## [edit interfaces irb] Configuration Statement Hierarchy on EX Series Switches

This topic lists supported and unsupported configuration statements in the **[edit interfaces irb]** hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.
- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see [Feature Explorer](#).

This topic lists:

- [Supported Statements in the \[edit interfaces irb\] Hierarchy Level on page 2725](#)
- [Unsupported Statements in the \[edit interfaces irb\] Hierarchy Level on page 2728](#)

### Supported Statements in the [edit interfaces irb] Hierarchy Level

The following hierarchy shows the **[edit interfaces irb]** configuration statements supported on EX Series switches.

```

interfaces {
  irb {
    accounting-profile name;
    description text;
    disable;

    (gratuitous-arp-reply | no-gratuitous-arp-reply);
    hold-time up milliseconds down milliseconds;
    mtu bytes;
    no-gratuitous-arp-request;
    traceoptions {
      flag flag;
    }
    (traps | no-traps);
    unit logical-unit-number {
      accounting-profile name;
      bandwidth rate;
      description text;
      disable;
      family inet {
        accounting {
          destination-class-usage;
          source-class-usage {
            input;
            output;
          }
        }
      }
      address ipv4-address {
        arp ip-address (mac | multicast-mac) mac-address <publish>;
        broadcast address;
      }
    }
  }
}

```

```
preferred;

## [edit interfaces xe] Configuration Statement Hierarchy on EX Series Switches

This topic lists supported and unsupported configuration statements in the [edit interfaces xe] hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.
- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see [Feature Explorer](#).

This topic lists:

- [Supported Statements in the \[edit interfaces xe\] Hierarchy Level on page 2738](#)
- [Unsupported Statements in the \[edit interfaces xe\] Hierarchy Level on page 2742](#)

### Supported Statements in the [edit interfaces xe] Hierarchy Level

The following hierarchy shows the [edit interfaces xe] configuration statements supported on EX Series switches.

```
interfaces {  
  xe-fpc/pic/port {  
    accounting-profile name;  
    description text;  
    disable;  
    encapsulation type;

## [edit protocols lACP] Configuration Statement Hierarchy on EX Series Switches

This topic lists supported and unsupported configuration statements in the [edit protocols lACP] hierarchy level on EX Series switches.

- *Supported* statements are those that you can use to configure some aspect of a software feature on the switch.
- *Unsupported* statements are those that appear in the command-line interface (CLI) on the switch, but that have no effect on switch operation if you configure them.
- Not all features are supported on all switch platforms. For detailed information about feature support on specific EX Series switch platforms, see *EX Series Switch Software Features Overview*.

This topic lists:

- [Supported Statements in the \[edit protocols lacp\] Hierarchy Level on page 2744](#)
- [Unsupported Statements in the \[edit protocols lacp\] Hierarchy Level on page 2744](#)

---

### Supported Statements in the [edit protocols lacp] Hierarchy Level

The following hierarchy shows the **[edit protocols lacp]** configuration statements supported on EX Series switches:

```
protocols {
  lacp {
    ppm {
      centralized
    }
    traceoptions {
      file <filename> <files number> <match regular-expression> <size maximum-file-size>
        <world-readable | no-world-readable>;
      flag <flag>;
      no-remote-trace;
    }
  }
}
```

---

### Unsupported Statements in the [edit protocols lacp] Hierarchy Level

All statements in the **[edit protocols lacp]** hierarchy level that are displayed in the command-line interface (CLI) on the switch are supported on the switch and operate as documented.

 family *family*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure the interface address.

**Options** *address*—Address of the interface.

- In Junos OS Release 13.3 and later, when you configure an IPv6 host address and an IPv6 subnet address on an interface, the commit operation fails.
- In releases earlier than Junos OS Release 13.3, when you use the same configuration on an interface, the commit operation succeeds, but only one of the IPv6 addresses that was entered is assigned to the interface. The other address is not applied.

**NOTE:** If you configure the same address on multiple interfaces in the same routing instance, Junos OS uses only the first configuration, the remaining address configurations are ignored and can leave interfaces without an address. Interfaces that do not have an assigned address cannot be used as a donor interface for an unnumbered Ethernet interface.

For example, in the following configuration the address configuration of interface xe-0/0/1.0 is ignored:

```
interfaces {
  xe-0/0/0 {
    unit 0 {
      family inet {
        address 192.168.1.1/24;
      }
    }
  }
  xe-0/0/1 {
    unit 0 {
      family inet {
        address 192.168.1.1/24;
      }
    }
  }
}
```

For more information on configuring the same address on multiple interfaces, see [“Configuring the Interface Address” on page 2632](#).

---

The remaining statements are explained separately.

**NOTE:** The edit logical-systems hierarchy is not available on QFabric systems.

---

**Required Privilege** interface—To view this statement in the configuration.  
**Level** interface-control—To add this statement to the configuration.

|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | (auto-negotiation   no-auto-negotiation) <remote-fault (local-interface-online   local-interface-offline)>;                                                                                                                                                                                    |
| <b>Hierarchy Level</b>     | [edit interfaces <i>interface-name</i> ether-options],<br>[edit interfaces <i>interface-name</i> gigether-options],<br>[edit interfaces <i>ge-pim</i> /0/0 switch-options switch-port <i>port-number</i> ]                                                                                     |
| <b>Release Information</b> | Statement introduced in Junos OS Release 7.6.<br>Statement introduced in Junos OS Release 8.4 for J Series Services Routers.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers. |
| <b>Description</b>         | For Gigabit Ethernet interfaces on M Series, MX Series, T Series, TX Matrix routers, and ACX Series routers explicitly enable autonegotiation and remote fault. For EX Series switches and J Series Services Routers, explicitly enable autonegotiation only.                                  |

- **auto-negotiation**—Enables autonegotiation. This is the default.
- **no-auto-negotiation**—Disable autonegotiation. When autonegotiation is disabled, you must explicitly configure the link mode and speed.

When you configure Tri-Rate Ethernet copper interfaces to operate at 1 Gbps, autonegotiation must be enabled.

**NOTE:** On EX Series switches, an interface configuration that disables autonegotiation and manually sets the link speed to 1 Gbps is accepted when you commit the configuration; however, if the interface you are configuring is a Tri-Rate Ethernet copper interface, the configuration is ignored as invalid and autonegotiation is enabled by default.

To correct the invalid configuration and disable autonegotiation:

1. Delete the **no-auto-negotiation** statement and commit the configuration.
2. Set the link speed to 10 or 100 Mbps, set **no-auto-negotiation**, and commit the configuration.

On J Series Services Routers with universal Physical Interface Modules (uPIMs) and on EX Series switches, if the link speed and duplex mode are also configured, the interfaces use the values configured as the desired values in the negotiation. If autonegotiation is disabled, the link speed and link mode must be configured.

**NOTE:** On T4000 routers, the **auto-negotiation** command is ignored for interfaces other than Gigabit Ethernet.

| <b>Description</b>              | Backup liveness detection determines the peer status (whether it is up or down) by exchanging keep alive messages (UDP-based packets) over the management link between the two Interchassis Control Protocol (ICCP) peers. When an ICCP connection is operationally down, the status of the peers hosting a multichassis link aggregation group (MC-LAG) is detected by sending liveness detection requests to each other. Peers must respond to liveness detection requests within a specified amount of time. If the responses are not received within that time for a given number of consecutive attempts, the liveness detection check fails, and a failure action is implemented. Backup liveness detection must be configured on both peers hosting the MC-LAG. |

## bandwidth (Interfaces)

---

|                            |                                                                                                                                                                                                  |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <code>bandwidth rate;</code>                                                                                                                                                                     |
| <b>Hierarchy Level</b>     | [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> ],<br>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> ] |
| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.                                                                        |
| <b>Description</b>         | Configure an informational-only bandwidth value for an interface. This statement is valid for all logical interface types except multilink and aggregated interfaces.                            |

**NOTE:** We recommend that you be careful when setting this value. Any interface bandwidth value that you configure using the `bandwidth` statement affects how the interface cost is calculated for a dynamic routing protocol, such as OSPF. By default, the interface cost for a dynamic routing protocol is calculated using the following formula:

$$\text{cost} = \text{reference-bandwidth} / \text{bandwidth},$$

where bandwidth is the physical interface speed. However, if you specify a value for bandwidth using the `bandwidth` statement, that value is used to calculate the interface cost, rather than the actual physical interface bandwidth.

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Options</b>                  | <b>rate</b> —Peak rate, in bits per second (bps) or cells per second (cps). You can specify a value in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation <b>k</b> (1000), <b>m</b> (1,000,000), or <b>g</b> (1,000,000,000). You can also specify a value in cells per second by entering a decimal number followed by the abbreviation <b>c</b> ; values expressed in cells per second are converted to bits per second by means of the formula 1 cps = 384 bps.<br><b>Range:</b> Not limited. |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Hierarchy Level</b>     | [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i> address <i>address</i> ],<br>[edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i> <b>address</b> <i>address</i> ] |
| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                  |
| <b>Description</b>         | Set the broadcast address on the network or subnet. On a subnet you cannot specify a host address of 0, nor can you specify a broadcast address.                                                                                                                                                |
| <b>Default</b>             | The default broadcast address has a host portion of all ones.                                                                                                                                                                                                                                   |
| <b>Options</b>             | <b>address</b> —Broadcast address. The address must have a host portion of either all ones or all zeros. You cannot specify the addresses 0.0.0.0 or 255.255.255.255.                                                                                                                           |

**NOTE:** The edit logical-systems hierarchy is not available on QFabric systems.

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.                           |
| <b>Description</b>         | Disable a physical or a logical interface, effectively unconfiguring it.                                                                                                                                                                      |

---

### CAUTION:

- Dynamic subscribers and logical interfaces use physical interfaces for connection to the network. The Junos OS allows you to set the interface to disable and commit the change while dynamic subscribers and logical interfaces are still active. This action results in the loss of all subscriber connections on the interface. Use care when disabling interfaces.
  - If aggregated SONET links are configured between a T1600 router and a T4000 router, interface traffic is disrupted when you disable the physical interface configured on the T1600 router. If you want to remove the interface, we recommend that you deactivate the interface instead of disabling it.
- 

---

### NOTE:

- When you use the disable statement at the [edit interfaces] hierarchy level, depending on the PIC type, the interface might or might not turn off the laser. Older PIC transceivers do not support turning off the laser, but newer Gigabit Ethernet (GE) PICs with SFP and XFP transceivers and ATM MIC with SFP do support it and the laser will be turned off when the interface is disabled. If the ATM MIC with SFP is part of an APS group, then the laser will not be turned off when you use the disable statement at the [edit interfaces] hierarchy level..
  - When you disable or deactivate an interface, then all the references made to the deactivated interface must be removed from the routing instance.
- 

---

**WARNING:** Do not stare into the laser beam or view it directly with optical instruments even if the interface has been disabled.

---

**Required Privilege** interface—To view this statement in the configuration.

**Release Information**    Statement introduced in Junos OS Release 13.2X51-D15 for EX Series switches.  
                              Statement introduced in Junos OS Release 13.2X51-D20 for QFX Series devices.  
                              The **fabric-load-balance** statement introduced in Junos OS Release 14.1X53-D10.

**Description**    Configure the hashing key used to hash link aggregation group (LAG) and equal-cost multipath (ECMP) traffic, or enable adaptive load balancing (ALB) in a Virtual Chassis Fabric (VCF).

The hashing algorithm is used to make traffic-forwarding decisions for traffic entering a LAG bundle or for traffic exiting a switch when ECMP is enabled.

For LAG bundles, the hashing algorithm determines how traffic entering a LAG bundle is placed onto the bundle's member links. The hashing algorithm tries to manage bandwidth by evenly load-balancing all incoming traffic across the member links in the bundle.

When ECMP is enabled, the hashing algorithm determines how incoming traffic is forwarded to the next-hop device.

The remaining statements are explained separately.

| Release Information | Statement introduced in Junos OS Release 9.0 for EX Series switches, including options <b>ethernet-switching</b> , <b>inet</b> , and <b>iso</b> .<br>Option <b>inet6</b> introduced in Junos OS Release 9.3 for EX Series switches.<br>Options <b>ccc</b> introduced in Junos OS Release 9.5 for EX Series switches. |
| Description         | Configure protocol family information for the logical interface on the switch.<br><br>You must configure a logical interface to be able to use the physical device.                                                                                                                                                  |
| Default             | Interfaces on EX4300 switches are set to <b>family ethernet-switching</b> by the default factory configuration. Before you can change the family setting for an interface to another family type, you must delete this default setting or any user-configured family setting.                                        |

**Options** See [Table 145 on page 1649](#) for protocol families available on the switch interfaces. Different protocol families support different subsets of the interface types on the switch. Interface types on the switch are:

- Aggregated Ethernet (**ae0**)
- 40-Gigabit Ethernet (**et**)
- Gigabit Ethernet (**ge**)
- Interface-range configuration (**interface-range**)
- Loopback (**lo0**)
- Management Ethernet (**me0**)
- Integrated Routing and Bridging (IRB) interfaces (IRB) (**irb**)
- Virtual management Ethernet (**vme**)
- 10-Gigabit Ethernet (**xe**)

If you are using an interface range, the supported protocol families are the ones supported by the interface types that compose the range.

Not all interface types support all **family** substatements. Check your switch CLI for supported substatements for a particular protocol family configuration.

**Table 299: Protocol Families and Supported Interface Types**

| Family             | Description                                | Supported Interface Types |    |    |     |     |     |     |    |

| <b>Release Information</b> | <p>Statement introduced before Junos OS Release 7.4.</p> <p>Statement introduced in Junos OS Release 9.0 for EX Series switches.</p> <p>Statement introduced in Junos OS Release 11.1 for the QFX Series.</p>                                      |
| <b>Description</b>         | <p>Apply a filter to an interface. You can also use filters for encrypted traffic. When you configure filters, you can configure them under the <b>family ethernet-switching</b>, <b>inet</b>, <b>inet6</b>, <b>mpls</b>, or <b>vpls</b> only.</p> |

**NOTE:** On QFX3500 and QFX3600 switches running Enhanced Layer 2 Software, VPLS is not supported.

| <b>Description</b>              | <p>Select the mode for the hashing algorithm.</p> <p>The hashing algorithm is used to make traffic-forwarding decisions for traffic entering a LAG bundle or for traffic exiting a switch when ECMP is enabled.</p> <p>For LAG bundles, the hashing algorithm determines how traffic entering a LAG bundle is placed onto the bundle's member links. The hashing algorithm tries to manage bandwidth by evenly load-balancing all incoming traffic across the member links in the bundle.</p> <p>When ECMP is enabled, the hashing algorithm determines how incoming traffic is forwarded to the next-hop device.</p> <p>The hash mode that is set using this statement determines which fields are inspected by the hashing algorithm. You must set the hash mode to <b>layer2-payload</b> if you want the hashing algorithm to inspect fields in the Layer 2 payload when making hashing decisions. You must set the hash mode to <b>layer2-header</b> if you want the hashing algorithm to inspect fields in the Layer 2 header when making hashing decisions.</p> <p>If the hash mode is set to <b>layer2-payload</b>, you can set the fields used by the hashing algorithm to hash IPv4 traffic using the <b>set forwarding-options enhanced-hash-key inet</b> statement. You can set the fields used by the hashing algorithm to hash IPv6 traffic using the <b>set forwarding-options enhanced-hash-key inet6</b> statement.</p> <p>If the hash mode is set to <b>layer2-header</b>, you can set the fields that the hashing algorithm inspects in the Layer 2 header using the <b>set forwarding-options enhanced-hash-key layer2</b> statement.</p> |
| <b>Default</b>                  | layer2-payload                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Command introduced in Junos OS Release 10.4R5 for EX Series switches.<br>Command introduced in Junos OS Release 11.1 for the QFX Series.<br>Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.                                                                          |
| <b>Description</b>         | Specify the <b>hold-time</b> value to use to damp shorter interface transitions milliseconds. When an interface goes from up to down, it is not advertised to the rest of the system as being down until it has remained down for the hold-time period. Similarly, an interface is not advertised as being up until it has remained up for the hold-time period. |

### NOTE:

- We recommend that you configure the hold-time value after determining an appropriate value by performing repeated tests in the actual hardware environment. This is because the appropriate value for hold-time depends on the hardware (XFP, SFP, SR, ER, or LR) used in the networking environment.
- The hold-time option is not available for controller interfaces.

**Hierarchy Level** [edit protocols]

**Release Information** Statement introduced in Junos OS Release 10.0 for MX Series routers.  
Statement introduced in Junos OS Release 12.2 for the QFX Series.  
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description** Configure Interchassis Control Protocol (ICCP) between the multichassis link aggregation group (MC-LAG) peers. ICCP replicates forwarding information, validates configurations, and propagates the operational state of the MC-LAG members.

**NOTE:** Backup liveness detection is not supported on MX Series routers.

The remaining statement are explained separately.

**Required Privilege** routing—To view this statement in the configuration.  
**Level** routing-control—To add this statement to the configuration.

## ieee-802-3az-eee

---

**Syntax** ieee-802-3az-eee;

**Hierarchy Level** [edit interfaces *interface-name* ether-options]

**Release Information** Statement introduced in Junos OS Release 12.2 for EX Series switches.

**Description** Configure Energy Efficient Ethernet (EEE) on an EEE-capable Base-T copper interface.

**Default** EEE is disabled on EEE-capable interfaces.

**Required Privilege** system—To view this statement in the configuration.  
**Level** system-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Select the payload fields in IPv4 traffic used by the hashing algorithm to make hashing decisions.</p> <p>When IPv4 traffic enters a LAG and the hash mode is set to Layer 2 payload, the hashing algorithm checks the fields configured using the <b>inet</b> statement and uses the information in the fields to decide how to place traffic onto the LAG bundle's member links or how to forward traffic to the next hop device when ECMP is enabled.</p> <p>The hashing algorithm, when used to hash LAG bundle traffic, always tries to manage bandwidth by evenly load-balancing all incoming traffic across the member links in the bundle.</p> <p>The hashing algorithm only inspects the IPv4 fields in the payload to make hashing decisions when the hash mode is set to <b>layer2-payload</b>. The hash mode is set to Layer 2 payload by default. You can set the hash mode to Layer 2 payload using the <b>set forwarding-options enhanced-hash-key hash-mode layer2-payload</b> statement.</p> |
| <b>Default</b>             | <p>The following fields are used by the hashing algorithm to make hashing decisions for IPv4 traffic:</p> <ul style="list-style-type: none"> <li>• IP destination address</li> <li>• IP source address</li> <li>• Layer 4 destination port</li> <li>• Layer 4 source port</li> <li>• Protocol</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b>         | <p>Select the payload fields in an IPv6 packet used by the hashing algorithm to make hashing decisions.</p> <p>When IPv6 traffic enters a LAG and the hash mode is set to Layer 2 payload, the hashing algorithm checks the fields configured using this statement and uses the information in the fields to decide how to place traffic onto the LAG bundle's member links or to forward traffic to the next hop device when ECMP is enabled.</p> <p>The hashing algorithm, when used to hash LAG traffic, always tries to manage bandwidth by evenly load-balancing all incoming traffic across the member links in the bundle.</p> <p>The hashing algorithm only inspects the IPv6 fields in the payload to make hashing decisions when the hash mode is set to Layer 2 payload. The hash mode is set to Layer 2 payload by default. You can set the hash mode to Layer 2 payload using the <b>set forwarding-options enhanced-hash-key hash-mode layer2-payload</b> statement.</p> |
| <b>Default</b>             | <p>The data in the following fields are used by the hashing algorithm to make hashing decisions for IPv6 traffic:</p> <ul style="list-style-type: none"> <li>• IP destination address</li> <li>• IP source address</li> <li>• Layer 4 destination port</li> <li>• Layer 4 source port</li> <li>• Next header</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

**no-l4-source-port**—Exclude the Layer 4 source port field from the hashing algorithm.

**no-next-header**—Exclude the Next Header field from the hashing algorithm.

**vlan-id**—Include the VLAN ID field in the hashing algorithm.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## interface (Multichassis Protection)

---

**Syntax** interface *interface-name*;

**Hierarchy Level** [edit [multi-chassis multi-chassis-protection](#) peer]

**Release Information** Statement introduced in Junos OS Release 9.6 for MX Series routers.  
Statement introduced in Junos OS Release 12.2 for the QFX Series.  
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description** Specify the name of the interface that is being used as an interchassis link-protection link (ICL-PL). The two switches hosting a multichassis link aggregation group (MC-LAG) use this link to pass Interchassis Control Protocol (ICCP) and data traffic.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| Release Information      | Statement introduced in Junos OS Release 9.2.<br>Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.<br>Statement introduced in Junos OS Release 13.2 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Description              |  <p><b>NOTE:</b> This statement supports the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does not support ELS, see <i>port-mode</i>. For ELS details, see <a href="#">“Getting Started with Enhanced Layer 2 Software” on page 3</a>.</p> <p>(QFX Series 3500 and 3600 standalone switches)—Determine whether the logical interface accepts or discards packets based on VLAN tags. Specify the <b>trunk</b> option to accept packets with a VLAN ID that matches the list of VLAN IDs specified in the <b>vlan-id</b> or <b>vlan-id-list</b> statement, then forward the packet within the bridge domain or VLAN configured with the matching VLAN ID. Specify the <b>access</b> option to accept packets with no VLAN ID, then forward the packet within the bridge domain or VLAN configured with the VLAN ID that matches the VLAN ID specified in the <b>vlan-id</b> statement.</p>  <p><b>NOTE:</b> On MX Series routers, if you want IGMP snooping to be functional for a bridge domain, then you should not configure <b>interface-mode</b> and <b>irb</b> for that bridge. Such a configuration commit succeeds, but IGMP snooping is not functional, and a message informing the same is displayed. For more information, see <i>Configuring a Trunk Interface on a Bridge Network</i>.</p> |
| Options                  | <p><b>access</b>—Configure a logical interface to accept untagged packets. Specify the VLAN to which this interface belongs using the <b>vlan-id</b> statement.</p> <p><b>trunk</b>—Configure a single logical interface to accept packets tagged with any VLAN ID specified with the <b>vlan-id</b> or <b>vlan-id-list</b> statement.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

## interface-range

```
Syntax  interface-range name {
        accounting-profile name;
        description text;
        disable;
        ether-options {
            802.3ad {
                aex;
                (backup | primary);
                lacp {
                    force-up;
                }
            }
            (auto-negotiation | no-auto-negotiation);
            (flow-control | no-flow-control);
            ieee-802-3az-eee;
            link-mode mode;
            (loopback | no-loopback);
            speed (auto-negotiation | speed);
        }
        (gratuitous-arp-reply | no-gratuitous-arp-reply);
        hold-time up milliseconds down milliseconds;
        member interface-name;
        member-range starting-interface name to ending-interface name;
        mtu bytes;
        no-gratuitous-arp-request;
        traceoptions {
            flag flag;
        }
        (traps | no-traps);
        unit logical-unit-number {
            accounting-profile name;
            bandwidth rate;
            description text;
            disable;
            family family-name {...}
            proxy-arp (restricted | unrestricted);
            (traps | no-traps);
            vlan-id (VLAN Tagging and Layer 3 Subinterfaces) vlan-id-number;
        }
        vlan-tagging;
    }
```

**Hierarchy Level** [edit interfaces]

**Release Information** Statement introduced in Junos OS Release 10.0 for EX Series switches.

**Description** Group interfaces that share a common configuration profile.

**NOTE:** You can specify interface ranges only for Gigabit and 10-Gigabit Ethernet interfaces.

**Options**    *name*—Name of the interface range.

**NOTE:** You can use regular expressions and wildcards to specify the interfaces in the member configuration. Do not use wildcards for interface types.

The remaining statements are explained separately.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                         interface-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Configure the Link Aggregation Control Protocol (LACP) for aggregated Ethernet interfaces only.</p> <p>When you configure the <b>accept-data</b> statement at the [edit interfaces aeX aggregated-ether-options lACP] hierarchy level, the router processes packets received on a member link irrespective of the LACP state if the aggregated Ethernet bundle is up.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> <b>NOTE:</b> When you configure the <b>accept-data</b> statement at the [edit interfaces aeX aggregated-ether-options lACP] hierarchy level, this behavior occurs:</p> <ul style="list-style-type: none"> <li>• By default, the <b>accept-data</b> statement is not configured when LACP is enabled.</li> <li>• You can configure the <b>accept-data</b> statement to improve convergence and reduce the number of dropped packets when member links in the bundle are enabled or disabled.</li> <li>• When LACP is down and a member link receives packets, the router or switch does not process packets as defined in the IEEE 802.1ax standard. According to this standard, the packets should be dropped, but they are processed instead because the <b>accept-data</b> statement is configured.</li> </ul> </div> |
| <b>Default</b>             | If you do not specify LACP as either <b>active</b> or <b>passive</b> , LACP remains passive.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>             | <b>active</b> —Initiate transmission of LACP packets.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

**admin-key *number***—Specify an administrative key for the router or switch.

**NOTE:** You must also configure multichassis link aggregation (MC-LAG) when you configure the **admin-key**.

**fast-failover**—Specify to override the IEEE 802.3ad standard and allow the standby link to receive traffic. Overriding the default behavior facilitates subsecond failover.

**passive**—Respond to LACP packets.

The remaining statements are explained separately.

| <b>Description</b>         | <p>Select the fields in the Layer 2 header that are used by the hashing algorithm to make hashing decisions.</p> <p>When traffic enters a link aggregation group (LAG) bundle, the hashing algorithm checks the fields configured using this statement and uses the information in the fields to decide how to place traffic onto the LAG bundle's member links. The hashing algorithm always tries to manage bandwidth by evenly load-balancing all incoming traffic across the member links in the bundle.</p> <p>When traffic is exiting a device that has enabled ECMP, the hashing algorithm checks the fields configured using this statement and uses the information in the fields to decide how to forward traffic to the next hop device.</p> <p>The hashing algorithm only inspects the fields in the Layer 2 header when the hash mode is set to Layer 2 header. You can set the hash mode to Layer 2 header using the <b>set forwarding-options enhanced-hash-key hash-mode layer2-header</b> statement.</p> |
| <b>Default</b>             | <p>The hash mode of the hashing algorithm is set to Layer 2 payload, by default. When the hash mode is set to Layer 2 payload, the hashing algorithm does not use fields in the Layer 2 header to make hashing decisions.</p> <p>The following fields are used by the hashing algorithm when the hash mode of the hashing algorithm is set to Layer 2 header, by default:</p> <ul style="list-style-type: none"><li>• Destination MAC address</li><li>• Ethertype</li><li>• Source MAC address</li></ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>             | <p><b>no-destination-mac-address</b>—Exclude the destination MAC address field from the hashing algorithm.</p> <p><b>no-ether-type</b>—Exclude the Ethertype field from the hashing algorithm.</p> <p><b>no-source-mac-address</b>—Exclude the source MAC address field from the hashing algorithm.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**vlan-id**—Include the VLAN ID field in the hashing algorithm.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>         | Set the device's link connection characteristic.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>             | <i>mode</i> —Link characteristics: <ul style="list-style-type: none"><li>• <b>automatic</b>—Link mode is negotiated. This is the default for EX Series switches.</li><li>• <b>full-duplex</b>—Connection is full duplex.</li><li>• <b>half-duplex</b>—Connection is half duplex.</li></ul> <p><b>Default:</b> Fast Ethernet interfaces, except the J Series ePIM Fast Ethernet interfaces, can operate in either full-duplex or half-duplex mode. The router's management Ethernet interface, <b>fxp0</b> or <b>em0</b>, the built-in Fast Ethernet interfaces on the FIC (M7i router), and the Gigabit Ethernet ports on J Series Services Routers with uPIMs installed and configured for access switching mode autonegotiate whether to operate in full-duplex or half-duplex mode. Unless otherwise noted here, all other interfaces operate only in full-duplex mode.</p> |

**NOTE:** On J Series ePIM Fast Ethernet interfaces, if you specify half-duplex (or if full-duplex mode is not autonegotiated), the following message is written to the system log: "Half-duplex mode not supported on this PIC, forcing full-duplex mode."

**NOTE:**

- On EX4300 switches, the interfaces operate in full-duplex mode only.
- On EX Series switches, if no-auto-negotiation is specified in [edit interfaces *interface-name* ether-options], you can select only full-duplex or half-duplex. If auto-negotiation is specified, you can select any mode.

**NOTE:** Member links of an aggregated Ethernet bundle must not be explicitly configured with a link mode. You must remove any such link-mode configuration before committing the aggregated Ethernet configuration.

| <b>Description</b>              | <p>On the router, for aggregated Ethernet interfaces only, configure link protection. In addition to enabling link protection, a primary and a secondary (backup) link must be configured to specify what links egress traffic should traverse. To configure primary and secondary links on the router, include the <b>primary</b> and <b>backup</b> statements at the <b>[edit interfaces ge-fpc/pic/port gigheter-options 802.3ad aex]</b> hierarchy level or the <b>[edit interfaces fe-fpc/pic/port fastether-options 802.3ad aex]</b> hierarchy level.</p> <p>On the switch, you can configure either Junos OS link protection for aggregated Ethernet interfaces or the LACP standards link protection for aggregated Ethernet interfaces.</p> <p>For Junos OS link protection, specify <b>link-protection</b> at the following hierarchy levels:</p> <ul style="list-style-type: none"><li>• <b>[edit interfaces ge-fpc/pic/port ether-options 802.3ad aex]</b></li><li>• <b>[edit interfaces xe-fpc/pic/port ether-options 802.3ad aex]</b></li></ul> <p>For LACP standards link protection, specify <b>link-protection</b> at the following hierarchy levels:</p> <ul style="list-style-type: none"><li>• For global LACP link protection, specify at <b>[edit chassis aggregated-devices ethernet lacp]</b></li><li>• For a specific aggregated Ethernet interface, specify at <b>[edit interfaces aeX aggregated-ether-options lacp]</b></li></ul> <p>To disable link protection, use the <b>delete interface ae aggregate-ether-options link-protection</b> statement at the <b>[edit interfaces aex aggregated-ether-options]</b> hierarchy level or the <b>[edit interfaces aex aggregated-ether-options lacp]</b> hierarchy level.</p> |
| <b>Options</b>                  | The statements are explained separately.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Description</b>         | For aggregated Ethernet interfaces only, set the required link speed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>             | <p><b><i>speed</i></b>—For aggregated Ethernet links, you can specify <b><i>speed</i></b> in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation <b>k</b> (1000), <b>m</b> (1,000,000), or <b>g</b> (1,000,000,000).</p> <p>Aggregated Ethernet links on the M120 router can have one of the following speeds:</p> <ul style="list-style-type: none"><li>• <b>100m</b>—Links are 100 Mbps.</li><li>• <b>10g</b>—Links are 10 Gbps.</li><li>• <b>1g</b>—Links are 1 Gbps.</li><li>• <b>oc192</b>—Links are OC192 or STM64c.</li></ul> <p>Aggregated Ethernet links on EX Series switches can be configured to operate at one of the following speeds:</p> <ul style="list-style-type: none"><li>• <b>10m</b>—Links are 10 Mbps.</li><li>• <b>100m</b>—Links are 100 Mbps.</li><li>• <b>1g</b>—Links are 1 Gbps.</li><li>• <b>10g</b>—Links are 10 Gbps.</li></ul> <p>Aggregated Ethernet links on T Series routers can be configured to operate at one of the following speeds:</p> <ul style="list-style-type: none"><li>• <b>100g</b>—Links are 100 Gbps.</li><li>• <b>100m</b>—Links are 100 Mbps.</li><li>• <b>10g</b>—Links are 10 Gbps.</li><li>• <b>1g</b>—Links are 1 Gbps.</li><li>• <b>40g</b>—Links are 40 Gbps.</li><li>• <b>50g</b>—Links are 50 Gbps.</li><li>• <b>80g</b>—Links are 80 Gbps.</li><li>• <b>8g</b>—Links are 8 Gbps.</li></ul> |

- **mixed**—Links are of various speeds.
- **oc192**—Links are OC192.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## liveness-detection

**Syntax**

```
liveness-detection {
  detection-time {
    threshold milliseconds;
  }
  minimum-interval milliseconds;
  minimum-receive-interval milliseconds;
  multiplier number;
  no-adaptation;
  transmit-interval {
    minimum-interval milliseconds;
    threshold milliseconds;
  }
  version (1 | automatic);
}
```

**Hierarchy Level** [edit protocols [iccp peer](#)]

**Release Information** Statement introduced in Junos OS Release 10.0 for MX Series routers.  
Statement introduced in Junos OS Release 12.2 for the QFX Series.  
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description** Enable Bidirectional Forwarding Detection (BFD). BFD enables rapid detection of communication failures between peers.

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.2X51-D20 for EX Series switches and QFX Series devices.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>              | <p>Enable local link bias for all links in the aggregated Ethernet interface.</p> <p>Local link bias conserves bandwidth on Virtual Chassis ports (VCPs) by using local links to forward unicast traffic exiting a Virtual Chassis or Virtual Chassis Fabric (VCF) that has a Link Aggregation group (LAG) bundle composed of member links on different member switches in the same Virtual Chassis or VCF. A local link is a member link in the LAG bundle that is on the member switch that received the traffic.</p> <p>You should enable local link bias if you want to conserve VCP bandwidth by always forwarding egress unicast traffic on a LAG bundle out of a local link. You should not enable local link bias if you want egress traffic load-balanced as it exits the Virtual Chassis or VCF.</p> |

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.                                                                                                   |
| <b>Description</b>         | For aggregated Ethernet, Fast Ethernet, Gigabit Ethernet, and 10-Gigabit Ethernet interfaces, enable or disable loopback mode.                                                                                                                                                                                        |

### NOTE:

- By default, local aggregated Ethernet, Fast Ethernet, Tri-Rate Ethernet copper, Gigabit Ethernet, and 10-Gigabit Ethernet interfaces connect to a remote system.
- IPv6 Neighbor Discovery Protocol (NDP) addresses are not supported on Gigabit Ethernet interfaces when loopback mode is enabled on the interface. That is, if the loopback statement is configured at the [edit interfaces *ge-fpc/pic/port* gigether-options] hierarchy level, an NDP address cannot be configured at the [edit interfaces *ge-fpc/pic/port* unit *logical-unit-number* family inet6 address] hierarchy level.

**Syntax**

```
mc-ae {
  chassis-id chassis-id;
  events {
    iccp-peer-down {
      force-icl-down;
      prefer-status-control-active;
    }
  }
  init-delay-time seconds;
  mc-ae-id mc-ae-id;
  mode (active-active | active-standby);
  redundancy-group group-id;
  revert-time revert-time;
  status-control (active | standby);
  switchover-mode (non-revertive | revertive);
}
```

**Hierarchy Level** [edit interfaces aeX aggregated-ether-options]  
[edit logical-systems *logical-system-name* interfaces aeX aggregated-ether-options]

**Release Information** Statement introduced in Junos OS Release 9.6.  
**events** statement introduced in Junos OS Release 11.4R4.  
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.  
**prefer-status-control-active** statement introduced in Junos OS Release 13.2R1 for EX Series switches.  
**init-delay-time *seconds*** statement introduced in Junos OS Release 13.2R3 for EX Series switches.  
**switchover-mode** and **revert-time** statements introduced in Junos OS Release 13.3.  
Support for logical systems introduced in Junos OS Release 14.1.

**Description** Enable multichassis link aggregation groups (MC-LAG), which enables one device to form a logical LAG interface with two or more other devices.

**Options** **chassis-id**—Specify the chassis ID for Link Aggregation Control Protocol (LACP) to calculate the port number of MC-LAG physical member links.

**Values:** 0 or 1

**events**—Specify an action if a specific MC-LAG event occurs.

**iccp-peer-down**—Specify an action if the ICCP peer of this node goes down.

**force-icl-down**—If the node's ICCP peer goes down, bring down the interchassis-link logical interface.

**prefer-status-control-active**—Specify that the node configured as **status-control active** become the active node if the peer of this node goes down.

**NOTE:** The **prefer-status-control-active** statement can be configured with the **status-control standby** configuration to prevent

the LACP MC-LAG system ID from reverting to the default LACP system ID on ICCP failure. Use this configuration only if you can ensure that ICCP will not go down unless the router or switch is down. You must also configure the **hold-time down** value (at the **[edit interfaces *interface-name*]** hierarchy level) for the interchassis link with the **status-control standby** configuration to be higher than the ICCP BFD timeout. This configuration prevents data traffic loss by ensuring that when the router or switch with the **status-control active** configuration goes down, the router or switch with the **status-control standby** configuration does not go into standby mode.

To make the **prefer-status-control-active** configuration work with the **status-control standby** configuration when an interchassis-link logical interface is configured on aggregate Ethernet interface, you must either configure the **lacp periodic *interval*** statement at the **[edit interface *interface-name* aggregated-ether-options]** hierarchy level as **slow** or configure the **detection-time threshold** statement at the **[edit protocols iccp peer liveness-detection]** hierarchy level as less than 3 seconds.

**mc-ae-id**—Specify the identification number of the MC-LAG device. The two MC-LAG network devices that manage a given MC-LAG must have the same identification number.

**Range:** 1 through 65,535

**mode (active-active | active-standby)**—Specify whether the MC-LAG is in active-active or active-standby mode.

**NOTE:** You can configure IPv4 (**inet**) and IPv6 (**inet6**) addresses on **mc-ae** interfaces when the **active-standby** mode is configured.

**redundancy-group**—Specify the redundancy group identification number. The Inter-Chassis Control Protocol (ICCP) uses the redundancy group ID to associate multiple chassis that perform similar redundancy functions.

**Range:** 1 through 4,294,967,294

**revert-time**—Wait interval (in minutes) before the switchover to the preferred node is performed when the **switchover-mode** is configured as **revertive**.

**Range:** 1 through 10

**status-control (active | standby)**—Specify whether the chassis becomes active or remains in standby when an interchassis link failure occurs.

**switchover-mode (non-revertive | revertive)**—Specify whether Junos OS should trigger a link switchover to the preferred node when the active node is available.

**NOTE:** For revertive mode to automatically switch over to the preferred node, the **status-control** statement should be configured as **active**.

**init-delay-time seconds**—To minimize traffic loss, specify the number of seconds by which to delay bringing the multichassis aggregated Ethernet (mc-ae) interface back to the up state when you reboot an MC-LAG peer.

The remaining statements are explained separately.

| <b>Release Information</b> | Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement updated with enhanced ? (CLI completion feature) functionality in Junos OS Release 9.5 for EX Series switches. |
| <b>Description</b>         | For trunk interfaces, configure the VLANs that can carry traffic.                                                                                                                                |

**TIP:** To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type ? after `vlan` or `vlands` in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range.

**NOTE:** The number of VLANs supported per switch varies for each model. Use the configuration-mode command `set vlans id vlan-id ?` to determine the maximum number of VLANs allowed on a switch. You cannot exceed this VLAN limit because each VLAN is assigned an ID number when it is created. You can, however, exceed the recommended VLAN member maximum.

On an EX Series switch that runs Junos OS that does not support the Enhanced Layer 2 Software (ELS) configuration style, the maximum number of VLAN members allowed on the switch is 8 times the maximum number of VLANs the switch supports (`vmember limit = vlan max * 8`). If the switch configuration exceeds the recommended VLAN member maximum, you see a warning message when you commit the configuration. If you ignore the warning and commit such a configuration, the configuration succeeds but you run the risk of crashing the Ethernet switching process (`eswd`) due to memory allocation failure.

On an EX Series switch that runs Junos OS that supports ELS, the maximum number of VLAN members allowed on the switch is 24 times the maximum number of VLANs the switch supports (`vmember limit = vlan max * 24`). If the configuration of one of these switches exceeds the recommended VLAN member maximum, a warning message appears in the system log (`syslog`).

**Options** `all`—Specifies that this trunk interface is a member of all the VLANs that are configured on this switch. When a new VLAN is configured on the switch, this trunk interface automatically becomes a member of the VLAN.

**NOTE:** Since VLAN members are limited, specifying all could cause the number of VLAN members to exceed the limit at some point.

**names**—Name of one or more VLANs. VLAN IDs are applied automatically in this case.

**NOTE:** **all** cannot be a VLAN name.

**vlan-ids**—Numeric identifier of one or more VLANs. For a series of tagged VLANs, specify a range; for example, 10–20 or 10–20 23 27–30.

**NOTE:** Each configured VLAN must have a specified VLAN ID to successfully commit the configuration; otherwise, the configuration commit fails.

**Required Privilege  
Level**

interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Specify the maximum transmission unit (MTU) size for the media or protocol. The default MTU size depends on the device type. Changing the media MTU or protocol MTU causes an interface to be deleted and added again.</p> <p>To route jumbo data packets on an integrated routing and bridging (IRB) interface or routed VLAN interface (RVI) on EX Series switches, you must configure the jumbo MTU size on the member physical interfaces of the VLAN that you have associated with the IRB interface or RVI, as well as on the IRB interface or RVI itself (the interface named <code>irb</code> or <code>vlan</code>, respectively).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**CAUTION:** For EX Series switches, setting or deleting the jumbo MTU size on an IRB interface or RVI while the switch is transmitting packets might cause packets to be dropped.

## NOTE:

The MTU for an IRB interface is calculated by removing the Ethernet header overhead [6(DMAC)+6(SMAC)+2(EtherType)]. Because, the MTU is the lower value of the MTU configured on the IRB interface and the MTU configured on the IRB's associated bridge domain IFDs or IFLs, the IRB MTU is calculated as follows:

- In case of Layer 2 IFL configured with the `flexible-vlan-tagging` statement, the IRB MTU is calculated by including 8 bytes overhead (SVLAN+CVLAN).
- In case of Layer 2 IFL configured with the `vlan-tagging` statement, the IRB MTU is calculated by including a single VLAN 4 bytes overhead.

## NOTE:

- If a packet whose size is larger than the configured MTU size is received on the receiving interface, the packet is eventually dropped. The value considered for MRU (maximum receive unit) size is also the same as the MTU size configured on that interface.
- Not all devices allow you to set an MTU value, and some devices have restrictions on the range of allowable MTU values. You cannot configure an MTU for management Ethernet interfaces (fxp0, em0, or me0) or for loopback, multilink, and multicast tunnel devices.
- On ACX Series routers, you can configure the protocol MTU by including the `mtu` statement at the [edit interfaces *interface-name* unit *logical-unit-number* family inet] or [edit interfaces *interface-name* unit *logical-unit-number* family inet6] hierarchy level.
  - If you configure the protocol MTU at any of these hierarchy levels, the configured value is applied to all families that are configured on the logical interface.
  - If you are configuring the protocol MTU for both inet and inet6 families on the same logical interface, you must configure the same value for both the families. It is not recommended to configure different MTU size values for inet and inet6 families that are configured on the same logical interface.

For more information about configuring MTU for specific interfaces and router or switch combinations, see [“Configuring the Media MTU” on page 2638](#).

## multi-chassis-protection

---

**Syntax**    `multi-chassis-protection peer-ip-address {  
                  interface interface-name;  
                  }`

**Hierarchy Level**    [edit [multi-chassis](#)]

**Release Information**    Statement introduced in Junos OS Release 9.6 for MX Series routers.  
Statement introduced in Junos OS Release 12.2 for the QFX Series.  
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description**    Configure multichassis link protection between the two peers that host a multichassis link aggregation group (MC-LAG). If the Interchassis Control Protocol (ICCP) connection is up and the interchassis link (ICL) comes up, the peer configured as standby brings up the multichassis aggregated Ethernet (MC-AE) interfaces shared with the peer. Multichassis protection must be configured on one interface for each peer.

The remaining statements are explained separately.

**Options**    **interface** *interface-name*—Specify the logical interface name of the peer.

The remaining statements are explained separately.

**Required Privilege Level**    **interface**—To view this statement in the configuration.  
                  **interface-control**—To add this statement to the configuration.

## peer (ICCP)

---

**Syntax** `peer ip-address {  
    authentication-key string;  
    backup-liveness-detection {  
        backup-peer-ip ip-address;  
    }  
    liveness-detection {  
        detection-time {  
            threshold milliseconds;  
        }  
        minimum-interval milliseconds;  
        minimum-receive-interval milliseconds;  
        multiplier number;  
        no-adaptation;  
        transmit-interval {  
            minimum-interval milliseconds;  
            threshold milliseconds;  
        }  
        version (1 | automatic);  
    }  
    local-ip-addr ipv4-address;  
    session-establishment-hold-time seconds;  
}`

**Hierarchy Level** [edit protocols [iccp](#)]

**Release Information** Statement introduced in Junos OS Release 10.0 for MX Series routers.  
Statement introduced in Junos OS Release 12.2 for the QFX Series.  
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description** Configure the peers that host a multichassis link aggregation group (MC-LAG). You must configure Interchassis Control Protocol (ICCP) for both peers that host the MC-LAG.

**NOTE:** Backup liveness detection is not supported on MX Series routers.

---

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## periodic

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.6 for EX Series switches.<br><b>restricted</b> added in Junos OS Release 10.0 for EX Series switches.<br>Statement introduced in Junos OS Release 12.2 for the QFX Series. |
| <b>Description</b>         | For Ethernet interfaces only, configure the router or switch to respond to any ARP request, as long as the router or switch has an active route to the ARP request's target address.                                                                                       |

**NOTE:** You must configure the IP address and the `inet` family for the interface when you enable proxy ARP.

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.<br>Statement introduced in Junos OS Release 13.2X50-D10 for EX Series switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | <p>Configure the interface speed. This statement applies to the management Ethernet interface (<b>fxp0</b> or <b>em0</b>), Fast Ethernet 12-port and 48-port PICs, the built-in Fast Ethernet port on the FIC (M7i router), the built-in Ethernet interfaces on J Series Services Routers, Combo Line Rate DPCs and Tri-Rate Ethernet Copper interfaces on MX Series routers, Gigabit Ethernet ports on J Series Services Routers with uPIMs installed and configured for access switching mode, and Gigabit Ethernet interfaces on EX Series switches.</p> <p>When you configure the Tri-Rate Ethernet copper interface to operate at 1 Gbps, autonegotiation must be enabled. When you configure 100BASE-FX SFP, you must set the port speed at 100 Mbps.</p>                       |
| <b>Options</b>                  | <p>You can specify the speed as either <b>10m</b> (10 Mbps), <b>100m</b> (100 Mbps), or on J Series routers with uPIMs installed and on MX Series routers, <b>1g</b> (1 Gbps). You can also specify the <b>auto</b> option on MX Series routers.</p> <p>For Gigabit Ethernet interfaces on EX Series switches, you can specify one of the following options:</p> <ul style="list-style-type: none"> <li>• <b>10m</b>—10 Mbps</li> <li>• <b>100m</b>—100 Mbps</li> <li>• <b>1g</b>—1 Gbps</li> <li>• <b>auto</b>—Automatically negotiate the speed (10 Mbps, 100 Mbps, or 1 Gbps) based on the speed of the other end of the link.</li> <li>• <b>auto-10m-100m</b>—Automatically negotiate the speed (10 Mbps or 100 Mbps) based on the speed of the other end of the link.</li> </ul> |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Description</b>         | <p>Define tracing operations for individual interfaces.</p> <p>To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <p>The interfaces <b>traceoptions</b> statement does not support a trace file. The logging is done by the kernel, so the tracing information is placed in the system <b>syslog</b> file in the directory <b>/var/log/dcd</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Default</b>             | If you do not include this statement, no interface-specific tracing operations are performed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Options</b>             | <p><b>file name</b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log/dcd</b>. By default, interface process tracing output is placed in the file <b>files number</b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p><b>match</b>—(Optional) Regular expression for lines to be traced.</p> <p><b>no-world-readable</b>—(Optional) Prevent any user from reading the log file.</p> <p><b>world-readable</b>—(Optional) Allow any user to read the log file.</p> <p><b>size size</b>—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named <b>trace-file</b> reaches this size, it is renamed <b>trace-file.0</b>. When the <b>trace-file</b> again reaches its maximum size, <b>trace-file.0</b> is renamed <b>trace-file.1</b> and <b>trace-file</b> is renamed <b>trace-file.0</b>. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.</p> <p><b>flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. The following are the interface-specific tracing options.</p> <ul style="list-style-type: none"><li>• <b>all</b>—All interface tracing operations</li><li>• <b>event</b>—Interface events</li><li>• <b>ipc</b>—Interface interprocess communication (IPC) messages</li></ul> |

- **media**—Interface media changes

| <b>Description</b>         | Define tracing operations for the interface process (dcd).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Default</b>             | If you do not include this statement, no interface-specific tracing operations are performed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>             | <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>filename</b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. By default, interface process tracing output is placed in the file <b>dcd</b>.</p> <p><b>files number</b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"><li>• <b>all</b></li><li>• <b>change-events</b>—Log changes that produce configuration events</li><li>• <b>config-states</b>—Log the configuration state machine changes</li><li>• <b>kernel</b>—Log configuration IPC messages to kernel</li><li>• <b>kernel-detail</b>—Log details of configuration messages to kernel</li></ul> <p><b>no-world-readable</b>—(Optional) Disallow any user to read the log file.</p> |

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify kilobytes, **xm** to specify megabytes, or **xg** to specify gigabytes

**Range:** 10 KB through the maximum file size supported on your router

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

**match regex**—(Optional) Refine the output to include only those lines that match the given regular expression.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

## transmit-interval (Liveness Detection)

**Syntax** transmit-interval {  
    **minimum-interval** *milliseconds*;  
    **threshold** *milliseconds*;  
}

**Hierarchy Level** [edit protocols **iccp** **peer** **liveness-detection**]

**Release Information** Statement introduced in Junos OS Release 10.0 for MX Series routers.  
Statement introduced in Junos OS Release 12.2 for the QFX Series.  
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description** Configure the Bidirectional Forwarding Detection (BFD) transmit interval. The negotiated transmit interval for a peer is the interval between the sending of BFD liveness detection requests to peers. The receive interval for a peer is the minimum interval between receiving packets sent from its peer; the receive interval is not negotiated between peers. To determine the transmit interval, each peer compares its configured minimum transmit interval with its peer's minimum receive interval. The larger of the two numbers is accepted as the transmit interval for that peer.

The remaining statements are explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## vlan-id (VLAN Tagging and Layer 3 Subinterfaces)

|                            |                                                                                 |
|----------------------------|---------------------------------------------------------------------------------|
| <b>Syntax</b>              | <code>vlan-id <i>vlan-id-number</i>;</code>                                     |
| <b>Hierarchy Level</b>     | [edit interfaces <i>interface-name</i> <b>unit</b> <i>logical-unit-number</i> ] |
| <b>Release Information</b> | Statement introduced in Junos OS Release 9.2 for EX Series switches.            |
| <b>Description</b>         | Bind an 802.1Q VLAN tag ID to a logical interface.                              |

**NOTE:** The VLAN tag ID cannot be configured on logical interface unit 0. The logical unit number must be 1 or higher.

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Monitoring Interface Status and Traffic

### Purpose

**NOTE:** This topic applies only to the J-Web Application package.

Use the monitoring functionality to view interface status or to monitor interface bandwidth utilization and traffic statistics on the EX Series switches.

The J-Web interface monitors interface bandwidth utilization and plots real-time charts to display input and output rates in bytes per second. In addition, the Interface monitoring page displays input and output packet counters and error counters in the form of charts.

Alternatively, you can enter the **show** commands in the CLI to view interface status and traffic statistics.

**NOTE:** For logical interfaces on EX Series switches, the traffic statistics fields in **show interfaces** commands show only control traffic; the traffic statistics do not include data traffic.

**NOTE:** EX Series switches do not support the collection and reporting of IPv6 transit statistics. Therefore, the IPv6 transit statistics field in the `show interfaces` commands displays all values as 0.

**Action** To view general interface information in the J-Web interface such as available interfaces, select **Monitor > Interfaces**. Click any interface to view details about its status.

To set up interface monitoring for Virtual Chassis and EX8200 switches, select a member from the **Port for Member** list. Details such as the admin status and link status are displayed in the table. For an EX8200 Virtual Chassis setup, select the member, **FPC**, and the required interface.

**NOTE:** By default, the details of the first member in the FPC list is displayed. In an EX8200 Virtual Chassis setup, details of the first member and the first FPC is displayed.

You have the following options:

- **Start/Stop**—Starts or stops monitoring the selected interface.
- **Show Graph**—Displays input and output packet counters and error counters in the form of charts. Click the pop-up icon to view the graph in a separate window.
- **Details**—Displays interface information such as general details, traffic statistics, I/O errors, CoS counters, and Ethernet statistics.
- **Refresh Interval (sec)**—Displays the time interval you have set for page refresh.
- **Clear Statistics**—Clears the statistics for the interface selected from the table.

Using the CLI:

- To view interface status for all the interfaces, enter `show interfaces xe-`.
- To view status and statistics for a specific interface, enter `show interfaces xe-interface-name`.
- To view status and traffic statistics for all interfaces, enter either `show interfaces xe-detail` or `show interfaces xe- extensive`.

**Meaning** In the J-Web interface the charts displayed are:

- Bar charts—Display the input and output error counters.
- Pie charts—Display the number of broadcast, unicast, and multicast packet counters.

For details about output from the CLI commands, see `show interfaces ge-` (Gigabit Ethernet) or `show interfaces xe-` (10-Gigabit Ethernet).

  - [Configuring Gigabit Ethernet Interfaces \(CLI Procedure\) on page 2616](#)

## Verifying the Status of a LAG Interface

**Purpose** Verify that a LAG (ae0) has been created on the switch.

**Action** Enter the following command:

```
user@switch> show interfaces ae0 terse
Interface      Admin  Link  Proto  Local      Remote
ae0            up     up
ae0.0          up     up     inet   10.10.10.2/24
```

**Meaning** The output confirms that the ae0 link is up and shows the family and IP address assigned to this link.

## Verifying That EEE Is Saving Energy on Configured Ports

**Purpose** Verify that enabling EEE saves energy on Base-T Copper Ethernet ports.

**Action** You can see the amount of energy saved by EEE on an EX Series switch using the [show chassis power-budget-statistics](#) command.

1. View the power budget of an EX Series switch before enabling EEE.

- On an EX6210 switch:

```
user@switch> show chassis power-budget-statistics
PSU 2 (EX6200-PWR-AC2500) : 2500 W Online
PSU 3 ) : 0 W Offline
Total Power supplied by all Online PSUs : 2500 W
Power Redundancy Configuration : N+1
Power Reserved for the Chassis : 500 W

Fan Tray Statistics
FTC 0 : Base power 300 W Power Used nan W
FPC Statistics
power Priority Base power Power Used PoE
FPC 3 (EX6200-48T) : 150 W 61.54 W
0 W 9
FPC 4 (EX6200-SRE64-4XS) : 100 W 48.25 W
0 W 0
FPC 5 (EX6200-SRE64-4XS) : 100 W 48.00 W
0 W 0
FPC 7 (EX6200-48T) : 150 W 63.11 W
0 W 9
```

```

FPC 8 (EX6200-48T) : 150 W 12.17 W
0 W 9

Total (non-PoE) Power allocated : 950 W
Total Power allocated for PoE : 0 W
Power Available (Redundant case) : 0 W
Total Power Available : 1550 W

```

- On an EX4300 switch:

```

user@switch> show chassis power-budget-statistics fpc 1
PSU 1 (JPSU-1100-AC-AF0-A) : 1100 W Online
Power redundancy configuration : N+0
Total power supplied by all online PSUs : 1100 W
Base power reserved : 175 W
Non-PoE power being consumed : 95 W
Total Power allocated for PoE : 925 W
Total PoE power consumed : 0 W
Total PoE power remaining : 925 W

```

2. Enable EEE on Base-T Copper Ethernet ports and save the configuration.

3. View the power budget of the switch after enabling EEE.

- On an EX6210 switch:

```

user@switch> show chassis power-budget-statistics
PSU 2 (EX6200-PWR-AC2500) : 2500 W Online
PSU 3 : 0 W Offline
Total Power supplied by all Online PSUs : 2500 W
Power Redundancy Configuration : N+1
Power Reserved for the Chassis : 500 W
Fan Tray Statistics
FTC 0 : Base power 300 W Power Used nan W
FPC Statistics
power Priority Base power Power Used PoE
FPC 3 (EX6200-48T) : 150 W 50.36 W
0 W 9
FPC 4 (EX6200-SRE64-4XS) : 100 W 48.60 W
0 W 0
FPC 5 (EX6200-SRE64-4XS) : 100 W 48.09 W
0 W 0
FPC 7 (EX6200-48T) : 150 W 51.38 W
0 W 9
FPC 8 (EX6200-48T) : 150 W 12.17 W
0 W 9

Total (non-PoE) Power allocated : 950 W
Total Power allocated for PoE : 0 W
Power Available (Redundant case) : 0 W
Total Power Available : 1550 W

```

- On an EX4300 switch:

```

user@switch> show chassis power-budget-statistics fpc 1
PSU 1 (JPSU-1100-AC-AF0-A) : 1100 W Online
Power redundancy configuration : N+0
Total power supplied by all online PSUs : 1100 W
Base power reserved : 175 W
Non-PoE power being consumed : 86 W
Total Power allocated for PoE : 925 W

```

```

Total PoE power consumed      :    0 W
Total PoE power remaining    :   925 W

```

**Meaning** On an EX6210 switch, the **Power Used** field in the output shows the actual power being consumed by the line card or SRE module, including PoE power. If you compare the values in the **Power Used** field before and after enabling EEE for FPC 3 and FPC 7, you will notice that power is saved when EEE is enabled.

**NOTE:** The **Power Used** field is displayed in the output only for EX6210 switches.

On an EX4300 switch, if you compare the values in the **Non-PoE power being consumed** field before and after enabling EEE, you will notice that power is saved when EEE is enabled.

## Verifying That LACP Is Configured Correctly and Bundle Members Are Exchanging LACP Protocol Packets

Verify that LACP has been set up correctly and that the bundle members are transmitting LACP protocol packets.

1. [Verifying the LACP Setup on page 2839](#)
2. [Verifying That LACP Packets Are Being Exchanged on page 2840](#)

### Verifying the LACP Setup

**Purpose** Verify that the LACP has been set up correctly.

**Action** To verify that LACP has been enabled as active on one end:

```

user@switch> show lacp interfaces xe-0/1/0
Aggregated interface: ae0

```

| LACP state:    | Role          | Exp | Def            | Dist | Col       | Syn | Aggr | Timeout | Activity |
|----------------|---------------|-----|----------------|------|-----------|-----|------|---------|----------|
| xe-0/1/0       | Actor         | No  | Yes            | No   | No        | No  | Yes  | Fast    | Active   |
| xe-0/1/0       | Partner       | No  | Yes            | No   | No        | No  | Yes  | Fast    | Passive  |
| LACP protocol: | Receive State |     | Transmit State |      | Mux State |     |      |         |          |
| xe-0/1/0       | Defaulted     |     | Fast periodic  |      | Detached  |     |      |         |          |

**Meaning** This output shows that LACP has been configured with one side as active and the other as passive. When LACP is enabled, at least one side must be set as active for the bundled link to be up.

### Verifying That LACP Packets Are Being Exchanged

---

**Purpose** Verify that LACP packets are being exchanged between interfaces.

**Action** Use the **show interfaces aex statistics** command to display LACP BPDU exchange information.

**show interfaces ae0 statistics**

```
Physical interface: ae0, Enabled, Physical link is Down
Interface index: 153, SNMP ifIndex: 30
Link-level type: Ethernet, MTU: 1514, Speed: Unspecified, Loopback: Disabled,
Source filtering: Disabled, Flow control: Disabled, Minimum links needed: 1,
Minimum bandwidth needed: 0
Device flags   : Present Running
Interface flags: Hardware-Down SNMP-Traps Internal: 0x0
Current address: 02:19:e2:50:45:e0, Hardware address: 02:19:e2:50:45:e0
Last flapped   : Never
Statistics last cleared: Never
  Input packets : 0
  Output packets: 0
Input errors: 0, Output errors: 0

Logical interface ae0.0 (Index 71) (SNMP ifIndex 34)
Flags: Hardware-Down Device-Down SNMP-Traps Encapsulation: ENET2
Statistics      Packets      pps      Bytes      bps
Bundle:
  Input :           0           0           0           0
  Output:           0           0           0           0
Protocol inet,
Flags: None
Addresses, Flags: Dest-route-down Is-Preferred Is-Primary
Destination: 10.10.10/24, Local: 10.10.10.1, Broadcast: 10.10.10.255
```

**Meaning** The output here shows that the link is down and that no PDUs are being exchanged (when there is no other traffic flowing on the link).

- Related Documentation**
- [Configuring Aggregated Ethernet LACP](#)
  - [Configuring Aggregated Ethernet LACP \(CLI Procedure\) on page 2671](#)
  - [Verifying the Status of a LAG Interface](#)
  - [Verifying the Status of a LAG Interface on page 2837](#)

### Verifying That Layer 3 Subinterfaces Are Working

**Purpose** After configuring Layer 3 subinterfaces, verify they are set up properly and transmitting data.

- Action** 1. Use the **show interfaces** command to determine whether you successfully created the subinterfaces and the links are up:

```
user@switch> show interfaces interface-name terse
Interface           Admin Link Proto  Local           Remote
ge-0/0/0            up    up
ge-0/0/0.0          up    up   inet   1.1.1.1/24
ge-0/0/0.1          up    up   inet   2.1.1.1/24
ge-0/0/0.2          up    up   inet   3.1.1.1/24
ge-0/0/0.3          up    up   inet   4.1.1.1/24
ge-0/0/0.4          up    up   inet   5.1.1.1/24
ge-0/0/0.32767      up    up
```

2. Use the **ping** command from a device on one subnet to an address on another subnet to determine whether packets were transmitted correctly on the subinterface VLANs:

```
user@switch> ping ip-address
PING 1.1.1.1 (1.1.1.1): 56 data bytes
64 bytes from 1.1.1.1: icmp_seq=0 ttl=64 time=0.157 ms
64 bytes from 1.1.1.1: icmp_seq=1 ttl=64 time=0.238 ms
64 bytes from 1.1.1.1: icmp_seq=2 ttl=64 time=0.255 ms
64 bytes from 1.1.1.1: icmp_seq=3 ttl=64 time=0.128 ms
--- 1.1.1.1 ping statistics ---
4 packets transmitted, 4 packets received, 0% packet loss
```

**Meaning** The output confirms that the subinterfaces are created and the links are up.

## Verifying Unicast RPF Status

**Purpose** Verify that unicast reverse-path forwarding (RPF) is enabled and is working on the interface.

- Action** Use one of the **show interfaces interface-name** commands with either the **extensive** or **detail** options to verify that unicast RPF is enabled and working on the switch. The following example displays output from the **show interfaces ge- extensive** command.

```
user@switch> show interfaces ge-1/0/10 extensive
Physical interface: ge-1/0/10, Enabled, Physical link is Down
Interface index: 139, SNMP ifIndex: 58, Generation: 140
Link-level type: Ethernet, MTU: 1514, Speed: Auto, MAC-REWRITE Error: None,
Loopback: Disabled, Source filtering: Disabled, Flow control: Enabled,
Auto-negotiation: Enabled, Remote fault: Online
Device flags   : Present Running
Interface flags: Hardware-Down SNMP-Traps Internal: 0x0
Link flags     : None
CoS queues     : 8 supported, 8 maximum usable queues
Hold-times     : Up 0 ms, Down 0 ms
Current address: 00:19:e2:50:95:ab, Hardware address: 00:19:e2:50:95:ab
Last flapped   : Never
Statistics last cleared: Never
Traffic statistics:
Input bytes   :                               0                0 bps
```

```

Output bytes :                0                0 bps
Input packets:                0                0 pps
Output packets:               0                0 pps
IPv6 transit statistics:
  Input bytes :                0
  Output bytes :               0
  Input packets:              0
  Output packets:             0
Input errors:
  Errors: 0, Drops: 0, Framing errors: 0, Runts: 0, Policed discards: 0,
  L3 incompletes: 0, L2 channel errors: 0, L2 mismatch timeouts: 0,
  FIFO errors: 0, Resource errors: 0
Output errors:
  Carrier transitions: 0, Errors: 0, Drops: 0, Collisions: 0, Aged packets: 0,

  FIFO errors: 0, HS link CRC errors: 0, MTU errors: 0, Resource errors: 0
Egress queues: 8 supported, 4 in use
Queue counters:      Queued packets  Transmitted packets      Dropped packets

  0 best-effort                0                0                0

  1 assured-forw              0                0                0

  5 expedited-fo              0                0                0

  7 network-cont              0                0                0

Active alarms : LINK

  Input packet rejects    0
  Input DA rejects        0
  Input SA rejects        0
  Output packet count      0
  Output packet pad count  0
  Output packet error count 0
  CAM destination filters: 0, CAM source filters: 0
Autonegotiation information:
  Negotiation status: Incomplete
Packet Forwarding Engine configuration:
  Destination slot: 1

Logical interface ge-1/0/10.0 (Index 69) (SNMP ifIndex 59) (Generation 135)
Flags: Device-Down SNMP-Traps 0x0 Encapsulation: ENET2
Traffic statistics:

```

```

Input bytes : 0
Output bytes : 0
Input packets: 0
Output packets: 0
IPv6 transit statistics:
Input bytes : 0
Output bytes : 0
Input packets: 0
Output packets: 0
Local statistics:
Input bytes : 0
Output bytes : 0
Input packets: 0
Output packets: 0
Transit statistics:
Input bytes : 0 0 bps
Output bytes : 0 0 bps
Input packets: 0 0 pps
Output packets: 0 0 pps
IPv6 transit statistics:
Input bytes : 0
Output bytes : 0
Input packets: 0
Output packets: 0
Protocol inet, Generation: 144, Route table: 0
Flags: uRPF
Addresses, Flags: Is-Preferred Is-Primary

```

**Meaning** The `show interfaces ge-1/0/10 extensive` command (and the `show interfaces ge-1/0/10 detail` command) displays in-depth information about the interface. The **Flags:** output field near the bottom of the display reports the unicast RPF status. If unicast RPF has not been enabled, the **uRPF** flag is not displayed.

On EX3200, EX4200, and EX4300 switches, unicast RPF is implicitly enabled on *all* switch interfaces, including aggregated Ethernet interfaces (also referred to as link aggregation groups or LAGs), integrated routing and bridging (IRB) interfaces, and routed VLAN interfaces (RVIs) when you enable unicast RPF on a single interface. However, the unicast RPF status is shown as enabled only on interfaces for which you have explicitly configured unicast RPF. Thus, the **uRPF** flag is not displayed on interfaces for which you have not explicitly configured unicast RPF even though unicast RPF is implicitly enabled on all interfaces on EX3200 and EX4200 switches.

## monitor interface

**Syntax** monitor interface  
 <interface-name> | traffic <detail>>

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
 Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Display real-time statistics about interfaces, updating the statistics every second. Check for and display common interface failures, such as SONET/SDH and T3 alarms, loopbacks detected, and increases in framing errors.

**NOTE:** This command is not supported on the QFX3000 QFabric system.

**Options** none—Display real-time statistics for all interfaces.

**detail**—(Optional) With traffic option only, display detailed output.

**interface-name**—(Optional) Display real-time statistics for the specified interface. In a TX Matrix or TX Matrix Plus router, display real-time statistics for the physical interfaces on the specified line-card chassis (LCC) only.

**traffic**—(Optional) Display traffic data for all active interfaces. In a TX Matrix or TX Matrix Plus router, display real-time statistics for the physical interfaces on the specified LCC only.

**Additional Information** The output of this command shows how much each field has changed since you started the command or since you cleared the counters by pressing the c key. For a description of the statistical information provided in the output of this command, see the **show interfaces extensive** command for a particular interface type in the [CLI Explorer](#). To control the output of the **monitor interface** command while it is running, use the keys listed in [Table 300 on page 2845](#). The keys are not case-sensitive.

**Table 300: Output Control Keys for the monitor interface Command**

| Key | Action                                                                                                                                                                                                                     |
|-----|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| c   | Clears (returns to zero) the delta counters since <b>monitor interface</b> was started. This does not clear the accumulative counter. To clear the accumulative counter, use the <b>clear interfaces interval</b> command. |
| f   | Freezes the display, halting the display of updated statistics and delta counters.                                                                                                                                         |
| i   | Displays information about a different interface. The command prompts you for the name of a specific interface.                                                                                                            |

**Table 300: Output Control Keys for the monitor interface Command** (*continued*)

| Key      | Action                                                                                                                                                                                         |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n        | Displays information about the next interface. The <b>monitor interface</b> command displays the physical or logical interfaces in the same order as the <b>show interfaces terse</b> command. |
| q or Esc | Quits the command and returns to the command prompt.                                                                                                                                           |
| t        | Thaws the display, resuming the update of the statistics and delta counters.                                                                                                                   |

To control the output of the **monitor interface traffic** command while it is running, use the keys listed in [Table 301 on page 2846](#). The keys are not case-sensitive.

**Table 301: Output Control Keys for the monitor interface traffic Command**

| Key      | Action                                                                                                               |
|----------|----------------------------------------------------------------------------------------------------------------------|
| b        | Displays the statistics in units of bits and bits per second (bps).                                                  |
| c        | Clears (return to 0) the delta counters in the <b>Current Delta</b> column. The statistics counters are not cleared. |
| d        | Displays the <b>Current Delta</b> column (instead of the rate column) in Bps or packets per second (pps).            |
| p        | Displays the statistics in units of packets and packets per second (pps).                                            |
| q or Esc | Quits the command and returns to the command prompt.                                                                 |
| r        | Displays the rate column (instead of the <b>Current Delta</b> column) in Bps and pps.                                |

[Table 302 on page 2847](#) describes the output fields for the **monitor interface** command. Output fields are listed in the approximate order in which they appear.

Table 302: monitor interface Output Fields

| Field Name               | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Level of Output |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>routerl</b>           | Hostname of the router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | All levels      |
| <b>Seconds</b>           | How long the monitor interface command has been running or how long since you last cleared the counters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | All levels      |
| <b>Time</b>              | Current time (UTC).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | All levels      |
| <b>Delay x/y/z</b>       | Time difference between when the statistics were displayed and the actual clock time. <ul style="list-style-type: none"> <li>• <b>x</b>—Time taken for the last polling (in milliseconds).</li> <li>• <b>y</b>—Minimum time taken across all pollings (in milliseconds).</li> <li>• <b>z</b>—Maximum time taken across all pollings (in milliseconds).</li> </ul>                                                                                                                                                                                                                                                                                                                        | All levels      |
| <b>Interface</b>         | Short description of the interface, including its name, status, and encapsulation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | All levels      |
| <b>Link</b>              | State of the link: <b>Up</b> , <b>Down</b> , or <b>Test</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | All levels      |
| <b>Current delta</b>     | Cumulative number for the counter in question since the time shown in the Seconds field, which is the time since you started the command or last cleared the counters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | All levels      |
| <b>Local Statistics</b>  | (Logical interfaces only) Number and rate of bytes and packets destined to the router or switch through the specified interface. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It usually takes less than 1 second for this counter to stabilize. <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul> | All levels      |
| <b>Remote Statistics</b> | (Logical interfaces only) Statistics for traffic transiting the router or switch. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It usually takes less than 1 second for this counter to stabilize. <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>                                                | All levels      |

Table 302: monitor interface Output Fields (*continued*)

| Field Name         | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Level of Output |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Traffic statistics | <p>Total number of bytes and packets received and transmitted on the interface. These statistics are the sum of the local and remote statistics. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It usually takes less than 1 second for this counter to stabilize.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul> | All levels      |
| Description        | With the <b>traffic</b> option, displays the interface description configured at the <b>[edit interfaces <i>interface-name</i>]</b> hierarchy level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | detail          |

## Sample Output

### monitor interface (Physical)

```

user@host> monitor interface so-0/0/0
router1                               Seconds: 19                      Time: 15:46:29

Interface: so-0/0/0, Enabled, Link is Up
Encapsulation: PPP, Keepalives, Speed: 0C48
Traffic statistics:
    Input packets:                6045 (0 pps)
    Input bytes:                  6290065 (0 bps)
    Output packets:               10376 (0 pps)
    Output bytes:                 10365540 (0 bps)
Encapsulation statistics:
    Input keepalives:             1901
    Output keepalives:           1901
    NCP state: Opened
    LCP state: Opened
Error statistics:
    Input errors:                 0
    Input drops:                  0
    Input framing errors:         0
    Policed discards:             0
    L3 incompletes:              0
    L2 channel errors:           0
    L2 mismatch timeouts:        0
    Carrier transitions:          1
    Output errors:               0
    Output drops:                0
    Aged packets:                0
Active alarms : None
Active defects: None
SONET error counts/seconds:
    LOS count                    1
    LOF count                    1
    SEF count                    1
    ES-S                         0
    SES-S                        0
SONET statistics:
    BIP-B1                      458871

```

```

BIP-B2                      460072          [0]
REI-L                      465610          [0]
BIP-B3                      458978          [0]
REI-P                      458773          [0]

```

Received SONET overhead:

```

F1      : 0x00 J0      : 0x00 K1      : 0x00
K2      : 0x00 S1      : 0x00 C2      : 0x00
C2(cmp) : 0x00 F2      : 0x00 Z3      : 0x00
Z4      : 0x00 S1(cmp) : 0x00

```

Transmitted SONET overhead:

```

## request diagnostics tdr

---

**Syntax**    request diagnostics tdr (abort | start) interface *interface-name*

**Release Information**    Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description**    Start a time domain reflectometry (TDR) diagnostic test on the specified interface. This test characterizes and locates faults on twisted-pair Ethernet cables. For example, it can detect a broken twisted pair and provide the approximate distance to the break. It can also detect polarity swaps, pair swaps, and excessive skew.

The TDR test is supported on the following switches and interfaces:

- EX2200, EX3200, EX3300, and EX4200 switches—RJ-45 network interfaces. The TDR test is not supported on management interfaces and SFP interfaces.
- EX6200 and EX8200 switches—RJ-45 interfaces on line cards.

**NOTE:** We recommend running the TDR test when there is no traffic on the interface under test.

---

You view the results of the TDR test with the [show diagnostics tdr](#) command.

**Options**    **abort**—Stop the TDR test currently in progress on the specified interface. No results are reported, and previous results, if any, are cleared.

**interface-name**—The name of the interface.

**start**—Start a TDR test on the specified interface.

**Required Privilege Level**    maintenance

| <b>Link status</b>                          | Operating status of link: <b>UP</b> or <b>Down</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>MDI pair</b>                             | Twisted pair for which test results are being reported, identified by pin numbers. (Displayed only when the <b>interface</b> option is used.)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Cable status</b>                         | <p>When detailed information is displayed, status for a twisted pair:</p> <ul style="list-style-type: none"> <li>• <b>Failed</b>—TDR test failed on the cable pair.</li> <li>• <b>Impedance Mismatch</b>—Impedance on the twisted pair is not correct. Possible reasons for an impedance mismatch include: <ul style="list-style-type: none"> <li>• The twisted pair is not connected properly.</li> <li>• The twisted pair is damaged.</li> <li>• The connector is faulty.</li> </ul> </li> <li>• <b>Normal</b>—No cable fault detected for the twisted pair.</li> <li>• <b>Open</b>—Lack of continuity between the pins at each end of the twisted-pair.</li> <li>• <b>Short on Pair-<i>n</i></b>—A short-circuit was detected on the twisted pair.</li> </ul> <p>When summary information for all interfaces is displayed, status for the cable as a whole:</p> <ul style="list-style-type: none"> <li>• <b>Fault</b>—A fault was detected on one or more of the twisted-pairs.</li> <li>• <b>OK</b>—No fault was detected on any of the twisted pairs.</li> </ul> |
| <b>Distance fault or Max distance fault</b> | <p>Distance to the fault in whole meters. If there is no fault, this value is 0.</p> <p>When summary information for all interfaces is displayed, this value is the distance to the most distant fault if there is more than one twisted pair with a fault.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Table 304: show diagnostics tdr Output Fields (*continued*)

| Field Name           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Polarity swap</b> | <p>Indicates the polarity status of the twisted pair:</p> <ul style="list-style-type: none"> <li>• <b>Normal</b>—Polarity is normal. Each conductor in the twisted pair has been connected the same pins at the both ends of the connection. For example, a conductor connected to pin 1 at the near end of the connection is connected to pin 1 at the far end.</li> <li>• <b>Reversed</b>—Polarity has been reversed. For the twisted pair, the conductors have switched which pins they are connected to at the near and far ends of the connection. For example, the conductor connected to pin 1 at the near end is connected to pin 2 at the far end.</li> </ul> <p>(Not available on EX8200 switches.) (Displayed only when the <b>interface</b> option is used)</p> |
| <b>Skew time</b>     | <p>Difference in nanoseconds between the propagation delay on this twisted pair and the twisted pair with the shortest propagation delay. (Not available on EX8200 switches.) (Displayed only when the <b>interface</b> option is used.)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Channel Pair</b>  | <p>Number of the 10/100BASE-T transmit/receive pair being reported on.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Pair Swap</b>     | <p>Indicates whether or not the twisted pairs are swapped:</p> <ul style="list-style-type: none"> <li>• <b>MDI</b>—The pairs are not swapped (straight-through cable).</li> <li>• <b>MDIX</b>—The pairs are swapped (cross-over cable).</li> </ul> <p>(Displayed only when the <b>interface</b> option is used.)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Downshift</b>     | <p>Indicates whether the connection speed is being downshifted:</p> <ul style="list-style-type: none"> <li>• <b>No Downshift</b>—No downshifting of connection speed.</li> <li>• <b>Downshift occurs</b>—Connection speed is downshifted to 10 or 100 Mbs. This occurs if the cable is a two-pair cable rather than the four-pair cable required by Gigabit Ethernet.</li> </ul> <p>(Displayed only when the <b>interface</b> option is used.)</p>                                                                                                                                                                                                                                                                                                                          |

## Sample Output

### show diagnostics tdr interface ge-0/0/19 (Normal Cable)

```

user@switch> show diagnostics tdr interface ge-0/0/19
Interface TDR detail:
Interface name           : ge-0/0/19
Test status              : Passed
Link status              : UP
MDI pair                 : 1-2
  Cable status           : Normal
  Distance fault         : 0 Meters
  Polartiy swap          : Normal
  Skew time              : 0 ns
MDI pair                 : 3-6

```

```

Cable status           : Normal
Distance fault         : 0 Meters
Polartiy swap          : Normal
Skew time              : 8 ns
MDI pair               : 4-5
Cable status           : Normal
Distance fault         : 0 Meters
Polartiy swap          : Normal
Skew time              : 8 ns
MDI pair               : 7-8
Cable status           : Normal
Distance fault         : 0 Meters
Polartiy swap          : Normal
Skew time              : 8 ns
Channel pair           : 1
Pair swap              : MDI
Channel pair           : 2
Pair swap              : MDI
Downshift              : No Downshift

```

#### show diagnostics tdr interface ge-2/0/2 (Faulty Cable)

```

user@switch> show diagnostics tdr interface ge-2/0/2
Interface TDR detail:
Interface name         : ge-2/0/2
Test status            : Passed
Link status            : Down
MDI Pair              : 1-2
  Cable status         : 1-2
  Distance fault       : 2 Meters
  Polartiy swap        : N/A
  Skew time            : N/A
MDI Pair              : 3-6
  Cable status         : Impedance Mismatch
  Distance fault       : 3 Meters
  Polartiy swap        : N/A
  Skew time            : N/A
MDI Pair              : 4-5
  Cable status         : Impedance Mismatch
  Distance fault       : 3 Meters
  Polartiy swap        : N/A
  Skew time            : N/A
MDI Pair              : 7-8
  Cable status         : Short on Pair-2
  Distance fault       : 3 Meters
  Polartiy swap        : N/A
  Skew time            : N/A
Channel pair          : 1
Pair swap             : N/A
Channel pair          : 2
Pair swap             : N/A
Downshift             : N/A

```

#### show diagnostics tdr (All Supported Interfaces)

```

user@switch> show diagnostics tdr

```

| Interface | Test status | Link status | Cable status | Max distance fault |
|-----------|-------------|-------------|--------------|--------------------|
| ge-0/0/0  | Not Started | N/A         | N/A          | N/A                |
| ge-0/0/1  | Not Started | N/A         | N/A          | N/A                |
| ge-0/0/2  | Started     | N/A         | N/A          | N/A                |

Output fields are listed in the approximate order in which they first appear.</p>                                                                                                                                                    |

**Table 305: show forwarding-options enhanced-hash-key Output Fields**

| Field Name                   | Field Description                                                                                        |
|------------------------------|----------------------------------------------------------------------------------------------------------|
| <b>Hash-Mode</b>             | Current hash mode: Layer 2 header or Layer 2 payload.                                                    |
| <b>Protocol</b>              | Indicates whether the Protocol field is or is not used by the hashing algorithm: Yes or No.              |
| <b>Destination L4 Port</b>   | Indicates whether the Destination L4 Port field is or is not used by the hashing algorithm: Yes or No.   |
| <b>Source L4 Port</b>        | Indicates whether the Source L4 Port field is or is not used by the hashing algorithm: Yes or No.        |
| <b>Destination IPv4 Addr</b> | Indicates whether the Destination IPv4 Addr field is or is not used by the hashing algorithm: Yes or No. |

Table 305: show forwarding-options enhanced-hash-key Output Fields (*continued*)

| Field Name                     | Field Description                                                                                                                                                                                                                    |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Source IPv4 Addr</b>        | Indicates whether the Source IPv4 Addr field is or is not used by the hashing algorithm: Yes or No.                                                                                                                                  |
| <b>Vlan id</b>                 | Indicates whether the Vlan id field is or is not used by the hashing algorithm: Yes or No.                                                                                                                                           |
| <b>Next Hdr</b>                | Indicates whether the Next Hdr field is or is not used by the hashing algorithm: Yes or No.                                                                                                                                          |
| <b>Destination IPv6 Addr</b>   | Indicates whether the Destination IPv6 Addr field is or is not used by the hashing algorithm: Yes or No.                                                                                                                             |
| <b>Source IPv6 Addr</b>        | Indicates whether the Source IPv6 Addr field is or is not used by the hashing algorithm: Yes or No.                                                                                                                                  |
| <b>Ether Type</b>              | Indicates whether the Ether Type field is or is not used by the hashing algorithm: Yes or No.                                                                                                                                        |
| <b>Destination MAC Address</b> | Indicates whether the Destination MAC Address field is or is not used by the hashing algorithm: Yes or No.                                                                                                                           |
| <b>Source MAC Address</b>      | Indicates whether the Source MAC Address field is or is not used by the hashing algorithm: Yes or No.                                                                                                                                |
| <b>Load Balancing Method</b>   | Indicates the load balancing method for adaptive load balancing (ALB): flowlet or per-packet.<br><br>The load balancing method is flowlet by default, and can be configured using the <a href="#">fabric-load-balance</a> statement. |
| <b>Fabric Link Scale</b>       | Indicates the fabric link scale, in mbps.                                                                                                                                                                                            |
| <b>Inactivity Interval</b>     | Indicates the fabric load balance inactivity interval, in microseconds (us).<br><br>The inactivity interval is 16 microseconds by default, and can be configured using the <a href="#">inactivity-interval</a> statement.            |
| <b>Hash Region Size/Trunk</b>  | Indicates the hash region size, in buckets per fabric trunk.                                                                                                                                                                         |

## Sample Output

### show forwarding-options enhanced-hash-key (Layer 2 Payload Hash Mode)

```
user@switch> show forwarding-options enhanced-hash-key
Slot 0
```

```

| <b>Release Information</b>      | Command introduced in Junos OS Release 10.0 for EX Series switches.<br>Command introduced in Junos OS Release 13.2X50-D15 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | <p>Display diagnostics data and alarms for Gigabit Ethernet optical transceivers (SFP, SFP+, XFP, QSFP+, or CFP) installed in EX Series or QFX Series switches. The information provided by this command is known as digital optical monitoring (DOM) information. For a list of transceivers supported on EX Series switches and their specifications, including DOM support, see <i>Pluggable Transceivers Supported on EX Series Switches</i>.</p> <p>Thresholds that trigger a high alarm, low alarm, high warning, or low warning are set by the transponder vendors. Generally, a high alarm or low alarm indicates that the optics module is not operating properly. This information can be used to diagnose why a transceiver is not working.</p> |
| <b>Options</b>                  | <i>interface-name</i> —Name of the interface associated with the port in which the transceiver is installed: <i>ge-fpc/pic/port</i> , <i>xe-fpc/pic/port</i> , or <i>et-fpc/pic/port</i> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Output Fields</b>            | <a href="#">Table 306 on page 2864</a> lists the output fields for the <b>show interfaces diagnostics optics</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Table 306: show interfaces diagnostics optics Output Fields

| Field Name         | Field Description                            |
|--------------------|----------------------------------------------|
| Physical interface | Displays the name of the physical interface. |

Table 306: show interfaces diagnostics optics Output Fields (*continued*)

| Field Name                                                                                           | Field Description                                                                                                                                                  |
|------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Laser bias current</b>                                                                            | Displays the magnitude of the laser bias power setting current, in milliamperes. The laser bias provides direct modulation of laser diodes and modulates currents. |
| <b>Laser output power</b><br>(Not available for QSFP+ transceivers)                                  | Displays the laser output power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm).                                                                         |
| <b>Laser temperature</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)               | Displays the laser temperature, in Celsius and Fahrenheit.                                                                                                         |
| <b>Module temperature</b>                                                                            | Displays the temperature, in Celsius and Fahrenheit.                                                                                                               |
| <b>Module voltage</b><br>(Not available for XFP transceivers)                                        | Displays the voltage, in Volts.                                                                                                                                    |
| <b>Laser rx power</b><br>(Not available for SFP, SFP+, QSFP+, and CFP transceivers)                  | Displays the laser received optical power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm).                                                               |
| <b>Receiver signal average optical power</b><br>(Not available for XFP, QSFP+, and CFP transceivers) | Displays the receiver signal average optical power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm).                                                      |
| <b>Laser bias current high alarm</b>                                                                 | Displays whether the laser bias power setting high alarm is <b>On</b> or <b>Off</b> .                                                                              |
| <b>Laser bias current low alarm</b>                                                                  | Displays whether the laser bias power setting low alarm is <b>On</b> or <b>Off</b> .                                                                               |
| <b>Laser bias current high warning</b>                                                               | Displays whether the laser bias power setting high warning is <b>On</b> or <b>Off</b> .                                                                            |
| <b>Laser bias current low warning</b>                                                                | Displays whether the laser bias power setting low warning is <b>On</b> or <b>Off</b> .                                                                             |
| <b>Laser output power high alarm</b><br>(Not available for QSFP+ transceivers)                       | Displays whether the laser output power high alarm is <b>On</b> or <b>Off</b> .                                                                                    |
| <b>Laser output power low alarm</b><br>(Not available for QSFP+ transceivers)                        | Displays whether the laser output power low alarm is <b>On</b> or <b>Off</b> .                                                                                     |
| <b>Laser output power high warning</b><br>(Not available for QSFP+ transceivers)                     | Displays whether the laser output power high warning is <b>On</b> or <b>Off</b> .                                                                                  |

Table 306: show interfaces diagnostics optics Output Fields (*continued*)

| Field Name                                                                                          | Field Description                                                                 |
|-----------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------|
| <b>Laser output power low warning</b><br>(Not available for QSFP+ transceivers)                     | Displays whether the laser output power low warning is <b>On</b> or <b>Off</b> .  |
| <b>Laser temperature high alarm</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)   | Displays whether the laser temperature high alarm is <b>On</b> or <b>Off</b> .    |
| <b>Laser temperature low alarm</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)    | Displays whether the laser temperature low alarm is <b>On</b> or <b>Off</b> .     |
| <b>Laser temperature high warning</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers) | Displays whether the laser temperature high warning is <b>On</b> or <b>Off</b> .  |
| <b>Laser temperature low warning</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)  | Displays whether the laser temperature low warning is <b>On</b> or <b>Off</b> .   |
| <b>Module temperature high alarm</b><br>(Not available for QSFP+ transceivers)                      | Displays whether the module temperature high alarm is <b>On</b> or <b>Off</b> .   |
| <b>Module temperature low alarm</b><br>(Not available for QSFP+ transceivers)                       | Displays whether the module temperature low alarm is <b>On</b> or <b>Off</b> .    |
| <b>Module temperature high warning</b><br>(Not available for QSFP+ transceivers)                    | Displays whether the module temperature high warning is <b>On</b> or <b>Off</b> . |
| <b>Module temperature low warning</b><br>(Not available for QSFP+ transceivers)                     | Displays whether the module temperature low warning is <b>On</b> or <b>Off</b> .  |
| <b>Module voltage high alarm</b><br>(Not available for XFP and QSFP+ transceivers)                  | Displays whether the module voltage high alarm is <b>On</b> or <b>Off</b> .       |
| <b>Module voltage low alarm</b><br>(Not available for XFP and QSFP+ transceivers)                   | Displays whether the module voltage low alarm is <b>On</b> or <b>Off</b> .        |
| <b>Module voltage high warning</b><br>(Not available for XFP and QSFP+ transceivers)                | Displays whether the module voltage high warning is <b>On</b> or <b>Off</b> .     |
| <b>Module voltage low warning</b><br>(Not available for XFP and QSFP+ transceivers)                 | Displays whether the module voltage low warning is <b>On</b> or <b>Off</b> .      |

Table 306: show interfaces diagnostics optics Output Fields (*continued*)

| Field Name                                                                                                  | Field Description                                                                                                                            |
|-------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Laser rx power high alarm</b><br>(Not available for QSFP+ and CFP transceivers)                          | Displays whether the receive laser power high alarm is <b>On</b> or <b>Off</b> .                                                             |
| <b>Laser rx power low alarm</b><br>(Not available for QSFP+ and CFP transceivers)                           | Displays whether the receive laser power low alarm is <b>On</b> or <b>Off</b> .                                                              |
| <b>Laser rx power high warning</b><br>(Not available for QSFP+ and CFP transceivers)                        | Displays whether the receive laser power high warning is <b>On</b> or <b>Off</b> .                                                           |
| <b>Laser rx power low warning</b><br>(Not available for QSFP+ and CFP transceivers)                         | Displays whether the receive laser power low warning is <b>On</b> or <b>Off</b> .                                                            |
| <b>Laser bias current high alarm threshold</b><br>(Not available for QSFP+ transceivers)                    | Displays the vendor-specified threshold for the laser bias current high alarm.                                                               |
| <b>Module not ready alarm</b><br>(Not available for SFP, SFP+, and QSFP+ transceivers)                      | Displays whether the module not ready alarm is <b>On</b> or <b>Off</b> . When the output is <b>On</b> , the module has an operational fault. |
| <b>Module low power alarm</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)                 | Displays whether the module low power alarm is <b>On</b> or <b>Off</b> .                                                                     |
| <b>Module initialization incomplete alarm</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers) | Displays whether the module initialization incomplete alarm is <b>On</b> or <b>Off</b> .                                                     |
| <b>Module fault alarm</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)                     | Displays whether the module fault alarm is <b>On</b> or <b>Off</b> .                                                                         |
| <b>PLD Flash initialization fault alarm</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)   | Displays whether the PLD Flash initialization fault alarm is <b>On</b> or <b>Off</b> .                                                       |
| <b>Power supply fault alarm</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)               | Displays whether the power supply fault alarm is <b>On</b> or <b>Off</b> .                                                                   |
| <b>Checksum fault alarm</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)                   | Displays whether the checksum fault alarm is <b>On</b> or <b>Off</b> .                                                                       |
| <b>Tx laser disabled alarm</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)                | Displays whether the Tx laser disabled alarm is <b>On</b> or <b>Off</b> .                                                                    |

Table 306: show interfaces diagnostics optics Output Fields (*continued*)

| Field Name                                                                                   | Field Description                                                                                                                                                                                |
|----------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Module power down alarm</b><br>(Not available for SFP, SFP+, QSFP+, and CFP transceivers) | Displays whether the module power down alarm is <b>On</b> or <b>Off</b> . When the output is <b>On</b> , module is in a limited power mode, low for normal operation.                            |
| <b>Tx data not ready alarm</b><br>(Not available for SFP, SFP+, QSFP+, and CFP transceivers) | Any condition leading to invalid data on the transmit path. Displays whether the Tx data not ready alarm is <b>On</b> or <b>Off</b> .                                                            |
| <b>Tx not ready alarm</b><br>(Not available for SFP, SFP+, QSFP+, and CFP transceivers)      | Any condition leading to invalid data on the transmit path. Displays whether the Tx not ready alarm is <b>On</b> or <b>Off</b> .                                                                 |
| <b>Tx laser fault alarm</b><br>(Not available for SFP, SFP+, QSFP+, and CFP transceivers)    | Laser fault condition. Displays whether the Tx laser fault alarm is <b>On</b> or <b>Off</b> .                                                                                                    |
| <b>Tx CDR loss of lock alarm</b><br>(Not available for SFP, SFP+, and QSFP+ transceivers)    | Transmit clock and data recovery (CDR) loss of lock. Loss of lock on the transmit side of the CDR. Displays whether the Tx CDR loss of lock alarm is <b>On</b> or <b>Off</b> .                   |
| <b>Rx not ready alarm</b><br>(Not available for SFP, SFP+, QSFP+, and CFP transceivers)      | Any condition leading to invalid data on the receive path. Displays whether the Rx not ready alarm is <b>On</b> or <b>Off</b> .                                                                  |
| <b>Rx loss of signal alarm</b><br>(Not available for SFP and SFP+ transceivers)              | Receive loss of signal alarm. When the output is <b>On</b> , indicates insufficient optical input power to the module. Displays whether the Rx loss of signal alarm is <b>On</b> or <b>Off</b> . |
| <b>Rx CDR loss of lock alarm</b><br>(Not available for SFP, SFP+, and QSFP+ transceivers)    | Receive CDR loss of lock. Loss of lock on the receive side of the CDR. Displays whether the Rx CDR loss of lock alarm is <b>On</b> or <b>Off</b> .                                               |
| <b>Laser bias current low alarm threshold</b><br>(Not available for QSFP+ transceivers)      | Displays the vendor-specified threshold for the laser bias current low alarm.                                                                                                                    |
| <b>Laser bias current high warning threshold</b><br>(Not available for QSFP+ transceivers)   | Displays the vendor-specified threshold for the laser bias current high warning.                                                                                                                 |
| <b>Laser bias current low warning threshold</b><br>(Not available for QSFP+ transceivers)    | Displays the vendor-specified threshold for the laser bias current low warning.                                                                                                                  |
| <b>Laser output power high alarm threshold</b><br>(Not available for QSFP+ transceivers)     | Displays the vendor-specified threshold for the laser output power high alarm.                                                                                                                   |
| <b>Laser output power low alarm threshold</b><br>(Not available for QSFP+ transceivers)      | Displays the vendor-specified threshold for the laser output power low alarm.                                                                                                                    |

Table 306: show interfaces diagnostics optics Output Fields (*continued*)

| Field Name                                                                                     | Field Description                                                                |
|------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------|
| <b>Laser output power high warning threshold</b><br>(Not available for QSFP+ transceivers)     | Displays the vendor-specified threshold for the laser output power high warning. |
| <b>Laser output power low warning threshold</b><br>(Not available for QSFP+ transceivers)      | Displays the vendor-specified threshold for the laser output power low warning.  |
| <b>Module temperature high alarm threshold</b><br>(Not available for QSFP+ transceivers)       | Displays the vendor-specified threshold for the module temperature high alarm.   |
| <b>Module temperature low alarm threshold</b><br>(Not available for QSFP+ transceivers)        | Displays the vendor-specified threshold for the module temperature low alarm.    |
| <b>Module temperature high warning threshold</b><br>(Not available for QSFP+ transceivers)     | Displays the vendor-specified threshold for the module temperature high warning. |
| <b>Module temperature low warning threshold</b><br>(Not available for QSFP+ transceivers)      | Displays the vendor-specified threshold for the module temperature low warning.  |
| <b>Module voltage high alarm threshold</b><br>(Not available for XFP and QSFP+ transceivers)   | Displays the vendor-specified threshold for the module voltage high alarm.       |
| <b>Module voltage low alarm threshold</b><br>(Not available for XFP and QSFP+ transceivers)    | Displays the vendor-specified threshold for the module voltage low alarm.        |
| <b>Module voltage high warning threshold</b><br>(Not available for XFP and QSFP+ transceivers) | Displays the vendor-specified threshold for the module voltage high warning.     |
| <b>Module voltage low warning threshold</b><br>(Not available for XFP and QSFP+ transceivers)  | Displays the vendor-specified threshold for the module voltage low warning.      |
| <b>Laser rx power high alarm threshold</b><br>(Not available for QSFP+ transceivers)           | Displays the vendor-specified threshold for the laser rx power high alarm.       |
| <b>Laser rx power low alarm threshold</b><br>(Not available for QSFP+ transceivers)            | Displays the vendor-specified threshold for the laser rx power low alarm.        |
| <b>Laser rx power high warning threshold</b><br>(Not available for QSFP+ transceivers)         | Displays the vendor-specified threshold for the laser rx power high warning.     |

Table 306: show interfaces diagnostics optics Output Fields (*continued*)

| Field Name                                                                                                    | Field Description                                                                                          |
|---------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|
| <b>Laser rx power low warning threshold</b><br>(Not available for QSFP+ transceivers)                         | Displays the vendor-specified threshold for the laser rx power low warning.                                |
| <b>Laser temperature high alarm threshold</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)   | Displays the vendor-specified threshold for the laser temperature high alarm, in Celsius and Fahrenheit.   |
| <b>Laser temperature low alarm threshold</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)    | Displays the vendor-specified threshold for the laser temperature low alarm, in Celsius and Fahrenheit.    |
| <b>Laser temperature high warning threshold</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers) | Displays the vendor-specified threshold for the laser temperature high warning, in Celsius and Fahrenheit. |
| <b>Laser temperature low warning threshold</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)  | Displays the vendor-specified threshold for the laser temperature low warning, in Celsius and Fahrenheit.  |
| <b>SOA bias current high alarm threshold</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)    | Displays the vendor-specified threshold for SOA bias current high alarm.                                   |
| <b>SOA bias current low alarm threshold</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)     | Displays the vendor-specified threshold for SOA bias current low alarm.                                    |
| <b>SOA bias current high warning threshold</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)  | Displays the vendor-specified threshold for SOA bias current high warning.                                 |
| <b>SOA bias current low warning threshold</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)   | Displays the vendor-specified threshold for SOA bias current low warning.                                  |
| <b>Laser receiver power high alarm</b><br>(Not available for SFP, SFP+, and XFP transceivers)                 | Displays whether the laser receiver power high alarm is <b>On</b> or <b>Off</b> .                          |
| <b>Laser receiver power low alarm</b><br>(Not available for SFP, SFP+, and XFP transceivers)                  | Displays whether the laser receiver power low alarm is <b>On</b> or <b>Off</b> .                           |
| <b>Laser receiver power high warning</b><br>(Not available for SFP, SFP+, and XFP transceivers)               | Displays whether the laser receiver power high warning is <b>On</b> or <b>Off</b> .                        |
| <b>Laser receiver power low warning</b><br>(Not available for SFP, SFP+, and XFP transceivers)                | Displays whether the laser receiver power low warning is <b>On</b> or <b>Off</b> .                         |

Table 306: show interfaces diagnostics optics Output Fields (*continued*)

| Field Name                                                                                          | Field Description                                                                            |
|-----------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
| <b>Laser receiver power</b><br>(Not available for SFP, SFP+, and XFP transceivers)                  | Displays the laser receiver power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm). |
| <b>Tx loss of signal functionality alarm</b><br>(Not available for SFP, SFP+, and XFP transceivers) | Displays whether the Tx loss of signal functionality alarm is <b>On</b> or <b>Off</b> .      |
| <b>APD supply fault alarm</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)         | Displays whether the APD supply fault alarm is <b>On</b> or <b>Off</b> .                     |
| <b>TEC fault alarm</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)                | Displays whether the TEC fault alarm is <b>On</b> or <b>Off</b> .                            |
| <b>Wavelength unlocked alarm</b><br>(Not available for SFP, SFP+, XFP, and QSFP+ transceivers)      | Displays whether the Wavelength unlocked alarm is <b>On</b> or <b>Off</b> .                  |

## show interfaces ge-

---

**Syntax** `show interfaces ge-fpc/pic/port`  
`<brief | detail | extensive | terse>`  
`<media>`  
`<statistics>`

**Release Information** Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Display status information about the specified Gigabit Ethernet interface.

**NOTE:** You must have a transceiver plugged into an SFP or SFP+ port before information about the interface can be displayed.

**Options** `ge-fpc/pic/port`—Display standard information about the specified Gigabit Ethernet interface.

`brief | detail | extensive | terse`—(Optional) Display the specified level of output.

`media`—(Optional) Display media-specific information about network interfaces.

`statistics`—(Optional) Display static interface statistics.

**Required Privilege Level** view

| <b>Input errors</b>            | <p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.</li> <li>• <b>L3 incompletes</b>—Number of incoming packets discarded because they failed Layer 3 sanity checks of the headers. For example, a frame with less than 20 bytes of available IP header is discarded.</li> <li>• <b>L2 channel errors</b>—Number of times the software did not find a valid logical interface for an incoming frame.</li> <li>• <b>L2 mismatch timeouts</b>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b>             |

Table 307: show interfaces ge- Output Fields (*continued*)

| Field Name                              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Level of Output              |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Output errors</b>                    | <p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Collisions</b>—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug.</li> <li>• <b>Aged packets</b>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>HS link CRC errors</b>—Number of errors on the high-speed links between the ASICs responsible for handling the switch interfaces.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b>             |
| <b>Egress queues</b>                    | Total number of egress queues supported on the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>detail extensive</b>      |
| <b>Queue counters (Egress )</b>         | <p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>detail extensive</b>      |
| <b>Active alarms and Active defects</b> | <p>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain time, it is promoted to an alarm. Based on the switch configuration, a defect can activate the red or yellow alarm bell on the switch or turn on the red or yellow alarm LED on the front of the switch. These fields can contain the value <b>None</b> or <b>Link</b>.</p> <ul style="list-style-type: none"> <li>• <b>None</b>—There are no active defects or alarms.</li> <li>• <b>Link</b>—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive none</b> |

| Field Name               | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Level of Output  |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>MAC statistics</b>    | <p>Receive and Transmit statistics reported by the PIC's MAC subsystem.</p> <ul style="list-style-type: none"> <li>• <b>Total octets</b> and <b>total packets</b>—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type.</li> <li>• <b>Unicast packets</b>, <b>Broadcast packets</b>, and <b>Multicast packets</b>—Number of unicast, broadcast, and multicast packets.</li> <li>• <b>CRC/Align errors</b>—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</li> <li>• <b>FIFO error</b>—Number of FIFO errors reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>MAC control frames</b>—Number of MAC control frames.</li> <li>• <b>MAC pause frames</b>—Number of MAC control frames with <b>pause</b> operational code.</li> <li>• <b>Oversized frames</b>—Number of frames that exceed 1518 octets.</li> <li>• <b>Jabber frames</b>—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</li> <li>• <b>Fragment frames</b>—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.</li> <li>• <b>Code violations</b>—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error."</li> </ul> | <b>extensive</b> |
| <b>Filter Statistics</b> | Receive and Transmit statistics reported by the PIC's MAC address filter subsystem.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>extensive</b> |

| Field Name                             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Level of Output |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Autonegotiation information            | <p>Information about link autonegotiation:</p> <ul style="list-style-type: none"> <li>• <b>Negotiation status:</b> <ul style="list-style-type: none"> <li>• <b>Complete</b>—The autonegotiation process between the local and remote Ethernet interfaces was successful.</li> <li>• <b>Incomplete</b>—Remote Ethernet interface has the speed or link mode configured or does not perform autonegotiation.</li> <li>• <b>No autonegotiation</b>—Local Ethernet interface has autonegotiation disabled and the link mode and speed are manually configured.</li> </ul> </li> <li>• <b>Link partner</b>—Information from the link partner: <ul style="list-style-type: none"> <li>• <b>Link mode</b>—Depending on the capability of the attached Ethernet device, either <b>Full-duplex</b> or <b>Half-duplex</b>. If the link mode of the remote device cannot be determined, the value is <b>Unknown</b>.</li> <li>• <b>Flow control</b>—Types of flow control supported by the remote Ethernet device. For Gigabit Ethernet interfaces, the types are: <b>Symmetric</b> (link partner supports <b>PAUSE</b> on receive and transmit); <b>Asymmetric</b> (link partner supports <b>PAUSE</b> on transmit); and <b>Symmetric/Asymmetric</b> (link partner supports <b>PAUSE</b> on both receive and transmit or <b>PAUSE</b> only on receive).</li> <li>• <b>Remote fault</b>—Remote fault information from the link partner—<b>Failure</b> indicates a receive link error. <b>OK</b> indicates that the link partner is receiving. <b>Negotiation error</b> indicates a negotiation error. <b>Offline</b> indicates that the link partner is going offline.</li> <li>• <b>Link partner speed</b>—Speed of the link partner.</li> </ul> </li> <li>• <b>Local resolution</b>—Resolution of the autonegotiation process on the local interface: <ul style="list-style-type: none"> <li>• <b>Flow control</b>—Type of flow control that is used by the local interface. For Gigabit Ethernet interfaces, the types are: <b>Symmetric</b> (link partner supports <b>PAUSE</b> on receive and transmit); <b>Asymmetric</b> (link partner supports <b>PAUSE</b> on transmit); and <b>Symmetric/Asymmetric</b> (link partner supports <b>PAUSE</b> on both receive and transmit or <b>PAUSE</b> only on receive).</li> <li>• <b>Link mode</b>—Link mode of local interface: either <b>Full-duplex</b> or <b>Half-duplex</b>. Displayed when <b>Negotiation status</b> is <b>Incomplete</b>.</li> <li>• <b>Local link speed</b>—Speed of the local interface. Displayed when <b>Negotiation status</b> is <b>Incomplete</b>.</li> <li>• <b>Remote fault</b>—Remote fault information. <b>Link OK</b> (no error detected on receive), <b>Offline</b> (local interface is offline), and <b>Link Failure</b> (link error detected on receive).</li> </ul> </li> </ul> | extensive       |
| Packet Forwarding Engine configuration | <p>Information about the configuration of the Packet Forwarding Engine:</p> <ul style="list-style-type: none"> <li>• <b>Destination slot</b>—FPC slot number: <ul style="list-style-type: none"> <li>• On standalone switches with built-in interfaces, the slot number refers to the switch itself and is always 0.</li> <li>• On Virtual Chassis composed of switches with built-in interfaces, the slot number refers to the member ID of the switch.</li> <li>• On switches with line cards or on Virtual Chassis composed of switches with line cards, the slot number refers to the line card slot number on the switch or Virtual Chassis.</li> </ul> </li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | extensive       |

#### Logical Interface

Table 307: show interfaces ge- Output Fields (*continued*)

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                     | Level of Output              |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Logical interface</b>       | Name of the logical interface.                                                                                                                                                                                                                                                                                                                                                                                        | All levels                   |
| <b>Index</b>                   | Index number of the logical interface, which reflects its initialization sequence.                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive none</b> |
| <b>SNMP ifIndex</b>            | SNMP interface index number for the logical interface.                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive none</b> |
| <b>Generation</b>              | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b>      |
| <b>Flags</b>                   | Information about the logical interface.                                                                                                                                                                                                                                                                                                                                                                              | All levels                   |
| <b>Encapsulation</b>           | Encapsulation on the logical interface.                                                                                                                                                                                                                                                                                                                                                                               | All levels                   |
| <b>Protocol</b>                | Protocol family.                                                                                                                                                                                                                                                                                                                                                                                                      | <b>detail extensive none</b> |
| <b>Traffic statistics</b>      | Number and rate of bytes and packets received (input) and transmitted (output) on the specified interface.<br><br><i>NOTE:</i> For logical interfaces on EX Series switches, the traffic statistics fields in <b>show interfaces</b> commands show only control traffic; the traffic statistics do not include data traffic.                                                                                          | <b>detail extensive</b>      |
| <b>IPv6 transit statistics</b> | EX Series switches do not support the collection and reporting of IPv6 transit statistics.                                                                                                                                                                                                                                                                                                                            | <b>extensive</b>             |
| <b>Local statistics</b>        | Number and rate of bytes and packets destined to and from the switch.                                                                                                                                                                                                                                                                                                                                                 | <b>extensive</b>             |
| <b>Transit statistics</b>      | Number and rate of bytes and packets transiting the switch.                                                                                                                                                                                                                                                                                                                                                           | <b>extensive</b>             |
| <b>Generation</b>              | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b>      |
| <b>Route Table</b>             | Route table in which the logical interface address is located. For example, 0 refers to the routing table <b>inet.0</b> .                                                                                                                                                                                                                                                                                             | <b>detail extensive none</b> |
| <b>Input Filters</b>           | Names of any input filters applied to this interface.                                                                                                                                                                                                                                                                                                                                                                 | <b>detail extensive</b>      |
| <b>Output Filters</b>          | Names of any output filters applied to this interface.                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive</b>      |
| <b>Flags</b>                   | Information about protocol family flags.<br><br>If unicast reverse-path forwarding (RPF) is explicitly configured on the specified interface, the uRPF flag is displayed. If unicast RPF was configured on a different interface (and therefore is enabled on all switch interfaces) but was not explicitly configured on the specified interface, the uRPF flag is not displayed even though unicast RPF is enabled. | <b>detail extensive</b>      |
| <b>protocol-family</b>         | Protocol family configured on the logical interface. If the protocol is <b>inet</b> , the IP address of the interface is also displayed.                                                                                                                                                                                                                                                                              | <b>brief</b>                 |
| <b>Flags</b>                   | Information about the address flags.                                                                                                                                                                                                                                                                                                                                                                                  | <b>detail extensive none</b> |

Table 307: show interfaces ge- Output Fields (*continued*)

| Field Name         | Field Description                                                 | Level of Output              |
|--------------------|-------------------------------------------------------------------|------------------------------|
| <b>Destination</b> | IP address of the remote side of the connection.                  | <b>detail extensive none</b> |
| <b>Local</b>       | IP address of the logical interface.                              | <b>detail extensive none</b> |
| <b>Broadcast</b>   | Broadcast address of the logical interlace.                       | <b>detail extensive none</b> |
| <b>Generation</b>  | Unique number for use by Juniper Networks technical support only. | <b>detail extensive</b>      |

## Sample Output

### show interfaces ge-0/0/0

```

user@switch> show interfaces ge-0/0/0
Physical interface: ge-0/0/0, Enabled, Physical link is Down
  Interface index: 129, SNMP ifIndex: 21
  Link-level type: Ethernet, MTU: 1514, Speed: Unspecified, Loopback: Disabled,
  Source filtering: Disabled, Flow control: Enabled, Auto-negotiation: Enabled
  Remote fault: Online
  Device flags   : Present Running Down
  Interface flags: Hardware-Down SNMP-Traps Internal: 0x0
  CoS queues     : 8 supported, 8 maximum usable queues
  Hold-times     : Up 0 ms, Down 0 ms
  Current address: 00:19:e2:50:3f:41, Hardware address: 00:19:e2:50:3f:41
  Last flapped   : 2008-01-16 11:40:53 UTC (4d 02:30 ago)
  Input rate      : 0 bps (0 pps)
  Output rate     : 0 bps (0 pps)
  Ingress rate at Packet Forwarding Engine : 0 bps (0 pps)
  Ingress drop rate at Packet Forwarding Engine : 0 bps (0 pps)
  Active alarms   : None
  Active defects  : None

Logical interface ge-0/0/0.0 (Index 65) (SNMP ifIndex 22)
  Flags: SNMP-Traps
  Encapsulation: ENET2
  Input packets : 0
  Output packets: 0
  Protocol eth-switch
  Flags: None

```

### show interfaces ge-0/0/0 brief

```

user@switch> show interfaces ge-0/0/0 brief
Physical interface: ge-0/0/0, Enabled, Physical link is Down
  Description: voice priority and tcp and icmp traffic rate-limiting filter at i
  ngress port
  Link-level type: Ethernet, MTU: 1514, Speed: Unspecified, Loopback: Disabled,
  Source filtering: Disabled, Flow control: Enabled, Auto-negotiation: Enabled,
  Remote fault: Online
  Device flags   : Present Running Down
  Interface flags: Hardware-Down SNMP-Traps Internal: 0x0
  Link flags      : None

Logical interface ge-0/0/0.0

```

Flags: Device-Down SNMP-Traps Encapsulation: ENET2  
eth-switch

#### show interfaces ge-0/0/0 brief (with IEEE Enabled on the IEEE-capable Base-T copper Ethernet interfaces)

```
user@switch> show interfaces ge-0/0/0 brief
Physical interface: ge-0/0/0, Enabled, Physical link is Up
Link-level type: Ethernet, MTU: 1514, Speed: Auto, Duplex: Auto,
Loopback: Disabled, Source filtering: Disabled, Flow control: Enabled,
Auto-negotiation: Enabled, Remote fault: Online,
IEEE 802.3az Energy Efficient Ethernet: Enabled, NO LPI
Device flags : Present Running
Interface flags: Hardware-Down SNMP-Traps Internal: 0x0
Link flags : None
```

#### show interfaces ge-0/0/0 detail

```
user@switch> show interfaces ge-0/0/0 detail
Physical interface: ge-0/0/0, Enabled, Physical link is Up
Interface index: 193, SNMP ifIndex: 206, Generation: 196
Link-level type: Ethernet, MTU: 1514, Speed: Auto, Duplex: Auto,
BPDU Error: None, MAC-REWRITE Error: None, Loopback: Disabled,
Source filtering: Disabled, Flow control: Enabled, Auto-negotiation: Enabled,
Remote fault: Online
Device flags : Present Running
Interface flags: SNMP-Traps Internal: 0x0
Link flags : None
CoS queues : 8 supported, 8 maximum usable queues
Hold-times : Up 0 ms, Down 0 ms
Current address: 00:1f:12:30:ff:40, Hardware address: 00:1f:12:30:ff:40

| <b>Additional Information</b>   | Integrated routing and bridging (IRB) provides simultaneous support for Layer 2 bridging and Layer 3 IP routing on the same interface. IRB enables you to route local packets to another routed interface or to another VLAN that has a Layer 3 protocol configured.                                                                                                                                                                                                                                                                                                                                                |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Proto</b>                   | Protocol configured on the interface.                                                                                                                                                                                                                      | <b>terse</b>                       |
| <b>Interface index</b>         | Physical interface index number, which reflects its initialization sequence.                                                                                                                                                                               | <b>detail extensive none</b>       |
| <b>SNMP ifIndex</b>            | SNMP index number for the physical interface.                                                                                                                                                                                                              | <b>detail extensive none</b>       |
| <b>Type</b>                    | Physical interface type.                                                                                                                                                                                                                                   | <b>detail extensive none</b>       |
| <b>Link-level type</b>         | Encapsulation being used on the physical interface.                                                                                                                                                                                                        | <b>detail extensive brief none</b> |
| <b>MTU</b>                     | MTU size on the physical interface.                                                                                                                                                                                                                        | <b>detail extensive brief none</b> |
| <b>Clocking</b>                | Reference clock source: <b>Internal</b> or <b>External</b> . Always unspecified on IRB interfaces.                                                                                                                                                         | <b>detail extensive brief</b>      |
| <b>Speed</b>                   | Speed at which the interface is running. Always unspecified on IRB interfaces.                                                                                                                                                                             | <b>detail extensive brief</b>      |
| <b>Device flags</b>            | Information about the physical device. Possible values are described in the “Device Flags” section under <i>Common Output Fields Description</i> .                                                                                                         | <b>detail extensive brief none</b> |
| <b>Interface flags</b>         | Information about the interface. Possible values are described in the “Interface Flags” section under <i>Common Output Fields Description</i> .                                                                                                            | <b>detail extensive brief none</b> |
| <b>Link type</b>               | Physical interface link type: <b>full duplex</b> or <b>half duplex</b> .                                                                                                                                                                                   | <b>detail extensive none</b>       |
| <b>Link flags</b>              | Information about the link. Possible values are described in the “Links Flags” section under <i>Common Output Fields Description</i> .                                                                                                                     | <b>detail extensive none</b>       |
| <b>Physical Info</b>           | Physical interface information.                                                                                                                                                                                                                            | All levels                         |
| <b>Hold-times</b>              | Current interface hold-time up and hold-time down, in milliseconds.                                                                                                                                                                                        | <b>detail extensive</b>            |
| <b>Current address</b>         | Configured MAC address.                                                                                                                                                                                                                                    | <b>detail extensive none</b>       |
| <b>Hardware address</b>        | MAC address of the hardware.                                                                                                                                                                                                                               | <b>detail extensive none</b>       |
| <b>Alternate link address</b>  | Backup address of the link.                                                                                                                                                                                                                                | <b>detail extensive</b>            |
| <b>Last flapped</b>            | Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hours:minutes:seconds timezone (hours:minutes:seconds ago)</b> . For example, <b>Last flapped: 2002-04-26 10:52:40 PDT (04:33:20 ago)</b> . | <b>detail extensive none</b>       |
| <b>Statistics last cleared</b> | Time when the statistics for the interface were last set to zero.                                                                                                                                                                                          | <b>detail extensive</b>            |

Table 308: show interfaces irb Output Fields (*continued*)

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Level of Output         |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Traffic statistics</b>      | <p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b> |
| <b>IPv6 transit statistics</b> | <p>Number of IPv6 transit bytes and packets received and transmitted on the physical interface if IPv6 statistics tracking is enabled.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>detail extensive</b> |
| <b>Input errors</b>            | <p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Giants</b>—Number of frames received that are larger than the giant threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>           | <b>detail extensive</b> |
| <b>Output errors</b>           | <p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the DPC is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>detail extensive</b> |

#### Logical Interface

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Level of Output                 |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------|
| <b>Logical interface</b>       | Name of the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | All levels                      |
| <b>Index</b>                   | Index number of the logical interface (which reflects its initialization sequence).                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail extensive</b><br>none |
| <b>SNMP ifIndex</b>            | SNMP interface index number of the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                  | <b>detail extensive</b><br>none |
| <b>Generation</b>              | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                                                                                                                                                                                                                                                                      | <b>detail extensive</b>         |
| <b>Flags</b>                   | Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                                                                        | <b>detail extensive</b>         |
| <b>Encapsulation</b>           | Encapsulation on the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive</b>         |
| <b>Bandwidth</b>               | Speed at which the interface is running.                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive</b>         |
| <b>Routing Instance</b>        | Routing instance IRB is configured under.                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive</b>         |
| <b>Bridging Domain</b>         | Bridging domain IRB is participating in.                                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive</b>         |
| <b>Traffic statistics</b>      | <p>Number and rate of bytes and packets received and transmitted on the logical interface.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>                                             | <b>detail extensive</b>         |
| <b>IPv6 transit statistics</b> | <p>Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul> | <b>detail extensive</b>         |
| <b>Local statistics</b>        | Statistics for traffic received from and transmitted to the Routing Engine.                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>detail extensive</b>         |
| <b>Transit statistics</b>      | Statistics for traffic transiting the router.                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>detail extensive</b>         |
| <b>Protocol</b>                | Protocol family configured on the local interface. Possible values are described in the “Protocol Field” section under <i>Common Output Fields Description</i> .                                                                                                                                                                                                                                                                                                                                       | <b>detail extensive</b>         |
| <b>MTU</b>                     | Maximum transmission unit size on the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                               | <b>detail extensive</b>         |
| <b>Maximum labels</b>          | Maximum number of MPLS labels configured for the MPLS protocol family on the logical interface.                                                                                                                                                                                                                                                                                                                                                                                                        | <b>detail extensive</b><br>none |

Table 308: show interfaces irb Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                               | Level of Output         |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Generation</b>       | Unique number for use by Juniper Networks technical support only.                                                                                               | <b>detail extensive</b> |
| <b>Route table</b>      | Routing table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.                                             | <b>detail extensive</b> |
| <b>Addresses, Flags</b> | Information about address flags. Possible values are described in the “Addresses Flags” section under <i>Common Output Fields Description</i> .                 | <b>detail extensive</b> |
| <b>Policer</b>          | The policer that is to be evaluated when packets are received or transmitted on the interface.                                                                  | <b>detail extensive</b> |
| <b>Flags</b>            | Information about the logical interface. Possible values are described in the “Logical Interface Flags” section under <i>Common Output Fields Description</i> . | <b>detail extensive</b> |

## Sample Output

### show interfaces irb extensive

```

user@host> show interfaces irb extensive
Physical interface: irb, Enabled, Physical link is Up
  Interface index: 129, SNMP ifIndex: 23, Generation: 130
  Type: Ethernet, Link-level type: Ethernet, MTU: 1514, Clocking: Unspecified,
  Speed: Unspecified
  Device flags   : Present Running
  Interface flags: SNMP-Traps
  Link type      : Full-Duplex
  Link flags     : None

| <b>Output Fields</b>            | <a href="#">Table 309 on page 2896</a> lists the output fields for the <b>show interfaces mc-ae</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Table 309: show interfaces mc-ae Output Fields**

| Output Field Name                    | Field Description                                               |
|--------------------------------------|-----------------------------------------------------------------|
| <b>Current State Machine's State</b> | Specifies the state of the MC-LAG initialization state machine. |

Table 309: show interfaces mc-ae Output Fields (*continued*)

| Output Field Name        | Field Description                                                                                                                                                                                |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Member Link</b>       | Specifies the identifiers of the configured multichassis link aggregated interface members.                                                                                                      |
| <b>Local Status</b>      | Specifies the status of the local link: <b>active</b> or <b>standby</b> .                                                                                                                        |
| <b>Peer Status</b>       | Specifies the status of the peer link: <b>active</b> or <b>standby</b> .                                                                                                                         |
| <b>Peer State</b>        | Specifies the status of the local and peer links in an <b>active/active</b> MC-LAG configuration                                                                                                 |
| <b>Logical Interface</b> | Specifies the identifier and unit of the AE interface.                                                                                                                                           |
| <b>Topology Type</b>     | Specifies the bridge configured on the AE.                                                                                                                                                       |
| <b>Local State</b>       | Specifies if the local device is up or down.                                                                                                                                                     |
| <b>Peer State</b>        | Specifies if the peer device is up or down.                                                                                                                                                      |
| <b>Peer Ip/MCP/State</b> | Specifies the multichassis protection (MCP) link or the interchassis link-protection link (ICL-PL) for all of the multichassis aggregated Ethernet (MC-AE) interfaces that are part of the peer. |

## Sample Output

### show interfaces mc-ae

```

user@host> show interfaces mc-ae ae1 512
Member Link           : ae0
Current State Machine's State: mcae active state
Local Status          : active
Local State           : up
Peer Status           : active
Peer State            : up
    Logical Interface  : ae0.0
    Topology Type      : bridge
    Local State        : up
    Peer State         : up
    Peer Ip/MCP/State  : 3.3.3.2 ae1.0 up

```

## show interfaces me0

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Field Name                | Field Description                                                                   | Level of Output              |
|---------------------------|-------------------------------------------------------------------------------------|------------------------------|
| <b>Physical Interface</b> |                                                                                     |                              |
| <b>Physical interface</b> | Name of the physical interface.                                                     | All levels                   |
| <b>Enabled</b>            | State of the interface: <b>Enabled</b> or <b>Disabled</b> .                         | All levels                   |
| <b>Interface index</b>    | Index number of the physical interface, which reflects its initialization sequence. | <b>detail extensive none</b> |

Table 310: show interfaces me0 Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                                                   | Level of Output        |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------|
| SNMP ifIndex            | SNMP index number for the physical interface.                                                                                                                                                                                                                       | detail extensive none  |
| Generation              | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                                   | detail extensive       |
| Description             | Optional user-specified description.                                                                                                                                                                                                                                | brief detail extensive |
| Type                    | Information about the type of functional interface.                                                                                                                                                                                                                 | All levels             |
| Link-level type         | Encapsulation being used on the physical interface.                                                                                                                                                                                                                 | All levels             |
| MTU                     | Maximum transmission unit size on the physical interface. The default is 1514.                                                                                                                                                                                      | All levels             |
| Clocking                | Interface that acts as a clock source. This field is not supported on EX Series switches and the default value is always <b>Unspecified</b> .                                                                                                                       | detail extensive       |
| Speed                   | Speed at which the interface is running.                                                                                                                                                                                                                            | All levels             |
| Device flags            | Information about the physical device.                                                                                                                                                                                                                              | All levels             |
| Interface flags         | Information about the interface.                                                                                                                                                                                                                                    | All levels             |
| Link type               | Information about whether the link is duplex and whether the negotiation is manual or automatic.                                                                                                                                                                    | detail extensive none  |
| Physical info           | Information about the device dependent physical interface selector. This field is applied only when a clocking option is specified. This field is not supported on EX Series switches and the default value is always <b>Unspecified</b> .                          | detail extensive       |
| Hold-times              | Current interface hold-time up and hold-time down, in milliseconds.                                                                                                                                                                                                 | detail extensive       |
| Current address         | Configured MAC address.                                                                                                                                                                                                                                             | detail extensive none  |
| Hardware address        | MAC address of the hardware.                                                                                                                                                                                                                                        | detail extensive none  |
| Alternate link address  | Information about alternate hardware address.                                                                                                                                                                                                                       | detail extensive       |
| Last flapped            | Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hour:minute:second timezone (weeksw:daysdhour:minute:second ago)</b> . For example, <b>Last flapped: 2008-01-16 10:52:40 UTC (3w:3d 22:58 ago)</b> . | detail extensive none  |
| Statistics last cleared | Time when the statistics for the interface was last set to zero. The format is <b>Last flapped: year-month-day hour:minute:second timezone (weeksw:daysdhour:minute:second ago)</b> . For example, <b>Last flapped: 2008-01-16 10:52:40 UTC (3w:3d 22:58 ago)</b> . | detail extensive       |

Table 310: show interfaces me0 Output Fields (*continued*)

| Field Name                     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Level of Output         |
|--------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Traffic statistics</b>      | <p>Number and rate of bytes and packets received and transmitted on the physical interface.</p> <p>Following are fields in <b>Traffic statistics</b>:</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail extensive</b> |
| <b>IPv6 transit statistics</b> | <p>Number and rate of bytes and IPv6 packets received and transmitted on the physical interface.</p> <p>Following are fields in <b>IPv6 transit statistics</b>:</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>detail extensive</b> |
| <b>Input errors</b>            | <p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and frame checksum (FCS) errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid FCS.</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Giants</b>—Number of packets that exceed the size for the medium. For example, if the medium is Ethernet, the <b>Giant</b> field shows the count of packets with size greater than 1518 bytes.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that the Junos OS does not handle.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul>                                 | <b>extensive</b>        |
| <b>Output errors</b>           | <p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly. It increases only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increment quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b>        |

Table 310: show interfaces me0 Output Fields (*continued*)

| Field Name                     | Field Description                                                                                                           | Level of Output              |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------|------------------------------|
| Logical Interface              |                                                                                                                             |                              |
| <b>Logical interface</b>       | Name of the logical interface.                                                                                              | All levels                   |
| <b>Index</b>                   | Index number of the logical interface, which reflects its initialization sequence.                                          | <b>detail extensive</b> none |
| <b>SNMP ifIndex</b>            | SNMP interface index number for the logical interface.                                                                      | <b>detail extensive</b> none |
| <b>Generation</b>              | Unique number for use by Juniper Networks technical support only.                                                           | <b>detail extensive</b>      |
| <b>Flags</b>                   | Information about the logical interface.                                                                                    | All levels                   |
| <b>Encapsulation</b>           | Encapsulation on the logical interface.                                                                                     | All levels                   |
| <b>Traffic statistics</b>      | Number and rate of bytes and packets received (input) and transmitted (output) on the specified interface.                  | <b>detail extensive</b>      |
| <b>IPv6 transit statistics</b> | If IPv6 statistics tracking is enabled, number of IPv6 bytes and packets received and transmitted on the logical interface. | <b>detail extensive</b>      |
| <b>Local statistics</b>        | Number and rate of bytes and packets destined to and exiting from the switch.                                               | <b>extensive</b>             |
| <b>Protocol</b>                | Protocol family.                                                                                                            | <b>detail extensive</b> none |
| <b>Generation</b>              | Unique number for use by Juniper Networks technical support only.                                                           | <b>detail extensive</b>      |
| <b>Route Table</b>             | Routing table in which the logical interface address is located. For example, 0 refers to the routing table <b>inet.0</b> . | <b>detail extensive</b>      |
| <b>Flags</b>                   | Information about protocol family flags.                                                                                    | <b>detail extensive</b>      |
| <b>Input Filter</b>            | Ingress filter name.                                                                                                        | <b>extensive</b>             |
| <b>Output Filter</b>           | Egress filter name.                                                                                                         | <b>extensive</b>             |
| <b>Addresses</b>               | Information about the management interface addresses.                                                                       | <b>detail extensive</b> none |
| <b>Flags</b>                   | Information about the address flags.                                                                                        | <b>detail extensive</b> none |
| <b>Destination</b>             | IP address of the remote side of the connection.                                                                            | <b>detail extensive</b> none |
| <b>Local</b>                   | IP address of the logical interface.                                                                                        | <b>detail extensive</b> none |
| <b>Broadcast</b>               | Broadcast address of the logical interface.                                                                                 | <b>detail extensive</b> none |
| <b>Generation</b>              | Unique number for use by Juniper Networks technical support only.                                                           | <b>detail extensive</b>      |

## Sample Output

### show interfaces me0

```
user@switch> show interfaces me0
Physical interface: me0, Enabled, Physical link is Up

## show interfaces xe-

**Syntax** `show interfaces xe-fpc/pic/port`  
`<brief | detail | extensive | terse>`  
`<media>`  
`<statistics>`

**Release Information** Command introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Display status information about the specified 10-Gigabit Ethernet interface.

**NOTE:** You must have a transceiver plugged into an SFP+ or an XFP port before information about the interface can be displayed.

**NOTE:** On an EX Series switch, the traffic statistics for a LAG might vary slightly from the cumulative traffic statistics of the member interfaces of the LAG. This difference is more likely to be seen when the traffic is bursty in nature, and because the statistics are not fetched from the LAG and the members in the same instant. For accurate traffic statistics for a LAG, use the aggregated Ethernet counters.

**Options** `xe-fpc/pic/port`—Display standard information about the specified 10-Gigabit Ethernet interface.

**brief | detail | extensive | terse**—(Optional) Display the specified level of output.

**media**—(Optional) Display media-specific information about network interfaces. For 10-Gigabit Ethernet interfaces, using the **media** option does not provide you with new or additional information. The output is the same as when the **media** option is not used.

**statistics**—(Optional) Display static interface statistics. For 10-Gigabit Ethernet interfaces, using the **statistics** option does not provide you with new or additional information. The output is the same as when the **statistics** option is not used.

**Required Privilege Level** view

| <b>Output errors</b>     | <p>Output errors on the interface:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Collisions</b>—Number of Ethernet collisions. A 10-Gigabit Ethernet interface supports only full-duplex operation, so for 10-Gigabit Ethernet interfaces, this number should always remain 0. If it is nonzero, there is a software bug.</li> <li>• <b>Aged packets</b>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>HS link CRC errors</b>—Number of errors on the high-speed links between the ASICs responsible for handling the switch interfaces.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b>                  |
| <b>Ingress queues</b>    | Number of CoS ingress queues supported on the specified interface. Displayed only for an interface on a line card with oversubscribed ports.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>detail</b><br><b>extensive</b> |
| <b>Egress queues</b>     | Number of CoS egress queues supported on the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>detail</b><br><b>extensive</b> |
| <b>PFE Egress queues</b> | Number of Packet Forwarding Engine egress queues shared by the interfaces in a port group. Displayed only for an interface on a line card with oversubscribed ports.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>detail</b><br><b>extensive</b> |

| <b>Active alarms and Active defects</b>       | <p>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the switch configuration, an alarm can ring the red or yellow alarm bell on the switch or turn on the red or yellow alarm LED on the front of the switch. These fields can contain the value <b>None</b> or <b>Link</b>.</p> <ul style="list-style-type: none"> <li>• <b>None</b>—There are no active defects or alarms.</li> <li>• <b>Link</b>—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <p><b>detail</b><br/><b>extensive</b><br/><b>none</b></p> |
| <b>MAC statistics</b>                         | <p>Receive and Transmit statistics reported by the PIC's MAC subsystem.</p> <ul style="list-style-type: none"> <li>• <b>Total octets</b> and <b>total packets</b>—Total number of octets and packets.</li> <li>• <b>Unicast packets</b>, <b>Broadcast packets</b>, and <b>Multicast packets</b>—Number of unicast, broadcast, and multicast packets.</li> <li>• <b>CRC/Align errors</b>—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</li> <li>• <b>FIFO error</b>—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>MAC control frames</b>—Number of MAC control frames.</li> <li>• <b>MAC pause frames</b>—Number of MAC control frames with <b>pause</b> operational code.</li> <li>• <b>Oversized frames</b>—Number of frames that exceed 1518 octets.</li> <li>• <b>Jabber frames</b>—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</li> <li>• <b>Fragment frames</b>—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.</li> <li>• <b>Code violations</b>—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error."</li> </ul> | <b>extensive</b>                                          |
| <b>Packet Forwarding Engine configuration</b> | <p>Information about the configuration of the Packet Forwarding Engine:</p> <ul style="list-style-type: none"> <li>• <b>Destination slot</b>—FPC slot number: <ul style="list-style-type: none"> <li>• On standalone switches with built-in interfaces, the slot number refers to the switch itself and is always 0.</li> <li>• On Virtual Chassis composed of switches with built-in interfaces, the slot number refers to the member ID of the switch.</li> <li>• On switches with line cards or on Virtual Chassis composed of switches with line cards, the slot number refers to the line card slot number on the switch or Virtual Chassis.</li> </ul> </li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>extensive</b>                                          |

| <b>Decrypted Bytes</b>               | The number of bytes received on the interface that have been decrypted. An encrypted byte has to be decrypted before it can be received on the receiving interface. The decrypted bytes counter is incremented for received traffic that was encrypted using MACSec.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | <b>detail</b><br><b>extensive</b> |

## Sample Output

show interfaces xe-4/1/0

```

user@switch show interfaces xe-4/1/0
Physical interface: xe-4/1/0, Enabled, Physical link is Up
Interface index: 387, SNMP ifIndex: 369

```

```

Link-level type: Ethernet, MTU: 1514, Speed: 10Gbps, Duplex: Full-Duplex,
BPDU Error: None, MAC-REWRITE Error: None, Loopback: Disabled,
Source filtering: Disabled, Flow control: Enabled
Device flags   : Present Running
Interface flags: SNMP-Traps Internal: 0x0
Link flags     : None
CoS queues     : 8 supported, 8 maximum usable queues
Current address: 00:23:9c:03:8e:70, Hardware address: 00:23:9c:03:8e:70
Last flapped   : 2009-05-12 08:01:04 UTC (00:13:44 ago)
Input rate     : 36432 bps (3 pps)
Output rate    : 0 bps (0 pps)
Active alarms  : None
Active defects : None

```

```

Logical interface xe-4/1/0.0 (Index 66) (SNMP ifIndex 417)
  Flags: SNMP-Traps Encapsulation: ENET2
  Input packets : 0
  Output packets: 0
  Protocol eth-switch
  Flags: None

```

#### show interfaces xe-0/1/0 brief

```

user@switch> show interfaces xe-0/1/0 brief
Physical interface: xe-0/1/0, Enabled, Physical link is Up
  Link-level type: Ethernet, MTU: 1514, Speed: 1000mbps, Loopback: Disabled,
  Source filtering: Disabled, Flow control: Enabled
  Device flags   : Present Running
  Interface flags: SNMP-Traps Internal: 0x0
  Link flags     : None

Logical interface xe-0/1/0.0
  Flags: SNMP-Traps Encapsulation: ENET2
  eth-switch

```

| Aggregated interface | Aggregated Ethernet interface name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| LACP State           | <p>LACP state information for each aggregated Ethernet interface:</p> <ul style="list-style-type: none"> <li>For a child interface configured with the <b>force-up</b> statement, LACP state displays <b>FUP</b> along with the interface name.</li> <li><b>Role</b>—Role played by the interface. It can be one of the following: <ul style="list-style-type: none"> <li><b>Actor</b>—Local device participating in the LACP negotiation.</li> <li><b>Partner</b>—Remote device participating in the LACP negotiation.</li> </ul> </li> <li><b>Exp</b>—Expired state. <b>Yes</b> indicates that the actor or partner is in an expired state. <b>No</b> indicates that the actor or partner is not in an expired state.</li> <li><b>Def</b>—Default. <b>Yes</b> indicates that the actor's receive machine is using the default operational partner information, which is administratively configured for the partner. <b>No</b> indicates that the operational partner information in use has been received in an LACP PDU.</li> <li><b>Dist</b>—Distribution of outgoing frames. <b>No</b> indicates that the distribution of outgoing frames on the link is currently disabled and is not expected to be enabled. Otherwise, the value is <b>Yes</b>.</li> <li><b>Col</b>—Collection of incoming frames. <b>Yes</b> indicates that the collection of incoming frames on the link is currently enabled and is not expected to be disabled. Otherwise, the value is <b>No</b>.</li> <li><b>Syn</b>—Synchronization. If the value is <b>Yes</b>, the link is considered to be synchronized. The link has been allocated to the correct link aggregation group, the group has been associated with a compatible aggregator, and the identity of the link aggregation group is consistent with the system ID and operational key information transmitted. If the value is <b>No</b>, the link is not synchronized. The link is currently not in the right aggregation.</li> <li><b>Aggr</b>—Ability of the aggregation port to aggregate (<b>Yes</b>) or to operate only as an individual link (<b>No</b>).</li> <li><b>Timeout</b>—LACP timeout preference. Periodic transmissions of LACP PDUs occur at either a slow or a fast transmission rate, depending upon the expressed LACP timeout preference (<b>Long Timeout</b> or <b>Short Timeout</b>).</li> <li><b>Activity</b>—Actor's or partner's port activity. <b>Passive</b> indicates the port's preference for not transmitting LAC PDUs unless its partner's control value is <b>Active</b>. <b>Active</b> indicates the port's preference to participate in the protocol regardless of the partner's control value.</li> </ul> |

Table 313: show lacp interfaces Output Fields (*continued*)

| Field Name    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| LACP Protocol | <p>LACP protocol information for each aggregated interface:</p> <ul style="list-style-type: none"> <li>Link state (active or standby) indicated in parentheses next to the interface when link protection is configured.</li> <li><b>Receive State</b>—One of the following values: <ul style="list-style-type: none"> <li><b>Current</b>—The state machine receives an LACP PDU and enters the <b>Current</b> state.</li> <li><b>Defaulted</b>—If no LACP PDU is received before the timer for the <b>Current</b> state expires a second time, the state machine enters the <b>Defaulted</b> state.</li> <li><b>Expired</b>—If no LACP PDU is received before the timer for the <b>Current</b> state expires once, the state machine enters the <b>Expired</b> state.</li> <li><b>Initialize</b>—When the physical connectivity of a link changes or a Begin event occurs, the state machine enters the <b>Initialize</b> state.</li> <li><b>LACP Disabled</b>—If the port is operating in half duplex, the operation of LACP is disabled on the port, forcing the state to <b>LACP Disabled</b>. This state is similar to the <b>Defaulted</b> state, except that the port is forced to operate as an individual port.</li> <li><b>Port Disabled</b>—If the port becomes inoperable and a Begin event has not occurred, the state machine enters the <b>Port Disabled</b> state.</li> </ul> </li> <li><b>Transmit State</b>—Transmit state of the state machine. The transmit state is one of the following values: <ul style="list-style-type: none"> <li><b>Fast periodic</b>—Periodic transmissions are enabled at a fast transmission rate.</li> <li><b>No periodic</b>—Periodic transmissions are disabled.</li> <li><b>Periodic timer</b>—Transitory state entered when the periodic timer expires.</li> <li><b>Slow periodic</b>—Periodic transmissions are enabled at a slow transmission rate.</li> </ul> </li> <li><b>Mux State</b>—State of the multiplexer state machine for the aggregation port. The state is one of the following values: <ul style="list-style-type: none"> <li><b>Attached</b>—The multiplexer state machine initiates the process of attaching the port to the selected aggregator.</li> <li><b>Collecting—Yes</b> indicates that the receive function of this link is enabled with respect to its participation in an aggregation. Received frames are passed to the aggregator for collection. <b>No</b> indicates the receive function of this link is not enabled.</li> <li><b>Collecting distributing</b>—Collecting and distributing states are merged together to form a combined state (coupled control). Because independent control is not possible, the coupled control state machine does not wait for the partner to signal that collection has started before enabling both collection and distribution.</li> <li><b>Detached</b>—Process of detaching the port from the aggregator is in progress.</li> <li><b>Distributing—Yes</b> indicates that the transmit function of this link is enabled with respect to its participation in an aggregation. Frames can be passed down from the aggregator's distribution function for transmission. <b>No</b> indicates the transmit function of this link is not enabled.</li> <li><b>Waiting</b>—The multiplexer state machine is in a holding process, awaiting an outcome.</li> </ul> </li> </ul> |

## Sample Output

### show lacp interfaces (EX Series Switches)

```

user@switch> show lacp interfaces ae5
Aggregated interface: ae5
  LACP state:      Role  Exp  Def  Dist  Col  Syn  Aggr  Timeout  Activity
    xe-2/0/7      Actor  No   No   Yes  Yes  Yes  Yes    Fast    Active
    xe-2/0/7      Partner No   No   Yes  Yes  Yes  Yes    Fast    Passive

```

|          |         |    |    |    |     |     |     |      |         |
|----------|---------|----|----|----|-----|-----|-----|------|---------|
| xe-4/0/7 | Actor   | No | No | No | No  | No  | Yes | Fast | Active  |
| xe-4/0/7 | Partner | No | No | No | Yes | Yes | Yes | Fast | Passive |

|                    |               |                |                         |

## Troubleshooting an Aggregated Ethernet Interface

---

Troubleshooting issues for aggregated Ethernet interfaces:

- [Show Interfaces Command Shows the LAG is Down on page 2931](#)
- [Logical Interface Statistics Do Not Reflect All Traffic on page 2931](#)
- [IPv6 Interface Traffic Statistics Are Not Supported on page 2932](#)
- [SNMP Counters ifHCInBroadcastPkts and ifInBroadcastPkts Are Always 0 on page 2932](#)

### Show Interfaces Command Shows the LAG is Down

**Problem**    **Description:** The `show interfaces terse` command shows that the LAG is down.

**Solution**    Check the following:

- Verify that there is no configuration mismatch.
- Verify that all member ports are up.
- Verify that a LAG is part of family ethernet—switching (Layer 2 LAG) or family inet (Layer 3 LAG).
- Verify that the LAG member is connected to the correct LAG at the other end.
- Verify that the LAG members belong to the same switch (or the same Virtual Chassis).

### Logical Interface Statistics Do Not Reflect All Traffic

**Problem**    **Description:** The traffic statistics for a logical interface do not include all of the traffic.

**Solution** Traffic statistics fields for logical interfaces in **show interfaces** commands show only control traffic; the traffic statistics do not include data traffic. You can view the statistics for all traffic only per physical interface.

## IPv6 Interface Traffic Statistics Are Not Supported

**Problem** **Description:** The IPv6 transit statistics in the **show interfaces** command display all 0 values.

**Solution** EX Series switches do not support the collection and reporting of IPv6 transit statistics.

## SNMP Counters ifHCInBroadcastPkts and ifInBroadcastPkts Are Always 0

**Problem** **Description:** The values for the SNMP counters ifHCInBroadcastPkts and ifInBroadcastPkts are always 0.

**Solution** The SNMP counters ifHCInBroadcastPkts and ifInBroadcastPkts are not supported for aggregated Ethernet interfaces on EX Series switches.

## Troubleshooting Interface Configuration and Cable Faults

---

**NOTE:** This topic applies only to the J-Web Application package.

Troubleshooting interface configuration and connectivity on the EX Series switch:

1. [Interface Configuration or Connectivity Is Not Working on page 2932](#)

## Interface Configuration or Connectivity Is Not Working

**Problem** **Description:**

**NOTE:** This topic applies only to the J-Web Application package.

You encounter errors when you attempt to configure an interface on the switch, or the interface is exhibiting connectivity problems.

**Solution** Use the port troubleshooter feature in the J-Web interface to identify and rectify port configuration and connectivity related problems.

To use the J-Web interface port troubleshooter:

1. Select the option **Troubleshoot** from the main menu.
2. Click **Troubleshoot Port**. The Port Troubleshooting wizard is displayed. Click **Next**.
3. Select the ports to troubleshoot.
4. Select the test cases to be executed on the selected port. Click **Next**.

When the selected test cases are executed, the final result and the recommended action is displayed.

If there is a cable fault, the port troubleshooter displays details and the recommended action. For example, the cable must be replaced.

If the port configuration needs to be modified, the port troubleshooter displays details and the recommended action.

## Troubleshooting Unicast RPF

Troubleshooting issues for unicast reverse-path forwarding (RPF) on EX Series switches include:

1. [Legitimate Packets Are Discarded on page 2933](#)

### Legitimate Packets Are Discarded

**Problem** **Description:** The switch filters valid packets from legitimate sources, which results in the switch's discarding packets that should be forwarded.

**Solution** The interface or interfaces on which legitimate packets are discarded are asymmetrically routed interfaces. An asymmetrically routed interface uses different paths to send and receive packets between the source and the destination, so the interface that receives a packet is not the same interface the switch uses to reply to the packet's source.

Unicast RPF works properly only on symmetrically routed interfaces. A symmetrically routed interface is an interface that uses the same route in both directions between the source and the destination. Unicast RPF filters packets by checking the forwarding table

for the best return path to the source of an incoming packet. If the best return path uses the same interface as the interface that received the packet, the switch forwards the packet. If the best return path uses a different interface than the interface that received the packet, the switch discards the packet.

**NOTE:** On EX3200, EX4200, and EX4300 switches, unicast RPF works properly only if all switch interfaces—including aggregated Ethernet interfaces (also referred to as link aggregation groups or LAGs), integrated routing and bridging (IRB) interfaces, and routed VLAN interfaces (RVIs)—are symmetrically routed, because unicast RPF is enabled globally on all switch interfaces.

---

## Diagnosing a Faulty Twisted-Pair Cable (CLI Procedure)

---

**Problem**    **Description:** A 10/100/1000BASE-T Ethernet interface has connectivity problems that you suspect might be caused by a faulty cable.

**Solution**    Use the time domain reflectometry (TDR) test to determine whether a twisted-pair Ethernet cable is faulty.

The TDR test:

- Detects and reports faults for each twisted pair in an Ethernet cable. Faults detected include open circuits, short circuits, and impedance mismatches.
- Reports the distance to fault to within 1 meter.
- Detects and reports pair swaps, pair polarity reversals, and excessive pair skew.

The TDR test is supported on the following switches and interfaces:

- EX2200, EX3200, EX3300, and EX4200 switches—RJ-45 network interfaces. The TDR test is not supported on management interfaces and SFP interfaces.
- EX6200 and EX8200 switches—RJ-45 network interfaces on line cards.

**NOTE:** We recommend running the TDR test on an interface when there is no traffic on the interface.

To diagnose a cable problem by running the TDR test:

1. Run the `request diagnostics tdr` command.

```
user@switch> request diagnostics tdr start interface ge-0/0/10
```

```
Interface TDR detail:
```

```
Test status : Test successfully executed ge-0/0/10
```

2. View the results of the TDR test with the `show diagnostics tdr` command.

```
user@switch> show diagnostics tdr interface ge-0/0/10
```

```
Interface TDR detail:
```

```
Interface name : ge-0/0/10
```

```
Test status : Passed
```

```
Link status : Down
```

```
MDI pair : 1-2
```

```
  Cable status : Normal
```

```
  Distance fault : 0 Meters
```

```
  Polartiy swap : N/A
```

```
  Skew time : N/A
```

```
MDI pair : 3-6
```

```
  Cable status : Normal
```

```
  Distance fault : 0 Meters
```

```
  Polartiy swap : N/A
```

```
  Skew time : N/A
```

```
MDI pair : 4-5
```

```
  Cable status : Open
```

```
  Distance fault : 1 Meters
```

```
  Polartiy swap : N/A
```

```
  Skew time : N/A
```

```
MDI pair : 7-8
```

```
  Cable status : Normal
```

```
  Distance fault : 0 Meters
```

```
  Polartiy swap : N/A
```

```
  Skew time : N/A
```

```
Channel pair : 1
```

```
  Pair swap : N/A
```

```
Channel pair : 2
```

```
  Pair swap : N/A
```

```
Downshift : N/A
```

3. Examine the **Cable status** field for the four MDI pairs to determine if the cable has a fault. In the preceding example, the twisted pair on pins 4 and 5 is broken or cut at approximately one meter from the `ge-0/0/10` port connection.

**NOTE:** The **Test Status** field indicates the status of the TDR test, not the cable. The value **Passed** means the test completed—it does not mean that the cable has no faults.

The following is additional information about the TDR test:

- The TDR test can take some seconds to complete. If the test is still running when you execute the `show diagnostics tdr` command, the **Test status** field displays **Started**. For example:

```
user@switch> show diagnostics tdr interface ge-0/0/22
```

```
Interface TDR detail:
```

```
Interface name      : ge-0/0/22
Test status        : Started
```

- You can terminate a running TDR test before it completes by using the **request diagnostics tdr abort interface *interface-name*** command. The test terminates with no results, and the results from any previous test are cleared.
- You can display summary information about the last TDR test results for all interfaces on the switch that support the TDR test by not specifying an interface name with the **show diagnostics tdr** command. For example:

```
user@switch> show diagnostics tdr
```

| Interface | Test status | Link status | Cable status | Max distance | fault |
|-----------|-------------|-------------|--------------|--------------|-------|
| ge-0/0/0  | Passed      | UP          | OK           | 0            |       |
| ge-0/0/1  | Not Started | N/A         | N/A          | N/A          |       |
| ge-0/0/2  | Passed      | UP          | OK           | 0            |       |
| ge-0/0/3  | Not Started | N/A         | N/A          | N/A          |       |
| ge-0/0/4  | Passed      | UP          | OK           | 0            |       |
| ge-0/0/5  | Passed      | UP          | OK           | 0            |       |
| ge-0/0/6  | Passed      | UP          | OK           | 0            |       |
| ge-0/0/7  | Not Started | N/A         | N/A          | N/A          |       |
| ge-0/0/8  | Passed      | Down        | OK           | 0            |       |
| ge-0/0/9  | Not Started | N/A         | N/A          | N/A          |       |
| ge-0/0/10 | Passed      | Down        | Fault        | 1            |       |
| ge-0/0/11 | Passed      | UP          | OK           | 0            |       |
| ge-0/0/12 | Not Started | N/A         | N/A          | N/A          |       |
| ge-0/0/13 | Not Started | N/A         | N/A          | N/A          |       |
| ge-0/0/14 | Not Started | N/A         | N/A          | N/A          |       |
| ge-0/0/15 | Not Started | N/A         | N/A          | N/A          |       |
| ge-0/0/16 | Not Started | N/A         | N/A          | N/A          |       |
| ge-0/0/17 | Not Started | N/A         | N/A          | N/A          |       |
| ge-0/0/18 | Not Started | N/A         | N/A          | N/A          |       |
| ge-0/0/19 | Passed      | Down        | OK           | 0            |       |
| ge-0/0/20 | Not Started | N/A         | N/A          | N/A          |       |
| ge-0/0/21 | Not Started | N/A         | N/A          | N/A          |       |
| ge-0/0/22 | Passed      | UP          | OK           | 0            |       |
| ge-0/0/23 | Not Started | N/A         | N/A          | N/A          |       |

- Configuring BGP Sessions (J-Web Procedure) on page 2943

### Configuring BGP Sessions (J-Web Procedure)

**NOTE:** This topic applies only to the J-Web Application package.

You can use the J-Web interface to create BGP peering sessions on a routing device.

**NOTE:** To configure BGP sessions, you must have a license for BGP installed on the EX Series switch.

To configure a BGP peering session:

1. Select **Configure > Routing > BGP**.

**NOTE:** After you make changes to the configuration on this page, you must commit the changes for them to take effect. To commit all changes to the active configuration, select **Commit Options > Commit**. See [Using the Commit Options to Commit Configuration Changes](#) for details about all commit options.

2. Click one of the following options:

- **Add**—Adds a BGP group. Enter information into the configuration page as described in [Table 316 on page 2944](#).
- **Edit**—Modifies an existing BGP group. Enter information into the configuration page as described in [Table 316 on page 2944](#).

- **Delete**—Deletes an existing BGP group.
  - **Disable**—Disables BGP configuration.
3. To modify BGP global settings, click **Edit** in the Global Information section. Enter information as described in [Table 317 on page 2945](#).

**Table 316: BGP Routing Configuration Summary**

| Field                     | Function                                                                                                                  | Your Action                                                                                                                                                                                                                                  |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>General tab</b>        |                                                                                                                           |                                                                                                                                                                                                                                              |
| Group Type                | Specifies whether the group is an internal BGP (IBGP) group or an external BGP (EBGP) group.                              | Select the option: <b>Internal</b> or <b>External</b> .                                                                                                                                                                                      |
| Group Name                | Specifies the name for the group.                                                                                         | Type a new name or select and edit the name.                                                                                                                                                                                                 |
| ASN                       | Sets the unique numeric identifier of the AS in which the routing device is configured.                                   | Type the routing device's 32-bit AS number, in dotted decimal notation.<br><br>If you enter an integer, the value is converted to a 32-bit equivalent. For example, if you enter <b>3</b> , the value assigned to the AS is <b>0.0.0.3</b> . |
| Preference                | Specifies the degree of preference for an external route. The route with the highest local preference value is preferred. | Type or select and edit the value.                                                                                                                                                                                                           |
| Cluster Id                | Specifies the cluster identifier to be used by the route reflector cluster in an internal BGP group.                      | Type or select and edit the IPv6 or IPv4 address to be used as the identifier.                                                                                                                                                               |
| Description               | Specifies the text description of the global, group, or neighbor configuration.                                           | Type or select and edit the description.                                                                                                                                                                                                     |
| Damping                   | Specifies whether route flap damping is enabled or not.                                                                   | To enable route flap damping, select the check box.<br><br>To disable route flap damping do not select the check box.                                                                                                                        |
| Advertise Inactive Routes | Specifies whether BGP advertises the best route even if the routing table did not select it to be an active route.        | To enable advertising inactive routes, select the check box.<br><br>To disable advertising inactive routes, do not select the check box.                                                                                                     |
| Advertise Peer AS Routes  | Specifies whether to disable the default behavior of suppressing AS routes.                                               | To enable advertising peer AS routes, select the check box.<br><br>To disable advertising peer AS routes, do not select the check box.                                                                                                       |
| <b>Neighbors tab</b>      |                                                                                                                           |                                                                                                                                                                                                                                              |
| Dynamic Neighbors         | Configures a neighbor (peer).                                                                                             | Type the IPv4 address of the peer.                                                                                                                                                                                                           |

Table 316: BGP Routing Configuration Summary (*continued*)

| Field               | Function                                                                                         | Your Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|---------------------|--------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Static Neighbors    | Configures the system's peers statically.                                                        | <p>To configure a static neighbor:</p> <ol style="list-style-type: none"> <li>1. Specify the IP address.</li> <li>2. Specify the address of the local end of a BGP session.</li> <li>3. Specify the degree of preference for an external route.</li> <li>4. Enter a description.</li> <li>5. Specify the hold-time value to use when negotiating a connection with the peer.</li> <li>6. Specify how long a route must be present in the routing table before it is exported to BGP. Use this time delay to help bundle routing updates.</li> <li>7. Select <b>Passive</b> if you do not want to send active open messages to the peer.</li> <li>8. Select the option to compare the AS path of an incoming advertised route with the AS number of the BGP peer under the group and replace all occurrences of the peer AS number in the AS path with its own AS number before advertising the route to the peer.</li> <li>9. Specify an import policy and export policy.</li> <li>10. Click <b>OK</b>.</li> </ol> |
| <b>Policies tab</b> |                                                                                                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Import Policy       | Specifies one or more routing policies to routes being imported into the routing table from BGP. | <p>Click <b>Add</b> to add an import policy. Select the policy and click <b>OK</b>.</p> <p>Click <b>Move up</b> or <b>Move down</b> to move the selected policy up or down the list of policies.</p> <p>Select the policy and click <b>Remove</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Export Policy       | Specifies one or more policies to routes being exported from the routing table into BGP.         | <p>Click <b>Add</b> to add an export policy. Select the policy and click <b>OK</b>.</p> <p>Click <b>Move up</b> or <b>Move down</b> to move the selected policy up or down the list of policies.</p> <p>Select the policy and click <b>Remove</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

Table 317: BGP Global Settings

| Field              | Function                                  | Your Action                             |
|--------------------|-------------------------------------------|-----------------------------------------|

| BGP Status            | Enables or disables BGP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <ul style="list-style-type: none"> <li>To enable BGP, select <b>Enabled</b>.</li> <li>To disable BGP, select <b>Disabled</b>.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Description           | Describes of the global, group, or neighbor configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Type or select and edit the description.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Confederation Number  | Specifies the routing device's confederation AS number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Type or select and edit the value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Confederation Members | Specifies the AS numbers for the confederation members.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <p>To add a member AS number, click <b>Add</b> and enter the number in the <b>Member ASN</b> box. Click <b>OK</b>.</p> <p>To modify a confederation member's AS number, select the member click <b>Edit</b> and, enter the number and click <b>OK</b>.</p> <p>To delete a confederation member, select the member and click <b>Remove</b>.</p>                                                                                                                                                                                                                 |
| Advance Options       | <p>You can configure the following:</p> <ul style="list-style-type: none"> <li><b>Keep routes</b>—Specifies whether routes learned from a BGP peer must be retained in the routing table even if they contain an AS number that was exported from the local AS.</li> <li><b>TCP MSS</b>—Configures the maximum segment size (MSS) for the TCP connection for BGP neighbors.</li> <li><b>MTU Discovery</b>—Select to configure MTU discovery.</li> <li><b>Remove Private ASN</b>—Select to have the local system strip private AS numbers from the AS path when advertising AS paths to remote systems.</li> <li><b>Graceful Restart</b>—Specifies the time period when the restart is expected to be complete. Specify the maximum time that stale routes are kept during restart.</li> <li><b>Multihop</b>—Configures the maximum time-to-live (TTL) value for the TTL in the IP header of BGP packets.</li> <li><b>Authentication Type</b>—Select the authentication algorithm: None, MD5, SHA1, AES.</li> </ul> | <p>Select <b>All</b> or <b>None</b> to configure Keep Routes.</p> <p>Enter a value in the <b>TCP MSS</b> box.</p> <p>Click to enable <b>MTU Discovery</b>.</p> <p>Click to enable <b>Remove Private ASN</b>.</p> <p>Enter the time period for a graceful restart and the maximum time that stale routes must be kept.</p> <p>To configure Multihop, select <b>Nextthop Change</b> to allow unconnected third-party next hops. Enter a TTL value.</p> <p>Select the authentication algorithm. If you select None, specify an authentication key (password).</p> |
| <b>Policies tab</b>   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Import Policy         | Specifies one or more routing policies to routes being imported into the routing table from BGP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <p>Click <b>Add</b> to add an import policy.</p> <p>Click <b>Move up</b> or <b>Move down</b> to move the selected policy up or down the list of policies.</p> <p>Click <b>Remove</b> to remove an import policy.</p>                                                                                                                                                                                                                                                                                                                                           |

Table 317: BGP Global Settings (*continued*)

| Field                    | Function                                                                                 | Your Action                                                                                                                                                                                                          |
|--------------------------|------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Export Policy            | Specifies one or more policies to routes being exported from the routing table into BGP. | <p>Click <b>Add</b> to add an export policy.</p> <p>Click <b>Move up</b> or <b>Move down</b> to move the selected policy up or down the list of policies.</p> <p>Click <b>Remove</b> to remove an export policy.</p> |
| <b>Trace Options tab</b> |                                                                                          |                                                                                                                                                                                                                      |
| File Name                | Specifies the name of the file to receive the output of the tracing operation.           | Type or select and edit the name.                                                                                                                                                                                    |
| Number of Files          | Specifies the maximum number of trace files.                                             | Type or select and edit the value.                                                                                                                                                                                   |
| File Size                | Specifies the maximum size for each trace file.                                          | Type or select and edit the value.                                                                                                                                                                                   |
| World Readable           | Specifies whether the trace file can be read by any user or not.                         | <p>Select <b>True</b> to allow any user to read the file.</p> <p>Select <b>False</b> to disallow all users being able to read the file.</p>                                                                          |
| Flags                    | Specifies the tracing operation to perform.                                              | Select a value from the list.                                                                                                                                                                                        |

| <b>Description</b>              | <p>Specify that a single-hop EBGP peer accepts a remote next hop with which it does not share a common subnet. Configure a separate import policy on the EBGP peer to specify the remote next hop. You cannot configure <b>multihop</b> and <b>accept-remote-nexthop</b> statements for the same EBGP peer.</p> <p>For Junos OS Release 13.3 and later releases, specify that a multihop EBGP peer accepts a remote next hop with which it does not share a common subnet. This allows working around current resolver limitations to realize multipath forwarding in recursive next-hop resolution scenarios.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Description</b>         | <p>Specify BGP to advertise the best external route into an IBGP mesh group, a route reflector cluster, or an AS confederation even if the best route is an internal route.</p> <p>In general, deployed BGP implementations do not advertise the external route with the highest local preference value to internal peers unless it is the best route. Although this behavior was required by an earlier version of the BGP version 4 specification, RFC 1771, it was typically not followed in order to minimize the amount of advertised information and to prevent routing loops. However, there are scenarios in which advertising the best external route is beneficial, in particular, situations that can result in IBGP route oscillation.</p> <p>The <b>advertise-external</b> statement is supported at both the group and neighbor level. If you configure the statement at the neighbor level, you must configure it for all neighbors in a group. Otherwise, the group is automatically split into different groups.</p> <p>In a confederation, when advertising a route to a confederation border router, any route from a different confederation sub-AS is considered external. When configuring the <b>advertise-external</b> statement for an AS confederation, it is recommended that EBGp peers belonging to different autonomous systems are configured in a separate EBGp peer group. This ensures consistency while BGP sends the best external route to peers in the configured peer group.</p> <p>To configure the <b>advertise-external</b> statement on a route reflector, you must disable intracluster reflection with the <b>no-client-reflect</b> statement.</p> <p>When a routing device is configured as a route reflector for a cluster, a route advertised by the route reflector is considered internal if it is received from an internal peer with the same cluster identifier or if both peers have no cluster identifier configured. A route received from an internal peer that belongs to another cluster, that is, with a different cluster identifier, is considered external.</p> <p>The <b>conditional</b> option causes BGP to advertise the external route only if the route selection process reaches the point where the multiple exit discriminator (MED) metric</p> |

is evaluated. As a result, an external route with an AS path longer than that of the active path is not advertised.

Junos OS also provides support for configuring a BGP export policy that matches on the state of an advertised route. You can match on either active or inactive routes.

**Default** BGP does not advertise the external route with the highest local preference value to internal peers unless it is the best route.

**Options** **conditional**—(Optional) Advertise the best external path only if the route selection process reaches the point at which the multiple exit discriminator (MED) metric is evaluated. The **conditional** option restricts advertisement to when the best external path and the active path are equal until the MED step of the route selection process. This implies that external routes with a longer AS path length than the active path, for instance, are not advertised. The criteria used for selecting the best external path is the same whether or not the **conditional** option is configured.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Configure the routing table to export to BGP the best route learned by BGP even if Junos OS did not select this route to be an active route.</p> <p>One way to achieve multivendor compatibility is to include the <b>advertise-inactive</b> statement in the external BGP (EBGP) configuration. By default, BGP stores the route information it receives from update messages in the Junos OS routing table, and the routing table exports only active routes into BGP, which BGP then advertises to its peers. The <b>advertise-inactive</b> statement causes Junos OS to advertise the best BGP route that is inactive because of IGP preference. When you use the <b>advertise-inactive</b> statement, the Junos OS device uses, for example, the OSPF route for forwarding, and the other vendor's device uses the EBGP route for forwarding. However, from the perspective of an EBGP peer in a neighboring AS, both vendors' devices appear to behave the same way.</p>                                                                                                                                                                                                                                                                         |
| <b>Default</b>                  | By default, BGP stores the route information it receives from update messages in the Junos OS routing table, and the routing table exports only active routes into BGP, which BGP then advertises to its peers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Description</b>              | <p>Disable the default behavior of suppressing AS routes.</p> <p>If you include the <b>advertise-peer-as</b> statement in the configuration, BGP advertises routes learned from one external BGP (EBGP) peer back to another EBGP peer in the same autonomous system (AS) but not back to the originating peer.</p> <p>Another way to disable the route suppression default behavior is with the <b>as-override</b> statement. If you include both the <b>as-override</b> and <b>no-advertise-peer-as</b> statements in the configuration, the <b>no-advertise-peer-as</b> statement is ignored.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Default</b>                  | By default, Junos OS does not advertise the routes learned from one EBGP peer back to the same external BGP (EBGP) peer. In addition, the software does not advertise those routes back to any EBGP peers that are in the same AS as the originating peer, regardless of the routing instance.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| <b>Description</b>              | Specify matching criteria (in the form of a community) such that all routes which match are assigned the same VPN label, selected from one of the several routes in the set defined by this criteria. This reduces the number of VPN labels that the router must consider, and aggregates the received labels.                                                                                                                                                                                                                                                                                      |
| <b>Options</b>                  | <b>community <i>community-name</i></b> —Specify the name of the community to which to apply the aggregate label.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <p>Enabling the AS override feature allows routes originating from an AS to be accepted by a router residing in the same AS. Without AS override enabled, the routing device refuses the route advertisement once the AS path shows that the route originated from its own AS. This is done by default to prevent route loops. The <b>as-override</b> statement overrides this default behavior.</p> <p>Note that enabling the AS override feature may result in routing loops. Use this feature only for specific applications that require this type of behavior, and in situations with strict network control. One application is the IGP protocol between the provider edge routing device and the customer edge routing device in a virtual private network.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Required Privilege Level</b>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Release Information**

Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.3 for the QFX Series.  
Statement introduced for BMP in Junos OS Release 13.2X51-D15 for the QFX Series.  
Statement introduced for BMP version 3 in Junos OS Release 13.3.

**Description** Configure an MD5 authentication key (password). Neighboring routing devices use the same password to verify the authenticity of BGP packets sent from this system.

**Options** *key*—Authentication password. It can be up to 126 characters. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (" ").

**Required Privilege** routing—To view this statement in the configuration.  
**Level** routing-control—To add this statement to the configuration.

| <b>Description</b>              | Apply and enable an authentication keychain to the routing device. Note that the referenced key chain must be defined. When configuring the authentication key update feature for BGP, you cannot commit the <b>0.0.0.0/allow</b> statement with authentication keys or key chains. The CLI issues a warning and fails to commit the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>                  | <b>key-chain</b> —Authentication keychain name. It can be up to 126 characters. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (" ").                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| <b>Description</b>         | Specify the routing device's AS number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

An autonomous system (AS) is a set of routing devices that are under a single technical administration and that generally use a single interior gateway protocol (IGP) and metrics to propagate routing information within the set of routing devices. An AS appears to other ASs to have a single, coherent interior routing plan and presents a consistent picture of what destinations are reachable through it. ASs are identified by a number that is assigned by the Network Information Center (NIC) in the United States (<http://www.isi.edu>).

If you are using BGP on the routing device, you must configure an AS number.

The AS path attribute is modified when a route is advertised to an EBGP peer. Each time a route is advertised to an EBGP peer, the local routing device prepends its AS number to the existing path attribute, and a value of 1 is added to the AS number.

In Junos OS Release 9.1 and later, the numeric range is extended to provide BGP support for 4-byte AS numbers as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*. RFC 4893 introduces two new optional transitive BGP attributes, AS4\_PATH and AS4\_AGGREGATOR. These new attributes are used to propagate 4-byte AS path information across BGP speakers that do not support 4-byte AS numbers. RFC 4893 also introduces a reserved, well-known, 2-byte AS number, AS 23456. This reserved AS number is called AS\_TRANS in RFC 4893. All releases of Junos OS support 2-byte AS numbers.

In Junos OS Release 9.3 and later, you can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: *<16-bit high-order value in decimal>.<16-bit low-order value in decimal>*. For example, the 4-byte AS number of 65,546 in plain-number format is represented as 1.10 in the AS-dot notation format.

**Options**    ***autonomous-system***—AS number. Use a number assigned to you by the NIC.

**Range:** 1 through 4,294,967,295 ( $2^{32} - 1$ ) in plain-number format for 4-byte AS numbers

In this example, the 4-byte AS number 65,546 is represented in plain-number format:

```
[edit]
routing-options {
  autonomous-system 65546;
}
```

**Range:** 0.0 through 65535.65535 in AS-dot notation format for 4-byte numbers

In this example, 1.10 is the AS-dot notation format for 65,546:

```
[edit]
routing-options {
  autonomous-system 1.10;
}
```

**Range:** 1 through 65,535 in plain-number format for 2-byte AS numbers (this is a subset of the 4-byte range)

In this example, the 2-byte AS number 60,000 is represented in plain-number format:

```
[edit]
routing-options {
  autonomous-system 60000;
}
```

**asdot-notation**—(Optional) Display the configured 4-byte autonomous system number in the AS-dot notation format.

**Default:** Even if a 4-byte AS number is configured in the AS-dot notation format, the default is to display the AS number in the plain-number format.

**loops number**—(Optional) Specify the number of times detection of the AS number in the AS\_PATH attribute causes the route to be discarded or hidden. For example, if you configure **loops 1**, the route is hidden if the AS number is detected in the path one or more times. This is the default behavior. If you configure **loops 2**, the route is hidden if the AS number is detected in the path two or more times.

**Range:** 1 through 10

**Default:** 1

**NOTE:** When you specify the same AS number in more than one routing instance on the local routing device, you must configure the same number of loops for the AS number in each instance. For example, if you configure a value of 3 for the loops statement in a VRF routing instance that uses the same AS number as that of the master instance, you must also configure a value of 3 loops for the AS number in the master instance.

Use the **independent-domain** option if the loops statement must be enabled only on a subset of routing instances.

The remaining statement is explained separately.

**Release Information** Statement introduced in Junos OS Release 8.1.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.  
**detection-time threshold** and **transmit-interval threshold** options introduced in Junos OS Release 8.2  
 Support for logical routers introduced in Junos OS Release 8.3.  
 Support for IBGP and multihop EBGP sessions introduced in Junos OS Release 8.3.  
**holddown-interval** statement introduced in Junos OS Release 8.5. You can configure this statement only for EBGP peers at the [edit protocols bgp group *group-name* neighbor *address*] hierarchy level.  
**no-adaptation** statement introduced in Junos OS Release 9.0.  
 Support for BFD authentication introduced in Junos OS Release 9.6.

Support for BFD on IPv6 interfaces with BGP introduced in Junos OS Release 11.2.  
Statement introduced in Junos OS Release 12.1 for the QFX Series.

**Description** Configure bidirectional failure detection (BFD) timers and authentication for BGP.

For IBGP and multihop EBGP support, configure the **bfd-liveness-detection** statement at the global **[edit bgp protocols]** hierarchy level. You can also configure IBGP and multihop support for a routing instance or a logical system.

**Options** **authentication algorithm** *algorithm-name* (Optional)—Configure the algorithm used to authenticate the specified BFD session: **simple-password**, **keyed-md5**, **keyed-sha-1**, **meticulous-keyed-md5**, **meticulous-keyed-sha-1**.

**authentication key-chain** *key-chain-name* (Optional)—Associate a security key with the specified BFD session using the name of the security keychain. The keychain name must match one of the keychains configured in the **authentication-key-chains key-chain** statement at the **[edit security]** hierarchy level.

**authentication loose-check**—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication may not be configured at both ends of the BFD session.

**detection-time threshold** *milliseconds* (Optional)—Configure a threshold. When the BFD session detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

**holddown-interval** *milliseconds* (Optional)—Configure an interval specifying how long a BFD session must remain up before a state change notification is sent. When you configure the hold-down interval for the BFD protocol for EBGp, the BFD session is unaware of the BGP session during this time. In this case, if the BGP session goes down during the configured hold-down interval, BFD already assumes it is down and does not send a state change notification. The **holddown-interval** statement is supported only for EBGp peers at the **[edit protocols bgp group group-name neighbor address]** hierarchy level. If the BFD session goes down and then comes back up during the configured hold-down interval, the timer is restarted. You must configure the hold-down interval on both EBGp peers. If you configure the hold-down interval for a multihop EBGp session, you must also configure a local IP address by including the **local-address** statement at the **[edit protocols bgp group group-name]** hierarchy level.

**Range:** 0 through 255,000

**Default:** 0

**minimum-interval** *milliseconds* (Required)—Configure the minimum intervals at which the local routing device transmits hello packets and then expects to receive a reply from a neighbor with which it has established a BFD session. This value represents the minimum interval at which the local routing device transmits hello packets as well as the minimum interval that the routing device expects to receive a reply from a neighbor with which it has established a BFD session. You can configure a value in the range from 1 through 255,000 milliseconds. Optionally, instead of using this statement, you can specify the minimum transmit and receive intervals separately (using the **minimum-receive-interval** and **transmit-interval** statements).

**Range:** 1 through 255,000

**minimum-receive-interval** *milliseconds* (Optional)—Configure only the minimum interval at which the local routing device expects to receive a reply from a neighbor with which it has established a BFD session.

**Range:** 1 through 255,000

**multiplier *number*** (Optional)—Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

**Range:** 1 through 255

**Default:** 3

**no-adaptation** (Optional)—Configure BFD sessions not to adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable to not to have BFD adaptation enabled in your network.

**transmit-interval threshold *milliseconds*** (Optional)—Configure a threshold. When the BFD session transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent. The interval threshold must be greater than the minimum transmit interval.

**Range:** 0 through 4,294,967,295 ( $2^{32} - 1$ )

**transmit-interval minimum-interval *milliseconds*** (Optional)—Configure only the minimum interval at which the local routing device transmits hello packets to a neighbor with which it has established a BFD session.

**Range:** 1 through 255,000

**version** (Optional)—Configure the BFD version to detect.

**Range:** 1 or **automatic** (autodetect the BFD version)

**Default:** **automatic**

The remaining statements are explained separately.

| <b>Description</b>         | Specify the cluster identifier to be used by the route reflector cluster in an internal BGP group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

### CAUTION:

If you configure both route reflection and VPNs on the same routing device, the following modifications to the route reflection configuration cause current BGP sessions to be reset:

- Adding a cluster ID—If a BGP session shares the same AS number with the group where you add the cluster ID, all BGP sessions are reset regardless of whether the BGP sessions are contained in the same group.
- Creating a new route reflector—If you have an IBGP group with an AS number and create a new route reflector group with the same AS number, all BGP sessions in the IBGP group and the new route reflector group are reset.

**NOTE:** If you change the address family specified in the [edit protocols bgp family] hierarchy level, all current BGP sessions on the routing device are dropped and then reestablished.

| <b>Description</b>         | <p>Enable route flap damping. BGP route flapping describes the situation in which BGP systems send an excessive number of update messages to advertise network reachability information. Flap damping reduces the number of update messages sent between BGP</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

peers, thereby reducing the load on these peers, without adversely affecting the route convergence time for stable routes.

You typically apply flap damping to external BGP (EBGP) routes (that is, to routes in different ASs). You can also apply it within a confederation, between confederation member ASs. Because routing consistency within an AS is important, do not apply flap damping to internal BGP (IBGP) routes. (If you do, it is ignored.) The exception to this rule is when flap damping is applied at the address family level. When you apply flap damping at the address family level, it works for both IBGP and EBGP.

**Default** Flap damping is disabled on the routing device.

**Required Privilege** routing—To view this statement in the configuration.  
**Level** routing-control—To add this statement to the configuration.

**Release Information** Statement introduced before Junos OS Release 7.4.  
 Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Advertise label 0 to the egress routing device of an LSP.

|                              |                                                                                                                       |
|------------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>Default</b>               | If you do not include the <b>explicit-null</b> statement in the configuration, label 3 (implicit null) is advertised. |
| <b>Required Privilege</b>    | routing—To view this statement in the configuration.                                                                  |
| <b>Level</b>                 | routing-control—To add this statement to the configuration.                                                           |

| <b>Description</b>              | <p>Apply one or more policies to routes being exported from the routing table into BGP.</p> <p>If you specify more than one policy, they are evaluated in the order specified, from left to right, and the first matching filter is applied to the route. If no routes match the filters, the routing table exports into BGP only the routes that it learned from BGP. If an action specified in one of the policies manipulates a route characteristic, the policy framework software carries the new route characteristic forward during the evaluation of the remaining policies. For example, if the action specified in the first policy of a chain sets a route's metric to 500, this route matches the criterion of <b>metric 500</b> defined in the next policy.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Description</b>         | <p>Enable multiprotocol BGP (MP-BGP) by configuring BGP to carry network layer reachability information (NLRI) for address families other than unicast IPv4, to specify MP-BGP to carry NLRI for the IPv6 address family, or to carry NLRI for VPNs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

- Options**
- any**—Configure the family type to be both unicast and multicast.
  - evpn**—Configure NLRI parameters for Ethernet VPNs (EVPNs).
  - inet**—Configure NLRI parameters for IPv4.
  - inet6**—Configure NLRI parameters for IPv6.
  - inet-mdt**—Configure NLRI parameters for the multicast distribution tree (MDT) subaddress family identifier (SAFI) for IPv4 traffic in Layer 3 VPNs.
  - inet-mvpn**—Configure NLRI parameters for IPv4 for multicast VPNs.
  - inet6-mvpn**—Configure NLRI parameters for IPv6 for multicast VPNs.
  - inet-vpn**—Configure NLRI parameters for IPv4 for Layer 3 VPNs.
  - inet6-vpn**—Configure NLRI parameters for IPv6 for Layer 3 VPNs.
  - iso-vpn**—Configure NLRI parameters for IS-IS for Layer 3 VPNs.
  - l2vpn**—Configure NLRI parameters for IPv4 for MPLS-based Layer 2 VPNs and VPLS.
  - labeled-unicast**—Configure the family type to be labeled-unicast. This means that the BGP peers are being used only to carry the unicast routes that are being used by labeled-unicast for resolving the labeled-unicast routes. This statement is supported only with **inet** and **inet6**.
  - multicast**—Configure the family type to be multicast. This means that the BGP peers are being used only to carry the unicast routes that are being used by multicast for resolving the multicast routes.
  - unicast**—Configure the family type to be unicast. This means that the BGP peers only carry the unicast routes that are being used for unicast forwarding purposes. The default family type is **unicast**.

The remaining statements are explained separately.

- Required Privilege Level**
- routing—To view this statement in the configuration.
  - routing-control—To add this statement to the configuration.

| <b>Release Information</b>      | <p>Statement introduced before Junos OS Release 7.4.<br/> Statement introduced in Junos OS Release 9.0 for EX Series switches.<br/> Statement introduced in Junos OS Release 12.1 for the QFX Series.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Description</b>              | <p>Configure graceful restart for BGP. Graceful restart allows a routing device undergoing a restart to inform its adjacent neighbors and peers of its condition. Graceful restart is disabled by default.</p> <p>To configure the duration of the BGP graceful restart period, include the <b>restart-time</b> statement at the [edit protocols bgp graceful-restart] hierarchy level. To set the length of time the router waits to receive messages from restarting neighbors before declaring them down, include the <b>stale-routes-time</b> statement at the [edit protocols bgp graceful-restart] hierarchy level.</p> <hr/> <div>  <p><b>NOTE:</b> If you configure graceful restart after a BGP session has been established, the BGP session restarts and the peers negotiate graceful restart capabilities.</p> </div> <hr/> <p>Configure graceful restart globally at the [edit routing-options] or [edit routing-instances <i>instance-name</i> routing-options] hierarchy level to enable the feature. You cannot enable graceful restart for specific protocols unless graceful restart is also enabled globally. You can, optionally, modify the global settings at the individual protocol level.</p> <p>The remaining statements are explained separately.</p> |

| <b>Description</b>              | <p>Define a BGP peer group. BGP peer groups share a common type, peer autonomous system (AS) number, and cluster ID, if present. To configure multiple BGP groups, include multiple <b>group</b> statements.</p> <p>By default, the group's options are identical to the global BGP options. To override the global options, include group-specific options within the <b>group</b> statement.</p> <p>The <b>group</b> statement is one of the statements you must include in the configuration to run BGP on the routing device.</p> <p>Each group must contain at least one peer.</p> |
| <b>Options</b>                  | <p><b>group-name</b>—Name of the BGP group.</p> <p>The remaining statements are explained separately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Description</b>         | <p>Specify the hold-time value to use when negotiating a connection with the peer. The hold-time value is advertised in open packets and indicates to the peer the length of time that it should consider the sender valid. If the peer does not receive a keepalive, update, or notification message within the specified hold time, the BGP connection to the peer is closed and routing devices through that peer become unavailable.</p> <p>The hold time is three times the interval at which keepalive messages are sent.</p> <p>BGP on the local routing device uses the smaller of either the local hold-time value or the peer's hold-time value received in the open message as the hold time for the BGP connection between the two peers.</p> <p>Starting in Junos OS Release 12.3, the BGP hold-time value can be zero (0). This implies that the speaker does not expect keepalive messages from its peer to maintain the BGP session. When negotiating between two peers, if one side requests a nonzero hold time and the other requests a zero hold time, the negotiation settles on the nonzero value and keepalive intervals are determined accordingly. Both sides must be set to zero for keepalive messages to stop being sent.</p> |
| <b>Options</b>             | <p><b>seconds</b>—Hold time.</p> <p><b>Range:</b> 10 through 65,535 seconds (or 0 for infinite hold time)</p> <p><b>Default:</b> 90 seconds</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**TIP:** When you set a hold-time value of 1 through 19 seconds, we recommend that you also configure the BGP `precision-timers` statement. The `precision-timers` statement ensures that if scheduler slip messages occur, the routing device continues to send keepalive messages. When the `precision-timers` statement is included, keepalive message generation is performed in a dedicated kernel thread, which helps to prevent BGP session flaps.

| <b>Description</b>              | Configure the routing device so that it does not automatically reestablish BGP peer sessions after a nonstop active routing (NSR) switchover. This feature is particularly useful if you are using dynamic routing policies because the dynamic database is not synchronized with the backup Routing Engine when NSR is enabled.                                                                                                                              |
| <b>Options</b>                  | <p><b>forever</b>—Do not reestablish a BGP peer session after an non-stop routing switchover until the <b>clear bgp neighbor</b> command is issued.</p> <p><b>seconds</b>—Do not reestablish a BGP peer session after an non-stop routing switchover until after the specified period.</p> <p><b>Range:</b> 1 through 4,294,967,295 (<math>2^{32} - 1</math>)</p>                                                                                             |

| <b>Description</b>         | <p>Apply one or more routing policies to routes being imported into the Junos OS routing table from BGP.</p> <p>If you specify more than one policy, they are evaluated in the order specified, from left to right, and the first matching filter is applied to the route. If no match is found, BGP places into the routing table only those routes that were learned from BGP routing devices. The policy framework software evaluates the routing policies in a chain sequentially. If an action specified in one of the policies manipulates a route characteristic, the policy framework software carries the new route characteristic forward during the evaluation of the remaining policies. For example, if the action specified in the first policy of a chain sets a route's metric to 500, this route matches the criterion of <b>metric 500</b> defined in the next policy.</p> <p>It is also important to understand that in Junos OS, although an import policy (inbound route filter) might reject a route, not use it for traffic forwarding, and not include it in an advertisement to other peers, the router retains these routes as hidden routes. These hidden routes are not available for policy or routing purposes. However, they do occupy memory space on the router. A service provider filtering routes to control the amount of information being kept in memory and processed by a router might want the router to entirely drop the routes being rejected by the import policy.</p> <p>Hidden routes can be viewed by using the <b>show route receive-protocol bgp <i>neighbor-address</i> hidden</b> command. The hidden routes can then be retained or dropped from the routing table by configuring the <b>keep all   none</b> statement at the <b>[edit protocols bgp]</b> or <b>[edit protocols bgp <i>group group-name</i>]</b> hierarchy level.</p> |

The rules of BGP route retention are as follows:

- By default, all routes learned from BGP are retained, except those where the AS path is looped. (The AS path includes the local AS.)
- By configuring the **keep all** statement, all routes learned from BGP are retained, even those with the local AS in the AS path.
- By configuring the **keep none** statement, all routes received are discarded. When this statement is configured and the inbound policy changes, Junos OS re-advertises all the routes advertised by the peer.

**Options**    *policy-names*—Name of one or more policies.

**Required Privilege**    routing—To view this statement in the configuration.  
**Level**    routing-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Control whether or not Junos OS keeps in memory and hides certain routes.</p> <p>If the <b>keep none</b> statement is used, Junos OS does not retain in memory and hide routes that are rejected because of a BGP import policy. Nor does BGP keep in memory and hide routes that are declared unfeasible due to BGP sanity checks. The <b>keep none</b> statement causes Junos OS to discard from memory the routes that are rejected due to BGP-specific logic or BGP evaluation. When a route is rejected because of some non-BGP-specific reason, the <b>keep none</b> statement has no effect on this route. This rejected route is retained in memory and hidden even though <b>keep none</b> is configured. An example of this type of hidden route is a route for which the protocol nexthop is unresolved.</p> <p>The routing table can retain the route information learned from BGP in one of the following ways:</p> <ul style="list-style-type: none"> <li>• Default (omit the <b>keep</b> statement)—Keep all route information that was learned from BGP, except for routes whose AS path is looped and whose loop includes the local AS.</li> <li>• <b>keep all</b>—Keep all route information that was learned from BGP.</li> <li>• <b>keep none</b>—Discard routes that were received from a peer and that were rejected by import policy or other sanity checking, such as AS path or next hop. When you configure <b>keep none</b> for the BGP session and the inbound policy changes, Junos OS forces readvertisement of the full set of routes advertised by the peer.</li> </ul> |

In an AS path healing situation, routes with looped paths theoretically could become usable during a soft reconfiguration when the AS path loop limit is changed. However, there is a significant memory usage difference between the default and **keep all**.

Consider the following scenarios:

- A peer readvertises routes back to the peer from which it learned them.

This can happen in the following cases:

- Another vendor's routing device advertises the routes back to the sending peer.
- The Junos OS peer's default behavior of not readvertising routes back to the sending peer is overridden by configuring **advertise-peer-as**.
- A provider edge (PE) routing device discards any VPN route that does not have any of the expected route targets.

When **keep all** is configured, the behavior of discarding routes received in the above scenarios is overridden.

**CAUTION:** If you add or remove **keep all** or **keep none** and the peer does not support session restart, the associated BGP sessions are restarted (flapped). To determine if a peer supports refresh, check for **Peer supports Refresh capability** in the output of the **show bgp neighbor** command.

|                                 |                                                                                                                                                                                                                                                                                                                                              |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Default</b>                  | By default, BGP retains incoming rejected routes in memory and hides them. If you do not include the <b>keep</b> statement, most routes are retained in the routing table. BGP keeps all route information that was learned from BGP, except for routes whose AS path is looped and whose loop includes the local AS.                        |
| <b>Options</b>                  | <b>all</b> —Retain all routes.<br><br><b>none</b> —Discard routes that were received from a peer and that were rejected by import policy or other sanity checking. When <b>keep none</b> is configured for the BGP session and the inbound policy changes, Junos OS forces readvertisement of the full set of routes advertised by the peer. |

| <b>Description</b>         | <p>Specify the address of the local end of a BGP session. This address is used to accept incoming connections to the peer and to establish connections to the remote peer. When none of the operational interfaces are configured with the specified local address, a session with a BGP peer is placed in the idle state.</p> <p>You generally configure a local address to explicitly configure the system's IP address from BGP's point of view. This IP address can be either an IPv6 or IPv4 address. Typically, an IP address is assigned to a loopback interface, and that IP address is configured here.</p> <p>For internal BGP (IBGP) peering sessions, generally the loopback interface (lo0) is used to establish connections between the IBGP peers. The loopback interface is always up as long as the device is operating. If there is a route to the loopback address, the IBGP peering session stays up. If a physical interface address is used instead and that interface goes up and down, the IBGP peering session also goes up and down. Thus, the loopback interface provides fault tolerance in case the physical interface or the link goes down, if the device has link redundancy.</p> <p>When a device peers with a remote device's loopback interface address, the local device expects BGP update messages to come from (be sourced by) the remote device's loopback interface address. The <b>local-address</b> statement enables you to specify the source information in BGP update messages. If you omit the <b>local-address</b> statement, the expected source of BGP update messages is based on the device's source address selection rules, which normally result in the egress interface address being the expected source of update messages. When this happens, the peering session is not established because a mismatch exists between the expected source address (the egress interface</p> |

of the peer) and the actual source (the loopback interface of the peer). To ensure that the expected source address matches the actual source address, specify the loopback interface address in the **local-address** statement.

**NOTE:** Although a BGP session can be established when only one of the paired routing devices has **local-address** configured, we strongly recommend that you configure **local-address** on both paired routing devices for IBGP and multihop EBGP sessions. The **local-address** statement ensures that deterministic fixed addresses are used for the BGP session end-points.

If you include the **default-address-selection** statement in the configuration, the software chooses the system default address as the source for most locally generated IP packets. For protocols in which the local address is unconstrained by the protocol specification, for example IBGP and multihop EBGP, if you do not configure a specific local address when configuring the protocol, the local address is chosen using the same methods as other locally generated IP packets.

**Default** If you do not configure a local address, BGP uses the routing device's source address selection rules to set the local address.

**Options** **address**—IPv6 or IPv4 address of the local end of the connection.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Specify the local autonomous system (AS) number. An AS is a set of routing devices that are under a single technical administration and generally use a single interior gateway protocol (IGP) and metrics to propagate routing information within the set of routing devices.</p> <p>Internet service providers (ISPs) sometimes acquire networks that belong to a different AS. When this occurs, there is no seamless method for moving the BGP peers of the acquired network to the AS of the acquiring ISP. The process of configuring the BGP peers with the new AS number can be time-consuming and cumbersome. In this case, it might not be desirable to modify peer arrangements or configuration. During this kind of transition period, it can be useful to configure BGP-enabled devices in the new AS to use the former AS number in BGP updates. This former AS number is called a <i>local</i> AS.</p>                                                                                                                                                                                                                                                                                                                                                      |

**NOTE:** If you are using BGP on the routing device, you must configure an AS number before you specify the local as number.

In Junos OS Release 9.1 and later, the AS numeric range in plain-number format is extended to provide BGP support for 4-byte AS numbers, as defined in RFC 4893, *BGP Support for Four-octet AS Number Space*.

In Junos OS Release 9.3 and later, you can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: *<16-bit high-order value in decimal>.<16-bit low-order value in decimal>*. For

example, the 4-byte AS number of 65546 in plain-number format is represented as 1.10 in the AS-dot notation format.

**Options** **alias**—(Optional) Configure the local AS as an alias of the global AS number configured for the router at the **[edit routing-options]** hierarchy level. As a result, a BGP peer considers any local AS to which it is assigned as equivalent to the primary AS number configured for the routing device. When you use the **alias** option, only the AS (global or local) used to establish the BGP session is prepended in the AS path sent to the BGP neighbor.

**autonomous-system**—AS number.

**Range:** 1 through 4,294,967,295 ( $2^{32} - 1$ ) in plain-number format

**Range:** 0.0 through 65535.65535 in AS-dot notation format

**loops number**—(Optional) Specify the number of times detection of the AS number in the AS\_PATH attribute causes the route to be discarded or hidden. For example, if you configure **loops 1**, the route is hidden if the AS number is detected in the path one or more times. This is the default behavior. If you configure **loops 2**, the route is hidden if the AS number is detected in the path two or more times.

**NOTE:** If you configure the local AS values for any BGP group, the detection of routing loops is performed using both the AS and the local AS values for all BGP groups.

If the local AS for the EBGp or IBGP peer is the same as the current AS, do not use the **local-as** statement to specify the local AS number.

When you configure the local AS within a VRF, this impacts the AS path loop-detection mechanism. All of the **local-as** statements configured on the device are part of a single AS domain. The AS path loop-detection mechanism is based on looking for a matching AS present in the domain.

**Range:** 1 through 10

**Default:** 1

**no-prepend-global-as**—(Optional) Specify to strip the global AS and to prepend only the local AS in AS paths sent to external peers.

**private**—(Optional) Configure to use the local AS only during the establishment of the BGP session with a BGP neighbor but to hide it in the AS path sent to external BGP peers. Only the global AS is included in the AS path sent to external peers.

**NOTE:** The **private** and **alias** options are mutually exclusive. You cannot configure both options with the same **local-as** statement.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## local-interface (IPv6)

**Syntax** `local-interface interface-name;`

**Hierarchy Level** [edit logical-systems *logical-system-name* protocols bgp [group group-name neighbor ipv6-link-local-address](#)],  
[edit logical-systems *logical-system-name* routing-instances *routing-instance-name* protocols bgp group *group-name* [neighbor ipv6-link-local-address](#)],  
[edit protocols bgp group *group-name* [neighbor ipv6-link-local-address](#)],  
[edit routing-instances *routing-instance-name* protocols bgp group *group-name* [neighbor ipv6-link-local-address](#)]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.

**Description** Specify the interface name of the EBGp peer that uses IPv6 link-local addresses. This peer is link-local in scope.

**Options** *interface-name*—Interface name of the EBGp IPv6 peer.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Modify the value of the <b>LOCAL_PREF</b> path attribute, which is a metric used by BGP sessions to indicate the degree of preference for an external route. The route with the highest local preference value is preferred.</p> <p>The <b>LOCAL_PREF</b> path attribute always is used in inbound routing policy and is advertised to internal BGP peers and to neighboring confederations. It is never advertised to external BGP peers.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Default</b>                  | If you omit this statement, the <b>LOCAL_PREF</b> path attribute, if present, is not modified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>                  | <p><b>local-preference</b>—Preference to assign to routes learned from BGP or from the group or peer.</p> <p><b>Range:</b> 0 through 4,294,967,295 (<math>2^{32} - 1</math>)</p> <p><b>Default:</b> If the <b>LOCAL_PREF</b> path attribute is present, do not modify its value. If a BGP route is received without a <b>LOCAL_PREF</b> attribute, the route is handled locally (it is stored in the routing table and advertised by BGP) as if it were received with a <b>LOCAL_PREF</b> value of 100. By default, non-BGP routes that are advertised by BGP are advertised with a <b>LOCAL_PREF</b> value of 100.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b>         | <p>Specify the metric for all routes sent using the multiple exit discriminator (MED, or <b>MULTI_EXIT_DISC</b>) path attribute in update messages. This path attribute is used to discriminate among multiple exit points to a neighboring AS. If all other factors are equal, the exit point with the lowest metric is preferred.</p> <p>You can specify a constant metric value by including the <b>metric</b> option. For configurations in which a BGP peer sends third-party next hops that require the local system to perform next-hop resolution—IBGP configurations, configurations within confederation peers, or EBGP configurations that include the <b>multihop</b> command—you can specify a variable metric by including the <b>minimum-igp</b> or <b>igp</b> option.</p> <p>You can increase or decrease the variable metric calculated from the IGP metric (either from the <b>igp</b> or <b>minimum-igp</b> statement) by specifying a value for <b>offset</b>. The metric is increased by specifying a positive value for <b>offset</b>, and decreased by specifying a negative value for <b>offset</b>.</p> <p>In Junos OS Release 9.0 and later, you can specify that a BGP group or peer not advertise updates for the MED path attributes used to calculate IGP costs for BGP next hops unless the MED is lower. You can also configure an interval to delay when MED updates are sent by including the <b>med-igp-update-interval minutes</b> statement at the <b>[edit routing-options]</b> hierarchy level.</p> |
| <b>Options</b>             | <p><b>delay-med-update</b>—Specify that a BGP group or peer configured with the <b>metric-out igp</b> statement not advertise MED updates unless the current MED value is lower than</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

the previously advertised MED value, or another attribute associated with the route has changed, or the BGP peer is responding to a refresh route request.

**NOTE:** You cannot configure the `delay-med-update` statement at the global BGP level.

**igp**—Set the metric to the most recent metric value calculated in the IGP to get to the BGP next hop. Routes learned from an EBGP peer usually have a next hop on a directly connected interface and thus the IGP value is equal to zero. This is the value advertised.

**metric**—Primary metric on all routes sent to peers.

**Range:** 0 through 4,294,967,295 ( $2^{32} - 1$ )

**Default:** No metric is sent.

**minimum-igp**—Set the metric to the minimum metric value calculated in the IGP to get to the BGP next hop. If a newly calculated metric is greater than the minimum metric value, the metric value remains unchanged. If a newly calculated metric is lower, the metric value is lowered to that value. When you change a neighbor's export policy from any configuration to a configuration that sets the minimum IGP offset on an exported route, the advertised MED is not updated if the value would increase as a result, even if the previous configuration does not use a minimum IGP-based MED value. This behavior helps to prevent unnecessary route flapping when an IGP cost changes, by not forcing a route update if the metric value increases past the previous lowest known value.

**offset**—Increases or decreases the metric by this value.

**Range:**  $-2^{31}$  through  $2^{31} - 1$

**Default:** None

| <b>Description</b>              | <p>Configure TCP path maximum transmission unit (MTU) discovery.</p> <p>TCP path MTU discovery enables BGP to automatically discover the best TCP path MTU for each BGP session. In Junos OS, TCP path MTU discovery is disabled by default for all BGP neighbor sessions.</p> <p>When MTU discovery is disabled, TCP sessions that are not directly connected transmit packets of 512-byte maximum segment size (MSS). These small packets minimize the chances of packet fragmentation at a device along the path to the destination. However, because most links use an MTU of at least 1500 bytes, 512-byte packets do not result in the most efficient use of link bandwidth. For directly connected EBGP sessions, MTU mismatches prevent the BGP session from being established. As a workaround, enable path MTU discovery within the EBGP group.</p> <p>Path MTU discovery dynamically determines the MTU size on the network path between the source and the destination, with the goal of avoiding IP fragmentation. Path MTU discovery works by setting the Don't Fragment (DF) bit in the IP headers of outgoing packets. When a device along the path has an MTU that is smaller than the packet, the device drops the packet. The device also sends back an ICMP Fragmentation Needed (Type 3, Code 4) message that contains the device's MTU, thus allowing the source to reduce its path MTU appropriately. The process repeats until the MTU is small enough to traverse the entire path without fragmentation.</p> |

**Release Information**    Statement introduced before Junos OS Release 7.4.  
                              Statement introduced in Junos OS Release 9.0 for EX Series switches.  
                              Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description**    Configure an EBGp multihop session.

For Layer 3 VPNs, you configure the EBGp multihop session between the PE and CE routing devices. This allows you to configure one or more routing devices between the PE and CE routing devices.

An external confederation peer is a special case that allows unconnected third-party next hops. You do not need to configure multihop sessions explicitly in this particular case because multihop behavior is implied.

If you have external BGP confederation peer-to-loopback addresses, you still need the multihop configuration.

**NOTE:** You cannot configure the `accept-remote-nexthop` statement at the same time.

---

**Default**    If you omit this statement, all EBGp peers are assumed to be directly connected (that is, you are establishing a nonmultihop, or “regular,” BGP session), and the default time-to-live (TTL) value is 1.

The remaining statements are explained separately.

| <b>Description</b>              | <p>Allow load sharing among multiple EBGP paths and multiple IBGP paths. A path is considered a BGP equal-cost path (and will be used for forwarding) if a tie-break is performed. The tie-break is performed after the BGP route path selection step that chooses the next-hop path that is resolved through the IGP route with the lowest metric. All paths with the same neighboring AS, learned by a multipath-enabled BGP neighbor, are considered.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Description              | <p>Explicitly configure a neighbor (peer). To configure multiple BGP peers, include multiple <b>neighbor</b> statements.</p> <p>By default, the peer's options are identical to those of the group. You can override these options by including peer-specific option statements within the <b>neighbor</b> statement.</p> <p>The <b>neighbor</b> statement is one of the statements you can include in the configuration to define a minimal BGP configuration on the routing device. (You can include an <b>allow all</b> statement in place of a <b>neighbor</b> statement.)</p> |
| Options                  | <p><b>address</b>—IPv6 or IPv4 address of a single peer.</p> <p>The remaining statements are explained separately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Required Privilege Level | <p>routing—To view this statement in the configuration.</p> <p>routing-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Description</b>              | <p>Prevent different routing devices within an AS from creating aggregate routes that contain different AS paths.</p> <p>Junos OS performs route aggregation, which is the process of combining the characteristics of different routes so that only a single route is advertised. Aggregation reduces the amount of information that BGP must store and exchange with other BGP systems. When aggregation occurs, the local routing device adds the local AS number and the router ID to the aggregator path attribute. The <b>no-aggregator-id</b> statement causes Junos OS to place a 0 in the router ID field and thus eliminate the possibility of having multiple aggregate advertisements in the network, each with different path information.</p>                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Default</b>                  | If you omit this statement, the router ID is included in the BGP aggregator path attribute.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>Description</b>              | Disable intracluster route redistribution by the system acting as the route reflector. Include this statement when the client cluster is fully meshed to prevent the sending of redundant route advertisements. Route reflection provides a way to decrease BGP control traffic and minimizing the number of update messages sent within the AS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Description</b>         | <p>When BGP is carrying flow-specification network layer reachability information (NLRI) messages, the <b>no-validate</b> statement omits the flow route validation procedure after packets are accepted by a policy.</p> <p>The receiving BGP-enabled device accepts a flow route if it passes the following criteria:</p> <ul style="list-style-type: none"><li>• The originator of a flow route matches the originator of the best match unicast route for the destination address that is embedded in the route.</li><li>• There are no more specific unicast routes, when compared to the destination address of the flow route, for which the active route has been received from a different next-hop autonomous system.</li></ul> <p>The first criterion ensures that the filter is being advertised by the next-hop used by unicast forwarding for the destination address embedded in the flow route. For example, if a flow route is given as 10.1.1.1, proto=6, port=80, the receiving BGP-enabled device selects the more specific unicast route in the unicast routing table that matches the destination prefix 10.1.1.1/32. On a unicast routing table containing 10.1/16 and 10.1.1/24, the latter is chosen as the unicast route to compare against. Only the active unicast route entry is considered. This follows the concept that a flow route is valid if advertised by the originator of the best unicast route.</p> <p>The second criterion addresses situations in which a given address block is allocated to different entities. Flows that resolve to a best-match unicast route that is an aggregate route are only accepted if they do not cover more specific routes that are being routed to different next-hop autonomous systems.</p> <p>You can bypass the validation process and use your own specific import policy. To disable the validation procedure and use an import policy instead, include the <b>no-validate</b> statement in the configuration.</p> <p>Flow routes configured for VPNs with family <b>inet-vpn</b> are not automatically validated, so the <b>no-validate</b> statement is not supported at the <code>[edit protocols bgp group <i>group-name</i> <b>family</b> <i>inet-vpn</i>]</code> hierarchy level. No validation is needed if the flow routes are configured locally between devices in a single AS.</p> |

**Options**    *policy-name*—Import policy to match NLRI messages.

**Required Privilege**    routing—To view this statement in the configuration.  
**Level**    routing-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Control how often BGP and the routing table exchange route information by specifying how long a route must be present in the Junos OS routing table before it is exported to BGP. Use this time delay to help bundle routing updates and to avoid sending updates too often.</p> <p>Alternatively or in addition, external BGP (EBGP) sessions can also use the route-flap damping mechanism upon the reception of BGP messages coming from an external neighbor.</p> <p>BGP stores the route information it receives from update messages in the routing table, and the routing table exports active routes from the routing table into BGP. BGP then advertises the exported routes to its peers. The <b>out-delay</b> statement enables a form of rate limiting. The delay is added to each update for each prefix individually. When a routing device changes its best path to a destination prefix, the device does not inform its peer about the change unless the route has been present in its routing table for the specified <b>out-delay</b>. If you use <b>out-delay</b> to perform rate-limiting, you can expect a less bursty pattern of updates. You will see a pattern in which updates arrive in a steady flow, and two updates for the same prefix are always spaced by at least the <b>out-delay</b> timer value (for example, 30 seconds). Thus, the <b>out-delay</b> setting is useful for limiting oscillation (sometimes called <i>churn</i>) in a network. Keep in mind that, regardless of the <b>out-delay</b> setting, BGP peers exchange routes immediately after neighbor establishment. The <b>out-delay</b> setting is only designed to delay the exchange of routes between BGP and the local routing table.</p> |

Caution is warranted because an **out-delay** can delay convergence. If your network is configured in a way that avoids oscillation, setting an **out-delay** is not necessary.

When configured, the **out-delay** value displays as **Outbound Timer** when using **show bgp group** or **show bgp group neighbor** commands.

**Default** By default, the exchange of route information between BGP and the routing table occurs immediately after the routes are received. This immediate exchange of route information might cause instabilities in the network reachability information. If you omit this statement, routes are exported to BGP immediately after they have been added to the routing table.

**Options** *seconds*—Output delay time.  
**Range:** 0 through 65,535 seconds  
**Default:** 0 seconds

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>              | Configure the routing device so that active open messages are not sent to the peer. Once you configure the routing device to be passive, the routing device will wait for the peer to issue an open request before a message is sent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Default</b>                  | If you omit this statement, all explicitly configured peers are active, and each peer periodically sends open requests until its peer responds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>         | <p>Specify the neighbor (peer) autonomous system (AS) number.</p> <p>For EBGP, the peer is in another AS, so the AS number you specify in the <b>peer-as</b> statement must be different from the local router's AS number, which you specify in the <b>autonomous-system</b> statement. For IBGP, the peer is in the same AS, so the two AS numbers that you specify in the <b>autonomous-system</b> and <b>peer-as</b> statements must be the same.</p> <p>The AS numeric range in plain-number format has been extended in Junos OS Release 9.1 to provide BGP support for 4-byte AS numbers, as defined in RFC 4893, <i>BGP Support for Four-octet AS Number Space</i>. RFC 4893 introduces two new optional transitive BGP attributes, AS4_PATH and AS4_AGGREGATOR. These new attributes are used to propagate 4-byte AS path information across BGP speakers that do not support 4-byte AS numbers. RFC 4893 also introduces a reserved, well-known, 2-byte AS number, AS 23456. This reserved AS number is called AS_TRANS in RFC 4893. All releases of the Junos OS support 2-byte AS numbers.</p> <p>In Junos OS Release 9.2 and later, you can also configure a 4-byte AS number using the AS-dot notation format of two integer values joined by a period: <i>&lt;16-bit high-order value in decimal&gt;.&lt;16-bit low-order value in decimal&gt;</i>. For example, the 4-byte AS number of 65,546 in plain-number format is represented as 1.10 in the AS-dot notation format.</p> <p>With the introduction of 4-byte AS numbers, you might have a combination of routers that support 4-byte AS numbers and 2-byte AS numbers. For more information about what happens when establishing BGP peer relationships between 4-byte and 2-byte capable routers, see the following topics:</p> |

- *Using 4-Byte Autonomous System Numbers in BGP Networks Technology Overview.*

**Options** *autonomous-system*—AS number.

**Range:** 1 through 4,294,967,295 ( $2^{32} - 1$ ) in plain-number format for 4-byte AS numbers

**Range:** 1 through 65,535 in plain-number format for 2-byte AS numbers (this is a subset of the 4-byte range)

**Range:** 0.0 through 65535.65535 in AS-dot notation format for 4-byte AS numbers

**Required Privilege** routing—To view this statement in the configuration.

**Level** routing-control—To add this statement to the configuration.

| <b>Description</b>         | <p>Limit the number of prefixes received on a BGP peer session and a rate-limit logging when injected prefixes exceed a set limit.</p> <p>This functionality is identical to the <b>accepted-prefix-limit</b> functionality except that it operates against received prefixes rather than accepted prefixes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Options</b>             | <p><b>maximum <i>number</i></b>—When you set the maximum number of prefixes, a message is logged when that number is exceeded.</p> <p><b>Range:</b> 1 through 4,294,967,295 (<math>2^{32} - 1</math>)</p> <p><b>teardown &lt;<i>percentage</i>&gt;</b>—If you include the <b>teardown</b> statement, the session is torn down when the maximum number of prefixes is reached. If you specify a percentage, messages are logged when the number of prefixes exceeds that percentage. After the session is torn down, it is reestablished in a short time unless you include the <b>idle-timeout</b> statement. Then the session can be kept down for a specified amount</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

of time, or forever. If you specify **forever**, the session is reestablished only after you issue a **clear bgp neighbor** command.

**Range:** 1 through 100

**idle-timeout (*forever* | *timeout-in-minutes*)**—(Optional) If you include the **idle-timeout** statement, the session is torn down for a specified amount of time, or forever. If you specify a period of time, the session is allowed to reestablish after this timeout period. If you specify **forever**, the session is reestablished only after you intervene with a **clear bgp neighbor** command.

**Range:** 1 through 2400

| <b>Description</b>                                                                                                                                                                                                                                                                                                                                                                                     | <p>When advertising AS paths to remote systems, have the local system strip private AS numbers from the AS path. The numbers are stripped from the AS path starting at the left end of the AS path (the end where AS paths have been most recently added). The routing device stops searching for private ASs when it finds the first nonprivate AS or a peer's private AS. If the AS path contains the AS number of the external BGP (EBGP) neighbor, BGP does not remove the private AS number.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <div>  <p><b>NOTE:</b> As of Junos OS 10.0R2 and higher, if there is a need to send prefixes to an EBGP peer that has an AS number that matches an AS number in the AS path, consider using the <code>as-override</code> statement instead of the <code>remove-private</code> statement.</p> </div>                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <p>The operation takes place after any confederation member ASs have already been removed from the AS path, if applicable.</p> <p>The Junos OS recognizes the set of AS numbers that is considered private, a range that is defined in the Internet Assigned Numbers Authority (IANA) assigned numbers document.</p> <p>The set of reserved AS numbers is in the range from 64,512 through 65,535.</p> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Do not stop the process of removing private AS numbers, even if a public AS number is encountered.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**nearest**—When you use the **all** and **replace** options, choose the last (right-most) public AS number encountered in the original AS path for the replacement value, as the AS path is processed from left to right. If no public AS number is encountered, the default replacement value is used. (See the **replace** option for information about the default replacement value.)

**replace**—When you use the **all** option, instead of removing private AS numbers, perform a replace operation. The default replacement value for the private AS number is the local AS number at the BGP group level for the BGP peer. If you are unsure about the replacement value, check the local AS value displayed in the output of the **show bgp group group-name** command.

| <b>Description</b>              | Configure the maximum segment size (MSS) for the TCP connection for BGP neighbors.<br><br>The MSS is only valid in increments of 2 KB. The value used is based on the value set, but is rounded down to the nearest multiple of 2048.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

The default group-level trace options are inherited from the BGP protocol-level <b>traceoptions</b> statement. The default peer-level trace options are inherited from the group-level <b>traceoptions</b> statement.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>                                                                                                                                                                       | <p><b>disable</b>—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>name</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <b>/var/log</b>. We recommend that you place BGP tracing output in the file <b>bgp-log</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**files *number***—(Optional) Maximum number of trace files. When a trace file named ***trace-file.0*** reaches its maximum size, it is renamed ***trace-file.0***, then ***trace-file.1***, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum number of files, you must also specify a maximum file size with the **size** option.

**Range:** 2 through 1000 files

**Default:** 10 files

**flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements.

#### BGP Tracing Flags

- **4byte-as**—4-byte AS events.
- **bfd**—BFD protocol events.
- **damping**—Damping operations.
- **graceful-restart**—Graceful restart events.
- **keepalive**—BGP keepalive messages. If you enable the the BGP **update** flag only, received keepalive messages do not generate a trace message.
- **nsr-synchronization**—Nonstop routing synchronization events.
- **open**—Open packets. These packets are sent between peers when they are establishing a connection.
- **packets**—All BGP protocol packets.
- **refresh**—BGP refresh packets.
- **update**—Update packets. These packets provide routing updates to BGP systems. If you enable only this flag, received keepalive messages do not generate a trace message. Use the **keepalive** flag to generate a trace message for keepalive messages.

#### Global Tracing Flags

- **all**—All tracing operations
- **general**—A combination of the **normal** and **route** trace operations
- **normal**—All normal operations

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **policy**—Policy operations and actions
- **route**—Routing table changes
- **state**—State transitions
- **task**—Routing protocol task processing
- **timer**—Routing protocol timer processing

**flag-modifier**—(Optional) Modifier for the tracing flag. You can specify one or more of these modifiers:

- **detail**—Provide detailed trace information.
- **filter**—Provide filter trace information. Applies only to **route**, **damping**, and **update** tracing flags.
- **receive**—Trace the packets being received.
- **send**—Trace the packets being transmitted.

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then, the oldest trace file is overwritten. If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 128 KB

**world-readable**—(Optional) Allow any user to read the log file.

## Routine Monitoring

- [Monitoring BGP Routing Information on page 3035](#)

### Monitoring BGP Routing Information

Purpose

**NOTE:** This topic applies only to the J-Web Application package.

Use the monitoring functionality to monitor BGP routing information on the routing device.

Action

To view BGP routing information in the J-Web interface, select **Monitor > Routing > BGP Information**.

To view BGP routing information in the CLI, enter the following commands:

- `show bgp summary`
- `show bgp neighbor`

Meaning

[Table 318 on page 3035](#) summarizes key output fields in the BGP routing display in the J-Web interface.

Table 318: Summary of Key BGP Routing Output Fields

| Field            | Values                           | Additional Information |
|------------------|----------------------------------|------------------------|
| BGP Peer Summary |                                  |                        |
| Total Groups     | Number of BGP groups.            |                        |
| Total Peers      | Number of BGP peers.             |                        |
| Down Peers       | Number of unavailable BGP peers. |                        |

Table 318: Summary of Key BGP Routing Output Fields (*continued*)

| Field                  | Values                                                                                                                                                                 | Additional Information |
|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------|
| Unconfigured Peers     | Address of each BGP peer.                                                                                                                                              |                        |
| <b>RIB Summary tab</b> |                                                                                                                                                                        |                        |
| RIB Name               | Name of the RIB group.                                                                                                                                                 |                        |
| Total Prefixes         | Total number of prefixes from the peer, both active and inactive, that are in the routing table.                                                                       |                        |
| Active Prefixes        | Number of prefixes received from the EBGp peers that are active in the routing table.                                                                                  |                        |
| Suppressed Prefixes    | Number of routes received from EBGp peers currently inactive because of damping or other reasons.                                                                      |                        |
| History Prefixes       | History of the routes received or suppressed.                                                                                                                          |                        |
| Dumped Prefixes        | Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols. |                        |
| Pending Prefixes       | Number of pending routes.                                                                                                                                              |                        |
| State                  | Status of the graceful restart process for this routing table: BGP restart is complete, BGP restart in progress, VPN restart in progress, or VPN restart is complete.  |                        |
| <b>BGP Neighbors</b>   |                                                                                                                                                                        |                        |
| Details                | Click this button to view the selected BGP neighbor details.                                                                                                           |                        |
| Peer Address           | Address of the BGP neighbor.                                                                                                                                           |                        |
| Autonomous System      | AS number of the peer.                                                                                                                                                 |                        |

Table 318: Summary of Key BGP Routing Output Fields (*continued*)

| Field        | Values                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Additional Information                                                                                                                                                                                                                                                                                                 |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Peer State   | <p>Current state of the BGP session:</p> <ul style="list-style-type: none"> <li>• <b>Active</b>—BGP is initiating a TCP connection in an attempt to connect to a peer. If the connection is successful, BGP sends an open message.</li> <li>• <b>Connect</b>—BGP is waiting for the TCP connection to become complete.</li> <li>• <b>Established</b>—The BGP session has been established, and the peers are exchanging BGP update messages.</li> <li>• <b>Idle</b>—This is the first stage of a connection. BGP is waiting for a Start event.</li> <li>• <b>OpenConfirm</b>—BGP has acknowledged receipt of an open message from the peer and is waiting to receive a keepalive or notification message.</li> <li>• <b>OpenSent</b>—BGP has sent an open message and is waiting to receive an open message from the peer.</li> </ul> | <p>Generally, the most common states are <b>Active</b>, which indicates a problem establishing the BGP connection, and <b>Established</b>, which indicates a successful session setup. The other states are transition states, and BGP sessions normally do not stay in those states for extended periods of time.</p> |
| Elapsed Time | Elapsed time since the peering session was last reset.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |                                                                                                                                                                                                                                                                                                                        |
| Description  | Description of the BGP session.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                                                                                                                                                                                                        |

| <b>Description</b>                              | <p>Perform one of the following tasks:</p> <ul style="list-style-type: none"> <li>• Change the state of one or more BGP neighbors to <b>IDLE</b>. For neighbors in the <b>ESTABLISHED</b> state, this command drops the TCP connection to the neighbors and then reestablishes the connection.</li> <li>• (<b>soft</b> keyword only) Reapply export policies or import policies, respectively, to one or more BGP neighbors without changing their state.</li> <li>• (<b>soft-inbound</b> keyword only) Reapply export policies or import policies, respectively, and send refresh updates to one or more BGP neighbors without changing their state.</li> </ul>                                                                                                   |
| <b>Options</b>                                  | <p><b>none</b>—Change the state of all BGP neighbors to <b>IDLE</b>.</p> <p><b>as <i>as-number</i></b>—(Optional) Apply this command only to neighbors in the specified autonomous system (AS).</p> <p><b>instance <i>instance-name</i></b>—(Optional) Apply this command only to neighbors for the specified routing instance.</p> <p><b>logical-system (all   <i>logical-system-name</i>)</b>—(Optional) Perform this operation on all logical systems or on a particular logical system.</p> <p><b>malformed-route</b>—(Optional) Remove malformed routes. If a specific neighbor is provided, Junos OS removes malformed routes for that particular neighbor. Otherwise, Junos OS removes malformed routes for all BGP neighbors. To find routes that have</p> |

malformed attributes, run the **show route hidden** command, and look for routes marked with **MalformedAttr** in the AS path field.

**neighbor**—(Optional) IP address of a BGP peer. Apply this command only to the specified neighbor.

**soft**—(Optional) Reapply any export policies and send refresh updates to neighbors without clearing the state.

**soft-inbound**—(Optional) Reapply any import policies and send refresh updates to neighbors without clearing the state.

**soft-minimum-igp**—(Optional) Provides soft refresh of the outbound state when the interior gateway protocol (IGP) metric is reset.

**Required Privilege  
Level**

clear

| <b>Release Information</b>                      | Command introduced in Junos OS Release 9.0.<br>Command introduced in Junos OS Release 9.0 for EX Series switches.<br>Command introduced in Junos OS Release 11.3 for the QFX Series.                                                                                                                                                                                                                     |
| <b>Description</b>                              | Request that BGP refresh routes in a specified routing table.                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>                                  | <b><code>logical-system (all   <i>logical-system-name</i>)</code></b> —(Optional) Perform this operation on all logical systems or on a particular logical system.<br><br><b><code>table-name</code></b> —Request that BGP refresh routes in the specified table.                                                                                                                                        |
| <b>Additional Information</b>                   | In some cases, a prefix limit is associated with a routing table for a VPN instance. When this limit is exceeded (for example, because of a network misconfiguration), some routes might not be inserted in the table. Such routes need to be added to the table after the network issue is resolved. Use the <b>clear bgp table</b> command to request that BGP refresh routes in a VPN instance table. |
| <b>Required Privilege Level</b>                 | clear                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Output Fields</b>            | <a href="#">Table 319 on page 3043</a> lists the output fields for the <b>show bgp bmp</b> command. Output fields are listed in the approximate order in which they appear.                 |

**Table 319: show bgp bmp Output Fields**

| Field Name                          | Field Description                                                                                                                                              |
|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>BMP station address/port</b>     | IP address and port number of the monitoring station to which BGP Monitoring Protocol (BMP) statistics are sent.                                               |
| <b>BMP session state</b>            | Status of the BMP session: <b>UP</b> or <b>DOWN</b> .                                                                                                          |
| <b>Memory consumed by BMP</b>       | Memory used by the active BMP session.                                                                                                                         |
| <b>Statistics timeout</b>           | Amount of time, in seconds, between transmissions of BMP data to the monitoring station.                                                                       |
| <b>Memory limit</b>                 | Threshold, in bytes, at which the routing device stops collecting BMP data.                                                                                    |
| <b>Memory-connect retry timeout</b> | Amount of time, in seconds, after which the routing device attempts to resume a BMP session that was ended after the configured memory threshold was exceeded. |

## Sample Output

### show bgp bmp

```

user@host> show bgp bmp
  BMP station address/port: 172.24.24.157+5454
  BMP session state: DOWN
  Memory consumed by BMP: 0
  Statistics timeout: 15
  Memory limit: 10485760
  Memory connect retry timeout: 600

```

## show bgp group

|                                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

[show bgp group summary on page 3051](#)

**Output Fields** [Table 320 on page 3046](#) describes the output fields for the **show bgp group** command. Output fields are listed in the approximate order in which they appear.

**Table 320: show bgp group Output Fields**

| Field Name                                | Field Description                                                                                                                                                                                                                                      | Level of Output             |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------|
| <b>Group Type or Group</b>                | Type of BGP group: <b>Internal</b> or <b>External</b> .                                                                                                                                                                                                | All levels                  |
| <b>group-index</b>                        | Index number for the BGP peer group. The index number differentiates between groups when a single BGP group is split because of different configuration options at the group and peer levels.                                                          | <b>rtf detail</b>           |
| <b>AS</b>                                 | AS number of the peer. For internal BGP (IBGP), this number is the same as <b>Local AS</b> .                                                                                                                                                           | <b>brief detail</b><br>none |
| <b>Local AS</b>                           | AS number of the local routing device.                                                                                                                                                                                                                 | <b>brief detail</b><br>none |
| <b>Name</b>                               | Name of a specific BGP group.                                                                                                                                                                                                                          | <b>brief detail</b><br>none |
| <b>Index</b>                              | Unique index number of a BGP group.                                                                                                                                                                                                                    | <b>brief detail</b><br>none |
| <b>Flags</b>                              | Flags associated with the BGP group. This field is used by Juniper Networks customer support.                                                                                                                                                          | <b>brief detail</b><br>none |
| <b>Remove-private options</b>             | Options associated with the <a href="#">remove-private</a> statement.                                                                                                                                                                                  | <b>brief detail</b><br>none |
| <b>Holdtime</b>                           | Maximum number of seconds allowed to elapse between successive keepalive or update messages that BGP receives from a peer in the BGP group, after which the connection to the peer is closed and routing devices through that peer become unavailable. | <b>brief detail</b><br>none |
| <b>Export</b>                             | Export policies configured for the BGP group with the <b>export</b> statement.                                                                                                                                                                         | <b>brief detail</b><br>none |
| <b>MED tracks IGP metric update delay</b> | Time, in seconds, that updates to multiple exit discriminator (MED) are delayed. Also displays the time remaining before the interval is set to expire                                                                                                 | All levels                  |
| <b>Traffic Statistics Interval</b>        | Time between sample periods for labeled-unicast traffic statistics, in seconds.                                                                                                                                                                        | <b>brief detail</b><br>none |
| <b>Total peers</b>                        | Total number of peers in the group.                                                                                                                                                                                                                    | <b>brief detail</b><br>none |

Table 320: show bgp group Output Fields (*continued*)

| Field Name                             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Level of Output |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Established</b>                     | Number of peers in the group that are in the established state.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | All levels      |
| <b>Active/Received/Accepted/Damped</b> | <p>Multipurpose field that displays information about BGP peer sessions. The field's contents depend upon whether a session is established and whether it was established in the main routing device or in a routing instance.</p> <ul style="list-style-type: none"> <li>If a peer is not established, the field shows the state of the peer session: <b>Active</b>, <b>Connect</b>, or <b>Idle</b>.</li> <li>If a BGP session is established in the main routing device, the field shows the number of active, received, accepted, and damped routes that are received from a neighbor and appear in the <b>inet.0</b> (main) and <b>inet.2</b> (multicast) routing tables. For example, <b>8/10/10/2</b> and <b>2/4/4/0</b> indicate the following: <ul style="list-style-type: none"> <li>8 active routes, 10 received routes, 10 accepted routes, and 2 damped routes from a BGP peer appear in the <b>inet.0</b> routing table.</li> <li>2 active routes, 4 received routes, 4 accepted routes, and no damped routes from a BGP peer appear in the <b>inet.2</b> routing table.</li> </ul> </li> </ul> | <b>summary</b>  |
| <b>ip-addresses</b>                    | List of peers who are members of the group. The address is followed by the peer's port number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | All levels      |
| <b>Route Queue Timer</b>               | Number of seconds until queued routes are sent. If this time has already elapsed, this field displays the number of seconds by which the updates are delayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail</b>   |
| <b>Route Queue</b>                     | Number of prefixes that are queued up for sending to the peers in the group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <b>detail</b>   |
| <b>inet.number</b>                     | <p>Number of active, received, accepted, and damped routes in the routing table. For example, <b>inet.0: 7/10/9/0</b> indicates the following:</p> <ul style="list-style-type: none"> <li>7 active routes, 10 received routes, 9 accepted routes, and no damped routes from a BGP peer appear in the <b>inet.0</b> routing table.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | none            |

| <b>Table</b>             | Name of a routing table.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>brief</b> , none |
| <b>Tot Paths</b>         | Total number of routes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>brief</b> , none |
| <b>Act Paths</b>         | Number of active routes.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>brief</b> , none |
| <b>Suppressed</b>        | Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>brief</b> , none |

Table 320: show bgp group Output Fields (*continued*)

| Field Name   | Field Description                                                                                                                                                                                           | Level of Output |
|--------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| History      | Number of withdrawn routes stored locally to keep track of damping history.                                                                                                                                 | brief, none     |
| Damp State   | Number of active routes with a figure of merit greater than zero, but lower than the threshold at which suppression occurs.                                                                                 | brief, none     |
| Pending      | Routes being processed by the BGP import policy.                                                                                                                                                            | brief, none     |
| Group        | Group the peer belongs to in the BGP configuration.                                                                                                                                                         | detail          |
| Receive mask | Mask of the received target included in the advertised route.                                                                                                                                               | detail          |
| Entries      | Number of route entries received.                                                                                                                                                                           | detail          |
| Target       | Route target that is to be passed by route-target filtering. If a route advertised from the provider edge (PE) routing device matches an entry in the route-target filter, the route is passed to the peer. | detail          |
| Mask         | Mask which specifies that the peer receive routes with the given route target.                                                                                                                              | detail          |

| Export                      | Name of the export policy that is configured on the peer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Import                      | Name of the import policy that is configured on the peer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Options                     | <p>Configured BGP options:</p> <ul style="list-style-type: none"> <li>• <b>AddressFamily</b>—Configured address family: <b>inet</b> or <b>inet-vpn</b>.</li> <li>• <b>AuthKeyChain</b>—Authentication key change is enabled.</li> <li>• <b>DropPathAttributes</b>—Certain path attributes are configured to be dropped from neighbor updates during inbound processing.</li> <li>• <b>GracefulRestart</b>—Graceful restart is configured.</li> <li>• <b>HoldTime</b>—Hold time configured with the <b>hold-time</b> statement. The hold time is three times the interval at which keepalive messages are sent.</li> <li>• <b>IgnorePathAttributes</b>—Certain path attributes are configured to be ignored in neighbor updates during inbound processing.</li> <li>• <b>Local Address</b>—Address configured with the <b>local-address</b> statement.</li> <li>• <b>Multihop</b>—Allow BGP connections to external peers that are not on a directly connected network.</li> <li>• <b>NLRI</b>—Configured MBGP state for the BGP group: <b>multicast</b>, <b>unicast</b>, or both if you have configured <b>nlri any</b>.</li> <li>• <b>Peer AS</b>—Configured peer autonomous system (AS).</li> <li>• <b>Preference</b>—Preference value configured with the <b>preference</b> statement.</li> <li>• <b>Refresh</b>—Configured to refresh automatically when the policy changes.</li> <li>• <b>Rib-group</b>—Configured routing table group.</li> </ul> |
| Path-attributes dropped     | Path attribute codes that are dropped from neighbor updates.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Path-attributes ignored     | Path attribute codes that are ignored during neighbor updates.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Authentication key change   | (appears only if the <b>authentication-keychain</b> statement has been configured) Name of the authentication keychain enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Authentication algorithm    | (appears only if the <b>authentication-algorithm</b> statement has been configured) Type of authentication algorithm enabled: <b>hmac</b> or <b>md5</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Address families configured | Names of configured address families for the VPN.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Table 321: show bgp neighbor Output Fields (*continued*)

| Field Name                             | Field Description                                                                                                                                                                                                                                                                                                                                                               |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Local Address                          | Address of the local routing device.                                                                                                                                                                                                                                                                                                                                            |
| Remove-private options                 | Options associated with the <code>remove-private</code> statement.                                                                                                                                                                                                                                                                                                              |
| Holdtime                               | Hold time configured with the <code>hold-time</code> statement. The hold time is three times the interval at which keepalive messages are sent.                                                                                                                                                                                                                                 |
| Flags for NLRI<br>inet-label-unicast   | Flags related to labeled-unicast: <ul style="list-style-type: none"> <li>• <b>TrafficStatistics</b>—Collection of statistics for labeled-unicast traffic is enabled.</li> </ul>                                                                                                                                                                                                 |
| Traffic statistics                     | Information about labeled-unicast traffic statistics: <ul style="list-style-type: none"> <li>• <b>Options</b>—Options configured for collecting statistics about labeled-unicast traffic.</li> <li>• <b>File</b>—Name and location of statistics log files.</li> <li>• <b>size</b>—Size of all the log files, in bytes.</li> <li>• <b>files</b>—Number of log files.</li> </ul> |
| Traffic Statistics<br>Interval         | Time between sample periods for labeled-unicast traffic statistics, in seconds.                                                                                                                                                                                                                                                                                                 |
| Preference                             | Preference value configured with the <code>preference</code> statement.                                                                                                                                                                                                                                                                                                         |
| Outbound Timer                         | Time for which the route is available in Junos OS routing table before it is exported to BGP. This field is displayed in the output only if the <code>out-delay</code> parameter is configured to a non-zero value.                                                                                                                                                             |
| Number of flaps                        | Number of times the BGP session has gone down and then come back up.                                                                                                                                                                                                                                                                                                            |
| Peer ID                                | Router identifier of the peer.                                                                                                                                                                                                                                                                                                                                                  |
| Group index                            | Index number for the BGP peer group. The index number differentiates between groups when a single BGP group is split because of different configuration options at the group and peer levels.                                                                                                                                                                                   |
| Peer index                             | Index that is unique within the BGP group to which the peer belongs.                                                                                                                                                                                                                                                                                                            |
| Local ID                               | Router identifier of the local routing device.                                                                                                                                                                                                                                                                                                                                  |
| Local Interface                        | Name of the interface on the local routing device.                                                                                                                                                                                                                                                                                                                              |
| Active holdtime                        | Hold time that the local routing device negotiated with the peer.                                                                                                                                                                                                                                                                                                               |
| Keepalive Interval                     | Keepalive interval, in seconds.                                                                                                                                                                                                                                                                                                                                                 |
| BFD                                    | Status of BFD failure detection.                                                                                                                                                                                                                                                                                                                                                |
| Local Address                          | Name of directly connected interface over which direct EBGP peering is established.                                                                                                                                                                                                                                                                                             |
| NLRI for restart<br>configured on peer | Names of address families configured for restart.                                                                                                                                                                                                                                                                                                                               |

Table 321: show bgp neighbor Output Fields (*continued*)

| Field Name                                      | Field Description                                                                                                                                                                                                                         |
|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NLRI advertised by peer                         | Address families supported by the peer: <b>unicast</b> or <b>multicast</b> .                                                                                                                                                              |
| NLRI for this session                           | Address families being used for this session.                                                                                                                                                                                             |
| Peer supports Refresh capability                | Remote peer's ability to send and request full route table readvertisement (route refresh capability). For more information, see RFC 2918, <i>Route Refresh Capability for BGP-4</i> .                                                    |
| Restart time configured on peer                 | Configured time allowed for restart on the neighbor.                                                                                                                                                                                      |
| Stale routes from peer are kept for             | When graceful restart is negotiated, the maximum time allowed to hold routes from neighbors after the BGP session has gone down.                                                                                                          |
| Peer does not support Restarter functionality   | Graceful restart restarter-mode is disabled on the peer.                                                                                                                                                                                  |
| Peer does not support Receiver functionality    | Graceful restart helper-mode is disabled on the peer.                                                                                                                                                                                     |
| Restart time requested by this peer             | Restart time requested by this neighbor during capability negotiation.                                                                                                                                                                    |
| Restart flag received from the peer             | When this field appears, the BGP speaker has restarted (Restarting), and this peer should not wait for the <b>end-of-rib</b> marker from the speaker before advertising routing information to the speaker.                               |
| NLRI that peer supports restart for             | Neighbor supports graceful restart for this address family.                                                                                                                                                                               |
| NLRI peer can save forwarding state             | Neighbor supporting this address family saves all forwarding states.                                                                                                                                                                      |
| NLRI that peer saved forwarding for             | Neighbor saves all forwarding states for this address family.                                                                                                                                                                             |
| NLRI that restart is negotiated for             | Router supports graceful restart for this address family.                                                                                                                                                                                 |
| NLRI of received end-of-rib markers             | Address families for which end-of-routing-table markers are received from the neighbor.                                                                                                                                                   |
| NLRI of all end-of-rib markers sent             | Address families for which end-of-routing-table markers are sent to the neighbor.                                                                                                                                                         |
| Peer supports 4 byte AS extension (peer-as1)    | Peer understands 4-byte AS numbers in BGP messages. The peer is running Junos OS Release 9.1 or later.                                                                                                                                    |
| NLRIs for which peer can receive multiple paths | Appears in the command output of the local router if the downstream peer is configured to receive multiple BGP routes to a single destination, instead of only receiving the active route.<br><br>Possible value is <b>inet-unicast</b> . |

Table 321: show bgp neighbor Output Fields (*continued*)

| Field Name                                                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NLRIs for which peer can send multiple paths: inet-unicast | Appears in the command output of the local router if the upstream peer is configured to send multiple BGP routes to a single destination, instead of only sending the active route.<br><br>Possible value is <b>inet-unicast</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Table inet.number                                          | Information about the routing table: <ul style="list-style-type: none"> <li>• <b>RIB State</b>—BGP is in the graceful restart process for this routing table: <b>restart is complete</b> or <b>restart in progress</b>.</li> <li>• <b>Bit</b>—Number that represents the entry in the routing table for this peer.</li> <li>• <b>Send state</b>—State of the BGP group: <b>in sync</b>, <b>not in sync</b>, or <b>not advertising</b>.</li> <li>• <b>Active prefixes</b>—Number of prefixes received from the peer that are active in the routing table.</li> <li>• <b>Received prefixes</b>—Total number of prefixes from the peer, both active and inactive, that are in the routing table.</li> <li>• <b>Accepted prefixes</b>—Total number of prefixes from the peer that have been accepted by a routing policy.</li> <li>• <b>Suppressed due to damping</b>—Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols.</li> </ul> |
| Last traffic (seconds)                                     | Last time any traffic was received from the peer or sent to the peer, and the last time the local routing device checked.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Input messages                                             | Messages that BGP has received from the receive socket buffer, showing the total number of messages, number of update messages, number of times a policy is changed and refreshed, and the buffer size in octets. The buffer size is 16 KB.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Output messages                                            | Messages that BGP has written to the transmit socket buffer, showing the total number of messages, number of update messages, number of times a policy is changed and refreshed, and the buffer size in octets. The buffer size is 16 KB.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Output queue                                               | Number of BGP packets that are queued to be transmitted to a particular neighbor for a particular routing table. Output queue 0 is for unicast NLRIs, and queue 1 is for multicast NLRIs.<br><br>It also specifies the routing table name and the NLRI they represent in the format ( <b>routing table name, NLRI</b> ).<br><br><b>NOTE:</b> The output queues of routing tables that are not advertised, will only show up at <b>extensive</b> output level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Trace options                                              | Configured tracing of BGP protocol packets and operations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Table 321: show bgp neighbor Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                   |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Trace file              | Name of the file to receive the output of the tracing operation.                                                                                                                                                                                                                                                                                    |
| Filter Updates rcv      | (orf option only) Number of outbound-route filters received for each configured address family.<br><br><b>NOTE:</b> The counter is cumulative. For example, the counter is increased after the remote peer either resends or clears the outbound route filtering prefix list.                                                                       |
| Immediate               | (orf option only) Number of route updates received with the immediate flag set. The immediate flag indicates that the BGP peer should readvertise the updated routes.<br><br><b>NOTE:</b> The counter is cumulative. For example, the counter is increased after the remote peer either resends or clears the outbound route filtering prefix list. |
| Filter                  | (orf option only) Type of prefix filter received: <b>prefix-based</b> or <b>extended-community</b> .                                                                                                                                                                                                                                                |
| Received filter entries | (orf option only) List of received filters displayed.                                                                                                                                                                                                                                                                                               |
| seq                     | (orf option only) Numerical order assigned to this prefix entry among all the received outbound route filter prefix entries.                                                                                                                                                                                                                        |
| prefix                  | (orf option only) Address for the prefix entry that matches the filter.                                                                                                                                                                                                                                                                             |
| minlength               | (orf option only) Minimum prefix length, in bits, required to match this prefix.                                                                                                                                                                                                                                                                    |
| maxlength               | (orf option only) Maximum prefix length, in bits, required to match this prefix.                                                                                                                                                                                                                                                                    |
| match                   | (orf option only) For this prefix match, whether to <b>permit</b> or <b>deny</b> route updates.                                                                                                                                                                                                                                                     |

## Sample Output

### show bgp neighbor

```

| Output Fields                            | <a href="#">Table 322 on page 3067</a> describes the output fields for the <b>show bgp summary</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

Table 322: show bgp summary Output Fields

| Field Name          | Field Description                                                                                                                                                      |
|---------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Groups</b>       | Number of BGP groups.                                                                                                                                                  |
| <b>Peers</b>        | Number of BGP peers.                                                                                                                                                   |
| <b>Down peers</b>   | Number of down BGP peers.                                                                                                                                              |
| <b>Table</b>        | Name of routing table.                                                                                                                                                 |
| <b>Tot Paths</b>    | Total number of paths.                                                                                                                                                 |
| <b>Act Paths</b>    | Number of active routes.                                                                                                                                               |
| <b>Suppressed</b>   | Number of routes currently inactive because of damping or other reasons. These routes do not appear in the forwarding table and are not exported by routing protocols. |
| <b>History</b>      | Number of withdrawn routes stored locally to keep track of damping history.                                                                                            |
| <b>Damp State</b>   | Number of routes with a figure of merit greater than zero, but still active because the value has not reached the threshold at which suppression occurs.               |
| <b>Pending</b>      | Routes in process by BGP import policy.                                                                                                                                |
| <b>Peer</b>         | Address of each BGP peer. Each peer has one line of output.                                                                                                            |
| <b>AS</b>           | Peer's AS number.                                                                                                                                                      |
| <b>InPkt</b>        | Number of packets received from the peer.                                                                                                                              |
| <b>OutPkt</b>       | Number of packets sent to the peer.                                                                                                                                    |
| <b>OutQ</b>         | Number of BGP packets that are queued to be transmitted to a particular neighbor. It normally is 0 because the queue usually is emptied quickly.                       |
| <b>Flaps</b>        | Number of times the BGP session has gone down and then come back up.                                                                                                   |
| <b>Last Up/Down</b> | Last time since the neighbor transitioned to or from the established state.                                                                                            |

Table 322: show bgp summary Output Fields (*continued*)

| Field Name                                              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|---------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>State #Active<br/>/Received/Accepted<br/>/Damped</b> | <p>Multipurpose field that displays information about BGP peer sessions. The field's contents depend upon whether a session is established and whether it was established on the main routing device or in a routing instance.</p> <ul style="list-style-type: none"> <li>If a peer is not established, the field shows the state of the peer session: <b>Active</b>, <b>Connect</b>, or <b>Idle</b>. In general, the Idle state is the first stage of a connection. BGP is waiting for a Start event. A session can be idle for other reasons as well. The reason that a session is idle is sometimes displayed. For example: <b>Idle (Removal in progress)</b> or <b>Idle (LicenseFailure)</b>.</li> <li>If a BGP session is established on the main routing device, the field shows the number of active, received, accepted, and damped routes that are received from a neighbor and appear in the <b>inet.0</b> (main) and <b>inet.2</b> (multicast) routing tables. For example, <b>8/10/10/2</b> and <b>2/4/4/0</b> indicate the following: <ul style="list-style-type: none"> <li>8 active routes, 10 received routes, 10 accepted routes, and 2 damped routes from a BGP peer appear in the <b>inet.0</b> routing table.</li> <li>2 active routes, 4 received routes, 4 accepted routes, and no damped routes from a BGP peer appear in the <b>inet.2</b> routing table.</li> </ul> </li> <li>If a BGP session is established in a routing instance, the field indicates the established (<b>Establ</b>) state, identifies the specific routing table that receives BGP updates, and shows the number of active, received, and damped routes that are received from a neighbor. For example, <b>Establ VPN-AB.inet.0: 2/4/0</b> indicates the following: <ul style="list-style-type: none"> <li>The BGP session is established.</li> <li>Routes are received in the <b>VPN-AB.inet.0</b> routing table.</li> <li>The local routing device has two active routes, four received routes, and no damped routes from a BGP peer.</li> </ul> </li> </ul> <p>When a BGP session is established, the peers are exchanging update messages.</p> |

| <b>Options</b>                                  | <b>none</b> —Display information about BGP route flap damping parameters.<br><br><b>logical-system (all   <i>logical-system-name</i>)</b> —(Optional) Perform this operation on all logical systems or on a particular logical system.                                                                                                                                                                                                                               |
| <b>Additional Information</b>                   | In the output from this command, figure-of-merit values correlate with the probability of future instability of a routing device. Routes with higher figure-of-merit values are suppressed for longer periods of time. The figure-of-merit value decays exponentially over time. A figure-of-merit value of zero is assigned to each new route. The value is increased each time the route is withdrawn or readvertised, or when one of its path attributes changes. |
| <b>Required Privilege Level</b>                 | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                               |

Table 323: show policy damping Output Fields

| Field Name                   | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Halflife</b>              | Decay half-life, in minutes. The value represents the period during which the accumulated figure-of-merit value is reduced by half if the route remains stable. If a route has flapped, but then becomes stable, the figure-of-merit value for the route decays exponentially. For example, for a route with a figure-of-merit value of 1500, if no incidents occur, its figure-of-merit value is reduced to 750 after 15 minutes and to 375 after another 15 minutes. |
| <b>Reuse merit</b>           | Figure-of-merit value below which a suppressed route can be used again. A suppressed route becomes reusable when its figure-of-merit value decays to a value below a reuse threshold, and the route once again is considered usable and can be installed in the forwarding table and exported from the routing table.                                                                                                                                                  |
| <b>Suppress/cutoff merit</b> | Figure-of-merit value above which a route is suppressed for use or inclusion in advertisements. When a route's figure-of-merit value reaches a particular level, called the cutoff or suppression threshold, the route is suppressed. When a route is suppressed, the routing table no longer installs the route into the forwarding table and no longer exports this route to any of the routing protocols.                                                           |
| <b>Maximum suppress time</b> | Maximum hold-down time, in minutes. The value represents the maximum time that a route can be suppressed no matter how unstable it has been before this period of stability.                                                                                                                                                                                                                                                                                           |
| <b>Computed values</b>       | <ul style="list-style-type: none"> <li>• <b>Merit ceiling</b>—Maximum merit that a flapping route can collect.</li> <li>• <b>Maximum decay</b>—Maximum decay half-life, in minutes.</li> </ul>                                                                                                                                                                                                                                                                         |

## Sample Output

### show policy damping

```

user@host> show policy damping
Default damping information:
  Halflife: 15 minutes
  Reuse merit: 750 Suppress/cutoff merit: 3000
  Maximum suppress time: 60 minutes
  Computed values:
    Merit ceiling: 12110
    Maximum decay: 6193
Damping information for "standard-damping":
  Halflife: 10 minutes
  Reuse merit: 4000 Suppress/cutoff merit: 8000
  Maximum suppress time: 30 minutes
  Computed values:
    Merit ceiling: 32120
    Maximum decay: 12453

```

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                       |
| <b>Description</b>         | <p>Authentication key (password). Neighboring routing devices use the password to verify the authenticity of packets sent from this interface. For the key to work, you also must include the <b>authentication-type</b> statement.</p> <p>All routing devices must use the same password. If you are using the Junos OS IS-IS software with another implementation of IS-IS, the other implementation must be configured to use the same password for the domain, the area, and all interfaces adjacent to the Juniper Networks routing device.</p> |
| <b>Default</b>             | If you do not include this statement and the <b>authentication-type</b> statement, IS-IS authentication is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>             | <b>key</b> —Authentication password. The password can be up to 1024 characters long. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (" ").                                                                                                                                                                                                                                                                                                                                               |

**CAUTION:** A simple password for authentication is truncated if it exceeds 254 characters.

| <b>Description</b>         | Configure bidirectional failure detection timers and authentication.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>             | <p><b>authentication algorithm <i>algorithm-name</i></b>—Configure the algorithm used to authenticate the specified BFD session: <b>simple-password</b>, <b>keyed-md5</b>, <b>keyed-sha-1</b>, <b>meticulous-keyed-md5</b>, <b>meticulous-keyed-sha-1</b>.</p> <p><b>authentication key-chain <i>key-chain-name</i></b>—Associate a security key with the specified BFD session using the name of the security keychain. The name you specify must match one of the keychains configured in the <b>authentication-key-chains key-chain</b> statement at the <b>[edit security]</b> hierarchy level.</p> <p><b>authentication loose-check</b>—(Optional) Configure loose authentication checking on the BFD session. Use only for transitional periods when authentication might not be configured at both ends of the BFD session.</p> |

**detection-time threshold *milliseconds***—Configure a threshold for the adaptation of the BFD session detection time. When the detection time adapts to a value equal to or greater than the threshold, a single trap and a single system log message are sent.

**minimum-interval *milliseconds***—Configure the minimum interval after which the local routing device transmits a hello packet and then expects to receive a reply from the neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can specify the minimum transmit and receive intervals separately using the **transmit-interval**, **minimum-interval**, and **minimum-receive-interval** statements.

**Range:** 1 through 255,000

**minimum-receive-interval *milliseconds***—Configure the minimum interval after which the local routing device expects to receive a reply from a neighbor with which it has established a BFD session. Optionally, instead of using this statement, you can configure the minimum receive interval using the **minimum-interval** statement.

**Range:** 1 through 255,000

**multiplier *number***—Configure the number of hello packets not received by a neighbor that causes the originating interface to be declared down.

**Range:** 1 through 255

**Default:** 3

**no-adaptation**—Specify that BFD sessions not adapt to changing network conditions. We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation enabled in your network.

**transmit-interval threshold *milliseconds***—Configure the threshold for the adaptation of the BFD session transmit interval. When the transmit interval adapts to a value greater than the threshold, a single trap and a single system message are sent. The interval threshold must be greater than the minimum transmit interval.

**Range:** 0 through 4,294,967,295 ( $2^{32} - 1$ )

**transmit-interval minimum-interval *milliseconds***—Configure a minimum interval after which the local routing device transmits hello packets to a neighbor. Optionally, instead of using this statement, you can configure the minimum transmit interval using the **minimum-interval** statement.

**Range:** 1 through 255,000

**version**—Configure the BFD version to detect: **1** (BFD version 1) or **automatic** (autodetect the BFD version)

**Default:** automatic

| <b>Description</b>              | <p>Configure the interval between complete sequence number PDUs (CSNPs) on a LAN interface.</p> <p>If the routing device is the designated router on a LAN, IS-IS sends CSN packets every 10 seconds. If the routing device is on a point-to-point interface, it sends CSN packets every 5 seconds multiplied by the number of IS-IS adjacencies over point-to-point links, which are in UP state.</p> <p>To configure the interface not to send any CSNPs, specify the <b>disable</b> option.</p> |
| <b>Default</b>                  | By default, IS-IS sends CSNPs periodically. If the routing device is the designated router on a LAN, IS-IS sends CSNPs every 10 seconds. If the routing device is on a point-to-point interface, it sends CSNPs every 5 seconds multiplied by the number of IS-IS adjacencies over point-to-point links, which are in UP state.                                                                                                                                                                    |

| <b>Description</b>                                                                                                                                                                                                                                                                                             | <p>Apply one or more policies to routes being exported from the routing table into IS-IS.</p> <p>All routing protocols store the routes that they learn in the routing table. The routing table uses this collected route information to determine the active routes to destinations. The routing table then installs the active routes into its forwarding table and exports them into the routing protocols. It is these exported routes that the protocols advertise.</p> <p>For each protocol, you control which routes the protocol stores in the routing table and which routes the routing table exports into the protocol from the routing table by defining a <i>routing policy</i> for that protocol.</p> |
| <div> <b>NOTE:</b> For IS-IS, you cannot apply routing policies that affect how routes are imported into the routing table; doing so with a link-state protocol can easily lead to an inconsistent topology database.</div> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Description</b>              | <p>Configure graceful restart parameters for IS-IS.</p> <p>Graceful restart allows a routing device to restart with minimal effects to the network, and is enabled for all routing protocols at the <b>[edit routing-options]</b> hierarchy level. When graceful restart is enabled, the restarting routing device is not removed from the network topology during the restart period. The adjacencies are reestablished after restart is complete.</p> <p>On LAN interfaces where IS-IS is configured on a transit router that serves as the designated router (DR), a graceful restart causes:</p> <ul style="list-style-type: none"><li>• The ingress router of the label-switched path (LSP), which passes through the DR, to break the LSP.</li><li>• The ingress router to re-signal the LSP.</li></ul> |
| <b>Options</b>                  | <p><b>disable</b>—Disable graceful restart for IS-IS.</p> <p><b>helper-disable</b>—Disable graceful restart helper capability. Helper mode is enabled by default.</p> <p><b>restart-duration <i>seconds</i></b>—Time period for the restart to last, in seconds.<br/><b>Range:</b> 30 through 300 seconds<br/><b>Default:</b> 30 seconds</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>              | Configure an authentication key (password) for hello packets. Neighboring routing devices use the password to verify the authenticity of packets sent from an interface. For the key to work, you also must include the <b>hello-authentication-type</b> statement.                                                                                                                                                                                                                                         |
| <b>Default</b>                  | By default, hello authentication is not configured on an interface. However, if IS-IS authentication is configured, the hello packets are authenticated using the IS-IS authentication type and password.                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>                  | <b>password</b> —Authentication password. The password can be up to 255 characters. Characters can include any ASCII strings. If you include spaces, enclose all characters in quotation marks (" ").                                                                                                                                                                                                                                                                                                       |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Description</b>              | <p>Modify the frequency with which the routing device sends hello packets out of an interface, in seconds.</p> <p>Routing devices send hello packets at a fixed interval on all interfaces to establish and maintain neighbor relationships. This interval is advertised in the hello interval field in the hello packet.</p> <p>You can send out hello packets in subsecond intervals. To send out hello packets every 333 milliseconds, set the <b>hello-interval</b> value to 1.</p>                                                            |

| <b>Description</b>         | <p>Configure padding on hello packets to accommodate asymmetrical maximum transfer units (MTUs) from different hosts.</p> <p>This helps to prevent a premature adjacency Up state when one routing device's MTU does not meet the requirements to establish the adjacency.</p> <p>As an OSI Layer 2 protocol, IS-IS does not support data fragmentation. Therefore, maximum packet sizes must be established and supported between two routers. During adjacency establishment, the IS-IS protocol makes sure that the link supports a packet size of 1492 bytes by padding outgoing hello packets up to the maximum packet size of 1492 bytes.</p> <p>This is the default behavior of the Junos OS IS-IS implementation. However, Junos OS provides an option to disable hello padding that can override this behavior.</p> <p>There are four types of hello padding:</p> <ul style="list-style-type: none"><li>• Adaptive padding—On point-to-point connections, the hello packets are padded from the initial detection of a new neighbor until the neighbor verifies the adjacency as Up in the adjacency state type, length, and value (TLV) tuple. If the neighbor does not support the adjacency state TLV, then padding continues. On LAN connections, padding starts from the initial detection of a new neighbor until there is at least one active adjacency on the interface. Adaptive padding has more overhead than loose padding and is able to detect MTU asymmetry from one side of the connection. This one-sided detection can result in generation of extra link-state PDUs that are flooded throughout the network. Specify the <b>adaptive</b> option to configure enough padding to establish an adjacency to neighbors.</li><li>• Disabled padding—Padding is disabled on all types of interfaces for all adjacency states. Specify the <b>disable</b> option to accommodate interfaces that support less than the default packet size of 1492 bytes.</li><li>• Loose padding (the default)—The hello packet is padded from the initial detection of a new neighbor until the adjacency transitions to the Up state. Loose padding might not be able to detect certain situations such as asymmetrical MTUs between the routing devices. Specify the <b>loose</b> option to configure enough padding to initialize an adjacency to neighbors.</li></ul> |

- **Strict padding**—Padding is done on all interface types and for all adjacency states, and is continuous. Strict padding has the most overhead. The advantage is that strict padding detects MTU issues on both sides of a link. Specify the **strict** option to configure padding to allow all adjacency states with neighbors.

**Options**    **adaptive**—Configure padding until the neighbor adjacency is established and active.

**disable**—Disable padding on all types of interfaces for all adjacency states.

**loose**—Configure padding until the state of the adjacency is initialized.

**strict**—Configure padding for all adjacency states.

**Required Privilege Level**    routing—To view this statement in the configuration.  
                                         routing-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Set the length of time a neighbor considers this router to be operative (up) after receiving a hello packet. If the neighbor does not receive another hello packet within the specified time, it marks this routing device as inoperative (down). The hold time itself is advertised in the hello packets.</p> <p>The hold time specifies how long a neighbor should consider this routing device to be operative without receiving another hello packet. If the neighbor does not receive a hello packet from this routing device within the hold time, it marks the routing device as being unavailable.</p> <p>For systems configured with graceful routing switchover (GRES) with Graceful Restart, the hold time for Master and Backup Routing Engines should be set to a value higher than 40 seconds. This ensures that adjacencies between the Routing Engine and the neighboring peer 'helper' routers do not time out, stopping graceful restart, and all traffic.</p> |
| <b>Options</b>                  | <p><b>seconds</b>—Hold-time value, in seconds.</p> <p><b>Range:</b> 3 through 65,535 seconds, or 1 to send out hello packets every 333 milliseconds</p> <p><b>Default:</b> 9 seconds (for designated intermediate system [DIS] routers), 27 seconds (for non-DIS routers; three times the default hello interval)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Release Information</b>      | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>              | <p>Ignore the attached bit on IS-IS Level 1 routers. Configuring this statement enables the routing device to ignore the attached bit on incoming Level 1 link-state PDUs. If the attached bit is ignored, no default route, which points to the routing device which has set the attached bit, is installed.</p> <p>There might be times, such as during a denial-of-service (DoS) attack, that you do not want a Level 1 router to be able to forward traffic based on a default route.</p> <p>To prevent a routing device from being able to reach interarea destinations, you can prevent the routing device from installing the default route without affecting the status of its IS-IS adjacencies. The <b>ignore-attached-bit</b> statement is used to tell the routing device to ignore the presence of the attached bit in Level 1 link-state PDUs, which blocks the installation of the IS-IS default route.</p> |
| <b>Default</b>                  | The <b>ignore-attached-bit</b> statement is disabled by default.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.                                                                                                                                                                                                          |
| <b>Description</b>         | Configure alternate IPv4 multicast topologies.                                                                                                                                                                                                                                                                                                                                                          |

**NOTE:** The IS-IS interface metrics for the IPv4 topology can be configured independently of the IPv6 metrics. You can also selectively disable interfaces from participating in the IPv6 topology while continuing to participate in the IPv4 topology. This lets you exercise control over the paths that unicast data takes through a network.

| <b>Description</b>              | Specify the IPv6 unicast topology metric value for the level. The IS-IS interface metrics for the IPv4 topology can be configured independently of the IPv6 metrics.                                                                                                                                                                                                                                                                                                                                                                |

| <b>Description</b>              | <p>Configure the global-level properties.</p> <p>You can administratively divide a single AS into smaller groups called areas. You configure each routing device interface to be in an area. Any interface can be in any area. The area address applies to the entire routing device. You cannot specify one interface to be in one area and another interface in a different area. To route between areas, you must have two adjacent Level 2 routers that communicate with each other.</p> <p>Level 1 routers can only route within their IS-IS area. To send traffic outside their area, Level 1 routers must send packets to the nearest intra-area Level 2 router. A routing device can be a Level 1 router, a Level 2 router, or both. You specify the router level on a per-interface basis, and a routing device becomes adjacent to other routing devices on the same level on that link only.</p> <p>You can configure one Level 1 routing process and one Level 2 routing process on each interface, and you can configure the two levels differently.</p> |
| <b>Options</b>                  | <p><i>level-number</i>—IS-IS level number.</p> <p><b>Values:</b> 1 or 2</p> <p>The remaining statements are explained separately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Description</b>              | <p>Configure the link-state PDU interval time.</p> <p>By default, the routing device sends one link-state PDU packet out an interface every 100 milliseconds. To disable the transmission of all link-state PDUs, set the interval to 0.</p> <p>Link-state PDU throttling by use of the <b>lsp-interval</b> statement controls the flooding pace to neighboring routing devices in order to not overload them.</p> <p>Also, consider that control traffic (such as link-state PDUs and related packets) might delay user traffic (information packets) because control traffic always has precedence in terms of scheduling on the routing device interface cards. Unfortunately, the control traffic transmission rate is not decreased on low-bandwidth interfaces, such as DS-0 or fractional T1 and E1 interface. Line control traffic stays the same. On a low-bandwidth circuit that is transmitting 30 full-MTU-sized packets, there is not much bandwidth left over for other types of packets.</p> |
| <b>Default</b>                  | By default, the routing device sends one link-state PDU out an interface every 100 milliseconds.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Description</b>              | <p>Specify how long a link-state PDU originating from the routing device should persist in the network. The routing device sends link-state PDUs often enough so that the link-state PDU lifetime never expires.</p> <p>Because link-state PDUs have a maximum lifetime, they need to be refreshed. Refreshing means that a routing device needs to re-originate its link-state PDUs periodically. The re-origination interval must be less than the link-state PDU's lifetime. For example, if the link-state PDU is valid for 1200 seconds, the routing device needs to refresh the link-state PDU in less than 1200 seconds to avoid removal of the link-state PDU from the link-state database by other routing devices. The recommended maximum link-state PDU origination interval is the lifetime minus 300 seconds. So, in a default environment this would be 900 seconds. In Junos OS, the refresh interval is derived from the lifetime and is equal to the lifetime minus 317 seconds. You can change the lifetime to a higher value to reduce the number of refreshes in the network. (You would rarely want to increase the number of refreshes.) Often these periodic link-state PDU refreshes are referred to as refresh noise, and network administrators want to reduce this noise as much as possible.</p> <p>The <code>show isis overview</code> command displays the link-state PDU lifetime.</p> |
| <b>Default</b>                  | By default, link-state PDUs are maintained in network databases for 1200 seconds (20 minutes) before being considered invalid. This length of time, called the <i>LSP lifetime</i> , normally is sufficient to guarantee that link-state PDUs never expire.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Description</b>              | <p>Configure an interface to be part of a mesh group, which is a set of fully connected nodes.</p> <p>A <i>mesh group</i> is a set of routing devices that are fully connected. That is, they have a fully meshed topology. When link-state PDUs are being flooded throughout an area, each router within a mesh group receives only a single copy of a link-state PDU instead of receiving one copy from each neighbor, thus minimizing the overhead associated with the flooding of link-state PDUs.</p> <p>To create a mesh group and designate that an interface be part of the group, assign a mesh-group number to all the routing device interfaces in the group. To prevent an interface in the mesh group from flooding link-state PDUs, configure blocking on that interface.</p> |
| <b>Options</b>                  | <p><b>blocked</b>—Configure the interface so that it does not flood link-state PDUs.</p> <p><b>value</b>—Number that identifies the mesh group.</p> <p><b>Range:</b> 1 through 4,294,967,295 (<math>2^{32} - 1</math>; 32 bits are allocated to identify a mesh group)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Description</b>         | <p>Specify the metric value for the level.</p> <p>All IS-IS routes have a cost, which is a routing metric that is used in the IS-IS link-state calculation. The cost is an arbitrary, dimensionless integer that can be from 1 through 63, or from 1 through 16,777,215 (<math>2^{24} - 1</math>) if you are using wide metrics.</p> <p>Similar to other routing protocols, IS-IS provides a way of exporting routes from the routing table into the IS-IS network. When a route is exported into the IS-IS network without a specified metric, IS-IS uses default metric values for the route, depending on the protocol that was used to learn the route.</p> |

Table 326 on page 3114 depicts IS-IS route export metric default values.

**Table 326: Default Metric Values for Routes Exported into IS-IS**

| Protocol Used for Learning the Route | Default Metric Value                                          |
|--------------------------------------|---------------------------------------------------------------|
| Direct                               | 10                                                            |
| Static                               | Same as reported by the protocol used for exporting the route |

| RIP                                  | Same as reported by the protocol used for exporting the route |
| OSPF                                 | Same as reported by the protocol used for exporting the route |
| BGP                                  | 10                                                            |

The default metric values behavior can be customized by using routing policies.

- Options** *metric*—Metric value.
- Range:** 1 through 63, or 1 through 16,777,215 (if you have configured wide metrics)

**Default:** 10 (for all interfaces except lo0), 0 (for the lo0 interface)
