>profile-name</i> routing-instances \$junos-routing-instance routing-options access route <i>prefix</i>],</code> <code>[edit dynamic-profiles <i>profile-name</i> routing-instances \$junos-routing-instance routing-options rib <i>routing-table-name</i> access route <i>prefix</i>],</code> <code>[edit dynamic-profiles <i>profile-name</i> routing-options <b>access</b> route <i>prefix</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5. Support at the <code>[edit dynamic-profiles <i>profile-name</i> routing-instances \$junos-routing-instance routing-options access route <i>prefix</i>]</code> and <code>[edit dynamic-profiles <i>profile-name</i> routing-instances \$junos-routing-instance routing-options rib <i>routing-table-name</i> access route <i>prefix</i>]</code> hierarchy levels introduced in Junos OS Release 10.1.
<b>Description</b>	Dynamically configure the next-hop address for an access route. Access routes are typically unnumbered interfaces.
<b>Options</b>	<i>next-hop</i> —Either the specific next-hop address you want to assign to the access route or one of the following next-hop address predefined variables. <ul style="list-style-type: none"><li>For IPv4 access routes, use the variable, <b>\$junos-framed-route-nexthop</b>. The route prefix variable is dynamically replaced with the value in Framed-Route RADIUS attribute [22].</li><li>For IPv6 access routes, use the variable, <b>\$junos-framed-route-ipv6-nexthop</b>. The variable is dynamically replaced with the value in Framed-IPv6-Route RADIUS attribute [99].</li></ul>
<b>Required Privilege Level</b>	<code>routing</code> —To view this statement in the configuration. <code>routing-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li><i>Configuring Dynamic Access Routes for Subscriber Management</i></li></ul>

## no-adaptation

<b>Syntax</b>	no-adaptation;
<b>Hierarchy Level</b>	[edit system services dhcp-local-server liveness-detection method <a href="#">bfd</a> ], [edit system services dhcp-local-server dhcpv6 liveness-detection method <a href="#">bfd</a> ], [edit forwarding-options dhcp-relay liveness-detection method <a href="#">bfd</a> ], [edit forwarding-options dhcp-relay dhcpv6 liveness-detection method <a href="#">bfd</a> ], [edit system services dhcp-local-server group <i>group-name</i> liveness-detection method <a href="#">bfd</a> ], [edit system services dhcp-local-server dhcpv6 group <i>group-name</i> liveness-detection method <a href="#">bfd</a> ], [edit forwarding-options dhcp-relay group <i>group-name</i> liveness-detection method <a href="#">bfd</a> ], [edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> liveness-detection method <a href="#">bfd</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1. Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
<b>Description</b>	Configure Bidirectional Forwarding Detection (BFD) sessions to not adapt to changing network conditions.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Group Liveness Detection for DHCP Local Server Clients on page 1395</a></li> <li>• <i>Example: Configuring Global Liveness Detection for DHCP Relay Agent Clients</i></li> </ul>

## no-allow-snooped-clients

<b>Syntax</b>	no-allow-snooped-clients;
<b>Hierarchy Level</b>	<p>[edit forwarding-options dhcp-relay <b>dhcpv6</b> group <i>group-name</i> interface <i>interface-name</i> <b>overrides</b>],</p> <p>[edit forwarding-options dhcp-relay <b>dhcpv6</b> group <i>group-name</i> <b>overrides</b>],</p> <p>[edit forwarding-options dhcp-relay <b>dhcpv6</b> <b>overrides</b>],</p> <p>[edit forwarding-options dhcp-relay group <i>group-name</i> interface <i>interface-name</i> <b>overrides</b>],</p> <p>[edit forwarding-options dhcp-relay group <i>group-name</i> <b>overrides</b>],</p> <p>[edit forwarding-options dhcp-relay <b>overrides</b>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options <b>dhcp-relay</b> ...],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options <b>dhcp-relay</b> ...],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options <b>dhcp-relay</b> ...]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 10.2.</p> <p>Support at the [edit ... <b>dhcpv6</b>] hierarchy levels introduced in Junos OS Release 12.1.</p> <p>Statement introduced in Junos OS Release 12.3 for EX Series switches.</p>
<b>Description</b>	<p>Explicitly disable DHCP snooping support on the router or switch.</p> <p>Use the statement at the [edit ... <b>dhcpv6</b>] hierarchy levels to explicitly disable snooping support on the router or switch for DHCPv6 relay agent.</p>
<div>  <p><b>NOTE:</b> In Junos OS Release 10.0 and earlier, DHCP snooping is <i>enabled</i> by default. In Release 10.1 and later, DHCP snooping is <i>disabled</i> by default.</p> </div>	
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Extended DHCP Relay Agent Overview on page 1379</a></li> <li>• <a href="#">Overriding the Default DHCP Relay Configuration Settings on page 1447</a></li> <li>• <a href="#">DHCP Snooping Support on page 1367</a></li> </ul>

## no-bind-on-request (DHCP Relay Agent)

<b>Syntax</b>	no-bind-on-request;
<b>Hierarchy Level</b>	<p>[edit forwarding-options dhcp-relay dhcpv6 <a href="#">overrides</a>],  [edit forwarding-options dhcp-relay <a href="#">overrides</a>],  [edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> <a href="#">overrides</a>],  [edit forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>],  [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay dhcpv6 <a href="#">overrides</a>],  [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay <a href="#">overrides</a>],  [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> <a href="#">overrides</a>],  [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>],  [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 <a href="#">overrides</a>],  [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay <a href="#">overrides</a>],  [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> <a href="#">overrides</a>],  [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>],  [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 <a href="#">overrides</a>],  [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay <a href="#">overrides</a>],  [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> <a href="#">overrides</a>],  [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>],  [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> interface <i>interface-name</i> <a href="#">overrides</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 10.4.  Support at the <b>[edit ... dhcpv6]</b> hierarchy levels introduced in Junos OS Release 11.4.  Statement introduced in Junos OS Release 12.3 for EX Series switches.</p>
<b>Description</b>	<p>Explicitly disable automatic binding of received DHCP request messages that have no entry in the database (<i>stray</i> requests). Use the statement at the <b>[edit ... dhcpv6]</b> hierarchy levels to configure DHCPv6 support.</p> <p>M120 and M320 routers do not support DHCPv6.</p>
<div>  <p><b>NOTE:</b> Beginning with Junos OS Release 10.4, automatic binding of stray requests is enabled by default. In Junos OS Release 10.3 and earlier releases, automatic binding of stray requests is disabled by default.</p> </div>	
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.  interface-control—To add this statement to the configuration.</p>

## option-60 (DHCP Relay Agent)

---

<b>Syntax</b>	option-60;
<b>Hierarchy Level</b>	[edit forwarding-options dhcp-relay authentication <a href="#">username-include</a> ], [edit forwarding-options dhcp-relay group <i>group-name</i> authentication <a href="#">username-include</a> ], [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay authentication <a href="#">username-include</a> ], [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay group <i>group-name</i> authentication <a href="#">username-include</a> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay authentication <a href="#">username-include</a> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> authentication <a href="#">username-include</a> ], [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay authentication <a href="#">username-include</a> ], [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> authentication <a href="#">username-include</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.1. Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
<b>Description</b>	Specify that the payload of the Option 60 (Vendor Class Identifier) from the client PDU is concatenated with the username during the subscriber authentication or client authentication process.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	• <a href="#">Using External AAA Authentication Services with DHCP on page 1420</a>

## option-82 (DHCP Relay Agent)

<b>Syntax</b>	<code>option-82 &lt;circuit-id&gt; &lt;remote-id&gt;;</code>
<b>Hierarchy Level</b>	<p>[edit forwarding-options dhcp-relay authentication <a href="#">username-include</a>],</p> <p>[edit forwarding-options dhcp-relay group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay authentication <a href="#">username-include</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> authentication <a href="#">username-include</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.1.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	Specify the option 82 that is concatenated with the username during the subscriber authentication or client authentication process. You can specify either, both, or neither the Agent Circuit ID and the Agent Remote ID suboptions. If you specify both, the Agent Circuit ID is supplied first, followed by a delimiter, and then the Agent Remote ID. If neither suboption is supplied, the raw payload of option 82 is concatenated to the username.
<div>  <b>NOTE:</b> The option 82 value used in creating the username is based on the option 82 value that is encoded in the outgoing (relayed) PDU. </div>	
<b>Options</b>	<p><b>circuit-id</b>—(Optional) The string for the Agent Circuit ID suboption (suboption 1).</p> <p><b>remote-id</b>—(Optional) The string for the Agent Remote ID suboption (suboption 2).</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Using External AAA Authentication Services with DHCP on page 1420</a></li> </ul>

## option-number (DHCP Relay Agent Option)

<b>Syntax</b>	<code>option-number option-number;</code>
<b>Hierarchy Level</b>	<p>[edit forwarding-options <a href="#">dhcp-relay relay-option</a>],</p> <p>[edit forwarding-options <a href="#">dhcp-relay dhcpv6 relay-option</a>],</p> <p>[edit forwarding-options dhcp-relay <a href="#">group group-name relay-option</a>],</p> <p>[edit forwarding-options dhcp-relay dhcpv6 <a href="#">group group-name relay-option</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options <a href="#">dhcp-relay ...</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options <a href="#">dhcp-relay ...</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options <a href="#">dhcp-relay ...</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 12.3.</p> <p>Statement introduced in Junos OS Release 12.3 for EX Series switches.</p>
<b>Description</b>	<p>Specify the DHCP option DHCP relay agent uses for selective processing of client traffic. You can configure support globally or for a named group of interfaces. You can also configure support for the extended DHCP relay agent on a per logical system and per routing instance basis.</p> <p>Use the <a href="#">[edit forwarding-options dhcp-relay dhcpv6]</a> hierarchy level to configure the DHCPv6 relay agent support.</p>
<b>Options</b>	<i>option-number</i> —The DHCP or DHCPv6 option in the incoming traffic.
<div>  <b>NOTE:</b> EX Series switches do not support the User Class Options.         </div>	
<ul style="list-style-type: none"> <li>• 15 (DHCPv6 only)—Use DHCPv6 option 15 (User Class Option) in packets</li> <li>• 16 (DHCPv6 only)—(MX Series routers and EX Series switches only) Use DHCPv6 option 16 (Vendor Class Option) in packets</li> <li>• 60 (DHCPv4 only)—(MX Series routers and EX Series switches only) Use DHCP option 60 (Vendor Class Identifier) in DHCP packets</li> <li>• 77 (DHCPv4 only)—Use DHCP option 77 (User Class Identifier) in packets</li> </ul>	
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Using DHCP Option Information to Selectively Process DHCP Client Traffic</a></li> <li>• <a href="#">Configuring an Extended DHCP Relay Server on EX Series Switches (CLI Procedure)</a> on page 1416</li> </ul>

## overrides (DHCP Relay Agent)

<b>Syntax</b>	<pre> overrides {   allow-snooped-clients;   allow-no-end-options;   always-write-giaddr;   always-write-option-82;   client-discover-match (option60-and-option82   incoming-interface);   delay-authentication;   delete-binding-on-renegotiation;   disable-relay;   interface-client-limit <i>number</i>;   layer2-unicast-replies;   no-allow-snooped-clients;   no-bind-on-request;   proxy-mode;   replace-ip-source-with;   send-release-on-delete;   trust-option-82; } </pre>
<b>Hierarchy Level</b>	<pre> [edit forwarding-options dhcp-relay], [edit forwarding-options dhcp-relay <b>dhcpv6</b>], [edit forwarding-options dhcp-relay <b>group</b> <i>group-name</i>], [edit forwarding-options dhcp-relay <b>group</b> <i>group-name</i> <b>interface</b> <i>interface-name</i>], [edit forwarding-options dhcp-relay <b>dhcpv6</b> <b>group</b> <i>group-name</i>], [edit forwarding-options dhcp-relay <b>dhcpv6</b> <b>group</b> <i>group-name</i> <b>interface</b> <i>interface-name</i>], [edit logical-systems <i>logical-system-name</i> forwarding-options <b>dhcp-relay</b> ...], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i>   forwarding-options <b>dhcp-relay</b> ...], [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay ...] </pre>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.3.</p> <p>Support at the <b>[edit ... dhcpv6]</b> hierarchy levels introduced in Junos OS Release 11.4.</p> <p>Statement introduced in Junos OS Release 12.1 for EX Series switches.</p> <p>Support for the <b>delete-binding-on-renegotiation</b> statement introduced in Junos OS Release 13.2 for EX Series switches.</p> <p>Support for the <b>allow-no-end-options</b> statement introduced in Junos OS Release 14.1X53 for EX Series switches.</p>
<b>Description</b>	<p>Override the default configuration settings for the extended DHCP relay agent. Specifying the <b>overrides</b> statement with no subordinate statements removes all DHCP relay agent overrides at that hierarchy level. Use the statement at the <b>[edit ... dhcpv6]</b> hierarchy levels to configure DHCPv6 support.</p> <p>M120 and M320 routers do not support DHCPv6.</p> <p>The following statements are supported at both the <b>[edit ... dhcp-relay]</b> and <b>[edit ... dhcpv6]</b> hierarchy levels. All other statements are supported at the <b>dhcp-relay</b> hierarchy levels only.</p> <ul style="list-style-type: none"> <li>• <b>allow-snooped-clients</b></li> </ul>

- **interface-client-limit**
- **no-allow-snooped-clients**
- **no-bind-on-request**
- **send-release-on-delete**

The remaining statements are explained separately.

<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

## password (DHCP Relay Agent)

<b>Syntax</b>	<code>password password-string;</code>
<b>Hierarchy Level</b>	<p>[edit forwarding-options dhcp-relay <a href="#">authentication</a>],  [edit forwarding-options dhcp-relay dhcpv6 <a href="#">authentication</a>],  [edit forwarding-options dhcp-relay group <i>group-name</i> <a href="#">authentication</a>],  [edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> <a href="#">authentication</a>],  [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay <a href="#">authentication</a>],  [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay dhcpv6 <a href="#">authentication</a>],  [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">authentication</a>],  [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> <a href="#">authentication</a>],  [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay <a href="#">authentication</a>],  [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 <a href="#">authentication</a>],  [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">authentication</a>],  [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> <a href="#">authentication</a>],  [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay <a href="#">authentication</a>],  [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 <a href="#">authentication</a>],  [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">authentication</a>],  [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> <a href="#">authentication</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.1.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p> <p>Support at the <a href="#">[edit ... dhcpv6]</a> hierarchy levels introduced in Junos OS Release 11.4.</p>
<b>Description</b>	<p>Configure the password that is sent to the external AAA authentication server for subscriber authentication or client authentication. Use the statement at the <a href="#">[edit ... dhcpv6]</a> hierarchy levels to configure DHCPv6 support.</p>
<b>Options</b>	<i>password-string</i> —Authentication password.
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Using External AAA Authentication Services with DHCP on page 1420</a></li> <li>• <a href="#">Configuring Passwords for Usernames on page 1439</a></li> </ul>

## preference (Subscriber Management)

---

<b>Syntax</b>	<code>preference route-distance</code>
<b>Hierarchy Level</b>	<code>[edit dynamic-profiles <i>profile-name</i> routing-instances \$junos-routing-instance routing-options access route <i>prefix</i>]</code> , <code>[edit dynamic-profiles <i>profile-name</i> routing-instances \$junos-routing-instance routing-options rib <i>routing-table-name</i> access route <i>prefix</i>]</code> , <code>[edit dynamic-profiles <i>profile-name</i> routing-options <b>access</b> route <i>prefix</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.5. Support at <code>[edit dynamic-profiles <i>profile-name</i> routing-instances \$junos-routing-instance routing-options access route <i>prefix</i>]</code> and <code>[edit dynamic-profiles <i>profile-name</i> routing-instances \$junos-routing-instance routing-options rib <i>routing-table-name</i> access route <i>prefix</i>]</code> hierarchy levels introduced in Junos OS Release 10.1.
<b>Description</b>	Dynamically configure the distance for an access route.
<b>Options</b>	<b><i>route-distance</i></b> —Either the specific distance you want to assign to the access route or either of the following distance variables: <ul style="list-style-type: none"><li>• <b><i>\$junos-framed-route-distance</i></b>—Distance of an IPv4 access route; the variable is dynamically replaced with the preference value (Subattribute 5) from the RADIUS Framed-Route attribute [22].</li><li>• <b><i>\$junos-framed-route-ipv6-distance</i></b>—Distance of an IPv6 access route; the variable is dynamically replaced with the preference value (Subattribute 5) from the RADIUS Framed-IPv6-Route attribute [99].</li></ul>
<b>Required Privilege Level</b>	<code>routing</code> —To view this statement in the configuration. <code>routing-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Dynamic Access Routes for Subscriber Management</i></li></ul>

## prefix (DHCP Relay Agent)

<b>Syntax</b>	<code>prefix <i>prefix</i>;</code>
<b>Hierarchy Level</b>	<p>[edit forwarding-options dhcp-relay <b>dhcpv6</b> (<b>relay-agent-interface-id</b>   relay-agent-remote-id)],</p> <p>[edit forwarding-options dhcp-relay <b>dhcpv6</b> group <i>group-name</i> (<b>relay-agent-interface-id</b>   relay-agent-remote-id)],</p> <p>[edit forwarding-options dhcp-relay relay-option-82 (<b>circuit-id</b>   remote-id)],</p> <p>[edit forwarding-options dhcp-relay group <i>group-name</i> relay-option-82 (<b>circuit-id</b>   remote-id)],</p> <p>[edit logical-systems <i>logical-system-name</i> ... forwarding-options dhcp-relay <b>dhcpv6</b> (<b>relay-agent-interface-id</b>   relay-agent-remote-id)],</p> <p>[edit logical-systems <i>logical-system-name</i> ... forwarding-options dhcp-relay ... relay-option-82 (<b>circuit-id</b>   remote-id)],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay <b>dhcpv6</b> (<b>relay-agent-interface-id</b>   relay-agent-remote-id)],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay ... relay-option-82 (<b>circuit-id</b>   remote-id)]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.3.</p> <p>Support at the [edit ... <b>dhcpv6</b>] hierarchy levels introduced in Junos OS Release 11.4.</p> <p>Statement introduced in Junos OS Release 12.3 for EX Series switches.</p> <p>Support at the [edit ... <b>relay-agent-remote-id</b>] and [edit ... <b>remote-id</b>] hierarchy levels introduced in Junos OS Release 14.1.</p>
<b>Description</b>	<p>Add a prefix to the DHCP base option 82 Agent Circuit ID (suboption 1) or Agent Remote ID (suboption 2) information, or to the DHCPv6 option 18 (Relay Agent Interface-ID) or option 37 (Relay Agent Remote-ID) information in DHCP packets that DHCP relay agent sends to a DHCP server. The prefix can consist of any combination of the hostname, logical system name, and routing instance name.</p>
<b>Options</b>	<p><i>prefix</i>—Any of the following:</p> <ul style="list-style-type: none"> <li>• <b>host-name</b>—Prepend the hostname of the router configured with the <b>host-name</b> statement at the [edit <b>system</b>] hierarchy level to the DHCP option information.</li> <li>• <b>logical-system-name</b>—Prepend the name of the logical system to the option information.</li> <li>• <b>routing-instance-name</b>—Prepend the name of the routing instance to the option information.</li> </ul>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Including a Prefix in DHCP Options on page 1466</a></li> <li>• <a href="#">Using DHCP Relay Agent Option 82 Information on page 1464</a></li> <li>• <a href="#">Configuring DHCPv6 Relay Agent Options</a></li> </ul>

## proxy-mode

---

<b>Syntax</b>	proxy-mode;
<b>Hierarchy Level</b>	<p>[edit forwarding-options dhcp-relay <a href="#">overrides</a>], [edit forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>], [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay <a href="#">overrides</a>], [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay <a href="#">overrides</a>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>], [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay <a href="#">overrides</a>], [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>], [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> interface <i>interface-name</i> <a href="#">overrides</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.5.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	<p>Enable DHCP relay proxy mode on the extended DHCP relay. Proxy mode supports all extended DHCP relay functionality.</p> <p>You cannot configure both the DHCP relay proxy and the extended DHCP local server on the same interface.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">DHCP Relay Proxy Overview on page 1382</a></li><li>• <a href="#">Extended DHCP Relay Agent Overview on page 1379</a></li><li>• <a href="#">Enabling DHCP Relay Proxy Mode on page 1470</a></li></ul>

## relay-agent-interface-id (DHCPv6 Relay Agent)

<b>Syntax</b>	<pre> relay-agent-interface-id {   prefix <i>prefix</i>;   use-interface-description (logical   device);   use-option-82; } </pre>
<b>Hierarchy Level</b>	<pre> [edit forwarding-options dhcp-relay <a href="#">dhcpv6</a>], [edit forwarding-options dhcp-relay <a href="#">dhcpv6 group</a> <i>group-name</i>], [edit logical-systems <i>logical-system-name</i> forwarding-options <a href="#">dhcp-relay dhcpv6</a> ...], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i>  forwarding-options dhcp-relay <a href="#">dhcpv6</a> ...], [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay <a href="#">dhcpv6</a> ...] </pre>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 11.4.</p> <p>Statement introduced in Junos OS Release 12.3 for EX Series switches.</p>
<b>Description</b>	<p>Insert the DHCPv6 Relay Agent Interface-ID option (option 18) in DHCPv6 packets destined for the DHCPv6 server.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">dhcp-relay on page 1570</a></li> <li>• <a href="#">Extended DHCP Relay Agent Overview on page 1379</a></li> <li>• <a href="#">DHCPv6 Relay Agent Overview on page 1384</a></li> <li>• <a href="#">Inserting DHCPv6 Interface-ID Option (Option 18) In DHCPv6 Packets on page 1470</a></li> </ul>

## relay-agent-remote-id (DHCPv6 Relay Agent Username)

---

<b>Syntax</b>	relay-agent-remote-id;
<b>Hierarchy Level</b>	<p>[edit forwarding-options dhcp-relay dhcpv6 authentication <a href="#">username-include</a>], [edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>], [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay dhcpv6 authentication <a href="#">username-include</a>], [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 authentication <a href="#">username-include</a>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>], [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 authentication <a href="#">username-include</a>], [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 11.4.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p> <p>For MX Series routers only, <b>enterprise-id</b> and <b>remote-id</b> options introduced in Junos OS Release 12.3R3.</p> <p>For MX Series routers only, the <b>enterprise-id</b> and <b>remote-id</b> options are obsoleted starting in Junos OS Releases 12.3R7, 13.2R4, 13.3R2, and 14.1R1.</p>
<b>Description</b>	<p>Specify that the DHCPv6 Relay Agent Remote-ID option (option 37) in the client PDU name is concatenated with the username during the subscriber authentication or client authentication process. In order to generate an ASCII version of the username, the router concatenates only the remote-id portion of option 37 to the username, and ignores the enterprise number.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">DHCPv6 Relay Agent Overview on page 1384</a></li><li>• <a href="#">Creating Unique Usernames for DHCP Clients on page 1439</a></li></ul>

## relay-option (DHCP Relay Agent)

<b>Syntax</b>	<pre> relay-option {   option-number option-number;   default-action {     drop;     forward-only;     local-server-group local-server-group;     relay-server-group relay-server-group;   }   equals (ascii <i>ascii-string</i>   hexadecimal <i>hexadecimal-string</i>) {     drop;     forward-only;     local-server-group local-server-group;     relay-server-group relay-server-group;   }   starts-with (ascii <i>ascii-string</i>   hexadecimal <i>hexadecimal-string</i>) {     drop;     forward-only;     local-server-group local-server-group;     relay-server-group relay-server-group;   } } </pre>
<b>Hierarchy Level</b>	<pre> [edit forwarding-options dhcp-relay], [edit forwarding-options dhcp-relay dhcpv6], [edit forwarding-options dhcp-relay group group-name], [edit forwarding-options dhcp-relay dhcpv6 group group-name], [edit logical-systems logical-system-name forwarding-options dhcp-relay ...], [edit logical-systems logical-system-name routing-instances routing-instance-name   forwarding-options dhcp-relay ...], [edit routing-instances routing-instance-name forwarding-options dhcp-relay ...] </pre>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 12.3.</p> <p>Statement introduced in Junos OS Release 12.3 for EX Series switches.</p>
<b>Description</b>	<p>Configure the extended DHCP relay agent selective processing that is based on DHCP options in DHCP client packets and specify the action to perform on client traffic. You can configure support globally or for a named group of interfaces, and for either DHCP or DHCPv6 relay agent.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Using DHCP Option Information to Selectively Process DHCP Client Traffic</i></li> </ul>

## relay-option-82

---

Syntax	<pre>relay-option-82 {   circuit-id {     prefix <i>prefix</i>;     use-interface-description (logical   device);   }   remote-id {     prefix <i>prefix</i>;     use-interface-description (logical   device);   } }</pre>
Hierarchy Level	<pre>[edit forwarding-options dhcp-relay], [edit forwarding-options dhcp-relay <i>group group-name</i>], [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay], [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay <i>group group-name</i>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i>   forwarding-options dhcp-relay], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i>   forwarding-options dhcp-relay <i>group group-name</i>], [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay], [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay <i>group</i>   <i>group-name</i>]</pre>
Release Information	<p>Statement introduced in Junos OS Release 8.3.</p> <p>Statement introduced in Junos OS Release 12.3 for EX Series switches.</p>
Description	<p>Enable or disable the insertion of the DHCP relay agent information option (option 82) in DHCP packets destined for a DHCP server.</p> <p>To enable insertion of option 82 information in DHCP packets, you must specify at least one of the <b>circuit-id</b> or <b>remote-id</b> statements.</p> <p>You can use the <b>relay-option-82</b> statement and its subordinate statements at the <b>[edit forwarding-options dhcp-relay]</b> hierarchy level to control insertion of option 82 information globally, or at the <b>[edit forwarding-options dhcp-relay <i>group group-name</i>]</b> hierarchy level to control insertion of option 82 information for a named group of interfaces.</p> <p>To restore the default behavior (option 82 information is not inserted into DHCP packets), use the <b>delete relay-option-82</b> statement.</p> <p>The remaining statements are explained separately.</p>
Required Privilege Level	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">Using DHCP Relay Agent Option 82 Information on page 1464</a></li><li>• <a href="#">dhcp-relay on page 1570</a></li></ul>

## relay-server-group (DHCP Relay Agent Option)

<b>Syntax</b>	<code>relay-server-group <i>relay-server-group</i>;</code>
<b>Hierarchy Level</b>	<p>[edit forwarding-options dhcp-relay relay-option (default-action   equals   starts-with),  [edit forwarding-options dhcp-relay dhcpv6 relay-option (default-action   equals   starts-with),  [edit forwarding-options dhcp-relay group <i>group-name</i> relay-option (default-action   equals   starts-with),  [edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> relay-option (default-action   equals   starts-with),  [edit logical-systems <i>logical-system-name</i> forwarding-options <a href="#">dhcp-relay</a> ...],  [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options <a href="#">dhcp-relay</a> ...],  [edit routing-instances <i>routing-instance-name</i> forwarding-options <a href="#">dhcp-relay</a> ...]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 12.3.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	Relay DHCP client packets to the specified group of DHCP servers when you use the DHCP relay selective processing feature. You can configure the relay operation globally or for a group of interfaces, and for either DHCP or DHCPv6 relay agent.
<b>Options</b>	<i>relay-server-group</i> —Name of DHCP server group.
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Using DHCP Option Information to Selectively Process DHCP Client Traffic</i></li> </ul>

## replace-ip-source-with

---

<b>Syntax</b>	replace-ip-source-with giaddr;
<b>Hierarchy Level</b>	[edit forwarding-options dhcp-relay <a href="#">overrides</a> ], [edit forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a> ], [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay <a href="#">overrides</a> ], [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay <a href="#">overrides</a> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a> ], [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay <a href="#">overrides</a> ], [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a> ], [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> interface <i>interface-name</i> <a href="#">overrides</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6. Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
<b>Description</b>	Replace the IP source address in DHCP relay request and release packets with the gateway IP address (giaddr).
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Extended DHCP Relay Agent Overview on page 1379</a></li><li>• <a href="#">Replacing the DHCP Relay Request and Release Packet Source Address on page 1450</a></li></ul>

## routing-instance-name (DHCP Relay Agent)

<b>Syntax</b>	routing-instance-name;
<b>Hierarchy Level</b>	<p>[edit forwarding-options dhcp-relay authentication <a href="#">username-include</a>],</p> <p>[edit forwarding-options dhcp-relay dhcpv6 authentication <a href="#">username-include</a>],</p> <p>[edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit forwarding-options dhcp-relay group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay dhcpv6 authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay authentication <a href="#">username-include</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 authentication <a href="#">username-include</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> authentication <a href="#">username-include</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.1.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p> <p>Support at the <a href="#">[edit ... dhcpv6]</a> hierarchy levels introduced in Junos OS Release 11.4.</p>
<b>Description</b>	Specify that the routing instance name is concatenated with the username during the subscriber authentication or client authentication process. No routing instance name is concatenated if the configuration is in the default routing instance. Use the statement at the <a href="#">[edit ... dhcpv6]</a> hierarchy levels to configure DHCPv6 support.
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Using External AAA Authentication Services with DHCP on page 1420</a></li> <li>• <a href="#">Creating Unique Usernames for DHCP Clients on page 1439</a></li> </ul>

## send-release-on-delete (DHCP Relay Agent)

<b>Syntax</b>	send-release-on-delete;
<b>Hierarchy Level</b>	<p>[edit forwarding-options dhcp-relay dhcpv6 <a href="#">overrides</a>],</p> <p>[edit forwarding-options dhcp-relay <a href="#">overrides</a>],</p> <p>[edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay dhcpv6 <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 <a href="#">overrides</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay <a href="#">overrides</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> interface <i>interface-name</i> <a href="#">overrides</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 10.2.</p> <p>Support at the <b>[edit ... dhcpv6]</b> hierarchy levels introduced in Junos OS Release 11.4.</p> <p>Statement introduced in Junos OS Release 12.3 for EX Series switches.</p>
<b>Description</b>	<p>Send a release message to the DHCP (or DHCPv6) server whenever DHCP relay or relay proxy deletes a client. Use the statement at the <b>[edit ... dhcpv6]</b> hierarchy levels to configure DHCPv6 support.</p> <p>M120 and M320 routers do not support DHCPv6.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Extended DHCP Relay Agent Overview on page 1379</a></li> <li>• <a href="#">Overriding the Default DHCP Relay Configuration Settings on page 1447</a></li> <li>• <a href="#">Sending Release Messages When Clients Are Deleted on page 1462</a></li> </ul>

## server-group

<b>Syntax</b>	<pre>server-group {     server-group-name {         server-ip-address;     } }</pre>
<b>Hierarchy Level</b>	<p>[edit forwarding-options dhcp-relay],          [edit forwarding-options <a href="#">dhcp-relay dhcpv6</a>],          [edit logical-systems <i>logical-system-name</i> forwarding-options <a href="#">dhcp-relay</a>],          [edit logical-systems <i>logical-system-name</i> forwarding-options <a href="#">dhcp-relay dhcpv6</a>],          [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options <a href="#">dhcp-relay</a>],          [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options <a href="#">dhcp-relay dhcpv6</a>],          [edit routing-instances <i>routing-instance-name</i> forwarding-options <a href="#">dhcp-relay</a>],          [edit routing-instances <i>routing-instance-name</i> forwarding-options <a href="#">dhcp-relay dhcpv6</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.3.          Support at the <a href="#">[edit ... dhcpv6]</a> hierarchy levels introduced in Junos OS Release 11.4.          Statement introduced in Junos OS Release 12.1 for EX Series switches.</p>
<b>Description</b>	<p>Specify the name of a group of DHCP server addresses for use by the extended DHCP relay agent. Use the statement at the <a href="#">[edit ... dhcpv6]</a> hierarchy levels to configure DHCPv6 support.</p>
<b>Options</b>	<p><b><i>server-group-name</i></b>—Name of the group of DHCP or DHCPv6 server addresses.</p> <p><b><i>server-ip-address</i></b>—IP address of the DHCP server belonging to this named server group. Use IPv6 addresses when configuring DHCPv6 support. You can configure a maximum of five IP addresses in each named server group.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.          interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">dhcp-relay on page 1570</a></li> <li>• <a href="#">Extended DHCP Relay Agent Overview on page 1379</a></li> <li>• <a href="#">Configuring Server Groups on page 1469</a></li> </ul>

## service-profile (DHCP Relay Agent)

---

Syntax	<code>service-profile <i>dynamic-profile-name</i>;</code>
Hierarchy Level	<code>[edit forwarding-options dhcp-relay],</code> <code>[edit forwarding-options dhcp-relay <b>dhcpv6</b>],</code> <code>[edit forwarding-options dhcp-relay <b>group</b> <i>group-name</i>],</code> <code>[edit forwarding-options dhcp-relay group <i>group-name</i> <b>interface</b> <i>interface-name</i>],</code> <code>[edit forwarding-options dhcp-relay dhcpv6 <b>group</b><i>group-name</i>],</code> <code>[edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> <b>interface</b> <i>interface-name</i>],</code> <code>[edit logical-systems <i>logical-system-name</i> forwarding-options <b>dhcp-relay</b> ...],</code> <code>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i></code> <code>forwarding-options <b>dhcp-relay</b> ...],</code> <code>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay ...]</code>
Release Information	Statement introduced in Junos OS Release 11.2. Statement introduced in Junos OS Release 12.3R2 for EX Series switches. Support at the <code>[edit ... <b>dhcpv6</b> ...]</code> hierarchy levels introduced in Junos OS Release 11.4.
Description	<p>Specify the default subscriber service (or the default DHCP client management service), which is activated when the subscriber (or client) logs in and no other service is activated by a RADIUS server or a provisioning server.</p> <ul style="list-style-type: none"><li>• To specify the default service for all DHCP relay agent clients, include the <b>service-profile</b> statement at the <code>[edit forwarding-options dhcp relay]</code> hierarchy level.</li><li>• To specify the default service for a named group of interfaces, include the <b>service-profile</b> statement at the <code>[edit forwarding-options dhcp relay group <i>group-name</i>]</code> hierarchy level.</li><li>• To specify the default service for a particular interface within a named group of interfaces, include the <b>service-profile</b> statement at the <code>[edit forwarding-options dhcp relay group <i>group-name</i> interface <i>interface-name</i>]</code> hierarchy level.</li></ul>
Options	<b><i>dynamic-profile-name</i></b> —Name of the dynamic profile.
Required Privilege Level	<code>interface</code> —To view this statement in the configuration. <code>interface-control</code> —To add this statement to the configuration.
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">dhcp-relay on page 1570</a></li><li>• <a href="#">Attaching Dynamic Profiles to DHCP Subscriber Interfaces or DHCP Client Interfaces</a></li><li>• <a href="#">Grouping Interfaces with Common DHCP Configurations on page 1421</a></li><li>• <a href="#">Default Subscriber Service Overview</a></li><li>• <a href="#">Configuring a Default Subscriber Service</a></li></ul>

## session-mode

<b>Syntax</b>	<code>session-mode (automatic   multihop   singlehop);</code>
<b>Hierarchy Level</b>	<p>[edit system services dhcp-local-server liveness-detection method <a href="#">bfd</a>],  [edit system services dhcp-local-server dhcpv6 liveness-detection method <a href="#">bfd</a>],  [edit forwarding-options dhcp-relay liveness-detection], [edit forwarding-options dhcp-relay dhcpv6 liveness-detection method <a href="#">bfd</a>],  [edit system services dhcp-local-server group <i>group-name</i> liveness-detection method <a href="#">bfd</a>],  [edit system services dhcp-local-server dhcpv6 group <i>group-name</i> liveness-detection method <a href="#">bfd</a>],  [edit forwarding-options dhcp-relay group <i>group-name</i> liveness-detection method <a href="#">bfd</a>],  [edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> liveness-detection method <a href="#">bfd</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 12.1.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	Configure the session mode.
<b>Options</b>	<p><b>automatic</b>—Configure single-hop BFD sessions if the peer is directly connected to the router interface and multihop BFD sessions if the peer is not directly connected to the router interface.</p> <p><b>multihop</b>—Configure multihop BFD sessions.</p> <p><b>single-hop</b>—Configure single hop BFD sessions.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Group Liveness Detection for DHCP Local Server Clients on page 1395</a></li> <li>• <a href="#">Example: Configuring Global Liveness Detection for DHCP Relay Agent Clients</a></li> </ul>

## threshold (detection-time)

---

<b>Syntax</b>	<code>threshold <i>milliseconds</i>;</code>
<b>Hierarchy Level</b>	<code>[edit system services dhcp-local-server liveness-detection method bfd <i>detection-time</i>],</code> <code>[edit system services dhcp-local-server dhcpv6 liveness-detection method bfd</code> <code>    <i>detection-time</i>],</code> <code>[edit forwarding-options dhcp-relay liveness-detection method bfd <i>detection-time</i>],</code> <code>[edit forwarding-options dhcp-relay dhcpv6 liveness-detection method bfd <i>detection-time</i>],</code> <code>[edit system services dhcp-local-server group <i>group-name</i> liveness-detection method bfd</code> <code>    <i>detection-time</i>],</code> <code>[edit system services dhcp-local-server dhcpv6 group <i>group-name</i> liveness-detection method</code> <code>    bfd <i>detection-time</i>],</code> <code>[edit forwarding-options dhcp-relay group <i>group-name</i> liveness-detection method bfd</code> <code>    <i>detection-time</i>],</code> <code>[edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> liveness-detection method</code> <code>    bfd <i>detection-time</i>]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1. Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
<b>Description</b>	Specify the threshold for the adaptation of the detection time. When the BFD session detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.
<div> <b>NOTE:</b> The threshold time must be greater than or equal to the minimum-interval or the minimum-receive-interval.</div>	
<b>Options</b>	<i>milliseconds</i> — Value for the detection time adaptation threshold. <b>Range:</b> 1 through 255,000
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Configuring Group Liveness Detection for DHCP Local Server Clients on page 1395</a></li><li>• <a href="#">Example: Configuring Global Liveness Detection for DHCP Relay Agent Clients</a></li></ul>

## threshold (transmit-interval)

<b>Syntax</b>	<code>threshold <i>milliseconds</i>;</code>
<b>Hierarchy Level</b>	<p>[edit system services dhcp-local-server liveness-detection method bfd <a href="#">transmit-interval</a>],</p> <p>[edit system services dhcp-local-server dhcpv6 liveness-detection method bfd <a href="#">transmit-interval</a>],</p> <p>[edit forwarding-options dhcp-relay liveness-detection method bfd <a href="#">transmit-interval</a>],</p> <p>[edit forwarding-options dhcp-relay dhcpv6 liveness-detection method bfd <a href="#">transmit-interval</a>],</p> <p>[edit system services dhcp-local-server group <i>group-name</i> liveness-detection method bfd <a href="#">transmit-interval</a>],</p> <p>[edit system services dhcp-local-server dhcpv6 group <i>group-name</i> liveness-detection method bfd <a href="#">transmit-interval</a>],</p> <p>[edit forwarding-options dhcp-relay group <i>group-name</i> liveness-detection method bfd <a href="#">transmit-interval</a>],</p> <p>[edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> liveness-detection method bfd <a href="#">transmit-interval</a>]</p>
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1.
<b>Description</b>	Specify the threshold for detecting the adaptation of the transmit interval. When the BFD session transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent.
<b>Options</b>	<p><i>milliseconds</i> — Threshold value.</p> <p><b>Range:</b> 0 through 4,294,967,295 (<math>2^{32} - 1</math>)</p>
<div>  <p><b>NOTE:</b> The threshold value specified in the <code>threshold</code> statement must be greater than the value specified in the <code>minimum-interval</code> statement for the <code>transmit-interval</code> statement.</p> </div>	
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Group Liveness Detection for DHCP Local Server Clients on page 1395</a></li> <li>• <a href="#">Example: Configuring Global Liveness Detection for DHCP Relay Agent Clients</a></li> </ul>

## trace (DHCP Relay Agent)

---

<b>Syntax</b>	trace;
<b>Hierarchy Level</b>	[edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> <b>interface</b> <i>interface-name</i> ], [edit forwarding-options dhcp-relay group <i>group-name</i> <b>interface</b> <i>interface-name</i> ], [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> <b>interface</b> <i>interface-name</i> ], [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay group <i>group-name</i> <b>interface</b> <i>interface-name</i> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> <b>interface</b> <i>interface-name</i> ], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> <b>interface</b> <i>interface-name</i> ], [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> <b>interface</b> <i>interface-name</i> ], [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> <b>interface</b> <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.4. Support at the [edit ... <b>dhcpv6</b> ] hierarchy levels introduced in Junos OS Release 11.4. Statement introduced in Junos OS Release 12.1 for EX Series switches.
<b>Description</b>	Enable trace operations for a group of interfaces or for a specific interface within a group. Use the statement at the [edit ... <b>dhcpv6</b> ] hierarchy levels to configure DHCPv6 support.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Tracing Extended DHCP Operations</i></li><li>• <i>Tracing Extended DHCP Operations for Specific Interfaces</i></li></ul>

## transmit-interval

<b>Syntax</b>	<pre>transmit-interval {     threshold milliseconds;     minimum-interval milliseconds; }</pre>
<b>Hierarchy Level</b>	<p>[edit system services dhcp-local-server liveness-detection method <a href="#">bfd</a>],          [edit system services dhcp-local-server dhcpv6 liveness-detection method <a href="#">bfd</a>],          [edit forwarding-options dhcp-relay liveness-detection method <a href="#">bfd</a>], [edit forwarding-options          dhcp-relay dhcpv6 liveness-detection method <a href="#">bfd</a>],          [edit system services dhcp-local-server group <i>group-name</i> liveness-detection method <a href="#">bfd</a>],          [edit system services dhcp-local-server dhcpv6 group <i>group-name</i> liveness-detection method  <a href="#">bfd</a>],          [edit forwarding-options dhcp-relay group <i>group-name</i> liveness-detection method <a href="#">bfd</a>],          [edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> liveness-detection method  <a href="#">bfd</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 12.1.          Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	<p>Configure the Bidirectional Forwarding Detection (BFD) transmit interval.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.          routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Configuring Group Liveness Detection for DHCP Local Server Clients on page 1395</a></li> <li>• <a href="#">Example: Configuring Global Liveness Detection for DHCP Relay Agent Clients</a></li> </ul>

## trust-option-82

---

<b>Syntax</b>	trust-option-82;
<b>Hierarchy Level</b>	<p>[edit forwarding-options dhcp-relay <a href="#">overrides</a>], [edit forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>], [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay <a href="#">overrides</a>], [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay <a href="#">overrides</a>], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>], [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay <a href="#">overrides</a>], [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> <a href="#">overrides</a>], [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> interface <i>interface-name</i> <a href="#">overrides</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 8.3.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p>
<b>Description</b>	Enable processing of DHCP client packets that have a gateway IP address (giaddr) of 0 (zero) and contain option 82 information. By default, the DHCP relay agent treats such packets as if they originated at an untrusted source, and drops them without further processing.
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Trusting Option 82 Information on page 1451</a></li><li>• <a href="#">Overriding the Default DHCP Relay Configuration Settings on page 1447</a></li></ul>

## use-interface-description

<b>Syntax</b>	<code>use-interface-description (logical   device);</code>
<b>Hierarchy Level</b>	<p>[edit forwarding-options dhcp-relay <b>dhcpv6</b> (<b>relay-agent-interface-id</b>   relay-agent-remote-id)],</p> <p>[edit forwarding-options dhcp-relay <b>dhcpv6</b> group <i>group-name</i> (<b>relay-agent-interface-id</b>   relay-agent-remote-id)],</p> <p>[edit forwarding-options dhcp-relay relay-option-82 (<b>circuit-id</b>   remote-id)],</p> <p>[edit forwarding-options dhcp-relay group <i>group-name</i> relay-option-82 (<b>circuit-id</b>   remote-id)],</p> <p>[edit logical-systems <i>logical-system-name</i> ... forwarding-options dhcp-relay dhcpv6 (<b>relay-agent-interface-id</b>   relay-agent-remote-id)],</p> <p>[edit logical-systems <i>logical-system-name</i> ... forwarding-options dhcp-relay ... relay-option-82 (<b>circuit-id</b>   remote-id)],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 (<b>relay-agent-interface-id</b>   relay-agent-remote-id)],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay ... relay-option-82 (<b>circuit-id</b>   remote-id)]</p> <p>[edit vlans <i>vlan-name</i> forwarding-options dhcp-security dhcpv6-options <b>option-18</b>],</p> <p>[edit vlans <i>vlan-name</i> forwarding-options dhcp-security dhcpv6-options <b>option-37</b>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.6.</p> <p>Support at the [edit ... <b>dhcpv6</b>] hierarchy levels introduced in Junos OS Release 11.4.</p> <p>Statement introduced in Junos OS Release 12.3 for EX Series switches.</p> <p>Support at the [edit ... <b>relay-agent-remote-id</b>] and [edit ... <b>remote-id</b>] hierarchy levels introduced in Junos OS Release 14.1.</p> <p>Support at the [edit vlans <i>vlan-name</i> dhcp-security dhcpv6-options <b>option-18</b>] and [edit vlans <i>vlan-name</i> dhcp-security dhcpv6-options <b>option-37</b>] hierarchy levels introduced in Junos OS Release 14.1X53-D10 for EX Series switches.</p>
<b>Description</b>	<p>Use the textual interface description instead of the interface identifier in the DHCP base option 82 Agent Circuit ID (suboption 1) or Agent Remote ID (suboption 2) information, or in the DHCPv6 option 18 (Relay Agent Interface ID) or option 37 (Relay Agent Remote ID) information in DHCP packets that the DHCP relay agent sends to a DHCP server.</p> <p>If you specify that the textual description be used and no description is configured for the interface, DHCP relay defaults to using the interface identifier. The textual description is configured using the <b>description</b> statement at the [edit interfaces <i>interface-name</i>] hierarchy level.</p>
<div>  <p><b>NOTE:</b> By default, DHCP relay accepts a maximum of 253 ASCII characters. If the textual interface description exceeds 253 characters, DHCP relay drops the packet, which results in the DHCP client failing to bind.</p> </div>	
<b>Options</b>	<p><b>logical</b>—Use the textual description that is configured for the logical interface.</p> <p><b>device</b>—Use the textual description that is configured for the device interface.</p>

<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Including a Textual Description in DHCP Options on page 1468</a></li><li>• <a href="#">Using DHCP Relay Agent Option 82 Information on page 1464</a></li><li>• <i>Configuring DHCPv6 Relay Agent Options</i></li></ul>

## use-primary (DHCP Relay Agent)

<b>Syntax</b>	<code>use-primary <i>primary-profile-name</i>;</code>
<b>Hierarchy Level</b>	<p>[edit forwarding-options dhcp-relay dhcpv6 <b>dynamic-profile</b> <i>profile-name</i>],</p> <p>[edit forwarding-options dhcp-relay <b>dynamic-profile</b> <i>profile-name</i>],</p> <p>[edit forwarding-options dhcp-relay dhcpv6 <b>group</b> <i>group-name</i> <b>dynamic-profile</b> <i>profile-name</i>],</p> <p>[edit forwarding-options dhcp-relay <b>group</b> <i>group-name</i> <b>dynamic-profile</b> <i>profile-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay dhcpv6 <b>dynamic-profile</b> <i>profile-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay <b>dynamic-profile</b> <i>profile-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay dhcpv6 <b>group</b> <i>group-name</i> <b>dynamic-profile</b> <i>profile-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay <b>group</b> <i>group-name</i> <b>dynamic-profile</b> <i>profile-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 <b>dynamic-profile</b> <i>profile-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay <b>dynamic-profile</b> <i>profile-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 <b>group</b> <i>group-name</i> <b>dynamic-profile</b> <i>profile-name</i>],</p> <p>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay <b>group</b> <i>group-name</i> <b>dynamic-profile</b> <i>profile-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 <b>dynamic-profile</b> <i>profile-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay <b>dynamic-profile</b> <i>profile-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 <b>group</b> <i>group-name</i> <b>dynamic-profile</b> <i>profile-name</i>],</p> <p>[edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay <b>group</b> <i>group-name</i> <b>dynamic-profile</b> <i>profile-name</i>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.3.</p> <p>Support at the <b>[edit ... dhcpv6]</b> hierarchy levels introduced in Junos OS Release 11.4.</p> <p>Statement introduced in Junos OS Release 12.1 for EX Series switches.</p>
<b>Description</b>	<p>Specify the dynamic profile to configure as the primary dynamic profile. The primary dynamic profile is instantiated when the first subscriber logs in. Subsequent subscribers are not assigned the primary dynamic profile; instead, they are assigned the dynamic profile specified for the interface. When the first subscriber logs out, the next subscriber that logs in is assigned the primary dynamic profile.</p> <p>Use the statement at the <b>[edit ... dhcpv6]</b> hierarchy levels to configure DHCPv6 support.</p> <p>EX Series switches do not support DHCPv6.</p>
<b>Options</b>	<b><i>primary-profile-name</i></b> —Name of the dynamic profile to configure as the primary dynamic profile
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>

## user-prefix (DHCP Relay Agent)

<b>Syntax</b>	<code>user-prefix user-prefix-string;</code>
<b>Hierarchy Level</b>	<p>[edit forwarding-options dhcp-relay authentication <a href="#">username-include</a>],          [edit forwarding-options dhcp-relay dhcpv6 authentication <a href="#">username-include</a>],          [edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>],          [edit forwarding-options dhcp-relay group <i>group-name</i> authentication <a href="#">username-include</a>],          [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay authentication <a href="#">username-include</a>],          [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay dhcpv6 authentication <a href="#">username-include</a>],          [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>],          [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay group <i>group-name</i> authentication <a href="#">username-include</a>],          [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay authentication <a href="#">username-include</a>],          [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 authentication <a href="#">username-include</a>],          [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>],          [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> authentication <a href="#">username-include</a>],          [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay authentication <a href="#">username-include</a>],          [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 authentication <a href="#">username-include</a>],          [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> authentication <a href="#">username-include</a>],          [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay group <i>group-name</i> authentication <a href="#">username-include</a>]</p>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.1.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p> <p>Support at the <a href="#">[edit ... dhcpv6]</a> hierarchy levels introduced in Junos OS Release 11.4.</p>
<b>Description</b>	Specify the user prefix that is concatenated with the username during the subscriber authentication or client authentication process. Use the statement at the <a href="#">[edit ... dhcpv6]</a> hierarchy levels to configure DHCPv6 support.
<b>Options</b>	<i>user-prefix-string</i> —User prefix string.
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Using External AAA Authentication Services with DHCP on page 1420</a></li> </ul>

## username-include (DHCP Relay Agent)

<b>Syntax</b>	<pre>username-include {   circuit-type;   client-id;   delimiter <i>delimiter-character</i>;   domain-name <i>domain-name-string</i>;   interface-name;   logical-system-name;   mac-address;   option-60;   option-82 &lt;circuit-id&gt; &lt;remote-id&gt;;   relay-agent-interface-id;   relay-agent-remote-id;   relay-agent-subscriber-id;   routing-instance-name;   user-prefix <i>user-prefix-string</i>; }</pre>
<b>Hierarchy Level</b>	<pre>[edit forwarding-options dhcp-relay <a href="#">authentication</a>], [edit forwarding-options dhcp-relay dhcpv6 <a href="#">authentication</a>], [edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> <a href="#">authentication</a>], [edit forwarding-options dhcp-relay group <i>group-name</i> <a href="#">authentication</a>], [edit logical-systems <i>logical-system-name</i> forwarding-options dhcp-relay ...], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i>   forwarding-options dhcp-relay ...], [edit routing-instances <i>routing-instance-name</i> forwarding-options dhcp-relay ...]</pre>
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.1.</p> <p>Statement introduced in Junos OS Release 12.3R2 for EX Series switches.</p> <p>Support at the <a href="#">[edit ... dhcpv6]</a> hierarchy levels introduced in Junos OS Release 11.4.</p>
<b>Description</b>	<p>Configure the username that the router (or switch) passes to the external AAA server. You must include at least one of the optional statements for the username to be valid. If you do not configure a username, the router (or switch) accesses the local authentication service only and does not use external authentication services, such as RADIUS. Use the statement at the <a href="#">[edit...dhcpv6]</a> hierarchy levels to configure DHCPv6 support.</p> <p>The following statements are not supported in the DHCPv6 hierarchy levels:</p> <ul style="list-style-type: none"> <li>• <b>mac-address</b></li> <li>• <b>option-60</b></li> <li>• <b>option-82</b></li> </ul> <p>The following statements are supported in the DHCPv6 hierarchy levels only:</p> <ul style="list-style-type: none"> <li>• <b>relay-agent-interface-id</b></li> <li>• <b>relay-agent-remote-id</b></li> <li>• <b>relay-agent-subscriber-id</b></li> </ul>

The remaining statements are explained separately.

<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Creating Unique Usernames for DHCP Clients on page 1439</a></li><li>• <a href="#">Using External AAA Authentication Services with DHCP on page 1420</a></li></ul>

---

## version (BFD)

---

<b>Syntax</b>	version (0   1   automatic);
<b>Hierarchy Level</b>	[edit logical-systems <i>logical-system-name</i> protocols ldp oam bfd-liveness-detection], [edit logical-systems <i>logical-system-name</i> protocols ldp oam fec address bfd-liveness-detection], [edit system services dhcp-local-server liveness-detection method <b>bfd</b> ], [edit system services dhcp-local-server dhcpv6 liveness-detection method <b>bfd</b> ], [edit forwarding-options dhcp-relay liveness-detection method <b>bfd</b> ], [edit forwarding-options dhcp-relay dhcpv6 liveness-detection method <b>bfd</b> ], [edit system services dhcp-local-server group <i>group-name</i> liveness-detection method <b>bfd</b> ], [edit system services dhcp-local-server dhcpv6 group <i>group-name</i> liveness-detection method <b>bfd</b> ], [edit forwarding-options dhcp-relay group <i>group-name</i> liveness-detection method <b>bfd</b> ], [edit forwarding-options dhcp-relay dhcpv6 group <i>group-name</i> liveness-detection method <b>bfd</b> ], [edit protocols ldp oam bfd-liveness-detection], [edit protocols ldp oam fec address bfd-liveness-detection]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1. Statement introduced in Junos OS Release 12.3R2 for EX Series switches.
<b>Description</b>	Configure the BFD protocol version to detect.
<b>Options</b>	<b>0</b> —Use BFD protocol version 0.  <b>1</b> —Use BFD protocol version 1.  <b>automatic</b> —Autodetect the BFD protocol version. <b>Default:</b> automatic
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.

## cache-size

---

<b>Syntax</b>	cache-size <i>bytes</i> ;
<b>Hierarchy Level</b>	[edit security <a href="#">certificates</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	(Encryption interface on M Series and T Series routers and EX Series switches only) Configure the cache size for digital certificates.
<b>Options</b>	<b>bytes</b> —Cache size for digital certificates. <b>Range:</b> 64 through 4,294,967,295 <b>Default:</b> 2 megabytes (MB)

**NOTE:** We recommend that you limit your cache size to 4 MB.

---

<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring Digital Certificates for an ES PIC</i></li> </ul>

## cache-timeout-negative

---

<b>Syntax</b>	cache-timeout-negative <i>seconds</i> ;
<b>Hierarchy Level</b>	[edit security <a href="#">certificates</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	(Encryption interface on M Series and T Series routers and EX Series switches only) Configure a negative cache for digital certificates.
<b>Options</b>	<b>seconds</b> —Negative time to cache digital certificates, in seconds. <b>Range:</b> 10 through 4,294,967,295 <b>Default:</b> 20

**CAUTION:** Configuring a large negative cache value can lead to a denial-of-service attack.

---

<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Digital Certificates for an ES PIC</i></li></ul>

## certificates

<b>Syntax</b>	<pre> certificates {   cache-size bytes;   cache-timeout-negative seconds;   certification-authority ca-profile-name {     ca-name ca-identity;     crt file-name;     encoding (binary   pem);     enrollment-url url-name;     file certificate-filename;     ldap-url url-name;   }   enrollment-retry attempts;   local certificate-name {     certificate-key-string;     load-key-file URL filename;   }   maximum-certificates number;   path-length certificate-path-length; } </pre>
<b>Hierarchy Level</b>	[edit security]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	<p>(Encryption interface on M Series and T Series routers and EX Series switches only)</p> <p>Configure the digital certificates for IPsec.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>

## certification-authority

---

<b>Syntax</b>	<code>certification-authority <i>ca-profile-name</i> {     <i>ca-name ca-identity</i>;     <i>crl file-name</i>;     <i>encoding</i> (binary   pem);     <i>enrollment-url url-name</i>;     <i>file certificate-filename</i>;     <i>ldap-url url-name</i>; }</code>
<b>Hierarchy Level</b>	[edit security <a href="#">certificates</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	(Encryption interface on M Series and T Series routers and EX Series switches only) Configure a certificate authority profile name.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration
<b>Related Documentation</b>	<ul style="list-style-type: none"><li><i>Configuring Digital Certificates for an ES PIC</i></li></ul>

## connection-limit

<b>Syntax</b>	<code>connection-limit <i>limit</i>;</code>
<b>Hierarchy Level</b>	<code>[edit system services finger],</code> <code>[edit system services ftp],</code> <code>[edit system services netconf ssh],</code> <code>[edit system services ssh],</code> <code>[edit system services telnet],</code> <code>[edit system services xnm-clear-text],</code> <code>[edit system services xnm-ssl]</code>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Configure the maximum number of connections sessions for each type of system services (finger, ftp, ssh, telnet, xnm-clear-text, or xnm-ssl) per protocol (either IPv6 or IPv4).
<b>Options</b>	<p><b>limit</b>—(Optional) Maximum number of established connections per protocol (either IPv6 or IPv4).</p> <p><b>Range:</b> 1 through 250</p> <p><b>Default:</b> 75</p>

**NOTE:** The actual number of maximum connections depends on the availability of system resources, and might be fewer than the configured `connection-limit` value if the system resources are limited.

<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring clear-text or SSL Service for Junos XML Protocol Client Applications</i></li> <li>• <i>Configuring DTCP-over-SSH Service for the Flow-Tap Application</i></li> <li>• <i>Configuring Finger Service for Remote Access to the Router</i></li> <li>• <i>Configuring FTP Service for Remote Access to the Router or Switch</i></li> <li>• <i>Configuring SSH Service for Remote Access to the Router or Switch</i></li> <li>• <i>Configuring Telnet Service for Remote Access to a Router or Switch</i></li> </ul>

## crl (Encryption Interface)

---

<b>Syntax</b>	<code>crl <i>file-name</i>;</code>
<b>Hierarchy Level</b>	[edit security <a href="#">certificates</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	(Encryption interface on M Series and T Series routers and EX Series switches only) Configure the certificate revocation list (CRL). A CRL is a time-stamped list identifying revoked certificates, which is signed by a CA and made available to the participating IPsec peers on a regular periodic basis.
<b>Options</b>	<i>file-name</i> —Specify the file from which to read the CRL.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Digital Certificates for an ES PIC</i></li></ul>

## domain-search

---

<b>Syntax</b>	<code>domain-search [ <i>domain-list</i> ];</code>
<b>Hierarchy Level</b>	[edit system], [edit system services dhcp], [edit system services dhcp], [edit system services dhcp pool], [edit system services dhcp static-binding]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure a list of domains to be searched.
<b>Options</b>	<i>domain-list</i> —A list of domain names to search. The list can contain up to six domain names, with a total of up to 256 characters.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Reaching a Domain Name System Server</i></li><li>• <i>Configuring the Router or Interface to Act as a DHCP Server on J Series Services Routers</i></li><li>• <i>Configuring a DHCP Server on Switches (CLI Procedure)</i></li></ul>

## encoding

<b>Syntax</b>	encoding (binary   pem);
<b>Hierarchy Level</b>	[edit security ike policy <i>ike-peer-address</i> ], [edit security certificates <b>certification-authority</b> <i>ca-profile-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	(Encryption interface on M Series and T Series routers and EX Series switches only) Specify the file format used for the <b>local-certificate</b> and <b>local-key-pair</b> statements.
<b>Options</b>	<b>binary</b> —Binary file format.  <b>pem</b> —Privacy-enhanced mail (PEM), an ASCII base 64 encoded format. <b>Default:</b> binary
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring Digital Certificates for an ES PIC</i></li> <li>• <i>Configuring an IKE Policy for Digital Certificates for an ES PIC</i></li> </ul>

## enrollment-retry

<b>Syntax</b>	enrollment-retry <i>attempts</i> ;
<b>Hierarchy Level</b>	[edit security <b>certificates</b> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	(Encryption interface on M Series and T Series routers and EX Series switches only) Specify how many times a router or switch can resend a digital certificate request.
<b>Options</b>	<b>attempts</b> —Number of enrollment retries. <b>Range:</b> 0 through 100 <b>Default:</b> 0
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring Digital Certificates for an ES PIC</i></li> </ul>

## enrollment-url

---

<b>Syntax</b>	<code>enrollment-url <i>url-name</i>;</code>
<b>Hierarchy Level</b>	[edit security certificates <a href="#">certification-authority</a> <i>ca-profile-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	(Encryption interface on M Series and T Series routers and EX Series switches only) Specify where your router or switch sends Simple Certificate Enrollment Protocol-based (SCEP-based) certificate enrollment requests (certificate authority URL).
<b>Options</b>	<i>url-name</i> —Certificate authority URL.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Digital Certificates for an ES PIC</i></li></ul>

## family (for EX Series switches)

<b>Syntax</b>	<a href="#">family ccc on page 1647</a> <a href="#">family ethernet-switching on page 1647</a> <a href="#">family inet on page 1647</a> <a href="#">family inet6 on page 1648</a> <a href="#">family iso on page 1648</a> <a href="#">family mpls on page 1648</a>
<b>family ccc</b>	family ccc;
<b>family ethernet-switching</b>	<pre> family ethernet-switching {   filter [input   output] <i>filter-name</i>;   native-vlan-id <i>vlan-id</i>;   port-mode <i>mode</i>;   vlan (802.1Q Tagging) {     members [ (all   <i>names</i>   <i>vlan-ids</i>)];   } }</pre>
<b>family inet</b>	<pre> family inet {   address <i>address</i> {     arp <i>ip-address</i> (mac   multicast-mac) <i>mac-address</i> &lt;publish&gt;;     broadcast;     preferred;     primary;     vrrp-group <i>group-id</i> {       advertise-interval <i>milliseconds</i>;       preempt   no-preempt {         hold-time <i>seconds</i>;       }       priority <i>number</i>;       virtual-address [<i>addresses</i>];       virtual-link-local-address <i>ip-address</i>;     }   }   dhcp {     client-identifier (ascii <i>ascii</i>   hexadecimal <i>hexadecimal</i>);     lease-time (<i>seconds</i>   infinite);     retransmission-attempt <i>number</i>;     retransmission-interval <i>seconds</i>;     server-address <i>ip-address</i>;     update-server;     vendor-id <i>vendor-id</i>;   }   filter {     input <i>filter-name</i>;     output <i>filter-name</i>;   }   mtu <i>bytes</i>;   no-redirects;   no-neighbor-learn;   primary;   rpf-check; }</pre>

	<pre>        targeted-broadcast;     }  family inet6 {     address address {         eui-64;         nd6-stale-time seconds;         ndp ip-address (mac   multicast-mac) mac-address &lt;publish&gt;;         preferred;         primary;         vrrp-inet6-group group-id {             inet6-advertise-interval milliseconds;             preempt   preempt {                 hold-time seconds;             }             priority number;             virtual-inet6-address [addresses];             virtual-link-local-address ipv6-address;         }     }     (dad-disable   no-dad-disable);     filter {         input filter-name;         output filter-name;     }     mtu bytes;     no-neighbor-learn     rpf-check; }  family iso {     address interface-address;     mtu bytes; }  family mpls {     mtu bytes; }</pre>
Hierarchy Level	[edit interfaces <i>interface-name</i> <b>unit</b> <i>logical-unit-number</i> ], [edit interfaces interface-range <i>name</i> unit <i>logical-unit-number</i> ]
Release Information	Statement introduced in Junos OS Release 9.0 for EX Series switches, including options <b>ethernet-switching</b> , <b>inet</b> , and <b>iso</b> . Option <b>inet6</b> introduced in Junos OS Release 9.3 for EX Series switches. Options <b>ccc</b> and <b>mpls</b> introduced in Junos OS Release 9.5 for EX Series switches.
Description	Configure protocol family information for the logical interface on the switch.  You must configure a logical interface to be able to use the physical device.

**Default** Interfaces on EX2200, EX3200, EX3300, EX4200, and EX4500 switches are set to **family ethernet-switching** by the default factory configuration. Before you can change the family setting for an interface to another family type, you must delete this default setting or any user-configured family setting. EX6200 and EX8200 switch interfaces do not have a default family setting.

**Options** See [Table 145 on page 1649](#) for protocol families available on the switch interfaces. Different protocol families support different subsets of the interface types on the switch. Interface types on the switch are:

- Aggregated Ethernet (**ae**)
- Gigabit Ethernet (**ge**)
- Interface-range configuration (**interface-range**)
- Loopback (**lo0**)
- Management Ethernet (**me0**)
- Routed VLAN interface (RVI) (**vlan**)
- Virtual management Ethernet (**vme**)
- 10-Gigabit Ethernet (**xe**)

If you are using an interface range, the supported protocol families are the ones supported by the interface types that compose the range.

Not all interface types support all **family** substatements. Check your switch CLI for supported substatements for a particular protocol family configuration.

**Table 145: Protocol Families and Supported Interface Types**

Family	Description	Supported Interface Types						
		ae	ge	lo0	me0	vlan	vme	xe
<b>ccc</b>	Circuit cross-connect protocol family	✓*	✓					✓
<b>ethernet-switching</b>	Ethernet switching protocol family	✓	✓		✓			✓
<b>inet</b>	IPv4 protocol family	✓	✓	✓	✓	✓	✓	✓
<b>inet6</b>	IPv6 protocol family	✓	✓	✓	✓	✓	✓	✓
<b>iso</b>	Junos OS protocol family for IS-IS traffic	✓	✓	✓	✓	✓	✓	✓
<b>mpls</b>	MPLS protocol family	✓	✓	✓	✓		✓	✓

\*Supported on EX8200 switches only

The remaining statements are explained separately.

<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring a DHCP Server on Switches (CLI Procedure)</i></li><li>• <i>Example: Configuring MPLS on EX Series Switches</i></li><li>• <i>Configuring Gigabit Ethernet Interfaces (CLI Procedure)</i></li><li>• <a href="#">Configuring Aggregated Ethernet Links (CLI Procedure) on page 2667</a></li><li>• <i>Configuring Routed VLAN Interfaces (CLI Procedure)</i></li></ul>

---

## file

---

<b>Syntax</b>	<code>file certificate-<i>filename</i>;</code>
<b>Hierarchy Level</b>	[edit security certificates <a href="#">certification-authority</a> <i>ca-profile-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	(Encryption interface on M Series and T Series routers and EX Series switches only) Specify the file from which to read the digital certificate.
<b>Options</b>	<i>certificate-filename</i> —File from which to read the digital certificate.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Digital Certificates for an ES PIC</i></li></ul>

---

## ftp

---

<b>Syntax</b>	<pre>ftp {     connection-limit limit;     rate-limit limit; }</pre>
<b>Hierarchy Level</b>	[edit system <a href="#">services</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Allow FTP requests from remote systems to the local router or switch.
<b>Options</b>	The remaining statements are explained separately.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring FTP Service for Remote Access to the Router or Switch</i></li></ul>

## http

---

<b>Syntax</b>	<pre>http {     interfaces [ <i>interface-names</i> ];     port <i>port</i>; }</pre>
<b>Hierarchy Level</b>	[edit system <a href="#">services web-management</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure the port and interfaces for HTTP service, which is unencrypted.
<b>Options</b>	<p><b>interfaces [ <i>interface-names</i> ]</b>—Name of one or more interfaces on which to allow the HTTP service. By default, HTTP access is allowed through built-in Fast Ethernet or Gigabit Ethernet interfaces only.</p> <p>The remaining statement is explained separately.</p>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Management Access for the EX Series Switch (J-Web Procedure) on page 529</a></li><li>• <a href="#">J-Web Interface User Guide</a></li><li>• <a href="#">https on page 1653</a></li><li>• <a href="#">port on page 1665</a></li><li>• <a href="#">web-management on page 1689</a></li></ul>

## https

<b>Syntax</b>	<pre>https {   interfaces [ <i>interface-names</i> ];   local-certificate <i>name</i>;   port <i>port</i>; }</pre>
<b>Hierarchy Level</b>	[edit system <a href="#">services web-management</a> ]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
<b>Description</b>	Configure the secure version of HTTP (HTTPS) service, which is encrypted.
<b>Options</b>	<p><b>interfaces [ <i>interface-names</i> ]</b>—Name of one or more interfaces on which to allow the HTTPS service. By default, HTTPS access is allowed through any ingress interface, but HTTP access is allowed through built-in Fast Ethernet or Gigabit Ethernet interfaces only.</p> <p><b>local-certificate <i>name</i></b>—Name of the X.509 certificate for a Secure Sockets Layer (SSL) connection. An SSL connection is configured at the <b>[edit security certificates local]</b> hierarchy.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring Management Access for the EX Series Switch (J-Web Procedure) on page 529</a></li> <li>• <a href="#">J-Web Interface User Guide</a></li> <li>• <a href="#">http on page 1652</a></li> <li>• <a href="#">port on page 1665</a></li> <li>• <a href="#">web-management on page 1689</a></li> </ul>

## ldap-url

---

<b>Syntax</b>	<ldap-url <i>url-name</i> >;
<b>Hierarchy Level</b>	[edit security certificates <a href="#">certification-authority</a> <i>ca-profile-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	(Encryption interface on M Series and T Series routers and EX Series switches only) (Optional) Specify the Lightweight Directory Access Protocol (LDAP) URL for digital certificates.
<b>Options</b>	<i>url-name</i> —Name of the LDAP URL.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Digital Certificates for an ES PIC</i></li></ul>

## lease-time

---

<b>Syntax</b>	lease-time ( <i>seconds</i>   infinite);
<b>Hierarchy Level</b>	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet dhcp]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5 for J Series devices. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 9.2 for SRX Series devices.
<b>Description</b>	Request a specific lease time for the IP address. The lease time is the length of time in seconds that a client holds the lease for an IP address assigned by a DHCP server.
<b>Default</b>	If no lease time is requested by client, then the server sends the lease time. The default lease time on a JUNOS OS DHCP server is one day.
<b>Options</b>	<b>seconds</b> —Request a lease time of a specific duration. <b>Range:</b> 60 through 2147483647 seconds  <b>infinite</b> —Request that the lease never expire.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring a DHCP Client (CLI Procedure) on page 1413</a></li> <li>• <i>Example: Configuring the Device as a DHCP Client</i></li> <li>• <i>interfaces</i></li> <li>• <a href="#">unit on page 2831</a></li> <li>• <a href="#">family on page 1647</a></li> </ul>

## load-key-file

---

<b>Syntax</b>	load-key-file <i>URL filename</i> ;
<b>Hierarchy Level</b>	[edit system root-authentication], [edit system login user <i>username</i> authentication]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	<div> <b>NOTE:</b> ECDSA is not supported on the QFabric system.</div> <p>Load RSA (SSH version 1 and SSH version 2) and DSA or ECDSA (SSH version 2) public keys from a previously-generated named file at a specified URL location or local path. The file contains one or more SSH keys that are copied into the configuration when the command is issued.</p>
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Root Password</i></li><li>• <i>Configuring the Root Password</i></li><li>• <i>Configuring Junos OS User Accounts</i></li><li>• <i>Configuring Junos OS User Accounts</i></li></ul>

## local

<b>Syntax</b>	<pre>local <i>certificate-name</i> {     <i>certificate-key-string</i>;     load-key-file <i>URL filename</i>; }</pre>
<b>Hierarchy Level</b>	[edit security <a href="#">certificates</a> ]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>
<b>Description</b>	Import a paired X.509 private key and authentication certificate, to enable Junos XML protocol client applications to establish Secure Sockets Layer (SSL) connections to the router or switch.
<div>  <p><b>NOTE:</b> For FIPS mode, the digital security certificates must be compliant with the National Institute of Standards and Technology (NIST) SP 800-131A standard.</p> </div>	
<b>Options</b>	<p><b><i>certificate-name</i></b><b><i>certificate-key-string</i></b>—String of alphanumeric characters that constitute the private key and certificate.</p> <p><b><i>certificate-name</i></b>—Name that uniquely identifies the certificate.</p> <p><b><i>load-key-file URL filename</i></b>—File that contains the private key and certificate. It can be one of two types of values:</p> <ul style="list-style-type: none"> <li>• Pathname of a file on the local disk (assuming you have already used another method to copy the certificate file to the router's or switch's local disk)</li> <li>• URL to the certificate file location (for instance, on the computer where the Junos XML protocol client application runs)</li> </ul>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Importing SSL Certificates for Junos XML Protocol Support</i></li> </ul>

## local-certificate

---

<b>Syntax</b>	local-certificate;
<b>Hierarchy Level</b>	[edit system services service-deployment], [edit system services web-management https], [edit system services xnm-ssl]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Import or reference an SSL certificate.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring clear-text or SSL Service for Junos XML Protocol Client Applications</i></li><li>• <a href="#">Generating SSL Certificates to Be Used for Secure Web Access on page 532</a></li><li>• <i>Importing SSL Certificates for Junos XML Protocol Support</i></li></ul>

## maximum-certificates

---

<b>Syntax</b>	maximum-certificates <i>number</i> ;
<b>Hierarchy Level</b>	[edit security <a href="#">certificates</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	(Encryption interface on M Series and T Series routers and EX Series switches only) Configure the maximum number of peer digital certificates to be cached.
<b>Options</b>	<i>number</i> —Maximum number of peer digital certificates to be cached. <b>Range:</b> 64 through 4,294,967,295 peer certificates <b>Default:</b> 1024 peer certificates
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Digital Certificates for an ES PIC</i></li></ul>

## maximum-hop-count

<b>Syntax</b>	<code>maximum-hop-count <i>number</i>;</code>
<b>Hierarchy Level</b>	[edit forwarding-options helpers bootp], [edit forwarding-options helpers bootpinterface ( <i>interface-name</i>   <i>interface-group</i> )]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for QFX Series switches.
<b>Description</b>	Specify the maximum number of hops allowed.
<b>Options</b>	<i>number</i> —Maximum number of hops. <b>Default:</b> 4 hops
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring Routers, Switches, and Interfaces as DHCP and BOOTP Relay Agents</i></li> </ul>

## maximum-lease-time (DHCP)

<b>Syntax</b>	<code>maximum-lease-time <i>seconds</i>;</code>
<b>Hierarchy Level</b>	[edit system services dhcp],
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	For J Series Services Routers and EX Series switches only. Specify the maximum length of time in seconds for which a client can request and hold a lease on a DHCP server.  An exception is that the dynamic BOOTP lease length can exceed the maximum lease length specified.
<b>Options</b>	<i>seconds</i> —The maximum number of seconds the lease can be held.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring the Router or Interface to Act as a DHCP Server on J Series Services Routers</i></li> <li>• <i>default-lease-time</i></li> </ul>

## minimum-wait-time

---

<b>Syntax</b>	<code>minimum-wait-time seconds;</code>
<b>Hierarchy Level</b>	[edit forwarding-options helpers bootp], [edit forwarding-options helpers bootpinterface ( <i>interface-name</i>   <i>interface-group</i> )]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for QFX Series switches.
<b>Description</b>	Specify the minimum time allowed.
<b>Options</b>	<b>seconds</b> —Minimum time. <b>Default:</b> 0 seconds
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Routers, Switches, and Interfaces as DHCP and BOOTP Relay Agents</i></li></ul>

## name-server

---

<b>Syntax</b>	<code>name-server {     <i>address</i>; }</code>
<b>Hierarchy Level</b>	[edit system], [edit system services dhcp], [edit system services dhcp], [edit system services dhcp pool], [edit system services dhcp static-binding]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure one or more Domain Name System (DNS) name servers.
<b>Options</b>	<b>address</b> —Address of the name server. To configure multiple name servers, include a maximum of three <b>address</b> options.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Reaching a Domain Name System Server</i></li><li>• <i>Configuring the Router or Interface to Act as a DHCP Server on J Series Services Routers</i></li><li>• <i>Configuring a DHCP Server on Switches (CLI Procedure)</i></li></ul>

---

## no-listen

---

<b>Syntax</b>	no-listen;
<b>Hierarchy Level</b>	[edit forwarding-options helpers bootp interface ( <i>interface-name</i>   <i>interface-group</i> )], [edit forwarding-options helpers domain interface <i>interface-name</i> ], [edit forwarding-options helpers <b>tftp</b> interface <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.3 for QFX Series switches.
<b>Description</b>	Disable recognition of DNS requests or stop packets from being forwarded on a logical interface, a group of logical interfaces, a router, or a switch.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring DNS and TFTP Packet Forwarding</i></li><li>• <i>Configuring Routers, Switches, and Interfaces as DHCP and BOOTP Relay Agents</i></li></ul>

## outbound-ssh

---

**Syntax** [edit system services]  
outbound-ssh {  
  client *client-id* {  
    address {  
      port *port-number*;  
      retry *number*;  
      timeout *seconds*;  
    }  
    device-id *device-id*;  
    keep-alive {  
      retry *number*;  
      timeout *seconds*;  
    }  
    reconnect-strategy (in-order | sticky);  
    secret *password*;  
    services netconf;  
  }  
  traceoptions {  
    file filename <files *number*> <match *regex*> <size *size*> <world-readable |  
      no-world-readable>;  
    flag *flag*;  
    no-remote-trace;  
  }  
}

**Hierarchy Level** [edit system services]

**Release Information** Statement introduced in Junos OS Release 8.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Configure a router or switch running the Junos OS behind a firewall to communicate with client management applications on the other side of the firewall.

**Default** To configure transmission of the router's or switch's device ID to the application, include the **device-id** statement at the [edit system services] hierarchy level.

**Options** **client-id**—Identifies the **outbound-ssh** configuration stanza on the router or switch. Each **outbound-ssh** stanza represents a single outbound SSH connection. This attribute is not sent to the client.

**device-id**—Identifies the router or switch to the client during the initiation sequence.

**keep-alive**—(Optional) When configured, specifies that the router or switch send keepalive messages to the management server. To configure the keepalive message, you must set both the **timeout** and **retry** attributes.

**reconnect-strategy**—(Optional) Specify the method the router or switch uses to reestablish a disconnected outbound SSH connection. Two methods are available:

- **in-order**—Specify that the router or switch first attempt to establish an outbound SSH session based on the management server address list. The router or switch attempts to establish a session with the first server on the list. If this connection is not available, the router or switch attempts to establish a session with the next server, and so on down the list until a connection is established.
- **sticky**—Specify that the router or switch first attempt to reconnect to the management server that it was last connected to. If the connection is unavailable, it attempts to establish a connection with the next client on the list and so forth until a connection is made.

**retry**—Number of keepalive messages the router or switch sends without receiving a response from the client before the current SSH connection is disconnected. The default is three messages.

**secret**—(Optional) Router's or switch's public SSH host key. If added to the **outbound-ssh** statement, during the initialization of the outbound SSH service, the router or switch passes its public key to the management server. This is the recommended method of maintaining a current copy of the router's or switch's public key.

**timeout**—Length of time that the Junos server waits for data before sending a keep alive signal. The default is 15 seconds.

When reconnecting to a client, the router or switch attempts to reconnect to the client based on the **retry** and **timeout** values for each client listed.

**address**—Hostname or the IPv4 address of the NSM application server. You can list multiple clients by adding each client's IP address or hostname along with the following connection parameters:

- **port**—Outbound SSH port for the client. The default is port 22.
- **retry**—Number of times the router or switch attempts to establish an outbound SSH connection before giving up. The default is three tries.
- **timeout**—Length of time that the router or switch attempts to establish an outbound SSH connection before giving up. The default is fifteen seconds.

**filename**—(Optional) By default, the filename of the log file used to record the trace options is the name of the traced process (for example, **mib2d** or **snmpd**). Use this option to override the default value.

**files**—(Optional) Maximum number of trace files generated. By default, the maximum number of trace files is 10. Use this option to override the default value.

When a trace file reaches its maximum size, the system archives the file and starts a new file. The system archives trace files by appending a number to the filename in sequential order from 1 to the maximum value (specified by the default value or the options value set here). Once the maximum value is reached, the numbering sequence is restarted at 1, overwriting the older file.

**size**—(Optional) Maximum size of the trace file in kilobytes (KB). Once the maximum file size is reached, the system archives the file. The default value is 1000 KB. Use this option to override the default value.

**match**—(Optional) When used, the system only adds lines to the trace file that match the regular expression specified. For example, if the match value is set to **=error**, the system only records lines to the trace file that include the string **error**.

**services**—Services available for the session. Currently, NETCONF is the only service available.

**world-readable | no-world-readable**—(Optional) Whether the files are accessible by the originator of the trace operation only or by any user. By default, log files are only accessible by the user that started the trace operation (**no-world-readable**).

**all | configuration | connectivity**—(Optional) Type of tracing operation to perform.

**all**—Log all events.

**configuration**—Log all events pertaining to the configuration of the router or switch.

**connectivity**—Log all events pertaining to the establishment of a connection between the client server and the router or switch.

**no-remote-trace**—(Optional) Disable remote tracing.

<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.

## path-length

<b>Syntax</b>	<code>path-length <i>certificate-path-length</i>;</code>
<b>Hierarchy Level</b>	[edit security <a href="#">certificates</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	(Encryption interface on M Series and T Series routers and EX Series switches only) Configure the digital certificate path length.
<b>Options</b>	<b><i>certificate-path-length</i></b> —Digital certificate path length. <b>Range:</b> 2 through 15 certificates <b>Default:</b> 15 certificates
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring Digital Certificates for an ES PIC</i></li> </ul>

## port (HTTP/HTTPS)

<b>Syntax</b>	<code>port <i>port-number</i>;</code>
<b>Hierarchy Level</b>	[edit system <a href="#">services web-management</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure the port on which the HTTP or HTTPS service is connected.
<b>Options</b>	<b><i>port-number</i></b> —The TCP port number on which the specified service listens.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Table 47 on page 530</a></li> <li>• <i>J-Web Interface User Guide</i></li> <li>• <a href="#">http on page 1652</a></li> <li>• <a href="#">https on page 1653</a></li> <li>• <a href="#">web-management on page 1689</a></li> </ul>

## port (SRC Server)

---

<b>Syntax</b>	<code>port <i>port-number</i>;</code>
<b>Hierarchy Level</b>	[edit system services service-deployment servers <i>server-address</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure the port number on which to contact the SRC server.
<b>Options</b>	<i>port-number</i> —(Optional) The TCP port number for the SRC server. <b>Default:</b> 3333
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Junos OS to Work with SRC Software</i></li></ul>

## process-inform

---

<b>Syntax</b>	<pre>process-inform {   pool <i>pool-name</i> network <i>address-range</i> }</pre>
<b>Hierarchy Level</b>	[edit system services dhcp-local-server overrides]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1 for EX Series switches.
<b>Description</b>	For extended Dynamic Host Configuration Protocol (DHCP) servers, enable the processing of DHCP information request messages sent from the client to the server to request DHCP options. The messages are also passed to the configured server list.
<b>Default</b>	Information request messages are not processed.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring a DHCP Server on Switches (CLI Procedure)</i></li></ul>

---

## protocol-version

---

<b>Syntax</b>	<code>protocol-version <i>version</i>;</code>
<b>Hierarchy Level</b>	[edit system services ssh]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Specify the secure shell (SSH) protocol version.
<b>Default</b>	<b>v2</b> —SSH protocol version 2 is the default, introduced in Junos OS Release 11.4.
<b>Options</b>	<b><i>version</i></b> —SSH protocol version: <b>v1</b> , <b>v2</b> , or both.
<b>Required Privilege Level</b>	<b>admin</b> —To view this statement in the configuration. <b>admin-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring SSH Service for Remote Access to the Router or Switch</i></li></ul>

## rate-limit

---

<b>Syntax</b>	<code>rate-limit <i>limit</i>;</code>
<b>Hierarchy Level</b>	[edit system services finger], [edit system services ftp], [edit system services netconf ssh], [edit system services ssh], [edit system services telnet], [edit system services xnm-clear-text], [edit system services xnm-ssl]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Configure the maximum number of connections attempts per protocol (either IPv6 or IPv4) on an access service.
<b>Default</b>	150 connections
<b>Options</b>	<b>rate-limit <i>limit</i></b> —(Optional) Maximum number of connection attempts allowed per minute, per IP protocol (either IPv4 or IPv6). <b>Range:</b> 1 through 250 <b>Default:</b> 150
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring clear-text or SSL Service for Junos XML Protocol Client Applications</i></li></ul>

## reconfigure

<b>Syntax</b>	<pre>reconfigure {     attempts <i>attempts</i>;     clear-on-abort;     timeout interval;     token token; }</pre>
<b>Hierarchy Level</b>	[edit system services <a href="#">dhcp-local-server</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1 for EX Series switches.
<b>Description</b>	For extended Dynamic Host Configuration Protocol (DHCP) servers, enable dynamic reconfiguration triggered by the server of all DHCP clients.
<b>Options</b>	<p><b>attempts</b>—Number of attempts made to reconfigure all DHCP clients.</p> <p><b>clear-on-abort</b>—Delete all DHCP clients when reconfiguration fails; that is, when the maximum number of retry attempts have been made without success.</p> <p><b>timeout interval</b>—Initial value (in seconds) between attempts to reconfigure all DHCP clients. Each successive attempt doubles the interval between attempts. For example, if the first value is 2, the first retry is attempted 2 seconds after the first attempt fails. The second retry is attempted 4 seconds after the first retry fails. The third retry is attempted 8 seconds after the second retry fails, and so on. A group configuration takes precedence over a DHCP local server configuration.</p> <p><b>token</b>—Configure a plain-text token for all DHCP clients. The token enables rudimentary entity authentication to protect against inadvertently instantiated DHCP servers. A null token (empty string) indicates that the configuration token functionality is not enabled.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Configuring a DHCP Server on Switches (CLI Procedure)</i></li> </ul>

## retransmission-attempt

---

<b>Syntax</b>	<code>retransmission-attempt <i>number</i>;</code>
<b>Hierarchy Level</b>	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet dhcp]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5 for J Series devices. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 9.2 for SRX Series devices.
<b>Description</b>	Specify the number of times the device retransmits a Dynamic Host Control Protocol (DHCP) packet if a DHCP server fails to respond. After the specified number of attempts, no further attempts at reaching a server are made.
<b>Options</b>	<b><i>number</i></b> —Number of retransmit attempts.. <b>Range:</b> 0 through 6 <b>Default:</b> 4
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring a DHCP Client (CLI Procedure) on page 1413</a></li><li>• <a href="#">Example: Configuring the Device as a DHCP Client</a></li><li>• <a href="#">interfaces</a></li><li>• <a href="#">unit on page 2831</a></li><li>• <a href="#">family on page 1647</a></li></ul>

## retransmission-interval

<b>Syntax</b>	<code>retransmission-interval seconds;</code>
<b>Hierarchy Level</b>	[edit interfaces <i>interface-name</i> <b>unit</b> <i>logical-unit-number</i> <b>family</b> inet dhcp]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Specify the time between successive retransmissions of the client DHCP request if a DHCP server fails to respond.
<b>Options</b>	<p><b>seconds</b>—Number of seconds between successive retransmissions.</p> <p><b>Range:</b> 4 through 64 seconds</p> <p><b>Default:</b> 4 seconds</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring a DHCP Client (CLI Procedure) on page 1413</a></li> </ul>

## server (DNS and TFTP Service)

<b>Syntax</b>	<code>server address &lt;logical-system <i>logical-system-name</i>&gt; &lt;routing-instance <i>routing-instance-name</i>&gt;;</code>
<b>Hierarchy Level</b>	<p>[edit forwarding-options helpers domain],</p> <p>[edit forwarding-options helpers domain interface <i>interface-name</i>],</p> <p>[edit forwarding-options helpers <b>tftp</b>],</p> <p>[edit forwarding-options helpers <b>tftp</b> interface <i>interface-name</i>]</p>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
<b>Description</b>	Specify the DNS or TFTP server for forwarding DNS or TFTP requests. Only one server can be specified for each interface.
<b>Options</b>	<p><b>address</b>—Address of the server.</p> <p><b>logical-system <i>logical-system-name</i></b>—(Optional) Logical system of the server.</p> <p><b>routing-instance [ <i>routing-instance-names</i> ]</b>—(Optional) Set the routing instance name or names that belong to the DNS server or TFTP server.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring DNS and TFTP Packet Forwarding</a></li> </ul>

## server-address

---

<b>Syntax</b>	<code>server-address <i>ip-address</i>;</code>
<b>Hierarchy Level</b>	[edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family inet dhcp]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5 for J Series devices. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 9.2 for SRX Series devices.
<b>Description</b>	Specify the address of the DHCP server that the client should accept DHCP offers from. If this option is included in the DHCP configuration, the client accepts offers only from this server and ignores all other offers.
<b>Default</b>	The client accepts the first offer it receives from any DHCP server.
<b>Options</b>	<i>ip-address</i> —DHCP server address.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring a DHCP Client (CLI Procedure) on page 1413</a></li><li>• <i>Example: Configuring the Device as a DHCP Client</i></li><li>• <i>interfaces</i></li><li>• <a href="#">unit on page 2831</a></li><li>• <a href="#">family on page 1647</a></li></ul>

## server-identifier

<b>Syntax</b>	<code>server-identifier address;</code>
<b>Hierarchy Level</b>	[edit system services dhcp], [edit system services dhcp pool], [edit system services dhcp static-binding]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	<p>For J Series Services Routers and EX Series switches only. Configure a server identifier. The identifier can be used to identify a DHCP server in a DHCP message. It can also be used as a destination address from clients to servers (for example, when the boot file is set, but not the boot server).</p> <p>Servers include the server identifier in <b>DHCPOFFER</b> messages so that clients can distinguish between multiple lease offers. Clients include the server identifier in <b>DHCPREQUEST</b> messages to select a lease and indicate which offer is accepted from multiple lease offers. Also, clients can use the server identifier to send unicast request messages to specific DHCP servers to renew a current lease.</p> <p>This address must be a manually assigned, static IP address. The server cannot send a request and receive an IP address from itself or another DHCP server.</p>
<b>Default</b>	If no server identifier is set, the DHCP server sets the server identifier based on the primary interface address used by the server to receive a client request. For example, if the client sends a DHCP request and the server receives it on <b>fe-0/0/0</b> and the primary interface address is <b>1.1.1.1</b> , then the server identifier is set to <b>1.1.1.1</b> .
<b>Options</b>	<b>address</b> —IPv4 address of the server. This address must be accessible by all clients served within a specified range of addresses (based on an address pool or static binding).
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Configuring the Router or Interface to Act as a DHCP Server on J Series Services Routers</i></li> </ul>

## servers

---

<b>Syntax</b>	<code>servers server-address {     port port-number; }</code>
<b>Hierarchy Level</b>	[edit system services <a href="#">service-deployment</a> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure an IPv4 address for the Session and Resource Control (SRC) server.
<b>Options</b>	<b>server-address</b> —The TCP port number. <b>Default:</b> 3333  The remaining statements are explained separately.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Junos OS to Work with SRC Software</i></li></ul>

## service-deployment

---

<b>Syntax</b>	<code>service-deployment {     <a href="#">servers</a> server-address {         port port-number;     }     <a href="#">source-address</a> source-address; }</code>
<b>Hierarchy Level</b>	[edit system services]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Enable Junos OS to work with the Session and Resource Control (SRC) software.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Junos OS to Work with SRC Software</i></li></ul>

## services (System Services)

```
Syntax  services {
        dhcp { \* DHCP not supported on a DCF
            dhcp_services;
        }

## sip-server

---

<b>Syntax</b>	<code>sip-server [address   name];</code>
<b>Hierarchy Level</b>	[edit system services dhcp], [edit system <a href="#">services</a> dhcp], [edit system <a href="#">services</a> dhcp pool], [edit system <a href="#">services</a> dhcp <a href="#">static-binding</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.1 for EX Series switches.
<b>Description</b>	Configure Session Initiation Protocol (SIP) server addresses or names for DHCP servers.
<b>Options</b>	<p><b>address</b>—IPv4 address of the SIP server. To configure multiple SIP servers, include multiple <b>address</b> options. This address must be accessible by all clients served within a specified range of addresses (based on an address pool or static binding).</p> <p><b>name</b>—Fully qualified domain name of the SIP server. To configure multiple SIP servers, include multiple <b>name</b> options. This domain name must be accessible by all clients served within a specified range of addresses (based on an address pool or static binding).</p>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring a DHCP SIP Server (CLI Procedure) on page 1412</a></li><li>• <a href="#">Configuring a DHCP Server on Switches (CLI Procedure)</a></li></ul>

## source-address (SRC Software)

---

<b>Syntax</b>	<code>source-address source-address;</code>
<b>Hierarchy Level</b>	[edit system services service-deployment]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Enable Junos OS to work with the Session and Resource Control (SRC) software.
<b>Options</b>	<b>source-address</b> — Local IPv4 address to be used as source address for traffic to the SRC server. The source address restricts traffic within the out-of-band network.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring the Junos OS to Work with SRC Software</a></li></ul>

## source-address-giaddr

<b>Syntax</b>	source-address-giaddr;
<b>Hierarchy Level</b>	[edit forwarding-options helpers bootp], [edit forwarding-options helpers bootp interface <i>interface-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.1 for EX Series switches.
<b>Description</b>	<p>Configure the gateway IP address (giaddr) as the source IP address of the switch for relayed DHCP packets when the switch is used as the DHCP relay agent.</p> <p>When this statement is entered in the [edit forwarding-options helpers bootp] hierarchy, the gateway IP address is configured as the source IP address of the switch for relayed DHCP packets exiting all interfaces on the switch.</p> <p>When this statement is entered in the [edit forwarding-options helpers bootp interface <i>interface-name</i>] hierarchy, the gateway IP address is configured as the source IP address of the switch for relayed DHCP packets exiting the specified interface of the switch.</p> <p>In Junos OS Release 10.1 for EX Series switches and later releases, the IP address of the interface that the DHCP packet exits on the switch acting as a DHCP relay agent is used as the source IP address for relayed DHCP packets by default.</p> <p>In Junos OS Releases 9.6 and 10.0 for EX Series switches, the gateway IP address of the switch is always used as the source IP address for relayed DHCP packets when the switch is used as the DHCP relay agent.</p> <p>In Junos OS Releases 9.3 through 9.5 for EX Series switches, the IP address of the interface that the DHCP packet exits on the switch acting as a DHCP relay agent is always used as the source IP address for relayed DHCP packets.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>

## ssh

---

**Syntax**    ssh {  
              ciphers [ *cipher-1 cipher-2 cipher-3 ...*];  
              client-alive-count-max *seconds*;  
              client-alive-interval *seconds*;  
              connection-limit *limit*;  
              hostkey-algorithm <*algorithm*|no-*algorithm*>;  
              key-exchange <*algorithm*>;  
              macs <*algorithm*>;  
              max-sessions-per-connection <*number*>;  
              no-passwords;  
              no-tcp-forwarding;  
              protocol-version [*v1 v2*];  
              rate-limit *limit*;  
              root-login (*allow* | *deny* | *deny-password*);  
              }

**Hierarchy Level**    [edit system services]

**Release Information**    Statement introduced before Junos OS Release 7.4.  
                              Statement introduced in Junos OS Release 9.0 for EX Series switches.  
                              Statement introduced in Junos OS Release 11.1 for the QFX Series.  
                              **client-alive-interval** and **client-alive-max-count** statements introduced in Junos OS Release 12.2.  
                              **no-passwords** statement introduced in Junos OS Release 13.3.

**Description**    Allow SSH requests from remote systems to the local router or switch.  
  
                      The remaining statements are explained separately.

**Required Privilege Level**    system—To view this statement in the configuration.  
                                  system-control—To add this statement to the configuration.

**Related Documentation**    • *Configuring SSH Service for Remote Access to the Router or Switch*

## static-binding

<b>Syntax</b>	<pre>static-binding <i>mac-address</i> {     client-identifier (ascii <i>client-id</i>   hexadecimal <i>client-id</i>);     fixed-address {         <i>address</i>;     }     host-name <i>client-hostname</i>; }</pre>
<b>Hierarchy Level</b>	<pre>[edit system services dhcp], [edit system services dhcp]</pre>
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
<b>Description</b>	<p>For J Series Services routers and EX Series switches only. Set static bindings for DHCP clients. A static binding is a mapping between a fixed IP address and the client's MAC address or client identifier.</p>
<b>Options</b>	<p><b><i>mac-address</i></b>—The MAC address of the client. This is a hardware address that uniquely identifies a client on the network.</p> <p><b><i>fixed-address address</i></b>—Fixed IP address assigned to the client. Typically a client has one address assigned, but you can assign more.</p> <p><b><i>host-name client-hostname</i></b>—Hostname of the client requesting the DHCP server. The name can include the local domain name. Otherwise, the name is resolved based on the <b><i>domain-name</i></b> statement.</p> <p><b><i>client-identifier (ascii client-id   hexadecimal client-id)</i></b>—Used by the DHCP server to index the database of address bindings. The client identifier is an ASCII string or hexadecimal number and can include a type-value pair as specified in RFC 1700, <i>Assigned Numbers</i>. Either a client identifier or the client's MAC address must be configured to uniquely identify the client on the network.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring the Router or Interface to Act as a DHCP Server on J Series Services Routers</i></li> <li>• <i>Configuring a DHCP Server on Switches (CLI Procedure)</i></li> </ul>

## system-generated-certificate

---

<b>Syntax</b>	system-generated-certificate;
<b>Hierarchy Level</b>	[edit system <a href="#">services web-management https</a> ]
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for EX Series switches.
<b>Description</b>	Configure the automatically generated self-signed certificate for enabling HTTPS services..
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Enabling HTTPS and XNM-SSL Services on Switches Using Self-Signed Certificates (CLI Procedure)</a> on page 1417</li></ul>

## telnet

---

<b>Syntax</b>	telnet { <a href="#">connection-limit</a> <i>limit</i> ; <a href="#">rate-limit</a> <i>limit</i> ; }
<b>Hierarchy Level</b>	[edit system services]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Provide Telnet connections from remote systems to the local router or switch.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Telnet Service for Remote Access to a Router or Switch</i></li></ul>

## tftp

<b>Syntax</b>	<pre> tftp {   description <i>text-description</i>;   interface <i>interface-name</i> {     broadcast;     description <i>text-description</i>;     no-listen;     server address &lt;logical-system <i>logical-system-name</i>&gt; &lt;routing-instance       <i>routing-instance-name</i>&gt;;   }   server address &lt;logical-system <i>logical-system-name</i>&gt; &lt;routing-instance     <i>routing-instance-name</i>&gt;; } </pre>
<b>Hierarchy Level</b>	[edit forwarding-options helpers]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
<b>Description</b>	<p>Enable TFTP request packet forwarding.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring DNS and TFTP Packet Forwarding</i></li> </ul>

## traceoptions (DNS and TFTP Packet Forwarding)

---

<b>Syntax</b>	<pre>traceoptions {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;match <i>regular-expression</i>&gt; &lt;size <i>bytes</i>&gt; &lt;world-readable           no-world-readable&gt;;     flag <i>flag</i>;     level <i>level</i>;     &lt;no-remote-trace&gt;; }</pre>
<b>Hierarchy Level</b>	[edit forwarding-options helpers]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement standardized and <b>match</b> option introduced in Junos OS Release 8.0. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure tracing operations for BOOTP, DNS and TFTP packet forwarding.
<b>Default</b>	If you do not include this statement, no tracing operations are performed.
<b>Options</b>	<p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks (" "). All files are placed in a file named <b>fud</b> in the directory <b>/var/log</b>. If you include the <b>file</b> statement, you must specify a filename.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option and a filename.</p> <p><b>Range:</b> 2 through 1000 <b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"><li>• <b>address</b>—Trace address management events</li><li>• <b>all</b>—Trace all events</li><li>• <b>bootp</b>—Trace BOOTP or DHCP services events</li><li>• <b>config</b>—Trace configuration events</li><li>• <b>domain</b>—Trace DNS service events</li><li>• <b>ifdb</b>—Trace interface database operations</li><li>• <b>io</b>—Trace I/O operations</li><li>• <b>main</b>—Trace main loop events</li><li>• <b>port</b>—Trace arbitrary protocol events</li></ul>

- **rtsock**—Trace routing socket operations
- **tftp**—Trace TFTP service events
- **trace**—Trace tracing operations
- **ui**—Trace user interface operations
- **util**—Trace miscellaneous utility operations

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**no-remote-trace**—(Optional) Disable remote tracing globally or for a specific tracing operation.

**no-world-readable**—(Optional) Restrict file access to the owner.

**size *size***—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** file again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option and filename.

**Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

**Range:** 0 bytes through 4,294,967,295 KB

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

<b>Required Privilege</b>	interface—To view this statement in the configuration.
<b>Level</b>	interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Tracing BOOTP, DNS, and TFTP Forwarding Operations</i></li> </ul>

## traceoptions

---

**Syntax**    traceoptions {  
              file *filename* <files *number*> <size *size*>;  
              flag all;  
              flag certificates;  
              flag database;  
              flag general;  
              flag ike;  
              flag parse;  
              flag policy-manager;  
              flag routing-socket;  
              flag timer;  
              level  
              no-remote-trace  
          }

**Hierarchy Level**    [edit security],  
                          [edit services ipsec-vpn]

Trace options can be configured at either the [edit security] or the [edit services ipsec-vpn] hierarchy level, but not at both levels.

**Release Information**    Statement introduced before Junos OS Release 7.4.  
                              Statement introduced in Junos OS Release 9.0 for EX Series switches.  
                              Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Configure security trace options.

To specify more than one trace option, include multiple **flag** statements. Trace option output is recorded in the `/var/log/kmd` file.

**NOTE:** The `traceoptions` statement is not supported on QFabric systems.

---

**Options**    **files *number***—(Optional) Maximum number of trace files. When a trace file (for example, **kmd**) reaches its maximum size, it is renamed **kmd.0**, then **kmd.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

**Range:** 2 through 1000 files

**Default:** 0 files

**size *size***—(Optional) Maximum size of each trace file, in kilobytes (KB). When a trace file (for example, **kmd**) reaches this size, it is renamed, **kmd.0**, then **kmd.1** and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

**Default:** 1024 KB

**flag *flag***—Trace operation to perform. To specify more than one trace operation, include multiple **flag** statements.

- **all**—Trace all security events.
- **certificates**—Trace certificate events.
- **database**—Trace database events.
- **general**—Trace general events.
- **ike**—Trace IKE module processing.
- **parse**—Trace configuration processing.
- **policy-manager**—Trace policy manager processing.
- **routing-socket**—Trace routing socket messages.
- **timer**—Trace internal timer events.

**level *level***—(Optional) Set traceoptions level.

- **all**—match all levels.
- **error**—Match error conditions.
- **info**—Match informational messages.
- **notice**—Match conditions that should be handled specially.
- **verbose**—Match verbose messages.
- **warning**—Match warning messages.

**no-remote-trace**—(Optional) Disable remote tracing

<b>Required Privilege</b>	admin—To view the configuration.
<b>Level</b>	admin-control—To add this statement to the configuration.

<b>Related Documentation</b>	• <i>Configuring Tracing Operations for Security Services</i>
------------------------------	---

## update-server

---

<b>Syntax</b>	update-server;
<b>Hierarchy Level</b>	[edit Interfaces <i>interface-name</i> unit <i>logical-unit-number</i> inet dhcp]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.5 for J Series devices. Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 9.2 for SRX Series devices.
<b>Description</b>	Propagate TCP/IP settings learned from an external DHCP server to the DHCP server running on the switch, router, or device.
<b>Required Privilege Level</b>	interface—To view this statement in the configuration. interface-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring a DHCP Client (CLI Procedure) on page 1413</a></li><li>• <i>Example: Configuring the Device as a DHCP Client</i></li><li>• <i>interfaces</i></li><li>• <a href="#">unit on page 2831</a></li><li>• <a href="#">family on page 1647</a></li></ul>

## web-management

<b>Syntax</b>	<pre> web-management {   http {     interfaces [ <i>interface-names</i> ];     port <i>port</i>;   }   https {     interfaces [ <i>interface-names</i> ];     local-certificate <i>name</i>;     port <i>port</i>;   } } </pre>
<b>Hierarchy Level</b>	[edit system <a href="#">services</a> ]
<b>Release Information</b>	<p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p>
<b>Description</b>	<p>Configure settings for HTTP or HTTPS access. HTTP access allows management of the router or switch using the browser-based J-Web graphical user interface. HTTPS access allows secure management of the router or switch using the J-Web interface. With HTTPS access, communication between the router or switch Web server and your browser is encrypted.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Table 47 on page 530</a></li> <li>• <a href="#">J-Web Interface User Guide</a></li> <li>• <a href="#">http on page 1652</a></li> <li>• <a href="#">https on page 1653</a></li> <li>• <a href="#">port on page 1665</a></li> </ul>

## wins-server (System)

---

<b>Syntax</b>	<code>wins-server {     address; }</code>
<b>Hierarchy Level</b>	[edit system services dhcp], [edit system services dhcp], [edit system services dhcp pool], [edit system services dhcp static-binding]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	For J Series Services Routers and EX Series switches only. Specify one or more NetBIOS Name Servers. When a DHCP client is added to the network and assigned an IP address, the NetBIOS Name Server manages the Windows Internet Name Service (WINS) database that matches IP addresses (such as <b>192.168.1.3</b> ) to Windows NetBIOS names (such as <b>\\Marketing</b> ). List servers in order of preference.
<b>Options</b>	<b>address</b> —IPv4 address of the NetBIOS Name Server running WINS. To configure multiple servers, include multiple <b>address</b> options.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring the Router or Interface to Act as a DHCP Server on J Series Services Routers</i></li><li>• <i>Configuring a DHCP Server on Switches (CLI Procedure)</i></li></ul>

## CHAPTER 26

# Administration

- [Routine Monitoring on page 1691](#)
- [Verifying and Managing DHCP Local Server Configurations on page 1695](#)
- [Verifying and Managing DHCP Relay Agent Configurations on page 1697](#)
- [DHCP Local Server Monitoring Commands on page 1697](#)
- [DHCP Relay Agent Monitoring Commands on page 1732](#)
- [Other Operational Commands on page 1788](#)

### Routine Monitoring

---

- [Monitoring DHCP Services on page 1691](#)

### Monitoring DHCP Services

#### Purpose

**NOTE:** This topic applies only to the J-Web Application package.

A switch or router can operate as a DHCP server. Use the monitoring functionality to view information about dynamic and static DHCP leases, conflicts, pools, and statistics.

**Action** To monitor the DHCP server in the J-Web interface, select **Monitor > Services > DHCP**.

To monitor the DHCP server in the CLI, enter the following CLI commands:

- `show system services dhcp binding`
- `show system services dhcp conflict`
- `show system services dhcp pool`
- `show system services dhcp statistics`
- `show system services dhcp relay-statistics`
- `show system services dhcp global`
- `show system services dhcp client`
- `clear system services dhcp binding`

- `clear system services dhcp conflict`
- `clear system services dhcp statistics`
- `clear dhcp relay-statistics`

On EX4300 switches, to monitor the DHCP server in the CLI, enter the following CLI commands:

- `show dhcp server binding`
- `show dhcp server statistics`
- `show dhcp relay binding`
- `show dhcp relay statistics`
- `clear dhcp server binding`
- `clear dhcp server statistics`
- `clear dhcp relay binding`
- `clear dhcp relay statistics`

**Meaning** [Table 146 on page 1692](#) summarizes the output fields in DHCP displays in the J-Web interface.

**Table 146: Summary of DHCP Output Fields**

Field	Values	Additional Information
Global tab		
Name	This column displays the following information: <ul style="list-style-type: none"><li>• Boot lease length</li><li>• Domain Name</li><li>• Name servers</li><li>• Server identifier</li><li>• Domain search</li><li>• Gateway routers</li><li>• WINS server</li><li>• Boot file</li><li>• Boot server</li><li>• Default lease time</li><li>• Minimum lease time</li><li>• Maximum lease time</li></ul>	
Value	Displays the value for each of the parameters in the Name column.	
Bindings tab		
Allocated Address	List of IP addresses the DHCP server has assigned to clients.	

Table 146: Summary of DHCP Output Fields (*continued*)

Field	Values	Additional Information
MAC Address	Corresponding media access control (MAC) address of the client.	
Binding Type	Type of binding assigned to the client: <b>dynamic</b> or <b>static</b> .	DHCP servers can assign a dynamic binding from a pool of IP addresses or a static binding to one or more specific IP addresses.
Lease Expires	Date and time the lease expires, or <b>never</b> for leases that do not expire.	
<b>Pools tab</b>		
Pool Name	Subnet on which the IP address pool is defined.	
Low Address	Lowest address in the IP address pool.	
High Address	Highest address in the IP address pool.	
Excluded Addresses	Addresses excluded from the address pool.	
<b>Clients tab</b>		
Interface Name	Name of the logical interface.	
Hardware Address	Vendor identification.	
Status	State of the client binding.	
Address Obtained	IP address obtained from the DHCP server.	
Update Server	Indicates whether server update is enabled.	
Lease Obtained	Date and time the lease was obtained.	
Lease Expires	Date and time the lease expires.	
Renew	Reacquires an IP address from the server for the interface. When you click this option, the command sends a discover message if the client state is INIT and a renew request message if the client state is BOUND. For all other states it performs no action.	

Table 146: Summary of DHCP Output Fields (*continued*)

Field	Values	Additional Information
Release	Clears other resources received earlier from the server, and reinitializes the client state to INIT for the particular interface.	
<b>Conflicts tab</b>		
Detection Time	Date and time the client detected the conflict.	
Detection Method	How the conflict was detected.	Only client-detected conflicts are displayed.
Address	IP address where the conflict occurs.	The addresses in the conflicts list remain excluded until you use the <b>clear system services dhcp conflict</b> command to manually clear the list.
<b>DHCP Statistics</b>		
<b>Relay Statistics tab</b>		
Packet Counters	Displays the number of packet counters.	
Dropped Packet Counters	Graphically displays the number of dropped packet counters.	
<b>Statistics tab</b>		
Packets dropped	Total number of packets dropped and the number of packets dropped due to a particular condition.	
Messages received	Number of BOOTREQUEST, DHCPDECLINE, DHCPDISCOVER, DHCPINFORM, DHCPRELEASE, and DHCPREQUEST messages sent from DHCP clients and received by the DHCP server.	
Messages sent	Number of BOOTREPLY, DHCPACK, DHCPOFFER, DHCPNAK, and DHCPFORCERENEW messages sent from the DHCP server to DHCP clients.	

[Table 147 on page 1694](#) summarizes the output fields in DHCP displays in EX4300 switches in the J-Web interface.

Table 147: Summary of DHCP Output Fields for EX4300 Switches

Field	Values	Additional Information
<b>Binding Information tab</b>		
IP Address	IP address of the DHCP client..	
Session ID	Session ID of the subscriber session.	

Table 147: Summary of DHCP Output Fields for EX4300 Switches (*continued*)

Field	Values	Additional Information
Hardware Address	Hardware address of the DHCP client.	
Expires	Number of seconds in which the lease expires.	
State	State of the address binding table on the extended DHCP local server: <ul style="list-style-type: none"> <li>• <b>BOUND</b>—Client has an active IP address lease.</li> <li>• <b>FORCERENEW</b>—Client has received the <b>FORCERENEW</b> message from the server.</li> <li>• <b>INIT</b>—Initial state.</li> <li>• <b>RELEASE</b>—Client is releasing the IP address lease.</li> <li>• <b>RENEWING</b>—Client is sending a request to renew the IP address lease.</li> <li>• <b>REQUESTING</b>—Client is requesting a DHCP server.</li> <li>• <b>SELECTING</b>—Client is receiving offers from DHCP servers.</li> </ul>	
Interface	Interface on which the request was received.	

[Table 148 on page 1695](#) summarizes the output fields in DHCP Statistics Information for EX4300 switches in the J-Web interface.

Table 148: Summary of the DHCP Statistics Information Output for EX4300 switches

Field	Values	Additional Information
Message Counters		
Message Counters	Graphically displays the number of messages sent and received.	
Dropped packet Counters		
MAC Limit	Graphically displays the number of dropped packet counters.

## Verifying and Managing DHCP Local Server Configurations

- [Verifying and Managing DHCP Local Server Configuration on page 1696](#)
- [Verifying and Managing DHCPv6 Local Server Configuration on page 1696](#)

## Verifying and Managing DHCP Local Server Configuration

**Purpose** View or clear information about client address bindings and statistics for the extended DHCP local server.

**NOTE:** If you delete the DHCP server configuration, DHCP server bindings might still remain. To ensure that DHCP bindings are removed, issue the `clear dhcp server binding` command before you delete the DHCP server configuration.

**Action**

- To display the address bindings in the client table on the extended DHCP local server:

```
user@host> show dhcp server binding routing-instance customer routing instance
```

- To display extended DHCP local server statistics:

```
user@host> show dhcp server statistics routing-instance customer routing instance
```

- To clear the binding state of a DHCP client from the client table on the extended DHCP local server:

```
user@host> clear dhcp server binding routing-instance customer routing instance
```

- To clear all extended DHCP local server statistics:

```
user@host> clear dhcp server statistics routing-instance customer routing instance
```

**Related Documentation**

- [CLI Explorer](#)

## Verifying and Managing DHCPv6 Local Server Configuration

**Purpose** View or clear information about client address bindings and statistics for the DHCPv6 local server.

**Action**

- To display the address bindings in the client table on the DHCPv6 local server:

```
user@host> show dhcpv6 server binding
```

- To display DHCPv6 local server statistics:

```
user@host> show dhcpv6 server statistics
```

- To clear all DHCPv6 local server statistics:

```
user@host> clear dhcpv6 server binding
```

- To clear all DHCPv6 local server statistics:

```
user@host> clear dhcpv6 server statistics
```

**Related Documentation**

## Verifying and Managing DHCP Relay Agent Configurations

---

- [Verifying and Managing DHCP Relay Configuration on page 1697](#)
- [Verifying and Managing DHCPv6 Relay Configuration on page 1697](#)

### Verifying and Managing DHCP Relay Configuration

**Purpose** View or clear address bindings or statistics for extended DHCP relay agent clients:

- Action**
- To display the address bindings for extended DHCP relay agent clients:  
`user@host> show dhcp relay binding routing-instance customer routing instance`
  - To display extended DHCP relay agent statistics:  
`user@host> show dhcp relay statistics routing-instance customer routing instance`
  - To clear the binding state of DHCP relay agent clients:  
`user@host> clear dhcp relay binding routing-instance customer routing instance`
  - To clear all extended DHCP relay agent statistics:  
`user@host> clear dhcp relay statistics routing-instance customer routing instance`

**Related Documentation**

- [CLI Explorer](#)

### Verifying and Managing DHCPv6 Relay Configuration

**Purpose** View or clear address bindings or statistics for extended DHCPv6 relay agent clients:

- Action**
- To display the address bindings for extended DHCPv6 relay agent clients:  
`user@host> show dhcpv6 relay binding`
  - To display extended DHCPv6 relay agent statistics:  
`user@host> show dhcpv6 relay statistics`
  - To clear the binding state of DHCPv6 relay agent clients:  
`user@host> clear dhcpv6 relay binding`
  - To clear all extended DHCPv6 relay agent statistics:  
`user@host> clear dhcpv6 relay statistics`

**Related Documentation**

- [CLI Explorer](#)

## DHCP Local Server Monitoring Commands

---

- `clear dhcp server binding`
- `clear dhcp server statistics`

- `clear dhcpv6 server binding`
- `clear dhcpv6 server statistics`
- `request dhcp server reconfigure`
- `request dhcpv6 server reconfigure`
- `request system reboot`

## clear dhcp server binding

**Syntax**    `clear dhcp server binding`  
               `<address>`  
               `<all>`  
               `<interface interface-name>`  
               `<interfaces-vlan>`  
               `<interfaces-wildcard>`  
               `<logical-system logical-system-name>`  
               `<routing-instance routing-instance-name>`

**Release Information**    Command introduced in Junos OS Release 9.0.  
                                  Options *interfaces-vlan* and *interfaces-wildcard* added in Junos OS Release 12.1.

**Description**    Clear the binding state of a Dynamic Host Configuration Protocol (DHCP) client from the client table on the extended DHCP local server.

**NOTE:** If you delete the DHCP server configuration, DHCP server bindings might still remain. To ensure that DHCP bindings are removed, issue the `clear dhcp server binding` command before you delete the DHCP server configuration.

**Options**    **address**—(Optional) Clear the binding state for the DHCP client, using one of the following entries:

- *ip-address*—The specified IP address.
- *mac-address*—The specified MAC address.
- *session-id*—The specified session ID.

**all**—(Optional) Clear the binding state for all DHCP clients.

**interface interface-name**—(Optional) Clear the binding state for DHCP clients on the specified interface.

**NOTE:** This option clears all bindings whose initial login requests were received over the specified interface. Dynamic demux login requests are not received over the dynamic demux interface, but rather the underlying interface of the dynamic demux interface. To clear a specific dynamic demux interface, use the *ip-address* or *mac-address* options.

**interfaces-vlan**—(Optional) Clear the binding state on the interface VLAN ID and S-VLAN ID.

**interfaces-wildcard**—(Optional) Clear bindings on a set of interfaces. This option supports the use of the wildcard character (\*).

**logical-system** *logical-system-name*—(Optional) Clear the binding state for DHCP clients on the specified logical system.

**routing-instance** *routing-instance-name*—(Optional) Clear the binding state for DHCP clients on the specified routing instance.

**Output Fields** See [show dhcp server binding](#) for an explanation of output fields.

## Sample Output

### [clear dhcp server binding <ip-address>](#)

The following sample output displays the address bindings in the DHCP client table on the extended DHCP local server before and after the **clear dhcp server binding** command is issued.

```
user@host> show dhcp server binding
```

```
2 clients, (0 bound, 0 selecting, 0 renewing, 0 rebinding)
```

IP address	Hardware address	Type	Lease expires at
100.20.32.1	90:00:00:01:00:01	active	2007-01-17 11:38:47 PST
100.20.32.3	90:00:00:02:00:01	active	2007-01-17 11:38:41 PST

```
user@host> clear dhcp server binding 10.20.32.1
```

```
user@host> show dhcp server binding
```

```
1 clients, (0 bound, 0 selecting, 0 renewing, 0 rebinding)
```

IP address	Hardware address	Type	Lease expires at
100.20.32.3	90:00:00:02:00:01	active	2007-01-17 11:38:41 PST

### [clear dhcp server binding all](#)

The following command clears all DHCP local server bindings:

```
user@host> clear dhcp server binding all
```

### clear dhcp server binding interface

The following command clears DHCP local server bindings on a specific interface:

```
user@host> clear dhcp server binding interface fe-0/0/2
```

### clear dhcp server binding <interfaces-vlan>

The following command uses the *interfaces-vlan* option to clear all DHCP local server bindings on top of the underlying interface **ae0**, which clears DHCP bindings on all demux VLANs on top of **ae0**:

```
user@host> clear dhcp server binding ae0
```

### clear dhcp server binding <interfaces-wildcard>

The following command uses the *interfaces-wildcard* option to clear all DHCP local server bindings over a specific interface:

```
user@host> clear dhcp server binding ge-1/0/0.*
```

## clear dhcp server statistics

[clear dhcpv6 server binding <interfaces-wildcard> on page 1705](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### clear dhcpv6 server binding all

The following command clears all DHCPv6 local server bindings:

```
user@host> clear dhcpv6 server binding all
```

### clear dhcpv6 server binding <ipv6-prefix>

The following command clears DHCPv6 local server bindings for a specific IPv6 prefix:

```
user@host> clear dhcpv6 server binding 14/0x00010001/0x02b3be8f/0x00109400/0x0005
```

### clear dhcpv6 server binding interface

The following command clears DHCPv6 local server bindings on a specific interface:

```
user@host> clear dhcpv6 server binding interface fe-0/0/2
```

### clear dhcpv6 server binding <interfaces-vlan>

The following command uses the *interfaces-vlan* option to clear all DHCPv6 local server bindings on top of the underlying interface **ae0**, which clears DHCPv6 bindings on all demux VLANs on top of **ae0**:

```
user@host> clear dhcpv6 server binding interface ae0
```

### clear dhcpv6 server binding <interfaces-wildcard>

The following command uses the *interfaces-wildcard* option to clear all DHCPv6 local server bindings over a specific interface:

```
user@host> clear dhcpv6 server binding ge-1/0/0.*
```

## clear dhcpv6 server statistics

### Sample Output

#### clear dhcpv6 server statistics

```
user@host> clear dhcpv6 server statistics
```

## request dhcp server reconfigure

**Syntax** `request dhcp server reconfigure (all | address | interface interface-name | logical-system logical-system-name | routing-instance routing-instance-name)`

**Release Information** Command introduced in Junos OS Release 10.0.  
Command introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description** Initiate reconfiguration processing for the specified DHCP clients if they are in the bound state. If the clients are in the reconfiguring state, this command has no effect. If the clients are in any state other than bound or reconfiguring, this command has the same effect as the **clear dhcp server binding** command.

When the local server state machine starts the reconfiguration process on a bound client, the client transitions to the reconfiguring state and the local server sends a **forcerenew** message to the client. Because the client was in the bound state before entering the reconfiguring state, all subscriber (or DHCP client) services, such as forwarding and statistics, continue to work. An exponential back-off timer determines the interval at which the **forcerenew** message is sent. If the final attempt is unsuccessful, the client is returned to its original state by default. You can optionally include the **clear-on-abort** statement to configure the client to be cleared when reconfiguration fails.

**Options** **all**—Initiate reconfiguration for all DHCP clients.

***address***—Initiate reconfiguration for DHCP client with the specified IP address or MAC address.

**interface *interface-name***—Initiate reconfiguration for all DHCP clients on this logical interface (clients whose initial login requests were received over the specified interface).

**NOTE:** You cannot use the **interface *interface-name*** option with the **request dhcp server reconfigure** command for DHCP passive clients (clients that are added as a result of DHCP snooped packets). For passive clients, the interface is not guaranteed to be the next-hop interface to the client, as is the case for active clients.

**logical-system *logical-system-name***—Initiate reconfiguration for all DHCP clients on the specified logical system.

**routing-instance *routing-instance-name***—Initiate reconfiguration reconfigured for all DHCP clients in the specified routing instance.

**Required Privilege Level** view

```
<media (external | internal)>  
<member member-id>  
<message "text">  
<other-routing-engine>
```

<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Option <b>other-routing-engine</b> introduced in Junos OS Release 8.0. Command introduced in Junos OS Release 9.0 for EX Series switches. Option <b>sfc</b> introduced for the TX Matrix Plus router in Junos OS Release 9.6. Option <b>both-routing-engines</b> introduced in Junos OS Release 12.1.
<b>Description</b>	Reboot the software.
<b>Options</b>	<p><b>none</b>—Reboot the software immediately.</p> <p><b>all-chassis</b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router or TX Matrix Plus router, reboot all routers connected to the TX Matrix or TX Matrix Plus router, respectively.</p> <p><b>all-lcc</b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router or TX Matrix Plus router, reboot all line card chassis connected to the TX Matrix or TX Matrix Plus router, respectively.</p> <p><b>all-members</b>—(EX4200 switches and MX Series routers only) (Optional) Reboot the software on all members of the Virtual Chassis configuration.</p> <p><b>at <i>time</i></b>—(Optional) Time at which to reboot the software, specified in one of the following ways:</p> <ul style="list-style-type: none"><li>• <b>now</b>—Stop or reboot the software immediately. This is the default.</li><li>• <b>+<i>minutes</i></b>—Number of minutes from now to reboot the software.</li><li>• <b><i>yymmddhhmm</i></b>—Absolute time at which to reboot the software, specified as year, month, day, hour, and minute.</li><li>• <b><i>hh:mm</i></b>—Absolute time on the current day at which to stop the software, specified in 24-hour time.</li></ul> <p><b>both-routing-engines</b>—(Optional) Reboot both Routing Engines at the same time.</p> <p><b>in <i>minutes</i></b>—(Optional) Number of minutes from now to reboot the software. This option is an alias for the <b>at +<i>minutes</i></b> option.</p> <p><b>lcc <i>number</i></b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Line-card chassis number. Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"><li>• 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.</li><li>• 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.</li></ul>

- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Reboot the software on the local Virtual Chassis member.

**media (compact-flash | disk | removable-compact-flash | usb)**—(Optional) Boot medium for next boot. (The options **removable-compact-flash** and **usb** pertain to the J Series routers only.)

**media (external | internal)**—(EX Series switches and MX Series routers only) (Optional) Reboot the boot media:

- **external**—Reboot the external mass storage device.
- **internal**—Reboot the internal flash device.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Reboot the software on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace ***member-id*** with a value from 0 through 9. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

**message "*text*"**—(Optional) Message to display to all system users before stopping or rebooting the software.

**other-routing-engine**—(Optional) Reboot the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is rebooted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is rebooted.

**partition**—(TX Matrix Plus routers only) (Optional) Reboot using the specified partition on the boot media. This option has the following suboptions:

- 1—Reboot from partition 1.
- 2—Reboot from partition 2.
- **alternate**—Reboot from the alternate partition.

**scc**—(TX Matrix routers only) (Optional) Reboot the Routing Engine on the TX Matrix switch-card chassis. If you issue the command from re0, re0 is rebooted. If you issue the command from re1, re1 is rebooted.

**sfc *number***—(TX Matrix Plus routers only) (Optional) Reboot the Routing Engine on the TX Matrix Plus switch-fabric chassis. If you issue the command from re0, re0 is rebooted. If you issue the command from re1, re1 is rebooted. Replace ***number*** with 0.

**slice *slice***—(EX Series switches only) (Optional) Reboot a partition on the boot media. This option has the following suboptions:

- 1—Power off partition 1.
- 2—Power off partition 2.
- **alternate**—Reboot from the alternate partition.

**Additional Information** Reboot requests are recorded in the system log files, which you can view with the **show log** command (see [show log](#)). Also, the names of any running processes that are scheduled to be shut down are changed. You can view the process names with the **show system processes** command (see [show system processes](#)).

On a TX Matrix or TX Matrix Plus router, if you issue the **request system reboot** command on the master Routing Engine, all the master Routing Engines connected to the routing matrix are rebooted. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are rebooted.

**NOTE:** Before issuing the **request system reboot** command on a TX Matrix Plus router with no options or the **all-chassis**, **all-lcc**, **lcc number**, or **sfc** options, verify that master Routing Engine for all routers in the routing matrix are in the same slot number. If the master Routing Engine for a line-card chassis is in a different slot number than the master Routing Engine for a TX Matrix Plus router, the line-card chassis might become logically disconnected from the routing matrix after the **request system reboot** command.

**NOTE:** To reboot a router that has two Routing Engines, reboot the backup Routing Engine (if you have upgraded it) first, and then reboot the master Routing Engine.

**Required Privilege Level** maintenance

**Related Documentation**

- [clear system reboot on page 84](#)
- [request system halt on page 101](#)
- [Routing Matrix with a TX Matrix Plus Router Solutions Page](#)

**List of Sample Output**

- [request system reboot on page 1715](#)
- [request system reboot \(at 2300\) on page 1715](#)
- [request system reboot \(in 2 Hours\) on page 1715](#)
- [request system reboot \(Immediately\) on page 1715](#)
- [request system reboot \(at 1:20 AM\) on page 1715](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system reboot

```
user@host> request system reboot
Reboot the system ? [yes,no] (no)
```

### request system reboot (at 2300)

```
user@host> request system reboot at 2300 message ?Maintenance time!?
Reboot the system ? [yes,no] (no) yes
```

```
shutdown: [pid 186]
*** System shutdown message from root@berry.network.net ***
System going down at 23:00
```

### request system reboot (in 2 Hours)

The following example, which assumes that the time is 5 PM (17:00), illustrates three different ways to request the system to reboot in two hours:

```
user@host> request system reboot at +120
user@host> request system reboot in 120
user@host> request system reboot at 19:00
```

### request system reboot (Immediately)

```
user@host> request system reboot at now
```

### request system reboot (at 1:20 AM)

To reboot the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

```
user@host> request system reboot at 06060120
request system reboot at 120
Reboot the system at 120? [yes,no] (no) yes
```

## show dhcp server binding

---

**Syntax**    `show dhcp server binding`  
              `<address>`  
              `<interfaces-vlan><brief | detail | summary>`  
              `<interface interface-name>`  
              `<interfaces-vlan>`  
              `<interfaces-wildcard>`  
              `<logical-system logical-system-name>`  
              `<routing-instance routing-instance-name>`

**Release Information**    Command introduced in Junos OS Release 9.0.  
                              Options *interfaces-vlan* and *interfaces-wildcard* added in Junos OS Release 12.1.

**Description**    Display the address bindings in the client table on the extended Dynamic Host Configuration Protocol (DHCP) local server.

**NOTE:** If you delete the DHCP server configuration, DHCP server bindings might still remain. To ensure that DHCP bindings are removed, issue the `clear dhcp server binding` command before you delete the DHCP server configuration.

**Options**    **address**—(Optional) Display DHCP binding information for a specific client identified by one of the following entries:

- *ip-address*—The specified IP address.
- *mac-address*—The specified MAC address.
- *session-id*—The specified session ID.

**brief | detail | summary**—(Optional) Display the specified level of output about active client bindings. The default is **brief**, which produces the same output as **show dhcp server binding**.

**interface interface-name**—(Optional) Display information about active client bindings on the specified interface. You can optionally filter on VLAN ID and SVLAN ID.

**interfaces-vlan**—(Optional) Show the binding state information on the interface VLAN ID and S-VLAN ID.

**interfaces-wildcard**—(Optional) The set of interfaces on which to show the binding state information. This option supports the use of the wildcard character (\*).

**logical-system logical-system-name**—(Optional) Display information about active client bindings for DHCP clients on the specified logical system.

**routing-instance routing-instance-name**—(Optional) Display information about active client bindings for DHCP clients on the specified routing instance.

**Required Privilege Level** view

**Output Fields** [Table 149 on page 1717](#) lists the output fields for the **show dhcp server binding** command. Output fields are listed in the approximate order in which they appear.

**Table 149: show dhcp server binding Output Fields**

Field Name	Field Description	Level of Output
<i>number</i> clients, ( <i>number</i> init, <i>number</i> bound, <i>number</i> selecting, <i>number</i> requesting, <i>number</i> renewing, <i>number</i> releasing)	Summary counts of the total number of DHCP clients and the number of DHCP clients in each state.	<b>summary</b>
IP address	IP address of the DHCP client.	<b>brief detail</b>
Session Id	Session ID of the subscriber session.	<b>brief detail</b>
Hardware address	Hardware address of the DHCP client.	<b>brief detail</b>
Expires	Number of seconds in which lease expires.	<b>brief detail</b>

Table 149: show dhcp server binding Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>State</b>	State of the address binding table on the extended DHCP local server: <ul style="list-style-type: none"> <li>• <b>BOUND</b>—Client has active IP address lease.</li> <li>• <b>FORCERENEW</b>—Client has received forcerenew message from server.</li> <li>• <b>INIT</b>—Initial state.</li> <li>• <b>RELEASE</b>—Client is releasing IP address lease.</li> <li>• <b>RENEWING</b>—Client sending request to renew IP address lease.</li> <li>• <b>REQUESTING</b>—Client requesting a DHCP server.</li> <li>• <b>SELECTING</b>—Client receiving offers from DHCP servers.</li> </ul>	<b>brief</b> <b>detail</b>
<b>Interface</b>	Interface on which the request was received.	<b>brief</b>
<b>Lease Expires</b>	Date and time at which the client's IP address lease expires.	<b>detail</b>
<b>Lease Expires in</b>	Number of seconds in which lease expires.	<b>detail</b>
<b>Lease Start</b>	Date and time at which the client's IP address lease started.	<b>detail</b>
<b>Lease time violated</b>	Lease time violation has occurred.	<b>detail</b>
<b>Last Packet Received</b>	Date and time at which the router received the last packet.	<b>detail</b>
<b>Incoming Client Interface</b>	Client's incoming interface.	<b>detail</b>
<b>Client Interface Svlan Id</b>	S-VLAN ID of the client's incoming interface.	<b>detail</b>
<b>Client Interface Vlan Id</b>	VLAN ID of the client's incoming interface.	<b>detail</b>
<b>Demux Interface</b>	Name of the IP demultiplexing (demux) interface.	<b>detail</b>
<b>Server IP Address or Server Identifier</b>	IP address of DHCP server.	<b>detail</b>
<b>Server Interface</b>	Interface of DHCP server.	<b>detail</b>
<b>Client Pool Name</b>	Name of address pool used to assign client IP address lease.	<b>detail</b>
<b>ACI Interface Set Name</b>	Internally generated name of the dynamic agent circuit identifier (ACI) interface set.	<b>detail</b>
<b>ACI Interface Set Index</b>	Index number of the dynamic ACI interface set.	<b>detail</b>
<b>ACI Interface Set Session ID</b>	Identifier of the dynamic ACI interface set entry in the session database.	<b>detail</b>

## Sample Output

### show dhcp server binding

```
user@host> show dhcp server binding

## show dhcpv6 server binding

---

Syntax	<pre>show dhcpv6 server binding &lt;address&gt; &lt;brief   detail   summary&gt; &lt;interface interface-name&gt; &lt;interfaces-vlan&gt; &lt;interfaces-wildcard&gt; &lt;logical-system logical-system-name&gt; &lt;routing-instance routing-instance-name&gt;</pre>
Release Information	Command introduced in Junos OS Release 9.6. Options <i>interfaces-vlan</i> and <i>interfaces-wildcard</i> added in Junos OS Release 12.1.
Description	Display the address bindings in the client table on the extended Dynamic Host Configuration Protocol for IPv6 (DHCPv6) local server.
Options	<p><b>address</b>—(Optional) One of the following identifiers for the DHCPv6 client whose binding state you want to show:</p> <ul style="list-style-type: none"><li>• <i>CID</i>—The specified Client ID (CID).</li><li>• <i>ipv6-prefix</i>—The specified IPv6 prefix.</li><li>• <i>session-id</i>—The specified session ID.</li></ul> <p><b>brief   detail   summary</b>—(Optional) Display the specified level of output about active client bindings. The default is <b>brief</b>, which produces the same output as <b>show dhcpv6 server binding</b>.</p> <p><b>interface interface-name</b>—(Optional) Display information about active client bindings on the specified interface. You can optionally filter on VLAN ID and SVLAN ID.</p> <p><b>interfaces-vlan</b>—(Optional) Interface VLAN ID or S-VLAN ID interface on which to show binding state information.</p> <p><b>interfaces-wildcard</b>—(Optional) Set of interfaces on which to show binding state information. This option supports the use of the wildcard character (*).</p> <p><b>logical-system logical-system-name</b>—(Optional) Display information about active client bindings for DHCPv6 clients on the specified logical system.</p> <p><b>routing-instance routing-instance-name</b>—(Optional) Display information about active client bindings for DHCPv6 clients on the specified routing instance.</p>

**Output Fields** [Table 151 on page 1725](#) lists the output fields for the **show dhcpv6 server binding** command. Output fields are listed in the approximate order in which they appear.

**Table 151: show dhcpv6 server binding Output Fields**

Field Name	Field Description	Level of Output
<i>number clients</i> , ( <i>number init</i> , <i>number bound</i> , <i>number selecting</i> , <i>number requesting</i> , <i>number renewing</i> , <i>number releasing</i> )	Summary counts of the total number of DHCPv6 clients and the number of DHCPv6 clients in each state.	<b>summary</b>
<b>Prefix</b>	Client's DHCPv6 prefix, or prefix used to support multiple address assignment.	<b>brief detail</b>
<b>Session Id</b>	Session ID of the subscriber session.	<b>brief detail</b>
<b>Expires</b>	Number of seconds in which lease expires.	<b>brief detail</b>
<b>State</b>	State of the address binding table on the extended DHCPv6 local server: <ul style="list-style-type: none"> <li>• <b>BOUND</b>—Client has active IP address lease.</li> <li>• <b>INIT</b>—Initial state.</li> <li>• <b>RECONFIGURE</b>—Server has sent reconfigure message to client.</li> <li>• <b>RELEASE</b>—Client is releasing IP address lease.</li> <li>• <b>RENEWING</b>—Client sending request to renew IP address lease.</li> <li>• <b>REQUESTING</b>—Client requesting a DHCPv6 server.</li> <li>• <b>SELECTING</b>—Client receiving offers from DHCPv6 servers.</li> </ul>	<b>brief detail</b>
<b>Interface</b>	Interface on which the DHCPv6 request was received.	<b>brief</b>
<b>Client IPv6 Address</b>	Client's IPv6 address.	<b>detail</b>
<b>Client IPv6 Prefix</b>	Client's IPv6 prefix.	<b>detail</b>
<b>Client DUID</b>	Client's DHCP Unique Identifier (DUID).	<b>brief detail</b>
<b>Lease expires</b>	Date and time at which the client's IP address lease expires.	<b>detail</b>

Table 151: show dhcpv6 server binding Output Fields (*continued*)

Field Name	Field Description	Level of Output
Lease expires in	Number of seconds in which lease expires.	detail
Preferred Lease Expires	Date and UTC time at which the client's IPv6 prefix expires.	detail
Preferred Lease Expires in	Number of seconds at which client's IPv6 prefix expires.	detail
Lease Start	Date and time at which the client's address lease was obtained.	detail
Lease time violated	Lease time violation has occurred.	detail
Incoming Client Interface	Client's incoming interface.	detail
Server IP Address	IP address of DHCPv6 server.	detail
Server Interface	Interface of DHCPv6 server.	detail
Client Pool Name	Address pool used to assign IPv6 address.	detail
Client Prefix Pool Name	Address pool used to assign IPv6 prefix.	detail
Client Id length	Length of the DHCPv6 client ID, in bytes.	detail
Client Id	ID of the DHCPv6 client.	detail

## show dhcpv6 server statistics

---

Syntax	<b>show dhcpv6 server statistics</b> <b>&lt;logical-system <i>logical-system-name</i>&gt;</b> <b>&lt;routing-instance <i>routing-instance-name</i>&gt;</b>
Release Information	Command introduced in Junos OS Release 9.6.
Description	Display extended Dynamic Host Configuration Protocol for IPv6 (DHCPv6) local server statistics.
Options	<b>logical-system <i>logical-system-name</i></b> —(Optional) Display information about extended DHCPv6 local server statistics on the specified logical system. If you do not specify a logical system, statistics are displayed for the default logical system.  <b>routing-instance <i>routing-instance-name</i></b> —(Optional) Display information about extended DHCPv6 local server statistics on the specified routing instance. If you do not specify a routing instance, statistics are displayed for the default routing instance.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">clear dhcpv6 server statistics on page 1706</a></li></ul>
List of Sample Output	<a href="#">show dhcpv6 server statistics on page 1731</a>
Output Fields	<a href="#">Table 152 on page 1731</a> lists the output fields for the <b>show dhcpv6 server statistics</b> command. Output fields are listed in the approximate order in which they appear.

Table 152: show dhcpv6 server statistics Output Fields

Field Name	Field Description
<b>Packets dropped</b>	<p>Number of packets discarded by the extended DHCPv6 local server because of errors. Only nonzero statistics appear in the Packets dropped output. When all of the Packets dropped statistics are 0 (zero), only the Total field appears.</p> <ul style="list-style-type: none"> <li>• <b>Total</b>—Total number of packets discarded by the extended DHCPv6 local server</li> <li>• <b>Strict Reconfigure</b>—Number of solicit messages discarded because the client does not support reconfiguration</li> <li>• <b>Bad hardware address</b>—Number of packets discarded because an invalid hardware address was specified</li> <li>• <b>Bad opcode</b>—Number of packets discarded because an invalid operation code was specified</li> <li>• <b>Bad options</b>—Number of packets discarded because invalid options were specified</li> <li>• <b>Invalid server address</b>—Number of packets discarded because an invalid server address was specified</li> <li>• <b>Lease Time Violation</b>—Number of packets discarded because of a lease time violation</li> <li>• <b>No available addresses</b>—Number of packets discarded because there were no addresses available for assignment</li> <li>• <b>No interface match</b>—Number of packets discarded because they did not belong to a configured interface</li> <li>• <b>No routing instance match</b>—Number of packets discarded because they did not belong to a configured routing instance</li> <li>• <b>No valid local address</b>—Number of packets discarded because there was no valid local address</li> <li>• <b>Packet too short</b>—Number of packets discarded because they were too short</li> <li>• <b>Read error</b>—Number of packets discarded because of a system read error</li> <li>• <b>Send error</b>—Number of packets that the extended DHCPv6 local server could not send</li> </ul>
<b>Messages received</b>	<p>Number of DHCPv6 messages received.</p> <ul style="list-style-type: none"> <li>• <b>DHCPV6_CONFIRM</b>—Number of DHCPv6 CONFIRM PDUs received.</li> <li>• <b>DHCPV6_DECLINE</b>—Number of DHCPv6 DECLINE PDUs received.</li> <li>• <b>DHCPV6_INFORMATION_REQUEST</b>—Number of DHCPv6 INFORMATION-REQUEST PDUs received.</li> <li>• <b>DHCPV6_REBIND</b>—Number of DHCPv6 REBIND PDUs received.</li> <li>• <b>DHCPV6_RELAY_FORW</b>—Number of DHCPv6 RELAY-FORW PDUs received.</li> <li>• <b>DHCPV6_RELAY_REPL</b>—Number of DHCPv6 RELAY-REPL PDUs received.</li> <li>• <b>DHCPV6_RELEASE</b>—Number of DHCPv6 RELEASE PDUs received.</li> <li>• <b>DHCPV6_RENEW</b>—Number of DHCPv6 RENEW PDUs received.</li> <li>• <b>DHCPV6_REQUEST</b>—Number of DHCPv6 REQUEST PDUs received.</li> <li>• <b>DHCPV6_SOLICIT</b>—Number of DHCPv6 SOLICIT PDUs received.</li> </ul>

**Output Fields** See [show dhcp relay binding](#) for an explanation of output fields.

## Sample Output

### clear dhcp relay binding

The following sample output displays the address bindings in the DHCP client table before and after the **clear dhcp relay binding** command is issued.

```
user@host> show dhcp relay binding
IP address      Hardware address  Type    Lease expires at
100.20.32.1     90:00:00:01:00:01 active    2007-02-08 16:41:17 EST
192.168.14.8    90:00:01:01:02:01 active    2007-02-10 10:01:06 EST
```

```
user@host> clear dhcp relay binding 100.20.32.1
```

```
user@host> show dhcp relay binding
IP address      Hardware address  Type    Lease expires at
192.168.14.8    90:00:01:01:02:01 active    2007-02-10 10:01:06 EST
```

### clear dhcp relay binding all

The following command clears all DHCP relay agent bindings:

```
user@host> clear dhcp relay binding all
```

### clear dhcp relay binding interface

The following command clears DHCP relay agent bindings on a specific interface:

```
user@host> clear dhcp relay binding interface fe-0/0/3
```

### clear dhcp relay binding <interfaces-vlan>

The following command uses the *interfaces-vlan* option to clear all DHCP relay agent bindings on top of the underlying interface **ae0**, which clears DHCP bindings on all demux VLANs on top of **ae0**:

```
user@host> clear dhcp relay binding interface ae0
```

### clear dhcp relay binding <interfaces-wildcard>

The following command uses the *interfaces-wildcard* option to clear all DHCP relay agent bindings over a specific interface:

```
user@host> clear dhcp relay binding ge-1/0/0.*
```

## clear dhcp relay statistics

### clear dhcpv6 relay binding all

The following command clears all DHCP relay agent bindings:

```
user@host> clear dhcpv6 relay binding all
```

### clear dhcv6p relay binding interface

The following command clears DHCPv6 relay agent bindings on a specific interface:

```
user@host> clear dhcpv6 relay binding interface fe-0/0/2
```

#### clear dhcpv6 relay binding <interfaces-vlan>

The following command uses the *interfaces-vlan* option to clear all DHCPv6 relay agent bindings on top of the underlying interface **ae0**, which clears DHCPv6 bindings on all demux VLANs on top of **ae0**:

```
user@host> clear dhcpv6 relay binding interface ae0
```

#### clear dhcpv6 relay binding <interfaces-wildcard>

The following command uses the *interfaces-wildcard* option to clear all DHCPv6 relay agent bindings over a specific interface:

```
user@host> clear dhcpv6 relay binding ge-1/0/0.*
```

## clear dhcpv6 relay statistics

<b>Syntax</b>	<b>clear dhcpv6 relay statistics</b> <b>&lt;logical-system <i>logical-system-name</i>&gt;</b> <b>&lt;routing-instance <i>routing-instance-name</i>&gt;</b>
<b>Release Information</b>	Command introduced in Junos OS Release 11.4. Command introduced in Junos OS Release 12.1X48R3 for PTX Series Packet Transport Routers.
<b>Description</b>	Clear all Dynamic Host Configuration Protocol for IPv6 (DHCPv6) relay statistics.
<b>Options</b>	<b>logical-system <i>logical-system-name</i></b> —(Optional) Perform this operation on the specified logical system. If you do not specify a logical system name, statistics are cleared for the default logical system.  <b>routing-instance <i>routing-instance-name</i></b> —(Optional) Perform this operation on the specified routing instance. If you do not specify a routing instance name, statistics are cleared for the default routing instance.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">clear dhcpv6 relay statistics on page 1741</a>
<b>Output Fields</b>	See <a href="#">show dhcpv6 relay statistics</a> for an explanation of output fields.

## Sample Output

### clear dhcpv6 relay statistics

The following sample output displays the DHCPv6 relay statistics before and after the **clear dhcpv6 relay statistics** command is issued.

```

user@host> show dhcpv6 relay statistics
DHCPv6 Packets dropped:
    Total                0
    Lease Time Violated  1

Messages received:
    DHCPV6_DECLINE        0
    DHCPV6_SOLICIT        10
    DHCPV6_INFORMATION_REQUEST  0
    DHCPV6_RELEASE        0
    DHCPV6_REQUEST        10

## show dhcp relay binding

<b>Syntax</b>	<pre> show dhcp relay binding &lt;address&gt; &lt;brief&gt; &lt;detail&gt; &lt;interface interface-name&gt; &lt;interfaces-vlan&gt; &lt;interfaces-wildcard&gt; &lt;ip-address   mac-address&gt; &lt;logical-system logical-system-name&gt; &lt;routing-instance routing-instance-name&gt; &lt;summary&gt; </pre>
<b>Release Information</b>	<p>Command introduced in Junos OS Release 8.3.</p> <p>Options <b>interface</b> and <b>mac-address</b> added in Junos OS Release 8.4.</p> <p>Options <b>interfaces-vlan</b> and <b>interfaces-wildcard</b> added in Junos OS Release 12.1.</p> <p>Command introduced in Junos OS Release 12.1X48R3 for PTX Series Packet Transport Routers.</p>
<b>Description</b>	Display the address bindings in the Dynamic Host Configuration Protocol (DHCP) client table.
<b>Options</b>	<p><b>address</b>—(Optional) Display DHCP binding information for a specific client identified by one of the following entries:</p> <ul style="list-style-type: none"> <li>• <b>ip-address</b>—The specified IP address.</li> <li>• <b>mac-address</b>—The specified MAC address.</li> <li>• <b>session-id</b>—The specified session ID.</li> </ul> <p><b>brief</b>—(Optional) Display brief information about the active client bindings. This is the default, and produces the same output as <b>show dhcp relay binding</b>.</p> <p><b>detail</b>—(Optional) Display detailed client binding information.</p> <p><b>interface interface-name</b>—(Optional) Perform this operation on the specified interface. You can optionally filter on VLAN ID and SVLAN ID.</p> <p><b>interfaces-vlan</b>—(Optional) Show the binding state information on the interface VLAN ID and S-VLAN ID.</p> <p><b>interfaces-wildcard</b>—(Optional) The set of interfaces on which to show binding state information. This option supports the use of the wildcard character (*).</p> <p><b>logical-system logical-system-name</b>—(Optional) Perform this operation on the specified logical system.</p> <p><b>routing-instance routing-instance-name</b>—(Optional) Perform this operation on the specified routing instance.</p> <p><b>summary</b>—(Optional) Display a summary of DHCP client information.</p>

**Output Fields** Table 154 on page 1744 lists the output fields for the **show dhcp relay binding** command. Output fields are listed in the approximate order in which they appear.

**Table 154: show dhcp relay binding Output Fields**

Field Name	Field Description	Level of Output
<i>number</i> clients, ( <i>number</i> init, <i>number</i> bound, <i>number</i> selecting, <i>number</i> requesting, <i>number</i> renewing, <i>number</i> rebinding, <i>number</i> releasing)	Summary counts of the total number of DHCP clients and the number of DHCP clients in each state.	<b>summary</b>
<b>IP address</b>	IP address of the DHCP client.	<b>briefdetail</b>
<b>Session Id</b>	Session ID of the subscriber session.	<b>briefdetail</b>
<b>Generated Remote ID</b>	Remote ID generated by the Option 82 Agent Remote ID (suboption 1)	<b>detail</b>
<b>Hardware address</b>	Hardware address of the DHCP client.	<b>briefdetail</b>
<b>Expires</b>	Number of seconds in which the lease expires.	<b>briefdetail</b>

Table 154: show dhcp relay binding Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>State</b>	State of the DHCP relay address binding table on the DHCP client: <ul style="list-style-type: none"> <li><b>BOUND</b>—Client has an active IP address lease.</li> <li><b>INIT</b>—Initial state.</li> <li><b>REBINDING</b>—Client is broadcasting a request to renew the IP address lease.</li> <li><b>RELEASE</b>—Client is releasing the IP address lease.</li> <li><b>RENEWING</b>—Client is sending a request to renew the IP address lease.</li> <li><b>REQUESTING</b>—Client is requesting a DHCP server.</li> <li><b>SELECTING</b>—Client is receiving offers from DHCP servers.</li> </ul>	<b>briefdetail</b>
<b>Interface</b>	Incoming client interface.	brief
<b>Lease Expires</b>	Date and time at which the client's IP address lease expires.	detail
<b>Lease Expires in</b>	Number of seconds in which the lease expires.	detail
<b>Lease Start</b>	Date and time at which the client's IP address lease started.	detail
<b>Lease time violated</b>	Lease time violation has occurred.	detail
<b>Incoming Client Interface</b>	Client's incoming interface.	detail
<b>Server IP Address</b>	IP address of the DHCP server.	detail
<b>Server Interface</b>	Interface of the DHCP server.	detail
<b>Bootp Relay Address</b>	IP address of BOOTP relay.	detail
<b>Type</b>	Type of DHCP packet processing performed on the router: <ul style="list-style-type: none"> <li><b>active</b>—Router actively processes and relays DHCP packets.</li> <li><b>passive</b>—Router passively snoops DHCP packets passing through the router.</li> </ul>	All levels
<b>Lease expires at</b>	Date and time at which the client's IP address lease expires.	All levels

## show dhcp relay statistics

---

Syntax	<code>show dhcp relay statistics</code> <code>&lt;logical-system <i>logical-system-name</i>&gt;</code> <code>&lt;routing-instance <i>routing-instance-name</i>&gt;</code>
Syntax	Syntax for EX Series switches:  <code>show dhcp relay statistics</code> <code>&lt;routing-instance <i>routing-instance-name</i>&gt;</code>
Release Information	Command introduced in Junos OS Release 8.3. Command introduced in Junos OS Release 12.1 for EX Series switches. Command introduced in Junos OS Release 12.1X48R3 for PTX Series Packet Transport Routers.
Description	Display Dynamic Host Configuration Protocol (DHCP) relay statistics.
Options	<code>logical-system <i>logical-system-name</i></code> —(On routers only) (Optional) Perform this operation on the specified logical system. If you do not specify a logical system name, statistics are displayed for the default logical system.  <code>routing-instance <i>routing-instance-name</i></code> —(Optional) Perform this operation on the specified routing instance. If you do not specify a routing instance name, statistics are displayed for the default routing instance.
Required Privilege Level	view
Related Documentation	<ul style="list-style-type: none"><li>• <a href="#">clear dhcp relay statistics on page 1735</a></li></ul>
List of Sample Output	<a href="#">show dhcp relay statistics on page 1750</a>
Output Fields	<a href="#">Table 155 on page 1749</a> lists the output fields for the <code>show dhcp relay statistics</code> command. Output fields are listed in the approximate order in which they appear.

Table 155: show dhcp relay statistics Output Fields

Field Name	Field Description
<b>Packets dropped</b>	<p>Number of packets discarded by the extended DHCP relay agent application due to errors. Only nonzero statistics appear in the <b>Packets dropped</b> output. When all of the Packets dropped statistics are 0 (zero), only the <b>Total</b> field appears.</p> <ul style="list-style-type: none"> <li>• <b>Total</b>—Total number of packets discarded by the extended DHCP relay agent application.</li> <li>• <b>Bad hardware address</b>—Number of packets discarded because an invalid hardware address was specified.</li> <li>• <b>Bad opcode</b>—Number of packets discarded because an invalid operation code was specified.</li> <li>• <b>Bad options</b>—Number of packets discarded because invalid options were specified.</li> <li>• <b>Invalid server address</b>—Number of packets discarded because an invalid server address was specified.</li> <li>• <b>Lease Time Violation</b>—Number of packets discarded because of a lease time violation</li> <li>• <b>No available addresses</b>—Number of packets discarded because there were no addresses available for assignment.</li> <li>• <b>No interface match</b>—Number of packets discarded because they did not belong to a configured interface.</li> <li>• <b>No routing instance match</b>—Number of packets discarded because they did not belong to a configured routing instance.</li> <li>• <b>No valid local address</b>—Number of packets discarded because there was no valid local address.</li> <li>• <b>Packet too short</b>—Number of packets discarded because they were too short.</li> <li>• <b>Read error</b>—Number of packets discarded because of a system read error.</li> <li>• <b>Send error</b>—Number of packets that the extended DHCP relay application could not send.</li> <li>• <b>Option 60</b>—Number of packets discarded containing DHCP option 60 vendor-specific information.</li> <li>• <b>Option 82</b>—Number of packets discarded because DHCP option 82 information could not be added.</li> </ul>
<b>Messages received</b>	<p>Number of DHCP messages received.</p> <ul style="list-style-type: none"> <li>• <b>BOOTREQUEST</b>—Number of BOOTP protocol data units (PDUs) received</li> <li>• <b>DHCPDECLINE</b>—Number of DHCP PDUs of type DECLINE received</li> <li>• <b>DHCPDISCOVER</b>—Number of DHCP PDUs of type DISCOVER received</li> <li>• <b>DHCPINFORM</b>—Number of DHCP PDUs of type INFORM received</li> <li>• <b>DHCPRELEASE</b>—Number of DHCP PDUs of type RELEASE received</li> <li>• <b>DHCPREQUEST</b>—Number of DHCP PDUs of type REQUEST received</li> </ul>

Table 156: show dhcpv6 relay binding Output Fields

Field Name	Field Description	Level of Output
<i>number clients, (number init, number bound, number selecting, number requesting, number renewing, number rebinding, number releasing)</i>	Summary counts of the total number of DHCPv6 clients and the number of DHCPv6 clients in each state.	<b>summary</b>
<b>Client IPv6 Prefix</b>	Prefix of the DHCPv6 client.	<b>brief detail</b>
<b>Client DUID</b>	DHCP for IPv6 Unique Identifier (DUID) of the client.	<b>brief detail</b>
<b>Session Id</b>	Session ID of the subscriber session.	<b>brief detail</b>
<b>Expires</b>	Number of seconds in which the lease expires.	<b>brief detail</b>
<b>State</b>	State of the DHCPv6 relay address binding table on the DHCPv6 client: <ul style="list-style-type: none"> <li>• <b>BOUND</b>—Client has an active IP address lease.</li> <li>• <b>INIT</b>—Initial state.</li> <li>• <b>REBINDING</b>—Client is broadcasting a request to renew the IP address lease.</li> <li>• <b>RELEASE</b>—Client is releasing the IP address lease.</li> <li>• <b>RENEWING</b>—Client is sending a request to renew the IP address lease.</li> <li>• <b>REQUESTING</b>—Client is requesting a DHCPv6 server.</li> <li>• <b>SELECTING</b>—Client is receiving offers from DHCPv6 servers.</li> </ul>	<b>brief detail</b>
<b>Interface</b>	Incoming client interface.	<b>brief</b>
<b>Lease Expires</b>	Date and time at which the client's IP address lease expires.	<b>detail</b>

Table 156: show dhcpv6 relay binding Output Fields (*continued*)

Field Name	Field Description	Level of Output
Lease Expires in	Number of seconds in which the lease expires.	detail
Preferred Lease Expires	Date and UTC time at which the client's IPv6 prefix expires.	detail
Preferred Lease Expires in	Number of seconds at which the client's IPv6 prefix expires.	detail
Lease Start	Date and time at which the client's IP address lease started.	detail
Lease time violated	Lease time violation has occurred.	detail
Incoming Client Interface	Client's incoming interface.	detail
Server Address	IP address of the DHCPv6 server.  Displays <b>unknown</b> for a DHCPv6 relay agent in a multi-relay topology that is not directly adjacent to the DHCPv6 server and does not detect the IP address of the server. In that case, the output instead displays the <b>Next Hop Server Facing Relay</b> field.	detail
Next Hop Server Facing Relay	Next-hop address in the direction of the DHCPv6 server.	detail
Server Interface	Interface of the DHCPv6 server.	detail
Relay Address	IP address of the relay.	detail
Client Pool Name	Address pool that granted the client lease.	detail
Client ID Length	Length of client ID.	All levels
Client Id	Client ID.	All levels
Generated Circuit ID	Circuit ID generated by the DHCPv6 Interface-ID option (option 18)	detail
Generated Remote ID Enterprise Number	The Juniper Networks IANA private enterprise number	detail
Generated Remote ID	Remote ID generated by the DHCPv6 Remote-ID option (option 37)	detail

## show dhcpv6 relay statistics

<b>Syntax</b>	<b>show dhcpv6 relay statistics</b> <code>&lt;logical-system <i>logical-system-name</i>&gt;</code> <code>&lt;routing-instance <i>routing-instance-name</i>&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.4. Command introduced in Junos OS Release 12.1X48R3 for PTX Series Packet Transport Switches. Command introduced in Junos OS Release 12.3R2 for EX Series switches.
<b>Description</b>	Display Dynamic Host Configuration Protocol for IPv6 (DHCPv6) relay statistics.
<b>Options</b>	<p><b>logical-system <i>logical-system-name</i></b>—(Optional) Perform this operation on the specified logical system. If you do not specify a logical system name, statistics are displayed for the default logical system.</p> <p><b>routing-instance <i>routing-instance-name</i></b>—(Optional) Perform this operation on the specified routing instance. If you do not specify a routing instance name, statistics are displayed for the default routing instance.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear dhcpv6 relay statistics on page 1741</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show dhcpv6 relay statistics on page 1758</a>
<b>Output Fields</b>	<a href="#">Table 157 on page 1757</a> lists the output fields for the <b>show dhcpv6 relay statistics</b> command. Output fields are listed in the approximate order in which they appear.

**Table 157: show dhcpv6 relay statistics Output Fields**

Field Name	Field Description
DHCPv6 Packets dropped	<p>Number of packets discarded by the extended DHCPv6 relay agent application due to errors. Only nonzero statistics appear in the <b>Packets dropped</b> output. When all of the Packets dropped statistics are 0 (zero), only the <b>Total</b> field appears.</p> <ul style="list-style-type: none"> <li>• <b>Total</b>—Total number of packets discarded by the DHCPv6 relay agent application.</li> <li>• <b>Bad options</b>—Number of packets discarded because invalid options were specified.</li> <li>• <b>Bad send</b>—Number of packets that the extended DHCP relay application could not send.</li> <li>• <b>Bad src address</b>—Number of packets discarded because the family type was not AF_INET6.</li> <li>• <b>No client id</b>—Number of packets discarded because they could not be matched to a client.</li> <li>• <b>Lease Time Violation</b>—Number of packets discarded because of a lease time violation</li> <li>• <b>No safd</b>—Number of packets discarded because they arrived on an unconfigured interface.</li> <li>• <b>Short packet</b>—Number of packets discarded because they were too short.</li> <li>• <b>Relay hop count</b>—Number of packets discarded because the hop count in the packet exceeded 32.</li> </ul>

Table 157: show dhcpv6 relay statistics Output Fields (*continued*)

Field Name	Field Description
<b>Messages received</b>	<p>Number of DHCPv6 messages received.</p> <ul style="list-style-type: none"> <li><b>DHCPV6_DECLINE</b>—Number of DHCPv6 PDUs of type DECLINE received</li> <li><b>DHCPV6_SOLICIT</b>—Number of DHCPv6 PDUs of type SOLICIT received</li> <li><b>DHCPV6_INFORMATION_REQUEST</b>—Number of DHCPv6 PDUs of type INFORMATION-REQUEST received</li> <li><b>DHCPV6_RELEASE</b>—Number of DHCPv6 PDUs of type RELEASE received</li> <li><b>DHCPV6_REQUEST</b>—Number of DHCPv6 PDUs of type REQUEST received</li> <li><b>DHCPV6_CONFIRM</b>—Number of DHCPv6 PDUs of type CONFIRM received</li> <li><b>DHCPV6_RENEW</b>—Number of DHCPv6 PDUs of type RENEW received</li> <li><b>DHCPV6_REBIND</b>—Number of DHCPv6 PDUs of type REBIND received</li> <li><b>DHCPV6_RELAY_REPL</b>—Number of DHCPv6 PDUs of type RELAY-REPL received</li> </ul>
<b>Messages sent</b>	<p>Number of DHCPv6 messages sent.</p> <ul style="list-style-type: none"> <li><b>DHCPV6_ADVERTISE</b>—Number of DHCPv6 ADVERTISE PDUs transmitted</li> <li><b>DHCP_REPLY</b>—Number of DHCPv6 REPLY PDUs transmitted</li> <li><b>DHCP_RECONFIGURE</b>—Number of DHCPv6 RECONFIGURE PDUs transmitted</li> <li><b>DHCP_RELAY_FORW</b>—Number of DHCPv6 RELAY-FORW PDUs transmitted</li> </ul>

External Server Response:	
State	Responding

## show route extensive

<b>List of Syntax</b>	<a href="#">Syntax on page 1760</a> <a href="#">Syntax (EX Series Switches) on page 1760</a>
<b>Syntax</b>	show route extensive <destination-prefix> <logical-system (all   logical-system-name)>
<b>Syntax (EX Series Switches)</b>	show route extensive <destination-prefix>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Display extensive information about the active entries in the routing tables.
<b>Options</b>	<b>none</b> —Display all active entries in the routing table.  <b>destination-prefix</b> —(Optional) Display active entries for the specified address or range of addresses.  <b>logical-system (all   logical-system-name)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.
<b>Required Privilege Level</b>	view
<b>List of Sample Output</b>	<a href="#">show route extensive on page 1767</a> <a href="#">show route extensive (Access Route) on page 1773</a> <a href="#">show route extensive (BGP PIC Edge) on page 1774</a> <a href="#">show route extensive (FRR and LFA) on page 1774</a> <a href="#">show route extensive (Route Reflector) on page 1775</a> <a href="#">show route label detail (Multipoint LDP Inband Signaling for Point-to-Multipoint LSPs) on page 1775</a> <a href="#">show route label detail (Multipoint LDP with Multicast-Only Fast Reroute) on page 1776</a>
<b>Output Fields</b>	<a href="#">Table 158 on page 1760</a> describes the output fields for the <b>show route extensive</b> command. Output fields are listed in the approximate order in which they appear.

**Table 158: show route extensive Output Fields**

Field Name	Field Description
<i>routing-table-name</i>	Name of the routing table (for example, inet.0).
<i>number destinations</i>	Number of destinations for which there are routes in the routing table.

Table 158: show route extensive Output Fields (*continued*)

Field Name	Field Description
<i>number routes</i>	<p>Number of routes in the routing table and total number of routes in the following states:</p> <ul style="list-style-type: none"> <li>• <b>active</b> (routes that are active).</li> <li>• <b>holddown</b> (routes that are in the pending state before being declared inactive).</li> <li>• <b>hidden</b> (routes that are not used because of a routing policy).</li> </ul>
<i>route-destination</i> (entry, announced)	<p>Route destination (for example: 10.0.0.1/24). The <b>entry</b> value is the number of route for this destination, and the <b>announced</b> value is the number of routes being announced for this destination. Sometimes the route destination is presented in another format, such as:</p> <ul style="list-style-type: none"> <li>• <b>MPLS-label</b> (for example, 80001).</li> <li>• <b>interface-name</b> (for example, ge-1/0/2).</li> <li>• <b>neighbor-address:control-word-status:encapsulation type:vc-id:source</b> (Layer 2 circuit only; for example, 10.1.1.195:NoCtrlWord:1:1:Local/96). <ul style="list-style-type: none"> <li>• <b>neighbor-address</b>—Address of the neighbor.</li> <li>• <b>control-word-status</b>—Whether the use of the control word has been negotiated for this virtual circuit: <b>NoCtrlWord</b> or <b>CtrlWord</b>.</li> <li>• <b>encapsulation type</b>—Type of encapsulation, represented by a number: (1) Frame Relay DLCI, (2) ATM AAL5 VCC transport, (3) ATM transparent cell transport, (4) Ethernet, (5) VLAN Ethernet, (6) HDLC, (7) PPP, (8) ATM VCC cell transport, (10) ATM VPC cell transport.</li> <li>• <b>vc-id</b>—Virtual circuit identifier.</li> <li>• <b>source</b>—Source of the advertisement: <b>Local</b> or <b>Remote</b>.</li> </ul> </li> </ul>
<b>TSI</b>	Protocol header information.
<b>label stacking</b>	<p>(Next-to-the-last-hop routing device for MPLS only) Depth of the MPLS label stack, where the label-popping operation is needed to remove one or more labels from the top of the stack. A pair of routes is displayed, because the pop operation is performed only when the stack depth is two or more labels.</p> <ul style="list-style-type: none"> <li>• <b>S=0 route</b> indicates that a packet with an incoming label stack depth of two or more exits this router with one fewer label (the label-popping operation is performed).</li> <li>• If there is no <b>S=</b> information, the route is a normal MPLS route, which has a stack depth of 1 (the label-popping operation is not performed).</li> </ul>
<b>[protocol, preference]</b>	<p>Protocol from which the route was learned and the preference value for the route.</p> <ul style="list-style-type: none"> <li>• <b>+</b>—A plus sign indicates the active route, which is the route installed from the routing table into the forwarding table.</li> <li>• <b>-</b>—A hyphen indicates the last active route.</li> <li>• <b>*</b>—An asterisk indicates that the route is both the active and the last active route. An asterisk before a <b>to</b> line indicates the best subpath to the route.</li> </ul> <p>In every routing metric except for the BGP <b>LocalPref</b> attribute, a lesser value is preferred. In order to use common comparison routines, Junos OS stores the 1's complement of the <b>LocalPref</b> value in the <b>Preference2</b> field. For example, if the <b>LocalPref</b> value for Route 1 is 100, the <b>Preference2</b> value is -101. If the <b>LocalPref</b> value for Route 2 is 155, the <b>Preference2</b> value is -156. Route 2 is preferred because it has a higher <b>LocalPref</b> value and a lower <b>Preference2</b> value.</p>

Table 158: show route extensive Output Fields (*continued*)

Field Name	Field Description
<b>Level</b>	(IS-IS only). In IS-IS, a single autonomous system (AS) can be divided into smaller groups called areas. Routing between areas is organized hierarchically, allowing a domain to be administratively divided into smaller areas. This organization is accomplished by configuring Level 1 and Level 2 intermediate systems. Level 1 systems route within an area. When the destination is outside an area, they route toward a Level 2 system. Level 2 intermediate systems route between areas and toward other ASs.
<b>Route Distinguisher</b>	IP subnet augmented with a 64-bit prefix.
<b>PMSI</b>	Provider multicast service interface (MVPN routing table).
<b>Next-hop type</b>	Type of next hop. For a description of possible values for this field, see the Output Field table in the <a href="#">show route detail</a> command.
<b>Next-hop reference count</b>	Number of references made to the next hop.
<b>Flood nexthop branches exceed maximum message</b>	Indicates that the number of flood next-hop branches exceeded the system limit of 32 branches, and only a subset of the flood next-hop branches were installed in the kernel.
<b>Source</b>	IP address of the route source.
<b>Next hop</b>	Network layer address of the directly reachable neighboring system.
<b>via</b>	Interface used to reach the next hop. If there is more than one interface available to the next hop, the name of the interface that is actually used is followed by the word <b>Selected</b> . This field can also contain the following information: <ul style="list-style-type: none"> <li>• <b>Weight</b>—Value used to distinguish primary, secondary, and fast reroute backup routes. Weight information is available when MPLS label-switched path (LSP) link protection, node-link protection, or fast reroute is enabled, or when the standby state is enabled for secondary paths. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.</li> <li>• <b>Balance</b>—Balance coefficient indicating how traffic of unequal cost is distributed among next hops when a routing device is performing unequal-cost load balancing. This information is available when you enable BGP multipath load balancing.</li> </ul>
<b>Label-switched-path lsp-path-name</b>	Name of the LSP used to reach the next hop.
<b>Label operation</b>	MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).
<b>Offset</b>	Whether the metric has been increased or decreased by an offset value.
<b>Interface</b>	(Local only) Local interface name.
<b>Protocol next hop</b>	Network layer address of the remote routing device that advertised the prefix. This address is used to recursively derive a forwarding next hop.

Table 158: show route extensive Output Fields (*continued*)

Field Name	Field Description
<b><i>label-operation</i></b>	MPLS label and operation occurring at this routing device. The operation can be <b>pop</b> (where a label is removed from the top of the stack), <b>push</b> (where another label is added to the label stack), or <b>swap</b> (where a label is replaced by another label).
<b>Indirect next hops</b>	<p>When present, a list of nodes that are used to resolve the path to the next-hop destination, in the order that they are resolved.</p> <p>When BGP PIC Edge is enabled, the output lines that contain <b>Indirect next hop: weight</b> follow next hops that the software can use to repair paths where a link failure occurs. The next-hop weight has one of the following values:</p> <ul style="list-style-type: none"> <li>• 0x1 indicates active next hops.</li> <li>• 0x4000 indicates passive next hops.</li> </ul>
<b>State</b>	State of the route (a route can be in more than one state). See the Output Field table in the <a href="#">show route detail</a> command.
<b>Session ID</b>	The BFD session ID number that represents the protection using MPLS fast reroute (FRR) and loop-free alternate (LFA).
<b>Weight</b>	<p>Weight for the backup path. If the weight of an indirect next hop is larger than zero, the weight value is shown.</p> <p>For sample output, see <a href="#">show route table</a>.</p>

Table 158: show route extensive Output Fields (*continued*)

Field Name	Field Description
Inactive reason	<p>If the route is inactive, the reason for its current state is indicated. Typical reasons include:</p> <ul style="list-style-type: none"> <li>• <b>Active preferred</b>—Currently active route was selected over this route.</li> <li>• <b>Always compare MED</b>—Path with a lower multiple exit discriminator (MED) is available.</li> <li>• <b>AS path</b>—Shorter AS path is available.</li> <li>• <b>Cisco Non-deterministic MED selection</b>—Cisco nondeterministic MED is enabled and a path with a lower MED is available.</li> <li>• <b>Cluster list length</b>—Path with a shorter cluster list length is available.</li> <li>• <b>Forwarding use only</b>—Path is only available for forwarding purposes.</li> <li>• <b>IGP metric</b>—Path through the next hop with a lower IGP metric is available.</li> <li>• <b>IGP metric type</b>—Path with a lower OSPF link-state advertisement type is available.</li> <li>• <b>Interior &gt; Exterior &gt; Exterior via Interior</b>—Direct, static, IGP, or EBGP path is available.</li> <li>• <b>Local preference</b>—Path with a higher local preference value is available.</li> <li>• <b>Next hop address</b>—Path with a lower metric next hop is available.</li> <li>• <b>No difference</b>—Path from a neighbor with a lower IP address is available.</li> <li>• <b>Not Best in its group</b>—Occurs when multiple peers of the same external AS advertise the same prefix and are grouped together in the selection process. When this reason is displayed, an additional reason is provided (typically one of the other reasons listed).</li> <li>• <b>Number of gateways</b>—Path with a higher number of next hops is available.</li> <li>• <b>Origin</b>—Path with a lower origin code is available.</li> <li>• <b>OSPF version</b>—Path does not support the indicated OSPF version.</li> <li>• <b>RIB preference</b>—Route from a higher-numbered routing table is available.</li> <li>• <b>Route distinguisher</b>—64-bit prefix added to IP subnets to make them unique.</li> <li>• <b>Route metric or MED comparison</b>—Route with a lower metric or MED is available.</li> <li>• <b>Route preference</b>—Route with a lower preference value is available.</li> <li>• <b>Router ID</b>—Path through a neighbor with a lower ID is available.</li> <li>• <b>Unusable path</b>—Path is not usable because of one of the following conditions: the route is damped, the route is rejected by an import policy, or the route is unresolved.</li> <li>• <b>Update source</b>—Last tiebreaker is the lowest IP address value.</li> </ul>
Local AS	Autonomous system (AS) number of the local routing device.
Age	How long the route has been known.
AIGP	Accumulated interior gateway protocol (AIGP) BGP attribute.
Metric	Cost value of the indicated route. For routes within an AS, the cost is determined by IGP and the individual protocol metrics. For external routes, destinations, or routing domains, the cost is determined by a preference value.
MED-plus-IGP	Metric value for BGP path selection to which the IGP cost to the next-hop destination has been added.
TTL-Action	<p>For MPLS LSPs, state of the TTL propagation attribute. Can be enabled or disabled for all RSVP-signaled and LDP-signaled LSPs or for specific VRF routing instances.</p> <p>For sample output, see <a href="#">show route table</a>.</p>

Table 158: show route extensive Output Fields (*continued*)

Field Name	Field Description
Task	Name of the protocol that has added the route.
Announcement bits	List of protocols that announce this route. <b>n-Resolve inet</b> indicates that the route is used for route resolution for next hops found in the routing table. <b>n</b> is an index used by Juniper Networks customer support only.
AS path	<p>AS path through which the route was learned. The letters at the end of the AS path indicate the path origin, providing an indication of the state of the route at the point at which the AS path originated:</p> <ul style="list-style-type: none"> <li>• <b>I</b>—IGP.</li> <li>• <b>E</b>—EGP.</li> <li>• <b>Recorded</b>—The AS path is recorded by the sample process (sampled).</li> <li>• <b>?</b>—Incomplete; typically, the AS path was aggregated.</li> </ul> <p>When AS path numbers are included in the route, the format is as follows:</p> <ul style="list-style-type: none"> <li>• <b>[ ]</b>—Brackets enclose the local AS number associated with the AS path if more than one AS number is configured on the routing device, or if AS path prepending is configured.</li> <li>• <b>{ }</b>—Braces enclose AS sets, which are groups of AS numbers in which the order does not matter. A set commonly results from route aggregation. The numbers in each AS set are displayed in ascending order.</li> <li>• <b>( )</b>—Parentheses enclose a confederation.</li> <li>• <b>( [ ] )</b>—Parentheses and brackets enclose a confederation set.</li> </ul> <p><b>NOTE:</b> In Junos OS Release 10.3 and later, the AS path field displays an unrecognized attribute and associated hexadecimal value if BGP receives attribute 128 (attribute set) and you have not configured an independent domain in any routing instance.</p>
validation-state	<p>(BGP-learned routes) Validation status of the route:</p> <ul style="list-style-type: none"> <li>• <b>Invalid</b>—Indicates that the prefix is found, but either the corresponding AS received from the EBGP peer is not the AS that appears in the database, or the prefix length in the BGP update message is longer than the maximum length permitted in the database.</li> <li>• <b>Unknown</b>—Indicates that the prefix is not among the prefixes or prefix ranges in the database.</li> <li>• <b>Unverified</b>—Indicates that origin validation is not enabled for the BGP peers.</li> <li>• <b>Valid</b>—Indicates that the prefix and autonomous system pair are found in the database.</li> </ul>
FECs bound to route	Point-to-multipoint root address, multicast source address, and multicast group address when multipoint LDP (M-LDP) inband signaling is configured.
AS path: I <Originator>	(For route reflected output only) Originator ID attribute set by the route reflector.
Primary Upstream	When multipoint LDP with multicast-only fast reroute (MoFRR) is configured, the primary upstream path. MoFRR transmits a multicast join message from a receiver toward a source on a primary path, while also transmitting a secondary multicast join message from the receiver toward the source on a backup path.
RPF Nexthops	When multipoint LDP with MoFRR is configured, the reverse-path forwarding (RPF) next-hop information. Data packets are received from both the primary path and the secondary paths. The redundant packets are discarded at topology merge points due to the RPF checks.

Table 158: show route extensive Output Fields (*continued*)

Field Name	Field Description
Label	Multiple MPLS labels are used to control MoFRR stream selection. Each label represents a separate route, but each references the same interface list check. Only the primary label is forwarded while all others are dropped. Multiple interfaces can receive packets using the same label.
weight	Value used to distinguish MoFRR primary and backup routes. A lower weight value is preferred. Among routes with the same weight value, load balancing is possible.
VC Label	MPLS label assigned to the Layer 2 circuit virtual connection.
MTU	Maximum transmission unit (MTU) of the Layer 2 circuit.
VLAN ID	VLAN identifier of the Layer 2 circuit.
Cluster list	(For route reflected output only) Cluster ID sent by the route reflector.
Originator ID	(For route reflected output only) Address of router that originally sent the route to the route reflector.
Prefixes bound to route	Forwarding equivalent class (FEC) bound to this route. Applicable only to routes installed by LDP.
Communities	Community path attribute for the route. See the Output Field table in the <a href="#">show route detail</a> command for all possible values for this field.
Layer2-info: encaps	Layer 2 encapsulation (for example, VPLS).
control flags	Control flags: <b>none</b> or Site Down.
mtu	Maximum transmission unit (MTU) information.
Label-Base, range	First label in a block of labels and label block size. A remote PE routing device uses this first label when sending traffic toward the advertising PE routing device.
status vector	Layer 2 VPN and VPLS network layer reachability information (NLRI).
Localpref	Local preference value included in the route.
Router ID	BGP router ID as advertised by the neighbor in the open message.
Primary Routing Table	In a routing table group, the name of the primary routing table in which the route resides.
Secondary Tables	In a routing table group, the name of one or more secondary tables in which the route resides.
Originating RIB	Name of the routing table whose active route was used to determine the forwarding next-hop entry in the resolution database. For example, in the case of inet.0 resolving through inet.0 and inet.3, this field indicates which routing table, inet.0 or inet.3, provided the best path for a particular prefix.
Node path count	Number of nodes in the path.

Table 158: show route extensive Output Fields (*continued*)

Field Name	Field Description
<b>Forwarding nexthops</b>	Number of forwarding next hops. The forwarding next hop is the network layer address of the directly reachable neighboring system (if applicable) and the interface used to reach it.

## Sample Output

### show route extensive

## clear security pki local-certificate

<b>Syntax</b>	clear security pki local-certificate <all   certificate-id <i>certificate-id-name</i>   system-generated>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for EX Series switches.
<b>Description</b>	Delete local digital certificates, certificate requests, and the corresponding public/private key pairs from the switch.
<b>Options</b>	all—(Optional) Delete all local digital certificates, certificate requests, and the corresponding public and private key pairs from the router.
<div>  <b>NOTE:</b> This option does not delete the automatically generated self-signed certificate or its public/private key pair.         </div>	
	<b>certificate-id <i>certificate-id-name</i></b> —(Optional) Delete the specified local digital certificate and corresponding public and private key pair.  <b>system-generated</b> —(Optional) Delete the automatically generated self-signed certificate.
<b>Required Privilege Level</b>	clear
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Deleting Self-Signed Certificates (CLI Procedure) on page 1419</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">clear security pki local-certificate all on page 1789</a>
<b>Output Fields</b>	This command produces no output.

## Sample Output

clear security pki local-certificate all

```
user@switch> clear security pki local-certificate all
```

## clear system services dhcp binding

---

<b>Syntax</b>	clear system services dhcp binding <address>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	(J Series routers and EX Series switches only) Remove obsolete IP address bindings on a Dynamic Host Configuration Protocol (DHCP) server and return them to the IP address pool.
<b>Options</b>	<b>address</b> —(Optional) Remove a specific IP address binding and return it to the address pool.
<b>Required Privilege Level</b>	view and system
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show system services dhcp binding on page 1803</a></li></ul>
<b>List of Sample Output</b>	<a href="#">clear system services dhcp binding on page 1790</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### clear system services dhcp binding

```
user@host> clear system services dhcp binding
```

## clear system services dhcp conflict

---

<b>Syntax</b>	clear system services dhcp conflict <address>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	(J Series routers and EX Series switches only) Remove IP addresses from the Dynamic Host Configuration Protocol (DHCP) server conflict list and return them to the IP address pool.
<b>Options</b>	<b>address</b> —(Optional) Remove a specific IP address from the conflict list and return it to the address pool.
<b>Required Privilege Level</b>	view and system
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show system services dhcp conflict on page 1806</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">clear system services dhcp conflict on page 1791</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### clear system services dhcp conflict

```
user@host> clear system services dhcp conflict
```

## clear system services dhcp statistics

---

<b>Syntax</b>	clear system services dhcp statistics
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	(J Series routers and EX Series switches only) Clear Dynamic Host Configuration Protocol (DHCP) server statistics.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view and system
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">show system services dhcp statistics on page 1811</a></li></ul>
<b>List of Sample Output</b>	<a href="#">clear system services dhcp statistics on page 1792</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

### Sample Output

#### clear system services dhcp statistics

```
user@host> clear system services dhcp statistics
```

## request ipsec switch

---

<b>Syntax</b>	<code>request ipsec switch (interface &lt;es-fpc/pic/port&gt;   security-associations &lt;sa-name&gt;)</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	(Encryption interface on M Series, PTX Series, and T Series routers and EX Series switches only) Manually switch from the primary to the backup encryption services interface, or switch from the primary to the backup IP Security (IPsec) tunnel.
<b>Options</b>	<code>interface &lt;es-fpc/pic/port&gt;</code> —Switch to the backup encryption interface. <code>security-associations &lt;sa-name&gt;</code> —Switch to the backup tunnel.
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show ipsec redundancy</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">request ipsec switch on page 1793</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request ipsec switch

```
user@host> request ipsec switch security-associations sa-private
```

## request security certificate (signed)

---

<b>Syntax</b>	<code>request security certificate enroll filename <i>filename</i> subject <i>subject</i> alternative-subject <i>alternative-subject</i> certification-authority <i>certification-authority</i> encoding (binary   pem) key-file <i>key-file</i> domain-name <i>domain-name</i></code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	(Encryption interface on M Series and T Series routers and EX Series switches only) Obtain a signed certificate from a certificate authority (CA). The signed certificate validates the CA and the owner of the certificate. The results are saved in a specified file to the <code>/var/etc/ikecert</code> directory.
<b>Options</b>	<p><b>filename <i>filename</i></b>—File that stores the certificate.</p> <p><b>subject <i>subject</i></b>—Distinguished name (<b>dn</b>), which consists of a set of components—for example, an organization (<b>o</b>), an organization unit (<b>ou</b>), a country (<b>c</b>), and a locality (<b>l</b>).</p> <p><b>alternative-subject <i>alternative-subject</i></b>—Tunnel source address.</p> <p><b>certification-authority <i>certification-authority</i></b>—Name of the certificate authority profile in the configuration.</p> <p><b>encoding (binary   pem)</b>—File format used for the certificate. The format can be a binary file or privacy-enhanced mail (PEM), an ASCII base64-encoded format. The default format is binary.</p> <p><b>key-file <i>key-file</i></b>—File containing a local private key.</p> <p><b>domain-name <i>domain-name</i></b>—Fully qualified domain name.</p>
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">request security certificate (signed) on page 1794</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request security certificate (signed)

```
user@host> request security certificate enroll filename host.crt subject c=uk,o=london  
alternative-subject 10.50.1.4 certification-authority verisign key-file host-1.prv domain-name  
host.juniper.net  
CA name: juniper.net CA file: ca_verisign  
local pub/private key pair: host.prv  
subject: c=uk,o=london domain name: host.juniper.net  
alternative subject: 10.50.1.4  
Encoding: binary  
Certificate enrollment has started. To view the status of your enrollment, check  
the key management process (kmd) log file at /var/log/kmd. <-----
```

## request security certificate (unsigned)

---

<b>Syntax</b>	<code>request security certificate enroll filename <i>filename</i> ca-file <i>ca-file</i> ca-name <i>ca-name</i> encoding (binary   perm) url <i>url</i></code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	(Encryption interface on M Series and T Series routers and EX Series switches only) Obtain a certificate from a certificate authority (CA). The results are saved in a specified file to the <code>/var/etc/ikecert</code> directory.
<b>Options</b>	<b>filename <i>filename</i></b> —File that stores the public key certificate.  <b>ca-file <i>ca-file</i></b> —Name of the certificate authority profile in the configuration.  <b>ca-name <i>ca-name</i></b> —Name of the certificate authority.  <b>encoding (binary   pem)</b> —File format used for the certificate. The format can be a binary file or privacy-enhanced mail (PEM), an ASCII base64-encoded format. The default value is <b>binary</b> .  <b>url <i>url</i></b> —Certificate authority URL.
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">request security certificate (unsigned) on page 1796</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request security certificate (unsigned)

```
user@host> request security certificate enroll filename ca_verisign ca-file verisign ca-name
juniper.net urlxyzcompany URL
http://<verisign ca-name xyzcompany url>/cgi-bin/pkiclient.exe CA name: juniper.net
CA file: verisign Encoding: binary
Certificate enrollment has started. To view the status of your enrollment, check
the key management process (kmd) log file at /var/log/kmd. <-----
```

## request security key-pair

---

<b>Syntax</b>	<code>request security key-pair <i>filename</i></code> <code>&lt;size <i>key-size</i>&gt;</code> <code>&lt;type (rsa   dsa)&gt;</code>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	(Encryption interface on M Series and T Series routers and EX Series switches only) Generate a public and private key pair for a digital certificate.
<b>Options</b>	<b><i>filename</i></b> —Name of a file in which to store the key pair.  <b><i>size key-size</i></b> —(Optional) Key size, in bits. The key size can be <b>512</b> , <b>1024</b> , or <b>2048</b> . The default value is <b>1024</b> .  <b><i>type</i></b> —(Optional) Algorithm used to encrypt the key: <ul style="list-style-type: none"> <li>• <b>rsa</b>—RSA algorithm. This is the default.</li> <li>• <b>dsa</b>—Digital signature algorithm with Secure Hash Algorithm (SHA).</li> </ul>
<b>Required Privilege Level</b>	maintenance
<b>List of Sample Output</b>	<a href="#">request security key-pair on page 1797</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request security key-pair

```
user@host> request security key-pair security-key-file
```

## request security pki generate-key-pair

---

<b>Syntax</b>	<code>request security pki generate-key-pair certificate-id <i>certificate-id-name</i></code> <code>&lt;size (512   1024   2048)&gt;</code> <code>&lt;type (dsa   rsa)&gt;</code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for EX Series switches.
<b>Description</b>	Generate a public key infrastructure (PKI) public/private key pair for a local digital certificate.
<b>Options</b>	<p><b>certificate-id <i>certificate-id-name</i></b>—Name of the local digital certificate and the public/private key pair.</p> <p><b>size</b>—(Optional) Key pair size. The key pair size can be <b>512</b>, <b>1024</b>, or <b>2048</b> bits. If a key pair size is not specified, the default value, <b>1024</b> bits, is applied.</p> <p><b>type</b>—(Optional) The algorithm to be used for encrypting the public/private key pair. The encryption algorithm can be <b>dsa</b> or <b>rsa</b>. If an encryption algorithm is not specified, the default value, <b>rsa</b>, is applied.</p>
<b>Required Privilege Level</b>	maintenance
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Manually Generating Self-Signed Certificates on Switches (CLI Procedure) on page 1417</a></li></ul>
<b>List of Sample Output</b>	<a href="#">request security pki generate-key-pair on page 1798</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request security pki generate-key-pair

```
user@switch> request security pki generate-key-pair certificate-id billy size 2048
Generated key pair billy, key size 2048 bits
```

## request security pki local-certificate generate-self-signed

<b>Syntax</b>	<code>request security pki local-certificate generate-self-signed certificate-id <i>certificate-id-name</i> domain-name <i>domain-name</i> ip-address <i>ip-address</i> email <i>email-address</i> subject <i>subject-distinguished-name</i></code>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for EX Series switches.
<b>Description</b>	Manually generate a self-signed certificate for the given distinguished name.
<b>Options</b>	<p><b>certificate-id <i>certificate-id-name</i></b>—Name of the local digital certificate and the public/private key pair.</p> <p><b>domain-name <i>domain-name</i></b>—Fully qualified domain name (FQDN). The FQDN provides the identity of the certificate owner for Internet Key Exchange (IKE) negotiations and provides an alternative to the subject name.</p> <p><b>email <i>email-address</i></b>—E-mail address of the certificate holder.</p> <p><b>ip-address <i>ip-address</i></b>—IP address of the switch.</p> <p><b>subject <i>subject-distinguished-name</i></b>—Distinguished name format that contains the common name, department, company name, state, and country:</p> <ul style="list-style-type: none"> <li>• <b>CN</b>—Common name</li> <li>• <b>OU</b>—Organizational unit name</li> <li>• <b>O</b>—Organization name</li> <li>• <b>ST</b>—State</li> <li>• <b>C</b>—Country</li> </ul>
<b>Required Privilege Level</b>	maintenance security
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Manually Generating Self-Signed Certificates on Switches (CLI Procedure) on page 1417</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">request security pki local-certificate generate-self-signed on page 1799</a>
<b>Output Fields</b>	When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request security pki local-certificate generate-self-signed

```
user@switch> request security pki local-certificate generate-self-signed certificate-id self-cert
subject cn=abc domain-name abc.net email jdoe@abc.net
Self-signed certificate generated and loaded successfully
```

## show security pki local-certificate

<b>Syntax</b>	show security pki local-certificate <brief   detail> <certificate-id <i>certificate-id-name</i> > <system-generated>
<b>Release Information</b>	Command introduced in Junos OS Release 11.1 for EX Series switches.
<b>Description</b>	Display information about the local digital certificates and the corresponding public keys installed in the switch.
<b>Options</b>	<p><b>none</b>—(Same as brief) Display information about all local digital certificates and corresponding public keys.</p> <p><b>brief   detail</b>—(Optional) Display information about local digital certificates and corresponding public keys for the specified level of output.</p> <p><b>certificate-id <i>certificate-id-name</i></b>—(Optional) Display information about only the specified the local digital certificate and corresponding public keys.</p> <p><b>system-generated</b>—(Optional) Display information about the automatically generated self-signed certificate.</p>
<b>Required Privilege Level</b>	view
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Manually Generating Self-Signed Certificates on Switches (CLI Procedure)</a> on page 1417</li> </ul>
<b>List of Sample Output</b>	<a href="#">show security pki local-certificate</a> on page 1801 <a href="#">show security pki local-certificate detail</a> on page 1802
<b>Output Fields</b>	<a href="#">Table 159 on page 1800</a> lists the output fields for the <b>show security pki local-certificate</b> command. Output fields are listed in the approximate order in which they appear.

Table 159: show security pki local-certificate Output Fields

Field Name	Field Description	Level of Output
Certificate identifier	Name of the digital certificate.	All levels
Certificate version	Revision number of the digital certificate.	detail
Serial number	Unique serial number of the digital certificate.	detail
Issued by	Authority that issued the digital certificate.	none brief
Issued to	Device that was issued the digital certificate.	none brief

Table 159: show security pki local-certificate Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>Issuer</b>	Authority that issued the digital certificate, including details of the authority organized using the distinguished name format. Possible subfields are: <ul style="list-style-type: none"> <li>• <b>Common name</b>—Name of the authority.</li> <li>• <b>Organization</b>—Organization of origin.</li> <li>• <b>Organizational unit</b>—Department within an organization.</li> <li>• <b>State</b>—State of origin.</li> <li>• <b>Country</b>—Country of origin.</li> </ul>	<b>detail</b>
<b>Subject</b>	Details of the digital certificate holder organized using the distinguished name format. Possible subfields are: <ul style="list-style-type: none"> <li>• <b>Common name</b>—Name of the authority.</li> <li>• <b>Organization</b>—Organization of origin.</li> <li>• <b>Organizational unit</b>—Department within an organization.</li> <li>• <b>State</b>—State of origin.</li> <li>• <b>Country</b>—Country of origin.</li> </ul>	<b>detail</b>
<b>Alternate subject</b>	Domain name or IP address of the device related to the digital certificate.	<b>detail</b>
<b>Validity</b>	Time period when the digital certificate is valid. Values are: <ul style="list-style-type: none"> <li>• <b>Not before</b>—Start time when the digital certificate becomes valid.</li> <li>• <b>Not after</b>—End time when the digital certificate becomes invalid.</li> </ul>	All levels
<b>Public key algorithm</b>	Encryption algorithm used with the private key, such as <b>rsaEncryption (1024 bits)</b> .	All levels
<b>Public key verification status</b>	Public key verification status: <b>Failed</b> or <b>Passed</b> . The <b>detail</b> output also provides the verification hash.	All levels
<b>Signature algorithm</b>	Encryption algorithm that the CA used to sign the digital certificate, such as <b>sha1WithRSAEncryption</b> .	<b>detail</b>
<b>Fingerprint</b>	Secure Hash Algorithm (SHA1) and Message Digest 5 (MD5) hashes used to identify the digital certificate.	<b>detail</b>
<b>Distribution CRL</b>	Distinguished name information and URL for the certificate revocation list (CRL) server.	<b>detail</b>
<b>Use for key</b>	Use of the public key, such as <b>Certificate signing</b> , <b>CRL signing</b> , <b>Digital signature</b> , or <b>Key encipherment</b> .	<b>detail</b>

## Sample Output

### show security pki local-certificate

```

user@switch> show security pki local-certificate
Certificate identifier: local-entrust2
Issued to: router2.juniper.net, Issued by: juniper

```

```
Validity:
  Not before: 2005 Nov 21st, 23:28:22 GMT
  Not after: 2008 Nov 21st, 23:58:22 GMT
Public key algorithm: rsaEncryption(1024 bits)
Public key verification status: Passed
```

#### show security pki local-certificate detail

```

## show system services dhcp binding

<b>Syntax</b>	show system services dhcp binding <detail> <address>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	(J Series routers only) Display Dynamic Host Configuration Protocol (DHCP) server client binding information.
<b>Options</b>	<p><b>none</b>—Display brief information about all active client bindings.</p> <p><b>detail</b>—(Optional) Display detailed information about all active client bindings.</p> <p><b>address</b>—(Optional) Display detailed client binding information for the specified IP address only.</p>
<b>Required Privilege Level</b>	view and system
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear system services dhcp binding on page 1790</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show system services dhcp binding on page 1804</a> <a href="#">show system services dhcp binding address on page 1804</a> <a href="#">show system services dhcp binding address detail on page 1804</a>
<b>Output Fields</b>	<a href="#">Table 160 on page 1803</a> describes the output fields for the <b>show system services dhcp binding</b> command. Output fields are listed in the approximate order in which they appear.

**Table 160: show system services dhcp binding Output Fields**

Field Name	Field Description	Level of Output
<b>Allocated address</b>	List of IP addresses the DHCP server has assigned to clients.	All levels
<b>MAC address</b>	Corresponding media access control (MAC) hardware address of the client.	All levels
<b>Client identifier</b>	( <b>address</b> option only) Client's unique identifier (represented by an ASCII string or hexadecimal digits). This identifier is used by the DHCP server to index its database of address bindings.	All levels
<b>Binding Type</b>	Type of binding assigned to the client. DHCP servers can assign a dynamic binding from a pool of IP addresses or a static binding to one or more specific IP addresses.	All levels
<b>Lease Expires at</b>	Time the lease expires or <b>never</b> for leases that do not expire.	All levels
<b>Lease Obtained at</b>	( <b>address</b> option only) Time the client obtained the lease from the DHCP server.	<b>detail</b>

Table 160: show system services dhcp binding Output Fields (*continued*)

Field Name	Field Description	Level of Output
<b>State</b>	Status of the binding. Bindings can be active or expired.	<b>detail</b>
<b>Pool</b>	Address pool that contains the IP address assigned to the client.	<b>detail</b>
<b>Request received on</b>	Interface on which the DHCP message exchange occurs. The IP address pool is configured based on the interface's IP address. If a relay agent is used, its IP address is also displayed.	<b>detail</b>
<b>DHCP options</b>	User-defined options created for the DHCP server. If no options have been defined, this field is blank.	<b>detail</b>

## Sample Output

### show system services dhcp binding

```
user@host> show system services dhcp binding

Allocated address  MAC address      Binding Type  Lease expires at
192.168.1.2        00:a0:12:00:12:ab  static       never
192.168.1.3        00:a0:12:00:13:02  dynamic      2004-05-03 13:01:42 PDT
```

### show system services dhcp binding address

```
user@host> show system services dhcp binding 192.168.1.3

DHCP binding information:
Allocated address: 192.168.1.3
Mac address: 00:a0:12:00:12:ab
Client identifier
61 63 65 64 2d 30 30 3a 61 30 3a 31 32 3a 30 30aced-00:a0:12:00
3a 31 33 3a 30 32:13:02

Lease information:
  Binding Type dynamic
  Obtained at 2004-05-02 13:01:42 PDT
  Expires at 2004-05-03 13:01:42 PDT
```

### show system services dhcp binding address detail

```
user@host> show system services dhcp binding 192.168.1.3 detail

DHCP binding information:
Allocated address      192.168.1.3
MAC address 00:a0:12:00:12:ab
Pool                  192.168.1.0/24
Request received on fe-0/0/0, relayed by 192.168.4.254

Lease information:
  Type                DHCP
  Obtained at         2004-05-02 13:01:42 PDT
  Expires at          2004-05-03 13:01:42 PDT
  State active

DHCP options:
  Name: name-server, Value: { 6.6.6.6, 6.6.6.7 }
```

Name: domain-name, Value: mydomain.tld  
Code: 19, Type: flag, Value: off  
Code: 40, Type: string, Value: domain.tld  
Code: 32, Type: ip-address, Value: 3.3.3.33

## show system services dhcp conflict

<b>Syntax</b>	show system services dhcp conflict
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	(J Series routers only and EX Series switches) Display Dynamic Host Configuration Protocol (DHCP) client-detected conflicts for IP addresses. When a conflict is detected, the DHCP server removes the address from the address pool.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view and system
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><a href="#">clear system services dhcp conflict on page 1791</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show system services dhcp conflict on page 1806</a>
<b>Output Fields</b>	<a href="#">Table 161 on page 1806</a> describes the output fields for the <b>show system services dhcp conflict</b> command. Output fields are listed in the approximate order in which they appear.

**Table 161: show system services dhcp conflict Output Fields**

Field Name	Field Description
Detection time	Date and time the client detected the conflict.
Detection method	How the conflict was detected.
Address	IP address where the conflict occurs. The addresses in the conflicts list remain excluded from the pool until you use a <b>clear system services dhcp conflict</b> command to manually clear the list.

## Sample Output

### show system services dhcp conflict

```
user@host> show system services dhcp conflict
```

```

Detection time      Detection method  Address
2004-08-03 19:04:00 PDT  ARP             3.3.3.5
2004-08-04 04:23:12 PDT  Ping            4.4.4.8
2004-08-05 21:06:44 PDT  Client          3.3.3.10
```

## show system services dhcp global

<b>Syntax</b>	show system services dhcp global
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	(J Series routers and EX Series switches only) Display Dynamic Host Configuration Protocol (DHCP) global configuration options. Global options apply to all scopes and clients served by the DHCP server. Global options are overridden if specified otherwise in scope or client options. Scope options apply to specific subnets or ranges of addresses. Client options apply to specific clients.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view and system
<b>List of Sample Output</b>	<a href="#">show system services dhcp global on page 1808</a>
<b>Output Fields</b>	<a href="#">Table 162 on page 1807</a> describes the output fields for the <b>show system services dhcp global</b> command. Output fields are listed in the approximate order in which they appear.

**Table 162: show system services dhcp global Output Fields**

Field Name	Field Description
<b>BOOTP lease length</b>	Length of lease time assigned to BOOTP clients.
<b>Default lease time</b>	Lease time assigned to clients that do not request a specific lease time.
<b>Minimum lease time</b>	Minimum time a client retains an IP address lease on the server.
<b>Maximum lease time</b>	Maximum time a client can retain an IP address lease on the server.
<b>DHCP options</b>	User-defined options created for the DHCP server. If no options have been defined, this field is blank.

## Sample Output

### show system services dhcp global

```
user@host> show system services dhcp global

Global settings:
  BOOTP lease length      infinite

DHCP lease times:
  Default lease time      1 hour
  Minimum lease time      2 hours
  Maximum lease time      infinite

DHCP options:
  Name: name-server, Value: { 6.6.6.6, 6.6.6.7 }
  Name: domain-name, Value: mydomain.tld
  Code: 19, Type: flag, Value: off
  Code: 40, Type: string, Value: domain.tld
  Code: 32, Type: ip-address, Value: 3.3.3.33
```

## show system services dhcp pool

<b>Syntax</b>	show system services dhcp pool <detail> <subnet-address>
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	(J Series routers and EX Series switches only) Display Dynamic Host Configuration Protocol (DHCP) server IP address pools.
<b>Options</b>	<b>none</b> —Display brief information about all IP address pools.  <b>detail</b> —(Optional) Display detailed information.  <b>subnet-address</b> —(Optional) Display information for the specified subnet address.
<b>Required Privilege Level</b>	view and system
<b>List of Sample Output</b>	<a href="#">show system services dhcp pool on page 1810</a> <a href="#">show system services dhcp pool subnet-address on page 1810</a> <a href="#">show system services dhcp pool subnet-address detail on page 1810</a>
<b>Output Fields</b>	<a href="#">Table 163 on page 1809</a> describes the output fields for the <b>show system services dhcp pool</b> command. Output fields are listed in the approximate order in which they appear.

Table 163: show system services dhcp pool Output Fields

Field Name	Field Description	Level of Output
Pool name	Subnet on which the IP address pool is defined.	None specified
Low address	Lowest address in the IP address pool.	None specified
High address	Highest address in the IP address pool.	None specified
Excluded addresses	Addresses excluded from the address pool.	None specified
Subnet	( <i>subnet-address</i> option only) Subnet to which the specified address pool belongs.	None specified
Address range	( <i>subnet-address</i> option only) Range of IP addresses in the address pool.	None specified
Addresses assigned	Number of IP addresses in the pool that are assigned to DHCP clients and the total number of IP addresses in the pool.	detail
Active	Number of assigned IP addresses in the pool that are active.	detail
Excluded	Number of assigned IP addresses in the pool that are excluded.	detail
Default lease time	Lease time assigned to clients that do not request a specific lease time.	detail

Table 163: show system services dhcp pool Output Fields (*continued*)

Field Name	Field Description	Level of Output
Minimum lease time	Minimum time a client can retain an IP address lease on the server.	detail
Maximum lease time	Maximum time a client can retain an IP address lease on the server.	detail
DHCP options	User-defined options created for the DHCP server. If no options have been defined, this field is blank.	detail

## Sample Output

### show system services dhcp pool

```
user@host> show system services dhcp pool

Pool name      Low address    High address    Excluded addresses
3.3.3.0/24     3.3.3.2       3.3.3.254      3.3.3.1
```

### show system services dhcp pool subnet-address

```
user@host> show system services dhcp pool 3.3.3.0/24

Pool information:
  Subnet                3.3.3.0/24
  Address range         3.3.3.2 - 3.3.3.254
  Addresses assigned     2/253
```

### show system services dhcp pool subnet-address detail

```
user@host> show system services dhcp pool 3.3.3.0/24 detail

Pool information:
  Subnet                3.3.3.0/24
  Address range         3.3.3.2 - 3.3.3.254
  Addresses assigned     2/253
  Active: 1, Excluded: 1

DHCP lease times:
  Default lease time     1 hour
  Minimum lease time     2 hours
  Maximum lease time     infinite

DHCP options:
  Name: name-server, Value: { 6.6.6.6, 6.6.6.7 }
  Name: domain-name, Value: mydomain.tld
  Name: router, Value: { 3.3.3.1 }
  Name: server-identifier, Value: 3.3.3.1
  Code: 19, Type: flag, Value: off
  Code: 40, Type: string, Value: domain.tld
  Code: 32, Type: ip-address, Value: 3.3.3.333.3.3.254 3.3.3.1
```

## show system services dhcp statistics

<b>Syntax</b>	show system services dhcp statistics
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	(J Series routers and EX Series switches only) Display Dynamic Host Configuration Protocol (DHCP) server statistics.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	view and system
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">clear system services dhcp statistics on page 1792</a></li> </ul>
<b>List of Sample Output</b>	<a href="#">show system services dhcp statistics on page 1812</a>
<b>Output Fields</b>	<a href="#">Table 164 on page 1811</a> describes the output fields for the <b>show system services dhcp statistics</b> command. Output fields are listed in the approximate order in which they appear.

**Table 164: show system services dhcp statistics Output Fields**

Field Name	Field Description
<b>Default lease time</b>	Lease time assigned to clients that do not request a specific lease time.
<b>Minimum lease time</b>	Minimum time a client can retain an IP address lease on the server.
<b>Maximum lease time</b>	Maximum time a client can retain an IP address lease on the server.
<b>Packets dropped</b>	Total number of packets dropped and number of packets dropped because of: <ul style="list-style-type: none"> <li>• Invalid hardware address</li> <li>• Invalid opcode</li> <li>• Invalid server address</li> <li>• No available address</li> <li>• No interface match</li> <li>• No routing instance match</li> <li>• No valid local addresses</li> <li>• Packet too short</li> <li>• Read error</li> <li>• Send error</li> </ul>

Table 164: show system services dhcp statistics Output Fields (*continued*)

Field Name	Field Description
<b>Messages received</b>	<p>Number of the following message types sent from DHCP clients and received by the DHCP server:</p> <ul style="list-style-type: none"> <li>• BOOTREQUEST</li> <li>• DHCPDECLINE</li> <li>• DHCPDISCOVER</li> <li>• DHCPINFORM</li> <li>• DHCPRELEASE</li> <li>• DHCPREQUEST</li> </ul>

## show system services service-deployment

<b>Syntax</b>	show system services service-deployment
<b>Release Information</b>	Command introduced before Junos OS Release 7.4. Command introduced in Junos OS Release 9.0 for EX Series switches. Command introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	Display information about a Session and Resource Control (SRC) client.
<b>Options</b>	This command has no options.
<b>Required Privilege Level</b>	system view
<b>List of Sample Output</b>	<a href="#">show system services service-deployment on page 1814</a>
<b>Output Fields</b>	<a href="#">Table 165 on page 1814</a> lists the output fields for the <b>show system services service-deployment</b> command. Output fields are listed in the approximate order in which they appear.

**Table 165: show system services service-deployment Output Fields**

Field Name	Field Description
PDT Keepalive settings	Configured PDT keepalive interval, in seconds.
Keepalives sent	Number of keepalives sent.
Notifications sent	Number of notifications sent.
Last update from peer	Time at which the last update from a peer was received.

## Sample Output

### show system services service-deployment

```

user@host> show system services service-deployment
Connected to 192.4.4.4 port 10288 since 2004-05-03 11:04:34 PDT Keepalive settings:
Interval 15 seconds Keepalives sent: 750 Notifications sent: 0 Last update from
peer: 00:00:06 ago

```

## ssh

**List of Syntax**    [Syntax on page 1815](#)  
                           [Syntax \(EX Series Switch and the QFX Series\) on page 1815](#)

**Syntax**    `ssh host`  
                   `<bypass-routing>`  
                   `<inet | inet6>`  
                   `<interface interface-name>`  
                   `<logical-system logical-system-name>`  
                   `<routing-instance routing-instance-name>`  
                   `<source address>`  
                   `<v1 | v2>`

**Syntax (EX Series Switch and the QFX Series)**    `ssh host`  
   `<bypass-routing>`  
   `<inet | inet6>`  
   `<interface interface-name>`  
   `<routing-instance routing-instance-name>`  
   `<source address>`  
   `<v1 | v2>`

**Release Information**    Command introduced before Junos OS Release 7.4.  
                                   Command introduced in Junos OS Release 9.0 for EX Series switches.  
                                   Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Use the SSH program to open a connection between a local router or switch and a remote system and execute commands on the remote system. You can issue the **ssh** command from the Junos OS CLI to log in to a remote system or from a remote system to log in to the local router or switch. When executing this command, you include one or more CLI commands by enclosing them in quotation marks and separating the commands with semicolons:

```
ssh address 'cli-command1 ; cli-command2 '
```

**Options**    **host**—Name or address of the remote system.

**bypass-routing**—(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it.

**inet | inet6**—(Optional) Create an IPv4 or IPv6 connection, respectively.

**interface interface-name**—(Optional) Interface name for the SSH session. (This option does not work when **default-address-selection** is configured at the **[edit system]** hierarchy level, because this configuration uses the loopback interface as the source address for all locally generated IP packets.)

**logical-system logical-system-name**—(Optional) Name of a particular logical system for the SSH attempt.

**routing-instance** *routing-instance-name*—(Optional) Name of the routing instance for the SSH attempt.

**source address**—(Optional) Source address of the SSH connection.

**v1 | v2**—(Optional) Use SSH version 1 or 2, respectively, when connecting to a remote host.

**Additional Information** To configure an SSH (version 1) key for your user account, include the **authentication ssh-rsa** statement at the **[edit system login user *user-name*]** hierarchy level. To configure an SSH (version 2) key for your user account, include the **authentication dsa-rsa** statement at the **[edit system login user *user-name*]** hierarchy level.

You can limit the number of times a user can attempt to enter a password while logging in through SSH. To specify the number of times a user can attempt to enter a password to log in through SSH, include the **retry-options** statement at the **[edit system login]** hierarchy level. For details, see the .

**Required Privilege Level** network

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

ssh

```
user@switch> ssh cree
Host key not found from the list of known hosts.
Are you sure you want to continue connecting (yes/no)? yes

Host ?cree' added to the list of known hosts.
boojun@cree's password:
Last login: Sun Jun 21 10:43:42 1998 from junos-router
% ...
```

## telnet

**List of Syntax**   [Syntax on page 1817](#)  
                               [Syntax \(EX Series Switches\) on page 1817](#)

**Syntax**   `telnet host`  
                   `<8bit>`  
                   `<bypass-routing>`  
                   `<inet | inet6>`  
                   `<interface interface-name>`  
                   `<logical-system logical-system-name>`  
                   `<no-resolve>`  
                   `<port port-number>`  
                   `<routing-instance routing-instance-name>`  
                   `<source source-address>`

**Syntax (EX Series Switches)**   `telnet host`  
   `<8bit>`  
   `<bypass-routing>`  
   `<inet | inet6>`  
   `<interface interface-name>`  
   `<no-resolve>`  
   `<port port-number>`  
   `<routing-instance routing-instance-name>`  
   `<source source-address>`

**Release Information**   Command introduced before Junos OS Release 7.4.  
                                   Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**   Open a telnet session to a remote system. Type Ctrl+] to escape from the telnet session to the telnet command level, and then type **quit** to exit from telnet.

**Options**   *host*—Name or address of the remote system.

**8bit**—(Optional) Use an 8-bit data path.

**bypass-routing**—(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it.

**inet | inet6**—(Optional) Open an IPv4 or IPv6 session, respectively.

**interface *interface-name***—(Optional) Interface name for the telnet session. (This option does not work when **default-address-selection** is configured at the **[edit system]** hierarchy level, because this configuration uses the loopback interface as the source address for all locally generated IP packets.)

**logical-system *logical-system-name***—(Optional) Name of a particular logical system for the telnet attempt.

**no-resolve**—(Optional) Do not attempt to determine the hostname that corresponds to the IP address.

**port** *port-number*—(Optional) Port number or service name on the remote system.

**routing-instance** *routing-instance-name*—(Optional) Name of the routing instance for the telnet attempt.

**source** *source-address*—(Optional) Source address of the telnet connection.

**Additional Information** You can limit the number of times a user can attempt to enter a password while logging in through telnet. To specify the number of times a user can attempt to enter a password to log in through telnet, include the **retry-options** statement at the [edit system login] hierarchy level. For details, see the *Junos OS Administration Library for Routing Devices*.

## 802.1X for EX Series Switches Overview

IEEE 802.1X provides network edge security, protecting Ethernet LANs from unauthorized user access.

### How 802.1X Authentication Works

---

802.1X authentication works by using an *Authenticator Port Access Entity* (the switch) to block all traffic to and from a supplicant (end device) at the port until the supplicant's credentials are presented and matched on the *Authentication server* (a RADIUS server). When authenticated, the switch stops blocking traffic and opens the port to the supplicant.

The end device is authenticated in either *single* mode, *single-secure* mode, or *multiple* mode:

- **single**—Authenticates only the first end device. All other end devices that connect later to the port are allowed full access without any further authentication. They effectively “piggyback” on the end devices' authentication.

- **single-secure**—Allows only one end device to connect to the port. No other end device is allowed to connect until the first logs out.
- **multiple**—Allows multiple end devices to connect to the port. Each end device will be authenticated individually.

Network access can be further defined using VLANs and firewall filters, which both act as filters to separate and match groups of end devices to the areas of the LAN they require. For example, you can configure VLANs to handle different categories of authentication failures depending upon:

- Whether or not the end device is 802.1X-enabled.
- Whether or not MAC RADIUS authentication has been configured on the switch interfaces to which the hosts are connected.
- Whether the RADIUS authentication server becomes unavailable or sends a RADIUS access-reject message. See [“Configuring Server Fail Fallback \(CLI Procedure\)” on page 1921](#).

---

## 802.1X Features Overview

---

**NOTE:** The 802.1X features available on the switches depend upon which switch you are using. See *EX Series Switch Software Features Overview* for a complete list of the Junos OS 802.1X features that are supported on specific switches.

---

802.1X features on Juniper Networks EX Series Ethernet Switches are:

- **Guest VLAN**—Provides limited access to a LAN, typically just to the Internet, for nonresponsive end devices that are not 802.1X-enabled when MAC RADIUS authentication has not been configured on the switch interfaces to which the hosts are connected. Also, a guest VLAN can be used to provide limited access to a LAN for guest users. Typically, the guest VLAN provides access just to the Internet and to other guests' end devices.
- **Server-reject VLAN**—Provides limited access to a LAN, typically just to the Internet, for responsive end devices that are 802.1X-enabled but that have sent the wrong credentials.
- **Server-fail VLAN**—Provides limited access to a LAN, typically just to the Internet, for 802.1X end devices during a RADIUS server timeout.
- **Dynamic VLAN**—Enables an end device, after authentication, to be a member of a VLAN dynamically.
- **Private VLAN**—Enables configuration of 802.1X authentication on interfaces that are members of private VLANs (PVLANS).
- **Dynamic changes to a user session**—Allows the switch administrator to terminate an already authenticated session. This feature is based on support of the RADIUS Disconnect Message defined in RFC 3576.

- Support for VoIP—Supports IP telephones. If the phone is 802.1X-enabled, it is authenticated like any other supplicant. If the phone is not 802.1X-enabled, but has another 802.1X-compatible device connected to its data port, that device is authenticated, and then VoIP traffic can flow to and from the phone (providing that the interface is configured in single mode and not in single-secure mode).

**NOTE:** Configuring a VoIP VLAN on private VLAN (PVLAN) interfaces is not supported.

- RADIUS accounting—Sends accounting information to the RADIUS accounting server. Accounting information is sent to the server whenever a subscriber logs in or logs out and whenever a subscriber activates or deactivates a subscription.
- Vendor Specific Attributes (VSAs)—Supports the **Juniper-Switching-Filter** attribute on the RADIUS authentication server that can be used further define a supplicant's access during the 802.1X authentication process. Centrally configuring VSAs on the authentication server does away with the need to configure these same attributes in the form of firewall filters on every switch in the LAN to which the supplicant may connect to the LAN. This feature is based on RLI 4583, AAA RADIUS BRAS VSA Support.

### Supported Features Related to 802.1X Authentication

802.1X does not replace other security technologies. 802.1X works together with port security features, such as DHCP snooping, dynamic ARP inspection (DAI), and MAC limiting, to guard against spoofing.

Supported features related to authentication include:

- Static MAC bypass—Provides a bypass mechanism to authenticate devices that are not 802.1X-enabled (such as printers). Static MAC bypass connects these devices to 802.1X-enabled ports, bypassing 802.1X authentication.
- MAC RADIUS authentication—Provides a means to enable or disable MAC authentication independently of whether 802.1X authentication is enabled.

**NOTE:** You cannot configure 802.1X authentication on redundant trunk groups (RTGs).

## Understanding Authentication on EX Series Switches

You can control access to your network through a Juniper Networks EX Series Ethernet Switch using several different authentication methods—802.1X, MAC RADIUS, or captive portal. Authentication prevents unauthorized devices and users from gaining access to your LAN. For 802.1X and MAC RADIUS authentication, end devices must be authenticated before they receive an IP address from a DHCP server. For captive portal authentication, the switch allows the end devices to get an IP address and allows forwarding of DHCP, DNS, and ARP packets.

You can allow end devices to access the network without authentication by including the MAC address of the end device in the static MAC bypass list or, for captive portal, by including the MAC address of the end device in the authentication whitelist.

You can configure 802.1X, MAC RADIUS, and captive portal on the same interface and in any combination, except that you cannot configure MAC RADIUS and captive portal on an interface without also configuring 802.1X. If you configure multiple authentication methods on a single interface, the switch falls back to another method if the first method is unsuccessful. For a description of the process flow when multiple authentication methods are configured on an interface, see [“Authentication Process Flow for EX Series Switches” on page 1839](#).

This topic covers:

- [Sample Basic Authentication Topology on page 1824](#)
- [802.1X Authentication on page 1825](#)
- [MAC RADIUS Authentication on page 1827](#)
- [Captive Portal Authentication on page 1827](#)
- [Static MAC Bypass of Authentication on page 1828](#)
- [Fallback of Authentication Methods on page 1828](#)

---

### Sample Basic Authentication Topology

[Figure 6 on page 1825](#) illustrates a basic deployment topology for authentication on an EX Series switch:

Figure 6: Example Authentication Topology

### 802.1X Authentication

802.1X is an IEEE standard for port-based network access control (PNAC). It provides an authentication mechanism to allow devices to access a LAN. The 802.1X authentication feature on an EX Series switch is based upon the IEEE 802.1D standard *Port-Based Network Access Control*.

The communication protocol between the end device and the switch is Extensible Authentication Protocol Over LAN (EAPoL). EAPoL is a version of EAP designed to work with Ethernet networks. The communication protocol between the authentication server and the switch is RADIUS.

During the authentication process, the switch completes multiple message exchanges between the end device and the authentication server. While 802.1X authentication is in process, only 802.1X traffic is allowed. Other traffic, such as DHCP and HTTP, is blocked at the data link layer.

**NOTE:** You can configure both the maximum number of times an EAPoL request packet is retransmitted and the timeout period between attempts. For information, see [“Configuring 802.1X Interface Settings \(CLI Procedure\)” on page 1908](#).

An 802.1X authentication configuration for a LAN contains three basic components:

- *Supplicant* (also called end device)—Supplicant is the IEEE term for an end device that requests to join the network. The end device can be responsive or nonresponsive. A responsive end device is 802.1X-enabled and provides authentication credentials—specifically, a username and password for EAP MD5 or a username and client certificates for EAP-TLS, EAP-TTLS, and EAP-PEAP.

You can configure a server-reject VLAN to provide limited LAN access for responsive end devices that are 802.1X-enabled but that have sent the wrong credentials. A server-reject VLAN can provide a remedial connection, typically just to the Internet, for these devices. See [“Example: Configuring Fallback Options on EX Series Switches for EAP-TTLS Authentication and Odyssey Access Clients” on page 1903](#) for additional information.

**NOTE:** If the end device that is authenticated using the server-reject VLAN is an IP phone, voice traffic is not allowed.

A nonresponsive end device is not 802.1X-enabled, but it can be authenticated through MAC RADIUS authentication.

- *Authenticator port access entity*—The IEEE term for the authenticator. The EX Series switch is the authenticator, and it controls access by blocking all traffic to and from end devices until they are authenticated.
- *Authentication server*—The authentication server contains the backend database that makes authentication decisions. It contains credential information for each end device that is allowed to connect to the network. The authenticator forwards credentials supplied by the end device to the authentication server. If the credentials forwarded by the authenticator match the credentials in the authentication server database, access is granted. If the credentials forwarded do not match, access is denied. The EX Series switches support RADIUS authentication servers.

**NOTE:** You cannot configure 802.1X authentication on redundant trunk groups (RTGs). For more information on RTGs, see [“Understanding Redundant Trunk Links” on page 2276](#).

---

## MAC RADIUS Authentication

---

You can configure MAC RADIUS authentication on interfaces that are connected to end devices that are not 802.1X-enabled but that you want to allow to access the LAN.

The EAP method supported for MAC RADIUS authentication on EX Series switches is EAP-MD5.

If both 802.1X-enabled end devices and end devices that are not 802.1X-enabled connect to an interface, you can configure both 802.1X and MAC RADIUS authentication methods on the interface. In this case, the switch first attempts to authenticate using 802.1X, and if that method fails, it attempts to authenticate the end device using MAC RADIUS authentication.

If you know that only non-802.1X-enabled end devices connect on that interface, you can eliminate the delay that occurs while the switch determines that the end device is non-802.1X-enabled by configuring the **mac-radius restrict** option. When this option is configured, the switch does not attempt to authenticate the end device through 802.1X but instead immediately sends a request to the RADIUS server for authentication of the MAC address of the end device. If the MAC address of an end device is configured as permitted on the RADIUS server, the switch opens LAN access to the end device on the interface to which it is connected.

This option is useful when no other 802.1X authentication methods, such as guest VLAN, are needed on the interface. When you configure **mac-radius restrict** on an interface to eliminate this delay, the switch drops all 802.1X packets.

---

## Captive Portal Authentication

---

Captive portal authentication (hereafter referred to as captive portal) allows you to authenticate users on EX Series switches by redirecting Web browser requests to a login page that requires users to input a username and password before they are allowed access to the network. Captive portal controls network access by requiring users to provide information that is authenticated against a RADIUS server database using EAP-MD5. You can also use captive portal to display an acceptable-use policy to users before they access your network.

Juniper Networks Junos operating system (Junos OS) for EX Series switches provides a template that allows you to easily design and modify the look of the captive portal login page. You enable specific interfaces for captive portal. The first time an end device connected to a captive portal interface attempts to access a web page, the switch presents the captive portal login page. Upon successful authentication, the user is allowed access to the network and to continue to the original page requested.

**NOTE:** If Hypertext Transfer Protocol over Secure Sockets Layer (HTTPS) is enabled, Hypertext Transfer Protocol (HTTP) requests are redirected to an HTTPS connection for the captive portal authentication process. After authentication, the end device is returned to the HTTP connection.

---

If there are end devices that are not HTTP-enabled connected to the captive portal interface, you can allow them to bypass captive portal authentication by adding their MAC addresses to an authentication whitelist.

When the user is authenticated by the RADIUS server, any per-user policies (attributes) associated with that user are also sent to the switch.

Captive portal on EX Series switches has the following limitations:

- The captive portal interface must be configured for **family ethernet-switching** and set to port mode **access**.
- Captive portal does not support dynamic assignment of VLANs downloaded from the RADIUS server.
- If the user is idle for more than about 5 minutes and there is no traffic passed, the user must log back in to the captive portal.

### Static MAC Bypass of Authentication

---

You can allow end devices to access the LAN without authentication on a RADIUS server by including their MAC addresses in the static MAC bypass list (also known as the exclusion list).

You might choose to include a device in the bypass list to:

- Allow non-802.1X-enabled devices access to the LAN.
- Eliminate the delay that occurs while the switch determines that a connected device is a non-802.1X-enabled host.

When you configure static MAC on the switch, the MAC address of the end device is first checked in a local database (a user-configured list of MAC addresses). If a match is found, the end device is successfully authenticated and the interface is opened up for it. No further authentication is done for that end device. If a match is not found and 802.1X authentication is enabled on the switch, the switch attempts to authenticate the end device through the RADIUS server.

For each MAC address, you can also configure the VLAN to which the end device is moved or the interfaces on which the host connects.

**CAUTION:** When you clear the learned MAC addresses from an interface using the `clear dot1x interface` command, all MAC addresses are cleared, including those in the static MAC bypass list.

---

### Fallback of Authentication Methods

---

You can configure multiple authentication methods on a single interface to enable fallback to another method if one method fails.

If an interface is configured in multiple supplicant mode, all end devices connecting through the interface must use either captive portal or a combination of 802.1X and MAC

RADIUS, captive portal cannot be mixed with 802.1X or MAC RADIUS. Therefore, if there is already an end device on the interface that was authenticated through 802.1X or MAC RADIUS authentication, then additional end devices authenticating do not fall back to captive portal. If only 802.1X authentication or MAC RADIUS authentication is configured, some end devices can be authenticated using 802.1X and others can still be authenticated using MAC RADIUS.

Fallback of authentication methods occurs in the following order:

1. 802.1X authentication—If 802.1X is configured on the interface, the switch sends EAPoL requests to the end device and attempts to authenticate the end device through 802.1X authentication. If the end device does not respond to the EAP requests, the switch checks whether MAC RADIUS authentication is configured on the interface.
2. MAC RADIUS authentication—If MAC RADIUS authentication is configured on the interface, the switch sends the MAC RADIUS address of the end device to the authentication server. If MAC RADIUS authentication is not configured, the switch checks whether captive portal is configured on the interface.
3. Captive portal authentication—If captive portal is configured on the interface, the switch attempts to authenticate using this method after attempting any other configured authentication methods. If an end device is authenticated on the interface using captive portal, this becomes the active authentication method on the interface. When captive portal is the active authentication method, the switch falls back to 802.1X authentication if there are no sessions in the authenticated state and if the interface receives an EAP packet.

## Understanding Guest VLANs for 802.1X on EX Series Switches

Guest VLANs can be configured on switches that are using 802.1X authentication to provide limited access—typically only to the Internet—for:

- Corporate guests
- End devices that are not 802.1X-enabled
- Nonresponsive end devices when MAC RADIUS authentication has not been configured on the switch interfaces to which the hosts are connected

A guest VLAN is not used for supplicants sending incorrect credentials. Those supplicants are directed to the server-reject VLAN instead.

For end devices that are not 802.1X-enabled, a guest VLAN can allow limited access to a server from which the non-802.1X-enabled end device can download the supplicant software and attempt authentication again.

A guest VLAN is not used when MAC RADIUS authentication has been configured on the switch interfaces to which the hosts are connected. Some end devices, such as a printer, cannot be enabled for 802.1X. The hosts for such devices should be connected to switch interfaces that are configured for MAC RADIUS authentication. See [“Configuring MAC RADIUS Authentication \(CLI Procedure\)” on page 1923](#).

## Understanding 802.1X and RADIUS Accounting on EX Series Switches

Juniper Networks EX Series Ethernet Switches support IETF RFC 2866, *RADIUS Accounting*. Configuring RADIUS accounting on an EX Series switch permits statistical data about users logging onto or off a LAN to be collected and sent to a RADIUS accounting server. The statistical data gathered can be used for general network monitoring, to analyze and track usage patterns, or to bill a user based upon the amount of time or type of services accessed.

To configure RADIUS accounting, specify one or more RADIUS accounting servers to receive the statistical data from the switch, and select the type of accounting data to be collected.

The RADIUS accounting server you specify can be the same server used for RADIUS authentication, or it can be a separate RADIUS server. You can specify a list of RADIUS accounting servers. In the event that the primary server (the first one configured) is unavailable, each RADIUS server in the list is tried in the order in which they are configured in the Juniper Networks Junos operating system (Junos OS).

The RADIUS accounting process between a switch and a RADIUS server works like this:

1. A RADIUS accounting server listens for User Datagram Protocol (UDP) packets on a specific port. For example, on FreeRADIUS, the default port is 1813.
2. The switch forwards an *accounting-request* packet containing an event record to the accounting server. For example, a supplicant is authenticated through 802.1X authentication and connected to the LAN. The event record associated with this supplicant contains an *Acct-Status-Type* attribute whose value indicates the beginning of user service for this supplicant. When the supplicant's session ends, the accounting request will contain an *Acct-Status-Type* attribute value indicating the end of user service. The RADIUS accounting server records this as a stop-accounting record containing session information and the length of the session.
3. The RADIUS accounting server logs these events as start-accounting or stop-accounting records. The records are in a file. On FreeRADIUS, the file name is the server's address; for example, 122.69.1.250.
4. The accounting server sends an *accounting-response* packet back to the switch confirming it has received the accounting request.
5. If the switch does not receive a response from the server, it continues to send accounting requests until an accounting response is returned from the accounting server.

The statistics collected through this process can be displayed from the RADIUS server; to see those statistics, the user accesses the log file configured to receive them.

## Understanding 802.1X and LLDP and LLDP-MED on EX Series Switches

Juniper Networks EX Series Ethernet Switches use Link Layer Discovery Protocol (LLDP) and Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED) to learn and distribute device information on network links. The information allows the switch to quickly identify a variety of devices, resulting in a LAN that interoperates smoothly and efficiently.

LLDP-capable devices transmit information in type, length, and value (TLV) messages to neighbor devices. Device information can include information such as chassis and port identification and system name and system capabilities. The TLVs leverage this information from parameters that have already been configured in the Juniper Networks Junos operating system (Junos OS).

LLDP-MED goes one step further than LLDP, exchanging IP-telephony messages between the switch and the IP telephone.

**NOTE:** If your IP telephone is configured for voice over IP (VoIP), the switch automatically detects the configuration and assigns the telephone to the voice VLAN. The implementation of a voice VLAN on an IP telephone is vendor-specific. Consult the documentation that came with your IP telephone for instructions on configuring a voice VLAN. For example, on an Avaya phone, you can ensure that the phone gets the correct VoIP VLAN ID even in the absence of LLDP-MED by enabling DHCP option 176.

LLDP and LLDP-MED also provide PoE power management capabilities. LLDP power negotiation allows the switch to manage PoE power by negotiating with LLDP-enabled powered devices to dynamically allocate PoE power as needed. LLDP power priority allows an LLDP-enabled powered device to set the PoE power priority on the switch interface to which it connects.

The switch also uses these protocols to ensure that voice traffic gets tagged and prioritized with the correct values at the source itself. For example, 802.1p CoS and 802.1Q tag information can be sent to the IP telephone.

EX Series switches support the following basic TLVs:

- **Chassis Identifier**—The MAC address associated with the local system.

**NOTE:** The Chassis ID TLV has a subtype for Network Address Family. LLDP frames are validated only if this subtype has a value of 1 (IPv4) or 2 (IPv6). For any other value, the transmitting device is detected by LLDP as a neighbor and displayed in the output of the "show lldp neighbors" command, but is not assigned to the VLAN.

- **Port Identifier**—The port identification for the specified port in the local system.
- **Port Description**—Textual description of the interface or the logical unit. The description for the logical unit is used, if available; otherwise, the Port Description TLV will contain the description configured on the physical interface. For example, LAG member interfaces do not contain a logical unit, so only the description configured on the physical interface can be used.
- **System Name**—The user-configured name of the local system. The system name can be a maximum of 256 characters.
- **System Description**—The system description containing information about the software and current image running on the system. This information is not configurable, but taken from the software.
- **System Capabilities**—The primary function performed by the system. The capabilities that system supports; for example, bridge or router. This information is not configurable, but based on the model of the product.
- **Management Address**—The IPv4 or IPv6 management address of the local system.

EX Series switches support the following 802.3 TLVs:

- **Power via MDI**—A TLV that advertises MDI power support, PSE power pair, and power class information.
- **MAC/PHY Configuration Status**—A TLV that advertises information about the physical interface, such as autonegotiation status and support and MAU type. The information is not configurable, but based on the physical interface structure.

**NOTE:** The MAC/PHY Configuration Status TLV has a subtype for the PMD Auto-Negotiation Advertised Capability field. This field will contain a value of **other** or **unknown** if the LLDP packet was transmitted from a 10-gigabit SFP+ port.

- **Link Aggregation**—A TLV that advertises if the port is aggregated and its aggregated port ID.
- **Maximum Frame Size**—A TLV that advertises the Maximum Transmission Unit (MTU) of the interface sending LLDP frames.
- **Port Vlan**—A TLV that advertises the VLAN name configured on the interface.

EX Series switches support the following LLDP-MED TLVs:

- **LLDP MED Capabilities**—A TLV that advertises the primary function of the port. The capabilities values range 0 through 15:
  - **0**— Capabilities
  - **1**— Network Policy
  - **2**— Location Identification
  - **3**— Extended Power via MDI-PSE
  - **4**— Inventory
  - **5–15**— Reserved
- **LLDP-MED Device Class Values:**
  - **0**— Class not defined.
  - **1**— Class 1 Device.
  - **2**— Class 2 Device.
  - **3**— Class 3 Device.
  - **4**— Network Connectivity Device
  - **5–255**— Reserved.
- **Network Policy**—A TLV that advertises the port VLAN configuration and associated Layer 2 and Layer 3 attributes. Attributes include the policy identifier, application types, such as voice or streaming video, 802.1Q VLAN tagging, and 802.1p priority bits and Diffserv code points.

- **Endpoint Location**— A TLV that advertises the physical location of the endpoint.
- **Extended Power via MDI**— A TLV that advertises the power type, power source, power priority, and power value of the port. It is the responsibility of the PSE device (network connectivity device) to advertise the power priority on a port.

## Understanding 802.1X and VoIP on EX Series Switches

When you use Voice over IP (VoIP), you can connect IP telephones to the switch and configure IEEE 802.1X authentication for 802.1X-compatible IP telephones. The 802.1X authentication provides network edge security, protecting Ethernet LANs from unauthorized user access.

VoIP is a protocol used for the transmission of voice through packet-switched networks. VoIP transmits voice calls using a network connection instead of an analog phone line.

When VoIP is used with 802.1X, the RADIUS server authenticates the phone, and Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED) provides the class-of-service (CoS) parameters to the phone.

You can configure 802.1X authentication to work with VoIP in multiple supplicant or single supplicant mode. In *multiple-supplicant* mode, the 802.1X process allows multiple supplicants to connect to the interface. Each supplicant will be authenticated individually. For an example of a VoIP multiple supplicant topology, see [Figure 7 on page 1835](#).

Figure 7: VoIP Multiple Supplicant Topology

If an 802.1X-compatible IP telephone does not have an 802.1X host but has another 802.1X-compatible device connected to its data port, you can connect the phone to an interface in single-supplicant mode. In *single-supplicant* mode, the 802.1X process authenticates only the first supplicant. All other supplicants who connect later to the interface are allowed full access without any further authentication. They effectively “piggyback” on the first supplicant’s authentication. For an example of a VoIP single supplicant topology, see [Figure 8 on page 1836](#).

Figure 8: VoIP Single Supplicant Topology

If an IP telephone does not support 802.1X, you can configure VoIP to bypass 802.1X and LLDP-MED and have the packets forwarded to a VoIP VLAN,

## Understanding 802.1X and VSAs on EX Series Switches

Juniper Networks EX Series Ethernet Switches support the configuration of RADIUS server attributes specific to Juniper Networks. These attributes are known as vendor-specific attributes (VSAs) and are described in RFC 2138, *Remote Authentication Dial In User Service* (RADIUS). Through VSAs, you can configure port-filtering attributes on the RADIUS server. VSAs are clear text fields sent from the RADIUS server to the switch as a result of the 802.1X authentication success or failure. The 802.1X authentication prevents unauthorized user access by blocking a supplicant at the port until the supplicant is authenticated by the RADIUS server. The VSA attributes are interpreted by the switch during authentication, and the switch takes appropriate actions. Implementing port-filtering attributes with 802.1X authentication on the RADIUS server provides a central location for controlling LAN access for supplicants.

These port-filtering attributes specific to Juniper Networks are encapsulated in a RADIUS server VSA with the vendor ID set to the Juniper Networks ID number, 2636.

As well as configuring port-filtering attributes through VSAs, you can apply a port firewall filter that has already been configured on the switch directly to the RADIUS server. Like port-filtering attributes, the filter is applied during the 802.1X authentication process, and its actions are applied at the switch port. Adding a port firewall filter to a RADIUS server eliminates the need to add the filter to multiple ports and switches. For more information, see [“Example: Applying a Firewall Filter to 802.1X-Authenticated Supplicants Using RADIUS Server Attributes on an EX Series Switch”](#) on page 1887.

VSAs are only supported for 802.1X single-supplicant configurations and multiple-supplicant configurations.

## Understanding Dynamic VLANs for 802.1X on EX Series Switches

Dynamic VLANs, in conjunction with the 802.1X authentication process, provide secure access to the LAN for end devices belonging to different VLANs on a single port.

When this feature is configured on the RADIUS server, an end device or user authenticating on the RADIUS server is assigned to the VLAN configured for it. The end device or user becomes a member of a VLAN dynamically after successful 802.1X authentication. For information on configuring dynamic VLANs on your RADIUS server, see the documentation for your RADIUS server.

Successful authentication requires that the VLAN ID or VLAN name exist on the switch and match the VLAN ID or VLAN name sent by the RADIUS server during authentication.

If neither exists, the end device is unauthenticated. If a guest VLAN is established, the unauthenticated end device is automatically moved to the guest VLAN.

## Understanding Server Fail Fallback and Authentication on EX Series Switches

Server fail fallback allows you to specify how end devices connected to the switch are supported if the RADIUS authentication server becomes unavailable or sends a RADIUS access-reject message.

Juniper Networks EX Series Ethernet Switches use authentication to implement access control in an enterprise network. If 802.1X, MAC RADIUS, or captive portal authentication are configured on the interface, end devices are evaluated at the initial connection by an authentication (RADIUS) server. If the end device is configured on the authentication server, the device is granted access to the LAN and the EX Series switch opens the interface to permit access.

A RADIUS server timeout occurs if no RADIUS authentication servers are reachable when an end device logs in and attempts to access the LAN. Server fail fallback allows you to specify one of four actions to be taken toward end devices awaiting authentication when the server is timed out:

- *Permit* authentication, allowing traffic to flow from the end device through the interface as if the end device were successfully authenticated by the RADIUS server.
- *Deny* authentication, preventing traffic from flowing from the end device through the interface. This is the default.
- *Move* the end device to a specified VLAN. (The VLAN must already exist on the switch.)
- *Sustain* authenticated end devices that already have LAN access and *deny* unauthenticated end devices. If the RADIUS servers time out during reauthentication, previously authenticated end devices are reauthenticated and new users are denied LAN access.

Server fail fallback is triggered most often during reauthentication when the already configured and in-use RADIUS server becomes inaccessible. However, server fail fallback can also be triggered by an end device's first attempt at authentication through the RADIUS server.

Server fail fallback allows you to specify that an end device be moved to a specified VLAN if the switch receives a RADIUS access-reject message. The configured VLAN name overrides any attributes sent by the server.

- *Example: Setting Up Captive Portal Authentication on an EX Series Switch*

## Understanding Authentication Session Timeout

You can specify authentication session timeout values for captive portal authentication sessions and 802.1X and MAC RADIUS authentication sessions.

For captive portal authentication, the length of the session depends on the value configured for the **session-expiry** statement. The remainder of this topic pertains only to 802.1X and MAC RADIUS authentication sessions.

For 802.1X and MAC RADIUS authentication sessions, the timeout of the session depends on the value of **reauthentication interval** for **dot1x authentication**. The authentication session might also end when the MAC table aging time expires because, unless you configure it not to, the session is removed from the authentication session table when the MAC address is removed from the Ethernet switching table.

Information about each 802.1X and MAC RADIUS authentication session—including the associated interfaces and VLANs for each MAC address that is authenticated by 802.1X authentication or MAC RADIUS authentication—is stored in the authentication session table. The authentication session table is tied to the Ethernet switching table (also called the MAC table). Each time the switch detects traffic from a MAC address, it updates the timestamp for that network node in the Ethernet switching table. A timer on the switch periodically checks the timestamp and if its value exceeds the user-configured **mac-table-aging-time** value, the switch removes the MAC address from the Ethernet switching table. When a MAC address ages out of the Ethernet switching table, the entry for that MAC address is also removed from the authentication database, with the result that the session ends.

You can control variables affecting timeout of authentication sessions in the following ways:

- Set the authentication session timeout on all interfaces or on selected interfaces using the **reauthentication** statement.
- Disassociate the authentication session table from the Ethernet switching table using the **no-mac-table-binding** statement. This setting prevents the termination of the authentication session when the associated MAC address ages out of the Ethernet switching table.

### Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch

802.1X is the IEEE standard for Port-Based Network Access Control (PNAC). You use 802.1X to control network access. Only users and devices providing credentials that have been verified against a user database are allowed access to the network. You can use a

RADIUS server as the user database for 802.1X authentication, as well as for MAC RADIUS authentication.

This example describes how to connect a RADIUS server to an EX Series switch, and configure it for 802.1X:

- [Requirements on page 1844](#)
- [Overview and Topology on page 1844](#)
- [Configuration on page 1846](#)
- [Verification on page 1847](#)

### Requirements

---

This example uses the following hardware and software components:

- Junos OS Release 9.0 or later for EX Series switches
- One EX Series switch acting as an authenticator port access entity (PAE). The ports on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.
- One RADIUS authentication server that supports 802.1X. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you connect the server to the switch, be sure you have:

- Performed basic bridging and VLAN configuration on the switch. See the documentation that describes setting up basic bridging and a VLAN for your switch. If you are using a switch that supports the Enhanced Layer 2 Software (ELS) configuration style, see [“Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch” on page 2281](#). For all other switches, see *Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch*.

**NOTE:** For more about ELS, see: [“Getting Started with Enhanced Layer 2 Software” on page 3](#)

---

- Configured users on the RADIUS authentication server.

### Overview and Topology

---

The EX Series switch acts as an authenticator Port Access Entity (PAE). It blocks all traffic and acts as a control gate until the supplicant (client) is authenticated by the server. All other users and devices are denied access.

[Figure 10 on page 1845](#) shows one EX4200 switch that is connected to the devices listed in [Table 166 on page 1845](#).

Figure 10: Topology for Configuration

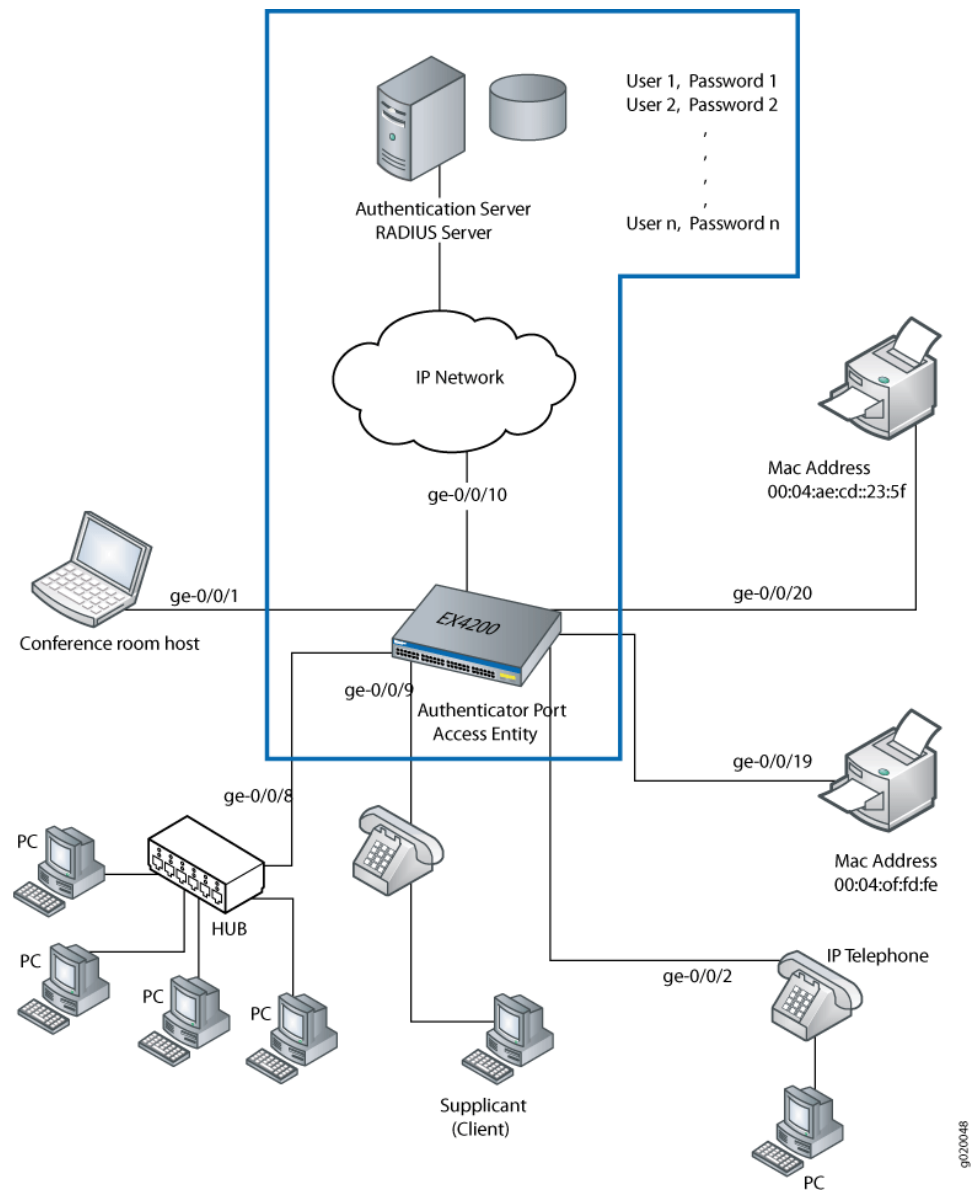

Table 166: Components of the Topology

Property	Settings
Switch hardware	EX4200 access switch, 24 Gigabit Ethernet ports: 8 PoE ports ( <b>ge-0/0/0</b> through <b>ge-0/0/7</b> ) and 16 non-PoE ports ( <b>ge-0/0/8</b> through <b>ge-0/0/23</b> )
VLAN name	<b>default</b>
One RADIUS server	Backend database with an address of <b>10.0.0.100</b> connected to the switch at port <b>ge-0/0/10</b>

In this example, connect the RADIUS server to access port **ge-0/0/10** on the EX4200 switch. The switch acts as the authenticator and forwards credentials from the supplicant to the user database on the RADIUS server. You must configure connectivity between the EX4200 and the RADIUS server by specifying the address of the server and configuring the secret password. This information is configured in an access profile on the switch.

**NOTE:** For more information about authentication, authorization, and accounting (AAA) services, see the [Junos OS System Basics Configuration Guide](#).

---

### Configuration

---

#### CLI Quick Configuration

To quickly connect the RADIUS server to the switch, copy the following commands and paste them into the switch terminal window:

```
[edit]
set access radius-server 10.0.0.100 secret juniper
set access radius-server 10.0.0.200 secret juniper
set access profile profile1 authentication-order radius
set access profile profile1 radius authentication-server [10.0.0.100 10.0.0.200]
```

#### Step-by-Step Procedure

To connect the RADIUS server to the switch:

1. Define the address of the servers, and configure the secret password. The secret password on the switch must match the secret password on the server:

```
[edit]
user@switch# set access radius-server 10.0.0.100 secret juniper
user@switch# set access radius-server 10.0.0.200 secret juniper
```

2. Configure the authentication order, making **radius** the first method of authentication:

```
[edit]
user@switch# set access profile profile1 authentication-order radius
```

3. Configure a list of server IP addresses to be tried in order to authenticate the supplicant:

```
[edit]
user@switch# set access profile profile1 radius authentication-server [10.0.0.100 10.0.0.200]
```

**Results** Display the results of the configuration:

```
user@switch> show configuration access
radius-server {
  10.0.0.100
  port 1812;
  secret "$9$qPT3ApBSrv69rvWLVb.P5"; ## SECRET-DATA
}
profile profile1{
  authentication-order radius;
  radius {
    authentication-server 10.0.0.100 10.0.0.200;
  }
}
```

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verify That the Switch and RADIUS Server are Properly Connected on page 1847](#)

### *Verify That the Switch and RADIUS Server are Properly Connected*

<b>Purpose</b>	Verify that the RADIUS server is connected to the switch on the specified port.
<b>Action</b>	<p>Ping the RADIUS server to verify the connection between the switch and the server:</p> <pre>user@switch&gt; ping 10.0.0.100 PING 10.0.0.100 (10.0.0.100): 56 data bytes 64 bytes from 10.93.15.218: icmp_seq=0 ttl=64 time=9.734 ms 64 bytes from 10.93.15.218: icmp_seq=1 ttl=64 time=0.228 ms</pre>
<b>Meaning</b>	ICMP echo request packets are sent from the switch to the target server at 10.0.0.100 to test whether it is reachable across the IP network. ICMP echo responses are being returned from the server, verifying that the switch and the server are connected.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Example: Setting Up 802.1X for Single Supplicant or Multiple Supplicant Configurations on an EX Series Switch on page 1852</a></li> <li>• <a href="#">Example: Setting Up 802.1X in Conference Rooms to Provide Internet Access to Corporate Visitors on an EX Series Switch on page 1847</a></li> <li>• <a href="#">Example: Setting Up VoIP with 802.1X and LLDP-MED on an EX Series Switch</a></li> <li>• <a href="#">Configuring 802.1X RADIUS Accounting (CLI Procedure) on page 1909</a></li> <li>• <a href="#">Filtering 802.1X Supplicants Using RADIUS Server Attributes on page 1910</a></li> </ul>

## Example: Setting Up 802.1X in Conference Rooms to Provide Internet Access to Corporate Visitors on an EX Series Switch

802.1X on EX Series switches provides LAN access to users who do not have credentials in the RADIUS database. These users, referred to as guests, are authenticated and typically provided with access to the Internet.

This example describes how to create a guest VLAN and configure 802.1X authentication for it.

- [Requirements on page 1848](#)
- [Overview and Topology on page 1848](#)
- [Configuration of a Guest VLAN That Includes 802.1X Authentication on page 1850](#)
- [Verification on page 1850](#)

## Requirements

---

This example uses the following hardware and software components:

- Junos OS Release 9.0 or later for EX Series switches
- One EX Series switch acting as an authenticator interface access entity (PAE). The interfaces on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.
- One RADIUS authentication server that supports 802.1X. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you configure guest VLAN authentication, be sure you have:

- Installed your EX Series switch. See the installation information for your switch.
- Performed the initial switch configuration. See *Connecting and Configuring an EX Series Switch (CLI Procedure)*.
- Performed basic bridging and VLAN configuration on the switch. See the documentation that describes setting up basic bridging and a VLAN for your switch. If you are using a switch that supports the Enhanced Layer 2 Software (ELS) configuration style, see [“Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch” on page 2281](#). For all other switches, see *Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch*.

**NOTE:** For more about ELS, see: [“Getting Started with Enhanced Layer 2 Software” on page 3](#)

---

## Overview and Topology

---

As part of IEEE 802.1X Port-Based Network Access Control (PNAC), you can provide limited network access to supplicants who do not belong to a VLAN authentication group by configuring authentication to a guest VLAN. Typically, guest VLAN access is used to provide Internet access to visitors to a corporate site. However, you can also use the guest VLAN feature to provide supplicants that fail 802.1X authentication to a corporate LAN with access to a VLAN with limited resources.

[Figure 11 on page 1849](#) shows the conference room connected to the switch at interface `ge-0/0/1`.

Figure 11: Topology for Guest VLAN Example

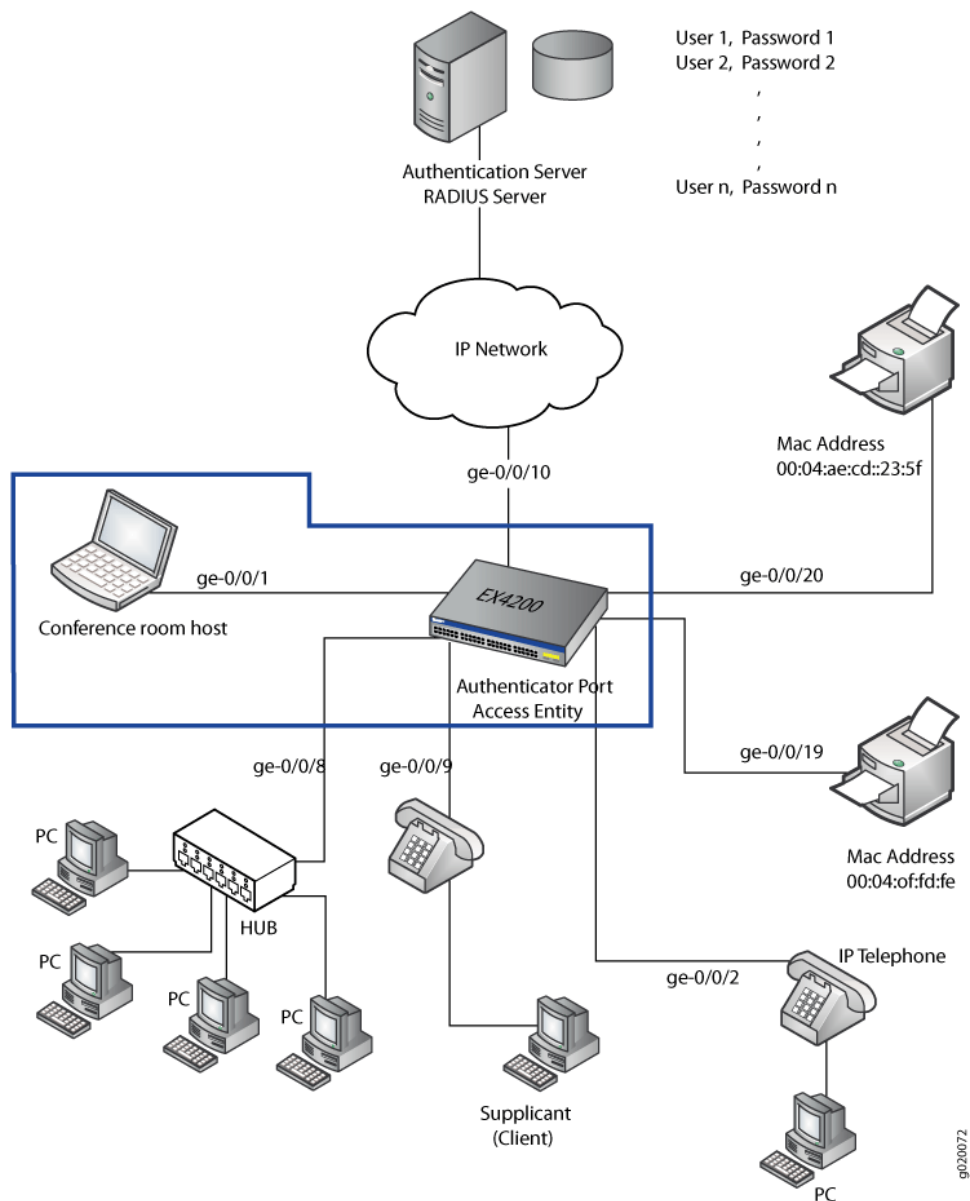

Table 167: Components of the Guest VLAN Topology

Property	Settings
Switch hardware	EX4200 switch, 24 Gigabit Ethernet interfaces: 8 PoE interfaces ( <b>ge-0/0/0</b> through <b>ge-0/0/7</b> ) and 16 non-PoE interfaces ( <b>ge-0/0/8</b> through <b>ge-0/0/23</b> )
VLAN names and tag IDs	<b>sales</b> , tag 100 <b>support</b> , tag 200  <b>guest-vlan</b> , tag 300
One RADIUS server	Backend database connected to the switch through interface <b>ge-0/0/10</b>

In this example, access interface **ge-0/0/1** provides LAN connectivity in the conference room. Configure this access interface to provide LAN connectivity to visitors in the conference room who are not authenticated by the corporate VLAN.

### Configuration of a Guest VLAN That Includes 802.1X Authentication

---

#### CLI Quick Configuration

To quickly configure a guest VLAN, with 802.1X authentication, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans guest-vlan vlan-id 300
set protocols dot1x authenticator interface all guest-vlan guest-vlan
```

#### Step-by-Step Procedure

To configure a guest VLAN that includes 802.1X authentication on an EX Series switch:

1. Configure the VLAN ID for the guest VLAN:

```
[edit]
user@switch# set vlans guest-vlan vlan-id 300
```

2. Configure the guest VLAN under **dot1x** protocols:

```
[edit]
user@switch# set protocols dot1x authenticator interface all guest-vlan guest-vlan
```

#### Results

Check the results of the configuration:

```
user@switch> show configuration
protocols {
  dot1x {
    authenticator {
      interface {
        all {
          guest-vlan {
            guest-vlan;
          }
        }
      }
    }
  }
}
vlangs {
  guest-vlan {
    vlan-id 300;
  }
}
```

### Verification

---

To confirm that the configuration is working properly, perform these tasks:

- [Verifying That the Guest VLAN is Configured on page 1850](#)

#### *Verifying That the Guest VLAN is Configured*

#### Purpose

Verify that the guest VLAN is created and that an interface has failed authentication and been moved to the guest VLAN.

**NOTE:** On switches running Junos OS for EX Series with support for the Enhanced Layer 2 Software (ELS), the output for the `show vlans` command will contain additional information. If your switch runs software that supports ELS, see [show vlans](#). For ELS details, see [“Getting Started with Enhanced Layer 2 Software”](#) on page 3.

**Action** Use the operational mode commands:

```
user@switch> show vlans
```

Name	Tag	Interfaces
default		ge-0/0/3.0*
dynamic	40	None
guest	30	None
guest-vlan	300	ge-0/0/1.0*
vlan_dyn		None

```
user@switch> show dot1x interface ge-0/0/1.0 detail
ge-0/0/1.0
```

```

  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Single
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Enabled
  Mac Radius Restrict: Disabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 2
  Guest VLAN member: guest-vlan
  Number of connected supplicants: 1
    Supplicant: user1, 00:00:00:00:13:23
      Operational state: Authenticated
      Authentication method: Radius
      Authenticated VLAN: vo11
      Dynamic Filter: match source-dot1q-tag 10 action deny
      Session Reauth interval: 60 seconds
      Reauthentication due in 50 seconds
```

**Meaning** The output from the `show vlans` command shows **guest-vlan** as the the name of the VLAN and the VLAN ID as **300**.

The output from the `show dot1x interface ge-0/0/1.0 detail` command displays the **Guest VLAN membership** field, indicating that a supplicant at this interface failed 802.1X authentication and was passed through to the **guest-vlan**.

**Related Documentation**

- [Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch on page 1843](#)
- [Example: Setting Up 802.1X for Single Supplicant or Multiple Supplicant Configurations on an EX Series Switch on page 1852](#)
- [Example: Setting Up VoIP with 802.1X and LLDP-MED on an EX Series Switch](#)
- [Configuring 802.1X Interface Settings \(CLI Procedure\) on page 1908](#)

## Example: Setting Up 802.1X for Single Supplicant or Multiple Supplicant Configurations on an EX Series Switch

802.1x Port-Based Network Access Control (PNAC) authentication on EX Series switches provides three types of authentication to meet the access needs of your enterprise LAN:

- Authenticate the first end device (supplicant) on an authenticator port, and allow all others also connecting to have access.
- Authenticate only one end device on an authenticator port at one time.
- Authenticate multiple end devices on an authenticator port. Multiple supplicant mode is used in VoIP configurations.

This example configures an EX4200 switch to use IEEE 802.1X to authenticate end devices that use three different administrative modes:

- [Requirements on page 1852](#)
- [Overview and Topology on page 1853](#)
- [Configuration of 802.1X to Support Multiple Supplicant Modes on page 1855](#)
- [Verification on page 1856](#)

### Requirements

---

This example uses the following hardware and software components:

- Junos OS Release 9.0 or later for EX Series switches
- One EX Series switch acting as an authenticator port access entity (PAE). The ports on the authenticator PAE form a control gate that blocks all traffic to and from end devices until they are authenticated.
- One RADIUS authentication server that supports 802.1X. The authentication server acts as the backend database and contains credential information for end devices (supplicants) that have permission to connect to the network.

Before you configure the ports for 802.1X authentication, be sure you have:

- Installed your EX Series switch.
- Performed the initial switch configuration. See *Connecting and Configuring an EX Series Switch (CLI Procedure)*.
- Performed basic bridging and VLAN configuration on the switch. See the documentation that describes setting up basic bridging and a VLAN for your switch. If you are using a

switch that supports the Enhanced Layer 2 Software (ELS) configuration style, see [“Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch” on page 2281](#). For all other switches, see *Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch*.

**NOTE:** For more about ELS, see: [“Getting Started with Enhanced Layer 2 Software” on page 3](#)

- Configured users on the authentication server.

### Overview and Topology

As shown in [Figure 12 on page 1854](#), the topology contains an EX4200 access switch connected to the authentication server on port **ge-0/0/10**. Interfaces **ge-0/0/8**, **ge-0/0/9**, and **ge-0/0/11** will be configured for three different administrative modes.

Figure 12: Topology for Configuring Supplicant Modes

Table 168: Components of the Supplicant Mode Configuration Topology

Property	Settings
Switch hardware	EX4200 switch, 24 Gigabit Ethernet ports: 8 PoE ports ( <b>ge-0/0/0</b> through <b>ge-0/0/7</b> ) and 16 non-PoE ports ( <b>ge-0/0/8</b> through <b>ge-0/0/23</b> )
Connections to Avaya phones—with integrated hub, to connect phone and desktop PC to a single port; (requires PoE)	<b>ge-0/0/8</b> , <b>ge-0/0/9</b> , and <b>ge-0/0/11</b>

To configure the administrative modes to support supplicants in different areas of the Enterprise network:

- Configure access port **ge-0/0/8** for single supplicant mode authentication.
- Configure access port **ge-0/0/9** for single secure supplicant mode authentication.
- Configure access port **ge-0/0/11** for multiple supplicant mode authentication.

*Single supplicant mode* authenticates only the first end device that connects to an authenticator port. All other end devices connecting to the authenticator port after the first has connected successfully, whether they are 802.1X-enabled or not, are permitted free access to the port without further authentication. If the first authenticated end device logs out, all other end devices are locked out until an end device authenticates.

*Single-secure supplicant mode* authenticates only one end device to connect to an authenticator port. No other end device can connect to the authenticator port until the first logs out.

*Multiple supplicant mode* authenticates multiple end devices individually on one authenticator port. If you configure a maximum number of devices that can be connected to a port through port security, the lesser of the configured values is used to determine the maximum number of end devices allowed per port.

### Configuration of 802.1X to Support Multiple Supplicant Modes

**CLI Quick Configuration** To quickly configure the ports with different 802.1X authentication modes, copy the following commands and paste them into the switch terminal window:

```
[edit]
set protocols dot1x authenticator interface ge-0/0/8 supplicant single
set protocols dot1x authenticator interface ge-0/0/9 supplicant single-secure
set protocols dot1x authenticator interface ge-0/0/11 supplicant multiple
```

**Step-by-Step Procedure** Configure the administrative mode on the interfaces:

1. Configure the supplicant mode as single on interface **ge-0/0/8**:  

```
[edit protocols]
user@switch# set dot1x authenticator interface ge-0/0/8 supplicant single
```
2. Configure the supplicant mode as single secure on interface **ge-0/0/9**:  

```
[edit protocols]
user@switch# set dot1x authenticator interface ge-0/0/9 supplicant single-secure
```
3. Configure multiple supplicant mode on interface **ge-0/0/11**:  

```
[edit protocols]
user@switch# set dot1x authenticator interface ge-0/0/11 supplicant multiple
```

### Results

Check the results of the configuration:

```
[edit]
user@access-switch> show configuration
protocols {
  dot1x {
    authenticator {
      interface {
        ge-0/0/8.0 {
          supplicant single;
```

```
    )
    ge-0/0/9.0 {
        supplicant single-secure;
    }
    ge-0/0/11.0 {
        supplicant multiple;
    }
}
}
```

---

### Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying the 802.1X Configuration on page 1856](#)

#### *Verifying the 802.1X Configuration*

**Purpose** Verify the 802.1X configuration on interfaces **ge-0/0/8**, **ge-0/0/9**, and **ge-0/0/5**.

**Action** Verify the 802.1X configuration with the operational mode command **show dot1x interface**:

```
user@switch> show dot1x interface ge-0/0/8.0 detail
ge-0/0/8.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Single
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Disabled
  Mac Radius Restrict: Disabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 2
  Guest VLAN member: <not configured>
```

```
user@switch> show dot1x interface ge-0/0/9.0 detail
ge-0/0/9.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Single-Secure
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Disabled
  Mac Radius Restrict: Disabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 2
  Guest VLAN member: <not configured>
  Number of connected supplicants: 0
```

```
user@switch> show dot1x interface ge-0/0/11.0 detail
ge-0/0/11.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Multiple
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Disabled
  Mac Radius Restrict: Disabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 2
  Guest VLAN member: <not configured>
  Number of connected supplicants: 0
```

**Meaning** The **Supplicant mode** output field displays the configured administrative mode for each interface. Interface **ge-0/0/8.0** displays **Single** supplicant mode. Interface **ge-0/0/9.0** displays **Single Secure** supplicant mode. Interface **ge-0/0/11.0** displays **Multiple** supplicant mode.

## Example: Setting Up VoIP with 802.1X and LLDP-MED on an EX Series Switch

---

**NOTE:** This example uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Example: Setting Up VoIP with 802.1X and LLDP-MED on an EX Series Switch*. For ELS details, see “[Getting Started with Enhanced Layer 2 Software](#)” on page 3.

---

You can configure voice over IP (VoIP) on an EX Series switch to support IP telephones. The Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED) protocol forwards VoIP parameters from the switch to the phone. You also configure 802.1X authentication to allow the telephone access to the LAN. Authentication is done through a backend RADIUS server.

This example describes how to configure VoIP on an EX Series switch to support an Avaya IP phone, as well as the LLDP-MED protocol and 802.1X authentication:

- [Requirements on page 1858](#)
- [Overview and Topology on page 1859](#)
- [Configuration on page 1861](#)
- [Verification on page 1863](#)

### Requirements

---

This example uses the following hardware and software components:

- Junos OS Release 13.2X50 or later for EX Series switches
- One EX4300 switch acting as an authenticator port access entity (PAE). The interfaces on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.
- An Avaya IP telephone that supports LLDP-MED and 802.1X

Before you configure VoIP, be sure you have:

- Installed your EX Series switch. See the installation information for your switch.
- Performed the initial switch configuration. See *Connecting and Configuring an EX Series Switch (CLI Procedure)*.
- Performed basic bridging and VLAN configuration on the switch. See [“Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch” on page 2281](#).
- Configured the RADIUS server for 802.1X authentication and set up the access profile. See [“Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch” on page 1843](#).
- (Optional) Configured the interface ge-0/0/2 for Power over Ethernet (PoE). The PoE configuration is not necessary if the VoIP supplicant is using a power adapter. For information about configuring PoE, see [“Configuring PoE on EX Series Switches \(CLI Procedure\)” on page 4440](#).

**NOTE:** If the IP address is not configured on the Avaya IP phone, the phone exchanges LLDP-MED information to get the VLAN ID for the voice VLAN. You must configure the `voip` statement on the interface to designate the interface as a VoIP interface and allow the switch to forward the VLAN name and VLAN ID for the voice VLAN to the IP telephone. The IP telephone then uses the voice VLAN (that is, it references the voice VLAN's ID) to send a DHCP discover request and exchange information with the DHCP server (voice gateway).

## Overview and Topology

Instead of using a regular telephone, you connect an IP telephone directly to the switch. An IP phone has all the hardware and software needed to handle VoIP. You also can power an IP telephone by connecting it to one of the Power over Ethernet (PoE) interfaces on the switch.

In this example, the access interface ge-0/0/2 on the EX4300 switch is connected to an Avaya IP telephone. Avaya phones have a built-in bridge that allows you to connect a desktop PC to the phone, so the desktop and phone in a single office require only one interface on the switch. The EX Series switch is connected to a RADIUS server on the ge-0/0/10 interface (see [Figure 13 on page 1860](#)).

Figure 13: VoIP Topology

In this example, you configure VoIP parameters and specify the forwarding class **assured-forward** for voice traffic to provide the highest quality of service.

[Table 169 on page 1860](#) describes the components used in this VoIP configuration example.

Table 169: Components of the VoIP Configuration Topology

Property	Settings
Switch hardware	EX4300 switch

Table 169: Components of the VoIP Configuration Topology (*continued*)

Property	Settings
VLAN names	<b>data-vlan</b> <b>voice-vlan</b>
Connection to Avaya phone—with integrated hub, to connect phone and desktop PC to a single interface (requires PoE)	<b>ge-0/0/2</b>
One RADIUS server	Provides backend database connected to the switch through interface <b>ge-0/0/10</b> .

As well as configuring a VoIP for interface ge-0/0/2, you configure:

- 802.1X authentication. Authentication is set to **multiple** supplicant mode to support more than one supplicant's access to the LAN through interface ge-0/0/2.
- LLDP-MED protocol information. The switch uses LLDP-MED to forward VoIP parameters to the phone. Using LLDP-MED ensures that voice traffic gets tagged and prioritized with the correct values at the source itself. For example, 802.1p class of service and 802.1Q tag information can be sent to the IP telephone.

**NOTE:** A PoE configuration is not necessary if an IP telephone is using a power adapter.

### Configuration

#### CLI Quick Configuration

To quickly configure VoIP, LLDP-MED, and 802.1X, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans data-vlan vlan-id 77
set vlans voice-vlan vlan-id 99
set vlans data-vlan switch-options interface ge-0/0/2.0
set interfaces ge-0/0/2 unit 0 family ethernet-switching interface-mode access
set interfaces ge-0/0/2 unit 0 family ethernet-switching vlan members data-vlan
set switch-options voip interface ge-0/0/2.0 vlan voice-vlan
set switch-options voip interface ge-0/0/2.0 forwarding-class assured-forwarding
set protocols lldp-med interface ge-0/0/2
set protocols dot1x authenticator interface ge-0/0/2.0 supplicant multiple
```

#### Step-by-Step Procedure

To configure VoIP with LLDP-MED and 802.1X:

1. Configure the VLANs for voice and data:
 

```
[edit vlans]
user@switch# set data-vlan vlan-id 77
user@switch# set voice-vlan vlan-id 99
```
2. Associate the VLAN **data-vlan** with the interface:
 

```
[edit vlans]
user@switch# set data-vlan switch-options interface ge-0/0/2.0
```
3. Configure the interface as an access interface, configure support for Ethernet switching, and add the **data-vlan** VLAN:

- ```
[edit interfaces]
user@switch# set ge-0/0/2 unit 0 family ethernet-switching interface-mode access
user@switch# set ge-0/0/2 unit 0 family ethernet-switching vlan members data-vlan
```
4. Configure VoIP on the interface and specify the **assured-forwarding** forwarding class to provide the most dependable class of service:
 

```
[edit switch-options]
user@switch# set voip interface ge-0/0/2.0 vlan voice-vlan
user@switch# set voip interface ge-0/0/2.0 forwarding-class assured-forwarding
```
  5. Configure LLDP-MED protocol support:
 

```
[edit protocols]
user@switch# set lldp-med interface ge-0/0/2
```
  6. To authenticate an IP phone and a PC connected to the IP phone on the interface, configure 802.1X authentication support and specify **multiple** supplicant mode:

**NOTE:** If you do not want to authenticate any device, skip the 802.1X configuration on this interface.

```
[edit protocols]
user@switch# set dot1x authenticator interface ge-0/0/2.0 supplicant multiple
```

**Results** Display the results of the configuration:

```
[edit]
user@switch# show configuration
interfaces {
  ge-0/0/2 {
    unit 0 {
      family ethernet-switching {
        interface-mode access;
        vlan {
          members data-vlan;
        }
      }
    }
  }
}
protocols {
  lldp-med {
    interface ge-0/0/2;
  }
  dot1x {
    authenticator {
      interface {
        ge-0/0/2.0 {
          supplicant multiple;
        }
      }
    }
  }
}
vllans {
  data-vlan {
```

```
    vlan-id 77;
    switch-options {
        interface ge-0/0/2.0;
    }
}
voice-vlan {
    vlan-id 99;
}
}
switch-options {
    voip {
        interface ge-0/0/2.0 {
            vlan voice-vlan;
            forwarding-class assured-forwarding;
        }
    }
}
```

---

### Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying LLDP-MED Configuration on page 1863](#)
- [Verifying 802.1X Authentication for IP Phone and Desktop PC on page 1864](#)
- [Verifying the VLAN Association with the Interface on page 1865](#)

#### ***Verifying LLDP-MED Configuration***

**Purpose** Verify that LLDP-MED is enabled on the interface.

**Action** user@switch> **show lldp detail**

```
LLDP : Enabled
Advertisement interval : 30 seconds
Transmit delay : 2 seconds
Hold timer : 120 seconds
Notification interval : 0 Second(s)
Config Trap Interval : 0 seconds
Connection Hold timer : 300 seconds
```

```
LLDP MED : Enabled
MED fast start count : 3 Packets
```

```
Port ID TLV subtype : locally-assigned
```

| Interface      | Parent Interface | LLDP    | LLDP-MED | Power Negotiation |
|----------------|------------------|---------|----------|-------------------|
| Neighbor count |                  |         |          |                   |
| all            | -                | Enabled | Enabled  | Enabled           |
| 0              |                  |         |          |                   |
| ge-0/0/2       | -                | -       | Enabled  | -                 |
| 0              |                  |         |          |                   |

| Interface | Parent Interface | Vlan-id | Vlan-name |
|-----------|------------------|---------|-----------|
| ge-0/0/0  | -                | 1       | vlan-1    |
| ge-0/0/1  | -                | 1       | vlan-1    |
| ge-0/0/2  | -                | 77      | vlan-77   |
| ge-0/0/2  | -                | 99      | vlan-99   |
| ge-0/0/3  | -                | 1       | vlan-1    |
| ge-0/0/4  | -                | 1       | vlan-1    |
| ge-0/0/5  | -                | 1       | vlan-1    |
| ge-0/0/6  | -                | 1       | vlan-1    |
| ge-0/0/7  | -                | 1       | vlan-1    |
| ge-0/0/8  | -                | 1       | vlan-1    |
| ge-0/0/9  | -                | 1       | vlan-1    |
| ge-0/0/10 | -                | 1       | vlan-1    |

Basic Management TLVs supported:  
End Of LLDPDU, Chassis ID, Port ID, Time To Live, Port Description, System Name,  
System Description, System Capabilities, Management Address

Organizationally Specific TLVs supported:  
MAC/PHY configuration/status, Power via MDI, Link aggregation, Maximum Frame Size,  
Port VLAN tag, Port VLAN name.

**Meaning** The **show lldp detail** output shows that both LLDP and LLDP-MED are configured on the ge-0/0/2 interface. The end of the output shows the list of supported LLDP basic management TLVs and organizationally specific TLVs that are supported.

#### **Verifying 802.1X Authentication for IP Phone and Desktop PC**

**Purpose** Display the 802.1X configuration to confirm that the VoIP interface has access to the LAN.

**Action** user@switch> **show dot1x** interface ge-0/0/2.0 detail  
ge-0/0/2.0  
Role: Authenticator  
Administrative state: Auto  
Supplicant mode: Multiple  
Number of retries: 3  
Quiet period: 60 seconds  
Transmit period: 30 seconds  
Mac Radius: Disabled  
Mac Radius Restrict: Disabled  
Reauthentication: Enabled  
Configured Reauthentication interval: 3600 seconds  
Supplicant timeout: 30 seconds  
Server timeout: 30 seconds  
Maximum EAPOL requests: 2  
Guest VLAN member: <not configured>  
Number of connected supplicants: 1  
Supplicant: user101, 00:04:0f:fd:ac:fe  
Operational state: Authenticated  
Authentication method: Radius  
Authenticated VLAN: vo11  
Dynamic Filter: match source-dot1q-tag 10 action deny  
Session Reauth interval: 60 seconds  
Reauthentication due in 50 seconds

**Meaning** The field **Role** shows that the ge-0/0/2.0 interface is in the authenticator state. The **Supplicant** field shows that the interface is configured in multiple supplicant mode, permitting multiple supplicants to be authenticated on this interface. The MAC addresses of the supplicants currently connected are displayed at the bottom of the output.

#### *Verifying the VLAN Association with the Interface*

**Purpose** Display the interface's VLAN membership.

**Action** user@switch> **show ethernet-switching interface ge-0/0/2.0**  
Routing Instance Name : default-switch  
Logical Interface flags (DL - disable learning, AD - packet action drop,  
LH - MAC limit hit, DN - interface down )  

| Logical interface | Vlan members  | TAG | MAC limit | STP state  | Logical interface flags | Tagging  |
|-------------------|---------------|-----|-----------|------------|-------------------------|----------|
| ge-0/0/2.0        |               |     | 65535     |            |                         | untagged |
|                   | voice-vlan 99 |     | 65535     | Discarding |                         |          |
|                   | data-vlan 77  |     | 65535     | Discarding |                         |          |

**Meaning** The field **VLAN members** shows that the ge-0/0/2.0 interface supports both the **data-vlan** VLAN and **voice-vlan** VLAN.

**Related Documentation**

- [Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch on page 1843](#)
- [Example: Setting Up 802.1X for Single Supplicant or Multiple Supplicant Configurations on an EX Series Switch on page 1852](#)
- [Defining CoS Forwarding Classes \(CLI Procedure\) on page 2107](#)

- [Defining CoS Forwarding Classes \(J-Web Procedure\) on page 2107](#)

## Example: Configuring VoIP on an EX Series Switch Without Including 802.1X Authentication

---

**NOTE:** This example uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Example: Configuring VoIP on an EX Series Switch Without Including 802.1X Authentication*. For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 3](#).

---

You can configure voice over IP (VoIP) on an EX Series switch to support IP telephones.

To configure VoIP on an EX Series switch to support an IP phone that does not support 802.1X authentication, you must either add the MAC address of the phone to the static MAC bypass list or enable MAC RADIUS authentication on the switch.

This example describes how to configure VoIP on an EX Series switch without 802.1X authentication by using static MAC bypass of authentication:

- [Requirements on page 1866](#)
- [Overview on page 1867](#)
- [Configuration on page 1867](#)
- [Verification on page 1869](#)

### Requirements

---

This example uses the following hardware and software components:

- One EX4300 switch.
- Junos OS Release 13.2 or later for EX Series switches
- An Avaya IP telephone

Before you configure VoIP, be sure you have:

- Installed your EX Series switch. See the installation information for your switch.
- Performed the initial switch configuration. See *Connecting and Configuring an EX Series Switch (CLI Procedure)*.
- Performed basic bridging and VLAN configuration on the switch. See [“Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch” on page 2281](#).
- Configured the RADIUS server for 802.1X authentication and set up the access profile. See [“Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch” on page 1843](#).
- (Optional) Configured the interface ge-0/0/2 for Power over Ethernet (PoE). The PoE configuration is not necessary if the VoIP supplicant is using a power adapter. For

information about configuring PoE, see “Configuring PoE on EX Series Switches (CLI Procedure)” on page 4440.

**NOTE:** If the IP address is not configured on the Avaya IP phone, the phone exchanges LLDP-MED information to get the VLAN ID for the voice VLAN. You must configure the `voip` statement on the interface to designate the interface as a VoIP interface and allow the switch to forward the VLAN name and VLAN ID for the voice VLAN to the IP telephone. The IP telephone then uses the voice VLAN (that is, it references the voice VLAN's ID) to send a DHCP discover request and exchange information with the DHCP server (voice gateway).

## Overview

Instead of using a regular telephone, you connect an IP telephone directly to the switch. An IP phone has all the hardware and software needed to handle VoIP. You also can power an IP telephone by connecting it to one of the Power over Ethernet (PoE) interfaces on the switch.

In this example, the access interface `ge-0/0/2` on the EX4300 switch is connected to a non-802.1X IP phone.

To configure VoIP on an EX Series switch to support an IP phone that does not support 802.1X authentication, add the MAC address of the phone as a static entry in the authenticator database and set the supplicant mode to multiple.

## Configuration

### CLI Quick Configuration

To quickly configure VoIP without using 802.1X authentication, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans data-vlan vlan-id 77
set vlans voice-vlan vlan-id 99
set vlans data-vlan switch-options interface ge-0/0/2.0
set interfaces ge-0/0/2 unit 0 family ethernet-switching interface-mode access
set interfaces ge-0/0/2 unit 0 family ethernet-switching vlan members data-vlan
set switch-options voip interface ge-0/0/2.0 vlan voice-vlan
set switch-options voip interface ge-0/0/2.0 forwarding-class assured-forwarding
set protocols lldp-med interface ge-0/0/2
set protocols dot1x authenticator authentication-profile-name auth-profile
set protocols dot1x authenticator static 00:04:f2:11:aa:a7
set protocols dot1x authenticator interface ge-0/0/2.0 supplicant multiple
```

### Step-by-Step Procedure

To configure VoIP without 802.1X authentication:

1. Configure the VLANs for voice and data:
 

```
[edit vlans]
user@switch# set data-vlan vlan-id 77
user@switch# set voice-vlan vlan-id 99
```
2. Associate the VLAN `data-vlan` with the interface:
 

```
[edit vlans]
```

- ```

user@switch# set data-vlan switch-options interface ge-0/0/2.0

```
3. Configure the interface as an access interface, configure support for Ethernet switching, and add the **data-vlan** VLAN:
 

```

[edit interfaces]
user@switch# set ge-0/0/2 unit 0 family ethernet-switching interface-mode access
user@switch# set ge-0/0/2 unit 0 family ethernet-switching vlan members data-vlan

```
  4. Configure VoIP on the interface and specify the **assured-forwarding** forwarding class to provide the most dependable class of service:
 

```

[edit switch-options]
user@switch# set voip interface ge-0/0/2.0 vlan voice-vlan
user@switch# set voip interface ge-0/0/2.0 forwarding-class assured-forwarding

```
  5. Configure LLDP-MED protocol support:
 

```

[edit protocols]
user@switch# set lldp-med interface ge-0/0/2

```
  6. Set the authentication profile (see ["Configuring 802.1X Interface Settings \(CLI Procedure\)" on page 1908](#) and ["Configuring 802.1X RADIUS Accounting \(CLI Procedure\)" on page 1909](#)):
 

```

[edit protocols]
set dot1x authenticator authentication-profile-name auth-profile

```
  7. Add the MAC address of the phone to the static MAC bypass list:
 

```

[edit protocols]
set dot1x authenticator static 00:04:f2:11:aa:a7

```
  8. Set the supplicant mode to **multiple**:
 

```

[edit protocols]
set dot1x authenticator interface ge-0/0/2.0 supplicant multiple

```

**Results** Display the results of the configuration:

```

[edit]
user@switch# show configuration
interfaces {
  ge-0/0/2 {
    unit 0 {
      family ethernet-switching {
        interface-mode access;
        vlan {
          members data-vlan;
        }
      }
    }
  }
}
protocols {
  lldp-med {
    interface ge-0/0/2;
  }
  dot1x {
    authenticator {
      authentication-profile-name auth-profile;
      static {
        00:04:f2:11:aa:a7;
      }
    }
  }
}

```

```

    }
    interface {
        ge-0/0/2.0 {
            supplicant multiple;
        }
    }
}
vllans {
    data-vlan {
        vlan-id 77;
        switch-options {
            interface ge-0/0/2.0;
        }
    }
    voice-vlan {
        vlan-id 99;
    }
}
switch-options {
    voip {
        interface ge-0/0/2.0 {
            vlan voice-vlan;
            forwarding-class assured-forwarding;
        }
    }
}
}

```

### Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying LLDP-MED Configuration on page 1869](#)
- [Verifying Authentication for the Desktop PC on page 1870](#)
- [Verifying the VLAN Association with the Interface on page 1871](#)

#### **Verifying LLDP-MED Configuration**

**Purpose** Verify that LLDP-MED is enabled on the interface.

**Action** user@switch> **show lldp detail**

```
LLDP : Enabled

End Of LLDPDU, Chassis ID, Port ID, Time To Live, Port Description, System Name,  
System Description, System Capabilities, Management Address

Organizationally Specific TLVs supported:  
MAC/PHY configuration/status, Power via MDI, Link aggregation, Maximum Frame Size,  
Port VLAN tag, Port VLAN name.

**Meaning** The **show lldp detail** output shows that both LLDP and LLDP-MED are configured on the ge-0/0/2 interface. The end of the output shows the list of supported LLDP basic management TLVs and organizationally specific TLVs that are supported.

#### ***Verifying Authentication for the Desktop PC***

**Purpose** Display the 802.1X configuration for the desktop PC connected to the VoIP interface through the IP phone.

**Action** user@switch> `show dot1x interface ge-0/0/2.0 detail`  
 ge-0/0/2.0  
 Role: Authenticator  
 Administrative state: Auto  
 Supplicant mode: Multiple  
 Number of retries: 3  
 Quiet period: 60 seconds  
 Transmit period: 30 seconds  
 Mac Radius: Disabled  
 Mac Radius Restrict: Disabled  
 Reauthentication: Enabled  
 Configured Reauthentication interval: 3600 seconds  
 Supplicant timeout: 30 seconds  
 Server timeout: 30 seconds  
 Maximum EAPOL requests: 2  
 Guest VLAN member: <not configured>  
 Number of connected supplicants: 1  
 Supplicant: user101, 00:04:0f:fd:ac:fe  
 Operational state: Authenticated  
 Authentication method: Radius  
 Authenticated VLAN: vo11  
 Dynamic Filter: match source-dot1q-tag 10 action deny  
 Session Reauth interval: 60 seconds  
 Reauthentication due in 50 seconds

**Meaning** The field **Role** shows that the ge-0/0/2.0 interface is in the authenticator state. The **Supplicant** field shows that the interface is configured in multiple supplicant mode, permitting multiple supplicants to be authenticated on this interface. The MAC addresses of the supplicants currently connected are displayed at the bottom of the output.

#### *Verifying the VLAN Association with the Interface*

**Purpose** Display the interface's VLAN membership.

**Action** user@switch> `show ethernet-switching interface ge-0/0/2.0`  
 Routing Instance Name : default-switch  
 Logical Interface flags (DL - disable learning, AD - packet action drop,  
 LH - MAC limit hit, DN - interface down )  

Logical interface	Vlan members	TAG	MAC limit	STP state	Logical interface flags	Tagging
ge-0/0/2.0			65535			untagged
	voice-vlan 99		65535	Discarding		
	data-vlan 77		65535	Discarding		

**Meaning** The field **VLAN members** shows that the ge-0/0/2.0 interface supports both the **data-vlan** VLAN and **voice-vlan** VLAN.

**Related Documentation**

- [Example: Setting Up VoIP with 802.1X and LLDP-MED on an EX Series Switch on page 1858](#)

## Example: Configuring Static MAC Bypass of Authentication on an EX Series Switch

To allow devices to access your LAN through 802.1X-configured interfaces without authentication, you can configure a static MAC bypass list on the EX Series switch. The static MAC bypass list, also known as the *exclusion list*, specifies MAC addresses that are allowed on the switch without a request to an authentication server.

You can use static MAC bypass of authentication to allow connection for devices that are not 802.1X-enabled, such as printers. If a host's MAC address is compared and matched against the static MAC address list, the nonresponsive host is authenticated and an interface opened for it.

This example describes how to configure static MAC bypass of authentication for two printers:

- [Requirements on page 1872](#)
- [Overview and Topology on page 1872](#)
- [Configuration on page 1874](#)
- [Verification on page 1875](#)

---

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 9.0 or later for EX Series switches
- One EX Series switch acting as an authenticator port access entity (PAE). The ports on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.

Before you configure static MAC authentication, be sure you have:

- Performed basic bridging and VLAN configuration on the switch. See the documentation that describes setting up basic bridging and a VLAN for your switch. If you are using a switch that supports the Enhanced Layer 2 Software (ELS) configuration style, see [“Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch” on page 2281](#). For all other switches, see *Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch*.

For more about ELS, see: [“Getting Started with Enhanced Layer 2 Software” on page 3](#)

- Specified the RADIUS server connections and configured an access profile on the switch. See [“Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch” on page 1843](#).

---

### Overview and Topology

To permit printers access to the LAN, add them to the static MAC bypass list. The MAC addresses on this list are permitted access without authentication from the RADIUS server.

[Figure 14 on page 1873](#) shows the two printers connected to the EX4200.

Figure 14: Topology for Static MAC Authentication Configuration

The interfaces shown in [Table 170 on page 1873](#) will be configured for static MAC authentication.

Table 170: Components of the Static MAC Authentication Configuration Topology

Property	Settings
Switch hardware	EX4200, 24 Gigabit Ethernet ports: 8 PoE ports ( <b>ge-0/0/0</b> through <b>ge-0/0/23</b> )
VLAN name	<b>default</b>
Connections to integrated printer/fax/copier machines (no PoE required)	<b>ge-0/0/19</b> , MAC address 00:04:0f:fd:ac:fe <b>ge-0/0/20</b> , MAC address 00:04:ae:cd:23:5f

The printer with the MAC address 00:04:0f:fd:ac:fe is connected to access interface **ge-0/0/19**. A second printer with the MAC address 00:04:ae:cd:23:5f is connected to access interface **ge-0/0/20**. Both printers will be added to the static list and bypass 802.1X authentication.

### Configuration

---

#### CLI Quick Configuration

To quickly configure static MAC authentication, copy the following commands and paste them into the switch terminal window:

```
[edit]
set protocols dot1x authenticator static [00:04:0f:fd:ac:fe 00:04:ae:cd:23:5f]
set protocols dot1x authenticator interface all supplicant multiple
set protocols dot1x authenticator authentication-profile-name profile1
```

#### Step-by-Step Procedure

Configure static MAC authentication:

1. Configure MAC addresses **00:04:0f:fd:ac:fe** and **00:04:ae:cd:23:5f** as static MAC addresses:

```
[edit protocols]
user@switch# set dot1x authenticator static [00:04:0f:fd:ac:fe 00:04:ae:cd:23:5f]
```

2. Configure the 802.1X authentication method:

```
[edit protocols]
user@switch# set dot1x authenticator interface all supplicant multiple
```

3. Configure the authentication profile name (access profile name) to use for authentication:

```
[edit protocols]
user@switch# set dot1x authenticator authentication-profile-name profile1
```

**NOTE:** Access profile configuration is required only for 802.1X clients, not for static MAC clients.

---

**Results** Display the results of the configuration:

```
user@switch> show
interfaces {
  ge-0/0/19 {
    unit 0 {
      family ethernet-switching {
        vlan members default;
      }
    }
  }
  ge-0/0/20 {
    unit 0 {
      family ethernet-switching {
        vlan members default;
      }
    }
  }
}
```

```

protocols {
  dot1x {
    authenticator {
      authentication-profile-name profile1
      static [00:04:0f:fd:ac:fe 00:04:ae:cd:23:5f];
      interface {
        all {
          supplicant multiple;
        }
      }
    }
  }
}

```

### Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying Static MAC Bypass of Authentication on page 1875](#)

#### *Verifying Static MAC Bypass of Authentication*

**Purpose** Verify that the MAC address for both printers is configured and associated with the correct interfaces.

**Action** Use the operational mode command:

```
user@switch> show dot1x static-mac-address
```

MAC address	VLAN-Assignment	Interface
00:04:0f:fd:ac:fe	default	ge-0/0/19.0
00:04:ae:cd:23:5f	default	ge-0/0/20.0

**Meaning** The output field **MAC address** shows the MAC addresses of the two printers.

The output field **Interface** shows that the MAC address **00:04:0f:fd:ac:fe** can connect to the LAN through interface **ge-0/0/19.0** and that the MAC address **00:04:ae:cd:23:5f** can connect to the LAN through interface **ge-0/0/20.0**.

### Example: Configuring 802.1X Authentication Options When the RADIUS Server is Unavailable to an EX Series Switch

Server fail fallback allows you to specify how 802.1X supplicants connected to the switch are supported if the RADIUS authentication server becomes unavailable or sends a RADIUS access-reject message.

You use 802.1X to control network access. Only users and devices (supplicants) providing credentials that have been verified against a user database are allowed access to the network. You use a RADIUS server as the user database.

This example describes how to configure an interface to move a supplicant to a VLAN in the event of a RADIUS server timeout:

- [Requirements on page 1876](#)
- [Overview and Topology on page 1876](#)
- [Configuration on page 1878](#)
- [Verification on page 1879](#)

---

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 9.3 or later for EX Series switches
- One EX Series switch acting as an authenticator port access entity (PAE). The ports on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.
- One RADIUS authentication server that supports 802.1X. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you connect the server to the switch, be sure you have:

- Performed basic bridging and VLAN configuration on the switch. See the documentation that describes setting up basic bridging and a VLAN for your switch. If you are using a switch that supports the Enhanced Layer 2 Software (ELS) configuration style, see [“Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch” on page 2281](#). For all other switches, see *Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch*.

**NOTE:** For more about ELS, see: [“Getting Started with Enhanced Layer 2 Software” on page 3](#)

---

- Set up a connection between the switch and the RADIUS server. See [“Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch” on page 1843](#).
- Disable firewall filters on the interface. Firewall filters interfere with server fail fallback operation.
- Configured users on the authentication server.

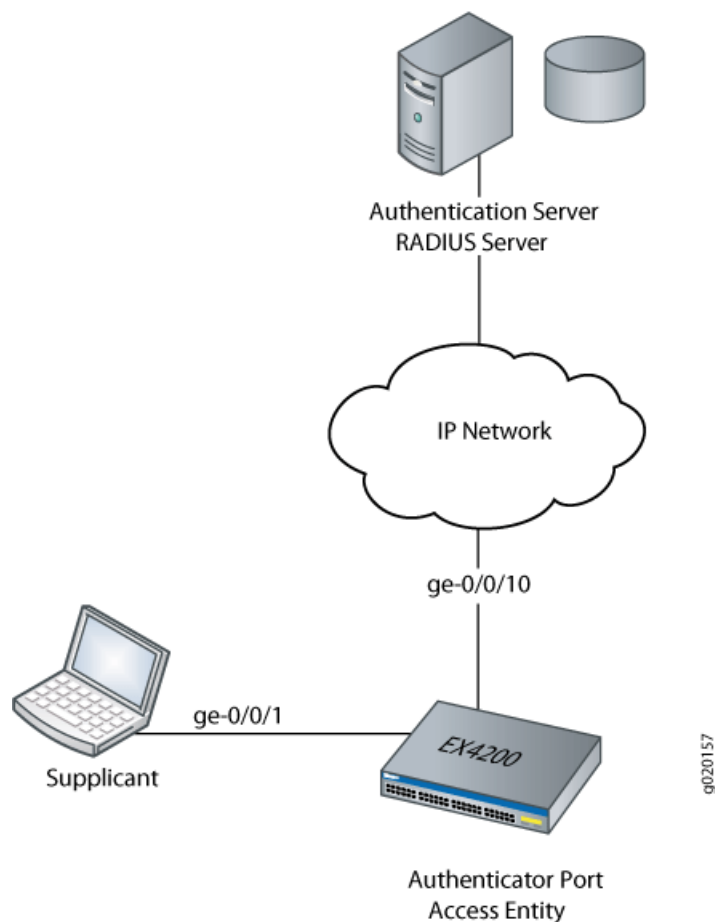

---

### Overview and Topology

A RADIUS server timeout occurs if no authentication RADIUS servers are reachable when a supplicant logs in and attempts to access the LAN. Using server fail fallback, configure alternative options for supplicants attempting LAN access. You can configure the switch

to accept or deny access to supplicants or to maintain the access already granted towards supplicants before the RADIUS server timeout. Additionally, you can configure the switch to move supplicants to a specific VLAN if a RADIUS timeout occurs or if the RADIUS server sends an EAP Access-Reject message. [Figure 15 on page 1877](#) shows the topology used for this example. The RADIUS server is connected to the EX4200 switch on access port **ge-0/0/10**. The switch acts as the authenticator Port Access Entity (PAE) and forwards credentials from the supplicant to the user database on the RADIUS server. The switch blocks all traffic and acts as a control gate until the supplicant is authenticated by the authentication server. A supplicant is connected to the switch through interface **ge-0/0/1**.

**Figure 15: Topology for Configuration**

[Table 171 on page 1877](#) describes the components in this topology.

**Table 171: Components of the Topology**

Property	Settings
Switch hardware	EX4200 access switch, 24 Gigabit Ethernet ports: 8 PoE ports.
VLAN names	<b>default</b> VLAN <b>vlan-sf</b> VLAN

Table 171: Components of the Topology (*continued*)

Property	Settings
Supplicant	Supplicant attempting access on interface <b>ge-0/0/1</b>
One RADIUS server	Backend database with an address of <b>10.0.0.100</b> connected to the switch at port <b>ge-0/0/10</b>

In this example, configure interface **ge-0/0/1** to move a supplicant attempting access to the LAN during a RADIUS timeout to another VLAN. A RADIUS timeout prevents the normal exchange of EAP messages that carry information from the RADIUS server to the switch and permit the authentication of a supplicant. The **default** VLAN is configured on interface **ge-0/0/1**. When a RADIUS timeout occurs, supplicants on the interface will be moved from the **default** VLAN to the VLAN named **vlan-sf**.

**NOTE:** For more information about authentication, authorization, and accounting (AAA) services, see [Junos OS System Basics Configuration Guide](#).

### Configuration

**CLI Quick Configuration** To quickly configure server fail fallback on the switch, copy the following commands and paste them into the switch terminal window:

```
[edit protocols dot1x authenticator]
set interface ge-0/0/1 server-fail vlan-name vlan-sf
```

**Step-by-Step Procedure** To configure an interface to divert supplicants to a specific VLAN when a RADIUS timeout occurs (here, the VLAN is **vlan-sf**):

1. Define the VLAN to which supplicants are diverted:

```
[edit protocols dot1x authenticator]
user@switch# set interface ge-0/0/1 server-fail vlan-name vlan-sf
```

**Results** Display the results of the configuration:

```
user@switch> show configuration
interfaces {
  ge-0/0/1 {
    unit 0 {
      family ethernet-switching {
        vlan {
          members default;
        }
      }
    }
  }
}
protocols {
  dot1x {
    authenticator {
      authentication-profile-name profile52;
      interface {
        ge-0/0/1.0 {
```

```

server-fail vlan-name vlan-sf;
    }
  }
}

```

### Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying That the Supplicants Are Moved to an Alternative VLAN During a RADIUS Timeout on page 1879](#)

#### *Verifying That the Supplicants Are Moved to an Alternative VLAN During a RADIUS Timeout*

**Purpose** Verify that the interface moves supplicants to an alternative VLAN during a RADIUS timeout.

**NOTE:** On switches running Junos OS for EX Series with support for the Enhanced Layer 2 Software (ELS), the output for the `show vlans` command will contain additional information. If your switch runs software that supports ELS, see [show vlans](#). For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 3](#)

**Action** Display the VLANs configured on the switch; the interface **ge-0/0/1.0** is a member of the **default** VLAN:

```
user@switch> show vlans
Name      Tag      Interfaces
default
          ge-0/0/0.0, ge-0/0/1.0*, ge-0/0/5.0*, ge-0/0/10.0,
          ge-0/0/12.0*, ge-0/0/14.0*, ge-0/0/15.0, ge-0/0/20.0
v2        77
          None
vlan-sf   50
          None
mgmt      me0.0*
```

Display 802.1X protocol information on the switch to view supplicants that are authenticated on interface **ge-0/0/1.0**:

```
user@switch> show dot1x interface brief
802.1X Information:
Interface  Role      State      MAC address      User
ge-0/0/1.0  Authenticator  Authenticated  00:00:00:00:00:01  abc
ge-0/0/10.0 Authenticator  Initialize
ge-0/0/14.0 Authenticator  Connecting
ge-0/0/15.0 Authenticator  Initialize
ge-0/0/20.0 Authenticator  Initialize
```

A RADIUS server timeout occurs. Display the Ethernet switching table to show that the supplicant with the MAC address **00:00:00:00:00:01** previously accessing the LAN through the **default** VLAN is now being learned on the VLAN named **vlan-sf**:

```
user@switch> show ethernet-switching table
Ethernet-switching table: 3 entries, 1 learned
VLAN      MAC address      Type      Age Interfaces
v1        *                Flood     - All-members
vlan-sf   00:00:00:00:00:01 Learn     1:07 ge-0/0/1.0
default   *                Flood     - All-members
```

Display 802.1X protocol information to show that interface **ge-0/0/1.0** is connecting and will open LAN access to supplicants:

```
user@switch> show dot1x interface brief
802.1X Information:
Interface  Role      State      MAC address      User
ge-0/0/1.0  Authenticator  Connecting
ge-0/0/10.0 Authenticator  Initialize
ge-0/0/14.0 Authenticator  Connecting
ge-0/0/15.0 Authenticator  Initialize
ge-0/0/20.0 Authenticator  Initialize
```

**Meaning** The command **show vlans** displays interface **ge-0/0/1.0** as a member of the **default** VLAN. The command **show dot1x interface brief** shows that a supplicant (**abc**) is authenticated on interface **ge-0/0/1.0** and has the MAC address **00:00:00:00:00:01**. A RADIUS server timeout occurs, and the authentication server cannot be reached by the

switch. The command **show-ethernet-switching table** shows that MAC address **00:00:00:00:00:01** is learned on VLAN **vlan-sf**. The supplicant has been moved from the **default** VLAN to the **vlan-sf** VLAN. The supplicant is then connected to the LAN through the VLAN named **vlan-sf**.

## Example: Configuring MAC RADIUS Authentication on an EX Series Switch

To permit hosts that are not 802.1X-enabled to access the LAN, you can configure MAC RADIUS authentication on the switch interfaces to which the non-802.1X-enabled hosts are connected. When MAC RADIUS authentication is configured, the switch will attempt to authenticate the host with the RADIUS server using the host's MAC address.

This example describes how to configure MAC RADIUS authentication for two non-802.1X-enabled hosts:

- [Requirements on page 1881](#)
- [Overview and Topology on page 1882](#)
- [Configuration on page 1884](#)
- [Verification on page 1885](#)

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 9.3 or later for EX Series switches.
- An EX Series switch acting as an authenticator port access entity (PAE). The ports on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.
- A RADIUS authentication server. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you configure MAC RADIUS authentication, be sure you have:

- Configured basic access between the EX Series switch and the RADIUS server. See [“Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch” on page 1843](#).
- Performed basic bridging and VLAN configuration on the switch. See the documentation that describes setting up basic bridging and a VLAN for your switch. If you are using a

switch that supports the Enhanced Layer 2 Software (ELS) configuration style, see [“Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch” on page 2281](#). For all other switches, see *Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch*.

**NOTE:** For more about ELS, see: [“Getting Started with Enhanced Layer 2 Software” on page 3](#)

- Performed basic 802.1X configuration. See [“Configuring 802.1X Interface Settings \(CLI Procedure\)” on page 1908](#).

---

### Overview and Topology

---

IEEE 802.1X Port-Based Network Access Control (PNAC) authenticates and permits devices access to a LAN if the devices can communicate with the switch using the 802.1X protocol (are 802.1X-enabled). To permit non-802.1X-enabled end devices to access the LAN, you can configure MAC RADIUS authentication on the interfaces to which the end devices are connected. When the MAC address of the end device appears on the interface, the switch consults the RADIUS server to check whether it is a permitted MAC address. If the MAC address of the end device is configured as permitted on the RADIUS server, the switch opens LAN access to the end device.

You can configure both MAC RADIUS authentication and 802.1X authentication methods on an interface configured for multiple supplicants. Additionally, if an interface is only connected to a non-802.1X-enabled host, you can enable MAC RADIUS and not enable 802.1X authentication using the **mac-radius restrict** option, and thus avoid the delay that occurs while the switch determines that the device does not respond to EAP messages.

[Figure 16 on page 1883](#) shows the two printers connected to the switch.

Figure 16: Topology for MAC RADIUS Authentication Configuration

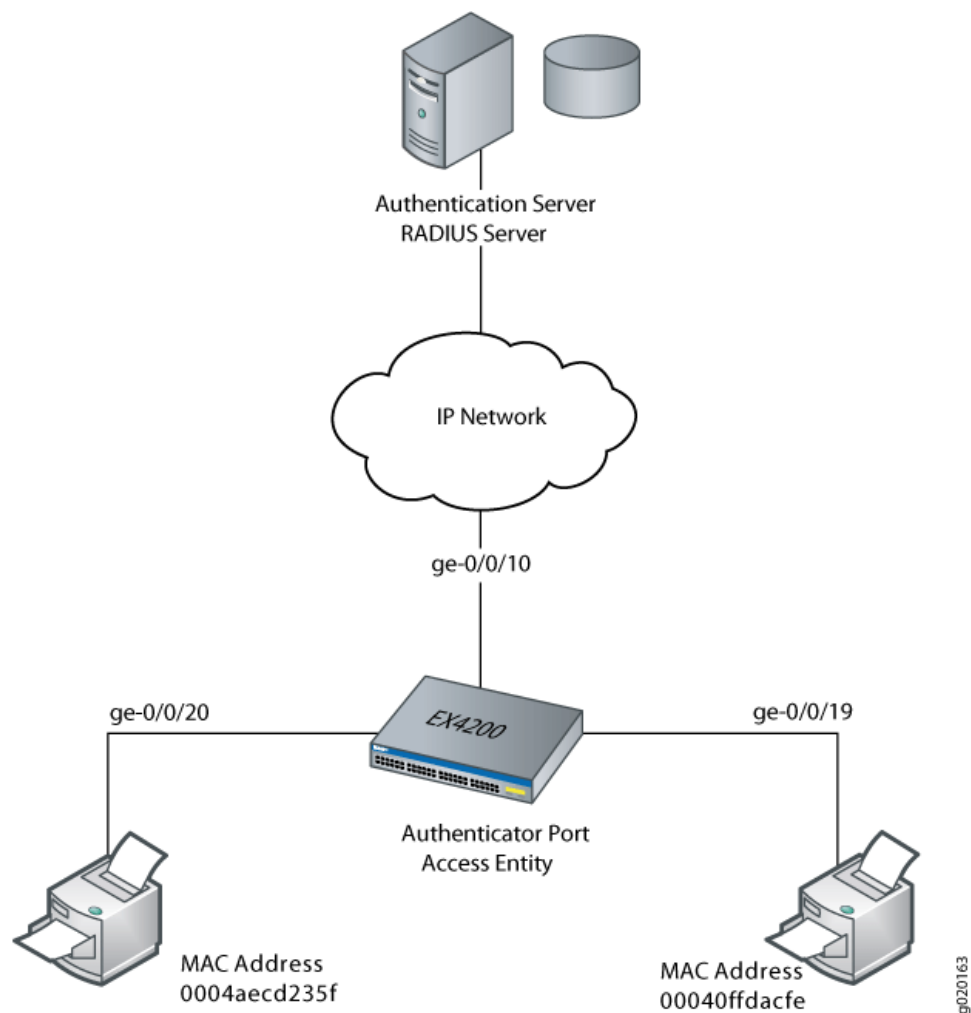

Table 172 on page 1883 shows the components in the example for MAC RADIUS authentication.

Table 172: Components of the MAC RADIUS Authentication Configuration Topology

Property	Settings
Switch hardware	EX4200 ports (ge-0/0/0 through ge-0/0/23)
VLAN name	sales
Connections to printers (no PoE required)	ge-0/0/19, MAC address 00040ffdacfe ge-0/0/20, MAC address 0004aec235f
RADIUS server	Connected to the switch on interface <b>ge-0/0/10</b>

The printer with the MAC address 00040ffdacfe is connected to access interface ge-0/0/19. A second printer with the MAC address 0004aec235f is connected to access interface ge-0/0/20. In this example, both interfaces are configured for MAC RADIUS authentication on the switch, and the MAC addresses (without colons) of both printers are configured on the RADIUS server. Interface ge-0/0/20 is configured to eliminate the normal delay while the switch attempts 802.1X authentication; MAC RADIUS authentication is enabled and 802.1X authentication is disabled using the **mac radius restrict** option.

### Configuration

---

#### CLI Quick Configuration

To quickly configure MAC RADIUS authentication, copy the following commands and paste them into the switch terminal window:

```
[edit]
set protocols dot1x authenticator interface ge-0/0/19 mac-radius
set protocols dot1x authenticator interface ge-0/0/20 mac-radius restrict
```

**NOTE:** You must also configure the two MAC addresses as usernames and passwords on the RADIUS server, as is done in step 2 of the Step-by-Step Procedure.

---

#### Step-by-Step Procedure

Configure MAC RADIUS authentication on the switch and on the RADIUS server:

1. On the switch, configure the interfaces to which the printers are attached for MAC RADIUS authentication, and configure the **restrict** option on interface **ge-0/0/20**, so that only MAC RADIUS authentication is used:

```
[edit]
user@switch# set protocols dot1x authenticator interface ge-0/0/19 mac-radius
user@switch# set protocols dot1x authenticator interface ge-0/0/20 mac-radius restrict
```

2. On the RADIUS server, configure the MAC addresses **00040ffdacfe** and **0004aec235f** as usernames and passwords:

```
[root@freeradius]#
edit /etc/raddb
vi users
00040ffdacfe Auth-type:=EAP, User-Password = "00040ffdacfe"
0004aec235f Auth-type:=EAP, User-Password = "0004aec235f"
```

#### Results

Display the results of the configuration on the switch:

```
user@switch> show configuration
protocols {
  dot1x {
    authenticator {
      authentication-profile-name profile52;
    }
    interface {
      ge-0/0/19.0 {
        mac-radius;
      }
      ge-0/0/20.0 {
        mac-radius {
```

```
restrict;  
}  
}  
}  
}  
}
```

### Verification

---

Verify that the supplicants are authenticated:

- [Verifying That the Supplicants Are Authenticated on page 1885](#)

#### ***Verifying That the Supplicants Are Authenticated***

**Purpose** After supplicants are configured for MAC RADIUS authentication on the switch and on the RADIUS server, verify that they are authenticated and display the method of authentication:

**Action** Display information about 802.1X-configured interfaces **ge-0/0/19** and **ge-0/0/20**:

```
user@switch> show dot1x interface ge-0/0/19.0 detail
ge-0/0/19.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Single
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Enabled
  Mac Radius Restrict: Disabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 2
  Guest VLAN member: <not configured>
  Number of connected supplicants: 1
    Supplicant: user101, 00:04:0f:fd:ac:fe
      Operational state: Authenticated
      Authentication method: Radius
      Authenticated VLAN: vo11
      Dynamic Filter: match source-dot1q-tag 10 action deny
      Session Reauth interval: 60 seconds
      Reauthentication due in 50 seconds

user@switch> show dot1x interface ge-0/0/20.0 detail
ge-0/0/20.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Single
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Enabled
  Mac Radius Restrict: Enabled
  Reauthentication: Enabled
  Configured Reauthentication interval: 3600 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 2
  Guest VLAN member: <not configured>
  Number of connected supplicants: 1
    Supplicant: user102, 00:04:ae:cd:23:5f
      Operational state: Authenticated
      Authentication method: Radius
      Authenticated VLAN: vo11
      Dynamic Filter: match source-dot1q-tag 10 action deny
      Session Reauth interval: 60 seconds
      Reauthentication due in 50 seconds
```

**Meaning** The sample output from the **show dot1x interface detail** command displays the MAC address of the connected end device in the **Supplicant** field. On interface **ge-0/0/19**, the MAC address is **00:04:0f:fd:ac:fe**, which is the MAC address of the first printer configured for MAC RADIUS authentication. The **Authentication method** field displays the authentication method as **MAC Radius**. On interface **ge-0/0/20**, the MAC address is **00:04:ae:cd:23:5f**, which is the MAC address of the second printer configured for MAC

RADIUS authentication. The **Authentication method** field displays the authentication method as **MAC Radius**.

**Related Documentation**

- [Configuring MAC RADIUS Authentication \(CLI Procedure\) on page 1923](#)
- [Configuring 802.1X Interface Settings \(CLI Procedure\) on page 1908](#)

### Example: Applying a Firewall Filter to 802.1X-Authenticated Supplicants Using RADIUS Server Attributes on an EX Series Switch

You can use RADIUS server attributes and a port firewall filter to centrally apply terms to multiple supplicants (end devices) connected to an EX Series switch in your enterprise. Terms are applied after a device is successfully authenticated through 802.1X. If the firewall filter configuration is modified after end devices are authenticated using the 802.1X authentication, then the established 802.1X authentication session must be terminated and re-established for the firewall filter changes to take effect.

EX Series switches support port firewall filters. Port firewall filters are configured on a single EX Series switch, but in order for them to operate throughout an enterprise, they have to be configured on multiple switches. To reduce the need to configure the same port firewall filter on multiple switches, you can instead apply the filter centrally on the RADIUS server using RADIUS server attributes.

The following example uses FreeRADIUS to apply a port firewall filter on a RADIUS server. For specifics on configuring your server, consult the documentation that was included with your RADIUS server.

This example describes how to configure a port firewall filter with terms, create counters to count packets for the supplicants, apply the filter to user profiles on the RADIUS server, and display the counters to verify the configuration:

- [Requirements on page 1887](#)
- [Overview and Topology on page 1888](#)
- [Configuring the Port Firewall Filter and Counters on page 1890](#)
- [Applying the Port Firewall Filter to the Supplicant User Profiles on the RADIUS Server on page 1892](#)
- [Verification on page 1892](#)

#### Requirements

This example uses the following hardware and software components:

- Junos OS Release 9.3 or later for EX Series switches
- One EX Series switch acting as an authenticator port access entity (PAE). The ports on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.

- One RADIUS authentication server. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you connect the server to the switch, be sure you have:

- Set up a connection between the switch and the RADIUS server. See [“Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch”](#) on page 1843.
- Configured 802.1X authentication on the switch, with the authentication mode for interface `ge-0/0/2` set to **multiple**. See [“Configuring 802.1X Interface Settings \(CLI Procedure\)”](#) on page 1908 and [“Example: Setting Up 802.1X for Single Supplicant or Multiple Supplicant Configurations on an EX Series Switch”](#) on page 1852.
- Configured users on the RADIUS authentication server (in this example, the user profiles for Supplicant 1 and Supplicant 2 in the topology are modified on the RADIUS server).

---

### Overview and Topology

When the 802.1X configuration on an interface is set to **multiple** supplicant mode, you can apply a single port firewall filter configured through the Junos OS CLI on the EX Series switch to any number of end devices (supplicants) on one interface by adding the filter centrally to the RADIUS server. Only a single filter can be applied to an interface; however, the filter can contain multiple terms for separate end devices.

For more information about firewall filters, see [“Firewall Filters for EX Series Switches Overview”](#) on page 4696.

RADIUS server attributes are applied to end devices after the devices are successfully authenticated using 802.1X. To authenticate an end device, the switch forwards the end device's credentials to the RADIUS server. The RADIUS server matches the credentials against preconfigured information about the supplicant located in the supplicant's user profile on the RADIUS server. If a match is found, the RADIUS server instructs the switch to open an interface to the end device. Traffic then flows from and to the end device on the LAN. Further instructions configured in the port firewall filter and added to the end device's user profile using a RADIUS server attribute further define the access that the end device is granted. Filtering terms configured in the port firewall filter are applied to the end device after 802.1X authentication is complete.

**NOTE:** If you modify the port firewall filter after an end device is successfully authenticated using 802.1X, you must terminate and re-establish the 802.1X authentication session for the firewall filter configuration changes to be effective.

---

[Figure 17 on page 1889](#) shows the topology used for this example. The RADIUS server is connected to an EX4200 switch on access port `ge-0/0/10`. Two end devices (supplicants) are accessing the LAN on interface `ge-0/0/2`. Supplicant 1 has the MAC address `00:50:8b:6f:60:3a`. Supplicant 2 has the MAC address `00:50:8b:6f:60:3b`.

Figure 17: Topology for Firewall Filter and RADIUS Server Attributes Configuration

Table 173 on page 1889 describes the components in this topology.

Table 173: Components of the Firewall Filter and RADIUS Server Attributes Topology

Property	Settings
Switch hardware	EX4200 access switch, 24 Gigabit Ethernet ports, 8 PoE ports.
One RADIUS server	Backend database with the address 10.0.0.100 connected to the switch at port ge-0/0/10.
802.1X supplicants connected to the switch on interface ge-0/0/2	<ul style="list-style-type: none"> <li>Supplicant 1 has MAC address 00:50:8b:6f:60:3a.</li> <li>Supplicant 2 has MAC address 00:50:8b:6f:60:3b.</li> </ul>

Table 173: Components of the Firewall Filter and RADIUS Server Attributes Topology (*continued*)

Property	Settings
Port firewall filter to be applied on the RADIUS server	<b>filter1</b>
Counters	<b>counter1</b> counts packets from Supplicant 1, and <b>counter2</b> counts packets from Supplicant 2.
Policer	<b>policer p1</b>
User profiles on the RADIUS server	<ul style="list-style-type: none"> <li>Supplicant 1 has the user profile <b>supplicant1</b>.</li> <li>Supplicant 2 has the user profile <b>supplicant2</b>.</li> </ul>

In this example, you configure a port firewall filter named **filter1**. The filter contains terms that will be applied to the end devices based on the MAC addresses of the end devices. When you configure the filter, you also configure the counters **counter1** and **counter2**. Packets from each end device are counted, which helps you verify that the configuration is working. Policer **policer p1** limits the traffic rate based on the values for **exceeding** and **discard** parameters. Then, you check to see that the RADIUS server attribute is available on the RADIUS server and apply the filter to the user profiles of each end device on the RADIUS server. Finally, you verify the configuration by displaying output for the two counters.

**NOTE:** For more information about authentication, authorization, and accounting (AAA) services, see the [Junos OS System Basics Configuration Guide](#).

### Configuring the Port Firewall Filter and Counters

#### CLI Quick Configuration

To quickly configure a port firewall filter with terms for Supplicant 1 and Supplicant 2 and create parallel counters for each supplicant, copy the following commands and paste them into the switch terminal window:

```
[edit]
set firewall family ethernet-switching filter filter1 term supplicant1 from source-mac-address 00:50:8b:6f:60:3a
set firewall family ethernet-switching filter filter1 term supplicant2 from source-mac-address 00:50:8b:6f:60:3b
set firewall policer p1 if-exceeding bandwidth-limit 1m
set firewall policer p1 if-exceeding burst-size-limit 1k
set firewall policer p1 then discard
set firewall family ethernet-switching filter filter1 term supplicant1 then count counter1
set firewall family ethernet-switching filter filter1 term supplicant1 then policer p1
set firewall family ethernet-switching filter filter1 term supplicant2 then count counter2
```

#### Step-by-Step Procedure

To configure a port firewall filter and counters on the switch:

1. Configure a port firewall filter (here, **filter1**) with terms for each end device based upon the MAC address of each end device:

```
[edit firewall family ethernet-switching]
user@switch# set filter filter1 term supplicant1 from source-mac-address 00:50:8b:6f:60:3a
user@switch# set filter filter1 term supplicant2 from source-mac-address 00:50:8b:6f:60:3b
```

2. Set policer definition:

```
user@switch# show policer p1 |display set
set firewall policer p1 if-exceeding bandwidth-limit 1m
set firewall policer p1 if-exceeding burst-size-limit 1k
set firewall policer p1 then discard
```

3. Create two counters that will count packets for each end device and a policer which limits the traffic rate:

```
[edit firewall family ethernet-switching]
user@switch# set filter filter1 term supplicant1 then count counter1
user@switch# set filter filter1 term supplicant1 then policer p1
user@switch# set filter filter1 term supplicant2 then count counter2
```

**Results** Display the results of the configuration:

```
user@switch> show configuration
firewall {
  family ethernet-switching {
    filter filter1 {
      term supplicant1 {
        from {
          source-mac-address {
            00:50:8b:6f:60:3a;
          }
        }
        then count counter1;
        then policer p1;
      }
      term supplicant2 {
        from {
          source-mac-address {
            00:50:8b:6f:60:3b;
          }
        }
        then count counter2;
      }
    }
  }
}
policer p1 {
  if-exceeding {
    bandwidth-limit 1m;
    burst-size-limit 1k;
  }
  then discard;
}
```

## Applying the Port Firewall Filter to the Supplicant User Profiles on the RADIUS Server

---

**Step-by-Step Procedure** To verify that the RADIUS server attribute **Filter-ID** is on the RADIUS server and to apply the filter to the user profiles:

1. Display the dictionary **dictionary.rfc2865** on the RADIUS server, and verify that the attribute **Filter-ID** is in the dictionary:

```
[root@freeradius]# cd usr/share/freeradius/dictionary.rfc2865
```

2. Close the dictionary file.

3. Display the local user profiles of the end devices to which you want to apply the filter (here, the user profiles are called **supplicant1** and **supplicant2**):

```
[root@freeradius]# cat /usr/local/etc/raddb/users
```

The output shows:

```
supplicant1 Auth-Type := EAP, User-Password == "supplicant1"
    Tunnel-Type = VLAN,
    Tunnel-Medium-Type = IEEE-802,
    Tunnel-Private-Group-Id = "1005"
```

```
supplicant2 Auth-Type := EAP, User-Password == "supplicant2"
    Tunnel-Type = VLAN,
    Tunnel-Medium-Type = IEEE-802,
    Tunnel-Private-Group-Id = "1005"
```

4. Apply the filter to both user profiles by adding the line **Filter-Id = "filter1"** to each profile, and then close the file:

```
[root@freeradius]# cat /usr/local/etc/raddb/users
```

After you paste the line into the files, the files look like this:

```
supplicant1 Auth-Type := EAP, User-Password == "supplicant1"
    Tunnel-Type = VLAN,
    Tunnel-Medium-Type = IEEE-802,
    Tunnel-Private-Group-Id = "1005",
    Filter-Id = "filter1"
```

```
supplicant2 Auth-Type := EAP, User-Password == "supplicant2"
    Tunnel-Type = VLAN,
    Tunnel-Medium-Type = IEEE-802,
    Tunnel-Private-Group-Id = "1005",
    Filter-Id = "filter1"
```

## Verification

---

### Verifying That the Filter Has Been Applied to the Supplicants

**Purpose** After the end devices are authenticated, verify that the filter has been configured on the switch and added to each end device's user profile on the RADIUS server:

**Action** Display information about firewall filter **filter1**:

```
user@switch> show firewall filter filter1
Filter: filter1
Counters:
Name                               Bytes      Packets
counter1                           128         2
counter2                            64         1
```

**Meaning** The output of the command **show firewall filter filter1** displays **counter1** and **counter2**. Packets from Supplicant 1 are counted using **counter1**, and packets from Supplicant 2 are counted using **counter2**. The output displays packets incrementing for both counters. The filter has been applied to both end devices.

  - [Example: Configuring Firewall Filters for Port, VLAN, and Router Traffic on EX Series Switches on page 4773](#)
  - [Configuring 802.1X RADIUS Accounting \(CLI Procedure\) on page 1909](#)
  - [Understanding Authentication on EX Series Switches on page 1824](#)
  - [Understanding 802.1X and VSAs on EX Series Switches on page 1837](#)

### Example: Applying Firewall Filters to Multiple Supplicants on Interfaces Enabled for 802.1X or MAC RADIUS Authentication

**NOTE:** This example uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see [“Example: Applying Firewall Filters to Multiple Supplicants on Interfaces Enabled for 802.1X or MAC RADIUS Authentication” on page 4798](#). For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 3](#).

On EX Series switches, firewall filters that you apply to interfaces enabled for 802.1X or MAC RADIUS authentication are dynamically combined with the per-user policies sent to the switch from the RADIUS server. The switch uses internal logic to dynamically combine the interface firewall filter with the user policies from the RADIUS server and create an individualized policy for each of the multiple users or nonresponsive hosts that are authenticated on the interface.

This example describes how dynamic firewall filters are created for multiple supplicants on an 802.1X-enabled interface (the same principles shown in this example apply to interfaces enabled for MAC RADIUS authentication):

- [Requirements on page 1894](#)
- [Overview and Topology on page 1894](#)
- [Configuration on page 1896](#)
- [Verification on page 1898](#)

---

## Requirements

This example uses the following hardware and software components:

- Junos OS Release 13.2 or later for EX Series switches
- One EX4300 switch
- One RADIUS authentication server. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.

Before you apply firewall filters to an interface for use with multiple supplicants, be sure you have:

- Set up a connection between the switch and the RADIUS server. See [“Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch” on page 1843](#).
- Configured 802.1X authentication on the switch, with the authentication mode for the interface ge-0/0/2 set to **multiple**. See [“Configuring 802.1X Interface Settings \(CLI Procedure\)” on page 1908](#) and [“Example: Setting Up 802.1X for Single Supplicant or Multiple Supplicant Configurations on an EX Series Switch” on page 1852](#).
- Configured users on the RADIUS authentication server.

---

## Overview and Topology

When the 802.1X configuration on an interface is set to multiple supplicant mode, the system dynamically combines the interface firewall filter with the user policies sent to the switch from the RADIUS server during authentication and creates separate terms for each user. Because there are separate terms for each user authenticated on the interface, you can, as shown in this example, use counters to view the activities of individual users that are authenticated on the same interface.

When a new user (or a nonresponsive host) is authenticated on an interface, the system adds a term to the firewall filter associated with the interface, and the term (policy) for each user is associated with the MAC address of the user. The term for each user is based on the user-specific filters set on the RADIUS server and the filters configured on the interface. For example, as shown in [Figure 18 on page 1895](#), when User 1 is authenticated by the EX Series switch, the system creates the firewall filter **dynamic-filter-example**. When User 2 is authenticated, another term is added to the firewall filter, and so on.

Figure 18: Conceptual Model: Dynamic Filter Updated for Each New User

This is a conceptual model of the internal process—you cannot access or view the dynamic filter.

**NOTE:** If the firewall filter on the interface is modified after the user (or nonresponsive host) is authenticated, the modifications are not reflected in the dynamic filter unless the user is reauthenticated.

In this example, you configure a firewall filter to count the requests made by each endpoint authenticated on interface ge-0/0/2 to the file server, which is located on subnet 192.0.2.16/28, and set policer definitions to rate-limit the traffic. [Figure 19 on page 1896](#) shows the network topology for this example.

Figure 19: Multiple Supplicants on an 802.1X-Enabled Interface Connecting to a File Server

### Configuration

#### Configuring Firewall Filters on Interfaces with Multiple Supplicants

##### CLI Quick Configuration

To quickly configure firewall filters for multiple supplicants on an 802.1X-enabled interface copy the following commands and paste them into the switch terminal window:

```
[edit]
set firewall family ethernet-switching filter filter1 term term1 from ip-destination-address 192.0.2.16/28
set firewall family ethernet-switching filter filter1 term term2 from ip-destination-address 192.0.2.16/28
set firewall policer p1 if-exceeding bandwidth-limit 1m
set firewall policer p1 if-exceeding burst-size-limit 1500
set firewall policer p1 then discard
set firewall family ethernet-switching filter filter1 term term1 then count counter1
set firewall family ethernet-switching filter filter1 term term2 then policer p1
```

##### Step-by-Step Procedure

To configure firewall filters on an interface enabled for multiple supplicants:

1. Set the policer definition:

```
user@switch# show policer p1 |display set
set firewall policer p1 if-exceeding bandwidth-limit 1m
set firewall policer p1 if-exceeding burst-size-limit 1500
set firewall policer p1 then discard
```

2. Configure a firewall filter to count packets from each user and a policer that limits the traffic rate. As each new user is authenticated on the multiple supplicant interface, this filter term will be included in the dynamically created term for the user:

```
[edit firewall family ethernet-switching]
user@switch# set filter filter1 term term1 from ip-destination-address 192.0.2.16/28
user@switch# set filter filter1 term term2 from ip-destination-address 192.0.2.16/28
user@switch# set filter filter1 term term1 then count counter1
user@switch# set filter filter1 term term2 then policer p1
```

**Results** Check the results of the configuration:

```
user@switch> show configuration
```

```
firewall {
  family ethernet-switching {
    filter filter1 {
      term term1 {
        from {
          ip-destination-address {
            192.0.2.16/28;
          }
        }
        then count counter1;
      }
      term term2 {
        from {
          ip-destination-address {
            192.0.2.16/28;
          }
        }
        then policer p1;
      }
    }
  }
  policer p1 {
    if-exceeding {
      bandwidth-limit 1m;
      burst-size-limit 1500;
    }
    then discard;
  }
}
protocols {
  dot1x {
    authenticator
    interface ge-0/0/2 {
      supplicant multiple;
    }
  }
}
```

## Verification

---

### Verifying Firewall Filters on Interfaces with Multiple Supplicants

- Purpose** Verify that firewall filters are functioning on the interface with multiple supplicants.
- Action**
1. Check the results with one user authenticated on the interface. In this case, User 1 is authenticated on ge-0/0/2:  

```
user@switch> show dot1x firewall
Filter: dot1x_ge-0/0/2
Counters
counter1_dot1x_ge-0/0/2_user1 100
```
  2. When a second user, User 2, is authenticated on the same interface, ge-0/0/2, you can verify that the filter includes the results for both of the users authenticated on the interface:  

```
user@switch> show dot1x firewall
Filter: dot1x-filter-ge-0/0/0
Counters
counter1_dot1x_ge-0/0/2_user1 100
counter1_dot1x_ge-0/0/2_user2 400
```
- Meaning** The results displayed by the **show dot1x firewall** command output reflect the dynamic filter created with the authentication of each new user. User 1 accessed the file server located at the specified destination address 100 times, while User 2 accessed the same file server 400 times.
- Related Documentation**
- [Example: Applying a Firewall Filter to 802.1X-Authenticated Supplicants Using RADIUS Server Attributes on an EX Series Switch on page 1887](#)

  - [Filtering 802.1X Supplicants Using RADIUS Server Attributes on page 1910](#)

## Example: Setting Up Captive Portal Authentication on an EX Series Switch

**NOTE:** This example uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see *Example: Setting Up Captive Portal Authentication on an EX Series Switch*. For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 3](#).

You can set up captive portal authentication (hereafter referred to as captive portal) on a switch to redirect Web browser requests to a login page that requires the user to input a username and password. Upon successful authentication, the user is allowed to continue with the original page request and subsequent access to the network.

This example describes how to set up captive portal on an EX4300 switch:

- [Requirements on page 1899](#)
- [Overview and Topology on page 1899](#)
- [Configuration on page 1899](#)
- [Verification on page 1901](#)
- [Troubleshooting on page 1902](#)

## Requirements

This example uses the following hardware and software components:

- Junos OS Release 13.2X50 or later for EX Series switches
- An EX4300 Series switch

Before you begin, be sure you have:

- Performed basic bridging and VLAN configuration on the switch. See [“Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch” on page 2281](#).
- Generated an SSL certificate and installed it on the switch. See [“Generating SSL Certificates to Be Used for Secure Web Access” on page 532](#).
- Configured basic access between the EX Series switch and the RADIUS server. See [“Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch” on page 1843](#).
- Designed your captive portal login page. See [“Designing a Captive Portal Authentication Login Page on an EX Series Switch” on page 1928](#).

## Overview and Topology

This example shows the configuration required on the switch to enable captive portal on an interface. To permit a printer connected to the captive portal interface to access the LAN, add its MAC address to the authentication whitelist and assign to a VLAN, vlan1. The MAC addresses on this list are permitted access on the interface without captive portal authentication.

The topology for this example consists of one EX4300 switch connected to a RADIUS authentication server. One interface on the switch is configured for captive portal. In this example, the interface is configured in multiple supplicant mode.

## Configuration

To configure captive portal on your switch:

### CLI Quick Configuration

To quickly configure captive portal on the switch after completing the tasks in the Requirements section, copy the following commands and paste them into the switch terminal window:

```
[edit]
set system services web-management https local-certificate my-signed-cert
set services captive-portal secure-authentication https
set services captive-portal interface ge-0/0/10.0 supplicant multiple
set switch-options authentication-whitelist 00:10:12:e0:28:22 vlan-assignment vlan1
```

```
set custom-options post-authentication-url http://www.my-home-page.com
```

### Step-by-Step Procedure

To configure captive portal on the switch:

1. To create a secure channel for Web access to the switch, configure captive portal for HTTPS:
  - a. Associate the security certificate with the Web server and enable HTTPS on the switch:

```
[edit]
user@switch# set system services web-management https local-certificate
my-signed-cert
```

**NOTE:** You can enable HTTP instead of HTTPS, but we recommend HTTPS for security purposes.

- b. Configure captive portal to use HTTPS:

```
[edit]
user@switch# set services captive-portal secure-authentication https
```

2. Enable an interface for captive portal:

```
[edit]
user@switch# set services captive-portal interface ge-0/0/10 supplicant multiple
```

3. (Optional) Allow specific clients to bypass captive portal authentication:

**NOTE:** If the client is already attached to the switch, you must clear its MAC address from the captive portal authentication by using the `clear captive-portal mac-address mac-address` command after adding its MAC address to the whitelist. Otherwise the new entry for the MAC address will not be added to the Ethernet switching table and the authentication bypass will not be allowed.

```
[edit]
user@switch# set switch-options authentication-whitelist 00:10:12:e0:28:22
vlan-assignment vlan1
```

**NOTE:** Optionally, you can use `set switch-options authentication-whitelist 00:10:12:e0:28:22 vlan-assignment vlan1 interface ge-0/0/10.0` to limit the scope to the interface.

4. (Optional) To redirect clients to a specified page rather than the page they originally requested, configure the post-authentication URL:

```
[edit services captive-portal]
user@switch# set custom-options post-authentication-url http://www.my-home-page.com
```

**Results** Display the results of the configuration:

```

[edit]
user@switch# show
system {
  services {
    web-management {
      https {
        local-certificate my-signed-cert;
      }
    }
  }
}
security {
  certificates {
    local {
      my-signed-cert {
        "-----BEGIN RSA PRIVATE KEY-----\nMIICXwIBAAKBgQDk8sUggnXdDUMr7T

    }
  }
}
}

```

### Verification

To confirm that captive portal authentication is configured and working properly, perform these tasks:

- [Verifying That Captive Portal Is Enabled on the Interface on page 1902](#)
- [Verify That Captive Portal Is Working Correctly on page 1902](#)

***Verifying That Captive Portal Is Enabled on the Interface***

**Purpose** Verify that captive portal is configured on the interface ge-0/0/10.

**Action** Use the operational mode command **show captive-portal interface *interface-name* detail**:

```
user@switch> show captive-portal interface ge-0/0/10.0 detail
ge-0/0/10.0
  Supplicant mode: Multiple
  Number of retries: 3
  Quiet period: 60 seconds
  Configured CP session timeout: 3600 seconds
  Server timeout: 15 seconds
```

**Meaning** The output confirms that captive portal is configured on the interface ge-0/0/10, with the default settings for number of retries, quiet period, CP session timeout, and server timeout.

***Verify That Captive Portal Is Working Correctly***

**Purpose** Verify that captive portal is working on the switch.

**Action** Connect a client to the interface ge-0/0/10. From the client, open a Web browser and request a webpage. The captive portal login page that you designed should be displayed. After you enter your login information and are authenticated against the RADIUS server, the Web browser should display either the page you requested or the post-authentication URL that you configured.

---

**Troubleshooting**

To troubleshoot captive portal, perform these tasks:

- [Troubleshooting Captive Portal on page 1902](#)

***Troubleshooting Captive Portal***

**Problem** The switch does not return the captive portal login page when a user connected to a captive portal interface on the switch requests a webpage.

**Solution** You can examine the ARP, DHCP, HTTPS, and DNS counters—if one or more of these counters are not incrementing, this provides an indication of where the problem lies. For example, if the client cannot get an IP address, you might check the switch interface to determine whether the DHCP counter is incrementing—if the counter increments, the DHCP packet was received by the switch.

```
user@switch> show captive-portal firewall ge-0/0/10.0
ge-0/0/10.0
  Filter name: dot1x_ge-0/0/10
  Counters:
  Name                               Bytes      Packets
  dot1x_ge-0/0/10_CP_arp              7616         119
  dot1x_ge-0/0/10_CP_dhcp              0             0
  dot1x_ge-0/0/10_CP_http              0             0
```

dot1x_ge-0/0/10_CP_https	0	0
dot1x_ge-0/0/10_CP_t_dns	0	0
dot1x_ge-0/0/10_CP_u_dns	0	0

## Example: Configuring Fallback Options on EX Series Switches for EAP-TTLS Authentication and Odyssey Access Clients

For 802.1X user authentication, EX Series switches support RADIUS authentication servers that are using Extensible Authentication Protocol–Tunneled TLS (EAP-TTLS) to authenticate Odyssey Access Client (OAC) supplicants. OAC networking software runs on endpoint computers (desktop, laptop, or notepad computers and supported wireless devices) and provides secure access to both wired and wireless networks.

This example describes how to configure an 802.1X-enabled interface on the switch to provide fallback support for OAC users who have entered incorrect login credentials:

- [Requirements on page 1903](#)
- [Overview and Topology on page 1904](#)
- [Configuration on page 1905](#)
- [Verification on page 1906](#)

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 11.2 or later for EX Series switches
- One EX Series switch acting as an authenticator port access entity (PAE). The ports on the authenticator PAE form a control gate that blocks all traffic to and from supplicants until they are authenticated.
- One RADIUS authentication server that supports 802.1X. The authentication server acts as the backend database and contains credential information for hosts (supplicants) that have permission to connect to the network.
- One OAC end device acting as a supplicant.

Before you begin configuring the fallback option, ensure that you have:

- Set up a connection between the switch and the RADIUS server. See [“Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch” on page 1843](#).
- Configured EAP-TTLS on the server. See your RADIUS server documentation.
- Configured users on the RADIUS server. See your RADIUS server documentation.

## Overview and Topology

---

OAC is networking software that runs on endpoint computers (desktop, laptop, or notepad) and supported wireless devices. OAC provides full support for EAP, which is required for secure wireless LAN access.

In this topology, OAC is deployed with an 802.1X-enabled switch and a RADIUS server. The switch functions as an enforcement point in the network security architecture. This topology:

- Ensures that only authorized users can connect.
- Maintains privacy of login credentials.
- Maintains data privacy over the wireless link.

This example includes the configuration of a server-reject VLAN on the switch, which can be used to prevent accidental lockout for users who have entered incorrect login credentials. These users can be given limited LAN access.

However, this fallback configuration is complicated by the fact that the OAC supplicant and RADIUS server are using EAP-TTLS. EAP-TTLS creates a secure encrypted tunnel between the server and the end device to complete the authentication process. When the user enters an incorrect login, the RADIUS server sends EAP failure messages directly to the client through this tunnel. The EAP failure message causes the client to restart the authentication procedure, so that the switch's 802.1X authentication process tears down the session that was established with the switch using the server-reject VLAN. You can enable the remedial connection to continue by configuring:

- **eapol-block**—Enable the EAPoL block timer on the 802.1X interface that is configured to belong to the server-reject VLAN. The block timer causes the authentication port access entity to ignore EAP start messages from the client, attempting to restart the authentication procedure.

**NOTE:** The EAPoL block timer is triggered only after the retries on the 802.1X interface have been exhausted. You can configure retries to specify the number of times the switch attempts to authenticate the port after an initial failure. The default is three retries.

- **block-interval**—Configure the amount of time that you want the EAPoL block timer to continue to ignore EAP start messages. If you do not configure the block interval, the EAPoL block timer defaults to 120 seconds.

When the 802.1X interface ignores the EAP start messages from the client, the switch allows the existing remedial session that was established through the server-reject VLAN to remain open.

These configuration options apply to **single**, **single-secure**, and **multiple** supplicant authentication modes. In this example, the 802.1X interface is configured in single-supplicant mode.

Figure 20 on page 1905 shows an EX Series switch connecting an OAC end device to a RADIUS server, and indicates the protocols being used to connect the network entities.

**Figure 20: EX Series Switch Connecting OAC to RADIUS Server Using EAP-TTLS Authentication**

Table 174 on page 1905 describes the components in this OAC deployment:

**Table 174: Components of the OAC Deployment**

Property	Settings
Switch hardware	EX Series switch
VLANs	<b>default</b> <b>server-reject-vlan:</b> VLAN name is <b>remedial</b> and VLAN ID is <b>700</b>
802.1X interface	<b>ge-0/0/8</b>
OAC supplicant	EAP-TTLS
One RADIUS authentication server	EAP-TTLS

### Configuration

To configure fallback options for EAP-TTLS and OAC supplicants, perform this task:

#### CLI Quick Configuration

To quickly configure the fallback options for EAP-TTLS and OAC supplicants, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans remedial vlan-id 700
set protocols dot1x authenticator interface ge-0/0/8 retries 4
set protocols dot1x authenticator interface ge-0/0/8 server-reject-vlan remedial
set protocols dot1x authenticator interface ge-0/0/8 server-reject-vlan eapol-block
set protocols dot1x authenticator interface ge-0/0/8 server-reject-vlan block-interval 130
```

**Step-by-Step Procedure** To configure the fallback options for EAP-TTLS and OAC supplicants:

**TIP:** In this example, the switch has only one server-reject VLAN. Therefore, the configuration specifies `eapol-block` and `block-interval` directly after `server-reject-vlan`. However, if you have configured multiple VLANs on the switch, you should include the VLAN name or VLAN ID directly after `server-reject-vlan` to indicate which VLAN is being modified.

1. Configure a VLAN that will function as the server-reject VLAN to provide limited LAN access for users who have entered incorrect login credentials:  

```
[edit]
user@switch# set vlans remedial vlan-id 700
```
2. Configure the number of times for the client to be prompted for username and password before an incorrect login is directed to the server-reject VLAN:  

```
[edit protocols dot1x authenticator interface ge-0/0/8]
user@switch# set retries 4
```
3. Configure the 802.1X authenticator interface to use the server-reject VLAN as a fallback for incorrect logins:  

```
[edit protocols dot1x authenticator interface ge-0/0/8]
user@switch# set server-reject-vlan remedial
```
4. Enable the EAPoL block timer on the 802.1X interface that is configured to belong to the server-reject VLAN.  

```
[edit protocols dot1x authenticator interface ge-0/0/8]
user@switch# set server-reject-vlan eapol-block
```
5. Configure the amount of time for the EAPoL block to remain in effect:  

```
[edit protocols dot1x authenticator interface ge-0/0/8]
user@switch# set server-reject-vlan block-interval 130
```

**Results**

Check the results of the configuration:

```
user@switch> show configuration
protocols {
  dot1x {
    authenticator {
      interface {
        ge-0/0/8.0 {
          supplicant single;
          retries 4;
          server-reject-vlan remedial block-interval 130 eapol-block;
        }
      }
    }
  }
}
```

**Verification**

To confirm that the configuration and the fallback options are working correctly, perform this task:

- [Verifying the Configuration of the 802.1X Interface on page 1907](#)

### *Verifying the Configuration of the 802.1X Interface*

**Purpose** Verify that the 802.1X interface is configured with the desired options:

**Action** user@switch> **show dot1x** interface ge-0/0/8.0 detail  
 ge-0/0/8.0  
 Role: Authenticator  
 Administrative state: Auto  
 Supplicant mode: Single  
 Number of retries: 4  
 Quiet period: 60 seconds  
 Transmit period: 30 seconds  
 Mac Radius: Disabled  
 Mac Radius Restrict: Disabled  
 Reauthentication: Enabled  
 Configured Reauthentication interval: 120 seconds  
 Supplicant timeout: 30 seconds  
 Server timeout: 30 seconds  
 Maximum EAPoL requests: 2  
 Guest VLAN member: guest  
 Number of connected supplicants: 1  
 Supplicant: tem, 2A:92:E6:F2:00:00  
 Operational state: Authenticated  
 Backend Authentication state: Idle  
 Authentication method: Radius  
 Authenticated VLAN: remedial  
 Session Reauth interval: 120 seconds  
 Reauthentication due in 68 seconds

**Meaning** The **show dot1x ge-0/0/8 detail** output shows that the **ge-0/0/8** interface is in the **Authenticated** state and that it is using the **remedial** VLAN.

## Configuring 802.1X Interface Settings (CLI Procedure)

IEEE 802.1X authentication provides network edge security, protecting Ethernet LANs from unauthorized user access by blocking all traffic to and from a supplicant (client) at the interface until the supplicant's credentials are presented and matched on the *authentication server* (a RADIUS server). When the supplicant is authenticated, the switch stops blocking access and opens the interface to the supplicant.

### NOTE:

- You can also specify an 802.1X exclusion list to specify supplicants that can bypass authentication and be automatically connected to the LAN. See [“Configuring Static MAC Bypass of Authentication \(CLI Procedure\)”](#) on page 1924.
- You cannot configure 802.1X user authentication on interfaces that have been enabled for Q-in-Q tunneling.
- You cannot configure 802.1X user authentication on redundant trunk groups (RTGs). For more information on RTGs, see [“Understanding Redundant Trunk Links”](#) on page 2276.

Before you begin, specify the RADIUS server or servers to be used as the authentication server. See [“Specifying RADIUS Server Connections on an EX Series Switch \(CLI Procedure\)”](#) on page 1925.

To configure 802.1X on an interface:

1. Configure the supplicant mode as **single** (authenticates the first supplicant), **single-secure** (authenticates only one supplicant), or **multiple** (authenticates multiple supplicants):

```
[edit protocols dot1x]
user@switch# set authenticator interface ge-0/0/5 supplicant multiple
```

2. Enable reauthentication and specify the reauthentication interval:

```
[edit protocols dot1x]
user@switch# set authenticator interface ge-0/0/5/0 reauthentication interval 5
```

3. Configure the interface timeout value for the response from the supplicant:

```
[edit protocols dot1x]
user@switch# set authenticator interface ge-0/0/5 supplicant-timeout 5
```

4. Configure the timeout for the interface before it resends an authentication request to the RADIUS server:

```
[edit protocols dot1x]
user@switch# set authenticator interface ge-0/0/5 server-timeout 5
```

5. Configure how long, in seconds, the interface waits before retransmitting the initial EAPOL PDUs to the supplicant:

```
[edit protocols dot1x]
user@switch# set authenticator interface ge-0/0/5 transmit-period 60
```

6. Configure the maximum number of times an EAPOL request packet is retransmitted to the supplicant before the authentication session times out:

```
[edit protocols dot1x]
user@switch# set authenticator interface ge-0/0/5 maximum-requests 5
```

7. Configure the number of times the switch attempts to authenticate the port after an initial failure. The port remains in a wait state during the quiet period after the authentication attempt.

```
[edit protocols dot1x]
user@switch# set authenticator interface ge-0/0/5 retries 1
```

**NOTE:** This setting specifies the number of tries before the switch puts the interface in a “HELD” state.

## Configuring 802.1X RADIUS Accounting (CLI Procedure)

RADIUS accounting permits statistical data about users logging onto or off a LAN to be collected and sent to a RADIUS accounting server. The statistical data gathered can be used for general network monitoring, to analyze and track usage patterns, or to bill a user based upon the amount of time or type of services accessed.

To configure basic RADIUS accounting using the CLI:

1. Specify the accounting servers to which the switch will forward accounting statistics:

```
[edit access]
user@switch# set profile profile1 radius accounting-server [122.69.1.250 122.69.1.252]
```

2. Define the RADIUS accounting servers:

```
[edit access]
user@switch# set radius-server 122.69.1.250 secret juniper
user@switch# set radius-server 122.69.1.252 secret juniper1
```

3. Enable accounting for an access profile:

```
[edit access]
user@switch# set profile profile1 accounting (Access Profile)
```

4. Configure the RADIUS servers to use while sending accounting messages and updates:

```
[edit access]
user@switch# set profile profile1 accounting order radius
```

5. Configure the statistics to be collected on the switch and forwarded to the accounting server:

```
[edit access]
```

```
user@switch# set profile profile1 accounting accounting-stop-on-access-deny
user@switch# set profile profile1 accounting accounting-stop-on-failure
```

6. Display accounting statistics collected on the switch:

```
user@switch> show network-access aaa statistics accounting
Accounting module statistics
  Requests received: 1
  Accounting Response failures: 0
  Accounting Response Success: 1
  Requests timedout: 0
```

7. Open an accounting log on the RADIUS accounting server using the server's address, and view accounting statistics:

```
[root@freeradius]# cd /usr/local/var/log/radius/radacct/122.69.1.250
[root@freeradius 122.69.1.250]# ls
```

```
detail-20071214
```

```
[root@freeradius 122.69.1.250]# vi details-20071214
```

  - [Understanding 802.1X and RADIUS Accounting on EX Series Switches on page 1830](#)

## Filtering 802.1X Supplicants Using RADIUS Server Attributes

There are two ways to configure the RADIUS server with port firewall filters:

- Include a match statement and corresponding action in the **Juniper-Firewall-Filter** attribute. The **Juniper-Firewall-Filter** attribute is a vendor-specific attribute (VSA) in

the Juniper dictionary on the RADIUS server. Use this attribute to configure simple filter conditions for authenticated users. Nothing needs to be configured on the switch; all of the configuration is on the RADIUS server.

- Apply a local firewall filter to users authenticated through the RADIUS server. Use this method for more complex filters. The firewall filter must be configured on each switch.

**NOTE:** If the firewall filter configuration is modified after users are authenticated using the 802.1X authentication, then the established 802.1X authentication session must be terminated and re-established for the firewall filter configuration changes to take effect.

This example describes using FreeRADIUS software to configure VSAs. For specifics on configuring your server, consult the AAA documentation that was included with your server.

This topic includes the following tasks:

1. [Configuring Match Statements on the RADIUS Server on page 1911](#)
2. [Applying a Port Firewall Filter from the RADIUS Server on page 1913](#)

### Configuring Match Statements on the RADIUS Server

You can configure simple filter conditions using the **Juniper-Switching-Filter** attribute in the Juniper dictionary on the RADIUS server. These filters are then sent to a switch whenever a new user is authenticated successfully. The filters are created and applied on all EX Series switches that authenticate users through that RADIUS server without the need to configure anything on each individual switch.

To configure the **Juniper-Switching-Filter** attribute, enter one or more match conditions and a resulting action using the CLI for the RADIUS server. Enter the match statement plus an action statement enclosed within quotes (" ") using the following syntax:

```
match <destination-mac mac-address> <source-vlan vlan-name> <source-dot1q-tag
tag> <destination-ip ip-address> <ip-protocol protocol-id> <source-port port>
<destination-port port>
}
action [allow | deny] <forwarding-class class-of-service> <loss-priority (low | medium |
high)>
}
```

See “[VSA Match Conditions and Actions](#)” on [page 1918](#) for definitions of match statement options.

To configure match conditions on the RADIUS server:

1. Verify that the Juniper dictionary is loaded on your RADIUS server and includes the filtering attribute **Juniper-Switching-Filter**, attribute ID 48:

```
[root@freeradius]# cat /usr/local/share/freeradius/dictionary.juniper

# dictionary.juniper
#
```

```
# Version:      $Id: dictionary.juniper,v 1.2.6.1 2005/11/30 22:17:25 a1and
Exp
$
#  VENDOR      Juniper      2636
BEGIN-VENDOR   Juniper
ATTRIBUTE      Juniper-Local-User-Name      1      string
ATTRIBUTE      Juniper-Allow-Commands       2      string
ATTRIBUTE      Juniper-Deny-Commands        3      string
ATTRIBUTE      Juniper-Allow-Configuration   4      string
ATTRIBUTE      Juniper-Deny-Configuration   5      string
ATTRIBUTE      Juniper-Switching-Filter      48     string
<-
```

2. Enter the match conditions and actions. For example:

- To deny authentication based on the 802.1Q tag (here, the 802.1Q tag is 10):

```
[root@freeradius]#
cd /usr/local/etc/raddb
vi users
```

For each relevant user, add the **Juniper-Switching-Filter** attribute:

**Juniper-Switching-Filter = "Match Source-dot1q-tag 10 Action deny"**

- To deny access based on a destination IP address:

```
[root@freeradius]# cd /usr/local/etc/raddb
vi users
```

For each relevant user, add the **Juniper-Switching-Filter** attribute:

**Juniper-Switching-Filter = "Match Destination-ip 192.168.1.0/31 Action deny"**

- To set the packet loss priority (PLP) to **high** based on a destination MAC address and the IP protocol:

```
[root@freeradius]# cd /usr/local/etc/raddb
vi users
```

For each relevant user, add the **Juniper-Switching-Filter** attribute:

**Juniper-Switching-Filter = "Match Destination-mac 00:04:0f:fd:ac:fe, Ip-protocol 2, forwarding-class high, Action loss-priority high"**

**NOTE:** For the forwarding-class option to be applied, the forwarding class must be configured on the switch. If it is not configured on the switch, this option is ignored. You must specify both the forwarding class and the packet loss priority.

3. Stop and restart the RADIUS process to activate the configuration.

### Applying a Port Firewall Filter from the RADIUS Server

You can apply a firewall filter to user policies on the RADIUS server. The RADIUS server can then specify the firewall filters that are to be applied to each user that requests to authenticate. Use this method when the firewall filter has more extensive conditions or you want to use different conditions for the same filter on different switches. The firewall filters must be configured on each switch.

For more information about firewall filters, see [“Firewall Filters for EX Series Switches Overview” on page 4696](#).

To apply a port firewall filter centrally from the RADIUS server:

**NOTE:** If port firewall filters are also configured locally for the interface, then VSAs take precedence if they conflict with the filters. If the VSAs and the local port firewall filters do not conflict, they are merged.

1. Create the firewall filter on the local switch. In this example, the filter is called **filter1**.
2. Open the users file on the RADIUS server:

```
[root@freeradius]#  
cd /usr/local/pool/raddb  
vi users
```

3. For each relevant user, add the filter (here, the filter ID is **filter1**):

```
Filter-Id = "filter1"
```

**NOTE:** Multiple filters are not supported on a single interface. However, you can support multiple filters for multiple users that are connected to the switch on the same interface by configuring a single filter with policies for each of those users.

4. Stop and restart the RADIUS process to activate the configuration.

#### Related Documentation

- [Example: Applying a Firewall Filter to 802.1X-Authenticated Supplicants Using RADIUS Server Attributes on an EX Series Switch on page 1887](#)

- [Understanding 802.1X and VSAs on EX Series Switches on page 1837](#)

### Configuring LLDP (CLI Procedure)

Devices use Link Layer Discovery Protocol (LLDP) and Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED) to learn and distribute device

information on network links. The information enables the device to quickly identify a variety of other devices, resulting in a LAN that interoperates smoothly and efficiently.

This topic describes:

- [Enabling LLDP on Interfaces on page 1914](#)
- [Adjusting LLDP Advertisement Settings on page 1914](#)
- [Adjusting SNMP Notification Settings of LLDP Changes on page 1915](#)
- [Specifying a Management Address for the LLDP Management TLV on page 1916](#)
- [Configuring LLDP Power Negotiation on page 1916](#)

---

### Enabling LLDP on Interfaces

LLDP is enabled on all interfaces by default. If it is disabled, you can enable LLDP by configuring it on all interfaces or on specific interfaces.

- To configure LLDP on all interfaces:

```
[edit protocols lldp]
user@switch# set interface all
```

- To configure LLDP on a specific interface:

```
[edit protocols lldp]
user@switch# set interface interface-name
```

**NOTE:** On EX4300 switches, LLDP cannot be configured on the me0 or vme interface. Issuing the command `set protocols lldp interface me0` generates the following error message:

```
error: name: 'me0': Invalid interface
error: statement creation failed: interface
```

Issuing the command `set protocols lldp interface vme` generates the following error message:

```
error: name: 'vme': Invalid interface
error: statement creation failed: interface
```

---

### Adjusting LLDP Advertisement Settings

You can adjust the following settings for LLDP advertisements for troubleshooting or verification purposes. The default values are applied when LLDP is enabled. For normal operations, we recommend that you do not change the default values.

- To specify the frequency at which LLDP advertisements are sent (in seconds):

```
[edit protocols lldp]
user@switch# set advertisement-interval seconds
```

For example, using the default value:

```
[edit protocols lldp]
user@switch# set advertisement-interval 45
```

- To specify the number of seconds that LLDP information is held before it is discarded (the multiplier value is used in combination with the **advertisement-interval** value):

```
[edit protocols lldp]
user@switch# set hold-multiplier seconds
```

For example, using the default value:

```
[edit protocols lldp]
user@switch# set hold-multiplier 5
```

- To specify the number of seconds the device delays before sending advertisements to neighbors after a change is made in a TLV (type, length, or value) element in LLDP or in the state of the local system, such as a change in hostname or management address, set the transmit delay. The transmit delay is enabled by default on switches to reduce the delay in notifying neighbors of a change in the local system. The default value is 2 seconds (if the **advertisement-interval** value is set to 8 seconds or more) or 1 second (if the **advertisement-interval** value is set to less than 8 seconds).

```
[edit protocols lldp]
user@switch# set transmit-delay seconds
```

For example:

```
[edit protocols lldp]
user@switch# set transmit-delay 2
```

**NOTE:** The **advertisement-interval** value must be greater than or equal to four times the **transmit-delay** value; otherwise, an error is returned when you attempt to commit the configuration.

### Adjusting SNMP Notification Settings of LLDP Changes

You can adjust the following settings for SNMP notifications of LLDP changes. If the values are not specified or if the interval values are set to 0, the notifications are disabled.

- To specify the frequency at which LLDP database changes are sent (in seconds):

```
[edit protocols lldp]
user@switch# set lldp-configuration-notification-interval seconds
```

For example:

```
[edit protocols lldp]
user@switch# set lldp-configuration-notification-interval 600
```

- To configure the time interval for SNMP trap notifications to wait for topology changes (in seconds):

```
[edit protocols lldp]
user@switch# set ptopo-configuration-trap-interval seconds
```

For example:

```
[edit protocols lldp]
user@switch# set ptopo-configuration-trap-interval 600
```

- To specify the holding time (used in combination with the **ptopo-configuration-trap-interval** value) to maintain dynamic topology entries (in seconds):

```
[edit protocols lldp]
user@switch# set ptopo-configuration-maximum-hold-time seconds
```

For example:

```
[edit protocols lldp]
user@switch# set ptopo-configuration-maximum-hold-time 2147483647
```

---

### Specifying a Management Address for the LLDP Management TLV

You can configure an IPv4 or IPv6 management address to be used in the LLDP Management Address type, length, and value (TLV) messages. Only out-of-band management addresses must be used as the value for the **management-address** statement.

To configure the management address:

```
[edit protocols lldp]
user@switch# set management-address ip-address
```

**NOTE:** Ensure that the interface with the configured management address has LLDP enabled using the `set protocols lldp interface` command. If you configure a customized management address for LLDP on an interface that has LLDP disabled, the `show lldp local-information` command output will not display the correct interface information.

---

### Configuring LLDP Power Negotiation

LLDP power negotiation enables the switch's Power over Ethernet (PoE) controller to dynamically allocate PoE power to PoE interfaces, based on the needs of the powered device, by negotiating with LLDP-enabled powered devices.

**NOTE:** LLDP power negotiation is not supported on EX3200 and EX4200 (except EX4200-24P and EX4200-48P models) switches.

LLDP power negotiation is supported on switches running PoE controller software version 4.04 or later. For information about upgrading the PoE controller software, see [“Upgrading the PoE Controller Software” on page 4467](#).

LLDP power negotiation is automatically enabled when the PoE management mode is set to **class**.

- To disable LLDP power negotiation on switch interfaces:

```
[edit protocols lldp interface all power-negotiation]
user@switch# disable
```

- To disable LLDP power negotiation on a specific switch interface:

```
[edit protocols lldp interface interface-name power-negotiation]
user@switch# disable
```

Documentation**

- [Configuring LLDP \(J-Web Procedure\)](#)

- [Configuring LLDP-MED \(CLI Procedure\) on page 1917](#)
- [Understanding 802.1X and LLDP and LLDP-MED on EX Series Switches on page 1831](#)

## Configuring LLDP-MED (CLI Procedure)

Link Layer Discovery Protocol–Media Endpoint Discovery (LLDP-MED) is an extension of LLDP. The EX Series switch uses LLDP-MED to support device discovery of VoIP telephones and to create location databases for these telephone locations.

LLDP-MED is turned on by default on EX Series switches.

This topic describes:

- [Enabling LLDP-MED on Interfaces on page 1917](#)
- [Configuring Location Information Advertised by the Switch on page 1917](#)
- [Configuring for Fast Start on page 1918](#)

### Enabling LLDP-MED on Interfaces

LLDP-MED is enabled on all interfaces by default. If it is disabled, you can enable LLDP-MED by configuring it on all interfaces or on specific interfaces.

**NOTE:** On switches running Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style, configure LLDP-MED on the physical interface—for example, on ge-0/0/2. For more about ELS, see [“Getting Started with Enhanced Layer 2 Software” on page 3](#).

To configure LLDP-MED on all interfaces or on a specific interface:

```
[edit protocols lldp-med]
user@switch# set interface (LLDP-MED) ge-0/0/2.0
```

### Configuring Location Information Advertised by the Switch

You can configure the location information that is advertised from the switch to the LLDP-MED device. You can specify a civic-based location (geographic location) or a location based on an ELIN (Emergency Location Identification Number):

- To specify a location by geography:

```
[edit protocols lldp-med]
user@switch# set interface ge-0/0/2.0 location civic-based country-code US
user@switch# set interface ge-0/0/2.0 location civic-based ca-type 1 ca-value "El Dorado County"
user@switch# set interface ge-0/0/2.0 location civic-based ca-type 2 ca-value CA
user@switch# set interface ge-0/0/2.0 location civic-based ca-type 3 ca-value Somerset
user@switch# set interface ge-0/0/2.0 location civic-based ca-type 6 ca-value "Mount Aukum Road"
user@switch# set interface ge-0/0/2.0 location civic-based ca-type 19 ca-value 6450
user@switch# set interface ge-0/0/2.0 location civic-based ca-type 21 ca-value "Holiday Market"
```

- To specify a location using an elin string:

```
[edit protocols lldp-med]
user@switch# set interface ge-0/0/2.0 location elin 4085551212
```

### Configuring for Fast Start

---

You can specify the number of LLDP-MED advertisements sent from the switch in the first second after it has detected an LLDP-MED device. The default is 3; to set it to another value:

```
[edit protocols lldp-med]
user@switch# set fast-start 6
```

**NOTE:** If an interface is configured as a VoIP interface, then the switch does not wait for an attached phone to identify itself as an LLDP-MED device before it performs an LLDP-MED fast start after a graceful Routing Engine switchover (GRES) or a reboot. Instead, it immediately performs an LLDP-MED fast start after a GRES or reboot. This behavior prevents certain models of IP phones from resetting after a GRES.

## VSA Match Conditions and Actions

Devices support the configuration of RADIUS server attributes specific to Juniper Networks. These attributes are known as vendor-specific attributes (VSAs). They are configured on RADIUS servers and work in combination with 802.1X authentication. Using VSAs, you can apply port firewall filter attributes as a subset of match conditions and actions sent from the RADIUS server to the switch as a result of successful 802.1X authentication.

Each term in a VSA configured through the RADIUS server consists of *match conditions* and an *action*. Match conditions are the values or fields that the packet must contain. You can define single, multiple, or no match conditions. If no match conditions are specified for the term, the packet is accepted by default. The action is the action that the switch takes if a packet matches the match conditions for the specific term. Allowed actions are to accept a packet or to discard a packet.

The following guidelines apply when you specify match conditions and actions for VSAs:

- Both **match** and **action** statements are mandatory.
- Any or all options (separated by commas) may be included in each **match** and **action** statement.

- Fields separated by commas will be ANDed if they are of a different type. The same types cannot be repeated.
- For OR cases (for example, match **10.1.1.0/24 OR 11.1.1.0/24**), apply multiple VSAs to the 802.1X supplicant.
- In order for the **forwarding-class** option to be applied, the forwarding class must be configured on the switch. If it is not configured on the switch, this option is ignored.

Table 175 on page 1919 describes the match conditions you can specify when configuring a VSA using the **match** command on the RADIUS server. The string that defines a match condition is called a *match statement*.

Table 175: Match Conditions

Option	Description
<b>destination-mac</b> <i>mac-address</i>	Destination media access control (MAC) address of the packet.
<b>source-vlan</b> <i>source-vlan</i>	Name of the source VLAN.
<b>source-dot1q-tag</b> <i>tag</i>	Tag value in the 802.1Q header, in the range 0 through 4095.
<b>destination-ip</b> <i>ip-address</i>	Address of the final destination node.
<b>ip-protocol</b> <i>protocol-id</i>	IPv4 protocol value. In place of the numeric value, you can specify one of the following text synonyms:  <b>ah</b> , <b>egp</b> (8), <b>esp</b> (50), <b>gre</b> (47), <b>icmp</b> (1), <b>igmp</b> (2), <b>ipip</b> (4), <b>ipv6</b> (41), <b>ospf</b> (89), <b>pim</b> (103), <b>rsvp</b> (46), <b>tcp</b> (6), or <b>udp</b> (17)
<b>source-port</b> <i>port</i>	TCP or User Datagram Protocol (UDP) source port field. Normally, you specify this match statement in conjunction with the <b>ip-protocol</b> match statement to determine which protocol is being used on the port. In place of the numeric field, you can specify one of the text options listed under <b>destination-port</b> .
<b>destination-port</b> <i>port</i>	TCP or UDP destination port field. Normally, you specify this match in conjunction with the <b>ip-protocol</b> match statement to determine which protocol is being used on the port. In place of the numeric value, you can specify one of the following text synonyms (the port numbers are also listed):  <b>afs</b> (1483), <b>bgp</b> (179), <b>biff</b> (512), <b>bootpc</b> (68), <b>bootps</b> (67), <b>cvspserver</b> (2401), <b>cmd</b> (514), <b>dhcp</b> (67), <b>domain</b> (53), <b>eklogin</b> (2105), <b>ekshell</b> (2106), <b>exec</b> (512), <b>finger</b> (79), <b>ftp</b> (21), <b>ftp-data</b> (20), <b>http</b> (80), <b>https</b> (443), <b>ident</b> (113), <b>imap</b> (143), <b>kerberos-sec</b> (88), <b>klogin</b> (543), <b>kpasswd</b> (761), <b>krb-prop</b> (754), <b>krbupdate</b> (760), <b>kshell</b> (544), <b>ldap</b> (389), <b>login</b> (513), <b>mobileip-agent</b> (434), <b>mobileip-mn</b> (435), <b>msdp</b> (639), <b>netbios-dgm</b> (138), <b>netbios-ns</b> (137), <b>netbios-ssn</b> (139), <b>nfsd</b> (2049), <b>nntp</b> (119), <b>ntalk</b> (518), <b>ntp</b> (123), <b>pop3</b> (110), <b>pptp</b> (1723), <b>printer</b> (515), <b>radacct</b> (1813), <b>radius</b> (1812), <b>rip</b> (520), <b>rkinit</b> (2108), <b>smtp</b> (25), <b>snmp</b> (161), <b>snmptrap</b> (162), <b>snpp</b> (444), <b>socks</b> (1080), <b>ssh</b> (22), <b>sunrpc</b> (111), <b>syslog</b> (514), <b>telnet</b> (23), <b>tacacs-ds</b> (65), <b>talk</b> (517), <b>tftp</b> (69), <b>timed</b> (525), <b>who</b> (513), <b>xdmcp</b> (177), <b>zephyr-clt</b> (2103), <b>zephyr-hm</b> (2104)

When you define one or more terms that specify the filtering criteria, you also define the action to take if the packet matches all criteria. [Table 176 on page 1920](#) shows the actions that you can specify in a term.

**Table 176: Actions for VSAs**

Option	Description
(allow   deny)	Accept a packet or discard a packet silently without sending an Internet Control Message Protocol (ICMP) message.
forwarding-class <i>class-of-service</i>	(Optional) Classify the packet in one of the following forwarding classes: <ul style="list-style-type: none"> <li>assured-forwarding</li> <li>best-effort</li> <li>expedited-forwarding</li> <li>network-control</li> </ul>
loss-priority (low   medium   high)	(Optional) Set the packet loss priority (PLP) to <b>low</b> , <b>medium</b> , or <b>high</b> . Specify both the forwarding class and loss priority.

## Configuring Server Fail Fallback (CLI Procedure)

Server fail fallback allows you to specify how end devices connected to the switch are supported if the RADIUS authentication server becomes unavailable or sends a RADIUS access-reject message.

802.1X and MAC RADIUS authentication work by using an *authenticator port access entity* (the EX Series switch) to block all traffic to and from an end device at the interface until the end device's credentials are presented and matched on the *authentication server* (a RADIUS server). When the end device has been authenticated, the switch stops blocking and opens the interface to the end device.

When you set up 802.1X or MAC RADIUS authentication on the switch, you specify a primary authentication server and one or more backup authentication servers. If the primary authentication server cannot be reached by the switch and the secondary authentication servers are also unreachable, a RADIUS server timeout occurs. Because the authentication server grants or denies access to the end devices awaiting authentication, the switch does not receive access instructions for end devices attempting access to the LAN and normal authentication cannot be completed. Server fail fallback allows you to configure authentication alternatives that permit the switch to take appropriate actions toward end devices awaiting authentication or reauthentication.

**NOTE:** The authentication fallback method called *server-reject VLAN* provides limited access to a LAN, typically just to the Internet, for responsive end devices that are 802.1X-enabled but that have sent the wrong credentials. If the end device that is authenticated using the server-reject VLAN is an IP phone, voice traffic is not allowed.

To configure basic server fail fallback options using the CLI:

- Configure an interface to allow traffic to flow from a supplicant to the LAN if a RADIUS server timeout occurs (as if the end device had been successfully authenticated by a RADIUS server):

```
[edit protocols dot1x authenticator]
user@switch# set interface ge-0/0/1 server-fail permit
```

- Configure an interface to prevent traffic flow from an end device to the LAN (as if the end device had failed authentication and had been rejected by the RADIUS server):

```
[edit protocols dot1x authenticator]
user@switch# set interface ge-0/0/1 server-fail deny
```

- Configure an interface to move an end device to a specified VLAN if a RADIUS server timeout occurs (in this case, the VLAN name is `vlan1`):

```
[edit protocols dot1x authenticator]
user@switch# set interface ge-0/0/1 server-fail vlan-name vlan1
```

- Configure an interface to recognize already connected end devices as reauthenticated if there is a RADIUS timeout during reauthentication (new users will be denied access):

```
[edit protocols dot1x authenticator]
user@switch# set interface ge-0/0/1 server-fail use-cache
```

- Configure an interface that receives a RADIUS access-reject message from the authentication server to move end devices attempting LAN access on the interface to a specified VLAN already configured on the switch (in this case, the VLAN name is `vlan-sf`):

```
[edit protocols dot1x authenticator]
user@switch# set interface ge-0/0/1 server-reject-vlan vlan-sf
```

**NOTE:** If an IP phone is authenticated in the server-reject VLAN, voice traffic is not allowed.

---

#### Related Documentation

- [Example: Configuring 802.1X Authentication Options When the RADIUS Server is Unavailable to an EX Series Switch on page 1875](#)
- [Configuring 802.1X Authentication \(J-Web Procedure\)](#)
- [Configuring 802.1X Interface Settings \(CLI Procedure\) on page 1908](#)

- [Understanding Server Fail Fallback and Authentication on EX Series Switches on page 1838](#)

## Configuring MAC RADIUS Authentication (CLI Procedure)

You can permit devices that are not 802.1X-enabled LAN access by configuring MAC RADIUS authentication on the EX Series switch interfaces to which the hosts are connected.

**NOTE:** You can also allow non-802.1X-enabled devices to access the LAN by configuring their MAC address for static MAC bypass of authentication.

You can configure MAC RADIUS authentication on an interface that also allows 802.1X authentication, or you can configure either authentication method alone.

If both MAC RADIUS and 802.1X authentication are enabled on the interface, the switch first sends the host three EAPOL requests to the host. If there is no response from the host, the switch sends the host's MAC address to the RADIUS server to check whether it is a permitted MAC address. If the MAC address is configured as permitted on the RADIUS server, the RADIUS server sends a message to the switch that the MAC address is a permitted address, and the switch opens LAN access to the nonresponsive host on the interface to which it is connected.

If MAC RADIUS authentication is configured on the interface but 802.1X authentication is not (by using the **mac-radius restrict** option), the switch attempts to authenticate the MAC address with the RADIUS server without delaying by attempting 802.1X authentication first.

Before you configure MAC RADIUS authentication, be sure you have:

- Configured basic access between the EX Series switch and the RADIUS server. See [“Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch” on page 1843](#).

To configure MAC RADIUS authentication using the CLI:

- On the switch, configure the interfaces to which the nonresponsive hosts are attached for MAC RADIUS authentication, and add the **restrict** qualifier for interface **ge-0/0/20** to have it use only MAC RADIUS authentication:

```
[edit]
user@switch# set protocols dot1x authenticator interface ge-0/0/19 mac-radius
user@switch# set protocols dot1x authenticator interface ge-0/0/20 mac-radius restrict
```

- On a RADIUS authentication server, create user profiles for each nonresponsive host using the MAC address (without colons) of the nonresponsive host as the username and password (here, the MAC addresses are **00:04:0f:fd:ac:fe** and **00:04:ae:cd:23:5f**):

```
[root@freeradius]#
edit /etc/raddb
vi users
00040ffdacfe Auth-type:=Local, User-Password = "00040ffdacfe"
0004aecdc235f Auth-type:=Local, User-Password = "0004aecdc235f"
```

### Related Documentation

- [Example: Configuring MAC RADIUS Authentication on an EX Series Switch on page 1881](#)

- [Verifying 802.1X Authentication on page 1994](#)
- [Understanding Authentication on EX Series Switches on page 1824](#)

## Configuring Static MAC Bypass of Authentication (CLI Procedure)

You can configure a static MAC bypass list (sometimes called the exclusion list) on the switch to specify MAC addresses of devices allowed access to the LAN without 802.1X or MAC RADIUS authentication requests to the RADIUS server.

To configure the static MAC bypass list:

- Specify a MAC address to bypass authentication:

```
[edit protocols dot1x]  
user@switch# set authenticator static 00:04:0f:fd:ac:fe
```

- Configure a supplicant to bypass authentication if connected through a particular interface:

```
[edit protocols dot1x]  
user@switch# set authenticator static 00:04:0f:fd:ac:fe interface ge-0/0/5
```

- You can configure a supplicant to be moved to a specific VLAN after it is authenticated:

```
[edit protocols dot1x]  
user@switch# set authenticator static 00:04:0f:fd:ac:fe interface ge-0/0/5 vlan-assignment  
default-vlan
```

### Related Documentation

- [Example: Configuring Static MAC Bypass of Authentication on an EX Series Switch on page 1872](#)
- [Configuring 802.1X Interface Settings \(CLI Procedure\) on page 1908](#)
- [Configuring 802.1X Authentication \(J-Web Procedure\)](#)

## Specifying RADIUS Server Connections on an EX Series Switch (CLI Procedure)

IEEE 802.1X and MAC RADIUS authentication both provide network edge security, protecting Ethernet LANs from unauthorized user access by blocking all traffic to and from devices at the interface until the supplicant's credentials or MAC address are presented and matched on the *authentication server* (a RADIUS server). When the supplicant is authenticated, the switch stops blocking access and opens the interface to the supplicant.

To use 802.1X or MAC RADIUS authentication, you must specify the connections on the switch for each RADIUS server to which you will connect.

To configure a RADIUS server on the switch:

1. Define the IP address of the RADIUS server, the RADIUS server authentication port number, and the secret password. You can define more than one RADIUS server. The secret password on the switch must match the secret password on the server:

```
[edit access]
user@switch# set radius-server 10.0.0.100 port 1812 secret abc
```

**NOTE:** Specifying the authentication port is optional, and port 1812 is the default. However, we recommend that you configure it in order to avoid confusion as some RADIUS servers might refer to an older default.

2. (Optional) Specify the IP address by which the switch is identified by the RADIUS server. If you do not specify this, the RADIUS server uses the address of the interface sending the RADIUS request. We recommend that you specify this IP address because if the request gets diverted on an alternate route to the RADIUS server, the interface relaying the request might not be an interface on the switch.

```
[edit access]
user@switch# set access radius-server source-address 10.93.14.100
```

3. Configure the authentication order, making **radius** the first method of authentication:

```
[edit access]
user@switch# set profile profile1 authentication-order radius
```

4. Create a profile and specify the list of RADIUS servers to be associated with the profile. For example, you might choose to group your RADIUS servers geographically by city. This feature enables easy modification whenever you want to change to a different set of authentication servers.

```
[edit access profile]
user@switch# set atlanta radius authentication-server 10.0.0.100 10.2.14.200
```

5. Specify the group of servers to be used for 802.1X or MAC RADIUS authentication by identifying the profile name:

```
[edit access profile]
user@switch# set protocols dot1x authenticator authentication-profile-name denver
```

6. Configure the IP address of the EX Series switch in the list of clients on the RADIUS server. For specifics on configuring the RADIUS server, consult the documentation for your server.

## Configuring Captive Portal Authentication (CLI Procedure)

---

**NOTE:** This task uses Junos OS for EX Series switches with support for the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see [Configuring Captive Portal Authentication \(CLI Procedure\)](#). For ELS details, see [“Getting Started with Enhanced Layer 2 Software” on page 3](#).

---

Configure captive portal authentication (hereafter referred to as captive portal) on an EX Series switch so that users connected to the switch are authenticated before being allowed to access the network. When the user requests a webpage, a login page is displayed that requires the user to input a username and password. Upon successful authentication, the user is allowed to continue with the original page request and subsequent access to the network.

Before you begin, be sure you have:

- Performed basic bridging and VLAN configuration on the switch. See [“Example: Setting Up Basic Bridging and a VLAN for an EX Series Switch” on page 2281](#).
- Generated an SSL certificate and installed it on the switch. See [“Generating SSL Certificates to Be Used for Secure Web Access” on page 532](#).
- Configured basic access between the EX Series switch and the RADIUS server. See [“Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch” on page 1843](#).
- Designed your captive portal login page. See [“Designing a Captive Portal Authentication Login Page on an EX Series Switch” on page 1928](#).

This topic includes the following tasks:

- [Configuring Secure Access for Captive Portal on page 1926](#)
- [Enabling an Interface for Captive Portal on page 1927](#)
- [Configuring Bypass of Captive Portal Authentication on page 1927](#)

### Configuring Secure Access for Captive Portal

---

To configure secure access for captive portal:

1. Associate the security certificate with the Web server and enable HTTPS on the switch:

[edit]

```
user@switch# set system services web-management https local-certificate my-signed-cert
```

**NOTE:** You can enable HTTP instead of HTTPS, but we recommend HTTPS for security purposes.

2. Configure captive portal to use HTTPS:

```
[edit]
user@switch# set services captive-portal secure-authentication https
```

### Enabling an Interface for Captive Portal

To enable an interface for use with captive portal authentication:

```
[edit]
user@switch# set services captive-portal interface ge-0/0/10
```

### Configuring Bypass of Captive Portal Authentication

You can allow specific clients to bypass captive portal authentication:

```
[edit]
user@switch# set switch-options authentication-whitelist 00:10:12:e0:28:22
```

**NOTE:** Optionally, you can use `set switch-options authentication-whitelist 00:10:12:e0:28:22 interface ge-0/0/10.0` to limit the scope to the interface.

**NOTE:** If the client is already attached to the switch, you must clear its MAC address from the captive portal authentication by using the `clear captive-portal mac-address session-mac-addr` command after adding its MAC address to the whitelist. Otherwise the new entry for the MAC address will not be added to the Ethernet switching table and the authentication bypass will not be allowed.

#### Related Documentation

- [Example: Setting Up Captive Portal Authentication on an EX Series Switch on page 1898](#)
- [Understanding Authentication on EX Series Switches on page 1824](#)

## Designing a Captive Portal Authentication Login Page on an EX Series Switch

You can set up captive portal authentication on your switch to redirect all Web browser requests to a login page that requires the user to input a username and password before they are allowed access. Upon successful authentication, the user is allowed access to the network and redirected to the original page requested.

Junos OS provides a customizable template for the captive portal window that allows you to easily design and modify the look of the captive portal login page. You can modify the design elements of the template to change the look of your captive portal login page and to add instructions or information to the page. You can also modify any of the design elements of a captive portal login page.

The first screen displayed before the captive login page requires the user to read the “Terms and Conditions of Use”. By clicking the Agree button, the user can access the captive portal login page.

Figure 21 on page 1928 shows an example of a captive portal login page:

Figure 21: Example of a Captive Portal Login Page

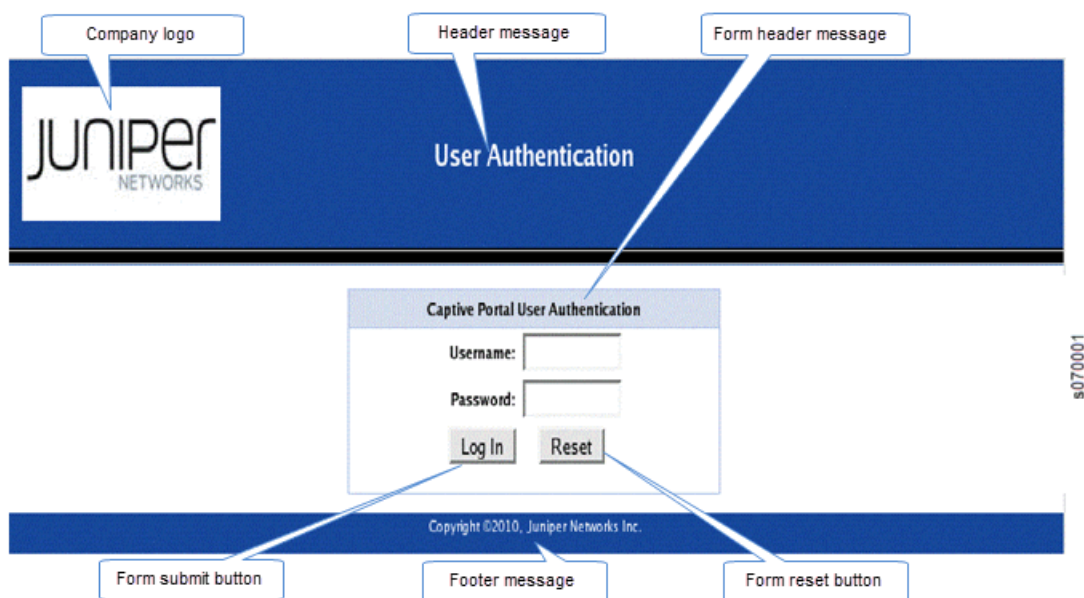

Table 177 on page 1928 summarizes the configurable elements of a captive portal login page.

Table 177: Configurable Elements of a Captive Portal Login Page

Element	CLI Statement	Description
Footer background color	<b>footer-bgcolor</b> <i>hex-color</i>	The HTML hexadecimal code for the background color of the captive portal login page footer.

Table 177: Configurable Elements of a Captive Portal Login Page (*continued*)

Element	CLI Statement	Description
Footer message	<b>footer-message</b> <i>text-string</i>	Text displayed in the footer of the captive portal login page. You can include copyright information, links, and additional information such as help instructions, legal notices, or a privacy policy  The default text shown in the footer is <b>Copyright ©2010, Juniper Networks Inc.</b>
Footer text color	<b>footer- text-color</b> <i>color</i>	Color of the text in the footer. The default color is white.
Form header background color	<b>form-header-bgcolor</b> <i>hex-color</i>	The HTML hexadecimal code for the background color of the header bar across the top of the form area of the captive portal login page.
Form header message	<b>form-header-message</b> <i>text-string</i>	Text displayed in the header of the captive portal login page. The default text is <b>Captive Portal User Authentication</b>
Form header text color	<b>form-header- text- color</b> <i>color</i>	Color of the text in the form header. The default color is black.
Form reset button label	<b>form-reset-label</b> <i>label-name</i>	Using the <b>Reset</b> button, the user can clear the username and password fields on the form.
Form submit button label	<b>form-submit-label</b> <i>label-name</i>	Using the <b>Login</b> button, the user can submit the login information.
Header background color	<b>header-bgcolor</b> <i>hex-color</i>	The HTML hexadecimal code for the background color of the captive portal login page header.
Header logo	<b>header-logo</b> <i>filename</i>	Filename of the file containing the image of the logo that you want to appear in the header of the captive portal login page. The image file can be in GIF, JPEG, or PNG format  You can upload a logo image file to the switch. Copy the logo to the /var/tmp directory on the switch (during commit, the files are saved to persistent locations).  If you do not specify a logo image, the Juniper Networks logo is displayed.
Header message	<b>header-message</b> <i>text-string</i>	Text displayed in the page header. The default text is <b>User Authentication</b> .
Header text color	<b>header-text- color</b> <i>color</i>	Color of the text in the header. The default color is white.
Post-authentication URL	<b>post-authentication-url</b> <i>url</i>	URL to which the users are directed on successful authentication. By default, users are directed to the page they had originally requested.

To design the captive portal login page:

- (Optional) Upload your logo image file to the switch:  

```
user@switch> file copy ftp://username:prompt@ftp.hostname.net/var/tmp/my-logo.jpeg
```
- Configure the custom options to specify the background colors and text displayed in the captive portal page:

```
[edit system services captive-portal]
user@switch# set custom-options header-bgcolor #006600
set custom-options header-message "Welcome to Our Network"
set custom-options banner-message "Please enter your username and password".The banner
displays the message "XXXXXXX" by default. The user can modify this message.
set custom-options footer-message "Copyright ©2010, Our Network"
```

Now you can commit the configuration.

**NOTE:** For the custom options that you do not specify, the default value is used.

## Controlling Authentication Session Timeouts (CLI Procedure)

For 802.1X and MAC RADIUS authentication sessions, you can specify authentication session timeout values using the **reauthentication** statement.

The session might also end when the MAC table aging time expires, because the session is removed from the authentication session table when the MAC address is removed from the Ethernet switching table. In order to prevent the session from being removed from the authentication session table, you must disassociate the authentication table from the Ethernet switching table using the **no-mac-table-binding** statement.

Before you begin:

- Specify the RADIUS server or servers to be used as the authentication server. See [“Specifying RADIUS Server Connections on an EX Series Switch \(CLI Procedure\)” on page 1925](#).
- Configure 802.1X authentication on the switch. See [“Configuring 802.1X Interface Settings \(CLI Procedure\)” on page 1908](#).

To configure the authentication session time on all interfaces:

```
[edit]
user@switch# set protocols dot1x authenticator interface all reauthentication seconds;
```

To configure the authentication session time on a single interface:

```
[edit]
user@switch# set protocols dot1x authenticator interface interface-name reauthentication
seconds;
```

To disable removal of authentication sessions from the authentication session table when a MAC address ages out of the Ethernet switching table, remove the binding of the authentication table to the Ethernet switching table.

To remove the binding on all interfaces:

```
[edit]
user@switch# set protocols dot1x authenticator no-mac-table-binding interface all;
```

To remove the binding on a single interface:

```
[edit]
user@switch# set protocols dot1x authenticator no-mac-table-binding interface interface-name;
```

## [edit access] Configuration Statement Hierarchy on EX Series Switches

This topic lists supported and unsupported configuration statements in the **[edit access]** hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.
- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see *EX Series Switch Software Features Overview*.

This topic lists:

- [Supported Statements in the \[edit access\] Hierarchy Level on page 1933](#)
- [Unsupported Statements in the \[edit access\] Hierarchy Level on page 1938](#)

### Supported Statements in the [edit access] Hierarchy Level

The following hierarchy shows the **[edit access]** configuration statements supported on EX Series switches:

```
access {
  address-assignment {
    abated-utilization;
    abated-utilization-v6;
    high-utilization;
    high-utilization-v6;
    neighbor-discovery-router-advertisement;
    pool name {
      family {
        inet {
          dhcp-attributes {
            boot-file filename;
            boot-server server-address;
            domain-name domain-name;
            grace-period seconds;
            maximum-lease-time (length | infinite);
```

```
name-server ip-address;
netbios-node-type (b-node | h-node | m-node | p-node);
option option-identifier-code;
option-match {
  option-82 {
    circuit-id match-value;
    remote-id match-value;
  }
}
router ip-address;
server-identifier;
tftp-server;
wins-server ip-address;
}
host;
network;
range;
xauth-attributes;
}
inet6 {
  dhcp-attributes;
  prefix;
  range;
}
}
link name {
  family {
    inet;
    inet6;
  }
}
}
}
address-pool pool-name {
  address address-or-prefix;
  address-range <low lower-limit> <high upper-limit>;
}
address-protection;
domain {
  delimiter characters;
  map name {
    aaa-logical-system name {
      aaa-routing-instance;
    }
    aaa-routing-instance aaa-routing-instance;
    access-profile;
    address-pool;
    dynamic-profile;
    padn destination-ip-address;
    strip-domain;
    target-logical-system;
    target-routing-instance;
  }
  parse-direction (left-to-right | right-to-left);
}
domain-name-server address;
```

```

domain-name-server-inet address;
domain-name-server-inet6 address;

- [Unsupported Statements in the \[edit protocols dot1x\] Hierarchy Level on page 1940](#)

### Supported Statements in the [edit protocols dot1x] Hierarchy Level

---

The following hierarchy shows the [edit protocols dot1x] configuration statements supported on EX Series switches:

```
protocols {
  dot1x {
    authenticator {
      authentication-profile-name access-profile-name;
      interface (all | [ interface-names ]) {
        disable;
        guest-vlan (vlan-id | vlan-name);
        mac-radius {
          flap-on-disconnect;
          restrict;
        }
        maximum-requests number;
        no-reauthentication;
        quiet-period seconds;
        reauthentication {
          interval seconds;
        }
        retries number;
        server-fail (deny | permit | use-cache | vlan-id | vlan-name);
        server-reject-vlan (vlan-id | vlan-name) {
          eapol-block;
          block-interval block-interval;
        }
        server-timeout seconds;
        supplicant (single | single-secure | multiple);
        supplicant-timeout seconds;
        transmit-period seconds;
      }
      no-mac-table-binding {
        interface interface-names
        static mac-address
      }
      static mac-address {
        interface interface-names;
        vlan-assignment (vlan-id | vlan-name);
      }
    }
  }
}
traceoptions {
  file filename <files number> <size size> <world-readable | no-world-readable> <match
    regex>;
  flag flag ;
}
```

### Unsupported Statements in the [edit protocols dot1x] Hierarchy Level

---

All statements in the [edit protocols dot1x] hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented.

## accounting

---

**Syntax**

```
accounting {
  events [ login change-log interactive-commands ];
  destination {
    radius {
      server {
        server-address {
          accounting-port port-number;
          secret password;
          source-address address;
          retry number;
          timeout seconds;
        }
      }
    }
    tacplus {
      server {
        server-address {
          port port-number;
          secret password;
          single-connection;
          timeout seconds;
        }
      }
    }
  }
  enhanced-avs-max <number>;
}
```

**Hierarchy Level** [edit system]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
**enhanced-avs-max** statement introduced in Junos OS Release 14.1.

**Description** Configure audit of TACACS+ or RADIUS authentication events, configuration changes, and interactive commands.

The remaining statements are explained separately.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

## accounting (Access Profile)

**Syntax**

```

accounting {
    accounting-stop-on-access-deny;
    accounting-stop-on-failure;
    address-change-immediate-update;
    coa-immediate-update;
    coa-no-override service-class-attribute;
    duplication;
    duplication-vrf {
        access-profile-name profile-name;
        vrf-name vrf-name;
    }
    immediate-update;
    order [ accounting-method ];
    send-acct-status-on-config-change
    statistics (time | volume-time);
    update-interval minutes;
    wait-for-acct-on-ack;
}

```

**Hierarchy Level** [edit access profile *profile-name*]

**Release Information** Statement introduced in Junos OS Release 9.1.  
Statement introduced in Junos OS Release 9.1 for EX Series switches.

**Description** Configure RADIUS accounting parameters and enable RADIUS accounting for an access profile.

The remaining statements are explained separately.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

**Related Documentation**

## accounting-order

---

<b>Syntax</b>	accounting-order (radius   [ <i>accounting-order-data-list</i> ]);
<b>Hierarchy Level</b>	[edit access profile <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 8.0. Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
<b>Description</b>	Enable RADIUS accounting for an L2TP profile.
<b>Options</b>	<b>radius</b> —Use the RADIUS accounting method.  <b>[<i>accounting-order-data-list</i>]</b> —Set of data listing the accounting order to be used, enclosed by brackets. This can be any combination of accounting methods, up to and including and entire list of the entire accounting order.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Access Profiles for L2TP or PPP Parameters</i></li></ul>

## accounting-port

---

<b>Syntax</b>	accounting-port <i>port-number</i> ;
<b>Hierarchy Level</b>	[edit access radius-server <i>server-address</i> ], [edit access profile <i>profile-name</i> radius-server <i>server-address</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
<b>Description</b>	Configure the port number on which to contact the accounting server.
<b>Options</b>	<b><i>port-number</i></b> —Port number on which to contact the accounting server. Most RADIUS servers use port number 1813 (as specified in RFC 2866).
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.

## address-assignment (Address-Assignment Pools)

```
Syntax  address-assignment {
        abated-utilization percentage;
        abated-utilization-v6 percentage;
        high-utilization percentage;
        high-utilization-v6 percentage;
        neighbor-discovery-router-advertisement ndra-pool-name;
        pool pool-name {
            family family {
                dhcp-attributes {
                    protocol-specific attributes;
                }
                host hostname {
                    hardware-address mac-address;
                    ip-address ip-address;
                }
                network ip-prefix / <prefix-length>;
                prefix ipv6-prefix;
                range range-name {
                    high upper-limit;
                    low lower-limit;
                    prefix-length prefix-length;
                }
            }
            link pool-name;
        }
    }
```

**Hierarchy Level** [edit access]

**Release Information** Statement introduced in Junos OS Release 9.0.  
Statement introduced in Junos OS Release 12.1 for EX Series switches.

**Description** Configure address-assignment pools that can be used by different client applications.

**NOTE:** Subordinate statement support depends on the platform. See individual statement topics for more detailed support information.

**Options** *pool-name*—Name assigned to an address-assignment pool.

The remaining statements are explained separately.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

## address-protection

---

<b>Syntax</b>	address-protection;
<b>Hierarchy Level</b>	[edit access], [edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> access]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2. Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
<b>Description</b>	<p>Prevents IPv6 prefixes from being used more than once when AAA is used to supply IPv6 prefixes for router advertisement.</p> <p>If enabled, the router checks the following attributes received from external servers:</p> <ul style="list-style-type: none"><li>• <i>Framed-IPv6-Prefix</i></li><li>• <i>Framed-IPv6-Pool</i></li></ul> <p>The router then takes one of the following actions:</p> <ul style="list-style-type: none"><li>• If a prefix overlaps with a prefix in an address pool, the prefix is taken from the pool if it is available.</li><li>• If the prefix is already in use, it is rejected as unavailable.</li><li>• If the prefix length requested from the external server does not match the pool's prefix length exactly, the authentication request is denied. If configured, the Acct-Stop message includes a termination cause.</li></ul>
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Duplicate Prefix Protection for Router Advertisement</i></li><li>• <i>Duplicate Prefix Protection for NDRA</i></li></ul>

## authorization-order

---

<b>Syntax</b>	authorization-order (jsrc   [ <i>authorization-order-data-list</i> ]);
<b>Hierarchy Level</b>	[edit access profile <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.6. Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
<b>Description</b>	Configure AAA to use JSRC in an SRC environment to request authorization from the SAE when verifying that a DHCP subscriber can access the router. When you include this statement, AAA ignores any configured authentication order settings. This statement is ignored for non-DHCP subscribers.
<b>Options</b>	<p>jsrc—Use JSRC application to communicate with the SAE for subscriber authorization. JSRC is the only application that is currently available.</p> <p>[<i>authorization-order-data-list</i>]<i>—Set of data listing the authorization order to be used, enclosed by brackets. This can be any combination of authorization methods, up to and including and entire list of the entire authorization order.</i></p>
<b>Required Privilege Level</b>	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring JSRC</i></li> <li>• <i>Authorizing Subscribers with JSRC</i></li> </ul>

## authentication-order

---

<b>Syntax</b>	authentication-order [(none   ldap   password   radius   secureid)];
<b>Hierarchy Level</b>	[edit access profile <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement introduced in Junos OS Release 11.1 for the QFX Series.
<b>Description</b>	(EX and QFX Series only) Configure the order of authentication, authorization, and accounting (AAA) servers to use while sending authentication messages.
<b>Default</b>	Not enabled
<b>Options</b>	<b>none</b> —No authentication for specified subscribers.  <b>ldap</b> —Lightweight Directory Access Protocol.  <b>password</b> —Locally configured password in access profile.  <b>radius</b> —RADIUS authentication.  <b>secureid</b> —RSA SecurID authentication.
<b>Required Privilege Level</b>	<b>admin</b> —To view this statement in the configuration. <b>admin-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Example: Connecting a RADIUS Server for 802.1X to an EX Series Switch on page 1843</a></li><li>• <a href="#">Configuring 802.1X RADIUS Accounting (CLI Procedure) on page 1909</a></li></ul>

## authentication-whitelist

---

<b>Syntax</b>	<pre>authentication-whitelist {   mac-address {     interface <i>interface-name</i>;     vlan-assignment ( <i>vlan-id</i>   <i>vlan-name</i> );   } }</pre>
<b>Hierarchy Level</b>	[edit ethernet-switching-options], [edit switch-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.1 for EX Series switches. Hierarchy level [edit switch-options] introduced in Junos OS Release 13.2X50-D10 for EX Series switches (ELS).
<b>Description</b>	Configure MAC addresses for which RADIUS authentication is to be bypassed.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Example: Setting Up Captive Portal Authentication on an EX Series Switch</i></li> <li>• <a href="#">Example: Setting Up Captive Portal Authentication on an EX Series Switch on page 1898</a></li> <li>• <a href="#">Configuring Captive Portal Authentication (CLI Procedure)</a></li> <li>• <a href="#">Configuring Captive Portal Authentication (CLI Procedure) on page 1926</a></li> </ul>

## authenticator

---

**Syntax**    authenticator {  
              authentication-profile-name *access-profile-name*;  
              interface (all | [ *interface-names* ]) {  
                  disable;  
                  guest-vlan ( *vlan-id* | *vlan-name* );  
                  lldp-med-bypass;  
                  mac-radius <restrict>;  
                  maximum-requests *number*;  
                  no-reauthentication;  
                  quiet-period *seconds*;  
                  reauthentication *interval*;  
                  retries *number*;  
                  server-fail (deny | permit | use-cache | *vlan-id* | *vlan-name*);  
                  server-reject-vlan ( *vlan-id* | *vlan-name* ) {  
                      eapol-block;  
                      block-interval *block-interval*;  
                  }  
                  server-timeout *seconds*;  
                  supplicant (single | single-secure | multiple);  
                  supplicant-timeout *seconds*;  
                  transmit-period *seconds*;  
                  }  
                  no-mac-table-binding {  
                      interface *interface-names*;  
                      static mac-address;  
                  }  
                  radius-options {  
                      use-vlan-id;  
                      use-vlan-name;  
                  }  
                  static mac-address {  
                      *vlan-assignment* *vlan-identifier*;  
                  }  
              }

**Hierarchy Level**    [edit protocols dot1x]

**Release Information**    Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description**    Configure an authenticator for 802.1X authentication.

The statements are explained separately.

**NOTE:** You cannot configure 802.1X user authentication on interfaces that have been enabled for Q-in-Q tunneling.

---

**Default**    No static MAC address or VLAN is configured.

<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring 802.1X Interface Settings (CLI Procedure) on page 1908</a></li> <li>• <a href="#">Specifying RADIUS Server Connections on an EX Series Switch (CLI Procedure) on page 1925</a></li> <li>• <a href="#">Example: Configuring Static MAC Bypass of Authentication on an EX Series Switch on page 1872</a></li> </ul>

## client-accounting-algorithm

<b>Syntax</b>	client-accounting-algorithm (direct   round-robin);
<b>Hierarchy Level</b>	[edit access profile <i>profile-name</i> radius <b>options</b> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.0. Statement introduced in Junos OS for EX Series switches Release 13.2X50-D10.
<b>Description</b>	Configure the access method the router uses to access RADIUS accounting servers.
<b>Default</b>	direct
<b>Options</b>	<p><b>direct</b>—Use the direct method.</p> <p><b>round-robin</b>—Use the round-robin method.</p>
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">Configuring RADIUS Server Parameters for Subscriber Access</a></li> <li>• <a href="#">Configuring RADIUS Server Options for Subscriber Access</a></li> </ul>

## client-authentication-algorithm

---

<b>Syntax</b>	client-authentication-algorithm (direct   round-robin);
<b>Hierarchy Level</b>	[edit access profile <i>profile-name</i> radius <a href="#">options</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 10.0. Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
<b>Description</b>	Configure the access method the router uses to access RADIUS authentication servers.
<b>Default</b>	direct
<b>Options</b>	<b>direct</b> —Use the direct method.  <b>round-robin</b> —Use the round-robin method.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring RADIUS Server Parameters for Subscriber Access</i></li><li>• <i>Configuring RADIUS Server Options for Subscriber Access</i></li></ul>

## coa-dynamic-variable-validation

---

<b>Syntax</b>	coa-dynamic-variable-validation;
<b>Hierarchy Level</b>	[edit access profile <i>profile-name</i> radius <a href="#">options</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1. Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
<b>Description</b>	Specify that when a CoA operation includes a change to a client profile dynamic variable that cannot be applied (such as an update to a non-existent filter), the router does not apply any changes to client profile dynamic variables in the request, and responds with a NACK message.
<b>Default</b>	If you do not configure this statement, the router does not apply any incorrect variable updates but does make any other changes to the client profile dynamic variables, and then responds with an ACK message.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring RADIUS Server Options for Subscriber Access</i></li><li>• <i>RADIUS Server Options for Subscriber Access</i></li><li>• <i>Configuring RADIUS Server Parameters for Subscriber Access</i></li></ul>

## destination (Accounting)

```
Syntax destination {
    radius {
        server {
            server-address {
                accounting-port port-number;
                secret password;
                source-address address;
                retry number;
                timeout seconds;
            }
        }
    }
    tacplus {
        server {
            server-address {
                port port-number;
                secret password;
                single-connection;
                timeout seconds;
            }
        }
    }
}
```

**Hierarchy Level** [edit system [accounting](#)]

**Release Information** Statement introduced before Junos OS Release 7.4.  
**radius** statement added in Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
 Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure the authentication server.

**Options** The remaining statements are explained separately.

**Required Privilege Level** system—To view this statement in the configuration.  
 system-control—To add this statement to the configuration.

**Related Documentation**

- *Configuring RADIUS System Accounting*

## destination-host (Gx-Plus)

---

<b>Syntax</b>	<code>destination-host <i>hostname</i>;</code>
<b>Hierarchy Level</b>	[edit access gx-plus <a href="#">partition</a> <i>partition-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2. Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
<b>Description</b>	Configure the host on which the PCRF application resides.
<b>Options</b>	<i>hostname</i> —Host on which the PCRF is installed.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Gx-Plus</i></li><li>• <i>Configuring the Gx-Plus Partition</i></li></ul>

## destination-realm (Gx-Plus)

---

<b>Syntax</b>	<code>destination-realm <i>realm</i>;</code>
<b>Hierarchy Level</b>	[edit access gx-plus <a href="#">partition</a> <i>partition-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2. Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
<b>Description</b>	Configure the realm in which the PCRF host resides.
<b>Options</b>	<i>realm</i> —Realm in which the PCRF host resides.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Gx-Plus</i></li><li>• <i>Configuring the Gx-Plus Partition</i></li></ul>

---

## diameter-instance (Gx-Plus)

---

<b>Syntax</b>	<code>diameter-instance <i>instance-name</i>;</code>
<b>Hierarchy Level</b>	[edit access gx-plus <a href="#">partition</a> <i>partition-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2. Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
<b>Description</b>	Specify the Diameter instance associated with the Gx-Plus partition.
<b>Options</b>	<i>instance-name</i> —Name of the Diameter instance. Currently, only <b>master</b> is supported.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Gx-Plus</i></li><li>• <i>Configuring the Gx-Plus Partition</i></li></ul>

## domain (Domain Map)

---

**Syntax**    domain {  
              delimiter [*delimiter-character*];  
              map *domain-map-name* {  
                  aaa-logical-system *logical-system-name* {  
                      aaa-routing-instance *routing-instance-name*;  
                      }  
                  aaa-routing-instance *routing-instance-name*;  
                  access-profile *profile-name*;  
                  address-pool *pool-name*;  
                  dynamic-profile *profile-name*;  
                  padn *destination-address* {  
                      mask *destination-mask*;  
                      metric *route-metric*;  
                      }  
                  strip-domain;  
                  target-logical-system *logical-system-name* {  
                      target-routing-instance *routing-instance-name*;  
                      }  
                  target-routing-instance *routing-instance-name*;  
                  tunnel-profile *profile-name*;  
                  }  
              parse-direction (left-to-right | right-to-left);  
              parse-order (domain-first | realm-first);  
              realm-delimiter [*delimiter-character*];  
              realm-parse-direction (left-to-right | right-to-left);  
              }  
              }

**Hierarchy Level**    [edit access]

**Release Information**    Statement introduced in Junos OS Release 10.4.

**Description**    Configure a domain map, which is used to map access options and session parameters for subscriber sessions.

The remaining statements are explained separately.

**Required Privilege Level**    admin—To view this statement in the configuration.  
                                  admin-control—To add this statement to the configuration.

**Related Documentation**    • *Configuring a Domain Map*

## domain-name-server (Routing Instances and Access Profiles)

<b>Syntax</b>	<code>domain-name-server <i>dns-address</i>;</code>
<b>Hierarchy Level</b>	[edit access], [edit access profile]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3. Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
<b>Description</b>	Configure an IPv4 address for a DNS name server. You can configure an address globally for a routing instance at the <b>[edit access]</b> hierarchy level or for an access profile at the <b>[edit access profile <i>profile-name</i>]</b> hierarchy level. You can configure more than one address by including the statement multiple times.

**NOTE:** A DNS name server address configured with this statement is lower in preference than one configured with the [domain-name-server-inet](#) statement.

<b>Options</b>	<i>dns-address</i> —IPv4 address of the DNS name server.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li><i>Configuring DNS Name Server Addresses for Subscriber Management</i></li> <li><i>DNS Name Server Address Overview</i></li> </ul>

## domain-name-server-inet (Routing Instances and Access Profiles)

---

<b>Syntax</b>	<code>domain-name-server-inet <i>dns-address</i>;</code>
<b>Hierarchy Level</b>	[edit access], [edit access profile]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3. Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
<b>Description</b>	Configure an IPv4 address for a DNS name server. You can configure an address globally for a routing instance at the [edit access] hierarchy level or for an access profile at the [edit access profile <i>profile-name</i> ] hierarchy level. You can configure more than one address by including the statement multiple times.

**NOTE:** A DNS name server address configured with this statement is higher in preference than one configured with the `domain-name-server` statement.

---

<b>Options</b>	<i>dns-address</i> —IPv4 address of the DNS name server.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring DNS Name Server Addresses for Subscriber Management</i></li><li>• <i>DNS Name Server Address Overview</i></li></ul>

## domain-name-server-inet6 (Routing Instances and Access Profiles)

<b>Syntax</b>	<code>domain-name-server-inet6 <i>dns-address</i>;</code>
<b>Hierarchy Level</b>	<code>[edit access],</code> <code>[edit access profile]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3. Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
<b>Description</b>	Configure an IPv6 address for a DNS name server. You can configure an address globally for a routing instance at the <b>[edit access]</b> hierarchy level or for an access profile at the <b>[edit access profile <i>profile-name</i>]</b> hierarchy level. You can configure more than one address by including the statement multiple times.
<b>Options</b>	<i>dns-address</i> —IPv6 address of the DNS name server.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring DNS Name Server Addresses for Subscriber Management</i></li> <li>• <i>DNS Name Server Address Overview</i></li> </ul>

## ethernet-port-type-virtual

<b>Syntax</b>	<code>ethernet-port-type-virtual;</code>
<b>Hierarchy Level</b>	<code>[edit access profile <i>profile-name</i> radius options]</code>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.1. Statement introduced in Junos OS Release 9.1 for EX Series switches.
<b>Description</b>	Specify the physical port type the router or switch uses to authenticate clients. The router or switch passes a port type of <b>ethernet</b> in RADIUS attribute 61 (NAS-Port-Type) by default. This statement specifies a port type of <b>virtual</b> .

**NOTE:** This statement takes precedence over the **nas-port-type** statement if you include both statements in the same access profile.

<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring RADIUS Server Options for Subscriber Access</i></li> <li>• <i>Configuring RADIUS Server Parameters for Subscriber Access</i></li> </ul>

## global (Gx-Plus)

---

<b>Syntax</b>	<pre>global {     include-ipv6;     max-outstanding-requests <i>number</i>; }</pre>
<b>Hierarchy Level</b>	[edit access <a href="#">gx-plus</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2. Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
<b>Description</b>	Configure global attributes for the Gx-Plus application.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Gx-Plus</a></li></ul>

## gx-plus (Gx-Plus)

---

<b>Syntax</b>	<pre>gx-plus {     global {         include-ipv6;         max-outstanding-requests <i>number</i>;     }     partition <i>partition-name</i> {         diameter-instance <i>instance-name</i>;         destination-host <i>hostname</i>;         destination-realm <i>realm</i>;     } }</pre>
<b>Hierarchy Level</b>	[edit access]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2. Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
<b>Description</b>	Configure the Gx-Plus application to interact with a PCRF to authorize and provision subscribers.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring Gx-Plus</a></li></ul>

## ignore

---

<b>Syntax</b>	<pre>ignore {     dynamic-iflset-name;     framed-ip-netmask;     input-filter;     logical-system-routing-instance;     output-filter; }</pre>
<b>Hierarchy Level</b>	[edit access profile <i>profile-name</i> radius attributes]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.1.</p> <p>Statement introduced in Junos OS Release 9.1 for EX Series switches.</p>
<b>Description</b>	Configure the router or switch to ignore the specified attributes in RADIUS Access-Accept messages. By default, the router or switch processes the attributes it receives from the external server.
<b>Options</b>	<p><b>dynamic-iflset-name</b>—Ignore Interface-Set/Dynamic-Ifset-Name (VSA 26-130).</p> <p><b>framed-ip-netmask</b>—Ignore Framed-IP-Netmask (RADIUS attribute 9).</p> <p><b>input-filter</b>—Ignore Ingress-Policy-Name (VSA 26-10).</p> <p><b>logical-system-routing-instance</b>—Ignore Virtual-Router (VSA 26-1).</p> <p><b>output-filter</b>—Ignore Egress-Policy-Name (VSA 26-11).</p>
<b>Required Privilege Level</b>	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring RADIUS Server Parameters for Subscriber Access</i></li> </ul>

## include-ipv6 (Gx-Plus)

---

<b>Syntax</b>	include-ipv6;
<b>Hierarchy Level</b>	[edit access gx-plus <a href="#">global</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3. Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
<b>Description</b>	Include IPv6 subscribers in Gx-Plus provisioning requests.
<b>Default</b>	By default, IPv6 subscribers are not included.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Gx-Plus Global Attributes</i></li><li>• <i>Configuring Gx-Plus</i></li></ul>

## interface (Static MAC Bypass)

<b>Syntax</b>	<code>interface [<i>interface-names</i>];</code>
<b>Hierarchy Level</b>	[edit protocols dot1x <a href="#">authenticator</a> authentication-profile-name static <i>mac-address</i> ], [edit ethernet-switching-options <a href="#">authentication-whitelist</a> <i>mac-address</i> ], [edit <a href="#">switch-options on page 2212</a> <a href="#">authentication-whitelist</a> <i>mac-address</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement added to the <a href="#">[edit ethernet-switching-options authentication-whitelist]</a> hierarchy in Junos OS Release 10.1 for EX Series switches. Statement added to the <a href="#">[edit switch-options authentication-whitelist]</a> hierarchy in Junos OS Release 13.2X50-D10 for EX Series switches (ELS).
<b>Description</b>	Configure interfaces on which the specified MAC addresses are allowed to bypass RADIUS authentication and allowed to connect to the LAN without authentication.
<b>Options</b>	<i>interface-names</i> —List of interfaces.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show dot1x static-mac-address on page 2016</a></li> <li>• <a href="#">Example: Configuring Static MAC Bypass of Authentication on an EX Series Switch on page 1872</a></li> <li>• <a href="#">Example: Setting Up Captive Portal Authentication on an EX Series Switch</a></li> <li>• <a href="#">Example: Setting Up Captive Portal Authentication on an EX Series Switch</a></li> <li>• <a href="#">Configuring Captive Portal Authentication (CLI Procedure)</a></li> </ul>

## interface (VoIP)

---

<b>Syntax</b>	interface (all   [ <i>interface-name</i> ]   access-ports) { vlan <i>vlan-name</i> ; forwarding-class <assured-forwarding   best-effort   expedited-forwarding   network-control>; }
<b>Hierarchy Level</b>	<ul style="list-style-type: none"><li>• For platforms with ELS:     [edit <a href="#">switch-options</a> on page 2212 <b>voip</b>]</li><li>• For platforms without ELS:     [edit ethernet-switching-options <b>voip</b>],</li></ul>
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches. Hierarchy level [edit <b>switch-options</b> ] introduced in Junos OS Release 13.2X50-D10. (See <a href="#">“Getting Started with Enhanced Layer 2 Software”</a> on page 3 for information about ELS.)
<b>Description</b>	Enable voice over IP (VoIP) for all interfaces or specific interfaces.
<b>Options</b>	all   <i>interface-name</i>   access-ports—Enable VoIP on all interfaces, on a specific interface, or on all access ports.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Example: Setting Up VoIP with 802.1X and LLDP-MED on an EX Series Switch</i></li><li>• <i>Example: Configuring VoIP on an EX Series Switch Without Including 802.1X Authentication</i></li><li>• <i>Example: Configuring VoIP on an EX Series Switch Without Including LLDP-MED Support</i></li></ul>

## interface-description-format

---

<b>Syntax</b>	<pre>interface-description-format {     exclude-adapter;     exclude-sub-interface; }</pre>
<b>Hierarchy Level</b>	[edit access profile <i>profile-name</i> radius <a href="#">options</a> ]
<b>Release Information</b>	<p>Statement introduced in Junos OS Release 9.1.</p> <p>Statement introduced in Junos OS Release 9.1 for EX Series switches.</p> <p>Options <b>exclude-adapter</b> and <b>exclude-sub-interface</b> introduced in Junos OS Release 10.4.</p>
<b>Description</b>	Specify the information that is excluded from the interface description that the device passes to RADIUS for inclusion in the RADIUS attribute 87 (NAS-Port-Id). By default, the device includes both the subinterface and the adapter in the interface description.
<b>Options</b>	<p><b>exclude-adapter</b>—Exclude the adapter from the interface description.</p> <p><b>exclude-sub-interface</b>—Exclude the subinterface from the interface description.</p>
<b>Required Privilege Level</b>	<p>admin—To view this statement in the configuration.</p> <p>admin-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring RADIUS Server Options for Subscriber Access</i></li> <li>• <i>RADIUS Server Options for Subscriber Access</i></li> </ul>

## juniper-dsl-attributes

---

<b>Syntax</b>	juniper-dsl-attributes;
<b>Hierarchy Level</b>	[edit access profile <i>profile-name</i> radius <a href="#">options</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.4.
<b>Description</b>	<p>Configure AAA to add Juniper Networks DSL VSAs to the RADIUS authentication and accounting request messages for subscribers. If the router has not received and processed the corresponding ANCP attributes from the access node, then AAA provides only the following in these RADIUS messages:</p> <ul style="list-style-type: none"><li>• Downstream-Calculated-QoS-Rate (IANA 4874, 26-141)—Default configured advisory transmit speed.</li><li>• Upstream-Calculated-QoS-Rate (IANA 4874, 26-142)—Default configured advisory receive speed.</li></ul>
<b>Default</b>	The Juniper Networks DSL VSAs are not added to the RADIUS authentication and accounting request messages. However, the DSL Forum VSA—if available—is added to RADIUS messages by default.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring AAA to Include Juniper Networks DSL VSAs in RADIUS Messages</i></li><li>• <i>Configuring the ANCP Agent</i></li></ul>

## max-outstanding-requests (Gx-Plus)

<b>Syntax</b>	max-outstanding-requests <i>number</i> ;
<b>Hierarchy Level</b>	[edit access gx-plus <a href="#">global</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.2. Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
<b>Description</b>	Limit the number of outstanding requests to the PCRF that Gx-Plus can retry when the requests are improperly answered. Too many requests risks overloading the PCRF and increases the chance of losing messages.
<b>Options</b>	<i>number</i> —Number of outstanding requests from Gx-Plus to the PCRF that can exist at any time. <b>Default:</b> 40 <b>Range:</b> 2 through 40
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring Gx-Plus Global Attributes</i></li> <li>• <i>Configuring Gx-Plus</i></li> </ul>

## nas-identifier

<b>Syntax</b>	nas-identifier <i>identifier-value</i> ;
<b>Hierarchy Level</b>	[edit access profile <i>profile-name</i> radius <a href="#">options</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.1. Statement introduced in Junos OS Release 9.1 for EX Series switches.
<b>Description</b>	Configure the value for the client RADIUS attribute 32 (NAS-Identifier). This attribute is used for authentication and accounting requests.
<b>Options</b>	<i>identifier-value</i> —String to use for authentication and accounting requests. <b>Range:</b> 1 through 64 characters
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring RADIUS Server Options for Subscriber Access</i></li> <li>• <i>Configuring RADIUS Server Parameters for Subscriber Access</i></li> </ul>

## nas-port-extended-format (Access Profile)

---

**Syntax**    `nas-port-extended-format {  
              adapter-width width;  
              ae-width width;  
              port-width width;  
              slot-width width;  
              stacked-vlan-width width;  
              vlan-width width;  
              atm {  
                  adapter-width width;  
                  port-width width;  
                  slot-width width;  
                  vci-width width;  
                  vpi-width width;  
              }  
              }`

**Hierarchy Level**    [edit access profile *profile-name* radius [options](#)]

**Release Information**    Statement introduced in Junos OS Release 9.1.  
Statement introduced in Junos OS Release 9.1 for EX Series switches.  
Option **ae-width** introduced in Junos OS Release 12.1.  
Option **stacked** introduced in Junos OS Release 12.3.  
Option **atm** introduced in Junos OS Release 12.3R3 and supported in later 12.3Rx releases.  
Option **atm** supported in Junos OS Release 13.2 and later releases. (Not supported in Junos OS Release 13.1.)

**Description**    In an access profile, configure the RADIUS client to use the extended format for RADIUS attribute 5 (NAS-Port) and specify the width of the fields in the NAS-Port attribute. You can use the same access profile to configure the NAS-Port extended format for Ethernet subscribers and ATM subscribers.

**Options**    **adapter-width *width***—Number of bits in the adapter field.

**ae-width *width***—Number of bits in the aggregated Ethernet identifier field.

**port-width *width***—Number of bits in the port field.

**slot-width *width***—Number of bits in the slot field.

**stacked**—Include stacked VLAN IDs, in addition to VLAN IDs, in the NAS-Port extended format.

**stacked-vlan-width *width***—Number of bits in the SVLAN ID field.

**vlan-width *width***—Number of bits in the VLAN ID field.

**atm**—Configure the NAS-Port extended format for ATM subscribers; options include:

- **adapter-width *width***—Number of bits in the adapter field.
- **port-width *width***—Number of bits in the port field.

- **slot-width *width***—Number of bits in the slot field.
- **vci-width *width***—Number of bits in the ATM virtual circuit identifier (VCI) field.
- **vpi-width *width***—Number of bits in the ATM virtual path identifier (VPI) field.

**NOTE:** Each field can be 0 through 32 bits wide; however, the total of the widths of all fields must not exceed 32 bits, or the configuration fails.

The router may truncate the values of individual fields depending on the bit width you specify.

<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring RADIUS Server Options for Subscriber Access</i></li> <li>• <i>Configuring RADIUS Server Parameters for Subscriber Access</i></li> </ul>

## nas-port-id-delimiter (Subscriber Management)

<b>Syntax</b>	nas-port-id-delimiter <i>delimiter-character</i> ;
<b>Hierarchy Level</b>	[edit access profile <i>profile-name</i> radius <a href="#">options</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.4. Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
<b>Description</b>	Specify the character that the router uses as a separator between the concatenated values in the NAS-Port-ID string. The router uses the delimiter when you configure more than one value in the <b>nas-port-id-format</b> statement.
<b>Default</b>	The hash (#) character.
<b>Options</b>	<b><i>delimiter-character</i></b> —Character used for the delimiter.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring RADIUS Server Options for Subscriber Access</i></li> <li>• <i>Configuring RADIUS Server Parameters for Subscriber Access</i></li> <li>• <i>Configuring a NAS-Port-ID with Additional Options</i></li> </ul>

## nas-port-id-format (Subscriber Management)

---

<b>Syntax</b>	<pre>nas-port-id-format {   agent-circuit-id;   agent-remote-id;   interface-description;   nas-identifier; }</pre>
<b>Hierarchy Level</b>	[edit access profile <i>profile-name</i> radius <a href="#">options</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.4. Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
<b>Description</b>	Specify the information that the router includes in the NAS-Port-ID (RADIUS attribute 87) that it is passed to the RADIUS server during authentication and accounting. You can include any combination of the optional values.
<b>Default</b>	The router includes the interface description.
<b>Options</b>	<p><b>agent-circuit-id</b>—Include the agent circuit ID from either DHCP option 82 or the DSL forum VSAs.</p> <p><b>agent-remote-id</b>—Include the agent remote ID from either DHCP option 82 or the DSL forum VSAs.</p> <p><b>interface-description</b>—Include the interface description.</p> <p><b>nas-identifier</b>—Include the NAS identifier value (RADIUS attribute 32).</p>
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring RADIUS Server Options for Subscriber Access</i></li><li>• <i>Configuring RADIUS Server Parameters for Subscriber Access</i></li><li>• <i>Configuring a NAS-Port-ID with Additional Options</i></li></ul>

## nas-port-type (Subscriber Management)

**Syntax**    `nas-port-type {  
          ethernet {  
            port-type;  
          }  
}`

**Hierarchy Level**    [edit access profile *profile-name* radius [options](#)]

**Release Information**    Statement introduced in Junos OS Release 11.4.  
Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.

**Description**    Specify the port type used to authenticate subscribers. The router includes the port type in RADIUS attribute 61 (NAS-Port-Type attribute).

**NOTE:** This statement is ignored if the [ethernet-port-type-virtual](#) statement is included in the same access profile.

**Default**    The router uses a port type of **ethernet**.

**Options**    *port-type*—One of the following port types:

- *value*—A value from 0-65535
- **adsl-cap**—Asymmetric DSL, carrierless amplitude phase (CAP) modulation
- **adsl-dmt**—Asymmetric DSL, discrete multitone (DMT)
- **async**—Asynchronous
- **cable**—Cable
- **ethernet**—Ethernet
- **fddi**—Fiber Distributed Data Interface
- **g3-fax**—G.3 Fax
- **hdlc-clear-channel**—HDLC Clear Channel
- **iapp**—Inter-Access Point Protocol (IAPP)
- **isdsl**—ISDN DSL
- **isdn-sync**—ISDN Synchronous
- **isdn-v110**—ISDN Async V.110
- **isdn-v120**—ISDN Async V.120
- **piafs**—Personal Handyphone System (PHS) Internet Access Forum Standard
- **sdsl**—Symmetric DSL

- **sync**—Synchronous
- **token-ring**—Token Ring
- **virtual**—Virtual
- **wireless**—Other wireless
- **wireless-1x-ev**—Wireless 1xEV
- **wireless-cdma2000**—Wireless code division multiple access (CDMA) 2000
- **wireless-ieee80211**—Wireless 802.11
- **wireless-umts**—Wireless universal mobile telecommunications system (UMTS)
- **x25**—X.25
- **x75**—X.75
- **xdsl**—DSL of unknown type

<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.

## radius-options (Protocols 802.1X)

---

<b>Syntax</b>	<pre>radius-options {     use-vlan-id;     use-vlan-name; }</pre>
<b>Hierarchy Level</b>	[edit protocols dot1x <a href="#">authenticator</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.1 for EX Series switches.
<b>Description</b>	Configure 802.1X authenticator so that the VLAN ID or VLAN name is included in the packet sent to the RADIUS server to request authentication.
<b>Options</b>	<p><b>use-vlan-id</b>—Include the VLAN ID in the packet sent to the RADIUS server to request authentication.</p> <p><b>use-vlan-name</b>—Include the VLAN name in the packet sent to the RADIUS server to request authentication. The VLAN name is sent even if the 802.1X interface is configured with the VLAN ID.</p>
<b>Required Privilege Level</b>	<p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <a href="#">Configuring 802.1X Interface Settings (CLI Procedure) on page 1908</a></li><li>• <a href="#">Specifying RADIUS Server Connections on an EX Series Switch (CLI Procedure) on page 1925</a></li><li>• <a href="#">authenticator on page 1950</a></li></ul>

## radius-options (Access)

<b>Syntax</b>	<code>radius-options {     revert-interval <i>seconds</i>; }</code>
<b>Hierarchy Level</b>	[edit access], [edit access profile <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Release 8.5 of Junos OS.
<b>Description</b>	Configure RADIUS options.
<b>Options</b>	The remaining statement is explained separately.
<b>Required Privilege Level</b>	access—To view this statement in the configuration. access-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Junos OS Security Configuration Guide</i></li> </ul>

## radius-server (System)

<b>Syntax</b>	<code>radius-server <i>server-address</i> {     accounting-port <i>port-number</i>;     port <i>number</i>;     retry <i>number</i>;     secret <i>password</i>;     source-address <i>source-address</i>;     timeout <i>seconds</i>; }</code>
<b>Hierarchy Level</b>	[edit system]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4.
<b>Description</b>	<p>Configure a RADIUS server for Point-to-Point Protocol (PPP).</p> <p>To configure multiple RADIUS servers, include multiple <b>radius-server</b> statements. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached.</p>
<b>Options</b>	<p><b><i>server-address</i></b>—Address of the RADIUS authentication server.</p> <p>The remaining statements are explained separately.</p>
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring RADIUS Authentication</i></li> </ul>

## retry

---

<b>Syntax</b>	<code>retry <i>attempts</i>;</code>
<b>Hierarchy Level</b>	[edit access radius-server <i>server-address</i> ], [edit access profile <i>profile-name</i> radius-server <i>server-address</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Specify the number of times that the router or switch is allowed to attempt to contact a RADIUS authentication or accounting server.
<b>Options</b>	<b><i>attempts</i></b> —Number of times that the router is allowed to attempt to contact a RADIUS server. <b>Range:</b> 1 through 30 <b>Default:</b> 3
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Authentication and Accounting Parameters for Subscriber Access</i></li><li>• <i>Configuring Router or Switch Interaction with RADIUS Servers</i></li><li>• <i>Example: Configuring CHAP Authentication with RADIUS</i></li><li>• <i>Configuring RADIUS Authentication for L2TP</i></li><li>• <a href="#">timeout on page 1987</a></li></ul>

## revert-interval

<b>Syntax</b>	<code>revert-interval <i>interval</i>;</code>
<b>Hierarchy Level</b>	[edit access profile <i>profile-name</i> radius <b>options</b> ], [edit access radius-options]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.1. Statement introduced in Junos OS Release 9.1 for EX Series switches.
<b>Description</b>	Configure the amount of time the router or switch waits after a server has become unreachable. The router or switch rechecks the connection to the server when the specified interval expires. If the server is then reachable, it is used in accordance with the order of the server list.
<b>Options</b>	<i>interval</i> —Amount of time to wait. <b>Range:</b> 0 through 604800 seconds <b>Default:</b> 60 seconds
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring RADIUS Server Options for Subscriber Access</i></li> <li>• <i>Configuring Authentication and Accounting Parameters for Subscriber Access</i></li> </ul>

## routing-instance

<b>Syntax</b>	<code>routing-instance <i>routing-instance-name</i>;</code>
<b>Hierarchy Level</b>	[edit access radius-server <i>server-address</i> ], [edit access profile <i>profile-name</i> radius-server <i>server-address</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure the routing instance used to send RADIUS packets to the RADIUS server.
<b>Options</b>	<i>routing-instance-name</i> —Routing instance name.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring the PPP Authentication Protocol</i></li> <li>• <i>Configuring Authentication and Accounting Parameters for Subscriber Access</i></li> </ul>

## secret

---

<b>Syntax</b>	<code>secret password;</code>
<b>Hierarchy Level</b>	[edit access profile <i>profile-name</i> radius-server <i>server-address</i> ], [edit access radius-disconnect <i>client-address</i> ], [edit access radius-server <i>server-address</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure the password to use with the RADIUS server. The secret password used by the local router or switch must match that used by the server.
<b>Options</b>	<i>password</i> —Password to use; it can include spaces if the character string is enclosed in quotation marks.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Authentication and Accounting Parameters for Subscriber Access</i></li><li>• <i>Configuring Router or Switch Interaction with RADIUS Servers</i></li><li>• <i>Example: Configuring CHAP Authentication with RADIUS</i></li><li>• <i>Configuring RADIUS Authentication for L2TP</i></li><li>• <i>Configuring the RADIUS Disconnect Server for L2TP</i></li><li>• <i>Configuring an EX Series Switch to Use Junos Pulse Access Control Service for Network Access Control (CLI Procedure)</i></li></ul>

## send-acct-status-on-config-change (Access Profile)

---

<b>Syntax</b>	<code>send-acct-status-on-config-change;</code>
<b>Hierarchy Level</b>	[edit access profile <i>profile-name</i> <b>accounting</b> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 13.1. Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
<b>Description</b>	Configure the router's authd process to send an Acct-On message when the first RADIUS server is added to an access profile, and to send an Acct-Off message when the last RADIUS server is removed from an access profile.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring RADIUS Server Parameters for Subscriber Access</i></li><li>• <i>Configuring Per-Subscriber Session Accounting</i></li></ul>

## server (RADIUS Accounting)

<b>Syntax</b>	<pre>server {   server-address {     accounting-port <i>port-number</i>;     retry <i>number</i>     secret <i>password</i>;     source-address <i>address</i>;     timeout <i>seconds</i>;   } }</pre>
<b>Hierarchy Level</b>	[edit system accounting destination radius]
<b>Release Information</b>	Statement introduced in Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure RADIUS logging.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring RADIUS System Accounting</i></li> </ul>

## service (Service Accounting)

<b>Syntax</b>	<pre>service {   accounting-order (activation-protocol   radius); }</pre>
<b>Hierarchy Level</b>	[edit access profile <i>profile-name</i> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 11.4. Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
<b>Description</b>	Define the subscriber service accounting configuration.  The remaining statement is explained separately.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring Service Accounting with JSRC</i></li> <li>• <i>Service Accounting with JSRC</i></li> </ul>

## source-address

---

<b>Syntax</b>	<code>source-address <i>source-address</i>;</code>
<b>Hierarchy Level</b>	<code>[edit access radius-server <i>server-address</i>],</code> <code>[edit access profile <i>profile-name</i> radius-server <i>server-address</i>]</code>
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure a source address for each configured RADIUS server. Each RADIUS request sent to a RADIUS server uses the specified source address.
<b>Options</b>	<b><i>source-address</i></b> —Valid IPv4 address configured on one of the router or switch interfaces. On M Series routers only, the source address can be an IPv6 address and the UDP source port is 514.
<b>Required Privilege Level</b>	<code>admin</code> —To view this statement in the configuration. <code>admin-control</code> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring Router or Switch Interaction with RADIUS Servers</i></li><li>• <i>Configuring Authentication and Accounting Parameters for Subscriber Access</i></li><li>• <i>Example: Configuring CHAP Authentication with RADIUS</i></li><li>• <i>Configuring RADIUS Authentication for L2TP</i></li></ul>

## timeout (RADIUS)

---

<b>Syntax</b>	<code>timeout seconds;</code>
<b>Hierarchy Level</b>	[edit access radius-server <i>server-address</i> ], [edit access profile <i>profile-name</i> radius-server <i>server-address</i> ]
<b>Release Information</b>	Statement introduced before Junos OS Release 7.4. Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure the amount of time that the local router or switch waits to receive a response from a RADIUS server.
<b>Options</b>	<b>seconds</b> —Amount of time to wait. <b>Range:</b> 1 through 90 seconds <b>Default:</b> 3 seconds
<b>Required Privilege Level</b>	<b>system</b> —To view this statement in the configuration. <b>system-control</b> —To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <i>Configuring Router or Switch Interaction with RADIUS Servers</i></li> <li>• <i>Configuring Authentication and Accounting Parameters for Subscriber Access</i></li> <li>• <i>Example: Configuring CHAP Authentication with RADIUS</i></li> <li>• <i>Configuring RADIUS Authentication for L2TP</i></li> </ul>

## vlan (VoIP)

---

<b>Syntax</b>	<code>vlan (vlan-id   vlan-name   untagged);</code>
<b>Hierarchy Level</b>	[edit ethernet-switching-options <b>voip interface (VoIP)</b> (all   [ <i>interface-name</i>   access-ports])
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	For EX Series switches, specify the VLAN name or VLAN tag identifier associated with the VLAN to be sent from the authenticating server to the IP phone.
<b>Options</b>	<p><i>vlan-name</i>—Name of a VLAN.</p> <p><i>vlan-id</i>—The VLAN tag identifier.</p> <p><b>Range:</b> 0 through 4095. Tags 0 and 4095 are reserved by Junos OS, and you should not configure them.</p> <p><i>untagged</i>—Allow untagged VLAN traffic.</p>
<b>Required Privilege Level</b>	<p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Example: Setting Up VoIP with 802.1X and LLDP-MED on an EX Series Switch</i></li><li>• <i>Example: Configuring VoIP on an EX Series Switch Without Including 802.1X Authentication</i></li><li>• <i>Example: Configuring VoIP on an EX Series Switch Without Including LLDP-MED Support</i></li></ul>

## vlan-assignment

<b>Syntax</b>	<code>vlan-assignment (vlan-id   vlan-name);</code>
<b>Hierarchy Level</b>	[edit protocols dot1x <a href="#">authenticator</a> authentication-profile-name static (Protocols 802.1X) <i>mac-address</i> ], [edit ethernet-switching-options <a href="#">authentication-whitelist</a> ], [edit <a href="#">switch-options</a> on page 2212 <a href="#">authentication-whitelist</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches. Statement added to the <a href="#">[edit ethernet-switching-options authentication-whitelist]</a> hierarchy in Junos OS Release 10.1 for EX Series switches. Statement added to the <a href="#">[edit switch-options authentication-whitelist]</a> hierarchy in Junos OS Release 13.2X50-D10 for EX Series switches.
<b>Description</b>	Configure the VLAN that is associated with the list of MAC addresses that are excluded from RADIUS authentication.
<b>Options</b>	<i>vlan-id   vlan-name</i> —The name of the VLAN or the VLAN tag identifier to associate with the device. The VLAN already exists on the switch.
<b>Required Privilege Level</b>	routing—To view this statement in the configuration. routing-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"> <li>• <a href="#">show dot1x static-mac-address on page 2016</a></li> <li>• <a href="#">Example: Configuring Static MAC Bypass of Authentication on an EX Series Switch on page 1872</a></li> <li>• <a href="#">Example: Setting Up Captive Portal Authentication on an EX Series Switch</a></li> <li>• <a href="#">Understanding Authentication on EX Series Switches on page 1824</a></li> <li>• <a href="#">Example: Setting Up Captive Portal Authentication on an EX Series Switch</a></li> <li>• <a href="#">Configuring Captive Portal Authentication (CLI Procedure)</a></li> </ul>

## vlan-nas-port-stacked-format

---

<b>Syntax</b>	vlan-nas-port-stacked-format;
<b>Hierarchy Level</b>	[edit access profile <i>profile-name</i> radius <a href="#">options</a> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.1. Statement introduced in Junos OS Release 9.1 for EX Series switches.
<b>Description</b>	Configure RADIUS attribute 5 (NAS-Port) to include the S-VLAN ID, in addition to the VLAN ID, for subscribers on Ethernet interfaces.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring RADIUS Server Options for Subscriber Access</i></li><li>• <i>Configuring Authentication and Accounting Parameters for Subscriber Access</i></li></ul>

## voip

---

<b>Syntax</b>	<pre>voip {   <a href="#">interface</a> (all   [<i>interface-name</i>   access-ports]) {     <a href="#">vlan</a> <i>vlan-name</i> ;     forwarding-class &lt;assured-forwarding   best-effort   expedited-forwarding         network-control&gt;;   } }</pre>
<b>Hierarchy Level</b>	[edit ethernet-switching-options], [edit <a href="#">switch-options</a> on page 2212]
<b>Release Information</b>	Statement introduced in Junos OS Release 9.0 for EX Series switches.
<b>Description</b>	Configure voice over IP (VoIP) interfaces.  The remaining statements are explained separately.
<b>Required Privilege Level</b>	system—To view this statement in the configuration. system-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Example: Setting Up VoIP with 802.1X and LLDP-MED on an EX Series Switch</i></li><li>• <i>Example: Configuring VoIP on an EX Series Switch Without Including 802.1X Authentication</i></li><li>• <i>Example: Configuring VoIP on an EX Series Switch Without Including LLDP-MED Support</i></li></ul>

---

## wait-for-acct-on-ack (Access Profile)

---

<b>Syntax</b>	wait-for-acct-on-ack;
<b>Hierarchy Level</b>	[edit access profile <i>profile-name</i> <b>accounting</b> ]
<b>Release Information</b>	Statement introduced in Junos OS Release 12.3. Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.
<b>Description</b>	Configure the router's <b>authd</b> process to wait for an Acct-On-Ack response message from RADIUS before sending new authentication and accounting updates to the RADIUS server. This configuration ensures that when a new subscriber session starts, the authentication and accounting information for the new session does not get deleted when RADIUS clears previously existing session state information.
<b>Required Privilege Level</b>	admin—To view this statement in the configuration. admin-control—To add this statement to the configuration.
<b>Related Documentation</b>	<ul style="list-style-type: none"><li>• <i>Configuring RADIUS Server Parameters for Subscriber Access</i></li><li>• <i>Configuring Per-Subscriber Session Accounting</i></li></ul>

## CHAPTER 29

# Administration

- [Routine Monitoring on page 1993](#)
- [Operational Commands on page 1995](#)

## Routine Monitoring

---

- [Monitoring 802.1X Authentication on page 1993](#)
- [Verifying 802.1X Authentication on page 1994](#)

## Monitoring 802.1X Authentication

### Purpose

**NOTE:** This topic applies only to the J-Web Application package.

Use the monitoring feature to display details of authenticated users and users who have failed authentication.

### Action

To display authentication details in the J-Web interface, select **Monitoring > Security > 802.1X**.

To display authentication details in the CLI, enter the following commands:

- **show dot1x interface detail | display xml**
- **show dot1x interface detail <interface> | display xml**
- **show dot1x auth-failed-users**

### Meaning

The details displayed include:

- A list of authenticated users.
- The total number of users connected.
- A list of users who have failed authentication

You can also specify an interface for which the details must be displayed.

- Related Documentation**
- [Configuring 802.1X Authentication \(J-Web Procedure\)](#)
  - [Configuring 802.1X Interface Settings \(CLI Procedure\) on page 1908](#)
  - [Example: Setting Up 802.1X for Single Supplicant or Multiple Supplicant Configurations on an EX Series Switch on page 1852](#)

## Verifying 802.1X Authentication

- Purpose** Verify that supplicants are being authenticated on an interface on an EX Series switch with the interface configured for 802.1X authentication, and display the method of authentication being used.
- Action** Display detailed information about an interface configured for 802.1X (here, the interface is **ge-0/0/16**):
- ```
user@switch> show dot1x interface ge-0/0/16.0 detail
ge-0/0/16.0
  Role: Authenticator
  Administrative state: Auto
  Supplicant mode: Single
  Number of retries: 3
  Quiet period: 60 seconds
  Transmit period: 30 seconds
  Mac Radius: Enabled
  Mac Radius Strict: Disabled
  Reauthentication: Enabled Reauthentication interval: 40 seconds
  Supplicant timeout: 30 seconds
  Server timeout: 30 seconds
  Maximum EAPOL requests: 1
  Guest VLAN member: <not configured>
  Number of connected supplicants: 1
    Supplicant: user5, 00:30:48:8C:66:BD
      Operational state: Authenticated
      Authentication method: Radius
      Authenticated VLAN: v200
      Reauthentication due in 17 seconds
```
- Meaning** The sample output from the **show dot1x interface detail** command shows that the **Number of connected supplicants** is 1. The supplicant that was authenticated and is now connected to the LAN is known as **user5** on the RADIUS server and has the MAC address **00:30:48:8C:66:BD**. The supplicant was authenticated by means of the 802.1X authentication method called **Radius** authentication. When the **Radius** authentication method is used, the supplicant is configured on the RADIUS server, the RADIUS server communicates this to the switch, and the switch opens LAN access on the interface to which the supplicant is connected. The sample output also shows that the supplicant is connected to VLAN **v200**.
- Other 802.1X authentication methods supported on EX Series switches in addition to the **RADIUS** method are:

- **Guest VLAN**—A nonresponsive host is granted Guest-VLAN access.
- **MAC Radius**—A nonresponsive host is authenticated based on its MAC address. The MAC address is configured as permitted on the RADIUS server, the RADIUS server lets the switch know that the MAC address is a permitted address, and the switch opens LAN access to the nonresponsive host on the interface to which it is connected.
- **Server-fail deny**—If the RADIUS servers time out, all supplicants are denied access to the LAN, preventing traffic from flowing from the supplicant through the interface. This is the default.
- **Server-fail permit**—When the RADIUS server is unavailable, a supplicant is still permitted access to the LAN as if the supplicant had been successfully authenticated by the RADIUS server.
- **Server-fail use-cache**—If the RADIUS servers time out during reauthentication, previously authenticated supplicants are granted access, but new supplicants are denied LAN access.
- **Server-fail VLAN**—A supplicant is configured to be moved to a specified VLAN if the RADIUS server is unavailable to reauthenticate the supplicant. (The VLAN must already exist on the switch.)

| <b>Output Fields</b>            | <a href="#">Table 179 on page 1997</a> lists the output fields for the <b>clear captive-portal interface</b> command. (The <b>clear captive-portal firewall</b> and <b>clear captive-portal mac-address</b> commands have no output). Output fields are listed in the approximate order in which they appear.                                                                                                                                      |

**Table 179: clear captive-portal interface Output Fields**

| Field Name       | Field Description                                      |
|------------------|--------------------------------------------------------|
| <b>Interface</b> | Interface on which captive portal has been configured. |

Table 179: clear captive-portal interface Output Fields (*continued*)

| Field Name         | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>State</b>       | <p>The state of the port:</p> <ul style="list-style-type: none"> <li>• <b>Authenticated</b>—The client has been authenticated through the RADIUS server or has been permitted access through server fail fallback.</li> <li>• <b>Authenticating</b>—The client is authenticating through the RADIUS server.</li> <li>• <b>Connecting</b>—Switch is attempting to contact the RADIUS server.</li> <li>• <b>Initialize</b>—The interface link is down.</li> <li>• <b>Held</b>—An action has been triggered through server fail fallback during a RADIUS server timeout. A supplicant is denied access, permitted access through a specified VLAN, or maintains the authenticated state granted to it before the RADIUS server timeout occurred.</li> </ul> |
| <b>MAC address</b> | The MAC address of the connected client on the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>User</b>        | Users connected to the captive portal interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

## Sample Output

### clear captive-portal interface

```
user@switch> clear captive-portal interface
ge-0/0/3.0
```

### clear captive-portal interface

```
user@switch> clear captive-portal interface
Captive Portal Information:
Interface      State      MAC address      User
ge-0/0/3.0     Authenticated  00:03:47:e1:ba:b9  aclallow
ge-0/0/5.0     Connecting
ge-0/0/7.0     Connecting
ge-0/0/9.0     Connecting
```

### clear captive-portal mac-address

```
user@switch> clear captive-portal mac-address 00:03:47:e1:ba:b9
This command has no output.
```

### clear captive-portal firewall

```
user@switch> clear captive-portal firewall
This command has no output.
```

## clear dot1x

**Syntax** `clear dot1x (firewall <counter-name> | interface <[interface-name]> | mac-address [mac-addresses] | statistics <interface interface-name>)`

**Release Information** Command introduced in Junos OS Release 9.0 for EX Series switches.  
**firewall** option added in Junos OS Release 9.5 for EX Series switches.

**Description** Reset the authentication state of an interface or delete 802.1X statistics from the switch. When you reset an interface using the **interface** or **mac-address** options, reauthentication on the interface is also triggered. The switch sends out a multicast message on the interface to restart the authentication of all connected supplicants. If a MAC address is reset, then the switch sends out a unicast message to that specific MAC address to restart authentication.

If a supplicant is sending traffic when the **clear dot1x interface** command is issued, the authenticator immediately initiates reauthentication. This process happens quickly, and it might seem that reauthentication did not occur. To verify that reauthentication has happened, issue the **show dot1x interface detail** command. The values for **Reauthentication due** and **Reauthentication interval** will be about the same.

**CAUTION:** When you clear the learned MAC addresses from an interface using the **clear dot1x interface** command, all MAC addresses are cleared, including those in static MAC bypass list.

If you have enabled Media Access Control Security (MACsec) using static secure association key (SAK) security mode on an EX Series switch, the SAKs are rotated when the **clear dot1x** command is entered. The **clear dot1x** command has no impact on MACsec when MACsec is enabled using static connectivity association keys (CAK) or any other security mode.

**Options** **firewall <counter-name>**—Clear 802.1X firewall counter statistics. If the *counter-name* option is specified, clear 802.1X firewall statistics for that counter.

**interface <[interface-name]>**—Reset the authentication state of all the supplicants (also, clears all the authentication bypassed clients) connected to the specified interface (when the interface is an authenticator) or reset the authentication state for the interface itself (when the interface is a supplicant).

**mac-address [mac-addresses]**—Reset the authentication state of the specified MAC addresses.

**statistics <interface interface-name>**—Clear 802.1X statistics on all 802.1X-enabled interfaces. If the **interface** option is specified, clear 802.1X firewall statistics for that interface or interfaces.

**Required Privilege Level** view

| <b>Server timeout</b>                  | Time, in seconds, that an interface will wait for a reply when relaying a response from the client to the authentication server before timing out and invoking the server-fail action.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | detail          |
| <b>Number of connected supplicants</b> | <p>Number of users connecting through the captive portal interface. Information for each user includes:</p> <ul style="list-style-type: none"> <li>• <b>Supplicant</b>—User name and MAC address.</li> <li>• <b>Operational state</b>—See State (above).</li> <li>• <b>Dynamic CP session timeout</b>—Timeout value dynamically downloaded from the RADIUS server for this user, if any.</li> <li>• <b>CP Session expiration due in</b>—Time remaining in session.</li> </ul>                                                                                                                                                                                                                                                                                 | detail          |

## Sample Output

### show captive-portal interface (Only captive portal is enabled)

```
user@switch> show captive-portal interface
Captive Portal Information:
Interface      State           MAC address      User             Fallen back
ge-0/0/1.0     Connecting      00:30:48:8c:66:bd No User
ge-0/0/10.0    Connecting      00:30:48:8c:66:bd No User
ge-6/0/5.0     Authenticated   00:30:48:8d:7a:9b abcdeX           No
```

### show captive-portal interface (Both 802.1X authentication and captive portal are enabled)

```
user@switch> show captive-portal interface
Captive Portal Information:
Interface      State           MAC address      User             Fallen back
ge-0/0/1.0     Connecting      00:30:48:8c:66:bd No User
ge-0/0/10.0    Connecting      00:30:48:8c:66:bd No User
ge-6/0/5.0     Authenticated   00:30:48:8d:7a:9b abcdeX           Yes
```

### show captive-portal interface detail (Only captive portal is enabled)

```
user@switch> show captive-portal interface detail ge-6/0/5.0
Supplicant mode: Multiple
Number of retries: 3
Quiet period: 60 seconds
Configured CP session timeout: 3600 seconds
Server timeout: 15 seconds
CP fallen back: No
Number of connected supplicants: 1
  Supplicant: abcdeX, 00:30:48:8d:7a:9b
    Operational state: Authenticated
    Dynamic CP Session Timeout: 3600 seconds
    CP Session Expiration due in: 3583 seconds
```

### show captive-portal interface detail (Both 802.1X authentication and captive portal are enabled)

```
user@switch> show captive-portal interface detail ge-6/0/5.0
Supplicant mode: Multiple
Number of retries: 3
Quiet period: 60 seconds
Configured CP session timeout: 3600 seconds
Server timeout: 15 seconds
CP fallen back: Yes
Number of connected supplicants: 1
  Supplicant: abcdeX, 00:30:48:8d:7a:9b
    Operational state: Authenticated
    Dynamic CP Session Timeout: 3600 seconds
    CP Session Expiration due in: 3583 seconds
```

| <b>Output Fields</b>            | <a href="#">Table 182 on page 2009</a> lists the output fields for the <b>show dot1x</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Table 182: show dot1x Output Fields

| Field Name  | Field Description                                        | Level of Output |
|-------------|----------------------------------------------------------|-----------------|
| Interface   | Name of a port.                                          | All levels      |
| MAC address | The MAC address of the connected supplicant on the port. | All levels      |

Table 182: show dot1x Output Fields (*continued*)

| Field Name                  | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Level of Output      |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------|
| <b>Role</b>                 | The 802.1X authentication role of the interface. When 802.1X is enabled on an interface, the role is <b>Authenticator</b> . As <b>Authenticator</b> , the interface blocks LAN access until a supplicant is authenticated through 802.1X or MAC RADIUS authentication.                                                                                                                                                                                                                                                                                                                                                                | <b>brief, detail</b> |
| <b>State</b>                | <p>The state of the port:</p> <ul style="list-style-type: none"> <li>• <b>Authenticated</b>—The supplicant has been authenticated through the RADIUS server or has been permitted access through server fail fallback.</li> <li>• <b>Authenticating</b>—The supplicant is authenticating through the RADIUS server.</li> <li>• <b>Held</b>—An action has been triggered through server fail fallback during a RADIUS server timeout. A supplicant is denied access, permitted access through a specified VLAN, or maintains the authenticated state granted to it before the RADIUS server timeout occurred.</li> </ul>               | <b>brief</b>         |
| <b>User</b>                 | The user name of the connected supplicant                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>brief</b>         |
| <b>Administrative state</b> | <p>The administrative state of the port:</p> <ul style="list-style-type: none"> <li>• <b>auto</b>—Traffic is allowed through the port based on the authentication result. (Default)</li> <li>• <b>force-authorize</b>—All traffic flows through the port irrespective of the authentication result. This state is not allowed on an interface whose VLAN membership has been set to <b>dynamic</b>.</li> <li>• <b>force-unauthorize</b>—All traffic drops on the port irrespective of the authentication result. This state is not allowed on an interface whose VLAN membership has been set to <b>dynamic</b>.</li> </ul>           | <b>detail</b>        |
| <b>Supplicant</b>           | <p>The mode for the supplicant:</p> <ul style="list-style-type: none"> <li>• <b>single</b>—Authenticates only the first supplicant. All other supplicants who connect later to the port are allowed full access without any further authentication. They effectively “piggyback” on the first supplicant’s authentication.</li> <li>• <b>single-secure</b>—Allows only one supplicant to connect to the port. No other supplicant is allowed to connect until the first supplicant logs out.</li> <li>• <b>multiple</b>—Allows multiple supplicants to connect to the port. Each supplicant is authenticated individually.</li> </ul> | <b>detail</b>        |
| <b>Quiet period</b>         | The number of seconds the port remains in the wait state following a failed authentication exchange with the supplicant before reattempting the authentication. The default value is 60 seconds. The range is 0 through 65,535 seconds.                                                                                                                                                                                                                                                                                                                                                                                               | <b>detail</b>        |
| <b>Transmit period</b>      | The number of seconds the port waits before retransmitting the initial EAPOL PDUs to the supplicant. The default value is 30 seconds. The range is 1 through 65,535 seconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>detail</b>        |

| <b>MAC radius</b>                                           | MAC RADIUS authentication: <ul style="list-style-type: none"> <li>• <b>enabled</b>—The switch sends an EAPOL request to the connecting host to attempt 802.1X authentication and if the connecting host is unresponsive, the switch tries to authenticate using the MAC address.</li> <li>• <b>disabled</b>—The default. The switch will not attempt to authenticate the MAC address of the connecting host.</li> </ul> | <b>detail</b>   |
| <b>MAC radius restrict</b>                                  | The authentication method is restricted to MAC RADIUS only. 802.1X authentication is not enabled.                                                                                                                                                                                                                                                                                                                       | <b>detail</b>   |
| <b>Reauthentication</b>                                     | The reauthentication state: <ul style="list-style-type: none"> <li>• <b>disable</b>—Periodic reauthentication of the client is disabled.</li> <li>• <b>interval</b>—Sets the periodic reauthentication time interval. The default value is 3600 seconds. The range is 1 through 65,535 seconds.</li> </ul>                                                                                                              | <b>detail</b>   |
| <b>Supplicant timeout</b>                                   | The number of seconds the port waits for a response when relaying a request from the authentication server to the supplicant before resending the request. The default value is 30 seconds. The range is 1 through 60 seconds.                                                                                                                                                                                          | <b>detail</b>   |
| <b>Server timeout</b>                                       | The number of seconds the port waits for a reply when relaying a response from the supplicant to the authentication server before timing out. The default value is 30 seconds. The range is 1 through 60 seconds.                                                                                                                                                                                                       | <b>detail</b>   |
| <b>Maximum EAPOL requests</b>                               | The maximum number of retransmission times of an EAPOL request packet to the supplicant before the authentication session times out. The default value is 2. The range is 1 through 10.                                                                                                                                                                                                                                 | <b>detail</b>   |
| <b>Number of clients bypassed because of authentication</b> | The number of non-802.1X clients granted access to the LAN by means of static MAC bypass. The following fields are displayed: <ul style="list-style-type: none"> <li>• <b>Client</b>—MAC address of the client.</li> <li>• <b>vlan</b> —The name of the VLAN to which the client is connected.</li> </ul>                                                                                                               | <b>detail</b>   |
| <b>Guest VLAN member</b>                                    | The VLAN to which a supplicant is connected when the supplicant is authenticated using a guest VLAN. If a guest VLAN is not configured on the interface, this field displays <b>&lt;not configured&gt;</b> .                                                                                                                                                                                                            | <b>detail</b>   |
| <b>Number of connected supplicants</b>                      | The number of supplicants connected to a port.                                                                                                                                                                                                                                                                                                                                                                          | <b>detail</b>   |
| <b>Supplicant</b>                                           | The user name and MAC address of the connected supplicant.                                                                                                                                                                                                                                                                                                                                                              | <b>detail</b>   |

| <b>List of Sample Output</b>    | <a href="#">show dot1x authentication-failed-users on page 2014</a>                                                                                                                                                                                                                                                |
| <b>Output Fields</b>            | <a href="#">Table 183 on page 2014</a> lists the output fields for the <b>show dot1x authentication-failed-users</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                              |

**Table 183: show dot1x authentication-failed-users Output Fields**

| Field Name           | Field Description                                                                           | Level of Output |
|----------------------|---------------------------------------------------------------------------------------------|-----------------|
| <b>Interface</b>     | The MAC address configured to bypass 802.1X authentication.                                 | all             |
| <b>MAC address</b>   | The MAC address configured statically on the interface.                                     | all             |
| <b>User</b>          | The user that is configured on the RADIUS server and that has failed 802.1X authentication. | all             |
| <b>Failure Count</b> | The number of times that 802.1X authentication has failed on the interface.                 | all             |

## Sample Output

### show dot1x authentication-failed-users

```
user@switch> show dot1x authentication-failed-users
```

| Interface   | MAC address       | User         | Failure Count |
|-------------|-------------------|--------------|---------------|
| ge-0/0/17.0 | 00:37:00:00:00:00 | 003700000000 | 28            |
| ge-0/0/20.0 | 00:04:10:00:00:00 | 000410000000 | 32            |
| ge-0/0/18.0 | 00:00:03:00:0a:00 | 000003000a00 | 4             |
| ge-0/0/19.0 | 00:00:03:00:0b:00 | 000003000b00 | 18            |

## show dot1x firewall

|                                 |                                                                                                                                                                                                                                                                                                                |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | <code>show dot1x firewall &lt;interface <i>interface-name</i>&gt;</code>                                                                                                                                                                                                                                       |
| <b>Release Information</b>      | Command introduced in Junos OS Release 9.5 for EX Series switches.                                                                                                                                                                                                                                             |
| <b>Description</b>              | Displays information about the firewall filters for each user or nonresponsive host that is authenticated on each 802.1X-enabled interface that is configured for multiple supplicants. For example, if the firewall filter is configured with a term for counters, the command shows the count for each user. |
| <b>Options</b>                  | <code>interface <i>interface-names</i></code> —(Optional) Display information for the specified interface.                                                                                                                                                                                                     |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                           |

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                      |

**Table 184: show dot1x static-mac-address Output Fields**

| Field Name             | Field Description                                                                      | Level of Output |
|------------------------|----------------------------------------------------------------------------------------|-----------------|
| <b>MAC address</b>     | The MAC address of the device that is configured to bypass 802.1X authentication.      | all             |
| <b>VLAN-Assignment</b> | The name of the VLAN to which the device is assigned.                                  | all             |
| <b>Interface</b>       | The name of the interface on which authentication is bypassed for a given MAC address. | all             |

## Sample Output

### show dot1x static-mac-address

```
user@switch> show dot1x static-mac-address
```

```
MAC address      VLAN-Assignment  Interface
00:00:00:11:22:33
```

|                   |            |            |
|-------------------|------------|------------|
| 00:00:00:00:12:12 |            | ge-0/0/3.0 |
| 00:00:00:02:34:56 | facilities | ge-0/0/1.0 |

#### `show dot1x static-mac-address interface ge-0/0/0.1`

```
user@switch> show dot1x static-mac-address interface ge-0/0/0.1
```

| MAC address       | VLAN-Assignment | Interface  |
|-------------------|-----------------|------------|
| 00:00:00:12:24:12 | support         | ge-0/0/1.0 |
| 00:00:00:72:30:58 | support         | ge-0/0/1.0 |

## show lldp

**Syntax** `show lldp`  
`<detail>`

**Release Information** Command introduced in Junos OS Release 9.0 for EX Series switches.  
 Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Display information about Link Layer Discovery Protocol (LLDP) and Link Level Discovery Protocol—Media Endpoint Discovery (LLDP-MED) configuration and capabilities on the switch. LLDP and LLDP-MED are used to learn about and to distribute device information on network links.

**NOTE:** LLDP-MED is not available on the QFX Series.

**Options** **none**—Display LLDP information for all interfaces.  
**detail**—(Optional) Display detailed LLDP information for all interfaces.

**Required Privilege Level** view

**Related Documentation**

**List of Sample Output** [show lldp \(EX3200 switches\) on page 2021](#)  
[show lldp \(EX4300 switches\) on page 2021](#)  
[show lldp detail \(EX4300 switches\) on page 2022](#)

**Output Fields** [Table 185 on page 1818](#) lists the output fields for the **show lldp** command. Output fields are listed in the approximate order in which they appear.

**Table 185: show lldp Output Fields**

| Field Name | Field Description                                                                                                                                                                                                                                                                                                 | Level of Output |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| LLDP       | LLDP operating state. The state can be <b>enabled</b> or <b>disabled</b> .<br><br><b>NOTE:</b> If a VLAN that has been configured for untagged packets on an interface also has Layer 2 protocol tunneling (L2PT) enabled for LLDP, the LLDP operating state for that interface is displayed as <b>disabled</b> . | All levels      |

Table 185: show lldp Output Fields (*continued*)

| Field Name                    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                | Level of Output |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Advertisement interval</b> | Frequency, in seconds, at which LLDP advertisements are sent.<br><br>This value is set by the <i>advertisement-interval</i> configuration statement.                                                                                                                                                                                                                                                                                                             | All levels      |
| <b>Transmit delay</b>         | Seconds of delay before advertisements are sent to neighbors following a change to a TLV (type, length, or value) element in the LLDP protocol or to the state of the local system, such as a change in hostname or management address. You can set this value to reduce the delay in notifying neighbors of a change in the local system.<br><br>This value is set by the <i>transmit-delay</i> configuration statement.                                        | All levels      |
| <b>Hold timer</b>             | On EX4300 switches, the hold timer shows the length of time LLDP information is held before it is discarded. The hold timer value is equal to the advertisement interval multiplied by the hold multiplier.<br><br>On all other switches, the hold timer shows the value of the hold multiplier.<br><br>The hold multiplier value is set by the <i>hold-multiplier</i> configuration statement.                                                                  | All levels      |
| <b>Notification interval</b>  | How often LLDP trap notifications are generated as a result of LLDP database changes. If the interval value is 0, LLDP trap notifications on database changes are disabled.<br><br>This value is set by the <i>lldp-configuration-notification-interval</i> configuration statement.                                                                                                                                                                             | All levels      |
| <b>Config Trap Interval</b>   | How often LLDP trap notifications are generated as a result of changes in topology—for example, when an endpoint connects or disconnects. If the interval value is 0, LLDP trap notifications on topology changes are disabled.<br><br>This value is set by the <i>ptopo-configuration-trap-interval</i> configuration statement.                                                                                                                                | All levels      |
| <b>Connection Hold timer</b>  | Amount of time the system maintains dynamic topology entries.<br><br>This value is set by the <i>ptopo-configuration-maximum-hold-time</i> configuration statement.                                                                                                                                                                                                                                                                                              | All levels      |
| <b>LLDP-MED</b>               | LLDP-MED operating state. The state can be <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                                                                                                                                                                                                                   | All levels      |
| <b>MED fast start count</b>   | Number of advertisements sent from a switch to a device, such as a VoIP telephone, when the device is first detected by the switch. These increased advertisements are temporary. After a device and a switch exchange information and can communicate, advertisements are reduced to one per second.<br><br>This value is set by using the <i>fast-start</i> configuration statement.<br><br><b>NOTE:</b> <i>fast-start</i> is not available on the QFX Series. | All levels      |
| <b>Interface</b>              | Name of the interface for which LLDP configuration information is being reported.                                                                                                                                                                                                                                                                                                                                                                                | All levels      |
| <b>Parent Interface</b>       | Name of the aggregated Ethernet interface, if any, to which the interface belongs.                                                                                                                                                                                                                                                                                                                                                                               | All levels      |

Table 185: show lldp Output Fields (*continued*)

| Field Name                       | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Level of Output |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>LLDP</b>                      | LLDP operating state. The state can be <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | All levels      |
| <b>Power Negotiation</b>         | LLDP power negotiation operating state. The state can be <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | All levels      |
| <b>Neighbor count</b>            | Total number of new LLDP neighbors detected since the last switch reboot.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail</b>   |
| <b>Interface</b>                 | Name of the interface that is advertising VLAN information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | All levels      |
| <b>Vlan-id</b>                   | VLAN tag associated with the interface sending LLDP frames. If the interface is not a member of a VLAN, the VLAN ID is advertised as 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>detail</b>   |
| <b>Vlan-name</b>                 | VLAN name associated with the VLAN ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>detail</b>   |
| <b>LLDP basic TLVs supported</b> | <p>Basic TLVs supported on the switch:</p> <ul style="list-style-type: none"> <li>• <b>Chassis identifier</b>—TLV that advertises the MAC address associated with the local system.</li> <li>• <b>Port identifier</b>—TLV that advertises the port identification for the specified port in the local system.</li> <li>• <b>Port description</b>—Interface name for the port.</li> <li>• <b>System name</b>—TLV that advertises the user-configured name of the local system.</li> <li>• <b>System description</b>—TLV that advertises the system description containing information about the software and current image running on the system. This information is taken from the software and is not configurable.</li> <li>• <b>System capabilities</b>—TLV that advertises the primary functions performed by the system—for example, bridge or router.</li> <li>• <b>Management address</b>—TLV that advertises the IP management address of the local system.</li> </ul> | <b>detail</b>   |
| <b>Supported LLDP 802 TLVs</b>   | <p>802.3 TLVs supported on the switch:</p> <ul style="list-style-type: none"> <li>• <b>MAC/PHY configuration status</b>—TLV that advertises information about the physical interface, such as autonegotiation status and support and MAU type. The information is based on the physical interface structure and is not configurable.</li> <li>• <b>Power via MDI</b>—TLV that advertises MDI power support, PSE power pair, and power class information.</li> <li>• <b>Link aggregation</b>—TLV that advertises if the interface is aggregated and its aggregated interface ID.</li> <li>• <b>Maximum frame size</b>—TLV that advertises the maximum transmission unit (MTU) of the interface sending LLDP frames.</li> <li>• <b>Port VLAN tag</b>—TLV that advertises the VLAN tag configured on the interface.</li> <li>• <b>Port VLAN name</b>—TLV that advertises the VLAN name configured on the interface.</li> </ul>                                                     | <b>detail</b>   |

Table 185: show lldp Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Level of Output |
