#### YEAR 2000 NOTICE

Juniper Networks hardware and software products are Year 2000 compliant. Junos OS has no known time-related limitations through the year 2038. However, the NTP application is known to have some difficulty in the year 2036.

#### END USER LICENSE AGREEMENT

The Juniper Networks product that is the subject of this technical documentation consists of (or is intended for use with) Juniper Networks software. Use of such software is subject to the terms and conditions of the End User License Agreement ("EULA") posted at <http://www.juniper.net/support/eula.html>. By downloading, installing or using such software, you agree to the terms and conditions of that EULA.

**Part 4****Junos OS Basics****Chapter 4**

<b>Overview</b>	<b>25</b>
Software Overview	25
Configuration File Terms	25
Format for Specifying IP Addresses, Network Masks, and Prefixes in Junos OS Configuration Statements	26
Junos OS Commit Model for Router or Switch Configuration	27
Junos OS Package Names	28
Understanding NTP Time Servers	29
NTP Time Server and Time Services Overview (QFabric System)	30
Overview of CoS Upgrade Requirements (Junos OS Release 11.1 or 11.2 to a Later Release)	30
Understanding Autoinstallation of Configuration Files	32
Typical Uses for Autoinstallation	32
Autoinstallation Configuration Files and IP Addresses	32
Typical Autoinstallation Process on a New Switch	33
Understanding Nonstop Software Upgrade for QFabric Systems	34
Understanding DHCP Services for Switches	38
DHCP Client/Server Model	39
Using DHCP	39
DHCP Relay Servers and DHCP Servers	40
Legacy DHCP and Extended DHCP for Server Versions	40
Configuring DHCP on a Switch	41
How DHCP Works	41
Understanding Software Infrastructure and Processes	42
Routing Engine and Packet Forwarding Engine	42
Junos OS Processes	43
Understanding Zero Touch Provisioning	44
User Interfaces	46
CLI User Interface Overview	47
CLI Overview	47
CLI Key Features	47
CLI Command Modes	48
Configuring Login Tips	49
Format for Specifying Filenames and URLs in Junos OS CLI Commands	50
Junos OS Operational Mode Commands That Combine Other Commands	51
Overview of Junos OS CLI Operational Mode Commands	52
CLI Command Categories	52
Commonly Used Operational Mode Commands	53
Overview of Navigating the CLI	54
CLI Command Hierarchy	55
CLI Configuration Statements	55
Moving Among Hierarchy Levels	55
Understanding the Brief, Detail, Extensive, and Terse Options of Junos OS Operational Commands	56

	Understanding Junos OS CLI Configuration Mode . . . . .	57
	Configuration Mode Commands . . . . .	58
	Configuration Statements and Identifiers . . . . .	59
	Configuration Statement Hierarchy . . . . .	61
	Licenses . . . . .	63
	Junos OS Feature Licenses . . . . .	63
	Software Features That Require Licenses on the QFX Series . . . . .	64
	Junos OS Feature License Keys . . . . .	65
	Release-Tied License Keys and Upgrade Licenses on MX Series Routers . . . . .	66
	Licensable Ports on MX5, MX10, and MX40 Routers . . . . .	67
	Port Activation on MX104 Routers . . . . .	68
	Generating License Keys . . . . .	69
	Generating the License Keys for a QFabric System . . . . .	71
	Adding New Licenses (CLI Procedure) . . . . .	73
	Deleting a License (CLI Procedure) . . . . .	74
	Saving License Keys . . . . .	75
	Verifying Junos OS License Installation . . . . .	76
	Displaying Installed Licenses . . . . .	76
	Displaying License Usage . . . . .	77
<b>Chapter 5</b>	<b>Installation . . . . .</b>	<b>79</b>
	Software Installation . . . . .	79
	Junos OS Package Names . . . . .	79
	Configuring Zero Touch Provisioning . . . . .	81
	Downgrading Software on a QFabric System . . . . .	85
	(Optional) Creating an Emergency Boot Device Using a Juniper Networks External Blank USB Flash Drive . . . . .	86
	Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software . . . . .	87
	Launching a Guest Virtual Machine (VM) to Run a Third Party Application on Junos OS Release 13.2X51-D15 . . . . .	91
	Understanding Guest VMs . . . . .	92
	Prerequisites for Setting up a Virtual Build Environment in the JunosV App Engine . . . . .	92
	Setting up the Virtual Build Environment for the JunosV App Engine . . . . .	95
	Downloading and Installing the JunosV App Engine Software . . . . .	95
	Launching the VNC Server . . . . .	96
	Launching the FreeBSD Virtual Build Environment (VBE) Virtual Machine (VM) . . . . .	96
	Installing the Junos SDK Packages on the Virtual Build Environment . . . . .	97
	Prerequisites for Using the Virtual Build Environment . . . . .	98
	Obtaining Junos SDK Certificate Request File and Certificate Key File for the Virtual Build Environment . . . . .	98
	Processing and Obtaining the Certificate File . . . . .	99
	Prerequisites for Packaging the Guest VM . . . . .	99
	Launching the Guest VM on the CentOS Server . . . . .	99
	Copying Required Application to Package with the Guest VM . . . . .	100
	Editing Packaging Tool Scripts . . . . .	101

Executing Packaging Scripts . . . . .	103
Copying the Third Party Application to the Switch . . . . .	103
Configure the Provider Name, License Type, and Deployment Scope . . . . .	103
Configure the Guest VM Options . . . . .	104
Launching a Guest Virtual Machine (VM) to Run a Third Party Application on Junos OS Release 13.2X51-D20 . . . . .	108
Understanding Guest VMs . . . . .	108
Troubleshooting Tips . . . . .	109
Copying the Third Party Application to the Switch . . . . .	109
Install the Third Party Application on the Switch . . . . .	109
Configure the Guest VM Options to Launch the Guest VM on the Host . . . . .	110
Performing a Nonstop Software Upgrade on the QFabric System . . . . .	115
Backing Up the Current Configuration Files . . . . .	116
Downloading Software Files Using a Browser . . . . .	116
Retrieving Software Files for Download . . . . .	118
Performing a Nonstop Software Upgrade for Director Devices in a Director Group . . . . .	118
Performing a Nonstop Software Upgrade for Interconnect Devices and Other Fabric-Related Components . . . . .	118
(Optional) Creating Upgrade Groups for Node Groups . . . . .	119
Performing a Nonstop Software Upgrade on a Node Group . . . . .	119
Performing a Recovery Installation . . . . .	120
Performing a Recovery Installation On QFX5100 and EX4600 Series Switches . . . . .	122
Performing a QFabric System Recovery Installation on the Director Group . . . . .	123
(Optional) Creating an Emergency Boot Device Using a Juniper Networks External Blank USB Flash Drive . . . . .	124
Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software . . . . .	125
Recovering from a Failed Software Installation . . . . .	129
Software Installation Overview . . . . .	131
Upgrading Jloader Software on QFX Series Devices . . . . .	132
Jloader Software Version 1.1.4 Guidelines . . . . .	133
Upgrading Jloader Software on a QFX3500 Switch . . . . .	134
Upgrading Jloader Software on a QFabric System . . . . .	137
Upgrading Software . . . . .	143
Downloading Software Files with a Browser . . . . .	143
Accessing Software Downloaded to a Remote Location . . . . .	144
Connecting to the Console Port . . . . .	144
Backing Up the Current Configuration Files . . . . .	144
Installing a Standard Software Package . . . . .	145
Upgrading to an ELS-Based Software Package . . . . .	146
Upgrading Software on a QFabric System . . . . .	148
Backing Up the Current Configuration Files . . . . .	148
Downloading Software Files Using a Browser . . . . .	149
Retrieving Software Files for Download . . . . .	150

	Installing the Software Package on the Entire QFabric System . . . . .	150
<b>Chapter 6</b>	<b>Configuration . . . . .</b>	<b>155</b>
	Initial Configuration . . . . .	155
	Configuring a DHCP Client (CLI Procedure) . . . . .	156
	Configuring a DHCP Server on Switches (CLI Procedure) . . . . .	157
	Configuring an Extended DHCP Server on a Switch . . . . .	158
	Configuring a Legacy DHCP Server on a Switch (CLI Procedure) . . . . .	159
	Configuring a DNS Name Server for Resolving a Hostname into Addresses . . . . .	160
	Reaching a Domain Name System Server . . . . .	160
	Configuring the Hostname of the Router or Switch . . . . .	163
	Configuring the Junos OS to Determine Conditions That Trigger Alarms on Different Interface Types . . . . .	163
	Configuring Junos OS to Disable Protocol Redirect Messages on the Router or Switch . . . . .	164
	Configuring Junos OS to Disable the Reporting of IP Address and Timestamps in Ping Responses . . . . .	164
	Configuring the Junos OS to Display a System Login Announcement . . . . .	165
	Configuring the Junos OS to Display a System Login Message . . . . .	165
	Configuring Junos OS to Extend the Default Port Address Range . . . . .	166
	Configuring the Junos OS ICMPv4 Rate Limit for ICMPv4 Routing Engine Messages . . . . .	167
	Configuring the Junos OS to Select a Fixed Source Address for Locally Generated TCP/IP Packets . . . . .	167
	Configuring NTP Authentication Keys . . . . .	168
	Configuring NTP Authentication Keys (QFabric System) . . . . .	168
	Configuring the NTP Time Server and Time Services . . . . .	169
	Configuring the Router or Switch to Operate in Client Mode . . . . .	169
	Configuring the Router or Switch to Operate in Symmetric Active Mode . . . . .	170
	Configuring the Router or Switch to Operate in Broadcast Mode . . . . .	170
	Configuring the Router or Switch to Operate in Server Mode . . . . .	171
	Configuring the NTP Time Server and Time Services (QFabric System) . . . . .	172
	Specifying the Physical Location of the Switch . . . . .	172
	Configuring the Root Password . . . . .	173
	Configuring the Router or Switch to Listen for Broadcast Messages Using NTP . . . . .	175
	Configuring the Router or Switch to Listen for Multicast Messages Using NTP . . . . .	175
	Configuring System Alarms to Appear Automatically Upon Login . . . . .	176
	Configuring Time-Based User Access . . . . .	176
	Configuring the Timeout Value for Idle Login Sessions . . . . .	178
	Configuring a QFX3500 Device as a Standalone Switch . . . . .	178
	Creating an Emergency Boot Device . . . . .	180

Creating a Snapshot and Using It to Boot a QFX Series Switch . . . . .	181
Creating a Snapshot on a USB Flash Drive and Using It to Boot the Switch . . . . .	182
Creating a Snapshot on an Internal Flash Drive and Using it to Boot the Switch . . . . .	182
Creating a Snapshot on the Alternate Slice of the Boot Media . . . . .	183
Including the Year or Millisecond in Timestamps . . . . .	183
Mapping the Hostname of the Switch to IP Addresses . . . . .	184
Methods for Configuring Junos OS . . . . .	185
Junos OS Command-Line Interface . . . . .	186
ASCII File . . . . .	186
J-Web Package . . . . .	186
Junos XML Management Protocol Software . . . . .	187
NETCONF XML Management Protocol Software . . . . .	187
Configuration Commit Scripts . . . . .	187
Modifying the Default Time Zone for a Router or Switch Running Junos OS . . . . .	188
Rebooting and Halting a Device . . . . .	188
Reverting to the Default Factory Configuration . . . . .	190
Reverting to the Default Factory Configuration by Using the request system zeroize Command . . . . .	190
Reverting to the Rescue Configuration . . . . .	191
Saving Core Files Generated by Junos OS Processes . . . . .	191
Updating the IANA Time Zone Database on Junos Devices . . . . .	192
Importing and Installing Time Zone Files . . . . .	192
Configuring a Custom Time Zone . . . . .	193
Setting the Date and Time . . . . .	194
Specifying Access Privileges for Junos OS Operational Mode Commands . . . . .	194
Synchronizing and Coordinating Time Distribution Using NTP . . . . .	196
Configuring NTP . . . . .	196
Configuring the NTP Boot Server . . . . .	196
Specifying a Source Address for an NTP Server . . . . .	197
Viewing Core Files from Junos OS Processes . . . . .	198
Configuration Examples . . . . .	198
Example: Changing the Requirements for Junos OS Plain-Text Passwords . . . . .	198
Reaching a Domain Name System Server . . . . .	200
Example: Configuring the Name of the Switch, IP Address, and System ID . . . . .	202
Example: Configuring NTP . . . . .	203
Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization . . . . .	205
Example: Configuring a Plain-Text Password for Root Logins . . . . .	206
Configuring the Root Password . . . . .	209
Configuration Statements . . . . .	211

	Recovering the Root Password .....	1302
	Troubleshooting Network Interfaces .....	1303
	The interface on the port in which an SFP or SFP+ transceiver is installed in an SFP or SFP+ module is down .....	1303
	Troubleshooting an Aggregated Ethernet Interface .....	1303
<b>Part 5</b>	<b>QFabric System Deployment</b>	
<b>Chapter 9</b>	<b>Overview</b> .....	<b>1307</b>
	Before You Begin .....	1307
	QFabric System Overview .....	1307
	Legacy Data Center Architecture .....	1307
	QFX Series QFabric System Architecture .....	1309
	Understanding QFabric System Terminology .....	1311
	Understanding Interfaces on the QFabric System .....	1316
	Four-Level Interface Naming Convention .....	1316
	QSFP+ Interfaces .....	1317
	Link Aggregation .....	1320
	Hardware Architecture Overview .....	1320
	Understanding the QFabric System Hardware Architecture .....	1321
	QFabric System Hardware Architecture Overview .....	1321
	QFX3000-G QFabric System Features .....	1323
	QFX3000-M QFabric System Features .....	1324
	Understanding the Director Group .....	1324
	Director Group Components .....	1324
	Director Group Services .....	1325
	Understanding Routing Engines in the QFabric System .....	1325
	Hardware-Based Routing Engines .....	1325
	Software-Based External Routing Engines .....	1326
	Understanding Interconnect Devices .....	1327
	Interconnect Device Introduction .....	1327
	QFX3008-I Interconnect Devices .....	1328
	QFX3600-I Interconnect Devices .....	1329
	QFX5100-24Q Interconnect Devices .....	1330
	Understanding Node Devices .....	1331
	Node Device Introduction .....	1331
	QFX3500 Node Devices .....	1331
	QFX3600 Node Devices .....	1332
	QFX5100 Node Devices .....	1333
	Understanding Node Groups .....	1335
	Network Node Groups .....	1335
	Server Node Groups .....	1335
	Understanding Port Oversubscription on Node Devices .....	1336

Software Architecture Overview .....	1340
Understanding the QFabric System Software Architecture .....	1340
Understanding the Director Software .....	1341
Understanding Partitions .....	1342
QFabric System Default Partition .....	1342
Understanding the QFabric System Control Plane .....	1344
Control Plane Elements .....	1345
Control Plane Services .....	1346
Understanding the QFabric System Data Plane .....	1347
Data Plane Components .....	1347
QFabric System Fabric .....	1348
Software Features .....	1349
Understanding Software Upgrade on the QFabric System .....	1350
Operational Software Commands .....	1350
Operational Reboot Commands .....	1351
Understanding Nonstop Software Upgrade for QFabric Systems .....	1351
Understanding Statements and Commands on the QFabric System ....	1356
Chassis Statements .....	1356
Chassis Commands .....	1356
Understanding NTP on the QFabric System .....	1357
Understanding Network Management Implementation on the QFabric System .....	1358
Understanding the Implementation of SNMP on the QFabric System ....	1359
Understanding the Implementation of System Log Messages on the QFabric System .....	1361
Understanding User and Access Management Features on the QFabric System .....	1363
Understanding QFabric System Login Classes .....	1363
Understanding Interfaces on the QFabric System .....	1364
Four-Level Interface Naming Convention .....	1365
QSFP+ Interfaces .....	1365
Link Aggregation .....	1368
Understanding Layer 3 Features on the QFabric System .....	1368
Understanding Security Features on the QFabric System .....	1369
Understanding Port Mirroring on the QFabric System .....	1370
Understanding Fibre Channel Fabrics on the QFabric System .....	1371
Understanding CoS Fabric Forwarding Class Sets .....	1373
Default Fabric Forwarding Class Sets .....	1374
Fabric Forwarding Class Set Configuration and Implementation ....	1377
QFabric System CoS .....	1379
Support for Flow Control and Lossless Transport Across the Fabric ..	1379
Viewing Fabric Forwarding Class Set Information .....	1381
Summary of Fabric Forwarding Class Set and Node Device Forwarding Class Set Differences .....	1383
Licenses .....	1384
Junos OS Feature Licenses .....	1384
Software Features That Require Licenses on the QFX Series .....	1384

	Junos OS Feature License Keys . . . . .	1386
	Release-Tied License Keys and Upgrade Licenses on MX Series Routers . . . . .	1386
	Licensable Ports on MX5, MX10, and MX40 Routers . . . . .	1387
	Port Activation on MX104 Routers . . . . .	1388
<b>Chapter 10</b>	<b>Configuration . . . . .</b>	<b>1391</b>
	Initial Setup . . . . .	1391
	QFabric System Initial and Default Configuration Information . . . . .	1391
	Converting the Device Mode for a QFabric System Component . . . . .	1394
	Example: Configuring the Virtual Chassis for a Copper-Based QFX3000-G QFabric System Control Plane . . . . .	1400
	Importing a QFX3000-G QFabric System Control Plane Virtual Chassis Configuration with a USB Flash Drive . . . . .	1443
	Example: Configuring EX4200 Switches for the QFX3000-M QFabric System Control Plane . . . . .	1444
	Importing a QFX3000-M QFabric System Control Plane EX4200 Switch Configuration with a USB Flash Drive . . . . .	1469
	Generating the MAC Address Range for a QFabric System . . . . .	1470
	Performing the QFabric System Initial Setup on a QFX3100 Director Group . . . . .	1471
	Performing an Initial Setup . . . . .	1472
	Restoring a Backup Configuration . . . . .	1475
	QFabric System Configuration . . . . .	1476
	Understanding QFabric System Administration Tasks and Utilities . . . . .	1476
	Gaining Access to the QFabric System Through the Default Partition . . . . .	1480
	Example: Configuring QFabric System Login Classes . . . . .	1481
	Configuring Aliases for the QFabric System . . . . .	1489
	Configuring Node Groups for the QFabric System . . . . .	1499
	Configuring the Port Type on QFX3600 Node Devices . . . . .	1503
	Example: Configuring SNMP . . . . .	1507
	Example: Configuring System Log Messages . . . . .	1510
	Configuring Graceful Restart for QFabric Systems . . . . .	1512
	Enabling Graceful Restart . . . . .	1512
	Configuring Graceful Restart Options for BGP . . . . .	1513
	Configuring Graceful Restart Options for OSPF and OSPFv3 . . . . .	1514
	Tracking Graceful Restart Events . . . . .	1515
	Configuration Statements . . . . .	1515
	aliases . . . . .	1517
	archive (QFabric System) . . . . .	1518
	chassis (QFabric System) . . . . .	1519
	device-authentication . . . . .	1521
	director-device (Aliases) . . . . .	1522
	fabric . . . . .	1523
	fabric-control . . . . .	1524
	file (QFabric System) . . . . .	1525
	graceful-restart (Enabling Globally) . . . . .	1526
	graceful-restart (Fabric Control) . . . . .	1527
	graceful-restart (Protocols BGP) . . . . .	1528

	graceful-restart (Protocols OSPF) . . . . .	1529
	interconnect-device (Chassis) . . . . .	1531
	interconnect-device (Aliases) . . . . .	1532
	multicast (QFabric Routing Options) . . . . .	1533
	network-domain . . . . .	1533
	no-make-before-break . . . . .	1534
	node-device (Aliases) . . . . .	1535
	node-device (Chassis) . . . . .	1536
	node-device (Resources) . . . . .	1537
	node-group (Chassis) . . . . .	1538
	node-group (Resources) . . . . .	1539
	pic (Port) . . . . .	1540
	protocols (Fabric) . . . . .	1541
	remote-debug-permission . . . . .	1542
	resources . . . . .	1543
	restart-time (Fabric Control) . . . . .	1544
	routing-options (QFabric System) . . . . .	1545
	syslog (QFabric System) . . . . .	1546
	stale-routes-time (Fabric Control) . . . . .	1547
<b>Chapter 11</b>	<b>Administration . . . . .</b>	<b>1549</b>
	Software Upgrade and Recovery . . . . .	1549
	Performing a Nonstop Software Upgrade on the QFabric System . . . . .	1549
	Backing Up the Current Configuration Files . . . . .	1551
	Downloading Software Files Using a Browser . . . . .	1551
	Retrieving Software Files for Download . . . . .	1552
	Performing a Nonstop Software Upgrade for Director Devices in a Director Group . . . . .	1552
	Performing a Nonstop Software Upgrade for Interconnect Devices and Other Fabric-Related Components . . . . .	1552
	(Optional) Creating Upgrade Groups for Node Groups . . . . .	1553
	Performing a Nonstop Software Upgrade on a Node Group . . . . .	1553
	Verifying Nonstop Software Upgrade for QFabric Systems . . . . .	1554
	Verifying a Director Group Nonstop Software Upgrade . . . . .	1554
	Verifying a Fabric Nonstop Software Upgrade . . . . .	1567
	Verifying a Redundant Server Node Group Nonstop Software Upgrade . . . . .	1568
	Verifying a Network Node Group Nonstop Software Upgrade . . . . .	1572
	Upgrading Software on a QFabric System . . . . .	1573
	Backing Up the Current Configuration Files . . . . .	1574
	Downloading Software Files Using a Browser . . . . .	1574
	Retrieving Software Files for Download . . . . .	1575
	Installing the Software Package on the Entire QFabric System . . . . .	1575
	Performing System Backup and Recovery for a QFabric System . . . . .	1578
	Operational Mode Commands . . . . .	1579
	QFabric System Operational Mode Commands . . . . .	1580
	Filtering Operational Mode Command Output in a QFabric System . . . . .	1582
	request chassis device-mode . . . . .	1584
	request chassis fabric fpc . . . . .	1586

	request component login . . . . .	1587
	request fabric administration director-group change-master . . . . .	1589
	request fabric administration remove . . . . .	1590
	request fabric administration system mac-pool add . . . . .	1592
	request fabric administration system mac-pool delete . . . . .	1593
	request system halt . . . . .	1594
	request system reboot . . . . .	1600
	request system software format-qfabric-backup . . . . .	1604
	request system software nonstop-upgrade . . . . .	1605
	request system software system-backup . . . . .	1611
	set chassis display message . . . . .	1613
	show chassis device-mode . . . . .	1616
	show chassis ethernet-switch interconnect-device cb . . . . .	1619
	show chassis ethernet-switch interconnect-device fpc . . . . .	1636
	show chassis fabric connectivity . . . . .	1661
	show chassis fabric device . . . . .	1668
	show chassis lcd . . . . .	1670
	show chassis nonstop-upgrade node-group . . . . .	1683
	show fabric administration inventory . . . . .	1684
	show fabric administration inventory director-group status . . . . .	1689
	show fabric administration inventory infrastructure . . . . .	1694
	show fabric administration inventory interconnect-devices . . . . .	1697
	show fabric administration inventory node-devices . . . . .	1699
	show fabric administration inventory node-groups . . . . .	1701
	show fabric administration system mac-pool . . . . .	1703
	show fabric inventory . . . . .	1704
	show fabric session-host . . . . .	1707
	show log . . . . .	1708
	show system software upgrade status . . . . .	1711
<b>Chapter 12</b>	<b>Troubleshooting . . . . .</b>	<b>1713</b>
	QFabric System Troubleshooting . . . . .	1713
	Performing System Backup and Recovery for a QFabric System . . . . .	1713
	Performing a QFabric System Recovery Installation on the Director Group . . . . .	1714
	(Optional) Creating an Emergency Boot Device Using a Juniper Networks External Blank USB Flash Drive . . . . .	1715
	Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software . . . . .	1717
	Performing a Recovery Installation . . . . .	1722
	Creating an Emergency Boot Device . . . . .	1724

<b>Part 6</b>	<b>Configuration and File Management</b>	
<b>Chapter 13</b>	<b>Overview</b>	<b>1729</b>
	Configuration Files Overview	1729
	Configuration File Terms	1729
	Software Overview	1730
	Forms of the configure Command	1730
	Junos OS Commit Model for Router or Switch Configuration	1731
	Understanding Configuration Files	1732
	Understanding How the Junos OS Configuration Is Stored	1733
<b>Chapter 14</b>	<b>Configuration</b>	<b>1735</b>
	Configuration Tasks	1735
	Comparing Configuration Changes with a Prior Version	1735
	Compressing the Current Configuration File	1737
	Creating and Returning to a Rescue Configuration	1738
	Loading a Configuration from a File	1739
	Loading a Previous Configuration File	1742
	Returning to the Most Recently Committed Junos OS Configuration	1742
	Returning to a Previously Committed Junos OS Configuration	1743
	Returning to a Configuration Prior to the One Most Recently Committed	1743
	Displaying Previous Configurations	1743
	Comparing Configuration Changes with a Prior Version	1744
	Creating and Returning to a Rescue Configuration	1746
	Saving a Configuration to a File	1747
	Reverting to the Default Factory Configuration	1748
	Reverting to the Rescue Configuration	1748
	Rolling Back Junos OS Configuration Changes	1749
	Saving a Configuration to a File	1750
	Setting or Deleting the Rescue Configuration	1751
	Uploading a Configuration File	1751
	Using Junos OS to Configure a Router or Switch to Transfer Its Configuration to an Archive Site	1753
	Configuring the Router or Switch to Transfer Its Currently Active Configuration to an Archive	1753
	Configuring the Transfer Interval for Periodic Transfer of the Active Configuration to an Archive Site	1753
	Configuring Transfer of the Current Active Configuration When a Configuration Is Committed	1754
	Configuring Archive Sites for Transfer of Active Configuration Files	1754
	Configuration Statements	1755
	archival	1756
	archive-sites (Configuration File)	1757
	configuration	1759
	transfer-interval (Configuration)	1760
	transfer-on-commit	1761
	Default Configurations	1761
	QFX3500 Switch Default Configuration	1761

	Configuration Examples . . . . .	1767
	Examples: Loading a Configuration from a File . . . . .	1767
<b>Chapter 15</b>	<b>Administration . . . . .</b>	<b>1771</b>
	Operational Commands . . . . .	1771
	clear log . . . . .	1772
	clear system commit . . . . .	1773
	file archive . . . . .	1774
	file checksum md5 . . . . .	1776
	file checksum sha1 . . . . .	1777
	file checksum sha-256 . . . . .	1778
	file compare . . . . .	1779
	file delete . . . . .	1782
	file list . . . . .	1783
	file rename . . . . .	1785
	file show . . . . .	1787
	request system configuration rescue delete . . . . .	1789
	request system configuration rescue save . . . . .	1790
	show system commit . . . . .	1791
	show system configuration archival . . . . .	1794
	show system configuration rescue . . . . .	1795
	show system rollback . . . . .	1797
	test configuration . . . . .	1799
<b>Chapter 16</b>	<b>Troubleshooting . . . . .</b>	<b>1801</b>
	Troubleshooting Procedures . . . . .	1801
	Loading a Previous Configuration File . . . . .	1801
	Reverting to the Default Factory Configuration . . . . .	1802
	Reverting to the Rescue Configuration . . . . .	1802
<b>Part 7</b>	<b>User and Access Management</b>	
<b>Chapter 17</b>	<b>Overview . . . . .</b>	<b>1805</b>
	Software Overview . . . . .	1805
	Understanding Software Infrastructure and Processes . . . . .	1805
	Routing Engine and Packet Forwarding Engine . . . . .	1805
	Junos OS Processes . . . . .	1806
	Understanding User and Access Management Features on the QFabric System . . . . .	1807
	Access Control Overview . . . . .	1808
	Overview of Template Accounts for RADIUS and TACACS+ Authentication . . . . .	1809
	Understanding Login Authentication . . . . .	1809
	MAC RADIUS Authentication . . . . .	1809
	Understanding LLDP . . . . .	1810
	Understanding RADIUS Accounting . . . . .	1811
	Understanding VSAs . . . . .	1812
	Juniper Networks Vendor-Specific RADIUS Attributes . . . . .	1812
	Juniper Networks Vendor-Specific TACACS+ Attributes . . . . .	1815

	Understanding Junos OS Access Privilege Levels . . . . .	1816
	Junos OS Login Class Permission Flags . . . . .	1817
	Allowing or Denying Individual Commands for Junos OS Login Classes . . . . .	1820
	Junos OS Authentication Order for RADIUS, TACACS+, and Password Authentication . . . . .	1821
	Using RADIUS or TACACS+ Authentication . . . . .	1821
	Using Local Password Authentication . . . . .	1822
	Order of Authentication Attempts . . . . .	1822
	Junos OS User Authentication Methods . . . . .	1825
	Junos OS User Accounts Overview . . . . .	1826
	Junos OS Login Classes Overview . . . . .	1828
	Understanding QFabric System Login Classes . . . . .	1829
	Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies . . . . .	1830
	Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands . . . . .	1831
	Special Requirements for Junos OS Plain-Text Passwords . . . . .	1832
<b>Chapter 18</b>	<b>Configuration . . . . .</b>	<b>1835</b>
	Configuration Tasks . . . . .	1835
	Configuring Access Privilege Levels . . . . .	1836
	Configuring Login Tips . . . . .	1836
	Configuring Junos OS User Accounts . . . . .	1836
	Configuring LLDP . . . . .	1837
	Configuring the Junos OS Authentication Order for RADIUS, TACACS+, and Local Password Authentication . . . . .	1838
	Configuring Local User Template Accounts for User Authentication . . . . .	1839
	Configuring Management Access . . . . .	1841
	Configuring RADIUS System Accounting . . . . .	1841
	Configuring Auditing of User Events on a RADIUS Server . . . . .	1841
	Specifying RADIUS Server Accounting and Auditing Events . . . . .	1842
	Configuring RADIUS Server Accounting . . . . .	1842
	Configuring RADIUS Authentication (QFX Series) . . . . .	1843
	Configuring RADIUS Server Details . . . . .	1843
	Configuring MS-CHAPv2 for Password-Change Support . . . . .	1844
	Specifying a Source Address for the Junos OS to Access External RADIUS Servers . . . . .	1845
	Configuring Remote Template Accounts for User Authentication . . . . .	1846
	Configuring the Root Password . . . . .	1846
	Configuring SNMP . . . . .	1848
	Configuring SSH Host Keys for Secure Copying of Data . . . . .	1851
	Configuring SSH Known Hosts . . . . .	1852
	Configuring Support for SCP File Transfer . . . . .	1852
	Updating SSH Host Key Information . . . . .	1853
	Configuring SSH Service for Remote Access to the Router or Switch . . . . .	1853
	Configuring the Root Login Through SSH . . . . .	1855
	Configuring the SSH Protocol Version . . . . .	1855
	Configuring the Client Alive Mechanism . . . . .	1855

Configuring TACACS+ Authentication (QFX Series) .....	1856
Configuring TACACS+ Server Details .....	1856
Specifying a Source Address for the Junos OS to Access External TACACS+ Servers .....	1857
Configuring the Same Authentication Service for Multiple TACACS+ Servers .....	1857
Configuring Juniper Networks Vendor-Specific TACACS+ Attributes ..	1858
Configuring TACACS+ System Accounting .....	1858
Specifying TACACS+ Auditing and Accounting Events .....	1859
Configuring TACACS+ Server Accounting .....	1859
Defining Junos OS Login Classes .....	1860
Limiting the Number of User Login Attempts for SSH and Telnet Sessions .....	1861
Recovering the Root Password .....	1862
Specifying Access Privileges for Junos OS Configuration Mode Hierarchies .....	1863
Specifying Access Privileges for Junos OS Operational Mode Commands .....	1864
Using Junos OS to Configure Logical System Administrators .....	1866
Using Regular Expressions on a RADIUS or TACACS+ Server to Allow or Deny Access to Commands .....	1867
VSA Match Conditions and Actions .....	1868
Configuration Examples .....	1870
Example: Changing the Requirements for Junos OS Plain-Text Passwords .....	1871
Example: Configuring Access Privilege Levels .....	1873
Example: Configuring Access Privileges for Operational Mode Commands .....	1873
Example: Configuring a Plain-Text Password for Root Logins .....	1874
Example: Configuring RADIUS Authentication .....	1876
Example: Configuring RADIUS Authentication on a QFabric System .....	1877
Example: Configuring RADIUS System Accounting .....	1878
Example: Configuring the Root Password .....	1878
Example: Configuring SSH Authentication for Root Logins .....	1879
Example: Configuring User Accounts .....	1879
Example: Configuring System Authentication for RADIUS, TACACS+, and Password Authentication .....	1880
Example: Creating Login Classes with Specific Privileges .....	1882
Example: Configuring QFabric System Login Classes .....	1882
Example: Configuring User Login Accounts .....	1890
Example: Configuring RADIUS Template Accounts .....	1891
Defining Access Privileges Using allow/deny-configuration Statements ..	1891
Example: Limiting the Number of Login Attempts for SSH and Telnet Sessions .....	1892

VEPA . . . . .	2037
Reflective Relay . . . . .	2037
Understanding Private VLANs . . . . .	2038
Typical Structure and Primary Application of PVLANS . . . . .	2038
Using 802.1Q Tags to Identify Packets . . . . .	2040
Efficient Use of IP Addresses . . . . .	2041
PVLAN Port Types . . . . .	2041
Limitations of Private VLANs . . . . .	2043
Understanding PVLAN Traffic Flows Across Multiple Switches . . . . .	2043
Community VLAN Sending Untagged Traffic . . . . .	2043
Isolated VLAN Sending Untagged Traffic . . . . .	2044
PVLAN Tagged Traffic Sent on a Promiscuous Port . . . . .	2045
Understanding Secondary VLAN Trunk Ports and Promiscuous Access Ports on PVLANS . . . . .	2047
PVLAN Port Types . . . . .	2047
Secondary VLAN Trunk Port Details . . . . .	2048
Use Cases . . . . .	2049
Understanding Egress Firewall Filters with PVLANS . . . . .	2056
Understanding Multiple VLAN Registration Protocol (MVRP) . . . . .	2057
QFabric Requirements . . . . .	2057
MVRP Operations . . . . .	2058
MRP Timers Control MVRP Updates . . . . .	2058
MVRP Uses MRP Messages to Transmit Switch and VLAN States . . . . .	2059
Spanning Trees Overview . . . . .	2059
Overview of Spanning-Tree Protocols . . . . .	2060
Understanding Spanning Tree Protocols on a QFabric System . . . . .	2060
Understanding MSTP . . . . .	2061
Understanding RSTP . . . . .	2061
Understanding VSTP . . . . .	2062
Understanding BPDU Protection for STP, RSTP, and MSTP . . . . .	2063
Understanding Loop Protection for STP, RSTP, VSTP, and MSTP . . . . .	2064

	Understanding Root Protection for STP, RSTP, VSTP, and MSTP . . . . .	2065
	Unified Forwarding Table . . . . .	2066
	Understanding the Unified Forwarding Table . . . . .	2066
	Using the Unified Forwarding Table to Optimize Address Storage . . .	2066
	MAC Address and Host Address Memory Allocation . . . . .	2067
	LPM Table Memory Allocation . . . . .	2068
	Q-in-Q Tunneling . . . . .	2068
	Understanding Q-in-Q Tunneling and VLAN Translation . . . . .	2068
	How Q-in-Q Tunneling Works . . . . .	2068
	How VLAN Translation Works . . . . .	2069
	Mapping C-VLANs to S-VLANs . . . . .	2070
	Routed VLAN Interfaces on Q-in-Q VLANs . . . . .	2071
	Constraints for Q-in-Q Tunneling and VLAN Translation . . . . .	2071
	Layer 2 Protocol Tunneling . . . . .	2072
	Understanding Layer 2 Protocol Tunneling . . . . .	2072
	Layer 2 Protocols Supported by L2PT . . . . .	2072
	How L2PT Works . . . . .	2073
	L2PT Basics . . . . .	2075
	Proxy ARP . . . . .	2076
	Understanding Proxy ARP . . . . .	2076
	What Is ARP? . . . . .	2076
	Proxy ARP Overview . . . . .	2077
	Best Practices for Proxy ARP . . . . .	2077
<b>Chapter 21</b>	<b>Configuration . . . . .</b>	<b>2079</b>
	Configuration Examples . . . . .	2080
	Example: Configuring Automatic VLAN Administration Using MVRP . . .	2080
	Example: Connecting an Access Switch to a Distribution Switch . . . .	2084
	Bridging Configuration Examples . . . . .	2093
	Example: Setting Up Basic Bridging and a VLAN on the QFX Series . . . .	2093
	Example: Setting Up Bridging with Multiple VLANs . . . . .	2110
	MAC Learning Configuration Examples . . . . .	2116
	Example: Disabling MAC Learning . . . . .	2116
	Example: Disabling MAC Learning in a VLAN . . . . .	2117
	Private VLAN Configuration Examples . . . . .	2118
	Example: Configuring a Private VLAN on a Single Switch . . . . .	2118
	Example: Configuring a Private VLAN Spanning Multiple Switches . . . .	2123
	Example: Configuring PVLANS with Secondary VLAN Trunk Ports and Promiscuous Access Ports . . . . .	2137
	Q-in-Q Tunneling Configuration Example . . . . .	2149
	Example: Setting Up Q-in-Q Tunneling . . . . .	2149
	Reflective Relay Configuration Example . . . . .	2152
	Example: Configuring Reflective Relay for Use with VEPA Technology . . .	2152
	VLAN Configuration Examples . . . . .	2157
	Example: Configuring BPDU Protection on STP Interfaces to Prevent STP Miscalculations . . . . .	2157
	Example: Configuring Faster Convergence and Improving Network Stability with RSTP . . . . .	2161

Example: Configuring Loop Protection to Prevent Interfaces from Transitioning from Blocking to Forwarding in a Spanning Tree . . . . .	2175
Example: Configuring Network Regions for VLANs with MSTP . . . . .	2179
Example: Configuring Root Protection to Enforce Root Bridge Placement in Spanning Trees . . . . .	2202
Example: Configuring Routing Between VLANs on One Switch . . . . .	2207
VLAN Configuration Tasks . . . . .	2212
Configuring the Native VLAN Identifier . . . . .	2213
Configuring VLANs . . . . .	2214
Creating a Series of Tagged VLANs . . . . .	2216
Unified Forwarding Table Configuration Task . . . . .	2217
Configuring the Unified Forwarding Table . . . . .	2217
Configuring an Address-Storage Profile . . . . .	2218
Configuring the LPM Allocation . . . . .	2219
Forwarding Mode Configuration Task . . . . .	2222
Configuring the Forwarding Mode . . . . .	2222
Interface Address Configuration Task . . . . .	2222
Configuring the Interface Address . . . . .	2222
Configuring Interface IPv4 Addresses . . . . .	2224
Configuring Interface IPv6 Addresses . . . . .	2226
MAC Learning Configuration Tasks . . . . .	2227
Configuring MAC Notification . . . . .	2227
Enabling MAC Notification . . . . .	2228
Disabling MAC Notification . . . . .	2228
Setting the MAC Notification Interval . . . . .	2228
Configuring MAC Table Aging . . . . .	2229
Disabling MAC Learning . . . . .	2229
Disabling MAC Learning in a VLAN . . . . .	2230
Multiple VLAN Registration Protocol Configuration Task . . . . .	2230
Configuring Multiple VLAN Registration Protocol . . . . .	2230
Enabling MVRP . . . . .	2231
Disabling MVRP . . . . .	2231
Configuring Timer Values . . . . .	2231
Configuring Passive Mode . . . . .	2232
Private VLAN Configuration Tasks . . . . .	2232
Creating a Private VLAN on a Single Switch . . . . .	2233
Creating a Private VLAN Spanning Multiple Switches . . . . .	2234
Proxy ARP Configuration Task . . . . .	2235
Configuring Proxy ARP . . . . .	2235
Q-in-Q Tunneling Configuration Tasks . . . . .	2236
Configuring Q-in-Q Tunneling . . . . .	2236
Configuring Layer 2 Protocol Tunneling . . . . .	2237
Reflective Relay Configuration Task . . . . .	2239

<b>Chapter 37</b>	<b>Configuration</b>	<b>3429</b>
	Basic BGP Configuration	3429
	Examples: Configuring External BGP Peering	3429
	Understanding External BGP Peering Sessions	3429
	Example: Configuring External BGP Point-to-Point Peer Sessions	3430
	Example: Configuring External BGP on Logical Systems with IPv6	
	Interfaces	3437
	Examples: Configuring Internal BGP Peering	3452
	Understanding Internal BGP Peering Sessions	3452
	Example: Configuring Internal BGP Peer Sessions	3453
	Example: Configuring Internal BGP Peering Sessions on Logical	
	Systems	3464
	BGP Path Attribute Configuration	3474
	Example: Configuring BGP Local Preference	3474
	Understanding the BGP Local Preference	3474
	Example: Configuring the Local Preference Value for BGP Routes	3475
	Examples: Configuring BGP MED	3488
	Understanding the MED Attribute	3488
	Example: Configuring the MED Attribute Directly	3490
	Example: Configuring the MED Using Route Filters	3503
	Example: Configuring the MED Using Communities	3516
	Example: Associating the MED Path Attribute with the IGP Metric and	
	Delaying MED Updates	3516
	Examples: Configuring BGP Local AS	3526
	Understanding the BGP Local AS Attribute	3526
	Example: Configuring a Local AS for EBGp Sessions	3531
	Example: Configuring a Private Local AS for EBGp Sessions	3541
	Example: Configuring the Accumulated IGP Attribute for BGP	3546
	Understanding the Accumulated IGP Attribute for BGP	3547
	Example: Configuring the Accumulated IGP Attribute for BGP	3547
	BGP Policy Configuration	3585
	Example: Configuring BGP Interactions with IGP	3585
	Understanding Routing Policies	3585
	Example: Injecting OSPF Routes into the BGP Routing Table	3586
	Example: Configuring BGP Route Advertisement	3589
	Understanding Route Advertisement	3589
	Example: Configuring BGP Prefix-Based Outbound Route Filtering	3593
	Example: Configuring EBGp Multihop	3597
	Understanding BGP Multihop	3597
	Example: Configuring EBGp Multihop Sessions	3597
	Example: Configuring BGP Route Preference (Administrative Distance)	3606
	Understanding Route Preference Values	3606
	Example: Configuring the Preference Value for BGP Routes	3607
	Example: Configuring BGP Path Selection	3613
	Example: Ignoring the AS Path Attribute When Selecting the Best	
	Path	3613
	Example: Removing Private AS Numbers	3620
	Understanding Private AS Number Removal from AS Paths	3620
	Example: Removing Private AS Numbers from AS Paths	3621

BGP BFD Configuration . . . . .	3626
Example: Configuring BFD for BGP . . . . .	3626
Understanding BFD for BGP . . . . .	3626
Example: Configuring BFD on Internal BGP Peer Sessions . . . . .	3627
Example: Configuring BFD Authentication for BGP . . . . .	3635
Understanding BFD Authentication for BGP . . . . .	3635
Example: Configuring BFD Authentication for BGP . . . . .	3637
BGP Load Balancing Configuration . . . . .	3640
Examples: Configuring BGP Multipath . . . . .	3640
Understanding BGP Multipath . . . . .	3640
Example: Load Balancing BGP Traffic . . . . .	3641
Example: Configuring Single-Hop EBGP Peers to Accept Remote Next Hops . . . . .	3646
Example: Advertising Multiple BGP Paths to a Destination . . . . .	3658
Understanding the Advertisement of Multiple Paths to a Single Destination in BGP . . . . .	3658
Example: Advertising Multiple Paths in BGP . . . . .	3659
IBGP Scaling Configuration . . . . .	3684
Example: Configuring BGP Route Reflectors . . . . .	3684
Understanding BGP Route Reflectors . . . . .	3684
Example: Configuring a Route Reflector . . . . .	3686
Example: Configuring BGP Confederations . . . . .	3701
Understanding BGP Confederations . . . . .	3701
Example: Configuring BGP Confederations . . . . .	3702
BGP Security Configuration . . . . .	3707
Example: Configuring BGP Route Authentication . . . . .	3708
Understanding Route Authentication . . . . .	3708
Example: Configuring Route Authentication for BGP . . . . .	3709
Examples: Configuring TCP and BGP Security . . . . .	3714
Understanding Security Options for BGP with TCP . . . . .	3714
Example: Configuring a Filter to Block TCP Access to a Port Except from Specified BGP Peers . . . . .	3715
Example: Configuring a Filter to Limit TCP Access to a Port Based On a Prefix List . . . . .	3720
Example: Limiting TCP Segment Size for BGP . . . . .	3723
BGP Flap Configuration . . . . .	3728
Example: Preventing BGP Session Resets . . . . .	3728
Understanding BGP Session Resets . . . . .	3728
Example: Preventing BGP Session Flaps When VPN Families Are Configured . . . . .	3728
Examples: Configuring BGP Flap Damping . . . . .	3736
Understanding BGP Route Flap Damping Parameters . . . . .	3736
Example: Configuring BGP Route Flap Damping Parameters . . . . .	3737
Example: Configuring BGP Route Flap Damping Based on the MBGP MVPN Address Family . . . . .	3746
BGP Monitoring Configuration . . . . .	3756
Example: Configuring BGP Trace Operations . . . . .	3756
Understanding Trace Operations for BGP Protocol Traffic . . . . .	3756
Example: Viewing BGP Trace Files on Logical Systems . . . . .	3758

<b>Chapter 42</b>	<b>Overview</b>	<b>4089</b>
	OSPF Overview	4089
	OSPF Overview	4090
	OSPF Default Route Preference Values	4092
	OSPF Routing Algorithm	4092
	OSPF Three-Way Handshake	4093
	OSPF Version 3	4094
	OSPF Areas and Router Functionality Overview	4095
	Areas	4095
	Area Border Routers	4095
	Backbone Areas	4095
	AS Boundary Routers	4096
	Backbone Router	4096
	Internal Router	4096
	Stub Areas	4096
	Not-So-Stubby Areas	4096
	Transit Areas	4097
	Packets Overview	4097
	OSPF Packet Header	4097
	Hello Packets	4098
	Database Description Packets	4098
	Link-State Request Packets	4098
	Link-State Update Packets	4098
	Link-State Acknowledgment Packets	4099
	Link-State Advertisement Packet Types	4099
	OSPF External Metrics Overview	4100
<b>Chapter 43</b>	<b>Configuration</b>	<b>4101</b>
	Basic OSPF Area Configuration	4101
	Examples: Configuring OSPF Designated Routers	4101
	OSPF Designated Router Overview	4101
	Example: Configuring an OSPF Router Identifier	4102
	Example: Controlling OSPF Designated Router Election	4104
	Examples: Configuring OSPF Areas	4106
	Understanding OSPF Areas and Backbone Areas	4106
	Example: Configuring a Single-Area OSPF Network	4107
	Example: Configuring a Multiarea OSPF Network	4109
	Advanced OSPF Area Configuration	4112
	Examples: Configuring OSPF Stub and Not-So-Stubby Areas	4113
	Understanding OSPF Stub Areas, Totally Stubby Areas, and	
	Not-So-Stubby Areas	4113
	Example: Configuring OSPF Stub and Totally Stubby Areas	4114
	Example: Configuring OSPF Not-So-Stubby Areas	4118
	Example: Configuring OSPF Multiarea Adjacency	4123
	Multiarea Adjacency for OSPF	4123
	Example: Configuring Multiarea Adjacency for OSPF	4124

Example: Disabling OSPFv2 Compatibility with RFC 1583 . . . . .	4127
OSPFv2 Compatibility with RFC 1583 Overview . . . . .	4128
Example: Disabling OSPFv2 Compatibility with RFC 1583 . . . . .	4128
OSPF Interface Configuration . . . . .	4129
Examples: Configuring OSPF Interfaces . . . . .	4130
About OSPF Interfaces . . . . .	4130
Example: Configuring an Interface on a Broadcast or Point-to-Point Network . . . . .	4131
Example: Configuring an OSPFv2 Interface on a Nonbroadcast Multiaccess Network . . . . .	4133
Example: Configuring an OSPFv2 Interface on a Point-to-Multipoint Network . . . . .	4136
Example: Configuring OSPF Demand Circuits . . . . .	4138
Example: Configuring a Passive OSPF Interface . . . . .	4140
Example: Configuring OSPFv2 Peer interfaces . . . . .	4142
OSPF Route Control Configuration . . . . .	4144
Examples: Configuring OSPF Route Summarization . . . . .	4144
Understanding OSPF Route Summarization . . . . .	4144
Example: Summarizing Ranges of Routes in OSPF Link-State Advertisements . . . . .	4145
Example: Limiting the Number of Prefixes Exported to OSPF . . . . .	4150
Configuring OSPF Refresh and Flooding Reduction in Stable Topologies . . . . .	4152
Examples: Configuring OSPF Traffic Control . . . . .	4153
Understanding OSPF Traffic Control . . . . .	4153
Example: Controlling the Cost of Individual OSPF Network Segments . . . . .	4155
Example: Dynamically Adjusting OSPF Interface Metrics Based on Bandwidth . . . . .	4159
Example: Controlling OSPF Route Preferences . . . . .	4161
Example: Configuring OSPF Overload Mode . . . . .	4163
OSPF Overload Function Overview . . . . .	4163
Example: Configuring OSPF to Make Routing Devices Appear Overloaded . . . . .	4164
OSPF Fault Detection Configuration . . . . .	4167
Example: Configuring OSPF Timers . . . . .	4167
OSPF Timers Overview . . . . .	4167
Example: Configuring OSPF Timers . . . . .	4168
Example: Configuring BFD for OSPF . . . . .	4174
Understanding BFD for OSPF . . . . .	4174
Example: Configuring BFD for OSPF . . . . .	4176
Example: Configuring BFD Authentication for OSPF . . . . .	4179
BFD Authentication for OSPF Overview . . . . .	4180
Configuring BFD Authentication for OSPF . . . . .	4181

OSPF Redundancy Features Configuration . . . . .	4184
Examples: Configuring Graceful Restart for OSPF . . . . .	4184
Graceful Restart for OSPF Overview . . . . .	4185
Example: Configuring Graceful Restart for OSPF . . . . .	4186
Example: Configuring the Helper Capability Mode for OSPFv2 Graceful Restart . . . . .	4190
Example: Configuring the Helper Capability Mode for OSPFv3 Graceful Restart . . . . .	4194
Example: Disabling Strict LSA Checking for OSPF Graceful Restart . .	4197
OSPF Traffic Engineering Configuration . . . . .	4200
Examples: Configuring OSPF Traffic Engineering . . . . .	4200
OSPF Support for Traffic Engineering . . . . .	4200
Example: Enabling OSPF Traffic Engineering Support . . . . .	4203
Example: Configuring the Traffic Engineering Metric for a Specific OSPF Interface . . . . .	4207
Example: Configuring OSPF Passive Traffic Engineering Mode . . . . .	4209
OSPF Passive Traffic Engineering Mode . . . . .	4209
Example: Configuring OSPF Passive Traffic Engineering Mode . . . .	4209
OSPF Database Protection Configuration . . . . .	4212
Example: Configuring OSPF Database Protection . . . . .	4212
OSPF Database Protection Overview . . . . .	4212
Configuring OSPF Database Protection . . . . .	4213
OSPF Policy Configuration . . . . .	4214
Examples: Configuring OSPF Routing Policy . . . . .	4214
Understanding OSPF Routing Policy . . . . .	4214
Example: Injecting OSPF Routes into the BGP Routing Table . . . . .	4216
Example: Redistributing Static Routes into OSPF . . . . .	4219
Example: Configuring an OSPF Import Policy . . . . .	4222
Example: Configuring a Route Filter Policy to Specify Priority for Prefixes Learned Through OSPF . . . . .	4226
Examples: Configuring Routing Policy for Network Summaries . . . . .	4230
Import and Export Policies for Network Summaries Overview . . . . .	4230
Example: Configuring an OSPF Export Policy for Network Summaries . . . . .	4231
Example: Configuring an OSPF Import Policy for Network Summaries . . . . .	4240
OSPF Monitoring Configuration . . . . .	4248
Example: Configuring OSPF Trace Options . . . . .	4248

<b>Part 16</b>	<b>Multicast</b>	
<b>Chapter 48</b>	<b>Overview . . . . .</b>	<b>4499</b>
	Introduction to PIM Basics . . . . .	4499
	PIM Overview . . . . .	4499
	Basic PIM Network Components . . . . .	4502
	PIM on Aggregated Interfaces . . . . .	4502
	Introduction to PIM Sparse Mode . . . . .	4503
	Understanding PIM Sparse Mode . . . . .	4503
	Rendezvous Point . . . . .	4505
	RP Mapping Options . . . . .	4505
	Designated Router . . . . .	4506
	Introduction to Static RP . . . . .	4506
	Understanding Static RP . . . . .	4506
	Introduction to Anycast RP . . . . .	4507
	Understanding RP Mapping with Anycast RP . . . . .	4507
	Introduction to PIM Bootstrap Router . . . . .	4507
	Understanding the PIM Bootstrap Router . . . . .	4507
	Introduction to PIM Filtering . . . . .	4508
	Understanding Multicast Message Filters . . . . .	4508
	Filtering MAC Addresses . . . . .	4509
	Filtering RP and DR Register Messages . . . . .	4509
	Introduction to PIM RPT and SPT Cutover . . . . .	4510
	Understanding Multicast Rendezvous Points, Shared Trees, and	
	Rendezvous-Point Trees . . . . .	4510
	Building an RPT Between the RP and Receivers . . . . .	4511
	PIM Sparse Mode Source Registration . . . . .	4512
	Multicast Shortest-Path Tree . . . . .	4515
	SPT Cutover . . . . .	4516
	SPT Cutover Control . . . . .	4519
	Introduction to IGMP . . . . .	4519
	Understanding Group Membership Protocols . . . . .	4519
	Understanding IGMP . . . . .	4521
	Introduction to IGMP Snooping . . . . .	4523
	IGMP Snooping Overview . . . . .	4523
	How IGMP Snooping Works . . . . .	4523
	How IGMP Snooping Works with Routed VLAN Interfaces . . . . .	4524

	How Hosts Join and Leave Multicast Groups . . . . .	4524
	IGMP Snooping and Forwarding Interfaces . . . . .	4524
	General Forwarding Rules . . . . .	4525
	Using a Switch as an IGMP Querier . . . . .	4525
	Introduction to MSDP . . . . .	4526
	Understanding MSDP . . . . .	4526
	Filtering MSDP SA Messages . . . . .	4528
	Introduction to Source-Specific Multicast . . . . .	4528
	Source-Specific Multicast Groups Overview . . . . .	4528
	Understanding PIM Source-Specific Mode . . . . .	4529
	PIM SSM . . . . .	4530
	Introduction to Multicast VLAN Registration . . . . .	4532
	Understanding Multicast VLAN Registration . . . . .	4532
	How MVR Works . . . . .	4532
<b>Chapter 49</b>	<b>Configuration . . . . .</b>	<b>4535</b>
	Optimizing Multicast Flows on QFabric Systems . . . . .	4535
	Optimizing the Number of Multicast Flows on QFabric Systems . . . . .	4536
	PIM Basics . . . . .	4536
	Changing the PIM Version . . . . .	4536
	Modifying the PIM Hello Interval . . . . .	4536
	Preserving Multicast Performance by Disabling Response to the ping Utility . . . . .	4537
	Configuring PIM Trace Options . . . . .	4538
	Disabling PIM . . . . .	4540
	Disabling the PIM Protocol . . . . .	4541
	Disabling PIM On an Interface . . . . .	4541
	Disabling PIM for a Family . . . . .	4542
	Disabling PIM for a Rendezvous Point . . . . .	4542
	PIM Designated Router . . . . .	4543
	Configuring Interface Priority for PIM Designated Router Selection . . . . .	4543
	Configuring PIM Designated Router Election on Point-to-Point Links . . . . .	4544
	PIM Sparse Mode . . . . .	4544
	Enabling PIM Sparse Mode . . . . .	4545
	Configuring PIM Join Load Balancing . . . . .	4546
	Modifying the Join State Timeout . . . . .	4549
	Example: Enabling Join Suppression . . . . .	4549
	Static RP . . . . .	4554
	Configuring Local PIM RPs . . . . .	4554
	Configuring the Static PIM RP Address on the Non-RP Routing Device . . . . .	4556
	Anycast RP . . . . .	4557
	Example: Configuring PIM Anycast With or Without MSDP . . . . .	4557
	Configuring a PIM Anycast RP Router with MSDP . . . . .	4561
	Configuring a PIM Anycast RP Router Using Only PIM . . . . .	4562
	Configuring All PIM Anycast Non-RP Routers . . . . .	4563
	Example: Configuring Multiple RPs in a Domain with Anycast RP . . . . .	4563

PIM Bootstrap Router	4566
Configuring PIM Bootstrap Properties for IPv4 or IPv6	4566
Example: Rejecting PIM Bootstrap Messages at the Boundary of a PIM Domain	4567
Example: Configuring PIM BSR Filters	4568
PIM Filtering	4568
Configuring Interface-Level PIM Neighbor Policies	4569
Filtering Outgoing PIM Join Messages	4570
Filtering Incoming PIM Join Messages	4571
Configuring Register Message Filters on a PIM RP and DR	4572
PIM RPT and SPT Cutover	4574
Example: Configuring the PIM Assert Timeout	4574
Example: Configuring the PIM SPT Threshold Policy	4577
PIM and the BFD Protocol	4580
Configuring BFD for PIM	4580
Configuring BFD Authentication for PIM	4582
Configuring BFD Authentication Parameters	4582
Viewing Authentication Information for BFD Sessions	4583
IGMP	4585
Configuring IGMP	4585
Enabling IGMP	4587
Changing the IGMP Version	4588
Modifying the IGMP Host-Query Message Interval	4589
Modifying the IGMP Last-Member Query Interval	4590
Specifying Immediate-Leave Host Removal for IGMP	4590
Filtering Unwanted IGMP Reports at the IGMP Interface Level	4591
Accepting IGMP Messages from Remote Subnetworks	4592
Modifying the IGMP Query Response Interval	4593
Modifying the IGMP Robustness Variable	4594
Limiting the Maximum IGMP Message Rate	4595
Enabling IGMP Static Group Membership	4595
Recording IGMP Join and Leave Events	4602
Limiting the Number of IGMP Multicast Group Joins on Logical Interfaces	4603
Tracing IGMP Protocol Traffic	4604
Disabling IGMP	4606
IGMP Snooping	4606
Configuring IGMP Snooping	4607
Changing the IGMP Snooping Group Timeout Value	4608
Example: Configuring IGMP Snooping	4608
Using a Switch as an IGMP Querier	4610
Configuring Multicast VLAN Registration (CLI Procedure)	4611
Example: Configuring Multicast VLAN Registration	4612
MSDP	4617
Configuring MSDP	4617
Tracing MSDP Protocol Traffic	4618

Configuring the Interface to Accept Traffic from a Remote Source . . . . .	4620
Example: Configuring MSDP . . . . .	4621
Example: Configuring MSDP with Active Source Limits and Mesh Groups . .	4622
Example: Configuring PIM Anycast With or Without MSDP . . . . .	4628
Configuring a PIM Anycast RP Router with MSDP . . . . .	4631
Source-Specific Multicast . . . . .	4632
Example: Configuring PIM SSM on a Network . . . . .	4632
Example: Configuring an SSM-Only Domain . . . . .	4634
Example: Configuring SSM Mapping . . . . .	4634
Example: Configuring Source-Specific Multicast Groups with Any-Source Override . . . . .	4637
Example: Configuring SSM Maps for Different Groups to Different Sources . . . . .	4640
Multiple SSM Maps and Groups for Interfaces . . . . .	4640
Example: Configuring Multiple SSM Maps Per Interface . . . . .	4641
PIM Configuration Statements . . . . .	4644
address (Anycast RPs) . . . . .	4646
address (Local RPs) . . . . .	4647
address (Static RPs) . . . . .	4648

## Part 17

### Chapter 51

## Security

<b>Overview .....</b>	<b>4929</b>
Firewall Filters .....	4929
Overview of Firewall Filters .....	4929
Firewall Filter Types .....	4930
Firewall Filter Components .....	4931
Firewall Filter Processing .....	4931
Understanding How Firewall Filters Are Evaluated .....	4932
Understanding How Firewall Filters Control Packet Flows .....	4934
Understanding Firewall Filter Match Conditions .....	4935
Filter Match Conditions .....	4935
Numeric Filter Match Conditions .....	4935
Interface Filter Match Conditions .....	4936
IP Address Filter Match Conditions .....	4936
MAC Address Filter Match Conditions .....	4937
Bit-Field Filter Match Conditions .....	4937
Firewall Filter Match Conditions and Actions .....	4938
Understanding How a Firewall Filter Tests a Protocol .....	4959
Understanding Firewall Filter Planning .....	4960
Planning the Number of Firewall Filters to Create .....	4961
Understanding How Many Firewall Filters Are Supported .....	4962
Egress Filters .....	4963
Avoid Configuring too Many Filters .....	4963
Configuring TCAM Error Messages .....	4964
Policers can Limit Egress Filters .....	4964
Planning for Filter-Specific Policers .....	4965

Understanding Firewall Filter Processing Points for Bridged and Routed Packets . . . . .	4965
Applying Firewall Filters to Interfaces . . . . .	4966
Policers . . . . .	4967
Overview of Policers . . . . .	4967
Policer Overview . . . . .	4967
Policer Types . . . . .	4968
Policer Actions . . . . .	4969
Policer Colors . . . . .	4969
Filter-Specific Policers . . . . .	4970
Suggested Naming Convention for Policers . . . . .	4970
Policer Counters . . . . .	4971
Policer Algorithms . . . . .	4971
How Many Policers are Supported? . . . . .	4971
Policers can Limit Egress Firewall Filters . . . . .	4971
Understanding Policers with Link Aggregation Groups . . . . .	4972
Understanding Color-Blind Mode for Single-Rate Tricolor Marking . . . . .	4973
Understanding Color-Aware Mode for Single-Rate Tricolor Marking . . . . .	4973
Summary of PLP Changes . . . . .	4973
Understanding Color-Blind Mode for Two-Rate Tricolor Marking . . . . .	4975
Understanding Color-Aware Mode for Two-Rate Tricolor Marking . . . . .	4975
Summary of PLP Changes . . . . .	4975
Effect on Green Packets (Low PLP) . . . . .	4976
Effect on Yellow Packets (Medium PLP) . . . . .	4976
Effect on Red Packets (High PLP) . . . . .	4977
Port Security . . . . .	4977
Overview of Access Port Protection . . . . .	4977
Mitigation of Ethernet Switching Table Overflow Attacks . . . . .	4978
Mitigation of Rogue DHCP Server Attacks . . . . .	4978
Protection Against ARP Spoofing Attacks . . . . .	4978
Protection Against DHCP Snooping Database Alteration Attacks . . . . .	4979
Protection Against DHCP Starvation Attacks . . . . .	4979
Understanding Port Security . . . . .	4980
Understanding DHCP Snooping for Port Security . . . . .	4982
DHCP Snooping Basics . . . . .	4982
DHCP Snooping Process . . . . .	4983
DHCPv6 Snooping . . . . .	4984
Rapid Commit for DHCPv6 . . . . .	4985
DHCP Server Access . . . . .	4985
Static IP Address Additions to the DHCP Snooping Database . . . . .	4988
Snooping DHCP Packets That Have Invalid IP Addresses . . . . .	4988
Prioritizing Snooped Packets . . . . .	4989
Understanding DAI for Port Security . . . . .	4989
Address Resolution Protocol . . . . .	4989
ARP Spoofing . . . . .	4990
Dynamic ARP Inspection . . . . .	4990
Prioritizing Inspected Packets . . . . .	4991

	Understanding MAC Limiting and MAC Move Limiting for Port Security . . .	4992
	MAC Limiting . . . . .	4992
	MAC Move Limiting . . . . .	4992
	Actions for MAC Limiting . . . . .	4993
	MAC Addresses That Exceed the MAC Limit or MAC Move Limit . . .	4993
	Understanding Trusted and Untrusted Ports . . . . .	4994
	Understanding Trusted DHCP Servers for Port Security . . . . .	4994
	Understanding DHCP Option 82 for Port Security . . . . .	4995
	DHCP Option 82 Processing . . . . .	4995
	Suboption Components of Option 82 . . . . .	4996
	Configurations That Support Option 82 . . . . .	4996
	Understanding Static ARP Entries . . . . .	4997
	Device Security . . . . .	4998
	Understanding Storm Control . . . . .	4998
<b>Chapter 52</b>	<b>Configuration . . . . .</b>	<b>5001</b>
	Firewall and Policer Configuration Examples . . . . .	5001
	Example: Using Two-Color Policers and Prefix Lists . . . . .	5001
	Example: Using Policers to Manage Oversubscription . . . . .	5004
	Port Security Configuration Examples . . . . .	5006
	Example: Configuring Basic Port Security Features . . . . .	5006
	Example: Configuring Storm Control to Prevent Network Outages . . . . .	5013
	Example: Configuring MAC Limiting to Protect the Switch from DHCP Starvation Attacks . . . . .	5015
	Example: Configuring MAC Limiting, Including Dynamic and Allowed MAC Addresses, to Protect the Switch from Ethernet Switching Table Overflow Attacks . . . . .	5018
	Example: Configuring a DHCP Server Interface as Untrusted to Protect the Switch from Rogue DHCP Server Attacks . . . . .	5022
	Example: Configuring DHCP Snooping, DAI, and MAC Limiting on a Switch with Access to a DHCP Server Through a Second Switch . . . . .	5025
	Example: Configuring DHCP Snooping and DAI to Protect the Switch from ARP Spoofing Attacks . . . . .	5033
	Example: Configuring Allowed MAC Addresses to Protect the Switch from DHCP Snooping Database Alteration Attacks . . . . .	5038
	Example: Setting Up DHCP Option 82 with a Switch with No Relay Agent Between Clients and a DHCP Server . . . . .	5041
	Example: Setting Up DHCP Option 82 with a Switch as a Relay Agent Between Clients and a DHCP Server . . . . .	5045
	Firewall and Policer Configuration Tasks . . . . .	5047
	Configuring Firewall Filters . . . . .	5048
	Configuring a Firewall Filter . . . . .	5048
	Applying a Firewall Filter to a Port . . . . .	5050
	Applying a Firewall Filter to a VLAN . . . . .	5050
	Applying a Firewall Filter to a Layer 3 (Routed) Interface . . . . .	5050
	Applying Firewall Filters to Interfaces . . . . .	5051
	Assigning Forwarding Classes and Loss Priority . . . . .	5052

Configuring Color-Blind Egress Policers for Medium-Low PLP . . . . .	5053
Configuring Two-Color and Three-Color Policers to Control Traffic	
Rates . . . . .	5054
Configuring Two-Color Policers . . . . .	5054
Configuring Three-Color Policers . . . . .	5055
Specifying Policers in a Firewall Filter Configuration . . . . .	5055
Applying a Firewall Filter That Includes a Policer . . . . .	5056
Port Security Configuration Tasks . . . . .	5056
Configuring Port Security (CLI Procedure) . . . . .	5057
Enabling DHCP Snooping . . . . .	5058
Enabling Dynamic ARP Inspection (DAI) . . . . .	5058
Enabling IPv6 Neighbor Discovery Inspection . . . . .	5058
Limiting Dynamic MAC Addresses on an Interface . . . . .	5059
Enabling Persistent MAC Learning on an Interface . . . . .	5059
Limiting MAC Address Movement . . . . .	5059
Configuring Trusted DHCP Servers on an Interface . . . . .	5059
Configuring MAC Limiting . . . . .	5060
Configuring MAC Move Limiting (CLI Procedure) . . . . .	5062
Configuring Autorecovery for MAC Limited or Storm Control Interfaces (CLI Procedure) . . . . .	5064
Configuring the none Action to Override a MAC Limit Applied to All Interfaces (CLI Procedure) . . . . .	5064
Configuring Static ARP Entries . . . . .	5065
Configuring Static IP Addresses for DHCP Bindings on Access Ports (CLI Procedure) . . . . .	5065
Enabling DHCP Snooping (CLI Procedure) . . . . .	5066
Enabling DHCP Snooping . . . . .	5067
Applying CoS Forwarding Classes to Prioritize Snooped Packets . . . .	5067
Enabling Dynamic ARP Inspection (CLI Procedure) . . . . .	5068
Enabling DAI . . . . .	5069
Applying CoS Forwarding Classes to Prioritize Inspected Packets . . .	5069
Enabling a Trusted DHCP Server (CLI Procedure) . . . . .	5070
Enabling a Trusted Port for DHCP . . . . .	5071
Setting Up DHCP Option 82 on the Switch with No Relay Agent Between Clients and DHCP Server (CLI Procedure) . . . . .	5072
Setting Up DHCP Option 82 with the Switch as a Relay Agent Between Clients and DHCP Server (CLI Procedure) . . . . .	5075

<b>Chapter 64</b>	<b>Configuration</b>	<b>6031</b>
	Configuration Examples	6031
	Example: Configuring CoS Hierarchical Port Scheduling (ETS)	6032
	Example: Configuring CoS PFC for FCoE Traffic	6054
	Example: Configuring CoS for FCoE Transit Switch Traffic Across an MC-LAG	6062
	Example: Configuring Unicast Classifiers	6086
	Example: Configuring Multidestination (Multicast, Broadcast, DLF) Classifiers	6089
	Example: Configuring WRED Drop Profiles	6092
	Example: Configuring Drop Profile Maps	6094
	Example: Configuring Forwarding Classes	6096
	Example: Configuring Forwarding Class Sets	6099
	Example: Configuring Queue Schedulers	6102
	Example: Configuring Queue Scheduling Priority	6108
	Example: Configuring Traffic Control Profiles (Priority Group Scheduling)	6110
	Example: Configuring Minimum Guaranteed Output Bandwidth	6113
	Example: Configuring Maximum Output Bandwidth	6117
	Example: Configuring Lossless FCoE Traffic When the Converged Ethernet Network Does Not Use IEEE 802.1p Priority 3 for FCoE Traffic (FCoE Transit Switch)	6121
	Example: Configuring Two or More Lossless FCoE Priorities on the Same FCoE Transit Switch Interface	6129
	Example: Configuring Two or More Lossless FCoE IEEE 802.1p Priorities on Different FCoE Transit Switch Interfaces	6138
	Example: Configuring Lossless IEEE 802.1p Priorities on Ethernet Interfaces for Multiple Applications (FCoE and iSCSI)	6152
	Example: Configuring IEEE 802.1p Priority Remapping on an FCoE-FC Gateway	6168
	Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Best-Effort Unicast Traffic	6177
	Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Best-Effort Traffic on Links with Ethernet PAUSE Enabled	6183
	Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Multicast Traffic	6188
	Example: Recommended Configuration of the Shared Buffer Pool for Networks with Mostly Lossless Traffic	6194
	Example: Configuring DCBX Application Protocol TLV Exchange	6200
	QFabric-Specific Configuration Examples	6211
	Example: Configuring CoS Scheduling Across the QFabric System	6211
	Configuration Tasks	6241
	Configuring CoS	6241
	Defining CoS Code-Point Aliases	6243
	Defining CoS Unicast BA Classifiers (DSCP, DSCP IPv6, IEEE 802.1p)	6244
	Defining CoS Multidestination (Multicast, Broadcast, DLF) BA Classifiers	6245
	Configuring CoS WRED Drop Profiles	6246

Configuring CoS Drop Profile Maps . . . . .	6247
Defining CoS Forwarding Classes . . . . .	6247

<b>Part 21</b>	<b>Network Management and Monitoring</b>	
<b>Chapter 67</b>	<b>Overview . . . . .</b>	<b>6565</b>
	Network Management . . . . .	6565
	Understanding Device and Network Management Features . . . . .	6565
	Understanding Network Management Implementation on the QFabric System . . . . .	6568
	Understanding Telnet on the QFabric System . . . . .	6569
	Understanding Tracing and Logging Operations . . . . .	6570
	Automation Scripts . . . . .	6571
	Understanding Automation Scripts Support . . . . .	6572
	How Commit Scripts Work . . . . .	6573
	Commit Script Input . . . . .	6574
	Commit Script Output . . . . .	6574
	Commit Scripts and the Junos OS Commit Model . . . . .	6575
	Avoiding Potential Conflicts When Using Multiple Commit Scripts . . . . .	6578
	Overview of Generating Persistent or Transient Configuration Changes . . . . .	6579
	Differences Between Persistent and Transient Changes . . . . .	6580
	Interaction of Configuration Changes and Configuration Groups . . . . .	6583
	Tag Elements and Templates for Generating Changes . . . . .	6583
	Required Boilerplate for Commit Scripts . . . . .	6584
	How Op Scripts Work . . . . .	6585
	Required Boilerplate for Op Scripts . . . . .	6586

Fabric OAM .....	6588
Overview of Internal Fabric Monitoring .....	6588
Junos Space .....	6590
Understanding Junos Space Support .....	6590
Preparing the Device for Junos Space Management .....	6591
sFlow Technology .....	6592
Overview of sFlow Technology .....	6592
SNMP .....	6595
Understanding the Implementation of SNMP .....	6595
Understanding the Implementation of SNMP on the QFabric System ...	6598
Fabric Chassis MIB .....	6600
Utility MIB .....	6604
SNMPv3 Overview .....	6605
Minimum SNMPv3 Configuration on a Device Running Junos OS .....	6606
Understanding RMON .....	6607
RMON Overview .....	6607
Alarm Thresholds and Events .....	6608
RMON MIB Event, Alarm, Log, and History Control Tables .....	6609
Understanding Health Monitoring .....	6611
SNMP MIBs Support .....	6612
MIBs Supported on QFX Series Standalone Switches and QFX Series	
Virtual Chassis .....	6612
MIBs Supported on QFabric Systems .....	6621
SNMP Traps Support .....	6628
SNMP Traps Supported on QFX Series Standalone Switches and QFX	
Series Virtual Chassis .....	6628
SNMP Traps Supported on QFabric Systems .....	6636
MIB Objects for the QFX Series .....	6640
QFX Series Standalone Switches .....	6640
QFabric Systems .....	6640
QFabric System QFX3100 Director Device .....	6641
QFabric System QFX3008-I Interconnect Device .....	6641
QFabric System QFX3600-I Interconnect Device .....	6641
QFabric System Node Devices .....	6642
System Logging .....	6642
Overview of Junos OS System Log Messages .....	6642
Overview of Single-Chassis System Logging Configuration .....	6643
Understanding the Implementation of System Log Messages on the QFabric	
System .....	6644
<b>Chapter 68 Configuration .....</b>	<b>6647</b>
Configuration Examples .....	6647
Examples: Configuring System Logging .....	6647
Examples: Assigning an Alternative Facility .....	6649
Example: Configuring System Log Messages .....	6650
Example: Monitoring Network Traffic Using sFlow Technology .....	6653
Example: Configuring SNMP .....	6657

Example: Configuring Internal Fabric OAM Monitoring . . . . .	6659
Configuration Tasks for Network Management . . . . .	6665
Configuring Console and Auxiliary Port Properties . . . . .	6665
Configuring SSH Service for Remote Access to the Router or Switch . . . . .	6666
Configuring the Root Login Through SSH . . . . .	6667
Configuring the SSH Protocol Version . . . . .	6668
Configuring the Client Alive Mechanism . . . . .	6668
Configuring Telnet Service for Remote Access to a Switch . . . . .	6668
Configuration Tasks for Automation Scripts . . . . .	6669
Controlling the Execution of Commit Scripts . . . . .	6669
Enabling Commit Scripts to Execute . . . . .	6670
Removing Commit Scripts from the Configuration . . . . .	6670
Deactivating Commit Scripts . . . . .	6671
Activating Inactive Commit Scripts . . . . .	6671
Configuration Tasks for Fabric OAM . . . . .	6672
Configuring a Fabric Maintenance Association . . . . .	6672
Configuring Flow Specifications . . . . .	6673
Configuring a Unicast Ethernet Flow Specification . . . . .	6674
Configuring a Unicast Ethernet IPv4 Flow Specification . . . . .	6675
Configuring a Multicast IPv4 Flow Specification . . . . .	6676
Configuring a Multicast VLAN Flood Flow Specification . . . . .	6676
Configuration Tasks for sFlow Technology . . . . .	6677
Configuring sFlow Technology . . . . .	6677
Configuration Tasks for SNMP . . . . .	6678
Configuring SNMP . . . . .	6679
Configuring the SNMP Community String . . . . .	6682
Configuring SNMP Trap Groups . . . . .	6683
Adding a Group of Clients to an SNMP Community . . . . .	6684
Configuring the Interfaces on Which SNMP Requests Can Be Accepted . . . . .	6685
Configuring MIB Views . . . . .	6686
Configuring RMON Alarms and Events . . . . .	6687
Configuring SNMP . . . . .	6688
Configuring an Event . . . . .	6688
Configuring an Alarm . . . . .	6689
Configuring Health Monitoring . . . . .	6690
Creating SNMPv3 Users . . . . .	6690
Configuring Access Privileges for a Group . . . . .	6692
Assigning a Security Name to a Group . . . . .	6693
Configuring SNMPv3 Traps on a Device Running Junos OS . . . . .	6694
Configuring SNMP Informs . . . . .	6695
Configuration Tasks for System Log Messages . . . . .	6696
Junos OS Minimum System Logging Configuration . . . . .	6697
Junos OS System Log Configuration Statements . . . . .	6697
Adding a Text String to System Log Messages Directed to a Remote Destination . . . . .	6698
Directing System Log Messages to a Log File . . . . .	6699
Directing System Log Messages to a Remote Machine . . . . .	6700
Directing System Log Messages to a User Terminal . . . . .	6701
Directing System Log Messages to the Console . . . . .	6701

Disabling the System Logging of a Facility . . . . .	6701
Displaying a Log File from a Single-Chassis System . . . . .	6702
Including Priority Information in System Log Messages . . . . .	6703
Including the Year or Millisecond in Timestamps . . . . .	6704
Logging Messages in Structured-Data Format . . . . .	6705
Interpreting Messages Generated in Structured-Data Format . . . . .	6706
Interpreting Messages Generated in Standard Format . . . . .	6709
Specifying Log File Size, Number, and Archiving Properties . . . . .	6710
Specifying the Facility and Severity of Messages to Include in the Log . . . .	6712
Junos OS System Logging Facilities and Message Severity Levels . . . . .	6712
Default Facilities for System Log Messages Directed to a Remote Destination . . . . .	6714
Alternate Facilities for System Log Messages Directed to a Remote Destination . . . . .	6714
Changing the Alternative Facility Name for System Log Messages Directed to a Remote Destination . . . . .	6715
Using Regular Expressions to Refine the Set of Logged Messages . . . . .	6717
Configuration Statements for Network Management . . . . .	6719
connection-limit . . . . .	6720
destination-override . . . . .	6721
no-remote-trace . . . . .	6721
protocol-version . . . . .	6722
rate-limit . . . . .	6723
ssh . . . . .	6724
telnet . . . . .	6725
tracing . . . . .	6726
Configuration Statements for Automation Scripts . . . . .	6726
allow-transients . . . . .	6727

<b>Chapter 69</b>	<b>Administration</b>	<b>6877</b>
	Routine Monitoring Using the CLI	6877
	Displaying a Log File from a Single-Chassis System	6877
	Monitoring Traffic Through the Router or Switch	6878
	Displaying Real-Time Statistics About All Interfaces on the Router or Switch	6878
	Displaying Real-Time Statistics About an Interface on the Router or Switch	6879
	Monitoring RMON MIB Tables	6881
	Monitoring SNMP	6881
	Monitoring System Log Messages	6883
	Pinging Hosts	6884
	Tracing SNMP Activity on a Device Running Junos OS	6885
	Configuring the Number and Size of SNMP Log Files	6886
	Configuring Access to the Log File	6886
	Configuring a Regular Expression for Lines to Be Logged	6886
	Configuring the Trace Operations	6887
	Using the Enterprise-Specific Utility MIB to Enhance SNMP Coverage	6888
	Displaying Commit Script Output	6890
	Monitoring Commands	6892
	clear sflow collector statistics	6893
	clear snmp history	6894
	clear snmp statistics	6895
	monitor traffic	6897
	ping	6907
	ping fabric multicast-flow	6911
	ping fabric unicast-flow	6913
	request snmp spoof-trap	6916
	request snmp utility-mib clear instance	6922
	request snmp utility-mib set instance	6923
	show oam fabric flow-specification	6924
	show oam fabric interfaces	6927
	show log	6929
	show sflow	6932
	show sflow collector	6934
	show sflow interface	6935
	show snmp health-monitor	6937
	show snmp inform-statistics	6942
	show snmp mib	6944
	show snmp rmon	6947
	show snmp rmon history	6951
	show snmp statistics	6952
	show snmp v3	6956
	traceroute fabric unicast-flow	6959
<b>Chapter 70</b>	<b>Troubleshooting</b>	<b>6963</b>
	Troubleshooting Overview	6963
	Understanding Troubleshooting Resources	6963
	Troubleshooting Overview	6965

	QFX5100 Switch with Automation Enhancements Frequently Asked Questions . . . . .	6967

Troubleshooting Firewall Filter Configuration . . . . .	7045
Firewall Filter Configuration Returns a No Space Available in TCAM Message . . . . .	7045
Filter Counts Previously Dropped Packet . . . . .	7047
Matching Packets Not Counted . . . . .	7047
Counter Reset When Editing Filter . . . . .	7048
Cannot Include loss-priority and policer Actions in Same Term . . . . .	7048
Cannot Egress Filter Certain Traffic Originating on QFX Switch . . . . .	7048
Firewall Filter Match Condition Not Working with Q-in-Q Tunneling . . . . .	7049
Egress Firewall Filters with Private VLANs . . . . .	7049
Egress Filtering of L2PT Traffic Not Supported . . . . .	7050
Cannot Drop BGP Packets in Certain Circumstances . . . . .	7050
Invalid Statistics for Policer . . . . .	7050
Policers can Limit Egress Filters . . . . .	7050
Troubleshooting Policer Configuration . . . . .	7051
Incomplete Count of Packet Drops . . . . .	7052
Counter Reset When Editing Filter . . . . .	7052
Invalid Statistics for Policer . . . . .	7052
Egress Policers on QFX3500 Devices Might Allow More Throughput Than Is Configured . . . . .	7052
Filter-Specific Egress Policers on QFX3500 Devices Might Allow More Throughput Than Is Configured . . . . .	7053
Policers Can Limit Egress Filters . . . . .	7054
Services . . . . .	7055
Troubleshooting Port Mirroring . . . . .	7055
Port Mirroring Constraints and Limitations . . . . .	7055
Egress Port Mirroring with VLAN Translation . . . . .	7057
Egress Port Mirroring with Private VLANs . . . . .	7057
Traffic Management . . . . .	7058
Troubleshooting Dropped FCoE Traffic . . . . .	7058
Troubleshooting Egress Bandwidth That Exceeds the Configured Maximum Bandwidth . . . . .	7061
Troubleshooting Egress Bandwidth That Exceeds the Configured Minimum Bandwidth . . . . .	7062

Troubleshooting Egress Queue Bandwidth Impacted by Congestion . . .	7063
Troubleshooting an Unexpected Rewrite Value . . . . .	7064
Troubleshooting a Port Reset on QFabric Systems When a Queue Stops Transmitting Traffic . . . . .	7065
Virtual Chassis Fabric . . . . .	7067
Troubleshooting Virtual Chassis Fabric . . . . .	7067
Virtual Chassis Port Link Does Not Form . . . . .	7068
QFX5100 Leaf Device Assumes Routing Engine Role . . . . .	7068

# List of Figures

# About the Documentation

- Documentation and Release Notes on page cxxvii
- Supported Platforms on page cxxvii
- Using the Examples in This Manual on page cxxvii
- Documentation Conventions on page cxxix
- Documentation Feedback on page cxxxi
- Requesting Technical Support on page cxxxi

## Documentation and Release Notes

---

To obtain the most current version of all Juniper Networks® technical documentation, see the product documentation page on the Juniper Networks website at <http://www.juniper.net/techpubs/>.

If the information in the latest release notes differs from the information in the documentation, follow the product Release Notes.

Juniper Networks Books publishes books by Juniper Networks engineers and subject matter experts. These books go beyond the technical documentation to explore the nuances of network architecture, deployment, and administration. The current list can be viewed at <http://www.juniper.net/books>.

## Supported Platforms

---

For the features described in this document, the following platforms are supported:

- QFabric System

## Using the Examples in This Manual

---

If you want to use the examples in this manual, you can use the **load merge** or the **load merge relative** command. These commands cause the software to merge the incoming configuration into the current candidate configuration. The example does not become active until you commit the candidate configuration.

If the example configuration contains the top level of the hierarchy (or multiple hierarchies), the example is a *full example*. In this case, use the **load merge** command.

If the example configuration does not start at the top level of the hierarchy, the example is a *snippet*. In this case, use the **load merge relative** command. These procedures are described in the following sections.

## Merging a Full Example

To merge a full example, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration example into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following configuration to a file and name the file **ex-script.conf**. Copy the **ex-script.conf** file to the **/var/tmp** directory on your routing platform.

```
system {
  scripts {
    commit {
      file ex-script.xml;
    }
  }
}
interfaces {
  fxp0 {
    disable;
    unit 0 {
      family inet {
        address 10.0.0.1/24;
      }
    }
  }
}
```

2. Merge the contents of the file into your routing platform configuration by issuing the **load merge** configuration mode command:

```
[edit]
user@host# load merge /var/tmp/ex-script.conf
load complete
```

## Merging a Snippet

To merge a snippet, follow these steps:

1. From the HTML or PDF version of the manual, copy a configuration snippet into a text file, save the file with a name, and copy the file to a directory on your routing platform.

For example, copy the following snippet to a file and name the file **ex-script-snippet.conf**. Copy the **ex-script-snippet.conf** file to the **/var/tmp** directory on your routing platform.

```
commit {
  file ex-script-snippet.xml; }
```

2. Move to the hierarchy level that is relevant for this snippet by issuing the following configuration mode command:

```
[edit]
user@host# edit system scripts
[edit system scripts]
```

3. Merge the contents of the file into your routing platform configuration by issuing the **load merge relative** configuration mode command:

```
[edit system scripts]
user@host# load merge relative /var/tmp/ex-script-snippet.conf
load complete
```

For more information about the **load** command, see the *CLI User Guide*.

## Documentation Conventions

Table 1 on page cxxix defines notice icons used in this guide.

Table 1: Notice Icons

Icon	Meaning	Description
	Informational note	Indicates important features or instructions.
	Caution	Indicates a situation that might result in loss of data or hardware damage.
	Warning	Alerts you to the risk of personal injury or death.
	Laser warning	Alerts you to the risk of personal injury from a laser.
	Tip	Indicates helpful information.
	Best practice	Alerts you to a recommended use or implementation.

Table 2 on page cxxix defines the text and syntax conventions used in this guide.

Table 2: Text and Syntax Conventions

Convention	Description	Examples
<b>Bold text like this</b>	Represents text that you type.	To enter configuration mode, type the <b>configure</b> command:  user@host> <b>configure</b>

Table 2: Text and Syntax Conventions (*continued*)

Convention	Description	Examples
Fixed-width text like this	Represents output that appears on the terminal screen.	user@host> <b>show chassis alarms</b>  No alarms currently active
<i>Italic text like this</i>	<ul style="list-style-type: none"><li>Introduces or emphasizes important new terms.</li><li>Identifies guide names.</li><li>Identifies RFC and Internet draft titles.</li></ul>	<ul style="list-style-type: none"><li>A policy <i>term</i> is a named structure that defines match conditions and actions.</li><li><i>Junos OS CLI User Guide</i></li><li>RFC 1997, <i>BGP Communities Attribute</i></li></ul>
<i>Italic text like this</i>	Represents variables (options for which you substitute a value) in commands or configuration statements.	Configure the machine's domain name:  [edit] root@# <b>set system domain-name</b> <i>domain-name</i>
Text like this	Represents names of configuration statements, commands, files, and directories; configuration hierarchy levels; or labels on routing platform components.	<ul style="list-style-type: none"><li>To configure a stub area, include the <b>stub</b> statement at the [edit protocols <b>ospf area area-id</b>] hierarchy level.</li><li>The console port is labeled <b>CONSOLE</b>.</li></ul>
< > (angle brackets)	Encloses optional keywords or variables.	<b>stub &lt;default-metric <i>metric</i>&gt;;</b>
(pipe symbol)	Indicates a choice between the mutually exclusive keywords or variables on either side of the symbol. The set of choices is often enclosed in parentheses for clarity.	<b>broadcast   multicast</b>  <b>(<i>string1</i>   <i>string2</i>   <i>string3</i>)</b>
# (pound sign)	Indicates a comment specified on the same line as the configuration statement to which it applies.	<b>rsvp { # Required for dynamic MPLS only</b>
[ ] (square brackets)	Encloses a variable for which you can substitute one or more values.	<b>community name members [</b> <i>community-ids</i> <b>]</b>
Indentation and braces ( { } )	Identifies a level in the configuration hierarchy.	[edit] routing-options { static { route default { nexthop <i>address</i> ; retain; } } }
;(semicolon)	Identifies a leaf statement at a configuration hierarchy level.	
GUI Conventions		
Bold text like this	Represents graphical user interface (GUI) items you click or select.	<ul style="list-style-type: none"><li>In the Logical Interfaces box, select <b>All Interfaces</b>.</li><li>To cancel the configuration, click <b>Cancel</b>.</li></ul>

Table 2: Text and Syntax Conventions (*continued*)

Convention	Description	Examples
> (bold right angle bracket)	Separates levels in a hierarchy of menu selections.	In the configuration editor hierarchy, select <b>Protocols&gt;Ospf</b> .

## Documentation Feedback

We encourage you to provide feedback, comments, and suggestions so that we can improve the documentation. You can provide feedback by using either of the following methods:

- Online feedback rating system—On any page at the Juniper Networks Technical Documentation site at <http://www.juniper.net/techpubs/index.html>, simply click the stars to rate the content, and use the pop-up form to provide us with information about your experience. Alternately, you can use the online feedback form at <https://www.juniper.net/cgi-bin/docbugreport/>.
- E-mail—Send your comments to [techpubs-comments@juniper.net](mailto:techpubs-comments@juniper.net). Include the document or topic name, URL or page number, and software version (if applicable).

## Requesting Technical Support

Technical product support is available through the Juniper Networks Technical Assistance Center (JTAC). If you are a customer with an active J-Care or JNASC support contract, or are covered under warranty, and need post-sales technical support, you can access our tools and resources online or open a case with JTAC.

- JTAC policies—For a complete understanding of our JTAC procedures and policies, review the *JTAC User Guide* located at <http://www.juniper.net/us/en/local/pdf/resource-guides/7100059-en.pdf>.
- Product warranties—For product warranty information, visit <http://www.juniper.net/support/warranty/>.
- JTAC hours of operation—The JTAC centers have resources available 24 hours a day, 7 days a week, 365 days a year.

## Self-Help Online Tools and Resources

For quick and easy problem resolution, Juniper Networks has designed an online self-service portal called the Customer Support Center (CSC) that provides you with the following features:

- Find CSC offerings: <http://www.juniper.net/customers/support/>
- Search for known bugs: <http://www2.juniper.net/kb/>
- Find product documentation: <http://www.juniper.net/techpubs/>
- Find solutions and answer questions using our Knowledge Base: <http://kb.juniper.net/>

- Download the latest versions of software and review release notes:  
<http://www.juniper.net/customers/csc/software/>
- Search technical bulletins for relevant hardware and software notifications:  
<http://kb.juniper.net/InfoCenter/>
- Join and participate in the Juniper Networks Community Forum:  
<http://www.juniper.net/company/communities/>
- Open a case online in the CSC Case Management tool: <http://www.juniper.net/cm/>

To verify service entitlement by product serial number, use our Serial Number Entitlement (SNE) Tool: <https://tools.juniper.net/SerialNumberEntitlementSearch/>

## Opening a Case with JTAC

You can open a case with JTAC on the Web or by telephone.

- Use the Case Management tool in the CSC at <http://www.juniper.net/cm/>.
- Call 1-888-314-JTAC (1-888-314-5822 toll-free in the USA, Canada, and Mexico).

For international or direct-dial options in countries without toll-free numbers, see <http://www.juniper.net/support/requesting-support.html>.

## PART 1

# QFX3500 Switch Overview

- [QFX3500 Switch Overview on page 3](#)

## CHAPTER 1

# QFX3500 Switch Overview

- [QFX3500 Device Overview on page 3](#)

## QFX3500 Device Overview

---

The Juniper Networks QFX3500 device is a high-speed, multipurpose switch especially designed for next-generation data centers. The QFX3500 can be configured as a standalone switch, a Node device in a QFabric system, or as a member of a Virtual Chassis.

Forty-eight 10-Gbps access ports in the device use small form-factor pluggable plus (SFP+) transceivers and operate by default as 10-Gigabit Ethernet interfaces. Optionally, you can choose to configure up to 12 of the ports as 2-Gbps, 4-Gbps, or 8-Gbps Fibre Channel (FC) interfaces, and up to 36 of the ports as 1-Gigabit Ethernet interfaces. When used as a standalone switch, four 40-Gbps uplink ports in the device use quad small form-factor pluggable plus (QSFP+) to four SFP+ copper breakout cables to support an additional 15 10-Gigabit Ethernet interfaces.

QFX3500 devices can function as a Fibre Channel over Ethernet (FCoE)-FC gateway or as an FCoE transit switch. FCoE is a method of supporting converged FC and Ethernet traffic on a data center bridging (DCB) network by encapsulating unmodified FC frames in Ethernet to transport the FC frames over the physical Ethernet network.

In a QFabric system, a QFX3500 device functions as a Node device, connected to a QFabric system through 40-Gbps uplink ports to a Juniper Networks QFX3008-I or QFX3600-I Interconnect device. Together, the QFX3500 Node devices and QFX3008-I or QFX3600-I Interconnect devices form a multistage, nonblocking switch fabric that provides a high-performance, low-latency, unified interconnect solution for next-generation data centers.

The QFX3500 Node devices and Interconnect devices are connected to Juniper Networks QFX3100 Director devices in an out-of-band management network through Juniper Networks EX4200 Ethernet Switches. The QFX3100 Director devices present the QFabric system devices as a single network entity, which enables simplified management of your data center using the Junos OS command-line interface (CLI).

In a QFX Virtual Chassis, the QFX3500 device can participate with other QFX3500 devices and QFX3600 devices in a ring topology with up to 10 members.

- [Software on page 4](#)
- [Hardware on page 4](#)

## Software

QFX Series devices use the Junos operating system (OS), which provides Layer 2 and Layer 3 switching, routing, and security services. Junos OS is installed on the QFX3500 device's 8-gigabyte (GB) internal flash drive. The same Junos OS code base that runs on QFX3500 devices also runs on all Juniper Networks EX Series switches, and J Series, M Series, MX Series, and T Series routers.

For more information about which features are supported on QFX Series devices, see *QFX Series Software Features Overview*.

When the QFX3500 device is operating as a standalone switch, you manage the switch using the Junos OS command-line interface (CLI), accessible through the console and out-of-band management ports on the device.

When a QFX Series device operates as part of a QFabric system, all the devices in the data center fabric are managed through the Administrator software installed on the QFX3100 Director devices. Each device in a QFabric system is interconnected in a single control plane and management network, using the redundant management ports on each device.

## Hardware

The compact QFX3500 device is 1 rack unit (1 U) in size and designed to fit in industry-standard 19-inch rack-mount enclosures. See [Figure 1 on page 4](#) and [Figure 2 on page 5](#) and *Chassis Physical Specifications for a QFX3500 Chassis*.

**NOTE:** The standard mounting configuration for the QFX3500 device uses a two rail mounting system. The QFX3500-RB-ACRB device model uses a four rail mounting system for installations that need to recess the switch or need to mount the port (rear) end of the switch forward.

**Figure 1: QFX3500 Device Front**

Figure 2: QFX3500 Device Rear

The front panel of the QFX3500 chassis has an LCD panel that displays the device hostname and the number of active alarms. See *Front Panel of a QFX3500 Device*. The rear panel has 48 10-Gbps access ports and 4 40-Gbps uplink ports. See *Rear Panel of a QFX3500 Device*.

### SFP+ Access Ports

The QFX3500 device has 48 access ports (0 through 47) that support small form-factor pluggable plus (SFP+) and small form-factor pluggable (SFP) transceivers, as well as SFP+ direct attach copper cables, also known as Twinax cables. See *Interface Support for the QFX3500 Device*.

- Up to 48 of the access ports can be used for SFP+ transceivers or SFP+ direct attach copper cables. You can use 10-Gigabit Ethernet SFP+ transceivers and SFP+ direct attach copper cables in any access port. You can use 2-Gbps, 4-Gbps, or 8-Gbps Fibre Channel SFP+ transceivers in ports 0 through 5 and ports 42 through 47.

**NOTE:** If you use Fibre Channel SFP+ transceivers in ports 0 through 5 or ports 42 through 47, you must configure the entire block of ports as Fibre Channel ports. For example, if you use a Fibre Channel SFP+ transceiver in any of the ports 0 through 5, then ports 0 through 5 must be configured as Fibre Channel ports. If you use a Fibre Channel SFP+ transceiver in any of the ports 42 through 47, then ports 42 through 47 must be configured as Fibre Channel ports. You then cannot use 10-Gigabit Ethernet SFP+ transceivers in these ports.

- Up to 36 of the access ports can be used for SFP transceivers. Gigabit Ethernet SFP transceivers can be used in ports 6 through 41.

**CAUTION:** Do not place a copper transceiver in an access port directly above or below another copper transceiver. Internal damage to the access ports and device can occur. Because of this limitation, a maximum of 18 copper transceivers can be installed in ports 6 through 41. We recommend using only the top row of access ports for copper transceivers.

Figure 3 on page 6 shows the location of the SFP+ access ports, including the ports that can be used with Fibre Channel SFP+ transceivers and Gigabit Ethernet SFP transceivers.

**Figure 3: SFP+ Access Port Locations**

### QSFP+ Uplink Ports

The QFX3500 device has four uplink ports (Q0 through Q3) that support up to four QSFP+ transceivers, as well as QSFP+ DAC or DAC breakout cables. See *Interface Support for the QFX3500 Device*.

When the QFX3500 device is used as part of a QFabric system, these uplink ports are used to connect the QFX3500 Node device to QFX3008-I or QFX3600-I Interconnect devices. See *Connecting a QFX3500 Node Device to a QFX3008-I Interconnect Device* or *Connecting a QFX3500 Node Device to a QFX3600-I Interconnect Device*.

When the QFX3500 device is used as a standalone switch, these uplink ports are configured by default as 15 10-Gigabit Ethernet interfaces. Another option for these ports is to configure one or more of the ports as 40-Gigabit Ethernet interfaces.

**NOTE:** Port Q0 is unique in that the number of 10-Gigabit Ethernet interfaces supported varies by Junos OS release. In some Junos OS releases, port 00 has a reserved port and in other releases the port is available. See the topics on Channelizing Interfaces or Configuring the Port Type, for your specific release.

Figure 4 on page 7 shows the location of the QSFP+ uplink ports and the default 10-Gigabit Ethernet interface numbering.

**NOTE:** The QSFP+ uplink ports are not supported in Junos OS Release 11.1. The QSFP+ uplink ports are supported in Junos OS Release 11.2 and later. To configure the ports as 40-Gigabit Ethernet interfaces, you must be using Junos OS Release 12.2X50-D20 or later.

Figure 4: QSFP+ Uplink Port Locations

\*Port availability is release dependent.  
See the topic on Channelizing Interfaces for your Junos Release.

## CHAPTER 2

# QFX3600 Switch Overview

- [QFX3600 Device Overview on page 11](#)

## QFX3600 Device Overview

---

The Juniper Networks QFX3600 device is a high-speed, multipurpose switch especially designed for next-generation data centers. The QFX3600 device can be configured as:

- A standalone switch
- A Node device in a QFX3000-M or QFX3000-G QFabric system
- An Interconnect device in a QFX3000-M QFabric system
- A member in a QFX Virtual Chassis
- A leaf node in a Virtual Chassis Fabric (VCF)

Sixteen 40-Gbps ports in the device use quad small form-factor pluggable plus (QSFP+) transceivers. The small form-factor and front facing ports in the switch make it suitable for deployment in high-density server racks and container-based data center deployments.

In a QFX3000-G QFabric system, the QFX3600 device can operate as a Node device through the 40-Gbps uplinks ports to a Juniper Networks QFX3008-I Interconnect device. On a QFX3000-M QFabric device, the QFX3600 can be configured to operate as either a Node device or as a QFX3600-I Interconnect device. When configured as a Node device in a QFX3000-M QFabric system, the QFX3600 device can connect to either a QFX3600-I Interconnect device to a QFX5100-24Q through the 40-Gbps uplink ports. Together, the QFX3600 Node devices and Interconnect devices form a multistage, nonblocking switch fabric that provides a high-performance, low-latency, unified interconnect solution for next-generation data centers.

The QFX3600 Node devices and QFX3008-I or QFX3600-I Interconnect devices are connected to Juniper Networks QFX3100 Director devices in a control plane and management network. The QFX3100 Director device presents the QFabric system devices as a single network entity, allowing for simplified management of your data center using the Junos OS command-line interface (CLI).

In a Virtual Chassis, the QFX3600 device can participate with other QFX3600 devices or QFX3500 devices in a ring topology with up to 10 members.

In a Virtual Chassis Fabric, the QFX3600 device can participate as a leaf device. Up to a total of 32 devices can participate in the Virtual Chassis Fabric.

- [Software on page 12](#)
- [Hardware on page 12](#)

## Software

QFX Series devices use the Junos operating system (OS), which provides Layer 2 and Layer 3 switching, routing, and security services. Junos OS is installed on the QFX3600 device's 8-gigabyte (GB) internal flash drive. The same Junos OS code base that runs on QFX Series devices also runs on all Juniper Networks EX Series, J Series, M Series, MX Series, and T Series devices.

For more information about which features are supported on QFX Series devices, see *QFX Series Software Features Overview*.

When the QFX3600 device is operating as a standalone switch, you manage the switch using the Junos OS command-line interface (CLI), accessible through the console and out-of-band management ports on the device.

When a QFX Series device operates as part of a QFabric system, all the devices in the data center fabric are managed through the Administrator software installed on the QFX3100 Director devices. Each device in a QFabric system is interconnected in a single control plane and management network, using the redundant management ports on each device.

## Hardware

The compact QFX3600 chassis is 1 rack unit (1 U) in size and designed to fit in industry-standard 19-inch rack-mount enclosures, as well as high-density server racks and container-based data center deployments. See [Figure 5 on page 12](#) and [Figure 6 on page 13](#) and *Chassis Physical Specifications for QFX3600 and QFX3600-I Devices*.

**Figure 5: QFX3600 Chassis Front**

Figure 6: QFX3600 Chassis Rear

1— Power supplies

2— Fan trays

The front panel of the QFX3600 chassis has an LCD panel that displays the device hostname and the number of active alarms. It also has sixteen 40-Gbps ports labeled **Q0** through **Q15** that support quad small form-factor pluggable plus (QSFP+) transceivers. See *Front Panel of a QFX3600 Device*.

If you are using the QFX3600 device as a Node device in a QFabric system, by default, four ports (labeled **Q0** through **C3**) are configured for uplink connections between your QFX3600 Node device and your Interconnect device, and twelve ports (labeled **Q4** through **Q15**) support 48 10-Gigabit Ethernet or 12 40-Gigabit Ethernet interfaces for connections to either endpoint systems (such as servers and storage devices) or external networks. Optionally, you can choose to configure the first eight ports (labeled **Q0** through **Q7**) for uplink connections between your QFX3600 Node device and your Interconnect device and ports **Q2** through **Q15** for 10-Gigabit Ethernet or 40-Gigabit Ethernet connections to either endpoint systems or external networks. See [“Configuring the Port Type on QFX3600 Node Devices” on page 1503](#) and *Interface Support for the QFX3600 Device*.

If you are using the QFX3600 device as a standalone switch, by default, all 16 QSFP+ ports (**Q0** through **Q15**) are configured as 40-Gigabit Ethernet (xle) ports. Optionally, you can choose to configure each port to operate as 10-Gigabit Ethernet (xe) ports. Port **00** is unique because the number of ports you can specify as 10-Gigabit Ethernet varies by Junos OS release. In some Junos OS releases, port **00** has a reserved port and in other releases, the port is available. See the topics on channelizing interfaces or configuring the port type for your specific software release.

The rear panel of the QFX3600 chassis has two redundant power supplies and three redundant fan trays that are field-replaceable and hot-swappable. See *Rear Panel of QFX3600 and QFX3600-I Devices*.

## PART 3

# QFX5100 Switch Overview

- [QFX5100 Switch Overview on page 17](#)

## CHAPTER 3

# QFX5100 Switch Overview

- [QFX5100 Device Hardware Overview on page 17](#)

## QFX5100 Device Hardware Overview

---

The QFX5100 line of switches is Juniper Network's second generation of top-of-rack switch solutions for data centers and campus distribution or aggregation environments. The QFX5100 portfolio consists of high-performance fixed-configuration switches that add higher port densities, additional scalability, and improved latency to the QFX Series.

This topic covers:

- [QFX5100 Hardware on page 17](#)
- [System Software on page 21](#)

## QFX5100 Hardware

QFX5100 line of switches offer two compact 1 U models and a 2 U model that provide wire-speed packet performance, very low latency, and rich set of Layer 2 and Layer 3 features. In addition to a high-throughput Packet Forwarding Engine, the performance of the control plane running on all the QFX5100 switches is enhanced by the 1.5 Ghz dual core Intel CPU with 8 GB of memory and 32 GB of solid-state drive (SSD) storage.

The QFX5100 line of switches include both 10GE and 40GE fixed-configurations:

- QFX5100-48S

As shown in [Figure 7 on page 18](#), the QFX5100-48S is a 10-Gigabit Ethernet Enhanced Small Form-Factor Pluggable (SFP+) top-of-rack switch with 48 SFP+ ports and 6 Quad SFP+ (QSFP+) ports. Each SFP+ port can operate as a native 10 Gigabit port or a 1 Gigabit port when 1\_Gigabit optics are inserted. Each QSFP+ port (48 through 53) can operate as uplink ports or four QSFP+ port (50 through 53) can operate at native 40-Gigabit speed or as 4 independent 10-Gigabit port speeds. The 6 QSFP+ ports can be used as either access ports or as uplinks. The QFX5100-48S provides full duplex throughput of 1.44 Tbps. The QFX5100-48S has a 1 U form factor and comes standard with redundant fans and redundant power supplies. The switch can be ordered with either ports-to-FRUs or FRUs-to-ports airflow and with AC or DC power supplies.

Figure 7: QFX5100-48S Port Panel

The QFX5100-48S can be used as:

- A standalone switch.
- A Node device in a QFabric system.

The QFX5100-48S is supported on both the QFX3000-G and QFX3000-M QFabric systems.

- A master, backup, or line card in a QFX Virtual Chassis.

A QFX Series Virtual Chassis allows you to interconnect up to 10 QFX3500, QFX3600, or QFX5100 switches into one logical device and manage the device as a single chassis using a ring topology.

- A spine or leaf device in a Virtual Chassis Fabric (VCF).

VCF uses Virtual Chassis technology to interconnect multiple devices into a single logical device and manage that device as a single logical device inside of a fabric architecture. VCF architecture supports up to 32 total devices in a spine and leaf topology. Out of the 32 total devices, you can configure a maximum of 4 spine devices.

- QFX5100-48T

As shown in [Figure 8 on page 18](#), the QFX5100-48T is a tri-speed 100/1000/10GBASE-T top-of-rack switch with 48 10GBASE-T access ports and 6 QSFP+ ports. Each 40-Gigabit QSFP+ port (48 through 53) can operate either as uplink ports or four QSFP+ ports (50 through 53) can operate at native 40-Gigabit port or be channelized into 4 independent 10 Gigabit ports. The 6 QSFP+ ports can be used as either access ports or as uplinks. The QFX5100-48T provides full duplex throughput of 720 Gbps. The QFX5100-48T has a 1U form factor and comes standard with redundant fans and redundant power supplies. The switch can be ordered with either ports-to-FRUs or FRUs-to-ports airflow and with AC or DC power supplies.

Figure 8: QFX5100-48T Port Panel

The QFX5100-48T can be used as:

- A standalone switch.
- A Node device in a QFabric system.

The QFX5100-48T is supported on both the QFX3000-G and QFX3000-M QFabric systems.

- A master, backup, or line card in a QFX Virtual Chassis.

A QFX Series Virtual Chassis allows you to interconnect up to ten QFX5100, QFX3500, or QFX3600, switches into one logical device and manage the device as a single chassis using a ring topology.

- A spine device or a leaf device in a Virtual Chassis Fabric (VCF).

VCF uses Virtual Chassis technology to interconnect multiple devices into a single logical device and manage that device as a single logical device inside of a fabric architecture. VCF architecture supports up to 32 total devices in a spine and leaf topology. Of those 32 devices, 4 QFX5100 devices can be configured as spine devices.

- QFX5100-24Q

As shown in [Figure 9 on page 19](#), the QFX5100-24Q is a 40-Gigabit Ethernet QSFP+ switch with 24 high-density QSFP+ ports. Each QSFP+ port can operate as a native 40 Gbps port or as 4 independent 10 Gbps ports. The QFX5100-24Q switch has a 1 U form factor and comes standard with redundant fans and redundant power supplies. The switch can be ordered with either ports-to-FRUs or FRUs-to-ports airflow and with AC or DC power supplies.

The QFX5100-24Q switch has two module bays for the optional expansion module, QFX-EM-4Q, which can add a total of 8 additional QSFP+ ports to the chassis. When operating as a standalone switch and fully populated with QFX-EM-4Q Expansion Modules, the QFX5100-24Q switch is equivalent to 80 10 Gbps interfaces and 4 40-Gbps interfaces. Of these total ports, 104 logical ports are available for 10G port channelization. For full details on the different port channelization modes, see *Port Panel of a QFX5100-24Q Device*. All ports on the QFX5100-24Q and QFX-EM-4Q can be configured as either access ports or as uplinks. The QFX5100-24Q switch provides full duplex throughput of 2.56 Tbps.

**Figure 9: QFX5100-24Q Port Panel**

The QFX5100-24Q can be used as:

- A standalone switch.
- An interconnect device in a QFX3000-M QFabric system.
- A Node device in a QFabric system.

The QFX5100-48T-24Q is supported on both the QFX3000-G and QFX3000-M QFabric systems. A QFX5100-24Q Node device is equivalent to 80 10-Gbps interfaces and 4 40-Gbps interfaces.

- A master, backup, or line card in a QFX Virtual Chassis.

A QFX Series Virtual Chassis allows you to interconnect up to 10 QFX3500, QFX3600, or QFX5100 switches into one logical device and manage the device as a single chassis in a ring topology.

- A spine or leaf device in a Virtual Chassis Fabric (VCF).

VCF uses Virtual Chassis technology to interconnect multiple devices into a single logical device and manage that device as a single logical device inside of a fabric architecture. VCF architecture supports up to 32 total devices in a spine and leaf topology. Of those 32 devices, 4 QFX5100 devices can be configured as spine devices.

**BEST PRACTICE:** Use QFX5100-24Q switches as master and backup in a QFX Virtual Chassis; use as spine devices in a VCF.

The QFX5100-24Q switch has two bays on the port panel for optional expansion modules. The QFX5100-24Q supports two expansion modules to increase port density:

- QFX-EM-4Q, which provides 4 additional 40-Gigabit Quad SFP+ (QSFP+) ports. See [Figure 10 on page 20](#).

**Figure 10: QFX-EM-4Q Expansion Module**

- EX4600-EM-8F, which provides 8 additional 10-Gigabit Ethernet Enhanced Small Form-Factor Pluggable (SFP+) ports. See [Figure 11 on page 20](#).

**Figure 11: EX4600-EM-8F Expansion Module**

**NOTE:** The EX4600-EM-EF is not supported the QFX5100-24Q running in QFabric systems.

The QFX5100-24Q is configured for the QFX-EM-4Q by default, but any combination of the two modules is supported. Expansion modules can be hot-inserted or hot-removed. However, when an EX4600-EM-8F is inserted instead of the default QFX-EM-4Q, the new configuration causes the interfaces to temporarily go down. Likewise, when an EX4600-EM-8F is running on the QFX5100-24Q and it is swapped

with a QFX-EM-4Q, the interfaces temporarily go down, which can cause a short disruption in traffic.

- QFX5100-96S

As shown in [Figure 12 on page 21](#), the QFX5100-96S switch is a 10-Gigabit Ethernet Enhanced Small Form-Factor Pluggable (SFP+) top-of-rack switch with 96 SFP+ ports and 8 Quad SFP+ (QSFP+) ports. Each SFP+ port can operate as a native 10 Gbps port or as a 1 Gbps port. QSFP+ ports 96 and 100 can operate at native 40 Gbps speed or can be channelized to 4 independent 10 Gbps port speeds. The 8 QSFP+ ports can be used as either access ports or as uplinks. The QFX5100-96S switch has a 2 U form factor and comes standard with redundant fans and redundant power supplies. The switch can be ordered with either ports-to-FRUs or FRUs-to-ports airflow and with AC or DC power supplies.

**Figure 12: QFX5100-96S Port Panel**

The QFX5100-96S can be used as:

- A standalone switch.
- A member in a QFX Virtual Chassis.

A QFX Series Virtual Chassis allows you to interconnect up to ten QFX3500, QFX3600, or QFX5100 switches into one logical device and manage the device as a single chassis in a ring topology.

- A spine or leaf device in a Virtual Chassis Fabric (VCF).

VCF uses Virtual Chassis technology to interconnect multiple devices into a single logical device and manage that device as a single logical device inside of a fabric architecture. VCF architecture supports up to 32 total devices in a spine and leaf topology. Of those 32 devices, 4 QFX5100 devices can be configured as spine devices.

## System Software

QFX Series devices use the Junos operating system (OS), which provides Layer 2 and Layer 3 switching, routing, and security services. Junos OS is installed on a QFX5100 switch's 32-gigabyte (GB) internal solid state flash drive. The same Junos OS code base that runs on QFX5100 switches also runs on all Juniper Networks EX Series switches, and J Series, M Series, MX Series, and T Series routers.

For more information about which features are supported on QFX Series devices, see *QFX Series Software Features Overview*.

You manage the switch using the Junos OS command-line interface (CLI), accessible through the console and out-of-band management ports on the device.

## Configuration File Terms

Table 3 on page 25 lists the various configuration file terms and their definitions.

**Table 3: Configuration File Terms**

Term	Definition
active configuration	Current committed configuration of a switch.
candidate configuration	Working copy of the configuration that allows users to make configurational changes without causing any operational changes until this copy is committed.

Table 3: Configuration File Terms (*continued*)

Term	Definition
configuration group	Group of configuration statements that can be inherited by the rest of the configuration.
commit a configuration	Check configuration for proper syntax, activate and mark as the current configuration file running on the switching platform.
configuration hierarchy	Junos OS configuration consists of a hierarchy of statements. There are two types of statements: container statements, which contain other statements, and leaf statements, which do not contain other statements. All the container and leaf statements together form the configuration hierarchy.
default configuration	Default configuration contains the initial values set for each configuration parameter when a switch is shipped.
rescue configuration	Well-known configuration that recovers a switch from a configuration that denies management access. You set a current committed configuration to be the rescue configuration through the CLI.
roll back a configuration	Return to a previously committed configuration.

**Related  
Documentation**

- [Loading a Previous Configuration File on page 1742](#)
- [Reverting to the Rescue Configuration on page 191](#)
- [Understanding Configuration Files on page 1732](#)

## Format for Specifying IP Addresses, Network Masks, and Prefixes in Junos OS Configuration Statements

Many statements in the Junos OS configuration include an option to specify an IP address or route prefix. This option is represented in one of the following ways:

- **network/prefix-length**—Network portion of the IP address, followed by a slash and the destination prefix length (previously called the subnet mask). For example, 10.0.0.1/8.
- **network**—IP address. For example, 10.0.0.2.
- **destination-prefix/prefix-length**—Route prefix, followed by a slash and the destination prefix length. For example, 192.168.1.10/32.

You enter all IP addresses in classless mode. You can enter the IP address with or without a prefix length, in standard dotted notation (for example, 1.2.3.4), or hexadecimal notation as a 32-bit number in network-byte order (for example, 0x01020304). If you omit any octets, they are assumed to be zero. Specify the prefix length as a decimal number from 1 through 32.

**Related  
Documentation**

- [Format for Specifying Filenames and URLs in Junos OS CLI Commands on page 50](#)

## Junos OS Commit Model for Router or Switch Configuration

The router or switch configuration is saved using a commit model—a candidate configuration is modified as desired and then committed to the system. When a configuration is committed, the router or switch checks the configuration for syntax errors, and if no errors are found, the configuration is saved as **juniper.conf.gz** and activated. The formerly active configuration file is saved as the first rollback configuration file (**juniper.conf.1.gz**), and any other rollback configuration files are incremented by 1. For example, **juniper.conf.1.gz** is incremented to **juniper.conf.2.gz**, making it the second rollback configuration file. The router or switch can have a maximum of 49 rollback configurations (numbered 1 through 49) saved on the system.

On the router or switch, the active configuration file and the first three rollback files (**juniper.conf.gz.1**, **juniper.conf.gz.2**, **juniper.conf.gz.3**) are located in the **/config** directory. If the file **rescue.conf.gz** is saved on the system, this file should also be saved in the **/config** directory. The factory default files are located in the **/etc/config** directory.

There are two mechanisms used to propagate the configurations between Routing Engines within a router or switch:

- Synchronization—Propagates a configuration from one Routing Engine to a second Routing Engine within the same router or switch chassis.

**NOTE:** The QFX3500 switch has only one Routing Engine.

To synchronize configurations, use the **commit synchronize** CLI command. If one of the Routing Engines is locked, the synchronization fails. If synchronization fails because of a locked configuration file, you can use the **commit synchronize force** command. This command overrides the lock and synchronizes the configuration files.

- Distribution—Propagates a configuration across the routing plane on a multichassis router or switch. Distribution occurs automatically. There is no user command available to control the distribution process. If a configuration is locked during a distribution of a configuration, the locked configuration does not receive the distributed configuration file, so the synchronization fails. You need to clear the lock before the configuration and resynchronize the routing planes.

**NOTE:** When you use the **commit synchronize force** CLI command on a multichassis platform, the forced synchronization of the configuration files does not affect the distribution of the configuration file across the routing plane. If a configuration file is locked on a router or switch remote from the router or switch where the command was issued, the synchronization fails on the remote router or switch. You need to clear the lock and reissue the **synchronization** command.

## Junos OS Package Names

You upgrade the Juniper Networks Junos OS on the QFX Series by copying a software package to your switch or another system on your local network and then installing the new software package on the switch.

A software package name is in the following format:

**NOTE:** A signed domestic package is used as an example only. Other types of software packages might be available in future releases.

*package-name-m.nZx.y-domestic-signed.tgz*

where:

- **package-name** is the name of the package—for example, **jinstall-qfx**.
- **m.n** is the software release, with **m** representing the major release number and **n** representing the minor release number—for example, **11.1**.
- **Z** indicates the type of software release, where **R** indicates released software and **B** indicates beta-level software.
- **x.y** represents the maintenance software release, with **x** representing the maintenance software release number and **y** representing the maintenance software spin number—for example, **1.5**.

A sample switch software package name is:

`jinstall-qfx-11.1R1.5-domestic-signed.tgz`

## Understanding NTP Time Servers

The IETF defined the Network Time Protocol (NTP) to synchronize the clocks of computer systems connected to each other over a network. Most large networks have an NTP server that ensures that time on all devices is synchronized, regardless of the device location. If you use one or more NTP servers on your network, ensure you include the NTS server addresses in your Junos OS configuration.

When configuring the NTP, you can specify which system on the network is the authoritative time source, or time server, and how time is synchronized between systems on the network. To do this, you configure the router, switch, or security device to operate in one of the following modes:

- Client mode—In this mode, the local router or switch can be synchronized with the remote system, but the remote system can never be synchronized with the local router or switch.
- Symmetric active mode—In this mode, the local router or switch and the remote system can synchronize with each other. You use this mode in a network in which either the local router or switch or the remote system might be a better source of time.

**NOTE:** Symmetric active mode can be initiated by either the local or the remote system. Only one system needs to be configured to do so. This means that the local system can synchronize with any system that offers symmetric active mode without any configuration whatsoever. However, we strongly encourage you to configure authentication to ensure that the local system synchronizes only with known time servers.

- Broadcast mode—In this mode, the local router or switch sends periodic broadcast messages to a client population at the specified broadcast or multicast address. Normally, you include this statement only when the local router or switch is operating as a transmitter.
- Server mode—In this mode, the local router or switch operates as an NTP server.

**NOTE:** In NTP server mode, the Junos OS supports authentication as follows:

- If the NTP request from the client comes with an authentication key (such as a key ID and message digest sent with the packet), the request is processed and answered based on the authentication key match.
- If the NTP request from the client comes without any authentication key, the request is processed and answered without authentication.

## NTP Time Server and Time Services Overview (QFabric System)

Network Time Protocol (NTP) synchronizes the time among all of the various devices in the QFabric system to an external time server. This ensures that time-stamped events, like log entries and database transactions, can be correlated between multiple devices in the QFabric system. The QFabric system can only be in client mode.

Additionally, you can authenticate time synchronization to ensure that the QFabric system obtains its time services only from known sources. By default, network time synchronization is unauthenticated. We strongly encourage you to configure authentication of network time services.

## Overview of CoS Upgrade Requirements (Junos OS Release 11.1 or 11.2 to a Later Release)

Before you upgrade to Junos OS Release 11.3, you must deactivate the CoS configuration if the CoS configuration includes any of the following features:

- **excess-rate** option
- **strict-high** or **high** priority queues
- Any of the Junos OS Release 11.1 or 11.2 default multidestination forwarding classes

**CAUTION:** If your CoS configuration contains any of the features listed above and you attempt to upgrade from Junos OS Release 11.1 or 11.2 to a later version without first editing the configuration, the Junos OS might not restart.

Junos OS Release 11.3 and later for QFX Series no longer supports the **excess-rate** statement, the **strict** priority option, or the default multidestination forwarding classes used in Junos OS Release 11.1 and 11.2. In addition, Junos OS Release 11.3 introduces new restrictions on how to configure and use **strict-high** priority queues.

This topic does not describe how to perform the software upgrade procedure. It describes how to deactivate your CoS configuration, edit your CoS configuration, and reactivate your CoS configuration at the appropriate times.

Use the following procedure to upgrade safely from Junos OS Release 11.1 or 11.2 to a later release:

1. Deactivate the CoS configuration *before* you upgrade the software:  

```
user@switch# deactivate class-of-service
```
2. Follow the upgrade procedure to Junos OS Release 11.3 or later software.

3. Make the following changes to the CoS configuration while the CoS configuration is still deactivated:
  - Remove the **excess-rate** statement from the CoS configuration if you have used it at the **[edit class-of-service schedulers]** or **[edit class-of-service traffic-control-profiles]** hierarchy level.
  - Remove the **strict-high** and **strict** priority queue configurations if you have used them at the **[edit class-of-service schedulers]** hierarchy level.
  - Remove the default multdestination forwarding classes (**mcast-be**, **mcast-af**, **mcast-ef**, and **mcast-nc**) if you have used them at the **[edit class-of-service schedulers]**, **[edit class-of-service rewrite-rules]**, **[edit class-of-service classifiers]**, **[edit class-of-service scheduler-maps]**, or **[edit class-of-service forwarding-class-sets]** hierarchy level. Alternatively, you can change the mapping of the multdestination traffic to use the new default multdestination forwarding class (**mcast**).
4. If desired, configure **strict-high** priority queues in accordance with the Junos OS Release 11.3 or later configuration rules, and map multdestination traffic to the default multdestination forwarding class (**mcast**).
5. Activate the CoS configuration:
 

```
user@switch# activate class-of-service
```
6. Commit the CoS configuration:
 

```
user@switch# commit
```

**NOTE:** If you configured the **transmit-rate** option for any queues under the **[edit class-of-service schedulers]** hierarchy level, if the rate is configured as an exact rate in Mbps, we recommend that you reconfigure the **transmit-rate** option as a percentage. This is because the scheduler converts exact rates to percentages, and when the exact rate is below 1 Gbps, some granularity may be lost in the conversion. You can avoid this potential issue by specifying the **transmit-rate** option as a percentage.

## Understanding Autoinstallation of Configuration Files

Autoinstallation is the automatic configuration of a device over the network from a preexisting configuration file that you create and store on a configuration server—typically a Trivial File Transfer Protocol (TFTP) server. You can use autoinstallation to configure new devices automatically and to deploy multiple devices from a central location in the network.

You enable autoinstallation so that the switches in your network implement autoinstallation when they are powered on. To configure autoinstallation, you specify a configuration server, an autoinstallation interface, and a protocol for IP address acquisition.

This topic describes:

- [Typical Uses for Autoinstallation on page 32](#)
- [Autoinstallation Configuration Files and IP Addresses on page 32](#)
- [Typical Autoinstallation Process on a New Switch on page 33](#)

### Typical Uses for Autoinstallation

---

Typical uses for autoinstallation of the software include:

- To deploy and update multiple devices from a central location in the network.
- To update a device—Autoinstallation occurs when a device that has been manually configured for autoinstallation is powered on.

### Autoinstallation Configuration Files and IP Addresses

---

For the autoinstallation process to work, you must store one or more host-specific or default configuration files on a configuration server in the network and have a service available—typically Dynamic Host Configuration Protocol (DHCP)—to assign an IP address to the switch.

You can set up the following configuration files for autoinstallation on the switch:

- **network.conf**—Default configuration file for autoinstallation, in which you specify IP addresses and associated hostnames for devices on the network.
- **switch.conf**—Default configuration file for autoinstallation with a minimum configuration sufficient for you to telnet to the device and configure it manually.
- **hostname.conf**—Host-specific configuration file for autoinstallation on a device that contains all the configuration information necessary for the switch. In the filename, **hostname** is replaced with the hostname assigned to the switch.

If the server with the autoinstallation configuration file is not on the same LAN segment as the new device, or if a specific device is required by the network, you must configure an intermediate device directly attached to the new switch, through which the new switch can send TFTP, Boot Protocol (BOOTP), and Domain Name System (DNS) requests. In this case, you specify the IP address of the intermediate device as the location to receive TFTP requests for autoinstallation.

---

### Typical Autoinstallation Process on a New Switch

---

When the switch configured for autoinstallation is powered on, it performs the following autoinstallation tasks:

1. The switch sends out DHCP or BOOTP requests on each connected interface simultaneously to obtain an IP address.

If a DHCP server responds to these requests, it provides the switch with some or all of the following information:

- An IP address and subnet mask for the autoinstallation interface.
- The location of the (typically) TFTP server, Hypertext Transfer Protocol (HTTP) server, or FTP server on which the configuration file is stored.
- The name of the configuration file to be requested from the TFTP server.
- The IP address or hostname of the TFTP server.

If the DHCP server provides the server's hostname, a DNS server must be available on the network to resolve the name to an IP address.

- The IP address of an intermediate device if the configuration server is on a different LAN segment from the switch.
2. After the switch acquires an IP address, the autoinstallation process on the switch attempts to download a configuration file in the following ways:
    - a. If the DHCP server specifies the host-specific configuration file **hostname.conf**, the switch uses that filename in the TFTP server request. The autoinstallation process on the new switch makes three unicast TFTP requests for **hostname.conf**. If these attempts fail, the switch broadcasts three requests to any available TFTP server for the file.
    - b. If the switch does not locate a **hostname.conf** file, the autoinstallation process sends three unicast TFTP requests for a **network.conf** file that contains the switch's hostname-to-IP-address mapping information. If these attempts fail, the switch broadcasts three requests to any available TFTP server for the file.
    - c. If the switch fails to find a **network.conf** file that contains a hostname entry for the switch, the autoinstallation process sends out a DNS request and attempts to resolve the switch's IP address to a hostname.
    - d. If the switch determines its hostname, it sends a TFTP request for the **hostname.conf** file.
    - e. If the switch is unable to map its IP address to a hostname, it sends TFTP requests for the default configuration file **switch.conf**. The TFTP request procedure is the same as for the **network.conf** file.
  3. After the switch locates a configuration file on a TFTP server, the autoinstallation process downloads the file, installs the file on the switch, and commits the configuration.

## Understanding Nonstop Software Upgrade for QFabric Systems

The framework that underlies a nonstop software upgrade in a QFabric system enables you to upgrade the system in a step-by-step manner and minimize the impact to the continuous operation of the system. This topic explains how a nonstop software upgrade works in a QFabric system, the steps that are involved, and the procedures that you need to implement to experience the benefits of this style of software upgrade.

Nonstop software upgrade enables some QFabric system components to continue operating while similar components in the system are being upgraded. In general, the QFabric system upgrades redundant components in stages so that some components remain operational and continue forwarding traffic while their equivalent counterparts upgrade to a new version of software.

**TIP:** Use the following guidelines to decide when to implement a nonstop software upgrade:

- If you need to upgrade all components of the system in the shortest amount of time (approximately one hour) and you do not need to retain the forwarding resiliency of the data plane, issue the `request system software add component all` command to perform a standard software upgrade. All components of the QFabric system upgrade simultaneously and expediently, but this type of upgrade does not provide resiliency or switchover capabilities.
- If you need to minimize service impact, preserve the forwarding operations of the data plane during the upgrade, and are willing to take the extra time required for component switchovers (in many cases, several hours), issue the three nonstop software upgrade commands (`request system software nonstop-upgrade (director-group | fabric | node-group)`) described in this topic in the correct order.

## NOTE:

- Before you begin a nonstop software upgrade, issue the **request system software download** command to copy the software to the QFabric system.
- Each of the 3 nonstop software upgrade steps must be considered parts of the whole process. You must complete all 3 steps of a nonstop software upgrade in the correct order to ensure the proper operation of the QFabric system.
- Open two SSH sessions to the QFabric CLI. Use one session to monitor the upgrade itself and use a second session to verify that the QFabric system components respond to operational mode commands as expected. For more information on verification of the upgrade, see [“Verifying Nonstop Software Upgrade for QFabric Systems” on page 1554](#).
- Issue the **show fabric administration inventory** command to verify that all upgraded components are operational at the end of a step before beginning the next step.
- Once you start the nonstop software upgrade process, we strongly recommend that you complete all 3 steps within 12 hours.

The three steps to a successful nonstop software upgrade must be performed in the following order:

- Director group—The first step upgrades the Director devices, the fabric manager Routing Engine, and the diagnostic Routing Engine. To perform the first step, issue the **request system software nonstop-upgrade director-group** command. The key actions that occur during a Director group upgrade are:
  1. Connecting to the QFabric system by way of an SSH connection. This action establishes a load-balanced CLI session on one of the Director devices in the Director group.
  2. The QFabric system downloads and installs the new software in both Director devices.
  3. The Director device hosting the CLI session becomes the master for all QFabric system processes running on the Director group, such as the fabric manager and network Node group Routing Engines.
  4. The QFabric system installs the new software for the backup fabric manager Routing Engine on the backup Director device.
  5. The backup Director device reboots to activate the new software.
  6. The master Director device begins a 15 minute sequence that includes a temporary suspension of QFabric services and a QFabric database transfer. You cannot issue operational mode commands in the QFabric CLI during this period.
  7. The QFabric system installs the new software for the fabric manager and diagnostic Routing Engines on the Director group master.

8. The QFabric system switches mastership of all QFabric processes from the master Director device to the backup Director device.
9. The master Director device reboots to activate the new software.
10. The CLI session terminates, and logging back in to the QFabric system with a new SSH connection establishes the session on the new master Director device (the original backup).
11. The previous master Director device resumes operation as a backup and the associated processes (such as the fabric manager and network Node group Routing Engines) become backup as well. The fabric control Routing Engine associated with this Director device returns to active status.

**NOTE:** After the Director group nonstop software upgrade completes, any Interconnect device or Node device that reboots will automatically download the new software, install it, and reboot again. As a result, try not to restart any QFabric system devices before you complete the rest of the nonstop software upgrade steps.

**TIP:**

- To enable BGP and OSPF to continue operating on the network Node group during a Director group nonstop service upgrade, we recommend that you configure graceful restart for these routing protocols. For more information on graceful restart, see [“Configuring Graceful Restart for QFabric Systems” on page 1512](#).
  - Wait 15 minutes after the second Director device returns to service and hosts Routing Engine processes before proceeding to step 2—the fabric upgrade. You can verify the operational status of both Director devices by issuing the `show fabric administration inventory director-group status` command. Also, issue the `show fabric administration inventory infrastructure` command to verify when the Routing Engine processes become load balanced (typically, there will be three to four Routing Engines running on each Director device).
- .....
- Fabric—The second step upgrades the Interconnect devices and the fabric control Routing Engines. To perform the second step, issue the **request system software nonstop-upgrade fabric** command. The key actions that occur during a fabric upgrade are:
    1. The QFabric system downloads, validates, and installs the new software in all Interconnect devices and fabric control Routing Engines (FC-0 and FC-1).
    2. One fabric control Routing Engine reboots and comes back online.
    3. The other fabric control Routing Engine reboots and comes back online.

4. The first Interconnect device reboots, comes back online, and resumes the forwarding of traffic.
5. Subsequent Interconnect devices reboot one at a time, come back online, and return to service.

**NOTE:**

- If the software does not load properly on any one of the fabric components, all components revert back to the original software version.
- If one of the components in a fabric upgrade does not reboot successfully, issue the **request system reboot fabric** command to reattempt the rebooting process for this fabric component and activate the new software.

- **Node group**—The third and final step upgrades Node groups. You can choose to upgrade a network Node group, a redundant server Node group, or individual server Node groups. You can upgrade the Node groups one at a time or in groups (known as upgrade groups). However, you must upgrade all Node groups in your QFabric system before you can complete the nonstop software upgrade process. To perform the third step, issue the **request system software nonstop-upgrade node-group** command.

The key actions that occur during a network Node group upgrade are:

1. The QFabric system copies the new software to each Node device one at a time.
2. The QFabric system validates and then installs the new software in all Node devices simultaneously.
3. The system copies the software to the network Node group Routing Engines.
4. The QFabric system validates and then installs the software in the network Node group Routing Engines one at a time -- first the backup, then the master.
5. The backup network Node group Routing Engine reboots and comes back online.
6. The supporting Node devices reboot and come back online one at a time.

**NOTE:** To reduce the total upgrade duration, configure an upgrade group. All Node devices within the upgrade group reboot at the same time.

7. The master network Node group Routing Engine relinquishes mastership to the backup, reboots, and comes back online.

The key actions that occur during a redundant server Node group upgrade are:

1. The QFabric system copies the new software to the backup Node device, then the master Node device.
2. The QFabric system validates and then installs the new software on the backup Node device, then the master Node device.

3. The backup Node device reboots, comes back online, and becomes the master Node device.
4. The previous master Node device reboots and comes back online as a backup Node device.

**NOTE:** For redundant server Node groups, both Node devices must be online before the upgrade will proceed. If one of the devices is no longer available, remove the Node device from the Node group configuration before you issue the nonstop software upgrade command.

The key actions that occur during a server Node group upgrade for a Node group that contains one member are:

1. The Node device downloads the software package and validates the software.
2. The Node device installs the software and reboots.

**NOTE:** Because there is no redundancy for Node groups containing a single Node device, traffic loss occurs when the device reboots during the upgrade.

## Understanding DHCP Services for Switches

A Dynamic Host Configuration Protocol (DHCP) server on a Juniper Networks EX Series Ethernet Switch can provide many valuable TCP/IP network services. For example, DHCP can dynamically allocate the four required IP parameters to each computer on the LAN: IP address, network mask, router or switch address, and name server address. Additionally, DHCP on the switch can automatically upgrade software on client systems.

This topic describes:

- [DHCP Client/Server Model on page 39](#)
- [Using DHCP on page 39](#)
- [DHCP Relay Servers and DHCP Servers on page 40](#)
- [Legacy DHCP and Extended DHCP for Server Versions on page 40](#)
- [Configuring DHCP on a Switch on page 41](#)
- [How DHCP Works on page 41](#)

### DHCP Client/Server Model

DHCP IP address allocation works on a client/server model in which the server, in this case a switch, assigns the client reusable IP information from an address pool. A DHCP client might receive offer messages from multiple DHCP servers and can accept any one of the offers; however, the client usually accepts the first offer it receives. See [Figure 13 on page 39](#).

**Figure 13: DHCP Client/Server Model**

g041177

### Using DHCP

DHCP automates network-parameter assignment to network devices. Even in small networks, DHCP is useful because it makes it easy to add new machines to the network.

DHCP access service minimizes the overhead required to add clients to the network by providing a centralized, server-based setup, which means that you do not have to manually create and maintain IP address assignments for clients. In addition, when you use DHCP to manage a pool of IP addresses among hosts, you reduce the number of IP addresses needed on the network. DHCP does this by leasing an IP address to a host for a limited period of time, allowing the DHCP server to share a limited number of IP addresses. DHCP also provides a central database of devices that are connected to the network and eliminates duplicate resource assignments. In addition to IP addresses for clients, DHCP provides other configuration information, particularly the IP addresses of local caching Domain Name System (DNS) resolvers, network boot servers, or other service hosts.

Another valuable DHCP feature is automatic software download for installation of software packages on switches. DHCP clients configured for automatic software download receive messages as part of the DHCP message exchange process—when the software package name in the DHCP server message is different from that of the software package that booted the DHCP client switch, the new software is downloaded and installed. See *Upgrading Software by Using Automatic Software Download*.

## DHCP Relay Servers and DHCP Servers

You can configure a switch either as a DHCP server or as a DHCP relay server, but not both. Whereas a DHCP server replies to a client with an IP address, a DHCP relay server relays DHCP messages to and from the configured DHCP server, even if the client and server are on different IP networks.

Configure a switch to be a DHCP relay agent if you have locally attached hosts and a remote DHCP server. For directions on configuring a DHCP relay server, see *DHCP/BOOTP Relay for Switches Overview*.

## Legacy DHCP and Extended DHCP for Server Versions

Two versions of both DHCP server and DHCP relay agent are available on EX Series switches and on the QFX Series. The original legacy DHCP server and legacy DHCP relay agent can be used in the same network as the extended DHCP servers and extended DHCP relay agent—extended DHCP is also referred to as virtual router (VR) aware DHCP.

You cannot configure legacy DHCP and extended DHCP versions on the same switch. Because the newer extended DHCP server version has more features, we recommend that you configure the extended DHCP server if it is supported by the switch. See *EX Series Switch Software Features Overview* for a list of switches that support the extended DHCP server.

The extended DHCP server version has the following added features:

- Graceful Routing Engine switchover (GRES), which provides mirroring support for clients. For details, see *High Availability Features for EX Series Switches Overview*.
- Virtual routing and forwarding (VRF), which allows multiple instances of a routing table to simultaneously coexist on the same switch. For details, see *Understanding Virtual Routing Instances on EX Series Switches*.

**NOTE:** Legacy DHCP supports the circuit ID and the remote ID fields for the relay agent option (option 82). Extended DHCP for the relay agent option supports only circuit ID. See *EX Series Switch Software Features Overview* for a list of switches that support extended DHCP (VR-aware DHCP).

Legacy DHCP and extended DHCP servers can be configured at the hierarchy levels shown in [Table 4 on page 40](#):

**Table 4: Legacy DHCP and Extended DHCP Server Hierarchy Levels**

DHCP Service	Hierarchy
Extended DHCP server	<code>edit system services dhcp-local-server</code>
Extended DHCP address pool	<code>edit access address-assignment pool</code>
Legacy DHCP server	<code>edit system services dhcp</code>

Table 4: Legacy DHCP and Extended DHCP Server Hierarchy Levels (*continued*)

DHCP Service	Hierarchy
Legacy DHCP relay	<code>edit forwarding-options helpers bootp</code>
Extended DHCP relay	<code>edit forwarding-options dhcp-relay</code>
Legacy DHCP address pool	<code>edit system services dhcp pool</code>

DHCP clients on a switch are always configured at the hierarchy level `[edit interfaces interface-name family dhcp]`.

### Configuring DHCP on a Switch

A DHCP configuration consists of two parts: the configuration for a DHCP server and the configuration for DHCP clients. The DHCP server configuration is simple if you accept the default configurations.

When you configure a legacy DHCP server, you only need to define the DHCP server name and the interface on the switch. You can use the default configuration for the rest of the settings. When you configure an extended DHCP server, you need to only define a DHCP pool, indicate IP addresses for the pool, and create a server group. You can use the default configuration for the rest of the settings.

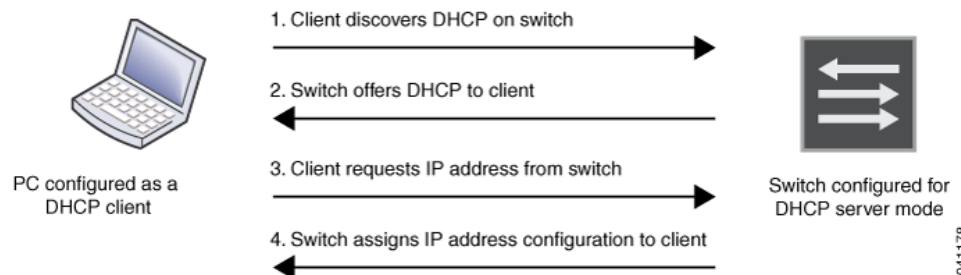

For directions for configuring either a legacy DHCP server or an extended DHCP server, see “[Configuring a DHCP Server on Switches \(CLI Procedure\)](#)” on page 157.

To configure a DHCP client, set the client’s DHCP interface address in the `[edit interfaces interface-name unit 0 family inet dhcp]` hierarchy. For directions for configuring a DHCP client on a switch, see “[Configuring a DHCP Client \(CLI Procedure\)](#)” on page 156.

### How DHCP Works

DHCP consists of a four-step transfer process beginning with a broadcast DHCP discovery message from the client. As the second step, the client receives a DHCP offer message from the server. This message includes the IP address and mask, and some other specific parameters. The client then sends a DHCP request message to accept the IP address and other parameters that it received from the server in the previous step. The DHCP server sends a DHCP response message and removes the now-allocated address from the DHCP address pool. See [Figure 14 on page 41](#).

Figure 14: DHCP Four-Step Transfer

g041178

**NOTE:** Because the DHCP discovery message from the client is a broadcast message and because broadcast messages cross other segments only when they are explicitly routed, you might have to configure a DHCP relay agent on the switch interface so that all DHCP discovery messages from the clients are forwarded to one DHCP server.

## Understanding Software Infrastructure and Processes

Junos OS includes processes for Internet Protocol (IP) routing and for managing interfaces, networks, and the switch.

Junos OS runs on the Routing Engine. The Routing Engine kernel coordinates communication among the Junos OS processes and provides a link to the Packet Forwarding Engine.

Using the Junos OS command-line interface (CLI), you configure switching features and set the properties of network interfaces. After activating a software configuration, use either the Junos Space or CLI user interface to monitor, manage operations, and diagnose protocol and network connectivity problems.

- [Routing Engine and Packet Forwarding Engine on page 42](#)
- [Junos OS Processes on page 43](#)

### Routing Engine and Packet Forwarding Engine

---

A switch has two primary software processing components:

- **Packet Forwarding Engine**—Processes packets; applies filters, routing policies, and other features; and forwards packets to the next hop along the route to their final destination.
- **Routing Engine**—Provides three main functions:
  - Creates the packet forwarding switch, which provides route lookup, filtering, and switching on incoming data packets, and then directs outbound packets to the appropriate interface for transmission to the network.
  - Maintains the routing tables used by the switch and controls the routing protocols that run on the switch.

- Provides control and monitoring functions for the switch, including controlling power and monitoring system status.

### Junos OS Processes

Junos OS running on the Routing Engine and Packet Forwarding Engine consists of multiple processes that are responsible for individual functions.

The separation of functions provides operational stability, because each process accesses its own protected memory space. In addition, because each process is a separate software package, you can selectively upgrade all or part of the Junos OS for added flexibility.

Table 5 on page 43 describes the primary Junos OS processes.

**Table 5: Junos OS Processes**

Process	Name	Description
Chassis process	chassisd	<p>Detects hardware on the system that is used to configure network interfaces.</p> <p>Monitors the physical status of hardware components and field-replaceable units (FRUs), detecting when environment sensors such as temperature sensors are triggered.</p> <p>Relays signals and interrupts—for example, when devices are taken offline, so that the system can close sessions and shut down gracefully.</p>
DNS Server process	named-service	Resolves hostnames into addresses.
Dynamic Host Configuration Protocol (DHCP) process	dhcp-service	Enables a DHCP server to allocate network IP addresses and deliver configuration settings to client hosts without user intervention.
Ethernet switching process	eswd	<p>Handles Layer 2 switching functionality such as MAC address learning, Spanning Tree Protocol, and access port security.</p> <p>Manages Ethernet switching interfaces, VLANs, and VLAN interfaces.</p>
Firewall management process	firewall	Manages the firewall configuration and helps accept or reject packets that are transiting an interface on a switch.
Forwarding process	pfem	Defines how routing protocols operate on the partition. The overall performance of the partition is largely determined by the effectiveness of the forwarding process.
Interface process	dcd	Configures and monitors network interfaces by defining physical characteristics such as link encapsulation, hold times, and keepalive timers.
Integrated Local Management Interface (ILMI) process	ilmi	Provides bidirectional exchange of management information between two ATM interfaces across a physical connection.
Link Management Protocol (LMP) process	link-management	Establishes and maintains LMP control channels.

Table 5: Junos OS Processes (*continued*)

Process	Name	Description
Management process	mgd	<p>Provides communication between the other processes and an interface to the configuration database.</p> <p>Populates the configuration database with configuration information and retrieves the information when queried by other processes to ensure that the system operates as configured.</p> <p>Interacts with the other processes when commands are issued through one of the user interfaces on the partition.</p> <p>If a process terminates or fails to start when called, the management process attempts to restart it a limited number of times to prevent thrashing and logs any failure information for further investigation.</p>
Multicast snooping process	multicast-snooping	Makes Layer 2 devices, such as VLAN switches, aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.
Secure Neighbor Discovery (SEND) Protocol process	send	Protects Neighbor Discovery Protocol (NDP) messages.
Simple Network Management Protocol (SNMP) process	snmp	Enables the monitoring of network devices from a central location and provides the switch's SNMP master agent.
Tunnel OAM process	tunnel-oamd	Enables the Operations, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol tunneling (L2PT) allows service providers to send Layer 2 protocol data units (PDUs) across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.
Virtual Router Redundancy Protocol (VRRP) process	vrrp	Enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.

## Understanding Zero Touch Provisioning

**NOTE:** To see which platforms support Zero Touch Provisioning, in a browser, go to [Feature Explorer](#). In the Explore Features section of the Feature Explorer page, select **All Features**. In the Features Grouped by Feature Family box, select **Zero Touch Provisioning**. You can also type the name of the feature in the **Search for Features** edit box. In previous Junos OS releases on EX Series switches, Zero Touch Provisioning was called EZ Touchless Provisioning.

Zero Touch Provisioning allows you to provision new Juniper Networks switches in your network automatically, without manual intervention. When you physically connect a switch to the network and boot it with a default factory configuration, it attempts to upgrade the Junos OS software automatically and autoinstall a configuration file from the network. To make sure you have the default factory configuration loaded on the switch, issue the **request system zeroize** command on the switch you want to provision.

The switch uses information that you configure on a Dynamic Host Configuration Protocol (DHCP) server to locate the necessary software image and configuration files on the network. If you do not configure the DHCP server to provide this information, the switch boots with the preinstalled software and default factory configuration.

The Zero Touch Provisioning process will either upgrade or downgrade the Junos OS version. During an downgrade:

- On an EX Series switch, If you downgrade to a software version earlier than Junos OS Release 12.2, in which Zero Touch Provisioning is not supported, the configuration file autoinstall phase of the Zero Touch Provisioning process does not happen.
- On an EX Series switch, to downgrade to a software version that does not support resilient dual-root partitions (Junos OS Release 10.4R2 or earlier), you must perform some manual work on the switch. For more information, see *Understanding Resilient Dual-Root Partitions on Switches*.

**NOTE:** On QFX3500 and QFX3600 switches running the original CLI, you cannot use ZTP to upgrade from Junos OS Release 12.2 or later to Junos OS Release 13.2X51-D15 or later.

When you boot a switch with the default factory configuration, the following process happens:

1. If DHCP option 43, suboption 00 (the name of the software image file on the FTP, HTTP, or TFTP server) is configured, the switch compares the version of the provided software image to the version of the software installed on the switch.

**NOTE:** When the DHCP server cannot use suboption 00, configure the image file using suboption 04. If both suboption 00 and suboption 4 are defined, suboption 04 is ignored.

2. If DHCP option 43, suboption 02 (a symbolic link to the software image file on the FTP, HTTP, or TFTP server), the switch compares the version of the provided software image to the version of the software installed on the switch.
  - If the Junos OS versions are different, the switch downloads the software image from the FTP, HTTP, or TFTP server, installs the Junos OS, and reboots using the default factory configuration.
  - If the software versions are the same, the switch does not upgrade the software.

3. If DHCP option 43, suboption 01 (the name of the configuration file on the FTP, TFTP, or HTTP server is configured, the switch compares the version of the provided configuration file to the version of the configuration file on the switch.

If DHCP option 43 suboption 01 is not specified, the switch uses the default factory configuration.

If the configuration file version on the FTP, HTTP, or TFTP server is newer than the configuration file on the switch, the configuration file is updated on the switch.

If both DHCP option 43 suboption 01 and suboption 2 are specified, suboption 01 is processed before suboption 02. The Junos OS is upgraded, and then the configuration file is applied.

4. If DHCP option 43, suboption 03 (the transfer mode setting) is configured, the switch accesses the FTP, HTTP, or TFTP server using the specified transfer mode setting—for example, FTP.

If DHCP option 43, suboption 03, is not configured, TFTP becomes the transfer mode automatically.

5. If DHCP option 43, suboption 04 (the name of the software image file on the FTP, HTTP, or TFTP server) is configured, the switch compares the version of the provided software image to the version of the software installed on the switch.

**NOTE:** When the DHCP server cannot use suboption 00, configure the image file using suboption 04. If both suboption 00 and suboption 4 are defined, suboption 04 is ignored.

6. If DHCP option 150 or option 66 is specified, the IP address of the FTP, HTTP, or TFTP server is configured.

**NOTE:** You must configure either option 150 or option 66. If you configure both option 150 and option 66, option 150 takes precedence, and option 66 is ignored. Also, make sure you specify an IP address, not a hostname, because name resolution is not supported.

7. (Optional) If DHCP option 7 is specified, you can configure one or more syslog servers.
8. (Optional) If DHCP option 42 is specified, you can configure one or more NTP servers.
9. (Optional) If DHCP option 12 is specified, you can configure the hostname of the switch.

## CLI User Interface Overview

- [CLI Overview on page 47](#)
- [CLI Key Features on page 47](#)
- [CLI Command Modes on page 48](#)

---

### CLI Overview

The command-line interface (CLI) is the software interface you use to access, monitor, configure, troubleshoot, and manage a device running Junos OS. You can access the CLI either from the console or through a network connection. The CLI is a Juniper Networks-specific command shell that runs on top of a FreeBSD UNIX-based operating system kernel.

The CLI provides a variety of UNIX utilities, such as Emacs-style keyboard sequences, which allows you to perform the following actions:

- Move around on a command line and scroll through recently executed commands.
- Match regular expressions to locate and replace values and identifiers in a configuration.
- Filter command output.
- Log file entries.
- Store and archive device files on a UNIX-based file system.

You can exit the CLI environment and create a UNIX C shell or Bourne shell to navigate the file system, manage processes, and perform other tasks.

---

### CLI Key Features

The CLI commands and statements follow a hierarchical organization and have consistent syntax. The CLI provides the following features for ease of use:

- Consistent command names—Commands that provide the same type of function have the same name, regardless of the portion of the software on which they are operating. For example, all **show** commands display software information and statistics, and all **clear** commands erase various types of system information.
- Lists and short descriptions of available commands—Information about available commands is provided at each level of the CLI command hierarchy. If you type a question mark (?) at any level, you see a list of the available commands along with a short description of each command. This means that if you already are familiar with

the Junos OS, you can use many of the CLI commands without referring to the documentation.

- Command completion—Command completion for command names (keywords) and for command options is available at each level of the hierarchy. To complete a command or option that you have partially typed, press Tab or the Spacebar. If the partially typed letters begin a string that uniquely identifies a command, the complete command name appears. Otherwise, a beep indicates that you have entered an ambiguous command, and the possible completions are displayed. Completion also applies to other strings, such as filenames, interface names, usernames, and configuration statements.

### CLI Command Modes

---

The CLI has two modes, operational mode and configuration mode.

- Operational mode—This mode displays the current status of the device. In operational mode, you enter commands to monitor and troubleshoot Junos OS and devices and network connectivity. Operational mode is indicated by the > prompt—for example, **user@switch> clear**
- Configuration mode—A Junos OS device configuration is stored as a hierarchy of statements. In configuration mode, you can define all properties of the Juniper Networks Junos OS, including interfaces, VLANs, Virtual Chassis information, user access, and several system hardware properties. To enter configuration mode, enter the **configure** command. Configuration mode is indicated by the # prompt and includes the current location in the configuration hierarchy—for example:

```
[edit interfaces ge-0/0/12]  
user@switch#
```

In configuration mode, you are actually viewing and changing the candidate configuration file. The candidate configuration allows you to make configuration changes without causing operational changes to the current operating configuration, called the active configuration. When you commit the changes you added to the candidate configuration, the system updates the active configuration. Candidate configurations enable you to alter your configuration without causing potential damage to your current network operations.

To activate your configuration changes, enter the **commit** command.

When you commit the candidate configuration, you can require an explicit confirmation for the commit to become permanent by using the **commit confirmed** command. This is useful for verifying that a configuration change works correctly and does not prevent management access to the switch. After you issue the **commit confirmed** command, you must issue another **commit** command within the defined period of time (10 minutes by default), or the system reverts to the previous configuration.

You can also activate your configuration changes and exit configuration mode with a single command, **commit and-quit**. This command succeeds only if there are no mistakes or syntax errors in the configuration.

To return to operational mode, go to the top of the configuration hierarchy and then quit—for example:

```
[edit interfaces ge-0/0/12]
user@switch# top
[edit]
user@switch# exit
```

When you monitor and configure a device running Junos OS, you may need to switch between operational mode and configuration mode. When you change to configuration mode, the command prompt also changes. The operational mode prompt is a right angle bracket (>) and the configuration mode prompt is a pound sign (#).

When you log in to the switch and type the **cli** command, you are automatically in operational mode. To switch to configuration mode, type the **configure** command or the **edit** command.

The CLI prompt changes from **user@switch>** to **user@switch#**, and a banner appears to indicate the hierarchy level.

To return to operational mode as well as commit your changes, enter **command and-quit**. To return to operational mode without committing any of your changes, enter **exit**.

To display the output of an operational mode command, such as **show**, while in configuration mode, issue the **run** configuration mode command and then specify the operational mode command.

## Configuring Login Tips

The Junos OS CLI provides the option of configuring login tips for the user. By default, the **tip** command is not enabled when a user logs in.

- To enable tips, include the **login-tip** statement at the **[edit system login class class-name]** hierarchy level:

```
[edit system login class class-name]
login-tip;
```

Adding this statement enables the **tip** command for the class specified, provided the user logs in using the CLI.

## Format for Specifying Filenames and URLs in Junos OS CLI Commands

In some CLI commands and configuration statements—including **file copy**, **file archive**, **load**, **save**, **set system login user *username* authentication load-key *file***, and **request system software add**—you can include a filename. On a routing matrix, you can include chassis information (for example, **lcc0**, **lcc0-re0**, or **lcc0-re1**) as part of the filename.

A *routing matrix* is a multichassis architecture composed of either one TX Matrix router and from one to four T640 routers connected to the TX Matrix router, or one TX Matrix Plus router and from one to four T1600 routers connected to the TX Matrix Plus router. From the perspective of the user interface, the routing matrix appears as a single router. On a routing matrix composed of the TX Matrix router and T640 routers, the TX Matrix router controls all the T640 routers. On a routing matrix composed of a TX Matrix Plus router and T1600 routers, the TX Matrix Plus router controls all the T1600 routers.

You can specify a filename or URL in one of the following ways:

- **filename**—File in the user's current directory on the local CompactFlash card (not applicable on the QFX Series). You can use wildcards to specify multiple source files or a single destination file. Wildcards are not supported in HTTP or FTP.

**NOTE:** Wildcards are supported only by the **file (compare | copy | delete | list | rename | show)** commands. When you issue the **file show** command with a wildcard, it must resolve to one filename.

- **path/filename**—File on the local flash disk.
- **/var/filename** or **/var/path/filename**—File on the local hard disk. You can also specify a file on a local Routing Engine for a specific T640 router or a T1600 router in a routing matrix:  

```
user@host> file delete lcc0-re0:/var/tmp/junk
```
- **a:filename** or **a:path/filename**—File on the local removable media. The default path is **/** (the root-level directory). The removable media can be in MS-DOS or UNIX (UFS) format.
- **hostname:/path/filename**, **hostname:filename**, **hostname:path/filename**, or **"scp://hostname/path/filename"**—File on an **scp/ssh** client. This form is not available in the worldwide version of Junos OS. The default path is the user's home directory on the remote system. You can also specify **hostname** as **username@hostname**.
- **ftp://hostname/path/filename**—File on an FTP server. You can also specify **hostname** as **username@hostname** or **username:password@hostname**. The default path is the user's home directory. To specify an absolute path, the path must start with **%2F**; for example, **ftp://hostname/%2Fpath/filename**. To have the system prompt you for the password, specify **prompt** in place of the password. If a password is required and you do not specify the password or **prompt**, an error message is displayed:

```
user@host> file copy ftp://username@ftp.hostname.net/filename
file copy ftp.hostname.net: Not logged in.
```

```
user@host> file copy ftp://username:prompt@ftp.hostname.net/filename
Password for username@ftp.hostname.net:
```

- **re0:/path/filename** or **re1:/path/filename**—File on a local Routing Engine. You can also specify a file on a local Routing Engine for a specific T640 router or a T1600 router in a routing matrix:

```
user@host> show log lcc0-re1:chassisd
```

**NOTE:** You cannot specify a URL for a file on an HTTP server, because HTTP URLs are not writable.

## Junos OS Operational Mode Commands That Combine Other Commands

In some cases, some Junos OS operational commands are created from a combination of other operational commands. These commands can be useful shortcuts for collecting information about the device, as shown in [Figure 15 on page 51](#).

**Figure 15: Commands That Combine Other Commands**

## Overview of Junos OS CLI Operational Mode Commands

This topic provides an overview of Junos OS CLI operational mode commands and contains the following sections:

- [CLI Command Categories on page 52](#)
- [Commonly Used Operational Mode Commands on page 53](#)

### CLI Command Categories

---

When you log in to a device running Junos OS and the CLI starts, there are several broad groups of CLI commands:

- Commands for controlling the CLI environment—Some set commands in the **set** hierarchy configure the CLI display screen. For information about these commands, see *Understanding the Junos OS CLI Modes, Commands, and Statement Hierarchies*.
- Commands for monitoring and troubleshooting—The following commands display information and statistics about the software and test network connectivity. Detailed command descriptions are provided in the *Junos OS Interfaces Command Reference*.
  - **clear**—Clear statistics and protocol database information.
  - **mtrace**—Trace mtrace packets from source to receiver.
  - **monitor**—Perform real-time debugging of various software components, including the routing protocols and interfaces.
  - **ping**—Determine the reachability of a remote network host.
  - **show**—Display the current configuration and information about interfaces, routing protocols, routing tables, routing policy filters, system alarms, and the chassis.
  - **test**—Test the configuration and application of policy filters and autonomous system (AS) path regular expressions.
  - **traceroute**—Trace the route to a remote network host.
- Commands for connecting to other network systems—The **ssh** command opens Secure Shell connections, and the **telnet** command opens telnet sessions to other hosts on the network. For information about these commands, see the [CLI Explorer](#).
- Commands for copying files—The **copy** command copies files from one location on the router or switch to another, from the router or switch to a remote system, or from a remote system to the router or switch. For information about these commands, see the [CLI Explorer](#).
- Commands for restarting software processes—The commands in the **restart** hierarchy restart the various Junos OS processes, including the routing protocol, interface, and SNMP. For information about these commands, see the [CLI Explorer](#).
- A command—**request**—for performing system-level operations, including stopping and rebooting the router or switch and loading Junos OS images. For information about this command, see the [CLI Explorer](#).

- A command—**start**—to exit the CLI and start a UNIX shell. For information about this command, see the [CLI Explorer](#).
- A command—**configure**—for entering configuration mode, which provides a series of commands that configure Junos OS, including the routing protocols, interfaces, network management, and user access. For information about the CLI configuration commands, see “[Understanding Junos OS CLI Configuration Mode](#)” on page 57.
- A command—**quit**—to exit the CLI. For information about this command, see the [CLI Explorer](#).
- For more information about the CLI operational mode commands, see the [CLI Explorer](#).

### Commonly Used Operational Mode Commands

Table 6 on page 53 lists some operational commands you may find useful for monitoring router or switch operation. For a complete description of operational commands, see the Junos OS command references.

**NOTE:** The QFX3500 switch does not support the IS-IS, OSPF, BGP, MPLS, and RSVP protocols.

**Table 6: Commonly Used Operational Mode Commands**

Items to Check	Description	Command
Software version	Versions of software running on the router or switch	<b>show version</b>
Log files	Contents of the log files	<b>monitor</b>
	Log files and their contents and recent user logins	<b>show log</b>
Remote systems	Host reachability and network connectivity	<b>ping</b>
	Route to a network system	<b>traceroute</b>
Configuration	Current system configuration	<b>show configuration</b>
Manipulate files	List of files and directories on the router or switch	<b>file list</b>
	Contents of a file	<b>file show</b>
Interface information	Detailed information about interfaces	<b>show interfaces</b>

Table 6: Commonly Used Operational Mode Commands (*continued*)

Items to Check	Description	Command
Chassis	Chassis alarm status	<b>show chassis alarms</b>
	Information currently on craft display	<b>show chassis craft-interface</b>
	Router or switch environment information	<b>show chassis environment</b>
	Hardware inventory	<b>show chassis hardware</b>
Routing table information	Information about entries in the routing tables	<b>show route</b>
Forwarding table information	Information about data in the kernel's forwarding table	<b>show route forwarding-table</b>
IS-IS	Adjacent routers or switches	<b>show isis adjacency</b>
OSPF	Display standard information about OSPF neighbors	<b>show ospf neighbor</b>
BGP	Display information about BGP neighbors	<b>show bgp neighbor</b>
MPLS	Status of interfaces on which MPLS is running	<b>show mpls interface</b>
	Configured LSPs on the router or switch, as well as all ingress, transit, and egress LSPs	<b>show mpls lsp</b>
	Routes that form a label-switched path	<b>show route label-switched-path</b>
RSVP	Status of interfaces on which RSVP is running	<b>show rsvp interface</b>
	Currently active RSVP sessions	<b>show rsvp session</b>
	RSVP packet and error counters	<b>show rsvp statistics</b>

- [Junos OS Operational Mode Commands That Combine Other Commands on page 51](#)
- [Understanding the Brief, Detail, Extensive, and Terse Options of Junos OS Operational Commands on page 56](#)

## Overview of Navigating the CLI

This topic describes how to navigate the CLI.

- [CLI Command Hierarchy on page 55](#)
- [CLI Configuration Statements on page 55](#)
- [Moving Among Hierarchy Levels on page 55](#)

## CLI Command Hierarchy

CLI commands are organized in a hierarchy. Commands that perform a similar function are grouped together under the same level of the hierarchy. For example, all commands that display information about the system and the system software are grouped under the **show system** command, and all commands that display information about the routing table are grouped under the **show route** command. [Figure 16 on page 55](#) illustrates a portion of the **show** command hierarchy.

**Figure 16: CLI Command Hierarchy**

To execute a command, you enter the full command name, starting at the top level of the hierarchy. For example, to display a brief view of your Ethernet switching options for your interfaces, use the command **show ethernet-switching-options interfaces**.

## CLI Configuration Statements

The configuration statement hierarchy has two types of statements: *container statements*, which are statements that contain other statements, and *leaf statements*, which do not contain other statements. All of the container and leaf statements together form the *configuration hierarchy*.

The **protocols** statement is a top-level statement at the trunk of the configuration tree. The **ospf**, **area**, and **interface** statements are all subordinate container statements of a higher statement (they are branches of the hierarchy tree), and the **hello-interval** statement is a leaf on the tree.

## Moving Among Hierarchy Levels

You can use the CLI commands to navigate the levels of the configuration statement hierarchy:

- **edit**— Moves to an existing configuration statement hierarchy or creates a hierarchy and moves to that level.
- **exit**— Moves up the hierarchy to the previous level where you were working. This command is, in effect, the opposite of the **edit** command. Alternatively, you can use the **quit** command. The **exit** and **quit** commands are interchangeable.
- **up**— Moves up the hierarchy one level at a time.
- **top**— Moves directly to the top level of the hierarchy.

## Understanding the Brief, Detail, Extensive, and Terse Options of Junos OS Operational Commands

The Junos OS operational mode commands can include **brief**, **detail**, **extensive**, or **terse** options. You can use these options to control the amount of information you want to view.

1. Use the ? prompt to list options available for the command. For example:

```
user@host> show interfaces fe-1/1/1 ?
Possible completions:
<[Enter]>      Execute this command
brief          Display brief output
descriptions   Display interface description strings
detail         Display detailed output
extensive       Display extensive output
media          Display media information
snmp-index     SNMP index of interface
statistics     Display statistics and detailed output
terse          Display terse output
|             Pipe through a command
```

2. Choose the option you wish to use with the command. (See [Figure 17 on page 56](#).)

Figure 17: Command Output Options

Command output with the **brief** option.

```
user@host> show interfaces fe-1/1/1 brief
Physical interface: fe-1/1/1, Enabled, Physical link is Down
  Link-level type: Ethernet, MTU: 1514, Speed: 100mbps, Loopback:
  Disabled, Source filtering: Disabled,
  Flow control: Enabled
  Device flags   : Present Running Down
  Interface flags: Hardware-Down SNMP-Traps Internal: 0x4000
  Link flags     : None
```

Command output with the **terse** option.

```
user@host> show interfaces fe-1/1/1 terse
Interface      Admin Link Proto  Local      Remote
fe-1/1/1       up    down
```

Command output with the **extensive** option.

```
user@host> show interfaces fe-1/1/1 extensive
Physical interface: fe-1/1/1, Enabled, Physical link is Down
  Interface index: 141, SNMP ifIndex: 33, Generation: 24
  Link-level type: Ethernet, MTU: 1514, Speed: 100mbps, Loopback:
  Disabled, Source filtering: Disabled,
  Flow control: Enabled
  Device flags   : Present Running Down
  Interface flags: Hardware-Down SNMP-Traps Internal: 0x4000
  Link flags     : None
  CoS queues     : 4 supported, 4 maximum usable queues
  Hold-times     : Up 0 ms, Down 0 ms
  Current address: 00:90:69:d0:f8:9e, Hardware address: 00:90:69:d0:f8:9e
  Last flapped   : 2007-02-02 09:26:25 PST (2w0d 03:40 ago)
  Statistics last cleared: Never
  Traffic statistics:
    Input bytes :                0                0 bps
    Output bytes:                0                0 bps
    Input packets:              0                0 pps
    Output packets:             0                0 pps
  --- (more) ---
```

## Understanding Junos OS CLI Configuration Mode

You can configure all properties of Junos OS, including interfaces, general routing information, routing protocols, and user access, as well as several system hardware properties.

As described in *Understanding the Junos OS CLI Modes, Commands, and Statement Hierarchies*, a router configuration is stored as a hierarchy of statements. In configuration mode, you create the specific hierarchy of configuration statements that you want to use. When you have finished entering the configuration statements, you commit them, which activates the configuration on the router.

You can create the hierarchy interactively or you can create an ASCII text file that is loaded onto the router or switch and then committed.

This topic covers:

- [Configuration Mode Commands on page 58](#)
- [Configuration Statements and Identifiers on page 59](#)
- [Configuration Statement Hierarchy on page 61](#)

## Configuration Mode Commands

Table 7 on page 58 summarizes each CLI configuration mode command. The commands are organized alphabetically.

**Table 7: Summary of Configuration Mode Commands**

Command	Description
<b>activate</b>	Remove the <b>inactive:</b> tag from a statement, effectively reading the statement or identifier to the configuration. Statements or identifiers that have been activated take effect when you next issue the <b>commit</b> command.
<b>annotate</b>	Add comments to a configuration. You can add comments only at the current hierarchy level.
<b>commit</b>	Commit the set of changes to the database and cause the changes to take operational effect.
<b>copy</b>	Make a copy of an existing statement in the configuration.
<b>deactivate</b>	Add the <b>inactive:</b> tag to a statement, effectively commenting out the statement or identifier from the configuration. Statements or identifiers marked as inactive do not take effect when you issue the <b>commit</b> command.
<b>delete</b>	Delete a statement or identifier. All subordinate statements and identifiers contained within the specified statement path are deleted with it.
<b>edit</b>	Move inside the specified statement hierarchy. If the statement does not exist, it is created.
<b>exit</b>	Exit the current level of the statement hierarchy, returning to the level prior to the last edit command, or exit from configuration mode. The <b>quit</b> and <b>exit</b> commands are synonyms.
<b>extension</b>	Manage configurations that are contributed by SDK application packages. Either display or delete user-defined configuration contributed by the named SDK application package. A configuration defined in any native Junos OS package is never deleted by the extension command.
<b>help</b>	Display help about available configuration statements.
<b>insert</b>	Insert an identifier into an existing hierarchy.
<b>load</b>	Load a configuration from an ASCII configuration file or from terminal input. Your current location in the configuration hierarchy is ignored when the load operation occurs.

Table 7: Summary of Configuration Mode Commands (*continued*)

Command	Description
<b>quit</b>	Exit the current level of the statement hierarchy, returning to the level prior to the last edit command, or exit from configuration mode. The <b>quit</b> and <b>exit</b> commands are synonyms.
<b>rename</b>	Rename an existing configuration statement or identifier.
<b>replace</b>	Replace identifiers or values in a configuration.
<b>rollback</b>	Return to a previously committed configuration. The software saves the last 10 committed configurations, including the rollback number, date, time, and name of the user who issued the <b>commit configuration</b> command.
<b>run</b>	Run a top-level CLI command without exiting from configuration mode.
<b>save</b>	Save the configuration to an ASCII file. The contents of the current level of the statement hierarchy (and below) are saved, along with the statement hierarchy containing it. This allows a section of the configuration to be saved, while fully specifying the statement hierarchy.
<b>set</b>	Create a statement hierarchy and set identifier values. This is similar to <b>edit</b> except that your current level in the hierarchy does not change.
<b>show</b>	Display the current configuration.
<b>status</b>	Display the users currently editing the configuration.
<b>top</b>	Return to the top level of configuration command mode, which is indicated by the <b>[edit]</b> banner.
<b>up</b>	Move up one level in the statement hierarchy.
<b>update</b>	Update a private database.
<b>wildcard</b>	Delete a statement or identifier. All subordinate statements and identifiers contained within the specified statement path are deleted with it. You can use regular expressions to specify a pattern. Based on this pattern, you search for items that contain these patterns and delete them.

### Configuration Statements and Identifiers

You can configure router or switch properties by including the corresponding statements in the configuration. Typically, a statement consists of a keyword, which is fixed text, and, optionally, an identifier. An identifier is an identifying name that you can define, such as

the name of an interface or a username, which enables you and the CLI to differentiate among a collection of statements.

Table 8 on page 60 describes top-level CLI configuration mode statements.

**NOTE:** The QFX3500 switch does not support the IS-IS, OSPF, BGP, LDP, MPLS, and RSVP protocols.

**Table 8: Configuration Mode Top-Level Statements**

Statement	Description
<b>access</b>	Configure the Challenge Handshake Authentication Protocol (CHAP). For information about the statements in this hierarchy, see the <i>Junos OS Administration Library for Routing Devices</i> .
<b>accounting-options</b>	Configure accounting statistics data collection for interfaces and firewall filters. For information about the statements in this hierarchy, see the <i>Network Management Administration Guide for Routing Devices</i> .
<b>chassis</b>	Configure properties of the router chassis, including conditions that activate alarms and SONET/SDH framing and concatenation properties. For information about the statements in this hierarchy, see the <i>Junos OS Administration Library for Routing Devices</i> .
<b>class-of-service</b>	Configure class-of-service parameters. For information about the statements in this hierarchy, see the <i>Class of Service Feature Guide for Routing Devices</i> .
<b>firewall</b>	Define filters that select packets based on their contents. For information about the statements in this hierarchy, see the <i>Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices</i> .
<b>forwarding-options</b>	Define forwarding options, including traffic sampling options. For information about the statements in this hierarchy, see the <i>Junos OS Network Interfaces Library for Routing Devices</i> .
<b>groups</b>	Configure configuration groups. For information about statements in this hierarchy, see the <i>Junos OS Administration Library for Routing Devices</i> .
<b>interfaces</b>	Configure interface information, such as encapsulation, interfaces, virtual channel identifiers (VCIs), and data-link connection identifiers (DLCIs). For information about the statements in this hierarchy, see the <i>Junos OS Network Interfaces Library for Routing Devices</i> .
<b>policy-options</b>	Define routing policies, which allow you to filter and set properties in incoming and outgoing routes. For information about the statements in this hierarchy, see the <i>Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices</i> .
<b>protocols</b>	Configure routing protocols, including BGP, IS-IS, LDP, MPLS, OSPF, RIP, and RSVP. For information about the statements in this hierarchy, see the chapters that discuss how to configure the individual routing protocols in the <i>Junos OS Routing Protocols Library for Routing Devices</i> and the <i>Junos OS MPLS Applications Library for Routing Devices</i> .

Table 8: Configuration Mode Top-Level Statements (*continued*)

Statement	Description
<b>routing-instances</b>	Configure multiple routing instances. For information about the statements in this hierarchy, see the <i>Junos OS Routing Protocols Library for Routing Devices</i> .
<b>routing-options</b>	Configure protocol-independent routing options, such as static routes, autonomous system numbers, confederation members, and global tracing (debugging) operations to log. For information about the statements in this hierarchy, see the <i>Junos OS Routing Protocols Library for Routing Devices</i> .
<b>security</b>	Configure IP Security (IPsec) services. For information about the statements in this hierarchy see the <i>Junos OS Administration Library for Routing Devices</i> .
<b>snmp</b>	Configure SNMP community strings, interfaces, traps, and notifications. For information about the statements in this hierarchy, see the <i>Network Management Administration Guide for Routing Devices</i> .
<b>system</b>	Configure systemwide properties, including the hostname, domain name, Domain Name System (DNS) server, user logins and permissions, mappings between hostnames and addresses, and software processes. For information about the statements in this hierarchy, see the <i>Junos OS Administration Library for Routing Devices</i> .

For specific information on configuration statements, see the Junos OS configuration guides.

### Configuration Statement Hierarchy

The Junos OS configuration consists of a hierarchy of *statements*. There are two types of statements: *container statements*, which are statements that contain other statements, and *leaf statements*, which do not contain other statements (see [Figure 18 on page 61](#)). All of the container and leaf statements together form the *configuration hierarchy*.

Figure 18: Configuration Mode Hierarchy of Statements

Each statement at the top level of the configuration hierarchy resides at the trunk (or root level) of a hierarchy tree. The top-level statements are container statements, containing other statements that form the tree branches. The leaf statements are the leaves of the hierarchy tree. An individual hierarchy of statements, which starts at the trunk of the hierarchy tree, is called a *statement path*. [Figure 18 on page 61](#) illustrates the hierarchy tree, showing a statement path for the portion of the protocol configuration hierarchy that configures the hello interval on an interface in an OSPF area.

The **protocols** statement is a top-level statement at the trunk of the configuration tree. The **ospf**, **area**, and **interface** statements are all subordinate container statements of a higher statement (they are branches of the hierarchy tree); and the **hello-interval** statement is a leaf on the tree which in this case contains a data value: the length of the hello interval, in seconds.

The CLI represents the statement path shown in [Figure 18 on page 61](#) as **[edit protocols ospf area *area-number* interface *interface-name*]** and displays the configuration as follows:

```
protocols {
  ospf {
    area 0.0.0.0 {
      interface so-0/0/0 {
        hello-interval 5;
      }
      interface so-0/0/1 {
        hello-interval 5;
      }
    }
  }
}
```

The CLI indents each level in the hierarchy to indicate each statement's relative position in the hierarchy and generally sets off each level with braces, using an open brace at the beginning of each hierarchy level and a closing brace at the end. If the statement at a hierarchy level is empty, the braces are not printed.

Each leaf statement ends with a semicolon. If the hierarchy does not extend as far as a leaf statement, the last statement in the hierarchy ends with a semicolon.

The configuration hierarchy can also contain “oneliners” at the last level in the hierarchy. Oneliners remove one level of braces in the syntax and display the container statement, its identifiers, the child or leaf statement and its attributes all on one line. For example, in the following sample configuration hierarchy, the line **level 1 metric 10** is a oneliner because the **level** container statement with identifier **1**, its child statement **metric**, and its corresponding attribute **10** all appear on a single line in the hierarchy:

```
[edit protocols]
isis {
  interface ge-0/0/0.0 {
    level 1 metric 10;
  }
}
```

Likewise, in the following example, **dynamic-profile** *dynamic-profile-name* **aggregate-clients;** is a oneliner because the **dynamic-profile** statement, its identifier *dynamic-profile-name*, and leaf statement **aggregate-clients** all appear on one line when you run the **show** command in the configuration mode:

```
[edit forwarding-options]
user@host# show
dhcp-relay {
  dynamic-profile dynamic-profile-name aggregate-clients;
}
```

## Junos OS Feature Licenses

Some Junos OS software features require a license to activate the feature. To enable a licensed feature, you need to purchase, install, manage, and verify a license key that corresponds to each licensed feature. To conform to Junos OS feature licensing requirements, you must purchase one license per feature per device. The presence of the appropriate software license key on your device determines whether you are eligible to configure and use the licensed feature.

To speed deployment of licensed features, Junos OS software implements an honor-based licensing structure and provides you with a 30-day grace period to use a licensed feature without a license key installed. The grace period begins when you configure the feature and your device uses the licensed feature for the first time, but not necessarily when you install the license. After the grace period expires, the system generates system log messages saying that the feature requires a license. To clear the error message and use the licensed feature properly, you must install and verify the required license.

For information about how to purchase software licenses, contact your Juniper Networks sales representative.

- *Software Feature Licenses*
- [Verifying Junos OS License Installation on page 76](#)

## Software Features That Require Licenses on the QFX Series

**NOTE:** If you try to configure a feature that is not licensed, you will receive syslog messages saying that you are using a feature that is licensable and that you do not possess a license for the feature. If you try to commit configuration changes for a feature that is not licensed, you will receive a commit warning saying that you have exceeded the allowed license limit for the feature.

[Table 9 on page 64](#) lists the licenses you can purchase for each QFX Series software feature.

For information about how to purchase a software license, contact your Juniper Networks sales representative.

**Table 9: Junos OS Feature Licenses and Model Numbers for QFX Series Devices**

Licensed Software Feature	Supported Devices	Number of Licenses Required	Model Number
QFX Series advanced feature license for Border Gateway Protocol (BGP), Intermediate System-to-Intermediate System (IS-IS), and Multi-protocol Label Switching (MPLS)	QFX3500, QFX3600, QFX5100-48S, and QFX5100-48T switches	One per switch	QFX-JSL-EDGE-ADV1
QFX Series advanced feature license for Border Gateway Protocol (BGP), Intermediate System-to-Intermediate System (IS-IS), and Multi-protocol Label Switching (MPLS)	QFX5100-24Q and QFX5100-96S switches	One per switch	QFX5100-HDNSE-LIC
Virtual Extensible Local Area Network (VXLAN) and Open vSwitch Database (OVSDb)	QFX5100-48S and QFX5100-48T switches	One per switch, two per Virtual Chassis and Virtual Chassis Fabric	QFX-JSL-EDGE-ADV1
Virtual Extensible Local Area Network (VXLAN) and Open vSwitch Database (OVSDb)	QFX5100-24Q and QFX5100-96S switches	One per switch, two per Virtual Chassis and Virtual Chassis Fabric	QFX5100-HDNSE-LIC
QFX Series advanced feature license for Border Gateway Protocol (BGP)	QFX3100 Director device	One per Node device in a network Node group	QFX-JSL-DRCTR-ADV1

Table 9: Junos OS Feature Licenses and Model Numbers for QFX Series Devices (*continued*)

Licensed Software Feature	Supported Devices	Number of Licenses Required	Model Number
QFX Series advanced feature license for Fibre Channel	QFX3500 switch	One per switch on which fibre channel ports are configured	QFX-JSL-EDGE-FC
QFX Series advanced feature license for Fibre Channel	QFX3100 Director device	One per QFX3500 Node device on which fibre channel ports are configured	QFX-JSL-DRCTR-FC
QFX Series advanced feature license for Fibre Channel - Capacity 16	QFX3100 Director device	One for up to 16 QFX3500 Node devices on which fibre channel ports are configured	QFX-JSL-DRCTR-FC-C16
QFX Series feature license for enabling fabric mode	QFX3500 and QFX3600 device	One per device	QFX3000-JSL-EDGE-FAB
QFX Series feature license for base software for QFX3000-G QFabric system	QFX3100 Director device	One per QFX3000-G QFabric system	QFX3008-JSL-DRCTR-FAB
QFX Series feature license for base software for QFX3000-M QFabric system	QFX3100 Director device	One per QFX3000-M QFabric system	QFX3000M-JSL-DRCTR-FAB
Virtual Chassis Fabric (VCF)	All member devices in a Virtual Chassis Fabric (VCF)	Two per Virtual Chassis Fabric (VCF)	QFX-VCF-LIC

## Junos OS Feature License Keys

Some Junos OS software features require a license to be activated. To enable each licensed feature, you must purchase, install, manage, and verify a license key that corresponds to the licensed feature.

### Release-Tied License Keys and Upgrade Licenses on MX Series Routers

---

The Junos OS licensing infrastructure currently associates a license feature with attributes such as date, platform, and validity. In addition to these attributes, for MX Series routers running Junos OS Release 12.2 and later, a licensed feature can be associated with a release number at the time of generating the license key. This type of release-tied license key is used to validate a particular licensed feature while attempting a software upgrade. The upgrade process aborts if the release number in the license key is earlier than the Junos OS release number to which the system is being upgraded.

Additionally, an upgrade license key can be generated for a release-tied licensed feature. An upgrade license key is used for carrying forward a capacity license to the upgrade release. Although an upgrade license might be an acceptable license on the current release, it does not add to the existing capacity limit. The capacity added in the upgrade license key is valid for the upgrade software release only.

The release number embedded in the license key indicates the maximum release number up to which Junos OS can be upgraded.

As an example, assume that your system is running Junos OS Release 12.2 and is using the **scale-subscriber** licensed feature with a later release-tied upgrade license key installed. If you request a software upgrade to the later release of Junos OS, the software upgrade operation fails and the following error message is displayed:

```
mgd: error: No valid upgrade license found for feature 'scale-subscriber'.  
Aborting Software upgrade.  
Validation failed
```

In this example, to successfully upgrade to the later release of Junos OS, the release number included in the upgrade license key should be greater than or equal to the later release number. Also, you can perform software upgrades up to the previous release without any additional license keys to retain the existing scale limit.

**NOTE:**

When you install a release-tied license, the following apply:

- You can purchase an upgrade capacity license only if a base capacity license for the same scale-tier has already been generated or purchased.
- You cannot install an upgrade license if the capacity does not match any of the existing base capacity licenses on the system.
- The license installation fails when you install a lower release number license key on a higher software release number.
- A release-tied license can be installed on a Junos OS release number that is lower than or equal to the release number included in the license key. For example, a 12.2 license key is valid on Junos OS Release 12.1.
- An upgrade license is valid only on the target release number specified in the license key, but can be installed on an earlier Junos OS release. For example, a 4 K scale-tier upgrade license for Junos OS Release 12.2 can be installed on an earlier release, and the installed count of licenses remains unaltered.
- Release-tied licenses of the previous release are not deleted on upgrading Junos OS to a newer release version.

### Licensable Ports on MX5, MX10, and MX40 Routers

Starting with Junos OS Release 12.2, license keys are available to enhance the port capacity on MX5, MX10, and MX40 routers up to the port capacity of an MX80 router. The MX5, MX10, and MX40 routers are derived from the modular MX80 chassis with similar slot and port assignments, and provide all functionality available on an MX80 router, but at a lower capacity. Restricting port capacity is achieved by making a set of MIC slots and ports licensable. MICs without a license are locked, and are unlocked or made usable by installing appropriate upgrade licenses.

The base capacity of a router is identified by the Ideeprom assembly ID (I2C ID), which defines the board type. However, the Junos OS licensing infrastructure allows the use of restricted ports without a license for a grace period of 30 days. After the grace period expires, the router reverts back to the base capacity if no upgrade license is purchased and installed for the locked ports. The I2C ID along with an upgrade license determine the final capacity of an MX5, MX10, or MX40 router.

The MX5, MX10, MX40, and MX80 routers support the following types of MICs:

- A built-in 10-Gigabit Ethernet MIC with four 10-Gigabit Ethernet ports
- Two front-pluggable MICs

A feature ID is assigned to every license upgrade for enhancing port capacity.

[Table 10 on page 68](#) displays the chassis types and their associated port capacity, I2C ID, base capacity, feature ID, feature name, and the final capacity after a license upgrade.

Table 10: Upgrade Licenses for Enhancing Port Capacity

Chassis Type	Port Capacity	I2C ID	Base Capacity	Feature ID and Feature Name	Upgrade Capacity
MX5	20G	0x556	Slot 1 <ul style="list-style-type: none"> <li>• 1/MIC0</li> </ul>	f1—MX5 to MX10 upgrade	Slot 1 and 2 <ul style="list-style-type: none"> <li>• 1/MIC0</li> <li>• 1/MIC1</li> </ul>
MX10	40G	0x555	Slot 1 and 2 <ul style="list-style-type: none"> <li>• 1/MIC0</li> <li>• 1/MIC1</li> </ul>	f2—MX10 to MX40 upgrade	Slot 2 and first 2 ports on Slot 0 <ul style="list-style-type: none"> <li>• 1/MIC1</li> <li>• First 2 ports on 0/MIC0</li> </ul>
MX40	60G	0x554	Slot 1, Slot 2 and first 2 ports on Slot 0 <ul style="list-style-type: none"> <li>• 1/MIC0</li> <li>• 1/MIC1</li> <li>• First 2 ports on 0/MIC0</li> </ul>	f3—MX40 to MX80 upgrade	Slot 2 and all ports on Slot 0 <ul style="list-style-type: none"> <li>• 1/MIC1</li> <li>• All 4 ports on 0/MIC0</li> </ul>

When installing an upgrade license for enhancing port capacity on MX5, MX10 and MX40 routers, consider the following:

- To upgrade an MX5 router to MX80 router capacity, licenses for all three features (f1, f2, f3) must be installed. All three features can be provided in a single license key.
- To upgrade an MX10 router to MX40 router capacity, installing a license key with f2 feature is sufficient.
- Non-applicable feature IDs in a license key reject the upgrade license. For example:
  - An f1 feature ID on an MX10 upgrade license key rejects the license.
  - Feature IDs f1 and f2 on an MX40 upgrade license key reject the entire license.

### Port Activation on MX104 Routers

Starting with Junos OS Release 13.3, license keys are available to activate the ports on the MX104 router. MX104 routers have four built-in ports. By default, in the absence of valid licenses, all four built-in ports are deactivated. By installing licenses, you can activate any two of the four or all of the four built-in ports. For instance, you can install a license to activate the first two built-in ports (xe-2/0/0 and xe-2/0/1) or you can install a license to activate the next two built-in ports (xe-2/0/2 and xe-2/0/3). You can also install a license to activate all four built-in ports (xe-2/0/0, xe-2/0/1, xe-2/0/2, and xe-2/0/3). If you have already activated two of the built-in ports, you can install an additional license to activate the other two built-in ports on the MX104 router.

A feature ID is assigned to every license for activating the built-in ports on the MX104 router. The port license model with the feature ID is described in [Table 11 on page 69](#).

Table 11: Port Activation License Model for MX104 Routers

Feature ID	Feature Name	Functionality
F1	MX104 2X10G Port Activate (0 and 1)	Ability to activate first two built-in ports (xe-2/0/0 and xe-2/0/1)
F2	MX104 2X10G Port Activate (2 and 3)	Ability to activate next two built-in ports (xe-2/0/2 and xe-2/0/3)

Both the features are also provided in a single license key for ease of use. To activate all four ports, you must either install the licenses for both the features listed in [Table 11 on page 69](#) or the single license key for both features. If you install the single license key when feature IDs F1 and F2 are already installed, the license does not get rejected. Also, MX104 routers do not support the graceful license expiry policy. A graceful license expiry policy allows the use of a feature for a certain period of time (usually a grace period of 30 days), and reverts if the license for that feature is not installed after the grace period.

## Generating License Keys

When you purchase a Junos OS software feature license for a device, you receive an e-mail containing an authorization code for the feature license from Juniper Networks. You can use the authorization code to generate a unique license key (a combination of the authorization code and the device's serial number) for the device, and then add the license key on the device.

Before generating the license keys for a device:

- Purchase the required licenses for the device. See [“Software Features That Require Licenses on the QFX Series” on page 64](#).
- Note down the authorization code in the e-mail you received from Juniper Networks when you purchased the license.
- Determine the serial number of the device. For instructions, see *Locating the Serial Number on a QFX3500 Device or Component*.

To generate the license keys for a device:

**NOTE:** This procedure shows you how to generate license keys on a QFX Series device, but you can follow the same procedure for any device.

1. In a browser, log in to the Juniper Networks License Management System at <https://www.juniper.net/lcrs/license.do>.

The Manage Product Licenses page appears.

**NOTE:** To access the licensing site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website <https://www.juniper.net/registration/Register.jsp>.

2. On the Generate Licenses tab, select **QFX Series Product** from the drop-down list, and click **Go**.

The Generate Licenses - QFX Series Product page appears.

3. Select the **QFX Series Product Device** option button, and click **Continue**.

The Generate Licenses - QFX Series Product Devices page appears.

4. In the **Device Serial Number** field, enter the serial number for the device.
5. In the **Authorization Code** field, enter the authorization code in the e-mail you received from Juniper Networks when you purchased the license.
6. (Optional) If you want to enter another authorization code for the same device, click **Enter More Authorization Codes** to display a new authorization code field. Enter the authorization code in this field.
7. Click **Confirm**.

The Confirm License Information page appears, displaying a summary of the information you submitted to the License Management System.

8. Review the information to ensure everything is correct and then click **Generate License**.

The Generate Licenses - QFX Series Product Devices page appears, displaying a summary of your license keys, including a link that displays the details of your new license keys.

9. Select the file format in which you want to obtain your new license keys.
10. Select the delivery method you want to use to obtain your new license keys.

To download the license keys:

- Select the **Download to this computer** option button, and click **OK**.

To e-mail the license keys:

- Select the **Send e-mail to e-mail ID** option button, and click **OK**.

#### Related Documentation

## Generating the License Keys for a QFabric System

When you purchase a Junos OS software feature license for a QFabric system, you receive an e-mail containing an authorization code for the feature license from Juniper Networks. You can use the authorization code to generate a unique license key (a combination of the authorization code and the QFabric system ID ) for the QFabric system, and then add the license key on the QFabric system.

Before generating the license keys for a QFabric system:

- Purchase the required licenses for the QFabric system. See [“Software Features That Require Licenses on the QFX Series” on page 64](#).
- Note down the authorization code in the e-mail you received from Juniper Networks when you purchased the license.
- Perform the initial setup of the QFabric system on the Director group. See [“Performing the QFabric System Initial Setup on a QFX3100 Director Group” on page 1471](#).
- Log in to the QFabric system, issue the `show version` command, and note down the software serial number and QFabric system ID for the QFabric system.

```
user@qfabric> show version
Hostname: qfabric
Model: qfx3000-g
Serial Number: qfsn-0123456789
QFabric System ID: f158527a-f99e-11e0-9fbd-00e081c57cda
JUNOS Base Version [12.2I20111018_0215_dc-builder]
```

To generate the license keys for a QFabric system:

1. In a browser, log in to the Juniper Networks License Management System at <https://www.juniper.net/lcrs/license.do>.

The Manage Product Licenses page appears.

**NOTE:** To access the licensing site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website <https://www.juniper.net/registration/Register.jsp>.

2. On the Generate Licenses tab, select **QFX Series Product** from the drop-down list, and click **Go**.

The Generate Licenses - QFX Series Product page appears.

3. Select the **QFX Series Product Fabric** option button, and then click **Continue**.

The Generate Licenses - QFX Series Product Fabrics page appears.

4. In the **Software Serial No** field, enter the software serial number for the QFabric system.
5. In the **QFabric System ID** field, enter the QFabric system ID for the QFabric system.
6. In the **Authorization Code** field, enter the authorization code in the e-mail you received from Juniper Networks when you purchased the license.
7. (Optional) If you want to enter another authorization code for the same device, click **Enter More Authorization Codes** to display a new authorization code field. Enter the authorization code in this field.
8. Click **Confirm**.

The Confirm License Information page appears, displaying a summary of the information you submitted to the License Management System.

9. Review the information to ensure everything is correct and then click **Generate License**.

The Generate Licenses - QFX Series Product Fabrics page appears, displaying a summary of your license keys, including a link that displays the details of your new license keys.

10. Select the file format in which you want to obtain your new license keys.
11. Select the delivery method you want to use to obtain your new license keys.

To download the license keys:

- Select the **Download to this computer** option button, and click **OK**.

To e-mail the license keys:

- Select the **Send e-mail to e-mail ID** option button, and click **OK**.

#### Related Documentation

- [Software Features That Require Licenses on the QFX Series on page 64](#)
- [Performing the QFabric System Initial Setup on a QFX3100 Director Group on page 1471](#)
- [Adding New Licenses \(CLI Procedure\) on page 73](#)
- [show version on page 1272](#)

## Adding New Licenses (CLI Procedure)

Before adding new licenses, complete the following tasks:

- Purchase the required licenses.
- Establish basic network connectivity with the router or switch. For instructions on establishing basic connectivity, see the *Getting Started Guide* or *Quick Start Guide* for your device.

**NOTE:** On QFabric systems, install your licenses in the default partition of the QFabric system and not on the individual components (Node devices and Interconnect devices).

To add a new license key to the device using the CLI:

1. From the CLI operational mode, enter one of the following CLI commands:

- To add a license key from a file or URL, enter the following command, specifying the filename or the URL where the key is located:

```
user@host> request system license add filename | url
```

- To add a license key from the terminal, enter the following command:

```
user@host> request system license add terminal
```

2. When prompted, enter the license key, separating multiple license keys with a blank line.

If the license key you enter is invalid, an error appears in the CLI output when you press Ctrl+d to exit license entry mode.

3. Go on to [“Verifying Junos OS License Installation” on page 76](#).

On routers that have graceful Routing Engine switchover (GRES) enabled, after successfully adding the new license on the master Routing Engine, the license keys are automatically synchronized on the backup Routing Engine as well. However, in case GRES

is not enabled, the new license is added on each Routing Engine separately. This ensures that the license key is enabled on the backup Routing Engine during changeover of mastership between the Routing Engines.

To add a new license key to a router with dual Routing Engines without GRES:

1. After adding the new license key on the master Routing Engine, use the **request chassis routing-engine master switch** command to have the backup Routing Engine become the master Routing Engine.
2. Log in to the active Routing Engine and add the new license key, repeat the same step.

**NOTE:** Adding a license key to the router or switch might be delayed if a kernel resynchronization operation is in progress at that time. The following message is displayed on the CLI when the license-adding operation is about to be delayed:

A kernel re-sync operation is in progress. License update may take several minutes to complete.

#### Related Documentation

- [Deleting a License \(CLI Procedure\) on page 74](#)
- [Junos OS Feature Licenses on page 63](#)
- [Verifying Junos OS License Installation on page 76](#)
- [request system license add on page 409](#)

## Deleting a License (CLI Procedure)

Before deleting a license, establish basic network connectivity with the router or switch. For instructions on establishing basic connectivity, see the *Getting Started Guide* or *Quick Start Guide* for your router or switch.

You have the options to delete a single license, delete all licenses, or delete a list of licenses enclosed in brackets.

1. Display the licenses available to be deleted.

```
user@host> request system license delete license-identifier-list ?
```

```
Possible completions:
```

E00468XXX4	License key identifier
JUNOS10XXX1	License key identifier
JUNOS10XXX2	License key identifier
JUNOS10XXX3	License key identifier
JUNOS10XXX4	License key identifier
[	Open a set of values

2. To delete a license key or keys from a device using the CLI operational mode, select one of the following methods:
  - Delete a single license by specifying the license ID. Using this option, you can delete only one license at a time.

```
user@host> request system license delete license-identifier
```

- Delete all license keys from the current device.

```
user@host> request system license delete all
```

- Delete multiple license keys from the current device. Specify the license identifier for each key and enclose the list of identifiers in brackets.

```
user@host> request system license delete license-identifier-list [JUNOS10XXX1  
JUNOS10XXX3 JUNOS10XXX4 ...]
```

```
Delete license(s) ?  
[yes,no] (no) yes
```

3. Go on to [“Verifying Junos OS License Installation” on page 76](#).

**NOTE:** Deleting a license key from the router or switch might be delayed if a kernel resynchronization operation is in progress at that time. The following message is displayed on the CLI when the license-deleting operation is about to be delayed:

A kernel re-sync operation is in progress. License update may take several minutes to complete.

#### Related Documentation

- [Saving License Keys on page 75](#)
- [Junos OS Feature Licenses on page 63](#)
- [Verifying Junos OS License Installation on page 76](#)
- [request system license delete on page 410](#)

## Saving License Keys

Before saving a license, establish basic network connectivity with the router or switch. For instructions on establishing basic connectivity, see the *Getting Started Guide* or *Quick Start Guide* for your router or switch.

To save the licenses installed on a device to a file using the CLI:

1. From the CLI operational mode, enter one of the following CLI commands:

- To save the installed license keys to a file or URL, enter the following command:

```
user@host> request system license save filename | url
```

For example, the following command saves the installed license keys to a file named **license.config**:

- To save a license key from the terminal, enter the following command:

```
user@host> request system license save ftp://user@host/license.config
```

2. Go on to [“Verifying Junos OS License Installation” on page 76](#).

- Related Documentation**

  - [Deleting a License \(CLI Procedure\) on page 74](#)
  - [Junos OS Feature Licenses on page 63](#)
  - [Verifying Junos OS License Installation on page 76](#)

## Verifying Junos OS License Installation

To verify Junos OS license management, perform the following tasks:

- [Displaying Installed Licenses on page 76](#)
- [Displaying License Usage on page 77](#)

### Displaying Installed Licenses

---

**Purpose** Verify that the expected licenses are installed and active on the router or switch.

**Action** From the CLI, enter the **show system license** command.

### Sample Output

```
user@host> show system license
License usage:

  Feature name      Licenses      Licenses      Licenses      Expiry
                   used       installed     needed
subscriber-acct      0           1           0    permanent
subscriber-auth      0           1           0    permanent
subscriber-addr      0           1           0    permanent
subscriber-vlan      0           1           0    permanent
subscriber-ip        0           1           0    permanent
scale-subscriber     0          1000         0    permanent
scale-l2tp           0          1000         0    permanent
scale-mobile-ip      0          1000         0    permanent

Licenses installed:
License identifier: E000185416
License version: 2
Features:
subscriber-acct - Per Subscriber Radius Accounting
permanent
subscriber-auth - Per Subscriber Radius Authentication
permanent
subscriber-addr - Address Pool Assignment
permanent
subscriber-vlan - Dynamic Auto-sensed Vlan
permanent
subscriber-ip   - Dynamic and Static IP
permanent
```

**Meaning** The output shows a list of the license usage and a list of the licenses installed on the router or switch. Verify the following information:

- Each license is present. Licenses are listed in ascending alphanumeric order by license ID.
- The state of each license is **permanent**.

**NOTE:** A state of invalid indicates that the license key is not a valid license key. Either it was entered incorrectly or it is not valid for the specific device.

- The feature for each license is the expected feature. The features enabled are listed by license. An all-inclusive license has all features listed.
- All configured features have the required licenses installed. The Licenses needed column must show that no licenses are required.

### Displaying License Usage

**Purpose** Verify that the licenses fully cover the feature configuration on the router or switch.

**Action** From the CLI, enter the **show system license usage** command.

### Sample Output

```
user@host> show system license usage
```

Feature name	Licenses used	Licenses installed	Licenses needed	Expiry
subscriber-addr	1	0	1	29 days
scale-subscriber	0	1000	0	permanent
scale-l2tp	0	1000	0	permanent
scale-mobile-ip	0	1000	0	permanent

**Meaning** The output shows any licenses installed on the router or switch and how they are used. Verify the following information:

- Any configured licenses appear in the output. The output lists features in ascending alphabetical order by license name. The number of licenses appears in the third column. Verify that you have installed the appropriate number of licenses.
- The number of licenses used matches the number of configured features. If a licensed feature is configured, the feature is considered used. The sample output shows that the subscriber address pooling feature is configured.
- A license is installed on the router or switch for each configured feature. For every feature configured that does not have a license, one license is needed.

For example, the sample output shows that the subscriber address feature is configured but that the license for the feature has not yet been installed. The license must be installed within the remaining grace period to be in compliance.

### Junos OS Package Names

You upgrade the Juniper Networks Junos OS on the QFX Series by copying a software package to your switch or another system on your local network and then installing the new software package on the switch.

A software package name is in the following format:

**NOTE:** A signed domestic package is used as an example only. Other types of software packages might be available in future releases.

***package-name-m.nZx.y-domestic-signed.tgz***

where:

- ***package-name*** is the name of the package—for example, ***jinstall-qfx***.
- ***m.n*** is the software release, with ***m*** representing the major release number and ***n*** representing the minor release number—for example, ***11.1***.
- ***Z*** indicates the type of software release, where ***R*** indicates released software and ***B*** indicates beta-level software.
- ***x.y*** represents the maintenance software release, with ***x*** representing the maintenance software release number and ***y*** representing the maintenance software spin number—for example, ***1.5***.

A sample switch software package name is:

***jinstall-qfx-11.1R1.5-domestic-signed.tgz***

## Configuring Zero Touch Provisioning

**NOTE:** To see which platforms support Zero Touch Provisioning, in a browser, go to [Feature Explorer](#). In the Explore Features section of the Feature Explorer page, select All Features. In the Features Grouped by Feature Family box, select Zero Touch Provisioning. You can also type the name of the feature in the Search for Features edit box. In previous Junos OS releases on EX Series switches, Zero Touch Provisioning was called EZ Touchless Provisioning. Search for that feature name if you want to know if this feature is supported on EX Series switches.

Zero Touch Provisioning allows you to provision new switches in your network automatically, without manual intervention. When you physically connect a switch to the network and boot it with a default configuration, it attempts to upgrade the Junos OS software automatically and autoinstall a configuration file from the network.

The switch uses information that you configure on a Dynamic Host Control Protocol (DHCP) server to determine whether to perform these actions and to locate the necessary software image and configuration files on the network. If you do not configure the DHCP server to provide this information, the switch boots with the preinstalled software and default configuration.

**NOTE:** If you have both DHCP and ZTP enabled, the switch broadcasts a DHCP DISCOVER packet every six minutes. If a DHCP server on the network responds with a DHCP ACK packet with DHCP vendor options set with the necessary values to initiate ZTP, then ZTP proceeds.

To disable broadcasting the DHCP DISCOVER packet every six minutes, without performing the ZTP process, manually delete the `auto-image-upgrade` statement located in the `[edit chassis]` hierarchy. If ZTP completes without errors, the `auto-image-upgrade` statement is automatically deleted.

**NOTE:** For detailed information regarding the DHCP and DHCP options, refer to RFC2131 (<http://www.ietf.org/rfc/rfc2131.txt>) and RFC2132 ([www.ietf.org/rfc/rfc2132.txt](http://www.ietf.org/rfc/rfc2132.txt)). Also, this document refers to Internet Systems Consortium (ISC) DHCP version 4.2. For more information regarding this version, refer to <http://www.isc.org/software/dhcp/documentation>.

Before you begin:

- Ensure that the switch has access to the following network resources:

- The DHCP server provides the location of the software image and configuration files on the network

Refer to your DHCP server documentation for configuration instructions.

- The File Transfer Protocol (anonymous FTP), Hypertext Transfer Protocol (HTTP), Trivial File Transfer Protocol (TFTP) server on which the software image and configuration files are stored

**NOTE:** Although TFTP is supported, we recommend that you use FTP or HTTP instead, because these transport protocols are more reliable.

- A Domain Name System (DNS) server to perform reverse DNS lookup
  - (Optional) An NTP server to perform time synchronization on the network
  - (Optional) A system log (syslog) server to manage system log messages and alerts
- Locate and record the MAC address printed on the switch chassis.

**CAUTION:** You cannot commit a configuration while the switch is performing the software update process. If you commit a configuration while the switch is performing the configuration file autoinstallation process, the process stops, and the configuration file is not downloaded from the network.

To configure Zero Touch Provisioning for a switch:

1. Make sure the switch has the default factory configuration installed.

Issue the **request system zeroize** command on the switch that you want to provision.

2. Download the software image file and the configuration file to the FTP, HTTP, TFTP, server that the switch will download these files from.

You can download either one or both of these files.

3. Configure the DHCP server to provide the necessary information to the switch.

Configure IP address assignment.

You can configure dynamic or static IP address assignment for the switch's management address. To determine the switch's management MAC address for static IP address mapping, add 1 to the last byte of the switch's MAC address, which you noted before you began this procedure.

4. Define the format of the vendor-specific information for DHCP option 43 in the `dhcpd.conf` file.

Here is an example of an ISC DHCP 4.2 server `dhcpd.conf` file:

```
option space NEW_OP; option;  
option NEW_OP.config-file-name code 1 = text;  
option NEW_OP.image-file-type code 2 = text;  
option NEW_OP.transfer-mode code 3 = text;
```

```
option NEW_OP.alt-image-file-name code 4= text;
option NEW_OP-encapsulation code 43 = encapsulate NEW_OP;
```

5. Configure the following DHCP option 43 suboptions:

- Suboption 00: The name of the software image file to install

**NOTE:** When the DHCP server cannot use suboption 00, configure the image file using suboption 04. If both suboption 00 and suboption 4 are defined, suboption 04 is ignored.

```
option NEW_OP.image-file-name
"/dist/images/jinstall-ex-4200-13.2R1.1-domestic-signed.tgz";
```

- Suboption 01: The name of the configuration file to install

```
option NEW_OP.config-file-name "/dist/config/jn-switch35.config";
```

- Suboption 02: The symbolic link to the software image file to install

```
option NEW_OP.image-file-type "symlink";
```

**NOTE:** If you do not specify suboption 2, the Zero Touch Provisioning process handles the software image as a filename, not a symbolic link.

- Suboption 03: The transfer mode that the switch uses to access the TFTP/FTP/HTTP server

```
option NEW_OP.transfer-mode "ftp";
```

**NOTE:** If suboption 03 is not configured, TFTP becomes the transfer mode by default.

- Suboption 04: The name of the software image file to install

**NOTE:** When the DHCP server cannot use suboption 00, configure the image file using suboption 04. If both suboption 00 and suboption 4 are defined, suboption 04 is ignored.

```
option NEW_OP.alt-image-file-name
"/dist/images/jinstall-ex-4200-13.2R1.1-domestic-signed.tgz";
```

6.

**NOTE:** You must configure either option 150 or option 66. If you configure both option 150 and option 66, option 150 takes precedence, and option 66 is ignored. Also, make sure you specify an IP address, not a hostname, because name resolution is not supported.

Configure DHCP option 150 to specify the IP address of the FTP, HTTP, or TFTP server.

```
option option-150 code 150 "10.100.31.71";
```

7. Configure DHCP option 66 to specify the IP address of the FTP, HTTP, or TFTP server.

```
option tftp-server-name "10.100.31.71";
```

8. (Optional) Configure DHCP option 7 to specify one or more system log (syslog) servers.

```
option log-servers 10.100.31.72;
```

9. (Optional) Configure DHCP option 42 to specify one or more NTP servers.

```
option ntp-servers 10.100.31.73;
```

10. (Optional) Configure DHCP option 12 to specify the hostname of the switch.

```
option hostname "jn-switch35";
```

The following sample configuration shows the DHCP options you just configured:

```
host jn-switch35 {  
  hardware ethernet ac:4b:c8:29:5d:02;  
  fixed-address 10.100.31.36;  
  option tftp-server-name "10.100.31.71";  
  option host-name "jn-switch35";  
  option log-servers 10.100.31.72;  
  option ntp-servers 10.100.31.73;  
  option NEW_OP.image-file-name  
    "/dist/images/jinstall-ex-4200-13.2R1.1-domestic-signed.tgz";  
  option NEW_OP.transfer-mode "ftp";  
  option NEW_OP.config-file-name "/dist/config/jn-switch35.config";  
}
```

Based on the DHCP options you just configured, the following statements are appended to the Junos OS configuration file (for example, **jn-switch35.config**):

```
system {  
  host-name jn-switch35;  
  syslog {  
    host 10.100.31.72 {  
      any any;  
    }  
  }  
  ntp {  
    server 10.100.31.73;  
  }  
}
```

11. Connect the switch to the network that includes the DHCP server and the FTP, HTTP, or TFTP,server.
12. Boot the switch with the default configuration.
13. Monitor the ZTP process by looking at the following log files.

**NOTE:** When SLAX (live operating system based on Linux) scripts are issued, the **op-script.log** and **event-script.log** files are produced.

---

- /var/log/dhcp\_logfile
- /var/log/image\_load\_log
- /var/log/op-script.log
- /var/log/event-script.log

## Downgrading Software on a QFabric System

If a software upgrade or configuration changes have made the QFabric system unstable or inoperable, you can rollback or downgrade to a previous version of software and configuration. The software and configuration that you rollback to is called a restore-point. The restore-point is stored in a dedicated partition. You can create a checksum (MD5 hash) for the partition in which the restore-partition is stored and verify the integrity of the restore-point partition.

**NOTE:** The ability to downgrade the software does not replace the existing back up and restore functionality.

If possible, perform the following steps before you perform the recovery installation:

1. Ensure that you have an emergency boot device (for example, an external USB flash drive) for each of your Director devices to use during the recovery installation.  
  
You can either use the external USB flash drive containing the software supplied by Juniper Networks, or you can use an external USB flash drive supplied by Juniper Networks on which you install the QFabric system install media.
2. Because the recovery installation process completely overwrites the entire contents of the Director device, make sure you back up any configuration files and initial setup information on a different external USB flash drive before you begin a recovery installation. You will need to restore this information as part of recovery process.

Use the **request system software configuration-backup** command to back up your configuration files and initial setup information:

```
user@switch> request system software configuration-backup path
```

**NOTE:** To recover the Director group, you must upgrade both Director devices in parallel. If you are recovering only one Director device in a Director group, and the software version will remain the same between the two Director devices, make sure that the other Director device is powered on and operational. If the software version of the Director device you are recovering will be different, make sure that the other Director device is powered off and is not operational.

- (Optional) Creating an Emergency Boot Device Using a Juniper Networks External Blank USB Flash Drive on page 86
- Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software on page 87

### (Optional) Creating an Emergency Boot Device Using a Juniper Networks External Blank USB Flash Drive

---

If you do not have an external USB flash drive preloaded with the software from Juniper Networks to use as an emergency boot device, you can create your own, using a blank external USB flash drive provided by Juniper Networks. Download the install media from the Juniper Networks Support website onto your UNIX workstation, uncompress and untar the software, and then burn the software image onto your Juniper Networks external USB (4-gigabyte) flash drive. Make sure you create two emergency boot devices, one for each Director device, so you can perform a recovery installation in parallel.

1. Using a Web browser, navigate to the <http://www.juniper.net/support>.
2. Click **Download Software**.
3. In the *Switchingbox*, click *Junos OS Platforms*.
4. In the *QFX Series* section, click the name of the platform for which you want to download software.
5. Click the *Software* tab and select the release number from the *Release* drop-down list.
6. Select the complete install media you want to download in the *QFabric System Install Media* section.  
A login screen appears.
7. Enter your name and password and press **Enter**.
8. Read the End User License Agreement, click the **I agree** radio button, and then click **Proceed**.
9. Log in and save the install media file to your UNIX workstation.
10. Use FTP to access the UNIX workstation where the install media resides.  
`ftp ftp://hostname/pathname install-media-qfabric-<version>.img.tgz`
11. When prompted, enter your username and password.
12. Make sure you are in binary mode by entering **binary** at the prompt.

binary

13. Use the **get** command to transfer the installation package from the FTP host to your UNIX workstation.

```
get install-media-qfabric-<version>.img.tgz
```

14. Close the FTP session:

bye

15. Untar the *install-media-qfabric-<version>.img.tgz* file on your UNIX workstation.

```
tar -xvzf install-media-qfabric-11.3X30.6.img.tgz
```

16. Insert a blank external USB (4-gigabyte) flash drive supplied by Juniper Networks into your UNIX workstation.

17. Burn the software image you just downloaded to your UNIX workstation onto your external USB flash drive using the **dd** command:

```
dd if=install-media-qfabric-11.3X30.6.img of=/dev/sdb bs=16k
250880+0 records in
250880+0 records out
4110417920 bytes (4.1 GB) copied, 5.10768 seconds, 805 MB/s
```

18. Perform the steps in [“Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software” on page 87](#) to continue with the recovery installation.

### Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software

This procedure describes how to perform a recovery installation using an external USB flash drive that contains Junos OS software.

**NOTE:** Since the recovery installation process completely overwrites the entire contents of the Director device, you will need to restore the required configuration files and initial setup information. The following procedure assumes you previously saved these backup files with the **request system software configuration-backup** command. Ensure that you have these backup files available on an external USB flash drive before you perform the following steps.

1. Insert the external USB flash drive into the Director device.
2. Perform one of the following tasks:
  - If you have access to the default partition, reboot the Director device by issuing the **request system reboot director-group** command.
  - If you do not have access to the default partition, power cycle the Director device.

The following menu appears on the Director device console when the Director device boots up:

```
Juniper Networks QFabric Director Install/Recovery Media
- To boot from the local disk, wait 10 seconds or press the Enter key.
- To reinstall the QFabric software on this Director device, type: install
```

3. Type **install** and then press **Enter** to install the software on the Director device.

Once the installation process is complete, the Director device reboots, and the following menu appears on the Director device console:

```
Juniper Networks QFabric Director Install/Recovery Media
```

- To boot from the local disk, wait 10 seconds or press the Enter key.
- To reinstall the QFabric software on this Director device, type: **install**

4. Press **Enter**.

The Director device reboots from the local disk on which the software was just installed.

5. Log in as root on the Director device.

The following menu appears on the Director device console:

Before you can access the QFabric system, you must complete the initial setup of the Director group by using the steps that follow.

If the initial setup procedure does not complete successfully, log out of the Director device and then log back in to restart this setup menu.

```
Continue?[y/n]
```

6. Enter **n** to bypass the initial setup script and enter the Director device root directory, where you can mount the external USB flash drive containing the configuration files and initial setup information.

7. Issue the **ls /mnt** command to list the *mount* directory.

```
root@dg0 ~]# ls /mnt
```

8. Issue the **mkdir** command to create a directory within the mount directory.

```
root@dg0 ~]# mkdir /mnt/myusb
```

9. Issue the **mount /dev/sdb2 /mnt/myusb/** command to mount the external USB flash drive to the local drive of the Director device.

```
root@dg0 ~]# mount /dev/sdb2 /mnt/myusb/
```

10. Issue the **ls -la /mnt/myusb/** command to verify the contents of your mounted external USB flashdrive.

```
root@dg0 ~]# ls -la /mnt/myusb/
total 1770884
drwxr-xr-x 2 root root      4096 Sep  7 05:16 .
drwxr-xr-x 3 root root      4096 Sep  7 10:15 ..
-rw-r--r-- 1 root root    4249 Sep  7 03:52 mybackup-20110907
```

11. Exit the Director device and log back in as root on the Director device.

The following menu appears:

Before you can access the QFabric system, you must complete the initial setup of the Director group by using the steps that follow.

If the initial setup procedure does not complete successfully, log out of the Director device and then log back in to restart this setup menu.

```
Continue?[y/n] y
```

```
Initial Configuration
```

You may enter the configuration manually or restore from a backup.

```
Specify a backup file? [y/n] : y
Please specify the full path of the configuration backup file. :
/mnt/myusb/mybackup-20110907
```

12. Enter **y** to continue.

13. Enter **y** and specify the path to the backup configuration file located on the external USB flash drive.

```
/mnt/myusb/mybackup-20110907
```

The following messages appear:

```

Applying the new Director Device password
Applying the QFabric component password
First install initial configuration, generating and sharing SSH keys.
First install initial configuration, generating SSH keys.
connect error for 1.1.1.2:9001
Shared SSH keys.
Configuration complete. Director Group services will auto start within 30
seconds.
```

The Director device reboots from the local disk on which the software was just installed. Exit the Director device session and log in to the QFabric default partition CLI.

14. Issue the **request system software configuration-restore** command and specify the path to the backup configuration file located on the external USB flash drive to load the previously saved QFabric system configuration.

15. From the default partition, issue the **request system reboot node-group all** command to reboot all of the Node groups in the QFabric system to ensure that all Node devices are running the same version of software as the Director-group.

```
user@switch> request system reboot node-group all
```

16. From the default partition, issue the **request system reboot fabric** command to reboot the Interconnect devices and the other components in the fabric in the QFabric system to ensure that Interconnect devices are running the same version of software as the Director group.

```
user@switch> request system reboot fabric
```

17. Log in to the default partition and issue the **show version component all** command to verify that all components are running the same version of software.

```
user@switch> show version component all

### [Understanding Guest VMs](#)

---

You can use a guest virtual machine (VM) to run third party software applications. Guest VMs provide a native environment in which third party applications can be executed, and eliminate the need for porting or adapting third party applications to work on the host OS. You can use the Junos SDK Virtual Build Environment in the JunosV App Engine to package the guest VM images. Once the guest VMs are packaged, you can launch them from the Junos OS CLI.

**NOTE:** Only one guest VM is supported at this time.

---

### [Prerequisites for Setting up a Virtual Build Environment in the JunosV App Engine](#)

---

Make sure the following prerequisites are met before you set up a Virtual Build Environment in the JunosV App Engine:

- Dedicated server running CentOS 6.2 with a 64-bit processor capable of full hardware virtualization

To find out if the server running CentOS is capable of full hardware virtualization, issue the following command at the shell:

```
egrep '(vmx|svm)' --color=always /proc/cpuinfo
```

If you receive a result with `vmx` or `svm`, the server is capable of virtualization. If you receive a null result, then the server is not capable of virtualization.

The server must have access to the Internet to download and install various Linux, Junos SDK, and JVAE packages.

- CentOS packages installed on the server:
  - `kvm`
  - `vnc`
  - `gcc`
  - `make`
  - `wget`
  - `libvirt`
  - `dhcp`

- dnsmasq
- bridge-utils
- flex
- bison
- gcc-c++
- glib2-devel
- vnc-server
- which
- xterm
- xorg-x11-twm
- xorg-x11-server-utils
- libXfont

You can install these packages using the **yum** tool in CentOS.

**NOTE:** For **yum** to work properly, the server must have Internet connectivity, and the DNS servers must be configured.

To see which packages are installed, issue the following command:

**yum list installed**

To install all of the packages in the list, issue the following command:

**yum install kvm vnc gcc make wget libvirt dhcp dnsmasq bridge-utils flex bison gcc-c++ glib2-devel vnc-server which xterm xorg-x11-twm xorg-x11-server-utils libXfont**

- Quick Emulator (QEMU) installed for managing VMs.

Issue the following commands to download and install QEMU on your server:

```
wget http://wiki.qemu.org/download/qemu-1.0.1.tar.gz
tar xvf *.gz
cd qemu-1.0.1
./configure
make
make install
```

- Virtual bridge for VM network connectivity is created.

To ensure network connectivity for the Virtual Build Environment (VBE) VM, create a virtual bridge. The virtual bridge allows you to connect the VM to the physical Ethernet interface of the host machine. After performing the following steps, you will have a virtual bridge interface named `virbr0`, which links to the `eth0` interface of the system. When the VM is created, the `virbr0` interface is added to the bridge, and the IP address of the `eth0` is assigned to the `virbr0` interface.

1. Before you configure a virtual bridge, make sure there are no virtual bridges already configured. Issue the following commands to remove any virtual bridges that have been created previously:

```
rm /etc/sysconfig/network-scripts/ifcfg-virbr0
virsh net-destroy default
virsh net-undefine default
service libvirtd restart
```

2. To create a bridge interface named virbr0 for the virtual bridge and then link it to the physical interface of the system (eth0), issue the following commands:

For example:

```
echo 10 > /var/tmp/tapno
chmod 644 /var/tmp/tapno
/etc/sysconfig/network-scripts/qifup
!/bin/sh
/sbin/ifconfig \${1} 0.0.0.0 promisc up
/usr/sbin/brctl addif virbr0 \${1}
/etc/sysconfig/network-scripts/qifdown
!/bin/sh
/sbin/ifconfig \${1} down
/usr/sbin/brctl delif virbr0 \${1}
chmod 755 /etc/sysconfig/network-scripts/qif*
/usr/sbin/brctl addbr virbr0
/usr/sbin/brctl addif virbr0 eth0
cd /etc/sysconfig/network-scripts
cp ifcfg-eth0 ifcfg-virbr0
```

3. Edit the ifcfg-eth0 file located at the **/etc/sysconfig/network-scripts/** directory and add the following line to specify that the virbr0 interface is being used as the bridge interface:

```
BRIDGE="virbr0"
```

4. Edit the ifcfg-virbr0 file located at the **/etc/sysconfig/network-scripts/** directory and modify the following values:

```
DEVICE="virbr0"
TYPE="Bridge"
```

5. Enable the VNC connection to the VM by adding the following lines to the iptables file located at the **/etc/sysconfig/** directory:

```
-A INPUT -i eth0 -j ACCEPT
-A INPUT -i virbr0 -j ACCEPT
```

6. Issue the following command to restart the network and iptables service for the changes to take effect:

```
/sbin/service iptables restart
```

7. Issue the following command to verify that all the changes have taken effect:

```
/usr/sbin/brctl show
```

The output of this command should show that the virbr0 interface is configured. Verify that there is still network connectivity to the server.

### Setting up the Virtual Build Environment for the JunosV App Engine

The JunosV App Engine (JVAE) enables third party applications—applications written in Linux—to run on a guest VM. JunosV App Engine also enables third party applications to run in their native environment without porting to Junos OS.

JVAE provides a virtualized environment with a Kernel-based Virtual Machine (KVM) hypervisor, which runs on the host OS. The host OS controls the creation of virtual machines (VMs) on top of the hypervisor. The hypervisor and host OS run within a compute node. The compute node is connected to a device running Junos OS. In this case, the compute node is connected to a QFX5100 switch.

### Downloading and Installing the JunosV App Engine Software

Download the following JunosV App Engine development tools, packaging tools, and sample guest OS packages located at <http://www.juniper.net/support/csc/swdist-junos-sdk/#sw> to your server:

- junos-sdk-remote-devtools-13.1R1.6.tgz
- junos-sdk-remote-pkgtools-13.1R1.6.tgz
- junos-sdk-os-13.1R1.6.tgz

1. Copy the junos-sdk-remote-devtools-13.1R1.6.tgz file to the **/usr/src/remote-devtools/** directory.

For example:

```
scp junos-sdk-remote-devtools-13.1R1.6.tgz /usr/src/remote-devtools/
```

2. Extract the junos-sdk-remote-devtools-13.1R1.6.tgz file.

For example:

```
tar -zxvf junos-sdk-remote-devtools-13.1R1.6.tgz
```

3. Install the junos-sdk-remote-devtools-13.1R1.6.

For example:

```
./setup
```

4. Copy the junos-sdk-remote-pkgtools-13.1R1.6.tgz file to the **/usr/src/remote-pkgtools** directory.

For example:

```
scp junos-sdk-remote-pkgtools-13.1R1.6.tgz /usr/src/remote-pkgtools
```

5. Extract the junos-sdk-remote-pkgtools-13.1R1.6.tgz file.

For example:

```
tar -zxvf junos-sdk-remote-pkgtools-13.1R1.6.tgz
```

6. Install the junos-sdk-remote-pkgtools-13.1R1.6 software.

For example:

```
./setup
```

7. Copy the junos-sdk-os-13.1R1.6.tgz file to the **/usr/src/sdk-os** directory.

For example:

```
scp junos-sdk-os-13.1R1.6.tgz /usr/src/sdk-os
```

8. Extract the junos-sdk-os-13.1R1.6.tgz file.

For example:

```
tar -zxvf junos-sdk-os-13.1R1.6.tgz
```

9. Install the junos-sdk-os-13.1R1.6 software.

For example:

```
./setup
```

---

### Launching the VNC Server

Launch a VNC server, so you can access a VM.

1. Before you can launch the VNC server, use **yum** to install the **Desktop** package.

For example:

```
yum groupinstall -y Desktop
```

2. Issue the following command to set the VNC password.

You need to set the password when you use VNC for the first time.

For example:

```
vncpasswd
```

3. Issue the following command to launch the VNC server.

For example:

```
vncserver &
```

The name of the desktop is displayed.

For example:

```
vnc-test.juniper.net:1
```

4. Issue the following command to verify that the VNC viewer is working correctly.

For example:

```
vncviewer vnc-test.juniper.net:1
```

A VNC session is created on the server.

---

### Launching the FreeBSD Virtual Build Environment (VBE) Virtual Machine (VM)

Use the Kernel-based Virtual Machine (KVM) hypervisor to launch the VBE VM.

1. Issue the following commands to launch the VBE VM.

For example:

```
cd /usr/src/remote-pkgtools/junos-sdk-remote-pkgtools
```

```
./start_vm --img /usr/src/sdk-os/junos-sdk-20110408a1/junos-sdk-20110408.img
```

This command launches the VM and returns a port number. The port number is used to establish a VNC connection to the VM.

2. Issue the following command to access the VM.

For example:

```
vncviewer localhost::<port> &
```

This command generates a VNC session to the FreeBSD VBE VM and enables the root password of **letmein**.

### Installing the Junos SDK Packages on the Virtual Build Environment

Before you install the Junos SDK packages, configure an IP address and default gateway on the VBE VM, and ensure that the VBE has proper network connectivity. Also, use the **adduser** tool to create user profiles for the VBE.

1. Issue the following commands to configure the IP address and default gateway on the VBE VM:

For example:

```
ipconfig em0 inet 10.204.42.20 netmask 255.255.255.0
route add default 10.204.42.20
```

2. Issue the **adduser** command to add user profiles for the VBE.

The **adduser** command provides an interactive guided procedure.

3. Download the following Junos SDK packages located at <http://www.juniper.net/support/csc/swdist-junos-sdk/> to the VBE:

- junos-sdk-ui-sim-13.1R1.6-signed.tgz
- junos-sdk-toolchain-13.1R1.6-signed.tgz
- junos-sdk-sb-13.1R1.6-signed.tgz

4. Issue the following commands to install the Junos SDK packages.

For example:

```
pkg_add junos-sdk-sb-13.1R1.6-signed.tgz
pkg_add junos-sdk-toolchain-13.1R1.6-signed.tgz
pkg_add junos-sdk-ui-sim-13.1R1.6-signed.tgz
```

### Prerequisites for Using the Virtual Build Environment

---

Before you can use the Virtual Build Environment to create sandboxes for development, you need to meet the following hardware and software requirements:

- Dedicated server running CentOS 6.2 with a 64-bit processor capable of full hardware virtualization
- Junos SDK Virtual Build Environment (VBE) Virtual Machine (VM) running with access to the Internet on a dedicated server
- Junos SDK packages installed on the VBE VM:
  - junos-sdk-ui-sim-13.1R1.6-signed.tgz
  - junos-sdk-toolchain-13.1R1.6-signed.tgz
  - junos-sdk-sb-13.1R1.6-signed.tgz

### Obtaining Junos SDK Certificate Request File and Certificate Key File for the Virtual Build Environment

---

1. Log into Virtual Build Environment (VBE) Virtual Machine (VM) as root.
2. Issue the following command to launch the **sdk-certificate-request** script.

For example:

```
/usr/local/junos-sdk/13.1R1.6/bin/sdk-certificate-request
```

3. Provide the following information when the script prompts you. Press **Enter** after you provide a response.

- City, state, and country
- Organization and unit
- Provider prefix

This is the unique provider name assigned by Juniper to each SDK partner

- User string

The user string can be a project name, product name, or any generic word.

- Deployment scope

Juniper assigns this string to differentiate multiple certificate for the same partner. If Juniper did not assign this string, you can leave this field empty

- Index number

This number is also referred to as a certificate generations number. The number 1 is used for the initial certificate. After the certificate expires and a new one is requested, this number is increased incrementally.

After you provide all of the information, the script will generate the following files in the **/usr/local/junos-sdk/cert** directory:

- Certificate Key *filename\_key.pem*

This file contains the Junos SDK package-signing key. Ensure that no one outside of the development organization has access to the certificate key. Do not send this file to Juniper

- Certificate Request File *filename\_req.pem*

This file contains the certificate request. Send this file to Juniper for processing

---

### Processing and Obtaining the Certificate File

1. Send the certificate request file to Juniper Junos SDK Certificate Processing Team at `sdk-cert@juniper.net`

Once the processing is complete, the Junos SDK Certificate Processing Team will send you the certificate.

2. When you receive the certificate, rename the certificate file as ***filename.pem*** and copy it to the **`/usr/local/junos-sdk/certs`** directory in the VBE VM.
3. Delete the Certificate Request File from the directory.

There should only be one key and certificate pair in the **`/usr/local/junos-sdk/certs`** directory.

---

### Prerequisites for Packaging the Guest VM

Before you can package the guest VM, make sure you meet the following hardware and software requirements:

- Dedicated server running CentOS 6.2 with a 64-bit processor capable of full hardware virtualization.
- Junos SDK Virtual Build Environment (VBE) Virtual Machine (VM) running with access to the Internet on a dedicated server.
  - You must be able to issue a successful ping request to the VBE VM, and SSH and SCP must be enabled on the VBE VM.
  - The VBE VM must have a valid Junos SDK certificate-and-key pair in the **`/usr/local/junos-sdk/certs`** directory.
- Junos SDK packages installed on the VBE VM:
  - `junos-sdk-ui-sim-13.1R1.6-signed.tgz`
  - `junos-sdk-toolchain-13.1R1.6-signed.tgz`
  - `junos-sdk-sb-13.1R1.6-signed.tgz`

---

### Launching the Guest VM on the CentOS Server

1. Issue the **`start_vm`** script from the Junos SDK Remote Packaging tools directory to launch the guest VM.

For example:

```
cd /usr/src/remote-pkgtools/junos-sdk-remote-pkgtools
./start_vm --img <path>/third-party-app.img -- tapno 1
```

This command launches the VM and returns a port number to which a VNC connection to the VM can be established.

2. Issue the following command to launch the guest VM

For example:

```
vncviewer localhost::port-number &
```

This command generates a VNC session to the Guest VM.

### Copying Required Application to Package with the Guest VM

---

Before you use scp to copy the required applications contained in the **junos-sdk-remote-devtools-13.1R1.6.tgz** file to the Guest VM, configure an IP address and default gateway on the VBE VM, and ensure that the VBE has proper network connectivity.

In this example, an IP address of 10.204.42.40 has been assigned to the Guest VM, and the required application is **remote-helloworld**.

1. Issue the following commands to configure the IP address and default gateway on the VBE VM:

For example:

```
ipconfig em0 inet 10.204.42.20 netmask 255.255.255.0
route add default 10.204.42.20
```

2. Copy the **remote-helloworld** binary to the **/usr/local/bin** directory and the script to the **/etc/init.d** directory in the Guest VM.

For example:

```
scp /usr/src/remote-devtools/examples/remote-helloworld/remote-helloworld
root@10.204.42.40:/usr/local/bin
scp /usr/src/remote-devtools/examples/remote-helloworld/remote-helloworld.sh
root@10.204.42.40:/etc/init.d
```

3. Rename the **remote-helloworld.sh** script in the **/etc/init.d** folder to **remote-helloworld**.

For example:

```
cd /etc/init.d
mv remote-helloworld.sh remote-helloworld
```

4. You can now add the **remote-helloworld** application as a startup service.

For example:

```
chkconfig --add remote-helloworld
chkconfig remote-helloworld on
```

5. Shutdown the VM before packaging the application.

For example:

```
shutdown -h now
```

## Editing Packaging Tool Scripts

Before you package the software, you need to modify the **sample.manifest** and **export-user-data.sh** files.

1. Modify the **sample.manifest** file to include the source and destination pairs of the application binaries and scripts to be packaged into the Guest VM.

For example:

```
cd /usr/src/remote-pkgtools/junos-sdk-remote-pkgtools
vi sample.manifest
```

Here is an example of a sample.manifest file:

```
# $Id: sample.manifest 131 2013-02-19 19:24:45Z tomwright $

# Copyright (c) 2012, Juniper Networks
# All rights reserved

# blank lines and lines beginning with # ignored

# dest (guest OS VM) user and host/IP are specified in export-user-data.sh
# dest ending with slash indicates directory

# src dest

/usr/src/remote-devtools/examples/remote-helloworld/remote-helloworld
/usr/local/bin/
/usr/src/remote-devtools/examples/remote-helloworld/remote-helloworld.sh
/etc/init.d/remote-helloworld
```

2. Modify the export-user-data.sh file to include details about the Guest VM .img file, DDL, ODL, and VBE VM details. In this example, an IP address of 10.204.42.20 has been assigned to the VBE VM

For example:

```
cd /usr/src/remote-pkgtools/junos-sdk-remote-pkgtools
vi export-user-data.sh
```

Modify the following values with the correct values:

- APP\_CMD

Name of the command DDL file, including the path (.cmd.dd). Leave this variable undefined if your application does not require a user interface.

In this example,

```
APP_CMD=/usr/src/remote-devtools/examples/remote-helloworld/extensions/libdd/input/remote-helloworldcmd
```

- APP\_CNF

Name of config DDL file, including the path (.cnf.dd). Leave this variable undefined if your application does not require a user interface.

In this example,

```
APP_CNF=/usr/src/remote-devtools/examples/remote-helloworld/extensions/libdd/input/remote-helloworldcnf
```

- APP\_MANIFEST

Name of application manifest file, including the path.

In this example,

APP\_MANIFEST=/usr/src/remote-pkgtools/junos-sdk-remote-pkgtools/sample.manifest

- APP\_ODL

Name of ODL file, including the path (.odl). Leave this variable undefined if your application does not require formatted output.

In this example,

APP\_ODL=/usr/src/remote-devtools/examples/remote-helloworld/extensions/libodl/input/remote-helloworld

- LOG\_DIR

Path on development system for log files.

In this example, LOG\_DIR=/var/tmp

- ROUTER\_PLATFORM

router platform (aka machine) can be i386 (default), octeon, powerpc or xlr

In this example, ROUTER\_PLATFORM=i386

- VBE\_BSB\_PATH

Path to the Junos SDK Backing Sandbox (BSB) on the VBE.

In this example, VBE\_BSB\_PATH=/usr/local/junos-sdk/13.1R1.6

- VBE\_DSB\_PATH

Path to your application code on the VBE.

In this example, VBE\_DSB\_PATH=/usr/home/<user1>/sandboxes/hello-world

- VBE\_IP

VBE IP address or hostname.

In this example, VBE\_IP=10.204.42.20

- VBE\_USER

VBE user account.

In this example, VBE\_USER=<user1>

- VE\_SDK\_DATA\_DEFINED

Set this to 1.

In this example, VE\_SDK\_DATA\_DEFINED=1

- VM\_IMG

Guest OS VM file name, including the path.

In this example, VM\_IMG=/root/test/third-party-app.img

- VM\_IP

Guest OS VM IP address or hostname.

In this example, VM\_IP=10.204.42.40

- VM\_USER

Guest OS VM user account

In this example, VM\_USER=root

### Executing Packaging Scripts

You can now execute the Junos SDK packaging scripts to package the guest VM with the required applications into a .tgz file. The Junos SDK VBE VM must be running on the server, with SCP and SSH enabled. The scripts will prompt for the VBE VM user password that you entered in the export-user-data.sh file.

1. Issue the following commands to execute the packaging scripts.

For example:

```
cd /usr/src/remote-pkgtools/junos-sdk-remote-pkgtools
./mksb-vbe-dsb.sh
./do-setup-re-ve-pkg.sh
./update-vbe-dsb.sh
./mk-vbe-dsb.sh
```

The guest VM application packages are now available in the ship directory in the VBE VM in the sandbox location you specified in the VBE\_DSB\_PATH in the export-user-data.sh file.

```
cd /usr/home/user1/sandboxes/hello-world/13.1R1.6-obj/ship
ls -lrt
-rw-r--r--  1 user1 wheel      21040 Aug 22 12:44
third-party-app-i386-13.1I20130822_1944.tgz
-rw-r--r--  1 user1 wheel  223695254 Aug 22 12:45
third-party-app-i386-13.1I20130822_1944.gz
-rw-r--r--  1 user1 wheel  223767502 Aug 22 12:46
third-party-app-bundle-i386-13.1I20130822_1944.gz
```

### Copying the Third Party Application to the Switch

1. Copy the third party application to the switch using either FTP or SCP:

For example:

```
root% scp //hostname/pathname/third-party-app.gz /var/tmp
```

### Configure the Provider Name, License Type, and Deployment Scope

1. Configure the provider name, the license type, and the deployment scope (describes the certificate associated with the third party application), at the **[edit system]** hierarchy. The certificate contains parameters regarding the provider's partnership with Juniper Networks. Configure these options to ensure that the third party application is installed.

For example:

```
{master:0}
root# set extensions providers [ Provider Name ] license-type customer deployment-scope
[ private commercial ]
```

2. Commit the configuration.

For example:

```
{master:0}  
root# commit
```

Here are the results of your configuration:

```
system {  
  extensions {  
    providers {  
      [Provider Name] {  
        license-type customer deployment-scope [ private commercial ]  
      }  
    }  
  }  
}
```

---

### Configure the Guest VM Options

1. Configure the following options for guest VM support in the Junos OS CLI at the **[edit]** hierarchy.
  - Compute cluster name
  - Compute node name
  - Virtual machine instance name
  - Dedicated management interface for guest VM
  - Third party package name
  - Internal IP address of the guest VM
2. Configure the name of the compute cluster and compute node.

The name of the compute cluster must be default-cluster, and the name of the name of the compute node must be default-node, otherwise launching the guest VM fails.

For example:

```
{master:0}  
root# set services app-engine compute-cluster default-cluster compute-node default-node  
hypervisor
```

3. Configure the name of the virtual machine instance and the name of the third party application.

**NOTE:** The package names in the `show app-engine virtual-machine-package` and `show version` commands should match.

```
{master:0}  
root# set services app-engine virtual-machines instance instance-name package  
package-name
```

For example:

```
{master:0}  
root# set services app-engine virtual-machines instance test package third-party-app ve
```

4. Associate the virtual machine instance with the configured compute cluster and compute node.

**NOTE:** The name of the compute cluster must be `default-cluster`, and the name of the compute node must be `default-node`, otherwise launching the guest VM fails.

```
{master:0}
root# set services app-engine virtual-machines instance instance-name compute-cluster
name compute-node name
```

For example:

```
{master:0}
root# set services app-engine virtual-machines instance test compute-cluster default-cluster
compute-node default-node
```

5. Configure the local management IP address.

This IP address is used for the internal bridging interface. The host uses this IP address to check the availability of the guest VM. The IP address must be 192.168.1.X, where X is from 100 to 200.

```
{master:0}
root# set services app-engine virtual-machines instance instance-name local-management
family inet address 192.168.1.X
```

For example:

```
{master:0}
root# set services app-engine virtual-machines instance test local-management family inet
address 192.168.1.100
```

6. Configure the management interface for the guest VM.

This management interface is separate from the one used for Junos OS.

**NOTE:** The management interface name must be either `em0` or `em1`. The configuration will fail if you do not configure a management interface and then commit the configuration.

For example:

```
{master:0}
root # set services app-engine virtual-machines instance test management-interface em1
```

The new management interface is provisioned for the guest VM.

7. Commit the configuration.

For example:

```
{master:0}
root# commit
```

Here are the results of the configuration:

```
services {
  app-engine {
    compute-cluster default-cluster {
      compute-node default-node {
```

```

        hypervisor;
    }
}
virtual-machines {
    instance test {
        package third-party-app;
        local-management {
            family inet {
                address 192.168.1.100;
            }
        }
        compute-cluster default-cluster {
            compute-node default-node;
        }
        management-interface em1;
    }
}
}
}
}

```

8. Configure the internal IP address of the guest VM.

- Log into the host shell by specifying the internal management IP address:

For example:

```
shell% ssh -JU __juniper_private4__ 192.168.1.1
```

- Issue the **virsh list** command to see which VMs are running. From the output, you can see that the guest VM (named **test** in this example) is running:

```

{master:0}
shell# virsh list
Id      Name                                State
-----
3       vjunos1                             running
4       test                                running

```

- Log into the guest VM console (named **4** in this example).

For example:

```

shell# virsh console 4
Connected to domain test
Escape character is ^]
CentOS release 6.4 (Final)
Kernel 2.6.32-358.el6.x86_64 on an x86_64

[root@localhost ~]

```

From the output, you can see that you are connected to the guest VM console (root@localhost)

9. Configure the internal IP address of the guest VM on the Ethernet interface.

- Issue the **ifconfig -a** command to see the name of the management interface that is used to access the guest VM from outside of the network, and the name of the management interface that is used for internal use.

The interface names are either eth6 or eth7, or eth7 or eth8. You can associate one of the interfaces to the guest VM by issuing the **set services app-engine**

**virtual-machines instance *name* management-interface *interface-name*** command. Use the same IP address as the one you configured using the **set services app-engine virtual-machines instance test local-management family inet address 192.168.1.100**. The MAC addresses associated with these interfaces are used for internal bridging.

For example:

```
root@localhost ifconfig -a
eth6      Link encap:Ethernet  HWaddr 52:54:00:5D:DB:01
          UP BROADCAST RUNNING MULTICAST  MTU:1500  Metric:1
          RX packets:982 errors:0 dropped:0 overruns:0 frame:0
          TX packets:970 errors:0 dropped:0 overruns:0 carrier:0
          collisions:0 txqueuelen:1000
          RX bytes:92188 (90.0 KiB)  TX bytes:91468 (89.3 KiB)
eth7      Link encap:Ethernet  HWaddr 52:54:00:5D:DB:02
          UP BROADCAST RUNNING MULTICAST  MTU:1500  Metric:1
          RX packets:982 errors:0 dropped:0 overruns:0 frame:0
          TX packets:970 errors:0 dropped:0 overruns:0 carrier:0
          collisions:0 txqueuelen:1000
          RX bytes:92188 (90.0 KiB)  TX bytes:91468 (89.3 KiB)
```

In this example, eth6 is a management interface that is used to access the guest VM, and eth7 is a management interface that is used for internal use.

- Issue the **ifconfig** command to configure the internal IP address on the Ethernet interface. This is the same IP address you configured in the Junos OS CLI.

For example:

```
root@localhost ifconfig eth7 192.168.1.100 netmask 255.255.255.0
```

10. Issue the following show commands to verify that everything is working correctly:

For example:

- root# **show app-engine status**

```
Compute cluster: default-cluster
                  Compute node   Status
                  default-node   Online
```

The status should be Online.

- root# **show app-engine virtual-machine instance**

```
VM name          Compute cluster   VM status
                test               default-cluster   ACTIVE
```

The VM status should be active.

- root# **show app-engine virtual-machine instanceshow app-engine virtual-machine package**

```
VM package: cust-vm-ve
              VM disk image:
third-party-app-ve/20140409_015447/third-party-app.img.gz
              Compute cluster   Package download status
              default-cluster   DOWNLOADED
```

The package downloaded status should be either download in progress or downloaded.

- root# show interfaces terse *management-interface*  
error: device em1 not found

This interface should be detached from Junos OS.

11. To remove the guest VM, delete the configuration statements and uninstall the third party software package.

For example, to remove the **app-engine** statement:

```
root # delete services app-engine
Commit the configuration.
```

For example:

```
root# commit
```

Issue the **show version** command to see what the name of the third party application package is.

Issue the **request system software delete <package-name>** command to uninstall the third party application:

For example:

```
root> request system software delete third-party-app.tgz
fpc0:
```

```
-----
Notifying sdk-vmmd ...
```

```
{master:0}
```

## Launching a Guest Virtual Machine (VM) to Run a Third Party Application on Junos OS Release 13.2X51-D20

- [Understanding Guest VMs on page 108](#)
- [Troubleshooting Tips on page 109](#)
- [Copying the Third Party Application to the Switch on page 109](#)
- [Install the Third Party Application on the Switch on page 109](#)
- [Configure the Guest VM Options to Launch the Guest VM on the Host on page 110](#)

### Understanding Guest VMs

---

You can use a guest virtual machine (VM) to run third party software applications. Guest VMs provide a native environment in which third party applications can be executed, and eliminate the need for porting or adapting third party applications to work on the host OS. You can use the Junos SDK Virtual Build Environment in the JunosV App Engine to

package the guest VM images. Once the guest VMs are packaged, you can launch them from the Junos OS CLI.

**NOTE:** Only one guest VM is supported at this time.

### Troubleshooting Tips

Configure traceoption and System Log options to troubleshoot issues that occur while you are launching a guest VM:

- `set system processes app-engine-virtual-machine-management-service traceoptions level all`
- `set system processes app-engine-virtual-machine-management-service traceoptions flag all`
- `set system syslog file messages any any`

### Copying the Third Party Application to the Switch

1. Copy the third party application to the switch using any file transfer protocol:

For example:

```
root% scp //hostname/pathname/third-party-app.img.gz /var/tmp
```

### Install the Third Party Application on the Switch

1. Install the third party application package on the switch.

This might take a few minutes.

For example:

```
{master:0}
root> request system software add virtual-machine-package /var/tmp/third-party-app.img.gz
Installing virtual-machine package..
Copying virtual-machine package..
Uncompressing virtual-machine package..
Finished virtual-machine package installation.
```

2. Issue the **show version** command to verify that the installation was successful.

For example:

```
{master:0}
root> show version
Apr 02 09:12:13
fpc0:
-----
Hostname: host
Model: qfx5100-96s-8q
JUNOS Base OS Software Suite [13.2-20140401_x_132_x51_vjunos.0]
JUNOS Base OS boot [13.2-20140401_x_132_x51_vjunos.0]
JUNOS Crypto Software Suite [13.2-20140401_x_132_x51_vjunos.0]
JUNOS Online Documentation [13.2-20140401_x_132_x51_vjunos.0]
JUNOS Kernel Software Suite [13.2-20140401_x_132_x51_vjunos.0]
JUNOS Packet Forwarding Engine Support (qfx-ex-x86-32)
```

```
[13.2-20140401_x_132_x51_vjunos.0]
JUNOS Routing Software Suite [13.2-20140401_x_132_x51_vjunos.0]
JUNOS Enterprise Software Suite [13.2-20140401_x_132_x51_vjunos.0]
JUNOS py-base-i386 [13.2-20140401_x_132_x51_vjunos.0]
third-party-app-ve Virtual Engine package [13.1I20130918_2234]
```

```
JUNOS Host Software [13.2-20140401_x_132_x51_vjunos.0]
```

The CLI output shows that the application named third-party-app was installed.

### Configure the Guest VM Options to Launch the Guest VM on the Host

---

1. Configure the following options for guest VM support in the Junos OS CLI at the **[edit]** hierarchy.
  - Compute cluster name
  - Compute node name
  - Virtual machine instance name
  - Dedicated management interface for guest VM
  - Third party package name
  - Internal IP address of the guest VM

2. Configure the name of the compute cluster and compute node.

The name of the compute cluster must be default-cluster, and the name of the name of the compute node must be default-node, otherwise launching the guest VM fails.

For example:

```
{master:0}
root# set services app-engine compute-cluster default-cluster compute-node default-node
hypervisor
```

3. Configure the name of the virtual machine instance and the name of the third party application.

**NOTE:** The package names in the `show app-engine virtual-machine-package` and `show version` commands should match.

```
{master:0}
root# set services app-engine virtual-machines instance instance-name package
package-name
```

For example:

```
{master:0}
root# set services app-engine virtual-machines instance test package third-party-app ve
```

4. Associate the virtual machine instance with the configured compute cluster and compute node.

**NOTE:** The name of the compute cluster must be default-cluster, and the name of the compute node must be default-node, otherwise launching the guest VM fails.

```
{master:0}
root# set services app-engine virtual-machines instance instance-name compute-cluster
name compute-node name
```

For example:

```
{master:0}
root# set services app-engine virtual-machines instance test compute-cluster default-cluster
compute-node default-node
```

5. Configure the local management IP address.

This IP address is used for the internal bridging interface. The host uses this IP address to check the availability of the guest VM. The IP address must be 192.168.1.X, where X is from 100 to 200.

```
{master:0}
root# set services app-engine virtual-machines instance instance-name local-management
family inet address 192.168.1.X
```

For example:

```
{master:0}
root# set services app-engine virtual-machines instance test local-management family inet
address 192.168.1.100
```

6. Configure the management interface for the guest VM.

This management interface is separate from the one used for Junos OS.

**NOTE:** The management interface name must be either em0 or em1. The configuration will fail if you do not configure a management interface and then commit the configuration.

For example:

```
{master:0}
root # set services app-engine virtual-machines instance test management-interface em1
```

The new management interface is provisioned for the guest VM.

7. Commit the configuration.

For example:

```
{master:0}
root# commit
```

Here are the results of the configuration:

```
services {
  app-engine {
    compute-cluster default-cluster {
      compute-node default-node {
        hypervisor;
      }
    }
  }
  virtual-machines {
    instance test {
      package third-party-app;
      local-management {
        family inet {
          address 192.168.1.100;
        }
      }
    }
  }
}
```

```

    }
  }
  compute-cluster default-cluster {
    compute-node default-node;
  }
  management-interface em1;
}
}
}
}

```

8. Configure the internal IP address of the guest VM.

- Log into the host shell by specifying the internal management IP address:

For example:

```
shell% ssh -JU _juniper_private4_ 192.168.1.1
```

- Issue the **virsh list** command to see which VMs are running. From the output, you can see that the guest VM (named **test** in this example) is running:

```
{master:0}
shell# virsh list
Id      Name                                State
-----
3       vjunos1                             running
4       test                                running
```

- Log into the guest VM console (named **4** in this example).

For example:

```
shell# virsh console 4
Connected to domain test
Escape character is ^]
CentOS release 6.4 (Final)
Kernel 2.6.32-358.el6.x86_64 on an x86_64
```

```
[root@localhost ~]
```

From the output, you can see that you are connected to the guest VM console (root@localhost)

9. Configure the internal IP address of the guest VM on the Ethernet interface.

- Issue the **ifconfig -a** command to see the name of the management interface that is used to access the guest VM from outside of the network, and the name of the management interface that is used for internal use.

The interface names are either eth6 or eth7, or eth7 or eth8. You can associate one of the interfaces to the guest VM by issuing the **set services app-engine virtual-machines instance *name* management-interface *interface-name*** command. Use the same IP address as the one you configured using the **set services app-engine virtual-machines instance test local-management family inet address 192.168.1.100**. The MAC addresses associated with these interfaces are used for internal bridging.

For example:

```
root@localhost ifconfig -a
```

```

eth6      Link encap:Ethernet  HWaddr 52:54:00:5D:DB:01
          UP BROADCAST RUNNING MULTICAST  MTU:1500  Metric:1
          RX packets:982 errors:0 dropped:0 overruns:0 frame:0
          TX packets:970 errors:0 dropped:0 overruns:0 carrier:0
          collisions:0 txqueuelen:1000
          RX bytes:92188 (90.0 KiB)  TX bytes:91468 (89.3 KiB)

eth7      Link encap:Ethernet  HWaddr 52:54:00:5D:DB:02
          UP BROADCAST RUNNING MULTICAST  MTU:1500  Metric:1
          RX packets:982 errors:0 dropped:0 overruns:0 frame:0
          TX packets:970 errors:0 dropped:0 overruns:0 carrier:0
          collisions:0 txqueuelen:1000
          RX bytes:92188 (90.0 KiB)  TX bytes:91468 (89.3 KiB)

```

In this example, eth6 is a management interface that is used to access the guest VM, and eth7 is a management interface that is used for internal use.

- Issue the **ifconfig** command to configure the internal IP address on the Ethernet interface. This is the same IP address you configured in the Junos OS CLI.

For example:

```
root@localhost ifconfig eth7 192.168.1.100 netmask 255.255.255.0
```

10. Issue the following show commands to verify that everything is working correctly:

For example:

- root# **show app-engine status**

```

Compute cluster: default-cluster
                  Compute node      Status
                  default-node      Online

```

The status should be Online.

- root# **show app-engine virtual-machine instance**

```

VM name          Compute cluster      VM status
                test                  default-cluster      ACTIVE

```

The VM status should be active.

- root# **show app-engine virtual-machine instanceshow app-engine virtual-machine package**

```

VM package: cust-vm-ve
              VM disk image:
third-party-app-ve/20140409_015447/third-party-app.img.gz
              Compute cluster      Package download status
              default-cluster      DOWNLOADED

```

The package downloaded status should be either download in progress or downloaded.

- root# **show interfaces terse management-interface**

```
error: device em1 not found
```

This interface should be detached from Junos OS.

11. To remove the guest VM, delete the configuration statements and uninstall the third party software package.

For example, to remove the **app-engine** statement:

```
root # delete services app-engine
```

Commit the configuration.

For example:

```
root# commit
```

Issue the **show version** command to see what the name of the third party application package is.

For example:

```
{master:0}
root> show version
fpc0:
-----
Hostname: st-96s-p2b-03
Model: qfx5100-96s-8q
JUNOS Base OS Software Suite [13.2-20140406_x_132_x51_vjunos.0]
JUNOS Base OS boot [13.2-20140406_x_132_x51_vjunos.0]
JUNOS Crypto Software Suite [13.2-20140406_x_132_x51_vjunos.0]

JUNOS Enterprise Software Suite [13.2-20140406_x_132_x51_vjunos.0]
JUNOS py-base-i386 [13.2-20140406_x_132_x51_vjunos.0]
  third-party-app-ve Virtual Engine package [20140409_015447]
JUNOS Host Software [13.2-20140406_x_132_x51_vjunos.0]
```

Issue the **request system software delete virtual-machine-package <package-name>** command to uninstall the third party application:

For example:

```
root> request system software delete virtual-machine-package third-party-app-ve
fpc0:
-----
Deleted virtual-machine package cust-vm-ve ...
```

## Performing a Nonstop Software Upgrade on the QFabric System

**NOTE:** Before you can perform a nonstop software upgrade to Junos OS Release 13.1X50-D10, you must have Junos OS Release 12.2X50-D42 or later installed. You cannot perform a nonstop software upgrade with Junos OS Release 12.2X50-D41 or earlier. Contact the Juniper Technical Assistance Center for information on how to download Junos OS Release 12.2X50-D42. Performing a standard software upgrade (that is, issuing the `request system software add component all` command) does not require that you upgrade to an intermediate Junos OS software release.

To perform a nonstop software upgrade to Junos OS Release 13.1X50-D10:

1. First perform a nonstop software upgrade to Junos OS Release 12.2X50-D42.
2. Then perform a nonstop software upgrade to Junos OS Release 13.1X50-D10.

Nonstop software upgrade enables you to upgrade a QFabric system with minimal packet loss and maximum uptime. This feature introduces several high availability improvements to the QFabric system software upgrade process, including:

- Upgrading members of a Director group or Node group one at a time so that one device in the group is always operational
- Switching mastership of Routing Engine processes to the backup Director device before upgrading the master Director device
- Rebooting Interconnect devices and fabric control Routing Engines one at a time, so that one Interconnect device or one fabric control Routing Engine is always operational
- Switching mastership of a Node group to the backup Node device before upgrading the master Node device
- Specifying an upgrade group if you want all Node devices in a Node group to be upgraded in parallel (which shortens the time of the upgrade)
- Rebooting devices automatically as part of the nonstop upgrade process

When performing a nonstop upgrade, start with the Director group upgrade, then issue the fabric upgrade, and end with the Node group upgrades.

**NOTE:** Because there is no redundancy for Node groups containing a single Node device, traffic loss occurs when the device reboots during the upgrade. For node-groups defined with two node-devices, both must be online in order for upgrade to succeed.

NOTE: Before you install the software, we recommend that you back up your current configuration files by issuing the `request system software configuration-backup` command.

NOTE: Before you can perform a nonstop software upgrade in your QFabric system, you must first upgrade your system to Junos OS Release 12.2 by using a conventional upgrade method such as issuing the `request system software add component all` command.

This topic describes the following tasks:

- [Backing Up the Current Configuration Files on page 116](#)
- [Downloading Software Files Using a Browser on page 116](#)
- [Retrieving Software Files for Download on page 118](#)
- [Performing a Nonstop Software Upgrade for Director Devices in a Director Group on page 118](#)
- [Performing a Nonstop Software Upgrade for Interconnect Devices and Other Fabric-Related Components on page 118](#)
- [\(Optional\) Creating Upgrade Groups for Node Groups on page 119](#)
- [Performing a Nonstop Software Upgrade on a Node Group on page 119](#)

---

### Backing Up the Current Configuration Files

To back up your current configuration files:

```
user@qfabri> request system software configuration-backup path
```

Back up the configuration files to a local directory, remote server, or removable drive (for example, an external USB flash drive).

For example:

```
user@qfabri> request system software configuration-backup/media/USB/
```

---

### Downloading Software Files Using a Browser

NOTE: To access the download site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website <https://www.juniper.net/registration/Register.jsp>.

1. Using a Web browser, navigate to the <http://www.juniper.net/support>.
2. Click **Download Software**.
3. In the **Switching** box, click **Junos OS Platforms**.

4. In the **QFX Series** section, click the name of the platform for which you want to download software.
5. Click the **Software** tab and select the release number from the **Release** drop-down list.
6. Select the complete install package you want to download in the **QFabric System Install Package** section:
  - If you want to upgrade the entire QFabric system, select **QFabric System - Complete Install Package**.
  - If you want to upgrade either a single Node or Interconnect device for recovery purposes, select **Node and Interconnect Device Install Package**. For information on how to perform a recovery installation on either a Node or Interconnect device, see [“Performing a Recovery Installation” on page 120](#).

A login screen appears.

7. Enter your user ID and password and press **Enter**.
8. Read the End User License Agreement, select the **I agree** option button, and then click **Proceed**.
9. Save the **jinstall-qfabric-version.rpm** file on your computer.

### Retrieving Software Files for Download

---

Retrieve the software from the location in which you downloaded it. To do this, issue the **request system software download** command. The software package is copied from where you downloaded it and is placed locally on the QFabric system.

- To retrieve the software:

```
user@qfabric> request system software download /path/package-name
```

For example:

```
user@qfabric> request system software download  
ftp://server/files/jinstall-qfabric-12.2X50-D10.3.rpm
```

### Performing a Nonstop Software Upgrade for Director Devices in a Director Group

---

**NOTE:** If you reboot any Node groups or Interconnect devices after you perform a nonstop upgrade on the Director group, these devices are upgraded to the same version of software that is running on the Director group.

---

To upgrade the software on the Director devices in a Director group:

- Issue the **request system software nonstop-upgrade director-group package-name** command.

For example:

```
user@qfabric> request system software nonstop-upgrade director-group  
jinstall-qfabric-12.2X50-D10.3.rpm
```

### Performing a Nonstop Software Upgrade for Interconnect Devices and Other Fabric-Related Components

---

Before you perform a nonstop upgrade on the Interconnect devices and other fabric-related components, verify that both Director devices in the Director group are online. Both Director devices must be online before you attempt to perform a nonstop upgrade. To verify that both Director devices are online, issue the **show fabric administration inventory director-group status** command.

To install the software on the Interconnect device and other components in the fabric:

- Issue the **request system software nonstop-upgrade fabric package-name** command.

For example:

```
user@qfabric> request system software nonstop-upgrade fabric  
jinstall-qfabric-12.2X50-D10.3.rpm
```

### (Optional) Creating Upgrade Groups for Node Groups

Upgrade groups enable two or more Node devices in a Node group, or an entire Node group, to be rebooted at the same time. If you do not create an upgrade group, the Node devices are upgraded one at a time. Before performing a nonstop upgrade on a Node group, create an upgrade group and include the devices you want to reboot at the same time.

**NOTE:** If you add Node devices that have links to the same link aggregation group (LAG), there might be traffic loss.

- Create the upgrade group by issuing the **set chassis node-group *node-group-name* nssu upgrade-group *upgrade-group-name* node-devices** command at the [edit chassis] hierarchy.

For example:

```
user@qfabric# set chassis node-group nodegroup1 nssu upgrade-group upgrade1 node-devices
[ node1 node2 ]
```

### Performing a Nonstop Software Upgrade on a Node Group

When you perform a nonstop software upgrade on a network Node group, the Node devices in the network Node group are upgraded in a serial fashion except when upgrade groups are configured. If you perform a nonstop upgrade on a redundant server Node group, both Node devices must be online for a successful upgrade. If one of the Node devices is no longer available, remove it from the configuration before you perform the nonstop software upgrade. If you perform a nonstop upgrade on a Node group with only one Node device, traffic loss occurs while the Node device is rebooting.

**NOTE:** You can upgrade multiple Node groups with this command. However, if more than one Node group is specified, there may be traffic loss depending on the topology of the network.

To install software on a Node group:

- Issue the **request system software nonstop-upgrade node-group *node-group-name* *package-name*** command.

To perform a nonstop upgrade on one Node group:

```
user@qfabric> request system software nonstop-upgrade node-group nodegroup1
jinstall-qfabric-12.2X50-D10.3.rpm
```

To perform a nonstop upgrade on more than one Node group:

```
user@qfabric> request system software nonstop-upgrade node-group [nodegroup1
nodegroup2 nodegroup3] jinstall-qfabric-12.2X50-D10.3.rpm
```

## Performing a Recovery Installation

If Junos OS on your device is damaged in some way that prevents the software from loading correctly, you may need to perform a recovery installation using an emergency boot device (for example, a USB flash drive) to restore the default factory installation. Once you have recovered the software, you need to restore the device configuration. You can either create a new configuration as you did when the device was shipped from the factory, or if you saved the previous configuration, you can simply restore that file to the device.

You can also use a system snapshot as a bootup option when your Junos OS or configuration is damaged. The system snapshot feature takes a “snapshot” of the files currently used to run the device—the complete contents of the `/config` directories, which include the running Juniper Networks Junos OS, the active configuration, and the rescue configuration, as well as the host OS—and copies all of these files into an external USB flash drive. See *Understanding System Snapshot*.

If at all possible, you should try to perform the following steps before you perform the recovery installation:

1. Ensure that you have an emergency boot device to use during the installation. See [“Creating an Emergency Boot Device” on page 180](#) for information on how to create an emergency boot device.
2. Copy the existing configuration in the file `/config/juniper.conf.gz` from the device to a remote system, such as a server, or to an emergency boot device. For extra safety, you can also copy the backup configurations (the files named `/config/juniper.conf.n`, where *n* is a number from 0 through 9) to a remote system or to an emergency boot device.

**WARNING:** The recovery installation process completely overwrites the entire contents of the internal flash storage.

3. Copy any other stored files to a remote system as desired.

To reinstall Junos OS:

1. Insert the emergency boot device into the QFX Series device.
2. Reboot the QFX Series device.

**NOTE:** Do not power off the device if it is already on.

```
[edit system]
user@device> request system reboot
```

If you do not have access to the CLI, power cycle the QFX Series device.

The emergency boot device (external USB install media) is detected. At this time, you can load the Junos OS from the emergency boot device onto the internal flash storage.

3. The software prompts you with the following options:

```
External USB install media detected.
You can load Junos from this media onto an internal drive.
Press 'y' to proceed, 'f' to format and install, or 'n' to abort.
Do you wish to continue ([y]/f/n)? f
```

4. Type **f** to format the internal flash storage and install the Junos OS on the emergency boot device onto the internal flash storage.

If you do not want to format the internal flash storage, type **y**.

The following messages are displayed:

```
Installing packages from external USB drive da1
Packages will be installed to da0, media size: 8G
```

```
Processing format options
Fri September  4 01:18:44 UTC 2012
```

```
-- IMPORTANT INFORMATION --
Installer has detected settings to format system boot media.
This operation will erase all data from your system.
```

```
Formatting installation disk .. this will take a while, please wait
Disabling platform watchdog - threshold 12 mins
```

```
Determining installation slice
Fri September  4 01:27:07 UTC 2012
```

5. The device copies the software from the emergency boot device, occasionally displaying status messages. Copying the software can take up to 12 minutes.

When the device is finished copying the software, you are presented with the following prompt:

```
*** Fri September  4 01:19:00 UTC 2012***
Installation successful..
Please select one of the following options:
Reboot to installed Junos after removing install media (default) ... 1
Reboot to installed Junos by disabling install media ..... 2
Exit to installer debug shell ..... 3
Install Junos to alternate slice ..... 4
Your choice: 4
NOTE: System installer will now install Junos to alternate slice
Do not power off or remove the external installer media or
interrupt the installation mechanism.
```

6. Select **4** to install Junos OS to the alternate slice of the partition, and then press Enter.
7. Remove the emergency boot device when prompted and then press Enter. The device then reboots from the internal flash storage on which the software was just installed. When the reboot is complete, the device displays the login prompt.
8. Create a new configuration as you did when the device was shipped from the factory, or restore the previously saved configuration file to the device.

**Related Documentation** • [Creating an Emergency Boot Device on page 180](#)

## Performing a Recovery Installation On QFX5100 and EX4600 Series Switches

If Junos OS on your device is damaged in some way that prevents the software from loading correctly, you may need to perform a recovery installation using an emergency boot device (for example, a USB flash drive) to restore the default factory installation. Once you have recovered the software, you need to restore the device configuration. You can either create a new configuration as you did when the device was shipped from the factory, or if you saved the previous configuration, you can simply restore that file to the device.

If at all possible, you should try to perform the following steps before you perform the recovery installation:

1. Ensure that you have an emergency boot device to use during the installation. See [“Creating an Emergency Boot Device” on page 180](#) for information on how to create an emergency boot device.
2. Copy the existing configuration in the file `/config/juniper.conf.gz` from the device to a remote system, such as a server, or to an emergency boot device. For extra safety, you can also copy the backup configurations (the files named `/config/juniper.conf.n`, where *n* is a number from 0 through 9) to a remote system or to an emergency boot device.

You can use the system snapshot feature to complete this step. The system snapshot feature takes a “snapshot” of the files currently used to run the QFX Series switch—the complete contents of the `/config` and `/var` directories, which include the running Juniper Networks Junos OS, the active configuration, and the rescue configuration—and copies all of these files into a memory source. See [“Creating a Snapshot and Using It to Boot a QFX Series Switch” on page 181](#) or [Creating a Snapshot and Using It to Boot QFX5100 and EX4600 Devices](#).

**WARNING:** The recovery installation process completely overwrites the entire contents of the internal flash storage.

3. Copy any other stored files to a remote system as desired.

To reinstall Junos OS:

1. Insert the emergency boot device into the device.
2. Power cycle the device.

The emergency boot device (external USB install media) is detected. At this time, you can load the Junos OS from the emergency boot device onto the internal flash storage.

3. The software prompts you with the following options:

```
Junos Snapshot Installer - (c) Juniper Networks 2013
Reboot
```

```
Install Junos Snapshot
[13.2-20131115_x_132_x51_vjunos.0Boot to host shell [debug]
```

On some devices, including a QFX5100 or EX4600 switch, the **Junos Recovery** option might also appear. The **Junos Recovery** option allows you to install a recovery version of Junos OS that was automatically saved when the switch was previously running.

4. Select **Install Junos** to format the internal flash storage and install the Junos OS on the emergency boot device onto the internal flash storage.
5. The device copies the software from the emergency boot device, occasionally displaying status messages. Copying the software can take up to 12 minutes.

When the software is finished being copied from the emergency device to the device, the device reboots from the internal flash storage on which the software was just installed. When the reboot is complete, the device displays the Junos OS login prompt:

```
root@switch#
```

6. Create a new configuration as you did when the device was shipped from the factory, or restore the previously saved configuration file to the device.
7. Remove the emergency boot device.

## Performing a QFabric System Recovery Installation on the Director Group

If the software on your QFabric system is damaged in some way that prevents the software from loading correctly, or you need to upgrade the software on your QFabric system, you may need to perform a recovery installation on the Director group.

If possible, perform the following steps before you perform the recovery installation:

1. Ensure that you have an emergency boot device (for example, an external USB flash drive) for each of your Director devices to use during the recovery installation.

You can either use the external USB flash drive containing the software supplied by Juniper Networks, or you can use an external USB flash drive supplied by Juniper Networks on which you install the QFabric system install media.

2. Because the recovery installation process completely overwrites the entire contents of the Director device, make sure you back up any configuration files and initial setup information on a different external USB flash drive before you begin a recovery installation. You will need to restore this information as part of recovery process.

Use the **request system software configuration-backup** command to back up your configuration files and initial setup information:

```
user@switch> request system software configuration-backup path
```

**NOTE:** To recover the Director group, you must upgrade both Director devices in parallel. If you are recovering only one Director device in a Director group, and the software version will remain the same between the two Director devices, make sure that the other Director device is powered on and operational. If the software version of the Director device you are recovering will be different, make sure that the other Director device is powered off and is not operational.

- (Optional) Creating an Emergency Boot Device Using a Juniper Networks External Blank USB Flash Drive on page 124
- Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software on page 125

### (Optional) Creating an Emergency Boot Device Using a Juniper Networks External Blank USB Flash Drive

---

If you do not have an external USB flash drive preloaded with the software from Juniper Networks to use as an emergency boot device, you can create your own, using a blank external USB flash drive provided by Juniper Networks. Download the install media from the Juniper Networks Support website onto your UNIX workstation, uncompress and untar the software, and then burn the software image onto your Juniper Networks external USB (4-gigabyte) flash drive. Make sure you create two emergency boot devices, one for each Director device, so you can perform a recovery installation in parallel.

1. Using a Web browser, navigate to the <http://www.juniper.net/support>.
2. Click **Download Software**.
3. In the *Switchingbox*, click *Junos OS Platforms*.
4. In the *QFX Series* section, click the name of the platform for which you want to download software.
5. Click the *Software* tab and select the release number from the *Release* drop-down list.
6. Select the complete install media you want to download in the *QFabric System Install Media* section.  
A login screen appears.
7. Enter your name and password and press **Enter**.
8. Read the End User License Agreement, click the **I agree** radio button, and then click **Proceed**.
9. Log in and save the install media file to your UNIX workstation.
10. Use FTP to access the UNIX workstation where the install media resides.  
`ftp ftp://hostname/pathname install-media-qfabric-<version>.img.tgz`
11. When prompted, enter your username and password.
12. Make sure you are in binary mode by entering **binary** at the prompt.

**binary**

13. Use the **get** command to transfer the installation package from the FTP host to your UNIX workstation.

```
get install-media-qfabric-<version>.img.tgz
```

14. Close the FTP session:

**bye**

15. Untar the *install-media-qfabric-<version>.img.tgz* file on your UNIX workstation.

```
tar -xvzf install-media-qfabric-11.3X30.6.img.tgz
```

16. Insert a blank external USB (4-gigabyte) flash drive supplied by Juniper Networks into your UNIX workstation.

17. Burn the software image you just downloaded to your UNIX workstation onto your external USB flash drive using the **dd** command:

```
dd if=install-media-qfabric-11.3X30.6.img of=/dev/sdb bs=16k
250880+0 records in
250880+0 records out
4110417920 bytes (4.1 GB) copied, 5.10768 seconds, 805 MB/s
```

18. Perform the steps in [“Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software” on page 87](#) to continue with the recovery installation.

### Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software

This procedure describes how to perform a recovery installation using an external USB flash drive that contains Junos OS software.

**NOTE:** Since the recovery installation process completely overwrites the entire contents of the Director device, you will need to restore the required configuration files and initial setup information. The following procedure assumes you previously saved these backup files with the **request system software configuration-backup** command. Ensure that you have these backup files available on an external USB flash drive before you perform the following steps.

1. Insert the external USB flash drive into the Director device.
2. Perform one of the following tasks:
  - If you have access to the default partition, reboot the Director device by issuing the **request system reboot director-group** command.
  - If you do not have access to the default partition, power cycle the Director device.

The following menu appears on the Director device console when the Director device boots up:

```
Juniper Networks QFabric Director Install/Recovery Media
- To boot from the local disk, wait 10 seconds or press the Enter key.
- To reinstall the QFabric software on this Director device, type: install
```

3. Type **install** and then press **Enter** to install the software on the Director device.

Once the installation process is complete, the Director device reboots, and the following menu appears on the Director device console:

```
Juniper Networks QFabric Director Install/Recovery Media
```

- To boot from the local disk, wait 10 seconds or press the Enter key.
- To reinstall the QFabric software on this Director device, type: **install**

4. Press **Enter**.

The Director device reboots from the local disk on which the software was just installed.

5. Log in as root on the Director device.

The following menu appears on the Director device console:

Before you can access the QFabric system, you must complete the initial setup of the Director group by using the steps that follow.

If the initial setup procedure does not complete successfully, log out of the Director device and then log back in to restart this setup menu.

```
Continue?[y/n]
```

6. Enter **n** to bypass the initial setup script and enter the Director device root directory, where you can mount the external USB flash drive containing the configuration files and initial setup information.

7. Issue the **ls /mnt** command to list the *mount* directory.

```
root@dg0 ~]# ls /mnt
```

8. Issue the **mkdir** command to create a directory within the mount directory.

```
root@dg0 ~]# mkdir /mnt/myusb
```

9. Issue the **mount /dev/sdb2 /mnt/myusb/** command to mount the external USB flash drive to the local drive of the Director device.

```
root@dg0 ~]# mount /dev/sdb2 /mnt/myusb/
```

10. Issue the **ls -la /mnt/myusb/** command to verify the contents of your mounted external USB flashdrive.

```
root@dg0 ~]# ls -la /mnt/myusb/
total 1770884
drwxr-xr-x 2 root root      4096 Sep  7 05:16 .
drwxr-xr-x 3 root root      4096 Sep  7 10:15 ..
-rw-r--r-- 1 root root    4249 Sep  7 03:52 mybackup-20110907
```

11. Exit the Director device and log back in as root on the Director device.

The following menu appears:

Before you can access the QFabric system, you must complete the initial setup of the Director group by using the steps that follow.

If the initial setup procedure does not complete successfully, log out of the Director device and then log back in to restart this setup menu.

```
Continue?[y/n] y
```

```
Initial Configuration
```

You may enter the configuration manually or restore from a backup.

```
Specify a backup file? [y/n] : y
Please specify the full path of the configuration backup file. :
/mnt/myusb/mybackup-20110907
```

12. Enter **y** to continue.

13. Enter **y** and specify the path to the backup configuration file located on the external USB flash drive.

```
/mnt/myusb/mybackup-20110907
```

The following messages appear:

```
Saving temporary configuration...
Configuring peer...
connect error for 1.1.1.2:9001
Configuring local interfaces...
Configuring interface eth0 with [10.49.213.163/24:10.49.213.254]

[00:10:00:00:00:00 - 00:10:00:00:0f:3b]
Configuring QFabric address [10.49.213.50]
Reconfiguring QFabric software static configuration
Applying the new Director Device password
Applying the QFabric component password
First install initial configuration, generating and sharing SSH keys.
First install initial configuration, generating SSH keys.
connect error for 1.1.1.2:9001
Shared SSH keys.
Configuration complete. Director Group services will auto start within 30
seconds.
```

The Director device reboots from the local disk on which the software was just installed. Exit the Director device session and log in to the QFabric default partition CLI.

14. Issue the **request system software configuration-restore** command and specify the path to the backup configuration file located on the external USB flash drive to load the previously saved QFabric system configuration.

15. From the default partition, issue the **request system reboot node-group all** command to reboot all of the Node groups in the QFabric system to ensure that all Node devices are running the same version of software as the Director-group.

```
user@switch> request system reboot node-group all
```

16. From the default partition, issue the **request system reboot fabric** command to reboot the Interconnect devices and the other components in the fabric in the QFabric system to ensure that Interconnect devices are running the same version of software as the Director group.

```
user@switch> request system reboot fabric
```

17. Log in to the default partition and issue the **show version component all** command to verify that all components are running the same version of software.

```
user@switch> show version component all

## Recovering from a Failed Software Installation

**Problem** **Description:** If the Junos OS appears to have been installed but the CLI does not work, or if the switch has no software installed, you can use this recovery installation procedure to install the Junos OS.

**Solution** If a Junos OS image already exists on the switch, you can either install the new Junos OS package in a separate partition, in which case both Junos OS images remain on the switch, or you can remove the existing Junos OS image before you start the new installation process.

**NOTE:** QFX5100 and EX4600 switches do not have a separate partition to reinstall a Junos OS image.

A recovery image is created automatically on these switches. If a previously-running switch is powered on and unable to boot using a Junos OS image, you can boot the switch using the recovery Junos OS image by selecting an option in the “Select a recovery image” menu.

We suggest creating a system snapshot on your QFX5100 or EX4600 switch onto the external USB flash drive, and using the snapshot for recovery purposes. The system snapshot feature takes a “snapshot” of the files currently used to run the device—the complete contents of the /config directories, which include the running Juniper Networks Junos OS, the active configuration, and the rescue configuration, as well as the host OS—and copies all of these files into an external USB flash drive. See [“Creating a Snapshot and Using It to Boot a QFX Series Switch” on page 181](#).

To perform a recovery installation:

1. Power on the switch. The loader script starts.
2. After the message **Loading /boot/defaults/loader.conf** appears, you are prompted with the following message:

**Hit [Enter] to boot immediately, or space bar for command prompt.**

Press the Spacebar to enter the manual loader. The **loader>** prompt appears.

**NOTE:** The loader prompt does not appear on QFX5100 and EX4600 switches.

On QFX5100 and EX4600 switches only, a recovery image is automatically saved if a previously-running switch is powered on and unable to boot using a Junos OS image.

The “Select a recovery image” menu appears on the console when one of these switches is booted and unable to load a version of Junos OS. Follow the instructions in the “Select a recovery image” menu to load the recovery version of Junos OS for one of these switches.

You can ignore the remainder of this procedure if you are using a QFX5100 or EX4600 switch.

3. Enter the following command:

```
loader> install [- --format] [- --external] source
```

where:

- **format**—Enables you to erase the installation media before installing the installation package. If you do not include this option, the system installs the new Junos OS in a different partition from that of the most recently installed Junos OS.
- **external**—Installs the installation package onto external media (a USB stick, for example).
- **source**—Represents the name and location of the Junos OS package, either on a server on the network or as a file on an external media, as shown in the following two examples:
  - Network address of the server and the path on the server; for example, **tftp://192.171.28/junos/jinstall-qfx-11.1R1.5-domestic-signed.tgz**
  - Junos OS package on a USB device (commonly stored in the root drive as the only file), for example, **file:///jinstall-qfx-11.1R1.5-domestic-signed.tgz**.

The installation now proceeds normally and ends with a login prompt.

## Software Installation Overview

A device is delivered with the Junos OS preinstalled. As new features and software fixes become available, you can upgrade your software to use them.

When you power on the switch, it starts (boots) using the installed software.

You upgrade the Junos OS on a switch by copying a software package to a switch or other system on your local network and then using the CLI to install the new software on the switch. You then reboot the switch, which boots from the upgraded software. After a successful upgrade, you should back up the new current configuration to a secondary device.

During a successful upgrade, the installation package removes all files from the `/var/tmp` directory of the switch and completely reinstalls the existing software. It retains configuration files, and similar information, such as secure shell and host keys, from the previous version. The previous software package is preserved in a separate disk partition, and you can manually revert to it if necessary. If the software installation fails for any reason, such as loss of power during the installation process, the system returns to the originally active installation when you reboot.

If you encounter any difficulties during software installation or an upgrade, you can use the recovery installation procedure to install the Junos OS on the switch.

## Upgrading Jloader Software on QFX Series Devices

Jloader software contains a boot loader (Uboot), which is used to bring up QFX Series devices and load the Junos OS from the flash memory of these devices. You can upgrade Jloader software on QFX3500 switches, QFX3500 and QFX3600 Node devices, and QFX3600-I and QFX3008-I Interconnect devices.

**NOTE:** Before you upgrade the Jloader software, see [Table 12 on page 132](#), [Table 13 on page 132](#), and [Table 14 on page 133](#) to make sure that you are upgrading to the right version of Jloader software for the Junos OS software release running on your QFX3500 switches, or Node devices and Interconnect devices in your QFabric system.

See [Table 15 on page 133](#) to see which Uboot software versions are available and the filenames of the Jloader software packages.

**Table 12: Junos OS and Jloader Software Compatibility Matrix for the QFX3500 Switch and QFX3500 Node Device**

Junos OS Software Version	1.1.2	1.1.4	1.1.5	1.1.8
11.3R1 and later (QFX3500 switch)	Supported	Supported	Not supported	Supported and recommended
11.3X30.6 and later (QFX3500 Node device)	Supported	Supported	Not supported	Supported and recommended
12.1X49-D1 and later (QFX3500 switch)	Supported	Supported	Not supported	Supported and recommended
12.2X50-D1 and later (QFX3500 switch and QFX3500 Node device)	Supported	Supported	Not supported	Supported and recommended

**NOTE:** An en dash means that the item is not applicable.

**Table 13: Junos OS and Jloader Software Compatibility Matrix for the QFX3008-I Interconnect Device**

Junos OS Software Version	1.1.2	1.1.4	1.1.5	1.1.8
11.3X30.9 and later (QFX3008-I Interconnect device)	Supported	Supported	Not supported	Supported and recommended

**Table 13: Junos OS and Jloader Software Compatibility Matrix for the QFX3008-I Interconnect Device (continued)**

Junos OS Software Version	1.1.2	1.1.4	1.1.5	1.1.8
11.3X30.6 and later (QFX3008-I Interconnect device)	Supported	Supported	Not supported	Supported and recommended
12.2X50-D10.3 and later (QFX3008-I Interconnect device)	Supported	Supported	Not supported	Supported and recommended

**NOTE:** An en dash means that the item is not applicable.

**Table 14: Junos OS and Jloader Software Compatibility Matrix for the QFX3600-I Interconnect Device and QFX3600 Node Device**

Junos OS Software Version	1.1.2	1.1.4	1.1.5	1.1.8
12.2X50-D10.3 and later (QFX3600-I Interconnect Device and QFX3600 Node Device)	-	-	Supported	Supported and recommended
12.2X50-D20 and later (QFX3600 switch)	-	-	Supported	Supported and recommended

**Table 15: Uboot Software Release and Jloader Software Compatibility Matrix**

Uboot Software Release Number	Jloader Software Package Name
1.1.2	jloader-qfx-11.3X30.9-signed.tgz
1.1.4 (11.3R3 and 11.3R2 releases only. Not supported on 11.3R1)	jloader-qfx-11.3I20120127_0733_dc-builder-signed.tgz
1.1.4 (12.1R1 release and later)	jloader-qfx-12.1-20120125_pr.0-signed.tgz
1.1.5 (12.2X50-D10.3 and later)	jloader-qfx-12.2X50.D10.3-signed.tgz
1.1.8 (13.1X50-D15.1 and later)	jloader-qfx-13.3-20130831_pr_branch_qfd.0.tgz

#### Jloader Software Version 1.1.4 Guidelines

Jloader Release 1.1.4 is compatible with Junos OS Release 11.3R3 and 11.3R2, and Junos OS Release 12.1R1 and later. Jloader Release 1.1.4 is not compatible with Junos OS Release 11.3R1. The Jloader software package names are different for versions 1.1.4 (Junos OS 11.3R3 and 11.3R2) and 1.1.4 (Junos OS 12.2R1 release and later), but the binaries are the same. Because the binaries are the same, you can upgrade or downgrade to any Junos OS release.

- If you have Junos OS Release 11.3 installed and want to upgrade the Jloader software from version 1.1.2 to version 1.1.4, you need to upgrade using the **jloader-qfx-11.3I20120127\_0733\_dc-builder-signed.tgz** software package.
- If you have Junos OS Release 11.3R2 installed and want to upgrade to Junos OS Release 12.1, you do not need to upgrade the Jloader Release and can continue to use Jloader Release 1.1.2.
- If you have Junos OS Release 12.1 installed and want to upgrade the Jloader software from version 1.1.2 to version 1.1.4, you need to upgrade using the **jloader-qfx-12.1-20120125\_pr.0-signed.tgz** software package.
- If you upgrade to Junos OS Release 12.1, you can upgrade to Jloader Release 1.1.4 using the **jloader-qfx-12.1-20120125\_pr.0-signed.tgz** software package.

### Upgrading Jloader Software on a QFX3500 Switch

---

The Jloader software for a QFX3500 switch resides in two flash memory banks. At any time, one bank acts as the primary bank, and the QFX3500 switch boots from it. The other bank is the backup bank—if the QFX3500 switch cannot boot from the primary bank, it boots from the backup bank. When you upgrade the Jloader software, the upgraded software is installed in the backup bank, which then becomes the new primary bank. Thus the primary and backup banks alternate each time you upgrade the Jloader software, with the primary bank containing the most recently installed version of the software, and the backup bank containing the previous version. To upgrade the Jloader software on a QFX3500 switch, you must perform the upgrade twice: once for each bank. Each upgrade requires that you to reboot the QFX3500 switch.

**NOTE:** If you are running Junos OS Release 11.3R1 or Junos OS Release 11.3R2, you must use the **no-validate** option when you issue the **request system software add** command to upgrade the Jloader software. Otherwise, the installation will fail and you receive a configuration error. The **no-validate** option is not required for Junos OS Release 11.3R3 and later.

**NOTE:** After you upgrade the Jloader software on the first bank, the software package is deleted after you reboot. Make sure that you have either downloaded the Jloader software package to either a remote site or in a local directory on the switch, such as the **/var/tmp** directory on the QFX3500 device.

1. In a browser, go to <http://www.juniper.net/support/downloads/junos.html> .  
The Junos Platforms Download Software page appears.
2. In the QFX Series section of the Junos Platforms Download Software download page, select the QFX Series platform software you want to download.
3. Select the number of the software version that you want to download in the Release: pull-down window to the right of the tabs on the Download Software page.

4. Select the Software tab and then select the install package you want to download in the Install Package section.
5. In the pop-up Alert box, click the link to the Product Support Notification (PSN) document.
6. Enter your name and password and press **Enter**.
7. Read the End User License Agreement, click the **I agree** radio button, and then click **Proceed**.
8. Open or save the **jloader-qfx-version-signed.tgz** file either to a local system or to a remote location. If you are saving the installation package to a remote system, make sure that you can access it using HTTP, TFTP, FTP, or scp.
9. Log in to the QFX3500 switch and enter the shell. We recommend using a console connection.
10. Determine the version of the Jloader software package installed on the switch.

For example:

```
root@switch% ls
gres-tp krt_gencfg_filter.txt
jloader-qfx-11.3-20110510.0-signed.tgz
```

11. Determine the version of the Uboot software that is running in the bank:

For example:

```
root@switch% kenv | grep boot.version
boot.version="1.0.7"
```

12. Enter the CLI and install the Jloader software package.

- To install a Jloader software package that is located in the **/var/tmp** directory, issue the **request system software add /var/tmp/jloader-qfx-version.tgz no-validate** command:

For example:

```
user@switch> request system software add
/var/tmp/jloader-qfx-11.3-20110510.0-signed.tgz no-validate
```

You see the following messages during the installation:

```
Verified jloader-qfx-11.3-20110510.0.tgz signed by PackageProduction_11_3_0
Adding jloader-qfx...
Installation in progress, please wait...
Mounted jloader-qfx package on /dev/md8...
Verified manifest signed by PackageProduction_11_3_0
Verified jloader-qfx-11.3-20110510.0 signed by PackageProduction_11_3_0
Registering jloader-qfx as unsupported
```

```
Installation finished successfully.
Please reboot to activate the package
Saving package file in /var/sw/pkg/jloader-qfx-11.3-20110510.0-signed.tgz
...
Saving state for rollback ...
```

```
juniper@qfx3500>
```

- To install a Jloader software package located on a remote server using FTP, issue the **request system software add**

**/ftp://hostname/pathname/jloader-qfx-version-signed.tgz no-validate**  
command.

For example:

```
user@switch> request system software add  
/ftp://hostname/pathname/jloader-qfx-11.3-20110510.0-signed.tgz no-validate
```

- To install a Jloader software package located on a remote server using HTTP, issue the **request system software add /http://hostname/pathname/jloader-qfx-version-signed.tgz no-validate** command.

For example:

```
user@switch> request system software add  
/http://hostname/pathname/jloader-qfx-11.3-20110510.0-signed.tgz no-validate
```

13. When prompted, reboot the Control Board by issuing the **request system reboot** command.

For example:

```
user@switch> request system reboot  
Reboot the system ? [yes,no] (no) yes
```

14. Enter the shell and verify that the version of the Uboot software in the primary bank is the version you just installed.

For example:

```
root@switch% kenv | grep boot.version  
boot.version="1.1.1"
```

15. To install the Jloader software package on the current backup bank, repeat Step 10 through Step 14.

## Upgrading Jloader Software on a QFabric System

This procedure explains how to upgrade the Jloader software on your Node devices and Interconnect devices. The example shows how to upgrade the Jloader Release 1.1.1 to 1.1.2 on a Node device with the serial number BBAK1186.

**NOTE:** Before you upgrade the Jloader software, make sure you have the serial numbers of the Node devices, Interconnect devices, and Control Boards in the Interconnect devices you want to upgrade.

1. Issue the **show chassis hardware node-device ?** command to view the serial numbers of the Node devices.

For example:

```
user@qfabric> show chassis hardware node-device ?
<node-device>      Node device identifier
BBAK1186            Node device
BBAK3149            Node device
BBAK3177            Node device
BBAK8063            Node device
BBAK8799            Node device
P2443-C             Node device
P2515-C             Node device
P3708-C             Node device
P3885-C             Node device
P3916-C             Node device
node0               Node device
node1               Node device
node2               Node device
node3               Node device
node4               Node device
node5               Node device
node6               Node device
node7               Node device
node8               Node device
```

An example of a Node device serial number is BBAK1186.

2. Issue the **show chassis hardware interconnect-device ?** command to view the serial numbers of the Interconnect devices.

For example:

```
user@qfabric> show chassis hardware interconnect-device ?
Possible completions:
interconnect-device  Interconnect device identifier
IC-F1052             Interconnect device
IC-F3947             Interconnect device
```

The Interconnect device serial numbers are IC-F1052 and IC-F3947.

3. Issue the **show chassis hardware interconnect-device name** command to view the serial numbers of the Control Boards in the Interconnect device.

For example:

```
user@qfabric> show chassis hardware interconnect-device IC-F3947
```

## Hardware inventory:

Item	Version	Part number	Serial number	Description
Chassis	REV 10		F3947	QFXC08-3008
Midplane	REV 10	750-035835	F3947-C	QFX Midplane
CB 0 Board	REV 14	750-035855	ZJ9432	QFX Chassis Control
Routing Engine 0		BUILTIN	BUILTIN	QFX Routing Engine
CB 1 Board	REV 14	750-035855	ZJ9404	QFX Chassis Control

The Control Board serial numbers are ZJ9432 and ZJ9404.

4. Issue the **show chassis firmware node-device *name*** command to see which version of Uboot software you have installed on your Node device.

For example:

```
user@qfabric> show chassis firmware node-device BBAK1186
```

Part	Type	Version
node4	U-Boot	1.1.6 (May 10 2011 - 04:52:59) 1.1.1
	loader	FreeBSD/MIPS U-Boot bootstrap loader 0.1

The Uboot software version is 1.1.1. The loader software version appears after the timestamp for U-Boot 1.1.6.

5. Issue the **show chassis firmware interconnect-device *name*** command to see which version of Uboot software you have installed on the Routing Engines located on the Control Boards of the Interconnect device.

For example:

```
user@qfabric> show chassis firmware interconnect-device IC-F3947
```

Part	Type	Version
Routing Engine 0	U-Boot	U-Boot 1.1.6 (Jan 27 2012 - 03:24:34) 1.1.4
	loader	FreeBSD/MIPS U-Boot bootstrap loader 0.1
Routing Engine 1	U-Boot	U-Boot 1.1.6 (Jan 27 2012 - 03:24:34) 1.1.4
	loader	FreeBSD/MIPS U-Boot bootstrap loader 0.1

The Uboot software version is 1.1.4. The loader software version appears after the timestamp for U-Boot 1.1.6.

6. In a browser, go to <http://www.juniper.net/support/downloads/junos.html>.

The Junos Platforms Download Software page appears.

7. In the QFX Series section of the Junos Platforms Download Software download page, select the QFX Series platform software you want to download.
8. Select the number of the software version that you want to download in the Release: pull-down window to the right of the tabs on the Download Software page.
9. Select the **Software** tab and then select the install package you want to download in the Install Package section.

10. In the pop-up Alert box, click the link to the Product Support Notification (PSN) document.
11. Enter your username and password, and press **Enter**.
12. Read the End User License Agreement, click the **I agree** radio button, and then click **Proceed**.
13. Open or save the **jloader-qfx-version-signed.tgz** file either to a local system or to a remote location. If you are saving the installation package to a remote system, make sure that you can access it using HTTP, TFTP, FTP, or scp.
14. Retrieve the software from the location in which you downloaded it. To do this, issue the **request system software download /path/package-name** command.

For example:

```
user@qfabric> request system software download
ftp://server/files/jloader-qfx-11.3X30.9-signed.tgz
```

15. Log in to the Director device as root and enter the shell to verify that you have downloaded the Jloader software package. We recommend using a console connection. The software package is copied from where you downloaded it and is placed locally on the QFabric system in the **/pbdata/packages** directory.

For example:

```
[root@dg0] # pwd
/pbdata/packages

[root@dg0] # ls
jloader-qfx-11.3X30.9-signed.tgz
```

16. Before you copy over the Jloader software package to the Node device or Interconnect device, determine the directory that matches the serial number of the Node device or Interconnect device that you want to upgrade. View the remote logs and the Node device and Interconnect device serial numbers by issuing the **ls /pbdata/export/rlogs** command at the command line of the Director device before you copy the software package over to the device.

**NOTE:** The **/pbdata/export/rlogs/node-device-serial-ID** and **/pbdata/export/rlogs/interconnect-device-serial-ID** directories on the Director device are NFS mounted as the **/tftpboot/logfiles** directories on the Node device and Interconnect device. These directories are created for all Node devices and Interconnect devices in a QFabric system. The Jloader files are stored in the **/tftpboot/logfiles** directories for each Node device and Interconnect device.

For example:

```
[root@dg0 tmp] # ls /pbdata/export/rlogs
02de4930-828b-11e1-a319-00e081c57938 c9898afe-828b-11e1-956c-00e081c57938
04103b2a-29d5-e011-bf8a-0e6bdf3aa1e6 eeba4aac-828b-11e1-85e2-00e081c57938
1e2739e0-828b-11e1-bf74-00e081c57938 F1052
8d8a978c-828b-11e1-a833-00e081c57938 F3947
ad55b89e-828b-11e1-b70e-00e081c57938 P2443-C
BBAK1186 P2515-C
```

BBAK3149	P3708-C
BBAK3177	P3885-C
BBAK8063	P3916-C
BBAK8799	

BBAK1186 is the serial number of the Node device that needs to be upgraded.

17. Copy the Jloader software package from the `/var/tmp` directory to the `/pbdata/export/rlogs/BBAK1186` directory.

For example:

```
[root@dg0 tmp] # cp jloader-qfx-11.3X30.9-signed.tgz /pbdata/export/rlogs/BBAK1186
```

18. Confirm that the Jloader software package you copied over is in the `/pbdata/export/rlogs/BBAK1186` directory.

For example:

```
[root@dg0 tmp] # ls /pbdata/export/rlogs/BBAK1186
jloader-qfx-11.3X30.9-signed.tgz
```

19. Issue the `/root/dns.dump` command to find out the internal IP addresses of the Node device or Interconnect device.

```
[root@dg0 tmp] # /root/dns.dump
; <<>> DiG 9.3.6-P1-RedHat-9.3.6-4.P1.e15 <<>> -t axfr pkg.dcbg.juniper.net
@169.254.0.1
;; global options: printcmd
pkg.dcbg.juniper.net. 600 IN SOA ns.pkg.dcbg.juniper.net.
mail.pkg.dcbg.juniper.net. 152 3600 600 7200 3600
pkg.dcbg.juniper.net. 600 IN NS ns.pkg.dcbg.juniper.net.
pkg.dcbg.juniper.net. 600 IN A 169.254.0.1
pkg.dcbg.juniper.net. 600 IN MX 1 mail.pkg.dcbg.juniper.net.
dcfnode---DCF-ROOT.pkg.dcbg.juniper.net. 45 IN A 169.254.192.17

169.254.128.19
dcfnode-ad55b89e-828b-11e1-b70e-00e081c57938.pkg.dcbg.juniper.net. 45 IN A
169.254.128.20
dcfnode-BBAK1186.pkg.dcbg.juniper.net. 45 IN A 169.254.128.14
```

The internal IP address for BBAK1186 is 169.254.128.14.

20. Upgrade the Jloader software on the Node device or Interconnect device.

Before you can upgrade the Jloader software, you need to use SSH to log in to the Node device or Interconnect device and verify that the software is in the `/tftpboot/logfiles` directory.

- a. Use SSH to log in to the Node device or Interconnect device.

For example:

```
[root@dg0 tmp] # ssh 160.254.128.14
root@169.254.128.14's password:
--- JUNOS 11.3X30.10 built 2012-03-11 22:55:43 UTC
At least one package installed on this device has limited support.
Run 'file show /etc/notices/unsupported.txt' for details.
root@sng3%
```

- b. Verify that the Jloader software package is in the `tftpboot/logfiles` directory of the Node device or Interconnect device.

For example:

```
root@sng3% ls /tftpboot/logfiles
.index                               jloader-qfx-11.3X30.9-signed.tgz
```

- c. Copy the Jloader software package from the **/tftpboot/logfiles** directory to the **/var/tmp** directory of the Node device or Interconnect device.

For example:

```
root@sng3% cp /tftpboot/logfiles/jloader-qfx-11.3X30.9-signed.tgz /var/tmp
```

- d. Verify that the Jloader software package is in the **/var/tmp** directory of the Node device or Interconnect device.

For example:

```
root@sng3% ls /var/tmp
.snap                               jloader-qfx-11.3X30.9-signed.tgz
    tmp
gres-tp                             krt_gencfg_filter.txt
    vc-autoupgrade
if-rtbdb                             rtsdb
```

- e. Enter CLI mode and issue the **request system software add /var/tmp/jloader-qfx-version-signed.tgz** command.

For example:

```
root@sng3% cli
root@sng3> request system software add /var/tmp/jloader-qfx-11.3X30.9-signed.tgz

#####
#####
Installation finished successfully.
Please reboot to activate the package
Saving package file in /var/sw/pkg/jloader-qfx-11.3X30.9-signed.tgz ...
Saving state for rollback ...
```

Upgrade has completed successfully.  
Reboot is now required.

- f. Reboot both the Node device and Interconnect device twice, because they each contain two partitions.

For example:

```
root@sng3> request system reboot
Reboot the system ? [yes,no] (no) yes
Shutdown NOW!
[pid 37663]
```

```
root@sng3>
```

```
*** FINAL System shutdown message from root@sng3 ***
```

```
System going down IMMEDIATELY
```

- g. Verify that the Uboot software on the Node device or Interconnect device has been upgraded to the new Uboot software by logging in to the QFabric CLI and issuing either the **show chassis firmware node-device *name*** command or the **show chassis firmware interconnect-device *name*** command.

For example:

```
user@qfabric> show chassis firmware node-device BBAK1186
Part                Type      Version
node4               U-Boot   1.1.6 (Nov 19 2011 - 11:42:07) 1.1.2
                                loader   FreeBSD/MIPS U-Boot bootstrap loader
0.1
```

The Uboot software version is now 1.1.2. The loader software version appears after the timestamp for U-Boot 1.1.6.

## Upgrading Software

To upgrade Junos OS, you need to install the appropriate upgrade package on the device. Upgrading involves these tasks:

1. [Downloading Software Files with a Browser on page 143](#)
2. [Accessing Software Downloaded to a Remote Location on page 144](#)
3. [Connecting to the Console Port on page 144](#)
4. [Backing Up the Current Configuration Files on page 144](#)
5. [Installing a Standard Software Package on page 145](#)
6. [Upgrading to an ELS-Based Software Package on page 146](#)

### Downloading Software Files with a Browser

To download the software package from the Juniper Networks Support website, go to <http://www.juniper.net/support/>.

**NOTE:** To access the download site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website <https://www.juniper.net/registration/Register.jsp>.

This procedure shows you how to upgrade software on a QFX Series device, but you can follow the same procedure for any device unless otherwise specified.

1. Using a Web browser, navigate to the <http://www.juniper.net/support>.
2. Click **Download Software**.
3. In the **Switching** box, click **Junos OS Platforms**.
4. In the **QFX Series** section, click the name of the platform for which you want to download software.
5. Click the **Software** tab and select the release number from the **Release** drop-down list.
6. In the **Install Package** section of the **Software** tab, select the **Install Package** for the release.  
A login screen appears.
7. Enter your name and password and press **Enter**.
8. Read the End User License Agreement, click the **I agree** radio button, and then click **Proceed**.

9. Save the **jinstall-qfx-<version>-domestic-signed.tgz** file on your computer.
10. Open or save the installation package either to the local system in the **var/tmp** directory or to a remote location. If you are saving the installation package to a remote system, make sure that you can access it using HTTP, TFTP, FTP, or scp.

### Accessing Software Downloaded to a Remote Location

---

To access the installation package if you downloaded it to a remote location (for example, any system other than the switch):

1. From the command line, make sure you are in the **/var/tmp** directory of the switch.
2. Start the shell interface:  

```
user@switch> start shell
```
3. Initiate an FTP, TFTP, or scp session.

In this example, FTP is used.

- ```
>ftp
```
4. Use FTP to access the remote location where the installation package resides.  

```
ftp ftp://<hostname>/<pathname>/<package-name-m.mZx-distribution>.tgz.
```

where **<package-name-m.mZx-distribution>.tgz** is  
**jinstall-qfx-11.1R1.5-domestic-signed.tgz**
  5. When prompted, enter your username and password.
  6. Use the **get** command to transfer the installation package from the remote location to your **/var/tmp** directory on your switch.  

```
get <package-name-m.mZx-distribution>.tgz
```
  7. Close the FTP session:  

```
bye
```

### Connecting to the Console Port

---

We recommend that you connect to the console port while installing the installation package so you can respond to any required user input and detect any errors that may occur.

### Backing Up the Current Configuration Files

---

Before you install the new installation package, we strongly recommend that you back up your current configuration files because the upgrade process removes all of the stored files on the switch.

To back up your current configuration files, enter the **save** command:

```
user@switch# save filename
```

Executing this command saves a copy of your configuration files to a remote location such as an external USB device.

## Installing a Standard Software Package

---

**NOTE:** Before you install the software, back up any critical files in `/var/home`. For more information regarding how to back up critical files, contact Customer Support at <http://www.juniper.net/support>.

---

**NOTE:** If you are upgrading from a standard software package to an ELS-based package, see the *Upgrading to an ELS-Based Software Package* section.

---

Install the software in one of three ways:

If the installation package resides locally on the switch, execute the **request system software add validate <pathname> <source> reboot** command.

For example:

```
user@switch> request system software add validate  
/var/tmp/jinstall-qfx-11.1R1.5-domestic-signed.tgz reboot
```

If the Install Package resides remotely, execute the **request system software add validate <pathname> <source> reboot** command.

For example:

```
user@switch> request system software add validate  
ftp://ftpserver/directory/jinstall-qfx-11.1R1.5-domestic-signed.tgz reboot
```

**NOTE:** On the QFX5100 switch, use the force-host option to force installing the latest version of the Host OS.

If the installation package resides locally on the QFX5100 switch, execute the **request system software add force-host validate <pathname> <source> reboot** command.

For example:

```
user@switch> request system software add force-host validate  
/var/tmp/jinstall-qfx-5.13.2X51-D10.6-domestic-signed.tgz reboot
```

If the install Package resides remotely from the QFX5100 switch, execute the **request system software add force-host validate <pathname> <source> reboot** command.

For example:

```
user@switch> request system software add force-host validate  
ftp://ftpserver/directory/jinstall-qfx-5.13.2X51-D10.6-domestic-signed.tgz reboot
```

After the reboot has finished, verify that the new version of software has been properly installed by executing the **show version** command.

```
user@switch> show version
```

---

### Upgrading to an ELS-Based Software Package

To upgrade your switch from a version of Junos OS that does not support Enhanced Layer 2 Software (ELS) to a version of Junos OS that supports ELS, we recommend performing the following procedure.

**NOTE:** Because this procedure can cause service outages, we recommend that you avoid performing this procedure on switches carrying traffic in a production network.

1. Log in to your device using the console port.

**NOTE:** Only perform this procedure from the console port. You can lose connectivity to your device if you perform this procedure from a management port or any other interface.

2. Set your device to standalone mode by issuing the **request chassis device-mode standalone** command. Do not reboot your system at this time.

**NOTE:** This step is only required for new devices shipped from the factory or QFabric system Node devices that you plan to redeploy in a QFX Series Virtual Chassis.

3. Choose whether you wish to reuse your previous configuration or not.
  - To reuse your previous configuration as part of the software upgrade, you must convert the configuration from the original style Junos OS CLI to the ELS CLI format using the following steps:

**NOTE:** We recommend this procedure for customers currently using a QFX3500 or QFX3600 switch as a standalone device.

- a. Copy your entire existing configuration into a text file. Save the file to a remote location or USB drive.
- b. Retain the portion of your existing configuration related to management network connectivity (such as **[edit system]** and management interfaces). Delete all other configuration elements (such as the **[edit protocols]** and **[edit vlans]** hierarchy levels, non-management interfaces, and so on). Issue a **commit** operation to remove the deleted configuration.
- c. Perform the software upgrade with the **validate** option and reboot your device to complete the upgrade by issuing the **request system software add validate reboot** command. Maintain your console port connection during the reboot.
- d. Using a web browser, navigate to the [ELS Translator Tool](#). Follow the instructions on the page to convert your saved configuration file to the new ELS CLI format.
- e. Return to your console port connection. When the switch has rebooted to complete the software upgrade, copy the configuration from the ELS Translator Tool and load it in to your switch.
- f. Issue a **commit** operation to activate the translated configuration.
- To delete your current configuration and upgrade the software, follow these steps:

**NOTE:** We recommend this procedure for customers with new QFX3500 or QFX3600 devices shipped from the factory or QFabric system Node devices that will be redeployed in a QFX Series Virtual Chassis.

- a. Perform a software upgrade with the **no-validate** option by issuing the **request system software add no-validate** command.
- b. Delete the configuration and set the device to factory defaults by issuing the **request system zeroize** command. The device automatically reboots and reverts to a factory default configuration.
- c. Configure your device using the ELS CLI format.

## Upgrading Software on a QFabric System

The QFabric system software package contains software for all of the different components in the QFabric system, such as the Director group, Interconnect devices, Node devices, and other QFabric system components. You can upgrade the software on all of the QFabric components at the same time using the **request system software add package-name component all reboot** command.

**NOTE:** Downgrading software on a QFabric system is not supported.

This topic describes the following tasks:

- [Backing Up the Current Configuration Files on page 148](#)
- [Downloading Software Files Using a Browser on page 149](#)
- [Retrieving Software Files for Download on page 150](#)
- [Installing the Software Package on the Entire QFabric System on page 150](#)

### Backing Up the Current Configuration Files

---

To back up your current configuration files:

```
user@switch> request system software configuration-backup path
```

Back up the configuration files to a local directory, remote server, or removable drive (for example, an external USB flash drive).

For example:

```
user@switch> request system software configuration-backup /media/USB/
```

---

## Downloading Software Files Using a Browser

---

**NOTE:** To access the download site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website <https://www.juniper.net/registration/Register.jsp>.

---

1. Using a Web browser, navigate to the <http://www.juniper.net/support>.
  2. Click **Download Software**.
  3. In the **Switching** box, click **Junos OS Platforms**.
  4. In the **QFX Series** section, click the name of the platform for which you want to download software.
  5. Click the **Software** tab and select the release number from the **Release** drop-down list.
  6. Select the complete install package you want to download in the **QFabric System Install Package** section:
    - If you want to upgrade the entire QFabric system, select **QFabric System - Complete Install Package**.
    - If you want to upgrade either a single Node or Interconnect device for recovery purposes, select **Node and Interconnect Device Install Package**. For information on how to perform a recovery installation on either a Node or Interconnect device, see [“Performing a Recovery Installation” on page 120](#).
- A login screen appears.
7. Enter your user ID and password and click **Login**.
  8. Read the End User License Agreement, select the **I agree** option button, and then click **Proceed**.
  9. Save the **jinstall-qfabric-version.rpm** file on your computer.

### Retrieving Software Files for Download

---

Retrieve the software from the location in which you downloaded it. To do this, issue the **request system software download** command. The software package is copied from where you downloaded it and is placed locally on the QFabric system.

- To retrieve the software:

```
user@switch> request system software download /path/package-name
```

For example:

```
user@switch> request system software download  
ftp://server/files/jinstall-qfabric-11.3X30.6.rpm
```

### Installing the Software Package on the Entire QFabric System

---

**NOTE:** On a QFabric system, a QFX3500 Node device or QFX3600 Node device might not be able to participate as a Node device in the QFabric system if the Node device is running a different version of software from that of the Director group. This mismatch of software versions between the Node device and the Director group can occur when the Node device is introduced into the setup, and both Director devices go offline before the Node device completes its auto-upgrade process to upgrade its software version to the same software version running on the Director group. The workaround is to reboot the QFX3500 or QFX3600 Node device once the Director group comes back online. The QFX3500 or QFX3600 Node device will initiate auto-upgrade and upgrade its software version from the Director group.

---

1. Issue the **request system software add package-name component all reboot** command.

For example:

```
user@switch> request system software add jinstall-qfabric-11.3X30.6.rpm component all  
reboot
```

---

**NOTE:** If you receive an error message after issuing the **request system software add package-name component all reboot** command that says that the configuration file cannot be loaded as is, you will need to enter configuration mode, make any necessary changes to the configuration file, and then commit the changes.

---

**NOTE:** The default value for a QFabric system software upgrade is `validate`. The validation step adds up to 10 minutes to the overall software upgrade. If the validation fails, the upgrade does not proceed and the QFabric system automatically issues the `request system software rollback` command to restore the current software image. If you upgrade more than one component (for example, by issuing the `component all` option), validation failure on one device stops the upgrade process for the other devices. If you do not want to validate the software package against the current configuration, issue the `no-validate` option.

2. After the reboot has finished, verify that the new version of software has been properly installed by issuing the `show version component all` command.

```
user@switch> show version component all

## Configuring a DHCP Client (CLI Procedure)

A Dynamic Host Configuration Protocol (DHCP) server can provide many valuable TCP/IP network services. DHCP can dynamically allocate IP parameters, such as an IP address, to clients, and it can also deliver software upgrades to clients.

DHCP configuration consists of two components, configuration of DHCP clients and configuration of a DHCP server. Client configuration determines how clients send a message requesting an IP address, whereas a DHCP server configuration enables the server to send an IP address configuration back to the client. This topic describes configuring a DHCP client. For directions for configuring a DHCP server, see [“Configuring a DHCP Server on Switches \(CLI Procedure\)” on page 157](#).

You can change DHCP client configurations from the switch, using client identifiers to indicate which clients you want to configure.

To configure a DHCP client, you configure an interface to belong to the DHCP family and specify additional attributes, as desired:

[edit]

```
user@switch# set interfaces interface-name unit number family inet dhcp
configuration-statement
```

The options that you can configure are listed in [Table 16 on page 157](#). Replace the variable *configuration-statement* with one or more of the statements listed in this table. If you do not explicitly configure these options, the switch uses default values for them.

**Table 16: DHCP Client Settings**

| Configuration Statement        | Description                                                                                                                                                                                                                                             |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>client-identifier</b>       | Unique client ID—By default this consists of the hardware type (01 for Ethernet) and the MAC address (a.b.c.d). For this example, the value would be 01abcd.                                                                                            |
| <b>lease-time</b>              | Time in seconds that a client holds the lease for an IP address assigned by a DHCP server. If a client does not request a specific lease time, then the server sends the default lease time. The default lease time on a Junos OS DHCP server is 1 day. |
| <b>retransmission-attempt</b>  | Number of times the client attempts to retransmit a DHCP packet.                                                                                                                                                                                        |
| <b>retransmission-interval</b> | Time between transmission attempts.                                                                                                                                                                                                                     |
| <b>server-address</b>          | IP address of the server that the client queries for an IP address.                                                                                                                                                                                     |
| <b>update-server</b>           | TCP/IP settings learned from an external DHCP server to the DHCP server running on the switch are propagated.                                                                                                                                           |
| <b>vendor-option</b>           | Vendor class ID (CPU's manufacturer ID string) for the DHCP client.                                                                                                                                                                                     |

**Related  
Documentation**

- [Configuring a DHCP Server on Switches \(CLI Procedure\) on page 157](#)
- [Understanding DHCP Services for Switches on page 38](#)

## Configuring a DHCP Server on Switches (CLI Procedure)

**NOTE:** This task uses Junos OS for EX Series switches that does not support the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that supports ELS, see *Configuring a DHCP Server on Switches (CLI Procedure)*. For ELS details, see *Getting Started with Enhanced Layer 2 Software*.

A Dynamic Host Configuration Protocol (DHCP) server can provide two valuable TCP/IP network services. DHCP can dynamically allocate IP parameters, such as an IP address, to clients and it can also deliver software upgrades to clients.

A DHCP configuration consists of two components—an optional reconfiguration of default settings on DHCP clients and the configuration of a DHCP server. This topic covers configuration of the DHCP server. For information about reconfiguring a DHCP client, see [“Configuring a DHCP Client \(CLI Procedure\)” on page 156](#).

You can configure either of two versions of a DHCP server on a switch— the extended server version or the legacy server version. We recommend that you configure the extended server unless you need to keep your DHCP server configuration backward-compatible with the legacy server version.

This topic includes the following tasks:

1. [Configuring an Extended DHCP Server on a Switch on page 158](#)
2. [Configuring a Legacy DHCP Server on a Switch \(CLI Procedure\) on page 159](#)

---

### Configuring an Extended DHCP Server on a Switch

To configure an extended DHCP server, you must configure a DHCP pool, indicate IP addresses for the pool, and create a server group. Additional configurations are optional.

Do not assign addresses that are already in use in the network to address pools. The extended DHCP server does not check whether addresses are already in use before it assigns them to clients.

1. Create an address pool for DHCP IP addresses:

```
[edit]
user@switch# set access address-pool address-pool
```

2. Configure an address-assignment pool that can be used by different client applications for DHCP dynamic assignment:

```
[edit access address-assignment]
user@switch# set pool address-pool-name
```

3. Create a server group on the switch, providing a group name and an interface name for DHCP:

```
[edit system services dhcp-local-server]
user@switch# set group group-name interface interface-name
```

4. (Optional) Process the information protocol data units (PDUs):

```
[edit system services dhcp-local-server]
user@switch# set overrides process-inform
```

5. (Optional) Redefine the order of attribute matching for pool selection:

```
[edit system services dhcp-local-server]
user@switch# set pool-match-order ip-address-first
```

6. (Optional) Enable dynamic reconfiguration triggered by the DHCP extended server for all DHCP clients or only for the DHCP clients serviced by the specified group of interfaces:

```
[edit system services dhcp-local-server]
user@switch# set reconfigure

[edit system services dhcp-local-server group group-name]
user@switch# set reconfigure
```

### Configuring a Legacy DHCP Server on a Switch (CLI Procedure)

To configure a legacy DHCP server, you must configure a pool of IP addresses for dynamic assignment. You only need to supply a series of network addresses. Additional configurations are optional.

1. Configure a pool of IP addresses for dynamic assignment:

```
[edit system services dhcp]
user@switch# set pool network-range
```

**NOTE:** Step 2 through Step 15 are for assigning global values at the [edit system services dhcp] hierarchy level. You can also assign the same values to a specific pool by using those same commands at the [edit system services dhcp pool *network-range*] hierarchy level.

2. (Optional) Change the domain search list used to resolve hostnames:

```
[edit system services dhcp]
user@switch# set domain-search [ domain-list ]
```

3. (Optional) Change the domain name server (DNS) name that the DHCP server advertises to clients:

```
[edit system services dhcp]
user@switch# set name-server address
```

4. (Optional) Change the DHCP options:

```
[edit system services dhcp]
user@switch# set option id-number
```

5. (Optional) Change the devices advertised to clients:

```
[edit system services dhcp]
user@switch# set router address
```

6. (Optional) Configure the name of the boot server advertised to DHCP clients. The client uses a boot file located on the boot server to complete the DHCP setup. This configuration step is equivalent to DHCP Option 66:

```
[edit system services dhcp]
user@switch# set boot-server (address | hostname)
```

7. (Optional) Set the boot file advertised to DHCP clients. After the client receives an IP address and the boot file location from the DHCP server, the client uses the boot image stored in the boot file to complete DHCP setup. This configuration step is equivalent to DHCP Option 67:

```
[edit system services dhcp]
user@switch# set boot-file filename
```

8. (Optional) Change the SIP server:

```
[edit system services dhcp]
user@switch# set sip-server addresses-or-names
```

For more information, see *Configuring a DHCP SIP Server (CLI Procedure)*.

9. (Optional) Change the DHCP client's hardware address:

```
[edit system services dhcp]
user@switch# set static-binding mac-address
```

10. (Optional) Change the NetBIOS name server:

```
[edit system services dhcp]
user@switch# set wins-server address
```

## Configuring a DNS Name Server for Resolving a Hostname into Addresses

To have the router or switch resolve hostnames into addresses, you must configure one or more Domain Name System (DNS) name servers by including the **name-server** statement at the **[edit system]** hierarchy level:

```
[edit system]
name-server {
  address;
}
```

The following example shows how to configure two DNS name servers:

```
[edit]
user@switch# set system name-server 192.168.1.253
[edit]
user@switch# set system name-server 192.168.1.254
[edit]
user@switch# show
system {
  name server {
    192.168.1.253;
    192.168.1.254;
  }
}
```

**Related  
Documentation**

- [name-server on page 294](#)

## Reaching a Domain Name System Server

Domain name system (DNS) servers are used for resolving hostnames to IP addresses.

For redundancy, it is a best practice to configure access to multiple DNS servers. You can configure a maximum of three DNS servers. The approach is similar to the way Web browsers resolve the names of a Web site to its network address. Additionally, Junos OS enables you configure one or more domain names, which it uses to resolve hostnames that are not fully qualified (in other words, the domain name is missing). This is convenient

because you can use a hostname in configuring and operating Junos OS without the need to reference the full domain name. After adding DNS server addresses and domain names to your Junos OS configuration, you can use DNS resolvable hostnames in your configuration and commands instead of IP addresses.

Optionally, instead of configuring the name server at the **[edit system]** hierarchy level, you can use a configuration group, as shown in this procedure. This is a recommended best practice for configuring the name server. This procedure uses a group called **global** as an example.

Before you begin, configure your DNS servers with the hostname and an IP address for your Junos OS device. It does not matter which IP address you assign as the address of your Junos OS device in the DNS server, as long it is an address that reaches your device. Normally, you would use the management interface IP address, but you can choose the loopback interface IP address, or a network interface IP address, or even configure multiple addresses on the DNS server.

To configure the router or switch to resolve hostnames into addresses:

1. Reference the IP addresses of your DNS servers.

```
[edit groups group-name system]
name-server {
  address;
}
```

The following example shows how to reference two DNS servers:

```
[edit groups global system]
user@host# set name-server 192.168.1.253
user@host# set name-server 192.168.1.254

user@host# show
name server {
  192.168.1.253;
  192.168.1.254;
}
```

2. (Optional) Configure the name of the domain in which the device itself is located.

This is a good practice. Junos OS then uses this configured domain name as the default domain name to append to hostnames that are not fully qualified.

```
[edit system]
domain-name domain-name;
```

The following example shows how to configure the domain name:

```
[edit groups global system]
user@host# set domain-name company.net

user@host# show
domain-name company.net;
```

3. (Optional) Configure a list of domains to be searched.

If your device can reach several different domains, you can configure these as a list of domains to be searched. Junos OS then uses this list to set an order in which it appends domain names when searching for the IP address of a host.

```
[edit groups global system]
domain-search [ domain-list ];
```

The domain list can contain up to six domain names, with a total of up to 256 characters.

The following example shows how to configure two domains to be searched. This example configures Junos OS to search the company.net domain and then the domainone.net domain and then the domainonealternate.com domain when attempting to resolve unqualified hosts.

```
[edit groups global system]
domain-search [ company.net domainone.net domainonealternate.com ]
```

4. If you used a configuration group, apply the configuration group, substituting **global** with the appropriate group name.

```
[edit]
user@host# set apply-groups global
```

5. Commit the configuration.

```
user@host# commit
```

6. Verify the configuration.

If you have configured your DNS server with the hostname and an IP address for your Junos OS device, you can issue the following commands to confirm that DNS is working and reachable. You can either use the configured hostname to confirm resolution to the IP address or use the IP address of your device to confirm resolution to the configured hostname.

```
user@host> show host host-name
user@host> show host host-ip-address
```

For example:

```
user@host> show host san-jose-router1
san-jose-router1.company.net
san-jose-router1.company.net has address 192.168.187.1

user@host> show host 192.168.187.1
1.187.168.192.in-addr.arpa domain name pointer san-jose-router1.company.net.
```

**Related Documentation**

- *Understanding DNS*

## Configuring the Hostname of the Router or Switch

The hostname of the device provides its identification for many purposes. Junos OS uses the configured hostname as part of the command prompt, to prepend log files and other accounting information, as well as in other places where knowing the device identity is useful. We recommend that the hostname be descriptive and memorable.

Optionally, instead of configuring the hostname at the **[edit system]** hierarchy level, you can use a configuration group, as shown in this procedure. This is a recommended best practice for configuring the hostname, especially if the device has dual Routing Engines. This procedure uses groups called **re0** and **re1** as an example.

To set the hostname:

1. Include the **host-name** statement in the configuration.

The name value must be less than 256 characters.

```
[edit groups group-name system]
host-name hostname;
```

For example:

```
[edit groups re0 system]
root@# set host-name san-jose-router
```

```
[edit groups re1 system]
root@# set host-name san-jose-router1
```

2. If you used one or more configuration groups, apply the configuration groups, substituting the appropriate group names.

For example:

```
[edit]
user@host# set apply-groups [re0 re1]
```

3. Commit the changes.

```
[edit]
root@# commit
```

The hostname subsequently appears in the device CLI prompt.

```
san-jose-router@#
```

**Related Documentation** • *Understanding Hostnames*

## Configuring the Junos OS to Determine Conditions That Trigger Alarms on Different Interface Types

For the different types of PICs, you can configure which conditions trigger alarms and whether they trigger a red or yellow alarm. Red alarm conditions light the **RED ALARM** LED and trigger an audible alarm if one is connected. Yellow alarm conditions light the **YELLOW ALARM** LED and trigger an audible alarm if one is connected.

**NOTE:** By default, any failure condition on the integrated-services interface (Adaptive Services PIC) triggers a red alarm.

To configure conditions that trigger alarms and that can occur on any interface of the specified type, include the **alarm** statement at the **[edit chassis]** hierarchy level.

```
[edit chassis]
alarm {
  interface-type {
    alarm-name (red | yellow | ignore);
  }
}
```

**alarm-name** is the name of an alarm.

**Related  
Documentation**

- *System-Wide Alarms and Alarms for Each Interface Type*
- *Chassis Conditions That Trigger Alarms*
- *Silencing External Devices Connected to Alarm Relay Contacts*

## Configuring Junos OS to Disable Protocol Redirect Messages on the Router or Switch

By default, the router or switch sends protocol redirect messages. To disable the sending of redirect messages by the router or switch, include the **no-redirects** statement at the **[edit system]** hierarchy level:

```
[edit system]
no-redirects;
```

To reenable the sending of redirect messages on the router or switch, delete the **no-redirects** statement from the configuration.

To disable the sending of redirect messages on a per-interface basis, include the **no-redirects** statement at the **[edit interfaces interface-name unit logical-unit-number family family]** hierarchy level.

**Related  
Documentation**

- *Configuring Junos OS to Ignore ICMP Source Quench Messages*
- *Configuring Junos OS to Select a Fixed Source Address for Locally Generated TCP/IP Packets*
- *Junos OS Network Interfaces Library for Routing Devices*

## Configuring Junos OS to Disable the Reporting of IP Address and Timestamps in Ping Responses

When you issue the **ping** command with the **record-route** option, the Routing Engine displays the path of the ICMP echo request packets and timestamps in the ICMP echo responses by default.

You can configure the Routing Engine to disable the setting of the **record-route** option in the IP header of the ping request packets. Disabling the **record-route** option prevents the

Routing Engine from recording and displaying the path of the ICMP echo request packets in the response.

- To configure the Routing Engine to disable the setting of the **record route** option, include the **no-ping-record-route** statement at the **[edit system]** hierarchy level:

```
[edit system]
no-ping-record-route;
```

- To disable the reporting of timestamps in the ICMP echo responses, include the **no-ping-time-stamp** option at the **[edit system]** hierarchy level:

```
[edit system]
no-ping-time-stamp;
```

By configuring the **no-ping-record-route** and **no-ping-timestamp** options, you can prevent unauthorized persons from discovering information about the provider edge (PE) router or switch and its loopback address.

#### Related Documentation

## Configuring the Junos OS to Display a System Login Announcement

By default, no login announcement is displayed. To configure a system login announcement, include the **announcement** statement at the **[edit system login]** hierarchy level:

```
[edit system login]
announcement text;
```

If the announcement text contains any spaces, enclose the text in quotation marks.

A system login *announcement* appears after the user logs in. A system login *message* appears before the user logs in.

**TIP:** You can use the same special characters described to format your system login announcement.

#### Related Documentation

- *Defining Junos OS Login Classes*
- *Configuring the Junos OS to Display a System Login Message*

## Configuring the Junos OS to Display a System Login Message

By default, no login message is displayed on the router or switch. To configure a system login message, include the **message** statement at the **[edit system login]** hierarchy level:

```
[edit system login]
message text;
```

If the message text contains any spaces, enclose it in quotation marks.

You can format the message using the following special characters:

- \n—New line
- \t—Horizontal tab
- \'—Single quotation mark
- \"—Double quotation mark
- \\—Backslash

The following is a sample login message configuration:

```
[edit]
system {
  login {
    message "\n\n\n\tUNAUTHORIZED USE OF THIS SYSTEM\n
\tIS STRICTLY PROHIBITED!\n\n\tPlease contact
\t'company-noc@company.com\t' to gain\naccess
to this equipment if you need authorization.\n\n\n";
  }
}
```

The preceding login message configuration example produces a login message similar to the following:

```
server% telnet router1
Trying 1.1.1.1...
Connected to router1.
Escape character is '^['.
```

```
UNAUTHORIZED USE OF THIS SYSTEM
IS STRICTLY PROHIBITED!
```

```
Please contact 'company-noc@company.com' to gain
access to this equipment if you need authorization.
```

```
router1 (ttyp0)
```

```
login:
```

A system login message appears before the user logs in. A system login announcement appears after the user logs in.

  - [message on page 288](#)

## Configuring Junos OS to Extend the Default Port Address Range

By default, the upper range of a port address is 5000. You can increase the range from which the port number can be selected to decrease the probability that someone can determine your port number.

- To configure the Junos OS to extend the default port address range, include the **source-port** statement at the **[edit system internet-options]** hierarchy level:

```
[edit system internet-options]
source-port upper-limit upper-limit;
```

**upper-limit** *upper-limit* is the upper limit of a source port address and can be a value from 5000 through 65,355.

#### Related Documentation

- [Configuring Junos OS to Disable TCP RFC 1323 Extensions](#)
- [Configuring Junos OS ARP Learning and Aging Options for Mapping IPv4 Network Addresses to MAC Addresses](#)
- [source-port on page 314](#)

## Configuring the Junos OS ICMPv4 Rate Limit for ICMPv4 Routing Engine Messages

To limit the rate at which ICMPv4 messages can be generated and received by the Routing Engine, include the **icmpv4-rate-limit** statement at the **[edit system internet-options]** hierarchy level:

```
icmpv4-rate-limit bucket-size bucket-size packet-rate packet-rate;
```

The bucket size is the number of seconds in the rate-limiting bucket. The packet rate is the rate-limiting packets earned per second. Specify a **bucket-size** from 0 through 4294967295 seconds. The default value is 5 seconds. Specify a **packet-rate** from 0 through 4,294,967,295. The default value is 1000.

#### Related Documentation

- [icmpv4-rate-limit on page 281](#)

## Configuring the Junos OS to Select a Fixed Source Address for Locally Generated TCP/IP Packets

By default, the source address included in locally generated Transmission Control Protocol/IP (TCP/IP) packets, such as FTP traffic, and in User Datagram Protocol (UDP) and IP packets, such as Network Time Protocol (NTP) requests, is chosen as the local address for the interface on which the traffic is transmitted. This means that the local address chosen for packets to a particular destination might change from connection to connection based on the interface that the routing protocol has chosen to reach the destination when the connection is established. If multiple equal-cost next hops are present for a destination, locally generated packets use the **lo0** address as a source.

- To configure the software to select a fixed address to use as the source for locally generated IP packets, include the **default-address-selection** statement at the **[edit system]** hierarchy level:

```
[edit system]
default-address-selection;
```

If you include the **default-address-selection** statement in the configuration, the Junos OS chooses the system default address as the source for most locally generated IP packets. The default address is usually an address configured on the **lo0** loopback interface. For

example, if you specified that SSH and telnet use a particular address, but you also have **default-address selection** configured, the system default address is used.

  - [default-address-selection on page 273](#)

## Configuring NTP Authentication Keys

Time synchronization can be authenticated to ensure that the switch obtains its time services only from known sources. By default, network time synchronization is unauthenticated. The switch will synchronize to whatever system appears to have the most accurate time. We strongly encourage you to configure authentication of network time services.

To authenticate other time servers, include the **trusted-key** statement at the **[edit system ntp]** hierarchy level. Only time servers that transmit network time packets containing one of the specified key numbers are eligible to be synchronized. Additionally, the key needs to match the value configured for that key number. Other systems can synchronize to the local switch without being authenticated.

```
[edit system ntp]
trusted-key [ key-numbers ];
```

Each key can be any 32-bit unsigned integer except 0. Include the **key** option in the **peer**, **server**, or **broadcast** statements to transmit the specified authentication key when transmitting packets. The key is necessary if the remote system has authentication enabled so that it can synchronize to the local system.

To define the authentication keys, include the **authentication-key** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
authentication-key key-number type type value password;
```

**number** is the key number, **type** is the authentication type (only Message Digest 5 [MD5] is supported), and **password** is the password for this key. The key number, type, and password must match on all systems using that particular key for authentication.

- Related Documentation**
- [Understanding NTP Time Servers on page 29](#)
  - [Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization on page 205](#)
  - [trusted-key on page 334](#)
  - [authentication-key](#)

## Configuring NTP Authentication Keys (QFabric System)

To configure the authentication keys using the CLI:

1. Configure the authentication-key number.

```
[edit system ntp]
user@switch# set authentication-key key-number
```

For example, to specify key 5:

```
user@switch# set authentication-key 5
```

2. Specify the type of authentication you want to use.

```
[edit system ntp]
user@switch# set authentication-key type type
```

**NOTE:** MD5 is the only authentication type supported.

For example, to specify MD5:

```
user@switch# set authentication-key type md5
```

#### Related Documentation

## Configuring the NTP Time Server and Time Services

When you use NTP, configure the router or switch to operate in one of the following modes:

- Client mode
- Symmetric active mode
- Broadcast mode
- Server mode

The following topics describe how to configure these modes of operation:

1. [Configuring the Router or Switch to Operate in Client Mode on page 169](#)
2. [Configuring the Router or Switch to Operate in Symmetric Active Mode on page 170](#)
3. [Configuring the Router or Switch to Operate in Broadcast Mode on page 170](#)
4. [Configuring the Router or Switch to Operate in Server Mode on page 171](#)

### Configuring the Router or Switch to Operate in Client Mode

To configure the local router or switch to operate in client mode, include the **server** statement and other optional statements at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
server address <key key-number> <version value> <prefer>;
authentication-key key-number type type value password;
boot-server address;
trusted-key [ key-numbers ];
```

Specify the address of the system acting as the time server. You must specify an address, not a hostname.

To include an authentication key in all messages sent to the time server, include the **key** option. The key corresponds to the key number you specify in the **authentication-key** statement, as described in .

By default, the router or switch sends NTP version 4 packets to the time server. To set the NTP version level to 1, 2, or 3, include the **version** option.

If you configure more than one time server, you can mark one server preferred by including the **prefer** option.

The following example shows how to configure the router or switch to operate in client mode:

```
[edit system ntp]
authentication-key 1 type md5 value "$9$EgfcvX7VY4ZEcwgoHjkP5Q3CuREyv87";
boot-server 10.1.1.1;
server 10.1.1.1 key 1 prefer;
trusted-key 1;
```

### Configuring the Router or Switch to Operate in Symmetric Active Mode

---

To configure the local router or switch to operate in symmetric active mode, include the **peer** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
peer address <key key-number> <version value> <prefer>;
```

Specify the address of the remote system. You must specify an address, not a hostname.

To include an authentication key in all messages sent to the remote system, include the **key** option. The key corresponds to the key number you specify in the **authentication-key** statement.

By default, the router or switch sends NTP version 4 packets to the remote system. To set the NTP version level to 1, 2 or 3, include the **version** option.

If you configure more than one remote system, you can mark one system preferred by including the **prefer** option:

```
peer address <key key-number> <version value> prefer;
```

### Configuring the Router or Switch to Operate in Broadcast Mode

---

To configure the local router or switch to operate in broadcast mode, include the **broadcast** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
broadcast address <key key-number> <version value> <ttl value>;
```

Specify the broadcast address on one of the local networks or a multicast address assigned to NTP. You must specify an address, not a hostname. If the multicast address is used, it must be 224.0.1.1.

To include an authentication key in all messages sent to the remote system, include the **key** option. The key corresponds to the key number you specify in the **authentication-key** statement.

By default, the router or switch sends NTP version 4 packets to the remote system. To set the NTP version level to 1, 2, or 3, include the **version** option.

### Configuring the Router or Switch to Operate in Server Mode

In server mode, the router or switch acts as an NTP server for clients when the clients are configured appropriately. The only prerequisite for “server mode” is that the router or switch must be receiving time from another NTP peer or server. No other configuration is necessary on the router or switch.

To configure the local router or switch to operate as an NTP server, include the following statements at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
authentication-key key-number type type value password;
server address <key key-number> <version value> <prefer>;
trusted-key [ key-numbers ];
```

Specify the address of the system acting as the time server. You must specify an address, not a hostname.

To include an authentication key in all messages sent to the time server, include the **key** option. The key corresponds to the key number you specify in the **authentication-key** statement.

By default, the router or switch sends NTP version 4 packets to the time server. To set the NTP version level to 1, or 2, or 3, include the **version** option.

If you configure more than one time server, you can mark one server preferred by including the **prefer** option.

The following example shows how to configure the router or switch to operate in server mode:

```
[edit system ntp]
authentication-key 1 type md5 value "$9$txErUBErWx-wtuLNdboaUjH.T3AtOESe";
server 172.17.27.46 prefer;
trusted-key 1;
```

## Configuring the NTP Time Server and Time Services (QFabric System)

To configure the external time server using the CLI:

1. Configure the IP address of the external time server.

```
[edit system ntp]
user@switch# set server address
```

For example, to set an IP address of 10.1.1.1 for your external time server:

```
user@switch# set server 10.1.1.1
```

2. (Optional) Configure the key number to encrypt authentication fields in packets that are sent to the external time server.

```
[edit system ntp]
user@switch# set server address key key-number
```

For example, to set a key number of 1:

```
user@switch# set server address key
```

3. (Optional) Specify the external time server as a preferred host. Doing this enables the switch to synchronize with the external time server.

**NOTE:** The switch can synchronize with the external time server, but the external time server cannot synchronize with the switch.

---

```
[edit system ntp]
user@switch# set server address prefer
```

4. (Optional) Specify the NTP version number to be used in outgoing NTP packets.

```
user@switch# set server address version
```

For example, to specify version 3:

```
user@switch# set server address version 3
```

## Specifying the Physical Location of the Switch

To specify the physical location of the switch, specify the following options for the **location** statement at the **[edit system]** hierarchy level:

- **altitude *feet***—Number of feet above sea level.
- **building *name***—Name of the building, 1 to 28 characters in length. If the string contains spaces, enclose it in quotation marks (" ").
- **country-code *code***—Two-letter country code.
- **floor *number***—Floor in the building.
- **hcoord *horizontal-coordinate***—Bellcore Horizontal Coordinate.

- **lata service-area**—Long-distance service area.
- **latitude degrees**—Latitude in degree format.
- **longitude degrees**—Longitude in degree format.
- **npa-nxx number**—First six digits of the phone number (area code and exchange).
- **postal-code postal-code**—Postal code.
- **rack number**—Rack number.
- **vcoord vertical-coordinate**—Bellcore Vertical Coordinate.

The following example shows how to specify the physical location of the switch:

```
[edit system]
location {
  altitude feet;
  building name;
  country-code code;
  floor number;
  hcoord horizontal-coordinate;
  lata service-area;
  latitude degrees;
  longitude degrees;
  npa-nxx number;
  postal-code postal-code;
  rack number;
  vcoord vertical-coordinate;
}
```

## Configuring the Root Password

The Junos OS is preinstalled on the router or switch. When the router or switch is powered on, it is ready to be configured. Initially, you log in as the user **root** with no password. The root directory of a UNIX device is the entry point to all other folders and files on that device. As a result, access to the root directory is restricted by default to a predefined user account known as the *root user*. The root user (also referred to as *superuser*) has unrestricted access and full permissions within the system. The expression “log in as root” is commonly used when an action requires the user to log into the device as the root user.

**NOTE:** If you configure a blank password using the `encrypted-password` statement at the `[edit system root-authentication]` hierarchy level for root authentication, you can commit a configuration but you *cannot* log in as the root user and gain root level access to the router or switch.

After you log in, you should configure the root (superuser) password by including the **root-authentication** statement at the `[edit system]` hierarchy level and configuring one of the password options:

```
[edit system]
root-authentication {
  (encrypted-password "password"| plain-text-password);
  load-key-file URL filename;
  ssh-dsa "public-key" <from hostname>;
  ssh-eccdsa "public-key" <from hostname>;
  ssh-rsa "public-key" <from hostname>;
}
```

If you configure the **plain-text-password** option, you are prompted to enter and confirm the password:

```
[edit system]
user@host# set root-authentication plain-text-password
New password: type password here
Retype new password: retype password here
```

The default requirements for plain-text passwords are:

- The password must be between 6 and 128 characters long
  - You can include most character classes in a password (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended.
  - Valid passwords must contain at least one change of case or character class.

You can use the **load-key-file URL filename** statement to load an SSH key file that was previously generated using **ssh-keygen**. The *URL filename* is the path to the file's location and name. When using this option, the contents of the key file are copied into the configuration immediately after entering the **load-key-file URL** statement. This command loads RSA (SSH version 1 and SSH version 2) and DSA (SSH version 2) public keys.

Optionally, you can use the **ssh-dsa**, **ssh-eccdsa**, or **ssh-rsa** statements to directly configure SSH RSA, DSA, or ECDSA keys to authenticate root logins. You can configure more than one public key for SSH authentication of root logins as well as for user accounts. When a user logs in as root, the public keys are referenced to determine whether the private key matches any of them.

To view the SSH keys entries, use the configuration mode **show** command. For example:

```
[edit system]
user@host# set root-authentication load-key-file my-host:.ssh/id_dsa.pub
.file.19692 | 0 KB | 0.3 kB/s | ETA: 00:00:00 | 100%
[edit system]
user@host# show
root-authentication {
  ssh-rsa "1024 35 9727638204084251055468226757249864241630322
20740496252839038203869014158453496417001961060835872296
15634757491827360336127644187426594689320773910834481012
68312595772262546166799927831612350043866091586628382248
97467326056611921489539813965561563786211940327687806538
16960202749164163735913269396344008443 boojum@juniper.net"; #
SECRET-DATA
}
```

Junos-FIPS software has special password requirements. FIPS passwords must be between 10 and 20 characters in length. Passwords must use at least three of the five defined character sets (uppercase letters, lowercase letters, digits, punctuation marks, and other special characters). If Junos-FIPS is installed on the router or switch, you cannot configure passwords unless they meet this standard. If you use the **encrypted-password** option, then a null-password (empty) is not permitted.

You cannot configure a blank password for **encrypted-password** using blank quotation marks (" "). You must configure a password whose number of characters range from 1 through 128 characters and enclose the password in quotation marks.

## Configuring the Router or Switch to Listen for Broadcast Messages Using NTP

When you are using NTP, you can configure the local router or switch to listen for broadcast messages on the local network to discover other servers on the same subnet by including the **broadcast-client** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
broadcast-client;
```

When the router or switch detects a broadcast message for the first time, it measures the nominal network delay using a brief client-server exchange with the remote server. It then enters *broadcast client* mode, in which it listens for, and synchronizes to, succeeding broadcast messages.

To avoid accidental or malicious disruption in this mode, both the local and remote systems must use authentication and the same trusted key and key identifier.

**Related  
Documentation**

- [Configuring the Router or Switch to Listen for Multicast Messages Using NTP on page 175](#)
- [Configuring the NTP Time Server and Time Services on page 169](#)
- [Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization on page 205](#)

## Configuring the Router or Switch to Listen for Multicast Messages Using NTP

When you are using NTP, you can configure the local router or switch to listen for multicast messages on the local network to discover other servers on the same subnet by including the **multicast-client** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
multicast-client <address>;
```

When the router or switch receives a multicast message for the first time, it measures the nominal network delay using a brief client-server exchange with the remote server. It then enters *multicast client* mode, in which it listens for, and synchronizes to, succeeding multicast messages.

You can specify one or more IP addresses. (You must specify an address, not a hostname.) If you do, the router or switch joins those multicast groups. If you do not specify any addresses, the software uses **224.0.1.1**.

To avoid accidental or malicious disruption in this mode, both the local and remote systems must use authentication and the same trusted key and key identifier.

**Related  
Documentation**

## Configuring System Alarms to Appear Automatically Upon Login

You can configure Juniper Networks routers and switches to run the **show system alarms** command whenever a user with the login class **admin** logs in to the router or switch. To do so, include the **login-alarms** statement at the **[edit system login class admin]** hierarchy level.

```
[edit system login class admin]
login-alarms;
```

For more information on the **show system alarms** command, see the [CLI Explorer](#).

**Related  
Documentation**

- [System Alarms on J Series Routers](#)
- [show system alarms on page 1040](#)

## Configuring Time-Based User Access

The Junos OS enables you to configure time-based restrictions for user access to log in to a device. This is useful for restricting the time and duration of user logins for all users belonging to a login class. You can specify the days of the week when users can log in, the access start time, and the access end time.

- To configure user access on specific days of the week, without any restrictions on the duration of login, include the **allowed-days** statement only.

```
[edit system]
login {
  class class-name {
    allowed-days [ days-of-the-week ];
  }
}
```

- To configure user access on all the days of the week for a specific duration, include the **access-start** and **access-end** statements only.

```
[edit system]
login {
  class class-name {
    access-start HH:MM;
    access-end HH:MM;
  }
}
```

- To configure user access on specific days of the week for a specified duration, include the **allowed-days**, **access-start**, and **access-end** statements.

```
[edit system]
login {
  class class-name {
    allowed-days [ days-of-the-week ];
    access-start HH:MM;
    access-end HH:MM;
  }
}
```

Specify the start time and end time in **HH:MM** (24-hour) format, where **HH** represents the hours and **MM** represents the minutes.

**NOTE:** Access start time and end time that spans across 12:00 AM on a specified day results in the user having access until the next day, even if the access day is not explicitly configured. For instance, the following configuration results in the user having access until 6:00 AM on Tuesday and Thursday, although the **allowed-days** statement specifies access only on Monday and Wednesday:

```
[edit system]
login {
  class operator-night-shift {
    allowed-days [ monday wednesday ];
    access-start 2000;
    access-end 0600;
  }
}
```

## Configuring the Timeout Value for Idle Login Sessions

An idle login session is one in which the CLI operational mode prompt is displayed but there is no input from the keyboard. By default, a login session remains established until a user logs out of the router or switch, even if that session is idle. To close idle sessions automatically, you must configure a time limit for each login class. If a session established by a user in that class remains idle for the configured time limit, the session automatically closes.

To define the timeout value for idle login sessions, include the **idle-timeout** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]  
idle-timeout minutes;
```

Specify the number of minutes that a session can be idle before it is automatically closed.

If you have configured a timeout value, the CLI displays messages similar to the following when timing out an idle user. It starts displaying these messages 5 minutes before timing out the user.

```
user@host# Session will be closed in 5 minutes if there is no activity.  
Warning: session will be closed in 1 minute if there is no activity  
Warning: session will be closed in 10 seconds if there is no activity  
Idle timeout exceeded: closing session
```

If you configure a timeout value, the session closes after the specified time has elapsed, unless the user is running telnet or monitoring interfaces using the **monitor interface** or **monitor traffic** command.

  - *idle-timeout (System-Login)*

## Configuring a QFX3500 Device as a Standalone Switch

If you are using the QFX3500 device as a standalone switch, you must perform the initial configuration of the QFX3500 device through the console port using the command-line interface (CLI). If you are using the QFX3500 as a Node device in a QFX3000 QFabric system, you instead perform the initial setup of a QFabric system on a QFX3100 Director device (see [“Performing the QFabric System Initial Setup on a QFX3100 Director Group” on page 1471](#)).

Before you begin connecting and configuring a QFX3500 device, set the following parameter values on the console server or PC:

- Baud Rate—9600
- Flow Control—None
- Data—8
- Parity—None

- Stop Bits—1
- DCD State—Disregard

To connect and configure the device from the console:

1. Connect the console port to a laptop or PC using the supplied RJ-45 cable and RJ-45 to DB-9 adapter. The console (**CON**) port is located on the front panel of the device.
2. Log in as **root**. There is no password. If the software booted before you connected to the console port, you might need to press the Enter key for the prompt to appear.

```
Login: root
```

3. Start the CLI.

```
root@% cli
```

4. Enter configuration mode.

```
root> configure
```

5. Add a password to the root administration user account.

```
[edit]
```

```
root@# set system root-authentication plain-text-password
```

```
New password: password
```

```
Retype new password: password
```

6. (Optional) Configure the name of the device. If the name includes spaces, enclose the name in quotation marks (" ").

```
[edit]
```

```
root@# set system host-name host-name
```

7. Configure the default gateway.

```
[edit]
```

```
root@# set routing-options static route default next-hop address
```

8. Configure the IP address and prefix length for the device management interface.

```
[edit]
```

```
root@# set interfaces me0 unit 0 family inet address address/prefix-length
```

**CAUTION:** Configuring the two management Ethernet interfaces within the same subnet is not supported.

**NOTE:** The management ports are on the front panel of the QFX3500 device. They are labeled C0 and C1 on the front panel. In the CLI they are referred to as me0 and me1.

9. (Optional) Configure the static routes to remote prefixes with access to the management port.

```
[edit]
```

```
root@# set routing-options static route remote-prefix next-hop destination-ip retain  
no-readvertise
```

10. Enable telnet service.

```
[edit]
```

```
root@# set system services telnet
```

**NOTE:** When Telnet is enabled, you cannot log in to a QFX3500 device through Telnet using root credentials. Root login is allowed only for SSH access.

11. Commit the configuration to activate it on the device.

```
[edit]
root@# commit
```

## Creating an Emergency Boot Device

If Junos OS on the device is damaged in some way that prevents the software from loading properly, you can use an emergency boot device to repartition the primary disk and load a fresh installation of Junos OS. Use the following procedure to create an emergency boot device.

Before you begin, you need to download the installation media image for your device and Junos OS release from <http://www.juniper.net/customers/support/>.

**NOTE:** In the following procedure, we assume that you are creating the emergency boot device on a QFX device. You can create the emergency boot device on another Juniper Networks switch or router, or any PC or laptop that supports Linux. The steps you take to create the emergency boot device vary, depending on the device.

To create an emergency boot device:

1. Use FTP to copy the installation media image into the **/var/tmp** directory on the device.
2. Insert a USB device into the USB port.
3. From the Junos OS command-line interface (CLI), start the shell:

```
user@device> start shell
%
```

4. Switch to the root account using the **su** command:

```
% su
Password: password
```

**NOTE:** The password is the root password for the device. If you logged in to the device as root, you do not need to perform this step.

5. Enter the following command on the QFX3500, QFX3600, and QFX3600-I devices:

```
root@device% dd if=/var/tmp/filename of=/dev/da1 bs=16k
```

The device writes the installation media image to the USB device:

```
root@device% dd if=/var/tmp/install-media-qfx3500.junos_11.1 of=/dev/da1 bs=16k
11006+1 records in
11006+1 records out
180332544 bytes transferred in 71.764266 secs (2512846 bytes/sec)
```

6. Enter the following command on the QFX5100 and EX4600 devices:

```
root@device% dd if=/var/tmp/filename of=/dev/da0 bs=1048576
```

The device writes the installation media image to the USB device:

```
root@device% dd if=/var/tmp/jinstall-vjunos-usb-13.2.img of=/dev/da0 bs=1048576
11006+1 records in
11006+1 records out
180332544 bytes transferred in 71.764266 secs (2512846 bytes/sec)
```

**NOTE:** QFX5100 and EX4600 devices automatically create a recovery Junos OS image.

The “Select a recovery image” menu appears on the console when one of these switches is booted and unable to load a version of Junos OS. You can follow the instructions in the “Select a recovery image” menu to load the Junos OS image for one of these switches.

7. Log out of the shell:

```
root@device% exit
% exit
user@device>
```

## Creating a Snapshot and Using It to Boot a QFX Series Switch

The system snapshot feature takes a “snapshot” of the files currently used to run the QFX Series switch—the complete contents of the **/config** and **/var** directories, which include the running Juniper Networks Junos OS, the active configuration, and the rescue configuration—and copies all of these files into an alternate (internal, meaning internal flash, or an external, meaning USB flash) memory source. You can then use these snapshots to boot the switch at the next bootup or as a backup boot option.

The system snapshot feature is especially effective as a bootup option after a partition corruption, as it is the only recovery option that allows you to completely restore the Junos OS and configuration in the event of a corrupted partition.

This topic includes the following tasks:

- [Creating a Snapshot on a USB Flash Drive and Using It to Boot the Switch on page 182](#)
- [Creating a Snapshot on an Internal Flash Drive and Using it to Boot the Switch on page 182](#)
- [Creating a Snapshot on the Alternate Slice of the Boot Media on page 183](#)

### [Creating a Snapshot on a USB Flash Drive and Using It to Boot the Switch](#)

---

A snapshot can be created on USB flash memory after a switch is booted using files stored in internal memory.

Ensure that you have the following tools and parts available before creating a snapshot on a USB Flash drive:

- A USB flash drive that meets the QFX Series switch USB port specifications. See *USB Port Specifications for the QFX Series*.

To create a snapshot on USB flash memory and use it to boot the switch:

1. Place the snapshot into USB flash memory:

```
user@switch> request system snapshot partition
```

**NOTE:** This example uses the `partition` option. If you have already created a partition for the snapshot, you don't need to use the `partition` option.

2. (Optional) Perform this step if you want to boot the switch now using the snapshot stored on the external USB flash drive. If you created the snapshot as a backup, do not perform this step.

- To reboot the switch using the most recently created snapshot:

```
user@switch> request system reboot
```

- To reboot the switch using a snapshot in a specific partition on the USB flash drive:

```
user@switch> request system reboot slice 1
```

### [Creating a Snapshot on an Internal Flash Drive and Using it to Boot the Switch](#)

---

A snapshot can be created on internal memory after a switch is booted using files stored in external memory.

To create a snapshot in internal memory and use it to boot the switch:

1. Place the snapshot files in internal memory:

```
user@switch> request system snapshot partition
```

**NOTE:** This example uses the `partition` option. If you have already created a partition for the snapshot, you don't need to use the `partition` option.

2. (Optional) Perform this step if you want to boot the switch now using the newly created snapshot. If you created the snapshot as a backup, do not perform this step.

- To reboot the switch using the most recently created snapshot:

```
user@switch> request system reboot
```

- To reboot the switch using a snapshot in a specific partition in internal memory:

```
user@switch> request system reboot slice 1
```

### Creating a Snapshot on the Alternate Slice of the Boot Media

The alternate slice of the boot media contains a backup software image that the switch can boot from if it is unable to boot from the primary slice. When you upgrade software, the new software image gets copied only to the primary slice of the boot media.

To create a snapshot of the currently booted software image on the backup slice of the boot media:

```
user@switch> request system reboot slice alternate
```

After the system boots up, you will see the following message before the login prompt:

**WARNING: THIS DEVICE HAS BOOTED FROM THE BACKUP JUNOS IMAGE**

It is possible that the primary copy of JUNOS failed to boot up properly, and so this device has booted up from the backup copy.

Please re-install JUNOS to recover the primary copy in case it has been corrupted.

The system will generate an alarm indicating that the switch has booted from the backup slice.

### Including the Year or Millisecond in Timestamps

By default, the timestamp recorded in a standard-format system log message specifies the month, date, hour, minute, and second when the message was logged, as in the following example:

```
Aug 21 12:36:30
```

To include the year, the millisecond, or both in the timestamp, include the **time-format** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
time-format (year | millisecond | year millisecond);
```

However, the timestamp for traceoption messages is specified in milliseconds by default, and is independent of the **[edit system syslog time-format]** statement.

The modified timestamp is used in messages directed to each destination configured by a **file**, **console**, or **user** statement at the **[edit system syslog]** hierarchy level, but not to destinations configured by a **host** statement.

The following example illustrates the format for a timestamp that includes both the millisecond (401) and the year (2006):

Aug 21 12:36:30.401 2006

**NOTE:** Messages logged in structured-data format include the year and millisecond by default. If you include the structured-data statement at the **[edit system syslog file filename]** hierarchy level along with the time-format statement, the time-format statement is ignored and messages are logged in structured-data format.

For information about the structured-data statement, see *Logging Messages in Structured-Data Format*. For information about the contents of a structured-data message, see the *Junos OS System Log Messages Reference*.

- Related Documentation**

  - [Examples: Configuring System Logging](#)

## Mapping the Hostname of the Switch to IP Addresses

To map a hostname of a switch to one or more IP addresses, include the **inet** statement at the **[edit system static-host-mapping hostname]** hierarchy level:

```
[edit system]
static-host-mapping {
  hostname {
    inet [ addresses ];
    alias [ aliases ];
  }
}
```

**hostname** is the name specified by the **host-name** statement at the **[edit system]** hierarchy level.

For each host, you can specify one or more aliases.

  - [static-host-mapping on page 316](#)

## Methods for Configuring Junos OS

You can use any of the methods shown in [Table 17 on page 185](#) to configure Junos OS.

**Table 17: Methods for Configuring Junos OS**

| Method                                          | Description                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|-------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Command-line interface (CLI)                    | Create the configuration for the device using the CLI. You can enter commands from a single command line, and scroll through recently executed commands.                                                                                                                                                                                                                                                                                         |
| ASCII file                                      | Load an ASCII file containing a configuration that you created earlier, either on this system or on another system. You can then activate and run the configuration file, or you can edit it using the CLI and then activate it.                                                                                                                                                                                                                 |
| J-Web graphical user interface (GUI)            | Use the J-Web GUI to configure the device. J-Web enables you to monitor, configure, troubleshoot, and manage the router on a client by means of a Web browser. The J-Web GUI is preinstalled on J Series Routers and is an optional software package that can be installed on M Series and T Series routers. J-Web is not available for the QFX Series.                                                                                          |
| Junos XML management protocol (API)             | Use Junos XML protocol Perl client modules to develop custom applications for configuring information on devices that run Junos OS. Client applications use the Junos XML management protocol to request and change configuration information on Juniper Networks J Series, M Series, and T Series routers. The Junos XML management protocol is customized for Junos OS, and operations in the API are equivalent to those in the Junos OS CLI. |
| NETCONF application programming interface (API) | Use NETCONF Perl client modules to develop custom applications for configuring information on devices that run Junos OS. Client applications use the NETCONF XML management protocol to request and change configuration information on Juniper Networks J Series, M Series, and T Series routers. The NETCONF XML management protocol includes features that accommodate the configuration data models of multiple vendors.                     |
| Configuration commit scripts                    | Create scripts that run at commit time to enforce custom configuration rules. Commit scripts are written in Extensible Stylesheet Language Transformations (XSLT). Commit scripts are not available for the QFX Series.                                                                                                                                                                                                                          |

The following sections contain complete descriptions of the methods you can use to configure Junos OS:

- [Junos OS Command-Line Interface on page 186](#)
- [ASCII File on page 186](#)
- [J-Web Package on page 186](#)
- [Junos XML Management Protocol Software on page 187](#)

- [NETCONF XML Management Protocol Software on page 187](#)
- [Configuration Commit Scripts on page 187](#)

---

## Junos OS Command-Line Interface

The Junos OS CLI is a straightforward command interface. You use Emacs-style keyboard sequences to move around on a command line and scroll through a buffer that contains recently executed commands. You type commands on a single line, and the commands are executed when you press the Enter key. The CLI also provides command help and command completion. For more information about the CLI, see the *CLI User Guide* and the [CLI Explorer](#).

---

## ASCII File

You can load an ASCII file containing a configuration that you created earlier, either on this system or another system. You can then activate and run the configuration file as is, or you can edit it using the CLI and then activate it.

---

## J-Web Package

As an alternative to entering CLI commands, Junos OS supports the J-Web GUI. The J-Web user interface enables you to monitor, configure, troubleshoot, and manage the router on a client by means of a Web browser with Hypertext Transfer Protocol (HTTP) or HTTP over Secure Sockets Layer (HTTPS) enabled.

The J-Web user interface is preinstalled on J Series Routers. It is provided as an optional, licensed software package (jweb package) on M Series and T Series routers. The jweb package is not included in jinstall and jbundle software bundles. It must be installed separately. To install the package on M Series and T Series routers, follow the procedure described in the *Installation and Upgrade Guide*.

J-Web supports weak (56-bit) encryption by default. This enables international customers to install J-Web and use HTTPS connections for J-Web access. Domestic customers can also install the jcrypto strong encryption package. This package automatically overrides the weak encryption. For more information about the J-Web GUI, see the *J-Web Interface User Guide*.

**NOTE:** Because the J-Web package is bundled separately from other packages, it is possible to have a version mismatch between J-Web and other Junos OS packages you have installed.

To check for a version mismatch, use the `show system alarms` CLI command. If the version number does not match exactly, a system alarm appears. For example, if you install the 7.4R1.2 jroute package and the 7.4R1.1 jweb package, an alarm is activated. For more information on the `show system alarms` command, see the [CLI Explorer](#).

---

---

### Junos XML Management Protocol Software

---

The Junos XML management protocol is an Extensible Markup Language (XML) application that client applications use to request and change configuration information on Juniper Networks J Series, M Series, MX Series, and T Series routers. This API is customized for Junos OS, and operations in the API are equivalent to Junos OS CLI configuration mode commands. The Junos XML management protocol includes a set of Perl modules that enable client applications to communicate with a Junos XML protocol server on the router. The Perl modules are used to develop custom applications for configuring and monitoring Junos OS.

For a complete description of how to use Junos XML and Junos XML management protocol software, see the *Junos XML Management Protocol Developer Guide*.

---

### NETCONF XML Management Protocol Software

---

The NETCONF XML management protocol is an Extensible Markup Language (XML) application that client applications can use to request and change configuration information on Juniper Networks J Series, M Series, MX Series, and T Series routers. This API is customized for Junos OS, and includes features that accommodate the configuration data models of multiple vendors. The NETCONF XML management protocol includes a set of Perl modules that enable client applications to communicate with a NETCONF server on the router. The Perl modules are used to develop custom applications for configuring and monitoring Junos OS.

For a complete description of how to use Junos XML and NETCONF XML management protocol software, see the *NETCONF XML Management Protocol Developer Guide*.

---

### Configuration Commit Scripts

---

You can create and use scripts that run at commit time to enforce custom configuration rules. If a configuration breaks the custom rules, the script can generate actions that the Junos OS performs. These actions include:

- Generating custom error messages
- Generating custom warning messages
- Generating custom system log messages
- Making changes to the configuration

Configuration commit scripts also enable you to create macros, which expand simplified custom aliases for frequently used configuration statements into standard Junos OS configuration statements. Commit scripts are written in Extensible Stylesheet Language Transformations (XSLT). For more information, see the *Junos OS Automation Library*.

## Modifying the Default Time Zone for a Router or Switch Running Junos OS

The default local time zone on the router or switch is UTC (Coordinated Universal Time, formerly known as Greenwich Mean Time, or GMT).

- To modify the local time zone, include the **time-zone** statement at the **[edit system]** hierarchy level:

```
[edit system]
time-zone (GMT hour-offset | time-zone);
```

You can use the **GMT *hour-offset*** option to set the time zone relative to UTC (GMT) time. By default, ***hour-offset*** is 0. You can configure this to be a value from -14 to +12.

You can also specify the **time-zone** value as a string such as PDT (Pacific Daylight Time) or WET (Western European Time), or specify the continent and major city.

**NOTE:** Junos OS complies with the POSIX time-zone standard, which is counter-intuitive to the way time zones are generally indicated relative to UTC. A time zone ahead of UTC (east of the Greenwich meridian) is commonly indicated as GMT +*n*; for example, the Central European Time (CET) zone is indicated as GMT +1. However, this is not true for POSIX time zone designations. POSIX indicates CET as GMT-1. If you include the **set system time-zone GMT+1** statement for a router in the CET zone, your router time will be set to one hour behind GMT, or two hours behind the actual CET time. For this reason, you might find it easier to use the POSIX time-zone strings, which you can list by entering **set system time-zone ?**.

For the time zone change to take effect for all processes running on the router or switch, you must reboot the router or switch.

The following example shows how to change the current time zone to **America/New\_York**:

```
[edit]
user@host# set system time-zone America/New_York
[edit]
user@host# show
system {
    time-zone America/New_York;
}
```

## Rebooting and Halting a Device

To reboot the switch, issue the **request system reboot** command.

```
user@switch> request system reboot ?
Possible completions:
<[Enter]>          Execute this command
```

```

all-members      Reboot all virtual chassis members
at               Time at which to perform the operation
both-routing-engines Reboot both the Routing Engines
fast-boot        Enable fast reboot
in               Number of minutes to delay before operation
local            Reboot local virtual chassis member
member           Reboot specific virtual chassis member (0..9)
message          Message to display to all users
other-routing-engine Reboot the other Routing Engine
|               Pipe through a command
{master:0}

user@switch> request system reboot
Reboot the system ? [yes,no] (no) yes
Rebooting switch

```

**NOTE:** Not all options shown in the preceding command output are available on all QFX Series and EX4600 devices. For example, the `fast-boot` option is available only on QFX5100. See the documentation for the [request system reboot](#) command for details about options.

Similarly, to halt the switch, issue the `request system halt` command.

**CAUTION:** Before entering this command, you must have access to the switch's console port in order to bring up the Routing Engine.

```

user@switch> request system halt ?
Possible completions:
<[Enter]>        Execute this command
all-members      Halt all virtual chassis members
at               Time at which to perform the operation
backup-routing-engine Halt backup Routing Engine
both-routing-engines Halt both Routing Engines
in               Number of minutes to delay before operation
local            Halt local virtual chassis member
member           Halt specific virtual chassis member (0..9)
message          Message to display to all users
other-routing-engine Halt other Routing Engine
|               Pipe through a command

```

**NOTE:** When you issue this command on an individual component in a QFabric system, you will receive a warning that says “Hardware-based members will halt, Virtual Junos Routing Engines will reboot.” If you want to halt only one member, use the `member` option. You cannot issue this command from the QFabric CLI.

Issuing the `request system halt` command on the switch halts the Routing Engine. To reboot a Routing Engine that has been halted, you must connect through the console.

- Related Documentation**
- [clear system reboot on page 354](#)
  - [request system reboot on page 418](#)
  - [request system halt on page 403](#)
  - [request system power-off on page 413](#)
  - [Connecting a QFX Series Device to a Management Console](#)

## Reverting to the Default Factory Configuration

If for any reason the current active configuration fails, you can revert to the default factory configuration. The default factory configuration contains the basic configuration settings. This is the first configuration of the switch, and it is loaded when the switch is first installed and powered on.

The **load factory default** command is a standard Junos OS configuration command. This configuration command replaces the current active configuration with the default factory configuration.

To revert the switch to the rescue configuration:

1. 

```
[edit]
user@switch# load factory-default
[edit]
user@switch# delete system commit factory-settings
[edit]
user@switch# commit
```

- Related Documentation**
- [Understanding Configuration Files on page 1732](#)
  - [Loading a Previous Configuration File on page 1742](#)
  - [Reverting to the Rescue Configuration on page 191](#)

## Reverting to the Default Factory Configuration by Using the request system zeroize Command

The **request system zeroize** command is a standard Junos OS operational mode command that removes all configuration information and resets all key values. The operation unlinks all user-created data files, including customized configuration and log files, from their directories. The switch then reboots and reverts to the factory-default configuration.

To completely erase user-created data so that it is unrecoverable, use the **request system zeroize media** command.

**CAUTION:** Before issuing **request system zeroize**, use the **request system snapshot** command to back up the files currently used to run the switch to a secondary device.

To revert to the factory-default configuration by using the **request system zeroize** command:

1. `user@switch> request system zeroize`  
warning: System will be rebooted and may not boot without configuration  
Erase all data, including configuration and log files? [yes,no] (yes)
2. Type **yes** to remove configuration and log files and revert to the factory default configuration.
3. Complete the initial configuration of the switch. See or [“Configuring a QFX3500 Device as a Standalone Switch” on page 178](#)

**Related Documentation** • [request system zeroize on page 467](#)

## Reverting to the Rescue Configuration

If someone inadvertently commits a configuration that denies management access to a device and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration. The rescue configuration is a previously committed, valid configuration.

To revert the switch to the rescue configuration:

1. Enter the **load override** command.  
  
[edit]  
`user@switch# load override filename`
2. Commit your changes.  
  
[edit]  
`user@switch# commit filename`

**Related Documentation** • [Setting or Deleting the Rescue Configuration on page 1751](#)  
• [Reverting to the Default Factory Configuration on page 190](#)  
• [Configuration File Terms on page 25](#)

## Saving Core Files Generated by Junos OS Processes

By default, when an internal Junos OS process generates a core file, the file and associated context information are saved for debugging purposes in a compressed tar file named `/var/tmp/process-name.core.core-number.tgz`. The contextual information includes the configuration and system log message files.

- To disable the saving of core files and associated context information:  
  
[edit system]  
`no-saved-core-context;`
- To save the core files only:  
  
[edit system]  
`saved-core-files number;`

Where **number** is the number of core files to save and can be a value from 1 through 10.

- To save the core files along with the contextual information:

```
[edit system]  
saved-core-context;
```

#### Related Documentation

- [Viewing Core Files from Junos OS Processes on page 198](#)

## Updating the IANA Time Zone Database on Junos Devices

Junos devices use the tz database, also known as the IANA Time Zone Database to manage time zones. This database is periodically updated by IANA to reflect political and time changes. As such, you may need from time to time to update this file to ensure the Junos devices continue to accurately reflect worldwide time zones and daylight savings time intervals.

To update the IANA Time Zone Database, perform the following steps:

1. [Importing and Installing Time Zone Files on page 192](#)
2. [Configuring a Custom Time Zone on page 193](#)

### Importing and Installing Time Zone Files

---

The IANA Time Zone Database is maintained by the Internet Assigned Numbers Authority (IANA), which is a department of the Internet Corporation for Assigned Names and Numbers (ICANN). You can download the latest IANA Time Zone Database file from the following URL: <http://www.iana.org/time-zones>.

The following steps will guide you through one method of installing the file to your device. However, depending on your network access and other preferences, you may need to modify these steps.

1. Log into the Junos device.
2. If you are in the CLI interface, open the shell interface.  

```
device@user# start shell
```
3. Create a **tz** directory in the **/var/tmp** and navigate to that directory.  

```
# mkdir /var/tmp/tz  
# cd /var/tmp/tz
```
4. Using FTP, download the time zone files archive.

**NOTE:** FTP must be enabled on your device before you can use FTP. FTP is enabled by adding the **ftp** statement into the **[edit system services]** hierarchy.

```
# ftp ftp.iana.org/tz  
# bin  
# get tzdata-latest.tar.gz
```

**NOTE:** If needed, you can edit the above untarred files to create or modify the time zones.

5. Select the names of time zone files to compile and feed them to the following script. For example, to generate **northamerica** and **asia** tz files:

```
# /usr/libexec/ui/compile-tz northamerica asia
```

6. Enable the use of the generated tz files using the CLI:

```
[edit]
# set system use-imported-time-zones
[edit]
# set system time-zone ?
```

This should show the newly generated tz files in **/var/db/zoneinfo/**.

7. Set the time zone and commit the configuration:

```
[edit]
# set system time-zone <your-time-zone>
# commit
```

8. Verify that the time zone change has taken effect:

```
[edit]
# run show system uptime
```

### Configuring a Custom Time Zone

To use a custom time zone, follow these steps:

1. Download a time zones archive (from a known or designated source) to the router or switch. Compile the time zone archive using the **zic** time zone compiler, which generates **tz** files.
2. Using the CLI, configure the router or switch to enable the use of the generated tz files as follows:

```
[edit]
user@host# set system use-imported-time-zones
```

3. Display the imported time zones (saved in the directory **/var/db/zoneinfo/**):

```
[edit]
user@host# set system time-zone ?
```

If you do not configure the router to use imported time zones, the Junos OS default time zones are shown (saved in the directory **/usr/share/zoneinfo/**).

## Setting the Date and Time

1. Enter operational mode in the CLI.

2. Enter the following command:

```
user@switch> set date YYYYMMDDHHMM.ss source-address
```

For example, the following command sets the date and time.

```
user@switch# set date 201102151010.55
```

3. To set the date and time from an NTP server, enter the following command:

```
user@switch# set date ntp servers
```

For example, the following command sets the date and time from an NTP server:

```
user@switch# set date ntp 200.40.40.1
```

4. To set the date and time from more than one NTP server, enter the same command:

```
user@switch# set date ntp servers
```

For example, the following command sets the date and time from more than one NTP server:

```
user@switch# set date ntp 200.40.40.1 200.40.40.2
```

**Related Documentation**

- *set date*

## Specifying Access Privileges for Junos OS Operational Mode Commands

You can specify extended regular expressions by using the **allow-commands** and **deny-commands** statements to define a user's access privileges to individual operational mode commands. Doing so takes precedence over a login class permissions bit set for a user. You can include one **deny-commands** and one **allow-commands** statement in each login class.

To explicitly provide use of an individual operational mode command that would otherwise be denied, include the **allow-commands** statement at the **[edit system login class class-name]** hierarchy level:

```
[edit system login class class-name]  
allow-commands "regular-expression";
```

To explicitly deny access to an individual operational mode command that would otherwise be supported, include the **deny-commands** statement at the **[edit system login class class-name]** hierarchy level:

```
[edit system login class class-name]  
deny-commands "regular-expression";
```

If the regular expression contains any spaces, operators, or wildcard characters, enclose the expression in quotation marks. Regular expressions are not case-sensitive.

allow-commands "show interfaces";

**NOTE:** Modifiers are not supported within the regular expression string to be matched. If a modifier is used, then nothing is matched.

For example, the deny command `set protocols` does not match anything, whereas `protocols` matches *protocols*.

Explicitly providing access to operational mode commands using the **allow-commands** statement adds to the regular permissions set using the **permissions** statement. Likewise, explicitly denying access to operational mode commands using the **deny-commands** statement removes permissions for the specified commands from the default permissions provided by the **permissions** statement.

For example, if a login class has the permission **view** and the **allow-commands** statement includes the **request system software add** command, the specified login class user can install software, in addition to the permissions specified by the **view** permissions flag. Likewise, if a login class has the permission **all** and the **deny-commands** statement includes the **request system software add** command, the specified login class user can perform all operations allowed by the **all** permissions flag, except installing software using the **request system software add** command.

If you allow and deny the same commands, the **allow-commands** permissions take precedence over the permissions specified by **deny-commands**. For example, if you include **allow-commands "request system software add"** and **deny-commands "request system software add"**, the login class user is allowed to install software using the **request system software add** command.

If you specify a regular expression for **allow-commands** and **deny-commands** with two different variants of a command, the longest match is always executed.

For example, if you specify a regular expression for **allow-commands** with the **commit-synchronize** command and a regular expression for **deny-commands** with the **commit** command, users assigned to such a login class would be able to issue the **commit synchronize** command, but not the **commit** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize**, and it is specified for **allow-commands**.

Likewise, if you specify a regular expression for **allow-commands** with the **commit** command and a regular expression for **deny-commands** with the **commit-synchronize** command, users assigned to such a login class would be able to issue the **commit** command, but not the **commit-synchronize** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize**, and it is specified for **deny-commands**.

Anchors are required when specifying complex regular expressions with **allow-commands** or **deny-commands** statements. For example, when specifying multiple commands using

the pipe (|) symbol for **allow-commands**, the following syntax is incorrect:

**allow-commands = "(monitor.\*)"|(ping.\*)"|(show.\*)"|(exit)".** Instead, you must specify the expression using the following syntax: **allow-commands = "^(^monitor)|(^ping)|(^show)|(^exit)"** OR **allow-commands = "^(monitor|ping|show|exit)"**

**Related Documentation**

- *allow-commands*
- *deny-commands*

## Synchronizing and Coordinating Time Distribution Using NTP

Using NTP to synchronize and coordinate time distribution in a large network involves these tasks:

1. [Configuring NTP on page 196](#)
2. [Configuring the NTP Boot Server on page 196](#)
3. [Specifying a Source Address for an NTP Server on page 197](#)

### Configuring NTP

---

- To configure NTP on the router or switch, include the **ntp** statement at the **[edit system]** hierarchy level:

```
[edit system]
ntp {
  authentication-key number type type value password;
  boot-server (address | hostname);
  broadcast <address> <key key-number> <version value> <ttl value>;
  broadcast-client;
  multicast-client <address>;
  peer address <key key-number> <version value> <prefer>;
  server address <key key-number> <version value> <prefer>;
  source-address source-address;
  trusted-key [ key-numbers ];
}
```

### Configuring the NTP Boot Server

---

When you boot the router or switch, it issues an **ntpdate** request, which polls a network server to determine the local date and time. You need to configure a server that the router or switch uses to determine the time when the router or switch boots. Otherwise, NTP will not be able to synchronize to a time server if the server's time appears to be very far off of the local router's or switch's time.

- To configure the NTP boot server, include the **boot-server** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
boot-server (address | hostname);
```

Specify either the IP address or the hostname of the network server.

### Specifying a Source Address for an NTP Server

For IP version 4 (IPv4), you can specify that if the NTP server configured at the **[edit system ntp]** hierarchy level is contacted on one of the loopback interface addresses, the reply always uses a specific source address. This is useful for controlling which source address NTP uses to access your network when it is either responding to or sending an NTP client request from your network.

To configure the specific source address that the reply will always use, and the source address that requests initiated by NTP server will use, include the **source-address** statement at the **[edit system ntp]** hierarchy level:

```
[edit system ntp]
source-address source-address;
```

**source-address** is a valid IP address configured on one of the router or switch interfaces.

**NOTE:** If a firewall filter is applied on the loopback interface, ensure that the source address specified for the NTP server at the **[edit system ntp]** hierarchy level is explicitly included as one of the match criteria in the firewall filter. This enables the Junos OS to accept traffic on the loopback interface from the specified source address.

The following example shows a firewall filter with the source address 10.0.10.100 specified in the **from** statement included at the **[edit firewall filter firewall-filter-name]** hierarchy:

```
[edit firewall filter Loopback-Interface-Firewall-Filter]
term Allow-NTP {
  from {
    source-address {
      172.17.27.46/32; // IP address of the NTP server
      10.0.10.100/32; // Source address specified for the NTP server
    }
  }
  then accept;
}
```

If no source address is configured for the NTP server, include the primary address of the loopback interface in the firewall filter.

## Viewing Core Files from Junos OS Processes

When an internal Junos OS process generates a core file, the output found at `/var/crash/` and `/var/tmp/` can now be viewed. This provides a quick method of finding core issues across large networks.

Use the CLI command **show system core-dumps** to view core files.

```
root@host> show system core-dumps
-rw----- 1 root  wheel 268369920 Jun 18 17:59 /var/crash/vmcore.0
-rw-rw---- 1 root  field  3371008 Jun 18 17:53 /var/tmp/rpd.core.0
-rw-r--r-- 1 root  wheel 27775914 Jun 18 17:59 /var/crash/kernel.0
```

## Configuration Examples

---

- [Example: Changing the Requirements for Junos OS Plain-Text Passwords on page 198](#)
- [Reaching a Domain Name System Server on page 200](#)
- [Example: Configuring the Name of the Switch, IP Address, and System ID on page 202](#)
- [Example: Configuring NTP on page 203](#)
- [Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization on page 205](#)
- [Example: Configuring a Plain-Text Password for Root Logins on page 206](#)
- [Configuring the Root Password on page 209](#)

### Example: Changing the Requirements for Junos OS Plain-Text Passwords

This example shows how to set various maximum and minimum requirements for plain-text passwords to increase password strength.

- [Requirements on page 198](#)
- [Overview on page 198](#)
- [Configuration on page 199](#)

#### Requirements

---

This example requires a device running Junos 12.2 or greater. The **minimum-length** and **maximum-length** password requirements statements are available in earlier releases, however, you must have Junos OS Release 12.2 or greater to configure **minimum-lower-cases**, **minimum-numeric**s, **minimum-punctuations**, or **minimum-upper-cases**.

#### Overview

---

You can use a variety of requirements to strengthen plain-text passwords for greater security. Junos OS provides a number of possible configurations at the **[edit system login**

**password]** hierarchy level that allow you to require users to create plain-text passwords that conform to a particular set of requirements that may include such things as length, number of changes, type of characters, numbers, or letter case.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set system login password minimum-length 12
```

```
set system login password maximum-length 22
```

```
set system login password minimum-numeric 1
```

```
set system login password minimum-upper-cases 1
```

```
set system login password minimum-lower-cases 1
```

```
set system login password minimum-punctuations 1
```

#### Configuring Requirements for Plain-Text Passwords

#### Step-by-Step Procedure

This example configures password requirements that require the user to create a password that has a minimum length of 12 characters, a maximum length of 22 characters, and that includes at least one lower-case letter, at least one upper-case letter, at least one punctuation character, and at least one numeric character.

1. Navigate to configuration mode in the **[system login password]** hierarchy level.
 

```
user@host> edit
[edit]
user@host# edit system login password
```
2. Set a minimum length requirement of 12 characters and a maximum length requirement of 22 characters for user passwords.
 

```
[edit system login password]
user@host# set minimum-length 12
[edit system login password]
user@host# set maximum-length 22
```
3. Require users to set a password that has at least one lower-case letter and at least one upper-case letter.
 

```
[edit system login password]
user@host# set minimum-lower-cases 1
[edit system login password]
user@host# set minimum-upper-cases 1
```
4. Require users to set a password that has at least one punctuation-class character and at least one number.
 

```
[edit system login password]
user@host# set minimum-punctuations 1
```

```
[edit system login password]
user@host# set minimum-numeric 1
```

### Results

From configuration mode, confirm your configuration by entering the show command at the edit system login password hierarchy level. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit system login password]
user@host# show
minimum-length 12;
maximum-length 22;
minimum-numeric 1;
minimum-upper-cases 1;
minimum-lower-cases 1;
```

## Reaching a Domain Name System Server

Domain name system (DNS) servers are used for resolving hostnames to IP addresses.

For redundancy, it is a best practice to configure access to multiple DNS servers. You can configure a maximum of three DNS servers. The approach is similar to the way Web browsers resolve the names of a Web site to its network address. Additionally, Junos OS enables you to configure one or more domain names, which it uses to resolve hostnames that are not fully qualified (in other words, the domain name is missing). This is convenient because you can use a hostname in configuring and operating Junos OS without the need to reference the full domain name. After adding DNS server addresses and domain names to your Junos OS configuration, you can use DNS resolvable hostnames in your configuration and commands instead of IP addresses.

Optionally, instead of configuring the name server at the **[edit system]** hierarchy level, you can use a configuration group, as shown in this procedure. This is a recommended best practice for configuring the name server. This procedure uses a group called **global** as an example.

Before you begin, configure your DNS servers with the hostname and an IP address for your Junos OS device. It does not matter which IP address you assign as the address of your Junos OS device in the DNS server, as long as it is an address that reaches your device. Normally, you would use the management interface IP address, but you can choose the loopback interface IP address, or a network interface IP address, or even configure multiple addresses on the DNS server.

To configure the router or switch to resolve hostnames into addresses:

1. Reference the IP addresses of your DNS servers.

```
[edit groups group-name system]
name-server {
```

```

    address;
}

```

The following example shows how to reference two DNS servers:

```

[edit groups global system]
user@host# set name-server 192.168.1.253
user@host# set name-server 192.168.1.254

```

```

user@host# show
name server {
    192.168.1.253;
    192.168.1.254;
}

```

2. (Optional) Configure the name of the domain in which the device itself is located.

This is a good practice. Junos OS then uses this configured domain name as the default domain name to append to hostnames that are not fully qualified.

```

[edit system]
domain-name domain-name;

```

The following example shows how to configure the domain name:

```

[edit groups global system]
user@host# set domain-name company.net

```

```

user@host# show
domain-name company.net;

```

3. (Optional) Configure a list of domains to be searched.

If your device can reach several different domains, you can configure these as a list of domains to be searched. Junos OS then uses this list to set an order in which it appends domain names when searching for the IP address of a host.

```

[edit groups global system]
domain-search [ domain-list ];

```

The domain list can contain up to six domain names, with a total of up to 256 characters.

The following example shows how to configure two domains to be searched. This example configures Junos OS to search the company.net domain and then the domainone.net domain and then the domainonealternate.com domain when attempting to resolve unqualified hosts.

```

[edit groups global system]
domain-search [ company.net domainone.net domainonealternate.com ]

```

4. If you used a configuration group, apply the configuration group, substituting **global** with the appropriate group name.

```

[edit]
user@host# set apply-groups global

```

5. Commit the configuration.

```
user@host# commit
```

6. Verify the configuration.

If you have configured your DNS server with the hostname and an IP address for your Junos OS device, you can issue the following commands to confirm that DNS is working and reachable. You can either use the configured hostname to confirm resolution to the IP address or use the IP address of your device to confirm resolution to the configured hostname.

```
user@host> show host host-name
user@host> show host host-ip-address
```

For example:

```
user@host> show host san-jose-router1
san-jose-router1.company.net
san-jose-router1.company.net has address 192.168.187.1

user@host> show host 192.168.187.1
1.187.168.192.in-addr.arpa domain name pointer san-jose-router1.company.net.
```

### Example: Configuring the Name of the Switch, IP Address, and System ID

The following example shows how to configure the switch name, map the name to an IP address and alias, and configure a system identifier:

```
[edit]
user@switch# set system host-names switch-sj1
[edit]
user@switch# set system static-host-mapping switch-sj1 inet 192.168.1.77
[edit]
user@switch# set system static-host-mapping switch-sj1 alias sj1
[edit]
user@switch# set system static-host-mapping switch-sj1 sysid 1921.6800.1077
[edit]
user@switch# show
system {
  host-name switch-sj1;
  static-host-mapping {
    switch-sj1 {
      inet 192.168.1.77;
      alias sj1;
      sysid 1921.6800.1077;
    }
  }
}
```

**Related Documentation** • *Getting Started Guide for Routing Devices*

## Example: Configuring NTP

The Network Time Protocol (NTP) provides the mechanisms to synchronize time and coordinate time distribution in a large, diverse network. NTP uses a returnable-time design in which a distributed subnet of time servers operating in a self-organizing, hierarchical primary-secondary configuration synchronizes local clocks within the subnet and to national time standards by means of wire or radio. The servers also can redistribute reference time using local routing algorithms and time daemons.

This example shows how to configure NTP:

- [Requirements on page 203](#)
- [Overview on page 203](#)
- [Configuration on page 203](#)
- [Verification on page 204](#)

### Requirements

This example uses the following software and hardware components:

- Junos OS Release 11.1 or later
- A switch connected to a network on which an NTP boot server and NTP server reside

### Overview

Debugging and troubleshooting are much easier when the timestamps in the log files of all switches are synchronized, because events that span a network can be correlated with synchronous entries in multiple logs. We recommend using the Network Time Protocol (NTP) to synchronize the system clocks of your switch and other network equipment.

In this example, an administrator wants to synchronize the time in a switch to a single time source. We recommend using authentication to make sure that the NTP peer is trusted. The **boot-server** statement identifies the server from which the initial time of day and date are obtained when the router or switch boots. The **server** statement identifies the NTP server used for periodic time synchronization. The **authentication-key** statement specifies that an HMAC-Message Digest 5 (MD5) scheme is used to hash the key value for authentication, which prevents the switch from synchronizing with an attacker's host that is posing as the time server.

### Configuration

To configure NTP:

#### CLI Quick Configuration

To quickly configure NTP, copy the following commands and paste them into the switch's terminal window:

```
[edit system]
set ntp boot-server 10.1.4.1
set ntp server 10.1.4.2
set ntp authentication-key 2 type md5 value "$9$aH1j8"
```

**Step-by-Step Procedure** To configure NTP :

1. Specify the boot server:  

```
[edit system]
user@switch# set ntp boot-server 10.1.4.1
```
2. Specify the NTP server:  

```
[edit system]
user@switch# set ntp server 10.1.4.2
```
3. Specify the key number, authentication type (MD5), and key for authentication:  

```
[edit system]
user@switch# set ntp authentication-key 2 type md5 value "$9$aHlj8"
```

**Results** Check the results:

```
[edit system]
user@switch# show
ntp {
  boot-server 10.1.4.1;
  authentication-key 2 type md5 value "$9$aHlj8"; ## SECRET-DATA
  server 10.1.4.2;
}
```

---

### Verification

To confirm that the configuration is correct, perform these tasks:

- [Checking the Time on page 204](#)
- [Displaying the NTP Peers on page 205](#)
- [Displaying the NTP Status on page 205](#)

#### *Checking the Time*

**Purpose** Check the time that has been set on the switch.

**Action** Enter the **show system uptime** operational mode command to display the time.

```
user@switch> show system uptime
fpc0:
-----
Current time: 2009-06-12 12:49:03 PDT
System booted: 2009-05-15 06:24:43 PDT (4w0d 06:24 ago)
Protocols started: 2009-05-15 06:27:08 PDT (4w0d 06:21 ago)
Last configured: 2009-05-27 14:57:03 PDT (2w1d 21:52 ago) by admin1
12:49PM up 28 days, 6:24, 1 user, load averages: 0.05, 0.06, 0.01
```

**Meaning** The output shows that the current date and time are June 12, 2009 and 12:49:03 PDT. The switch booted 4 weeks, 6 hours, and 24 minutes ago, and its protocols were started approximately 3 minutes before it booted. The switch was last configured by user **admin1** on May 27, 2009, and there is currently one user logged in to the switch.

The output also shows that the load average is 0.05 seconds for the last minute, 0.06 seconds for the last 5 minutes, and 0.01 seconds for the last 15 minutes.

*Displaying the NTP Peers*

**Purpose** Verify that the time has been obtained from an NTP server.

**Action** Enter the **show ntp associations** operational mode command to display the NTP server from switch obtained its time.

```
user@switch> show ntp associations
      remote      refid      st t when poll reach  delay  offset  jitter
=====
*ntp5.domain1.ne .GPS.          1 u  414 1024  377   3.435   4.002   0.765
```

**Meaning** The asterisk (\*) in front of the NTP server name, or peer, indicates that the time is synchronized and obtained from this server. The delay, offset, and jitter are displayed in milliseconds.

*Displaying the NTP Status*

**Purpose** View the configuration of the NTP server and the status of the system.

**Action** Enter the **show ntp status** operational mode command to view the status of the NTP.

```
user@switch> show ntp status
status=0644 leap_none, sync_ntp, 4 events, event_peer/strat_chg,
version="ntpd 4.2.0-a Mon Apr 13 19:09:05 UTC 2009 (1)",
processor="powerpc", system="JUNOS9.5R1.8", leap=00, stratum=2,
precision=-18, rootdelay=2.805, rootdispersion=42.018, peer=48172,
refid=172.17.28.5,
reftime=cddd397a.60e6d7bf  Fri, Jun 12 2009 13:30:50.378, poll=10,
clock=cddd3b1b.ec5a2bb4  Fri, Jun 12 2009 13:37:47.923, state=4,
offset=3.706, frequency=-23.018, jitter=1.818, stability=0.303
```

**Meaning** The output shows status information about the switch and the NTP.

- Related Documentation**

  - [Configuring the NTP Time Server and Time Services on page 169](#)
  - [CLI Explorer](#)
  - [Junos OS Baseline Network Operations Guide](#)

**Example: Configuring NTP as a Single Time Source for Router and Switch Clock Synchronization**

Debugging and troubleshooting are much easier when the timestamps in the log files of all the routers or switches are synchronized, because events that span the network can be correlated with synchronous entries in multiple logs. We strongly recommend using the Network Time Protocol (NTP) to synchronize the system clocks of routers, switches, and other network equipment.

By default, NTP operates in an entirely unauthenticated manner. If a malicious attempt to influence the accuracy of a router or switch's clock succeeds, it could have negative

effects on system logging, make troubleshooting and intrusion detection more difficult, and impede other management functions.

The following sample configuration synchronizes all the routers or switches in the network to a single time source. We recommend using authentication to make sure that the NTP peer is trusted. The **boot-server** statement identifies the server from which the initial time of day and date is obtained when the router boots. The **server** statement identifies the NTP server used for periodic time synchronization. The **authentication-key** statement specifies that an HMAC-Message Digest 5 (MD5) scheme should be used to hash the key value for authentication, which prevents the router or switch from synchronizing with an attacker's host posing as the time server.

```
[edit]
system {
  ntp {
    authentication-key 2 type md5 value "$9$aHlj8gqQ1gijjghgijiiii"; # SECRET-DATA
    boot-server 10.1.4.1;
    server 10.1.4.2;
  }
}
```

## Example: Configuring a Plain-Text Password for Root Logins

This example shows how to configure the authentication methods for the root-level user, whose username is "root".

- [Requirements on page 206](#)
- [Overview on page 207](#)
- [Configuration on page 207](#)
- [Verification on page 208](#)

---

### Requirements

No special configuration beyond device initialization is required before configuring this example.

Make sure you understand the requirements for a valid plain-text password. For Junos OS, the The default requirements for plain-text passwords are as follow:

- The password must be between 6 and 128 characters long.

- You can include most character classes in a password (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended.
- Valid passwords must contain at least one change of case or character class.

### Overview

Junos OS is preinstalled on the router. When the router is powered on, it is ready to be configured. Initially, you log in as the user “root” with no password. To set the root password, you have several options. This example shows you how to enter a plain-text password that Junos OS then encrypts for you.

### Configuration

**CLI Quick Configuration**

```
[edit system]
set root-authentication plain-text-password
New password: new-password
Retype new password: new-password
```

### Configuring [item]

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the Junos OS CLI User Guide.

To configure a plain-text password:

1. Type the set command for plain-text password and press Enter.
 

```
[edit]
user@host# set system root-authentication plain-text-password
New password:
```
2. Type the new password next to the **New password:** prompt and press Enter.
 

```
user@host# new-password
Retype new password:
```
3. Retype the same password next to the next prompt and press Enter.

### Results

From configuration mode, confirm your configuration by entering the **show** command. It should look something like this:

```
root-authentication {
  encrypted-password "$1$ASwBkGYd$YUcEwgd0IO4QkRzziQdmT/"; ## SECRET-DATA
}
```

If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

After you have confirmed that the interfaces are configured, enter the **commit** command in configuration mode.

## Verification

---

- [Verifying the Configuration of a Plain-Text Password for Root Logins on page 208](#)

### *Verifying the Configuration of a Plain-Text Password for Root Logins*

**Purpose** Verify the configuration of a plain-text password.

**Action** From operational mode, confirm your configuration by entering the **show configuration system** command.

```
user@host> show configuration system
root-authentication {
  encrypted-password "$1$ASwBkGYd$YUcEwgd0IO4QkRzzlQdmT/"; ## SECRET-DATA
}
```

**Meaning** If you use a clear-text password, Junos OS displays the password as an encrypted string so that users viewing the configuration cannot see it. As you enter the password in plain text, Junos OS encrypts it immediately. You do not have to configure Junos OS to encrypt the password as in some other systems. Plain-text passwords are hidden and marked as ## SECRET-DATA in the configuration.

- Related Documentation**
- *root-authentication*
  - [Special Requirements for Junos OS Plain-Text Passwords on page 1832](#)
  - *Configuring Special Requirements for Plain-Text Passwords*
  - *Changing the Requirements for Junos OS Plain-Text Passwords*

## Configuring the Root Password

Junos OS is preinstalled on the router. When the router is powered on, it is ready to be configured. Initially, you log in as the user **root** with no password. The root directory of a UNIX device is the entry point to all other folders and files on that device. As a result, access to the root directory is restricted by default to a predefined user account known as the root user. The root user (also referred to as superuser) has unrestricted access and full permissions within the system. The expression “log in as root” is commonly used when an action requires the user to log into the device as the root user. Junos OS requires configuration of the root password before it accepts a commit operation. On a new device, the root password must always be a part of the configuration submitted with your initial commit.

To set the root password, you have several options: enter a clear-text password that Junos OS encrypts, enter a password that is already encrypted, or enter a secure shell (ssh) public key string.

Optionally, instead of configuring the root password at the **[edit system]** hierarchy level, you can use a configuration group, as shown in this procedure. This is a recommended best practice for configuring the root password. This procedure uses a group called **global** as an example.

To set the root password:

1. Use one of the following methods to configure the root password.

- To enter a clear-text password that the system encrypts for you, use the following command to set the root password:

```
[edit groups global system]
root@# set root-authentication plain-text-password
New Password: type password here
Retype new password: retry password here
```

If you use a clear-text password, Junos OS displays the password as an encrypted string so that users viewing the configuration cannot see it. As you enter the password in plain text, Junos OS encrypts it immediately. You do not have to configure Junos OS to encrypt the password as in some other systems. Plain-text passwords are hidden and marked as **## SECRET-DATA** in the configuration.

- To enter a password that is already encrypted, use the following command to set the root password:

**CAUTION:** Do not use the encrypted-password option unless the password is *already* encrypted, and you are entering the encrypted version of the password.

If you accidentally configure the encrypted-password option with a clear-text password or with blank quotation marks (""), you will not be able to log in to the device as root, and you will need to complete the root password recovery process.

```
[edit groups global system]
root@# set root-authentication encrypted-password password
```

- To enter an SSH public string, use the following command to set the root password:

```
[edit groups global system]
root@# set root-authentication (ssh-dsa | ssh-eccdsa | ssh-rsa)key
```

2. (Optional) Strengthen security by only allowing root access from the console port.

```
[edit groups global system]
root@# set services ssh root-login deny
```

3. If you used a configuration group, apply the configuration group, substituting **global** with the appropriate group name.

```
[edit]
user@host# set apply-groups global
```

4. Commit the changes.

```
root@# commit
```

## allow-transients

|                                 |                                                                                                                                                                                                                                                        |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | allow-transients;                                                                                                                                                                                                                                      |
| <b>Hierarchy Level</b>          | [edit systems scripts commit]                                                                                                                                                                                                                          |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                      |
| <b>Description</b>              | For Junos OS commit scripts, enable transient configuration changes to be committed.                                                                                                                                                                   |
| <b>Default</b>                  | Transient changes are disabled by default. If you do not include the <b>allow-transients</b> statement, and an enabled script generates transient changes, the command-line interface (CLI) generates an error message and the commit operation fails. |
| <b>Required Privilege Level</b> | maintenance—To view this statement in the configuration.<br>maintenance-control—To add this statement to the configuration.                                                                                                                            |

| <b>Description</b>              | <p>Specify ARP options. You can enable backup VRRP routers to learn ARP requests for VRRP-IP to VRRP-MAC address translation. You can also set the time interval between ARP updates.</p> <p>For EX-Series switches, set only the time interval between ARP updates.</p>                                                                                                                                                                                                                                                                                       |
| <b>Options</b>                  | <p><b>aging-timer</b>—Time interval in minutes between ARP updates. In environments where the number of ARP entries to update is high (for example, on routers only, metro Ethernet environments), increasing the time between updates can improve system performance.</p> <p><b>passive-learning</b> (QFX-Series only)—Configure switches to learn the ARP mappings (IP-to-MAC address) for hosts sending the requests.</p> <p><b>Default:</b> 20 minutes</p> <p><b>Range:</b> 1 to 240 minutes</p> <p>The remaining statements are explained separately.</p> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Release Information      | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Description              | Authentication methods that a user can use to log in to the switch. You can assign multiple authentication methods to a single user.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Options                  | <p><b>encrypted-password "<i>password</i>"</b>—Message Digest 5 (MD5) or other encrypted authentication. Specify the MD5 or other password. You can specify only one encrypted password for each user.</p> <p>You cannot configure a blank password for <b>encrypted-password</b> using blank quotation marks (" "). You must configure a password of 1 through 128 characters and enclose the password in quotation marks.</p> <p><b>load-key-file</b>—Load RSA (SSH version 1 and SSH version 2) and DSA (SSH version 2) public keys from a file. The file is a URL containing one or more SSH keys.</p> <p><b>plain-text-password</b>—Plain-text password. The command-line interface (CLI) prompts you for the password and then encrypts it.</p> <p><b>remote-debug-permission</b> (QFabric systems only)—QFabric component authentication. Specifies permission levels for users to access individual components in a QFabric system.</p> <p><b>ssh-dsa "<i>public-key</i>"</b>—SSH version 2 authentication. Specify the SSH public key. You can specify one or more public keys for each user.</p> <p><b>ssh-rsa "<i>public-key</i>"</b>—SSH version 1 and SSH version 2 authentication. Specify the SSH public key. You can specify one or more public keys for each user.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | Configure the order in which the software tries different user authentication methods when attempting to authenticate a user. For each login attempt, the software tries the authentication methods in order, starting with the first one, until the password matches.                                                                                                                                                                                                                                            |
| <b>Default</b>                  | If you do not include the <b>authentication-order</b> statement, users are verified based on their configured passwords.                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>                  | <p><b><i>authentication-methods</i></b>—One or more authentication methods, listed in the order in which they should be tried. The method can be one or more of the following:</p> <ul style="list-style-type: none"><li>• <b>password</b>—Use the password configured for the user with the <b>authentication</b> statement at the [edit system login user] hierarchy level.</li><li>• <b>radius</b>—Use RADIUS authentication services.</li><li>• <b>tacplus</b>—Use TACACS+ authentication services.</li></ul> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Description</b>              | <p>Configure the server that NTP queries when the router or switch boots to determine the local date and time.</p> <p>When you boot the router or switch, it issues an <b>ntpdate</b> request, which polls a network server to determine the local date and time. You need to configure a server that the router or switch uses to determine the time when the router or switch boots. Otherwise, NTP cannot synchronize to a time server if the server time significantly differs from the local router's or switch's time. You can configure either an IP address or a hostname for the boot server. If you configure a hostname instead of an IP address, the <b>ntpdate</b> request resolves the hostname to an IP address when the router or switch boots up.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                     |
| <b>Description</b>              | Set requirements for using character sets in plain-text passwords. When you combine this statement with the <b>minimum-changes</b> statement, you can check for the total number of character sets included in the password or for the total number of character-set changes in the password. Newly created passwords must meet these requirements.   |
| <b>Options</b>                  | Specify one of the following: <ul style="list-style-type: none"><li>• <b>character-sets</b>—Number of character sets in the password. Valid character sets include uppercase letters, lowercase letters, numbers, punctuation, and other special characters.</li><li>• <b>set-transitions</b>—Number of transitions between character sets.</li></ul> |
| <b>Required Privilege Level</b> | system—To view this statement in the configuration.<br>system-control—To add this statement to the configuration.                                                                                                                                                                                                                                     |

## commit

---

**Syntax**    `commit {  
          allow-transients;  
          direct-access;  
          file filename {  
              checksum (md5 | sha-256 | sha1) hash;  
              optional;  
              refresh;  
              refresh-from url;  
              sourceurl;  
          }  
          refresh;  
          refresh-from url;  
          traceoptions {  
              file <filename> <files number> <size size> <world-readable | no-world-readable>;  
              flag flag;  
              no-remote-trace;  
          }  
          }`

**Hierarchy Level**    [edit system scripts]

**Release Information**    Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    For Junos OS commit scripts, configure the commit-time scripting mechanism.

**Options**    The statements are explained separately.

**Required Privilege Level**    maintenance—To view this statement in the configuration.  
                                  maintenance-control—To add this statement to the configuration.

## compress-configuration-files (System)

| <b>Description</b>                                                                                                                                                                                                                             | Compress the current operational configuration file. The file is stored in the file <b>juniper.conf</b> , in the <b>/config</b> file system, along with the last three committed versions of the configuration. However, with large networks, the current configuration file might exceed the available space in the <b>/config</b> file system. Compressing the current configuration file allows the file to fit in the file system, typically reducing the size of the file by 90 percent. The current configuration file is compressed on the second commit of the configuration after the first commit is made to include the <b>compress-configuration-files</b> statement. |
| <div>  <p><b>NOTE:</b> We recommend that you enable compression of the configuration files to minimize the amount of disk space that they require.</p> </div> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>              | Configure the characteristics of the console port.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Default</b>                  | The console port is enabled and its speed is 9600 baud.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>                  | <p><b>disable</b>—Disable console login connections.</p> <p><b>insecure</b>—Disable root login connections to the console and auxiliary ports. Configuring the console port as insecure also prevents superusers and anyone with a user identifier (UID) of 0 from establishing terminal connections in multiuser mode. This option can be used to prevent a user from attempting password recovery by booting into single-user mode, if the user does not know the root password.</p> <p><b>log-out-on-disconnect</b>—Log out the session when the data carrier on the console port is lost.</p> <p><b>type <i>terminal-type</i></b>—Type of terminal that is connected to the port: <b>ansi</b>, <b>vt100</b>, <b>small-xterm</b>, or <b>xterm</b>.</p> |
| <b>Required Privilege Level</b> | <p><b>system</b>—To view this statement in the configuration.</p> <p><b>system-control</b>—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Description</b>              | <p>Use the loopback interface, <b>lo0</b>, as the source address for all locally generated IP packets when the packet is sent through a routed interface, but not when the packet is sent through a local interface such as <b>fxp0</b>. The <b>lo0</b> interface is the interface to the switch's Routing Engine.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Default</b>                  | <p>The default address is used as the source address for all locally generated IP packets on outgoing interfaces that are unnumbered. If an outgoing interface is numbered, the default address is chosen using the following sequence:</p> <ul style="list-style-type: none"> <li>• The primary address on the loopback interface <b>lo0</b> that is <i>not</i> <b>127.0.0.1</b> is used.</li> <li>• The primary address for the primary interface or the preferred address (if configured) for the primary interface is used.</li> </ul> <p>By default, the primary address on an interface is selected as the numerically lowest local address configured on the interface.</p> <p>An interface's <i>primary address</i> is used by default as the local address for broadcast and multicast packets sourced locally and sent out through the interface. An interface's <i>preferred address</i> is the default local address used for packets sourced by the local switch to destinations on the subnet. By default, the numerically lowest local address configured for the interface is chosen as the preferred address on the subnet.</p> <p>To configure a different primary address or preferred address, include the <b>primary</b> or <b>preferred</b> statement at the [edit interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i> address <i>address</i>] or [edit logical-systems <i>logical-system-name</i> interfaces <i>interface-name</i> unit <i>logical-unit-number</i> family <i>family</i> address <i>address</i>] hierarchy levels.</p> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

## destination (Accounting)

---

**Syntax**

```
destination {  
  radius {  
    server {  
      server-address {  
        accounting-port port-number;  
        secret password;  
        source-address address;  
        retry number;  
        timeout seconds;  
      }  
    }  
  }  
  tacplus {  
    server {  
      server-address {  
        port port-number;  
        secret password;  
        single-connection;  
        timeout seconds;  
      }  
    }  
  }  
}
```

**Hierarchy Level** [edit system accounting]

**Release Information** Statement introduced before Junos OS Release 7.4.  
**radius** statement added in Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure the authentication server.

**Options** The remaining statements are explained separately.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

```

**Hierarchy Level** [edit system]

**Release Information** Statement introduced in Junos OS Release 8.1.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Disable the Routing Engine from responding to ICMP echo requests sent to multicast group addresses.

**Default** The Routing Engine responds to ICMP echo requests sent to multicast group addresses.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

| <b>Description</b>              | For NTP, configure the local router or switch to operate in symmetric active mode with the remote system at the specified address. In this mode, the local router or switch and the remote system can synchronize with each other. This configuration is useful in a network in which either the local router or switch or the remote system might be a better source of time.                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>                  | <p><b>address</b>—Address of the remote system. You must specify an address, not a hostname.</p> <p><b>key key-number</b>—(Optional) All packets sent to the address include authentication fields that are encrypted using the specified key number.</p> <p><b>Range:</b> Any unsigned 32-bit integer</p> <p><b>prefer</b>—(Optional) Mark the remote system as the preferred host, which means that if all other factors are equal, this remote system is chosen for synchronization among a set of correctly operating systems.</p> <p><b>version value</b>—(Optional) Specify the NTP version number to be used in outgoing NTP packets.</p> <p><b>Range:</b> 1 through 4</p> <p><b>Default:</b> 4</p> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

| <b>Description</b>              | Maximum number of times a user can attempt to enter a password while logging in through SSH or Telnet before being disconnected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Options</b>                  | <p><b>backoff-threshold <i>number</i></b>—Threshold for the number of failed login attempts before the user experiences a delay when attempting to reenter a password. Use the <b>backoff-factor</b> option to specify the length of delay, in seconds.</p> <p><b>Range:</b> 1 through 3</p> <p><b>Default:</b> 2</p> <p><b>backoff-factor <i>seconds</i></b>—Length of delay after each failed login attempt. The length of delay increases by this value for each subsequent login attempt after the value specified in the <b>backoff-threshold</b> option.</p> <p><b>Range:</b> 5 through 10</p> <p><b>Default:</b> 5</p> <p><b>maximum-time <i>seconds</i></b>—Maximum length of time that the connection remains open for the user to enter a username and password to log in. If the user remains idle and does not enter a username and password within the configured <b>maximum-time</b>, the connection is closed.</p> <p><b>Range:</b> 20 through 300</p> <p><b>Default:</b> 120</p> <p><b>minimum-time <i>seconds</i></b>—Minimum length of time that the connection remains open while the user is attempting to enter a password to log in.</p> <p><b>Range:</b> 20 through 60</p> <p><b>Default:</b> 20</p> <p><b>tries-before-disconnect <i>number</i></b>—Maximum number of times a user is allowed to attempt to enter a password to log in through SSH or Telnet.</p> <p><b>Range:</b> 1 through 10</p> <p><b>Default:</b> 10</p> |
| <b>Required Privilege Level</b> | admin—To view this statement in the configuration.<br>admin-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Description</b>              | Configure the authentication methods for the root-level user, whose username is <b>root</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Options</b>                  | <p><b>encrypted-password "password"</b>— Specify the MD5 or other encrypted authentication password. You can specify only one encrypted password.</p> <p>You cannot configure a blank password for the <b>encrypted-password</b> option using blank quotation marks (" "). You must configure a password of 1 through 128 characters and enclose the password in quotation marks.</p> <hr/> <p> <b>CAUTION:</b> Do not use the <b>encrypted-password</b> option unless the password is <i>already</i> encrypted, and you are entering the encrypted version of the password. If you commit the <b>encrypted-password</b> option with a plain-text password or with blank quotation marks (" "), you will not be able to log in to the device as root, and you will need to use the password recovery process.</p> <hr/> <p><b>plain-text-password</b>—Plain-text password. The CLI prompts you for the password and then encrypts it. The CLI displays the encrypted version, and the software places the encrypted version in its user database. You can specify only one plain-text password.</p> <p><b>ssh-dsa "public-key"</b>—SSH version 2 authentication. Specify the DSA (SSH version 2) public key. You can specify one or more public keys.</p> <p><b>ssh-rsa "public-key"</b>—SSH version 1 authentication. Specify the RSA (SSH version 1 and SSH version 2) public key. You can specify one or more public keys.</p> |

| <b>Description</b>              | Map a hostname to one or more IP addresses and aliases, and configure an International Organization for Standardization (ISO) system identifier (system ID).                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>                  | <p><b>alias <i>alias</i></b>—Alias for the hostname.</p> <p><b>hostname</b>—Fully qualified hostname.</p> <p><b>inet <i>address</i></b>—IP address. You can specify one or more IP addresses for the host.</p> <p><b>sysid <i>system-identifier</i></b>—ISO system identifier (system ID). This is the 6-byte portion of the Intermediate System-to-Intermediate System (IS-IS) network service access point (NSAP). We recommend that you use the host's IP address represented in binary-coded decimal (BCD) format. For example, the IP address <b>208.197.169.18</b> is <b>2081.9716.9018</b> in BCD.</p> |

Hierarchy Level [edit]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure system management properties.

**NOTE:** The `radius-server source-address` and `radius-options` statements are not available on the QFabric system.

**Required Privilege** system—To view this statement in the configuration.

**Level** system-control—To add this statement to the configuration.

## tacplus

**Syntax**

```
tacplus {
  server {
    server-address {
      port port-number;
      secret password;
      single-connection;
      timeout seconds;
    }
  }
}
```

**Hierarchy Level** [edit system accounting destination]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure TACACS+.

**Options** *server-address*—Address of the TACACS+ authentication server.

The remaining statements are explained separately.

**Required Privilege** system—To view this statement in the configuration.

**Level** system-control—To add this statement to the configuration.

| <b>Hierarchy Level</b>     | [edit system scripts commit],                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Release Information</b> | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Description</b>         | Define tracing operations for commit or op scripts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Default</b>             | If you do not include this statement, no script-specific tracing operations are performed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Options</b>             | <p><b>filename</b>—Name of the file to receive the output of the tracing operation. All files are placed in the directory <code>/var/log</code>. By default, commit script process tracing output is placed in the file <code>cscript.log</code> and op script process tracing is placed in the file <code>op-script.log</code>. If you include the <b>file</b> statement, you must specify a filename. To retain the default, you can specify <code>cscript.log</code> or <code>op-script.log</code> as the filename.</p> <p><b>files number</b>—(Optional) Maximum number of trace files. When a trace file named <i>trace-file</i> reaches its maximum size, it is renamed and compressed to <i>trace-file.0.gz</i>. When <i>trace-file</i> again reaches its maximum size, <i>trace-file.0.gz</i> is renamed <i>trace-file.1.gz</i> and <i>trace-file</i> is renamed and compressed to <i>trace-file.0.gz</i>. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option and a filename.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 10 files</p> <p><b>flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Log all operations</li> <li>• <b>events</b>—Log important events</li> <li>• <b>input</b>—Log script input data</li> <li>• <b>offline</b>—Generate data for offline development</li> <li>• <b>output</b>—Log script output data</li> <li>• <b>rpc</b>—Log script RPCs</li> <li>• <b>xslt</b>—Log the XSLT library</li> </ul> <p><b>no-world-readable</b>—Restrict file access to owner. This is the default.</p> |

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches this size, it is renamed and compressed to **trace-file.0.gz**. When **trace-file** again reaches its maximum size, **trace-file.0.gz** is renamed **trace-file.1.gz** and **trace-file** is renamed and compressed to **trace-file.0.gz**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option and a filename.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through 1 GB

**Default:** 128 KB

**world-readable**—Enable unrestricted file access.

## CHAPTER 7

# Administration

- [Routine Monitoring on page 337](#)
- [Operational Commands on page 340](#)

### Routine Monitoring

---

- [Monitoring System Process Information on page 337](#)
- [Monitoring System Properties on page 338](#)
- [Monitoring Interface Status and Traffic on page 339](#)
- [Other Tools to Configure and Monitor Devices Running Junos OS on page 340](#)

### Monitoring System Process Information

**Purpose** View the processes running on the device.

**Action** To view the software processes running on the device:

[edit system]

user@switch> [show system processes](#)

**Meaning** [Table 18 on page 337](#) summarizes the output fields in the system process information display.

The display includes the total CPU load and total memory utilization.

**Table 18: Summary of System Process Information Output Fields**

| Field              | Values                                                   |
|--------------------|----------------------------------------------------------|
| PID                | Identifier of the process.                               |
| Name               | Owner of the process.                                    |
| State              | Current state of the process.                            |
| CPU Load           | Percentage of the CPU that is being used by the process. |
| Memory Utilization | Amount of memory that is being used by the process.      |

Table 18: Summary of System Process Information Output Fields (*continued*)

| Field      | Values                                |
|------------|---------------------------------------|
| Start Time | Time of day when the process started. |

  - [show system uptime on page 1204](#)

## Monitoring System Properties

**Purpose** View system properties such as the name, IP address, and resource usage.

**Action** To monitor system properties in the CLI, enter the following commands:

- [show system uptime](#)
- [show system users](#)
- [show system storage](#)

**Meaning** [Table 19 on page 338](#) summarizes key output fields in the system properties display.

Table 19: Summary of Key System Properties Output Fields

| Field                      | Values                                                                                                  | Additional Information                                 |
|----------------------------|---------------------------------------------------------------------------------------------------------|--------------------------------------------------------|
| <b>General Information</b> |                                                                                                         |                                                        |
| Serial Number              | Serial number of device.                                                                                |                                                        |
| Junos OS Version           | Version of Junos OS active on the switch, including whether the software is for domestic or export use. | Export software is for use outside the USA and Canada. |
| Hostname                   | Name of the device.                                                                                     |                                                        |
| IP Address                 | IP address of the device.                                                                               |                                                        |
| Loopback Address           | Loopback address.                                                                                       |                                                        |
| Domain Name Server         | Address of the domain name server.                                                                      |                                                        |
| Time Zone                  | Time zone on the device.                                                                                |                                                        |
| <b>Time</b>                |                                                                                                         |                                                        |
| Current Time               | Current system time, in Coordinated Universal Time (UTC).                                               |                                                        |

Table 19: Summary of Key System Properties Output Fields (*continued*)

| Field                          | Values                                                                                                                                       | Additional Information                                                           |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------|
| System Booted Time             | Date and time when the device was last booted and how long it has been running.                                                              |                                                                                  |
| Protocol Started Time          | Date and time when the protocols were last started and how long they have been running.                                                      |                                                                                  |
| Last Configured Time           | Date and time when a configuration was last committed. This field also shows the name of the user who issued the last <b>commit</b> command. |                                                                                  |
| Load Average                   | CPU load average for 1, 5, and 15 minutes.                                                                                                   |                                                                                  |
| <b>Storage Media</b>           |                                                                                                                                              |                                                                                  |
| Internal Flash Memory          | Usage details of internal flash memory.                                                                                                      |                                                                                  |
| External Flash Memory          | Usage details of external USB flash memory.                                                                                                  |                                                                                  |
| <b>Logged in Users Details</b> |                                                                                                                                              |                                                                                  |
| User                           | Username of any user logged in to the switch.                                                                                                |                                                                                  |
| Terminal                       | Terminal through which the user is logged in.                                                                                                |                                                                                  |
| From                           | System from which the user has logged in. A hyphen indicates that the user is logged in through the console.                                 |                                                                                  |
| Login Time                     | Time when the user logged in.                                                                                                                | This is the <b>user@switch</b> field in <b>show system users</b> command output. |
| Idle Time                      | How long the user has been idle.                                                                                                             |                                                                                  |

## Monitoring Interface Status and Traffic

**Purpose** View interface status to monitor interface bandwidth utilization and traffic statistics.

- Action**
- To view interface status for all the interfaces, enter **show interfaces xe**.
  - To view status and statistics for a specific interface, enter **show interfaces xe interface-name**.

- To view status and traffic statistics for all interfaces, enter either [show interfaces xe detail](#) or [show interfaces xe extensive](#).

**Meaning** For details about output from the CLI commands, see [show interfaces xe](#).

## Other Tools to Configure and Monitor Devices Running Junos OS

Apart from the command-line interface, Junos OS also supports the following applications, scripts, and utilities that enable you to configure and monitor devices running Junos OS:

- Junos XML Management Protocol Application Programming Interface (API)—Application programmers can use the Junos XML Management Protocol API to monitor and configure Juniper Networks devices. Juniper Networks provides a Perl module with the API to help you more quickly and easily develop custom Perl scripts for configuring and monitoring the devices.
- NETCONF Application Programming Interface (API)—Application programmers can also use the NETCONF API to monitor and configure Juniper Networks devices.
- Junos OS commit scripts—You can define scripts to enforce custom configuration tasks, enforce consistency, prevent common mistakes, and more. Every time you commit a new candidate configuration, the active commit scripts are called to inspect the new candidate configuration. If a configuration violates your custom rules, the script can instruct the Junos OS to perform various actions, including making changes to the configuration and generating custom, warning, and system log messages.
- Junos OS Op scripts—You can add your own commands to the operation-mode CLI. You can use these scripts to automate troubleshooting of known network problems and correct them.
- Junos OS event scripts—You can use event scripts to diagnose and fix issues, monitor the overall status of the system, and examine errors periodically. Event scripts are similar to op scripts except that certain events on the switch will trigger these scripts.
- Junos Space—The Junos Space application design allows multiple users concurrent access to its user interface. It also includes applications for network infrastructure automation.

## Operational Commands

- [commit](#)
- [clear log](#)
- [clear chassis display message](#)

- `clear system commit`
- `clear system reboot`
- `file`
- `file archive`
- `file checksum md5`
- `file checksum sha1`
- `file checksum sha-256`
- `file compare`
- `file delete`
- `file list`
- `file rename`
- `file show`
- `load`
- `ping`
- `request chassis beacon`
- `request chassis cb`
- `request chassis fpc`
- `request chassis routing-engine master`
- `request fabric administration power-off interconnect-device`
- `request fabric administration power-off interconnect-device fpc`
- `request fabric administration power-off node-device`
- `request message`
- `request system configuration rescue delete`
- `request system configuration rescue save`
- `request system halt`
- `request system license add`
- `request system license delete`
- `request system license save`
- `request system logout`
- `request system power-off`
- `request system reboot`
- `request system snapshot`
- `request system software add`
- `request system software configuration-backup`
- `request system software configuration-restore`
- `request system software delete`
- `request system software download`

- request system software nonstop-upgrade
- request system software recover-from-restore-point
- request system software restore-point
- request system software rollback
- request system software validate
- request system storage cleanup
- request system zeroize
- restart
- rollback
- save
- show chassis alarms
- show chassis beacon
- show chassis ethernet-switch interconnect-device fpc
- show chassis ethernet-switch interconnect-device cb
- show chassis environment
- show chassis environment cb
- show chassis environment fpc
- show chassis environment pem
- show chassis environment routing-engine
- show chassis fan
- show chassis firmware
- show chassis fpc
- show chassis hardware

- `show system rollback`
- `show system services service-deployment`
- `show system software`
- `show system software restore-point-status`
- `show system statistics`
- `show system storage`
- `show system uptime`
- `show system users`
- `show system virtual-memory`
- `show version`
- `start shell`
- `test configuration`
- `traceroute`
- `traceroute monitor`

## commit

**Syntax** `commit <at <"string">> <and-quit> <check> <comment <"comment-string">>  
<confirmed> <display detail> <fast-synchronize> <minutes>  
<synchronize <force> <scripts>>`

**Release Information** Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 11.1 for the QFX Series.  
Option **fast-synchronize** added in Junos OS Release 12.2.  
Option **synchronize scripts** introduced in Junos OS Release 13.2.

**Description** Commit the set of changes to the database and cause the changes to take operational effect.

**NOTE:** The **fast-synchronize** option is not supported in a QFX Series Virtual Chassis.

**NOTE:** Beginning in Junos OS 12.3, it is possible that FPCs brought offline using the `request chassis fpc slot fpc-slot offline` operational-mode CLI command can come online during a configuration commit or power-supply replacement procedure. As an alternative, use the `set fpc fpc-slot power off` configuration-mode command at the `[edit chassis]` hierarchy level to ensure that the FPCs remain offline.

**Options** `at <"string">`—(Optional) Save software configuration changes and activate the configuration at a future time, or upon reboot.

**string** is **reboot** or the future time to activate the configuration changes. Enclose the **string** value (including **reboot**) in quotation marks (" "). You can specify time in two formats:

- A time value in the form **hh:mm[:ss]** (hours, minutes, and optionally seconds)—Commit the configuration at the specified time, which must be in the future but before 11:59:59 PM on the day the **commit at** configuration command is issued. Use 24-hour time for the **hh** value; for example, **04:30:00** is 4:30:00 AM, and **20:00** is 8:00 PM. The time is interpreted with respect to the clock and time zone settings on the router.
- A date and time value in the form **yyyy-mm-dd hh:mm[:ss]** (year, month, date, hours, minutes, and, optionally, seconds)—Commit the configuration at the specified day and time, which must be after the **commit at** command is issued. Use 24-hour time for the **hh** value. For example, **2003-08-21 12:30:00** is 12:30 PM on August 21, 2003. The time is interpreted with respect to the clock and time zone settings on the router.

For example, **commit at "18:00:00"**. For date and time, include both values in the same set of quotation marks. For example, **commit at "2005-03-10 14:00:00"**.

A *commit check* is performed when you issue the **commit at** configuration mode command. If the result of the check is successful, then the current user is logged out of configuration mode, and the configuration data is left in a read-only state. No other commit can be performed until the scheduled commit is completed.

**NOTE:** If Junos OS fails before the configuration changes become active, all configuration changes are lost.

You cannot enter the **commit at** configuration command when there is a pending reboot.

You cannot enter the **request system reboot** command once you schedule a commit operation for a specific time in the future.

You cannot commit a configuration when a scheduled commit is pending. For information about how to use the **clear** command to cancel a scheduled configuration, see the [CLI Explorer](#).

**and-quit**—(Optional) Commit the configuration and, if the configuration contains no errors and the commit succeeds, exit from configuration mode.

**check**—(Optional) Verify the syntax of the configuration, but do not activate it.

**comment** <"*comment-string*">—(Optional) Add a comment that describes the committed configuration. The comment can be as long as 512 bytes and must be typed on a single line. You cannot include a comment with the **commit check** command. Enclose *comment-string* in quotation marks (" "). For example, **commit comment "Includes changes recommended by SW Lab"**.

**confirmed** <*minutes*>—(Optional) Require that the commit be confirmed within the specified amount of time. To confirm a commit, enter either a **commit** or **commit check** command. If the commit is not confirmed within the time limit, the configuration rolls back automatically to the precommit configuration and a broadcast message is sent to all logged-in users. To show when a rollback is scheduled, enter the **show system commit** command. The allowed range is 1 through 65,535 minutes, and the default is 10 minutes.

In Junos OS Release 11.4 and later, you can also use the **commit confirmed** command in the **[edit private]** configuration mode.

**display detail**—(Optional) Monitors the commit process.

**NOTE:** In Junos OS Release 10.4 and later, if the number of commit details or messages exceeds a page when used with the **| display detail** pipe option, the **more** pagination option on the screen is no longer available. Instead, the messages roll up on the screen by default, just like using the **commit** command with the **| no more** pipe option.

**fast-synchronize**—(Optional) Configure the commits to run in parallel on both the master and backup Routing Engines to reduce the time taken for commit synchronization.

**NOTE:** The **fast-synchronize** statement is not supported on QFX Series devices when used in a Virtual Chassis.

**synchronize <force> <scripts>**—(Optional) If your router has two Routing Engines, you can manually direct one Routing Engine to synchronize its configuration with the other by issuing the **commit synchronize** command. The Routing Engine on which you execute this command (request Routing Engine) copies and loads its candidate configuration to the other (responding Routing Engine). Both Routing Engines then perform a syntax check on the candidate configuration file being committed. If no errors are found, the configuration is activated and becomes the current operational configuration on both Routing Engines. The **commit synchronize** command does not work if the responding Routing Engine has uncommitted configuration changes. However, you can enforce commit synchronization on the Routing Engines by using the **force** option. When you issue the **commit synchronize** command with the **force** option from one Routing Engine, the configuration sessions on the other Routing Engine are terminated and its configuration synchronized with that on the Routing Engine from which you issued the command.

When you issue the **commit synchronize** command with the **scripts** option, the device synchronizes all commit, event, lib, and op scripts from the requesting Routing Engine to the responding Routing Engine and also commits and synchronizes the configuration. If the commit check operation fails for the requesting Routing Engine, the process stops, and the scripts are not copied to the responding Routing Engine. If the commit check or commit operation fails for the responding Routing Engine, the scripts are still synchronized, since the synchronization occurs prior to the commit check operation on the responding Routing Engine.

If the **load-scripts-from-flash** statement is configured for the requesting Routing Engine, the device synchronizes the scripts from flash memory on the requesting Routing Engine to flash memory on the responding Routing Engine. Otherwise, the device synchronizes the scripts from the hard disk on the requesting Routing Engine to the hard disk on the responding Routing Engine. The device synchronizes all scripts regardless of whether they are enabled in the configuration or have been updated since the last synchronization.

**NOTE:** When you issue the **commit synchronize** command, you must use the **apply-groups re0** and **re1** commands. For information about how to use groups, see *Disabling Inheritance of a Junos OS Configuration Group*.

The responding Routing Engine must use Junos OS Release 5.0 or later.

**Required Privilege Level**

**configure**—To enter configuration mode.

**NOTE:** If you are using Junos OS in a Common Criteria environment, system log messages are created whenever a secret attribute is changed (for example, password changes or changes to the RADIUS shared secret). These changes are logged during the following configuration load operations:

```
load merge
load replace
load override
load update
```

For more information, see the *Secure Configuration Guide for Common Criteria and Junos-FIPS*

## Sample Output

### clear log

The following sample commands list log file information, clear the contents of a log file, and then display the updated log file information:

```
user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:
-----
-rw-r-----  1 root  wheel          26450 Jun 23 18:47 /var/log/sampled
total 1

user@host> clear log lcc0-re0:sampled
lcc0-re0:
-----

user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:
-----
-rw-r-----  1 root  wheel           57 Sep 15 03:44 /var/log/sampled
total 1
```

## clear chassis display message

| <b>Description</b>                    | (M40e, M160, M320, T Series routers, EX Series, and QFabric systems only) Clear or stop a text message on the craft interface display, which is on the front of the router or switch or on the LCD panel display on the router or switch. The craft interface alternates the display of text messages with standard craft interface messages, switching between messages every 2 seconds. By default, on both the router and the switch, the text message is displayed for 5 minutes. The craft interface display has four 20-character lines. The LCD panel display has two 16-character lines, and text messages appear only on the second line.                                                                                           |
| <b>Options</b>                        | <b>none</b> —Clear or stop a text message on the craft interface display.<br><br><b>interconnect-device <i>name</i></b> —(QFabric systems only) (Optional) On a QFabric system, clear or stop a text message on the LCD panel display on the specified Interconnect device.<br><br><b>lcc <i>number</i></b> —(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.<br>Replace <i>number</i> with the following values depending on the LCC configuration: <ul style="list-style-type: none"><li>• 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.</li><li>• 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.</li></ul> |

- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**node-device *name***—(QFabric systems only) (Optional) On a QFabric system, clear or stop a text message on the LCD panel display on the specified Node device in a Node group.

**scc**—(TX Matrix routers only) (Optional) Clear or stop a text message on the craft interface on the TX Matrix router (switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Clear or stop a text message on the craft interface on the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

**Required Privilege Level** clear

## Sample Output

### clear chassis display message

The following example displays and then clears the text message on the craft interface display:

```
user@host> show chassis craft-interface
Red alarm:      LED off, relay off
Yellow alarm:   LED off, relay off
Host OK LED:    On
Host fail LED:  Off
FPCs           0  1  2  3  4  5  6  7
-----
Green  ..  *..  *  *.
Red    .....
LCD screen:
      +-----+
      |NOC contact Dusty|
      |(888) 526-1234   |
      +-----+

user@host> clear chassis display message

user@host> show chassis craft-interface
Red alarm:      LED off, relay off
Yellow alarm:   LED off, relay off
```

```
Host OK LED:  On
Host fail LED: Off
FPCs      0  1  2  3  4  5  6  7

| <b>Description</b>                    | Clear any pending system software reboots or halts. When issued on a TX Matrix router without any options, the default behavior clears all pending system software reboots or halts on all T640 routers connected to the TX Matrix router. When issued on a TX Matrix Plus router without any options, the default behavior clears all pending system software reboots or halts on all T1600 or T4000 routers connected to the TX Matrix Plus router.                                                                                                                        |
| <b>Options</b>                        | <b>none</b> —Clear all pending system software reboots or halts.<br><br><b>all-chassis</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) Clear all halt or reboot requests for all the Routing Engines in the chassis.<br><br><b>all-lcc</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, clear all halt or reboot requests for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, clear all halt or reboot requests on the l connected T1600 or T4000 LCCs. |

**all-members**—(EX4200 switches only) (Optional) Clear all halt or reboot requests on all members of the Virtual Chassis configuration.

**both-routing-engines**—(Systems with multiple Routing Engines) (Optional) Clear all halt or reboot requests on both Routing Engines. On a TX Matrix router, clear both Routing Engines on all chassis connected to the TX Matrix router. Likewise, on a TX Matrix Plus router, clear both Routing Engines on all chassis connected to the TX Matrix Plus router.

**infrastructure name**—(QFabric systems) (Optional) Clear all halt or reboot requests on the fabric control Routing Engines or fabric manager Routing Engines.

**interconnect-device name**—(QFabric systems) (Optional) Clear all halt or reboot requests on the Interconnect device.

**lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, clear all halt or reboot requests for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, clear all halt or reboot requests for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches only) (Optional) Clear all halt or reboot requests on the local Virtual Chassis member.

**member member-id**—(EX4200 switches only) (Optional) Clear all halt or reboot requests on the specified member of the Virtual Chassis configuration. Replace *member-id* with a value from 0 through 9.

**node-group name**—(QFabric systems) (Optional) Clear all halt or reboot requests on the Node group.

**scc**—(TX Matrix routers only) (Optional) Clear all halt or reboot requests for the TX Matrix router (or switch-card chassis).

**sfc number**—(TX Matrix Plus routers only) (Optional) Clear all halt or reboot requests for the TX Matrix Plus router. Replace *number* with 0.

**Required Privilege Level**      maintenance

## Sample Output

### clear system reboot

```
user@host> clear system reboot
reboot requested by root at Sat Dec 12 19:37:34 1998
[process id 17855]
Terminating...
```

### clear system reboot (TX Matrix Router)

```
user@host> clear system reboot
scc-re0:
-----
No shutdown/reboot scheduled.
lcc0-re0:
-----
No shutdown/reboot scheduled.
lcc2-re0:
-----
No shutdown/reboot scheduled.
```

### clear system reboot (QFX Series)

```
user@switch> clear system reboot node-group node1
No shutdown/reboot scheduled.
```

## Sample Output

### file archive (Multiple Files)

The following sample command archives all message files in the local directory `/var/log/messages` as the single file `messages-archive.tar`.

```
user@host> file archive source /var/log/messages* destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.
user@host>
```

### file archive (Single File)

The following sample command archives one message file in the local directory `/var/log/messages` as the single file `messages-archive.tar`.

```
user@host> file archive source /var/log/messages destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.
user@host
```

### file archive (with Compression)

The following sample command archives and compresses all message files in the local directory **/var/log/messages** as the single file **messages-archive.tgz**.

```
user@host> file archive compress source /var/log/messages* destination
/var/log/messages-archive.tgz
/usr/bin/tar: Removing leading / from absolute path names in the archive.
```

## file checksum md5

| <b>Description</b>              | <p>Compare two local files and describe the differences between them in default, context, or unified output styles:</p> <ul style="list-style-type: none"> <li>• <b>Default</b>—In the first line of output, <b>c</b> means lines were changed between the two files, <b>d</b> means lines were deleted between the two files, and <b>a</b> means lines were added between the two files. The numbers preceding this alphabetical marker represent the first file, and the lines after the alphabetical marker represent the second file. A left angle bracket (&lt;) in front of output lines refers to the first file. A right angle bracket (&gt;) in front of output lines refers to the second file.</li> <li>• <b>Context</b>—The display is divided into two parts. The first part is the first file; the second part is the second file. Output lines preceded by an exclamation point (!) have changed. Additions are marked with a plus sign (+), and deletions are marked with a minus sign (-).</li> <li>• <b>Unified</b>—The display is preceded by the line number from the first and the second file (xx,xxx,x). Before the line number, additions to the file are marked with a plus sign (+), and deletions to the file are marked with a minus sign (-). The body of the output contains the affected lines. Changes are viewed as additions plus deletions.</li> </ul> |
| <b>Options</b>                  | <p><b>files <i>filename</i></b>—Names of two local files to compare.</p> <p><b>context</b>—(Optional) Display output in context format.</p> <p><b>ignore-white-space</b>—(Optional) Ignore changes in the amount of white space.</p> <p><b>unified</b>—(Optional) Display output in unified format.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Release Information</b>      | Command introduced before Junos OS Release 7.4.<br>Command introduced in Junos OS Release 9.0 for EX Series switches.<br>Command introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                             |
| <b>Description</b>              | Display a list of files on the local router or switch.                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>                  | <p><b>none</b>—Display a list of all files for the current directory.</p> <p><b>detail   recursive</b>—(Optional) Display detailed output or descend recursively through the directory hierarchy, respectively.</p> <p><b>filename</b>—(Optional) Display a list of files. For a routing matrix, the filename must include the chassis information.</p>              |
| <b>Additional Information</b>   | The default directory is the home directory of the user logged in to the router or switch. To view available directories, enter a space and then a backslash (/) after the <b>file list</b> command. To view files within a specific directory, include a backslash followed by the directory and, optionally, subdirectory name after the <b>file list</b> command. |
| <b>Required Privilege Level</b> | maintenance                                                                                                                                                                                                                                                                                                                                                          |

### Sample Output

#### file rename

The following example lists the files in `/var/tmp`, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file rename /var/tmp/dcd.core /var/tmp/dcd.core.990413
user@host> file list /var/tmp
dcd.core.990413
rpd.core
snmpd.core
```

#### file rename (Routing Matrix)

The following example lists the files in `/var/tmp`, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list lcc0-re1:/var/tmp
lcc0-re1:
-----

/var/tmp:
.pccardd
sartre.conf
snmpd
syslogd.core-tarball.0.tgz
```

```
user@host> file rename lcc0-re0:/var/tmp/snmpd /var/tmp/snmpd.rr
```

```
user@host> file list lcc0-re1:/var/tmp
```

```
lcc0-re1:
```

```
-----
```

```
/var/tmp:
```

```
.pccardd
```

```
sartre.conf
```

```
snmpd.rr
```

```
syslogd.core-tarball.0.tgz
```

| <b>Description</b>         | Load a configuration from an ASCII configuration file, from terminal input, or from the factory default. Your current location in the configuration hierarchy is ignored when the load operation occurs.                                                                                                                                                                            |
| <b>Options</b>             | <b>dhcp-snooping</b> —(QFX Series switches) Loads DHCP snooping entries.<br><br><b>factory-default</b> —Loads the factory configuration. The factory configuration contains the manufacturer's suggested configuration settings. The factory configuration is the router or switch's first configuration and is loaded when the router or switch is first installed and powered on. |

**NOTE:** To load the factory default configuration, you must first *unprotect* any protected hierarchies in the configuration.

On J Series Services Routers, pressing and holding down the Config button on the router for 15 seconds causes the factory configuration to be loaded and committed. However, this operation deletes all other configurations on the router; using the **load factory-default** command does not.

**filename**—Name of the file to load. For information about specifying the filename, see *Viewing Files and Directories on a Device Running Junos OS*.

**merge**—Combine the configuration that is currently shown in the CLI with the configuration.

**override**—Discard the entire configuration that is currently shown in the CLI and load the entire configuration. Marks every object as changed.

**patch**—Change part of the configuration and mark only those parts as changed.

**replace**—Look for a **replace** tag in *filename*, delete the existing statement of the same name, and replace it with the configuration.

**set**—Merge a set of commands with an existing configuration. This option executes the configuration instructions line by line as they are stored in a file or from a terminal. The instructions can contain any configuration mode command, such as **set**, **edit**, **exit**, and **top**.

**relative**—(Optional) Use the **merge** or **replace** option without specifying the full hierarchy level.

**terminal**—Use the text you type at the terminal as input to the configuration. Type Ctrl+d to end terminal input.

**update**—Discard the entire configuration that is currently shown in the CLI, and load the entire configuration. Marks changed objects only.

**NOTE:** If you are using Junos OS in a Common Criteria environment, system log messages are created whenever a secret attribute is changed (for example, password changes or changes to the RADIUS shared secret). These changes are logged during the following configuration load operations:

```
load merge
load replace
load override
load update
```

For more information, see the *Secure Configuration Guide for Common Criteria and Junos-FIPS*.

---

**Required Privilege Level**    configure—To enter configuration mode, but other required privilege levels depend on where the statement is located in the configuration hierarchy.

| <b>Description</b>         | Check host reachability and network connectivity. The <b>ping</b> command sends Internet Control Message Protocol (ICMP) ECHO_REQUEST messages to elicit ICMP ECHO_RESPONSE messages from the specified host. Press Ctrl+c to interrupt a ping command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>             | <p><b>host</b>—IP address or hostname of the remote system to ping.</p> <p><b>bypass-routing</b>—(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it.</p> <p><b>count requests</b>—(Optional) Number of ping requests to send. The range of values is 1 through 2,000,000,000. The default value is an unlimited number of requests.</p> <p><b>detail</b>—(Optional) Include in the output the interface on which the ping reply was received.</p> <p><b>do-not-fragment</b>—(Optional) Set the do-not-fragment (DF) flag in the IP header of the ping packets. For IPv6 packets, this option disables fragmentation.</p> <div><p><b>NOTE:</b> In Junos OS Release 11.1 and later, when issuing the <b>ping</b> command for an IPv6 route with the <b>do-not-fragment</b> option, the maximum ping packet size is calculated by subtracting 48 bytes (40 bytes for the IPV6 header and 8 bytes for the ICMP header) from the MTU. Therefore, if the ping packet size (including the 48-byte header) is greater than the MTU, the ping operation might fail.</p></div> <p><b>inet</b>—(Optional) Ping Packet Forwarding Engine IPv4 routes.</p> <p><b>inet6</b>—(Optional) Ping Packet Forwarding Engine IPv6 routes.</p> <p><b>interface source-interface</b>—(Optional) Interface to use to send the ping requests.</p> <p><b>interval seconds</b>—(Optional) How often to send ping requests. The range of values, in seconds, is 1 through infinity. The default value is 1.</p> <p><b>logical-system logical-system-name</b>—(Optional) Name of logical system from which to send the ping requests.</p> <p>Alternatively, enter the <b>set cli logical-system logical-system-name</b> command and then run the <b>ping</b> command. To return to the main router or switch, enter the <b>clear cli logical-system</b> command.</p> |

**loose-source *value***—(Optional) Intermediate loose source route entry (IPv4). Open a set of values.

**mac-address *mac-address***—(Optional) Ping the physical or hardware address of the remote system you are trying to reach.

**no-resolve**—(Optional) Do not attempt to determine the hostname that corresponds to the IP address.

**pattern *string***—(Optional) Specify a hexadecimal fill pattern to include in the ping packet.

**rapid**—(Optional) Send ping requests rapidly. The results are reported in a single message, not in individual messages for each ping request. By default, five ping requests are sent before the results are reported. To change the number of requests, include the **count** option.

**record-route**—(Optional) Record and report the packet's path (IPv4).

**routing-instance *routing-instance-name***—(Optional) Name of the routing instance for the ping attempt.

**size *bytes***—(Optional) Size of ping request packets. The range of values, in bytes, is 0 through 65,468. The default value is 56, which is effectively 64 bytes because 8 bytes of ICMP header data are added to the packet.

**source *source-address***—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (lo.0).

**strict**—(Optional) Use the strict source route option (IPv4).

**strict-source *value***—(Optional) Intermediate strict source route entry (IPv4). Open a set of values.

**tos *type-of-service***—(Optional) Set the type-of-service (ToS) field in the IP header of the ping packets. The range of values is 0 through 255.

If the device configuration includes the **dscp-code-point *value*** statement at the **[edit class-of-service host-outbound-traffic]** hierarchy level, the configured DSCP value overrides the value specified in this command option. In this case, the ToS field of ICMP echo request packets sent on behalf of this command carries the DSCP value specified in the **dscp-code-point** configuration statement instead of the value you specify in this command option.

**ttl *value***—(Optional) Time-to-live (TTL) value to include in the ping request (IPv6). The range of values is 0 through 255.

**verbose**—(Optional) Display detailed output.

**vpls *instance-name***—(Optional) Ping the instance to which this VPLS belongs.

**wait *seconds***—(Optional) Maximum wait time, in seconds, after the final packet is sent. If this option is not specified, the default delay is 10 seconds. If this option is used without the count option, a default count of 5 packets is used.

| Output Fields            | When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. These packets are not counted in the received packets count. They are accounted for separately. |

## Sample Output

### ping hostname

```
user@host> ping skye
PING skye.net (192.168.169.254): 56 data bytes
64 bytes from 192.168.169.254: icmp_seq=0 ttl=253 time=1.028 ms
64 bytes from 192.168.169.254: icmp_seq=1 ttl=253 time=1.053 ms
64 bytes from 192.168.169.254: icmp_seq=2 ttl=253 time=1.025 ms
64 bytes from 192.168.169.254: icmp_seq=3 ttl=253 time=1.098 ms
64 bytes from 192.168.169.254: icmp_seq=4 ttl=253 time=1.032 ms
64 bytes from 192.168.169.254: icmp_seq=5 ttl=253 time=1.044 ms
^C [abort]
```

### ping hostname rapid

```
user@host> ping skye rapid
PING skye.net (192.168.169.254): 56 data bytes
!!!!
--- skye.net ping statistics ---
5 packets transmitted, 5 packets received, 0% packet loss

## Sample Output

### request chassis beacon fpc 0 on (QFX Series)

```
user@switch> request chassis beacon fpc 0 on

Beacon set to ON
```

### request chassis beacon node-device (QFabric System)

```
user@switch> request chassis beacon node-device node1 on
```

node1 ON

**request chassis beacon on interconnect-device fpc (QFabric System)**

user@switch> request chassis beacon on interconnect-device fpc 2

FPC 2 ON

## request chassis cb

| <b>Description</b>                    | (M120, M320, and MX Series routers and T Series routers, QFabric systems, and EX8200 switches only) Control the operation of the Control Board (CB). For information about the meaning of “CBs” on the switches, see <i>EX Series Switches Hardware and CLI Terminology Mapping</i> .                                                                                                                                                                            |
| <b>Options</b>                        | <b>offline</b> —Take the Control Board offline.                                                                                                                                                                                                                                                                                                                                                                                                                  |

**NOTE:** On a QFabric system, to bring the backup Control Board on a QFX3008-I Interconnect device offline, issue the `request chassis cb slot backup-slot-number offline` command.

**NOTE:** Only backup Control Board can be turned offline or online. To turn a Control Board offline or to bring it back online, the Routing Engine should be turned offline first.

**online**—Bring the Control Board online.

**interconnect-device *name***—(QFabric systems only) (Optional) Bring the QFX3008-I Interconnect device Control Board either offline or online:

**slot slot-number**—Control Board slot number:

- (TX Matrix and TX Matrix Plus routers only) On a TX Matrix router, if you specify the number of the T640 router by using the **lcc number** option (the recommended method), replace **cb-slot-number** with a value from 0 through 1.

Likewise, on a TX Matrix Plus router, if you specify the number of the T1600 or T4000 router by using the **lcc number** option (the recommended method), replace **cb-slot-number** with a value from 0 through 1.

- M320 router—Replace **slot-number** with a value from 0 through 1.
- MX480/MX240 routers—Replace **slot-number** with a value from 0 through 1.
- MX960 router—Replace **slot-number** with a value from 0 through 2.
- MX2020 and MX2010 routers—Replace **slot-number** with 0 or 1.
- EX8208 switch—Replace **slot-number** with a value from 0 through 2.
- EX8216 switch—Replace **slot-number** with a value from 0 through 1.
- QFabric System—Replace **slot-number** with a value from 0 through 1.

**lcc number**—(TX Matrix, TX Matrix Plus routers only) (Optional) Line-card chassis number.

Replace **number** with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**sfc number**—(TX Matrix Plus routers only) (Optional) Change the CB status for the TX Matrix Plus router (switch-fabric chassis). Replace **number** with 0.

**Required Privilege Level** maintenance

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request chassis cb

```
user@host> request chassis cb offline slot 1
Backup CB 1 cannot be set offline, backup RE is online
```

### request chassis cb interconnect-device (QFabric System)

```
user@switch> request chassis cb interconnect-device interconnect1 offline slot 1
Backup CB 1 cannot be set offline, backup RE is online
```

### request chassis cb (MX2020 Router)

```
user@host> request chassis cb offline slot 1
Backup CB 1 cannot be set offline, backup RE is online
```

### request chassis cb (MX2010 Router)

```
user@host> request chassis cb offline slot 1
Backup CB 1 cannot be set offline, backup RE is online
```

## request chassis fpc

| <b>Description</b>                                   | (M20, M40, M40e, M120, M160, M320, MX Series, and T Series routers, QFabric systems, EX Series switches, and PTX Series Packet Transport Routers only) Control the operation of the Flexible PIC Concentrator (FPC). For information about the meaning of “FPCs” on the switches, see <i>EX Series Switches Hardware and CLI Terminology Mapping</i> .                                                                                                         |

**NOTE:** Beginning in Junos OS 12.3, it is possible that FPCs brought offline using the `request chassis fpc slot fpc-slot offline` operational-mode CLI command can come online during a configuration commit or power-supply replacement procedure. As an alternative, use the `set fpc fpc-slot power off` configuration-mode command at the `[edit chassis]` hierarchy level to ensure that the FPCs remain offline.

**Options**    **offline**—Take the FPC offline.

**online**—Bring the FPC online.

**interconnect-device *name***—(QFabric systems only) Bring the Flexible Port Concentrator (FPC) on the QFX3008-I Interconnect device either offline or online:

- (QFabric System) On a QFabric system, specify the name of the QFX3008-I Interconnect device containing the Flexible Port Concentrator (FPC) you want to bring either offline or online.

**restart**—Restart the FPC.

**slot *slot-number***—FPC slot number:

- M20 router—0 through 3.
- M120 router—0 through 5.
- MX240 router—0 through 2. On the MX240 router, slot-number corresponds to the Dense Port Concentrator (DPC) slot number. If an MPC is installed, slot-number corresponds to the MPC slot number.
- MX480 router—0 through 5. On the MX480 router, slot-number corresponds to the Dense Port Concentrator (DPC) slot number. If an MPC is installed, slot-number corresponds to the MPC slot number.
- MX960 router—0 through 11. On the MX960 router, slot-number corresponds to the Dense Port Concentrator (DPC) slot number. If an MPC is installed, slot-number corresponds to the MPC slot number.
- MX2020 router—0 through 19.
- MX2010 router—0 through 9.
- TX Matrix and TX Matrix Plus routers only—On the TX Matrix router, if you specify the number of the T640 router by using the ***lcc number*** option (the recommended method), replace ***slot-number*** with a value from 0 through 7. Otherwise, replace ***slot-number*** with a value from 0 through 31.

Likewise, on a TX Matrix Plus router, if you specify the number of the T1600 or T4000 router by using the ***lcc number*** option (the recommended method), replace ***slot-number*** with a value from 0 through 7. Otherwise, replace ***slot-number*** with a value from 0 through 31. In case of TX Matrix Plus router with 3D SIBs, replace

*slot-number* with a value from 0 through 63. For example, the following commands have the same result:

```
user@host> request chassis fpc lcc 1 slot 1 offline
user@host> request chassis fpc slot 9 offline
```

- Other routers—0 through 7.
- QFabric System—Replace *slot-number* with a value from 0 through 2.
- EX Series switches:
  - EX4200 switches in a Virtual Chassis configuration—Replace *slot-number* with a value from 0 through 9.
  - EX6210 switches—Replace *slot-number* with a value from 0 through 9.

**NOTE:** These commands are not supported for slots 4 and 5 when a Switch Fabric and Routing Engine (SRE) module is installed in those slots. These commands are supported for slots 4 and 5 only if a line card is installed in them.

- EX8208 switches—Replace *slot-number* with a value from 0 through 7.
- EX8216 switches—Replace *slot-number* with a value from 0 through 15.
- PTX5000 Packet Transport Router—Replace *slot-number* with a value from 0 through 7.

**all-members**—(MX Series routers only) (Optional) Change FPC status of all members of the Virtual Chassis configuration.

**local**—(MX Series routers only) (Optional) Change FPC status of the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Change FPC status of the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**lcc *number***—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.

- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**List of Sample Output**

- [request chassis fpc on page 389](#)
- [request chassis fpc \(MX Series Routers with Media Services Blade \[MSB\]\) on page 389](#)
- [request chassis fpc \(MX2020 Router\) on page 389](#)
- [request chassis fpc \(MX2010 Router\) on page 389](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request chassis fpc

```
user@host> request chassis fpc online slot 0
FPC 0 already online
```

### request chassis fpc (MX Series Routers with Media Services Blade [MSB])

```
user@host> request chassis fpc slot 0
Possible completions:
offline           Take FPC offline
online            Bring FPC online
restart           Restart FPC
```

### request chassis fpc (MX2020 Router)

```
user@host >request chassis fpc online slot 2
FPC 2 already online
```

### request chassis fpc (MX2010 Router)

```
user@host >request chassis fpc offline slot 5
Offline initiated, use "show chassis fpc" to verify
```

## request chassis routing-engine master

| <b>Description</b>                                    | For routers or switches with multiple Routing Engines, control which Routing Engine is the master.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**CAUTION:** (Routing matrix based on the TX Matrix or TX Matrix Plus routers only) Within the routing matrix, we recommend that all Routing Engines run the same Junos OS Release. If you run different releases on the Routing Engines and a change in mastership occurs on any backup Routing Engine in the routing matrix, one or all routers (in a routing matrix based on the TX Matrix router or in a routing matrix based on a TX Matrix Plus router) might become logically disconnected from the TX Matrix router and cause data loss. For more information, see the [TX Matrix Router Hardware Guide](#) or the *Junos OS High Availability Library for Routing Devices*.

**NOTE:** Successive graceful Routing Engine switchover events must be a minimum of 240 seconds (4 minutes) apart after both Routing Engines have come up.

If the router or switch displays a warning message similar to “Standby Routing Engine is not ready for graceful switchover. Packet Forwarding Engines that are not ready for graceful switchover might be reset,” do not attempt switchover. If you choose to proceed with switchover, only the Packet Forwarding Engines that were not ready for graceful switchover are reset. None of the Flexible PIC concentrators (FPCs) should spontaneously restart. We recommend that you wait until the warning no longer appears and then proceed with the switchover.

You will receive an error message stating “Command aborted. Not ready for mastership switch, try after n seconds” when this command is re-entered before 240 seconds have elapsed on EX Series switches.

**NOTE:** On a QFabric system, to avoid traffic loss on the network Node group, switch mastership of the routing engine to the backup routing engine, and then reboot.

**Options** **acquire**—Attempt to become the master Routing Engine.

**release**—Request that the other Routing Engine become the master.

**switch**—Toggle mastership between Routing Engines.

**NOTE:** The **acquire** option should be used with caution because acquiring a Routing Engine may result in a corrupted database. If possible, use the **switch** option instead.

The **acquire**, **release**, and **switch** options have the following suboptions:

**all-chassis**—(TX Matrix and TX Matrix Plus routers only) On a routing matrix composed of a TX Matrix router and the attached T640 routers, switch mastership on all the Routing Engines in the routing matrix. Likewise, on a routing matrix composed of a TX Matrix Plus router and the attached T1600 or T4000 routers, switch mastership on all the Routing Engines in the routing matrix.

**all-lcc**—(TX Matrix Plus routers only) Request to acquire mastership for all line-card chassis (LCC).

**all-members**—(MX Series routers only) (Optional) Control Routing Engine mastership on the Routing Engines in all member routers of the Virtual Chassis configuration.

**check**—(QFabric systems, MX104, MX480, MX960, MX2010, and MX2020 routers, and PTX5000 routers only) (Optional) Available only with the **switch** option. Check graceful switchover status of the standby Routing Engine before toggling mastership between Routing Engines.

**interconnect-device *name***—(QFabric systems only) (Optional) Control Routing Engine mastership on the Routing Engines on an Interconnect device.

**lcc *number***—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Control Routing Engine mastership on the Routing Engines in the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Control Routing Engine mastership on the Routing Engines of the specified member in the Virtual Chassis Configuration. Replace *member-id* with a value of 0 or 1.

**no-confirm**—(Optional) Do not request confirmation for the switch.

**node-group *name***—(QFabric systems only) (Optional) Control Routing Engine mastership on the Routing Engines on a Node group.

**scc**—(TX Matrix routers only) TX Matrix (switch-card chassis).

**sfc**—(TX Matrix Plus routers only) TX Matrix Plus router (or switch-fabric chassis).

**force**—(Optional) Available only with the **acquire** option. Force the change to a new master Routing Engine.

**NOTE:** The **force** option is not supported on the M Series, MX Series, or T Series routers.

**Additional Information** Because both Routing Engines are always running, the transition from one to the other as the master Routing Engine is immediate. However, the changeover interrupts communication to the System and Switch Board (SSB). The SSB takes several seconds to reinitialize the Flexible PIC Concentrators (FPCs) and restart the PICs. Interior gateway protocol (IGP) and BGP convergence times depend on the specific network environment.

By default, the Routing Engine in slot 0 (**RE0**) is the master and the Routing Engine in slot 1 (**RE1**) is the backup. To change the default master Routing Engine, include the **routing-engine** statement at the **[edit chassis redundancy]** hierarchy level in the configuration. For more information, see the *Junos OS Administration Library for Routing Devices*

To have the backup Routing Engine become the master Routing Engine, use the **request chassis routing-engine master switch** command. If you use this command to change the master and then restart the chassis software for any reason, the master reverts to the default setting.

**NOTE:** Although the configurations on the two Routing Engines do not have to be the same and are not automatically synchronized, we recommend making both configurations the same.

## Sample Output

### request chassis routing-engine master acquire

```
user@host> request chassis routing-engine master acquire

warning: Traffic will be interrupted while the PFE is re-initialized

warning: The other routing engine's file system could be corrupted

Reset other routing engine and become master ? [yes,no] (no)
```

### request chassis routing-engine master switch

```
user@host> request chassis routing-engine master switch

warning: Traffic will be interrupted while the PFE is re-initialized
Toggle mastership between Routing Engines ? [yes,no] (no) yes

Resolving mastership...
Complete. The other Routing Engine becomes the master.
```

Switch mastership back to the local Routing Engine:

```
user@host> request chassis routing-engine master switch

warning: Traffic will be interrupted while the PFE is re-initialized
Toggle mastership between routing engines ? [yes,no] (no) yes

Resolving mastership...
Complete. The local routing engine becomes the master.
```

### request chassis routing-engine master switch check

Usage shown for M Series, MX Series, and T Series routers.

```
{master}[edit]
user@host> request chassis routing-engine master switch check

warning: Standby Routing Engine is not ready for graceful switchover.

{master}[edit]
user@host> request chassis routing-engine master switch check
Switchover Ready

You can similarly check the backup Routing Engine.
```

## request fabric administration power-off interconnect-device

## Sample Output

### request fabric administration power-off interconnect-device

```

user@qfabric request fabric administration power-off interconnect-device IC-12345
STEP 1 of 7 (Acquiring lock):
Acquiring lock to perform this operation
Acquired lock to perform this operation
STEP 2 of 7 (Performing pre-checks):
interconnect-device IC-12345 is online
STEP 3 of 7 (Gracefully offlining the interconnect):
Disabling fabric protocol on interconnect-device
Disabled fabric protocol on interconnect-device
STEP 4 of 7 (Waiting for convergence):
Waiting for convergence(this will take few minutes)
Convergence complete
STEP 5 of 7 (Powering-off the interconnect):
Now, powering-off the interconnect-device (this may take some time)
Powered-off the interconnect-device
STEP 6 of 7 (Updating inventory):
Removing the interconnect-device - IC-A0004 from inventory
interconnect-device - IC-12345 is removed from inventory
STEP 7 of 7 (Releasing lock):
Releasing the lock

```

## request fabric administration power-off interconnect-device fpc

### Sample Output

#### request fabric administration power-off interconnect-device fpc 13

```
user@qfabric request fabric administration power-off interconnect-device IC-12345 fpc 13
STEP 1 of 6 (Acquiring lock):
Acquiring lock to perform this operation
Acquired lock to perform this operation
STEP 2 of 6 (Performing pre-checks):
interconnect-device IC-12345 is online
STEP 3 of 6 (Gracefully offlining the interconnect linecard):
Gracefully offlining the fpc
fpc is successfully offlined
STEP 4 of 6 (Waiting for convergence):
Waiting for convergence(this will take few minutes)
request fabric administration power-off interconnect-device IC-12345
Convergence complete
STEP 5 of 6 (Powering-off the interconnect linecard):
Now, powering-off the fpc on the interconnect-device
Powered-off the fpc on the interconnect-device
STEP 6 of 6 (Releasing lock):
Releasing the lock
```

| <b>Description</b>              | <p>In QFX3000-G QFabric systems, you can use this command to power off QFX3500, QFX3600, QFX5100-48S, QFX5100-48T, and QFX5100-24Q devices in server Node groups, redundant server Node groups, and network Node groups. In QFX3000-M QFabric systems, you can use this command to power off QFX5100-24Q Interconnect devices and QFX3600-I Interconnect devices.</p> <p>This command systematically takes the device offline and gracefully shuts down the device while preserving system state information. A message appears on the console or console log, confirming that the operating system has stopped on the device.</p> |
| <b>Options</b>                  | <code>serial-id   alias-name</code> —Provide the serial ID or alias name of the device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

### Sample Output

#### request fabric administration power-off node-device

```
user@qfabric request fabric administration power-off node-device ED1234
STEP 1 of 8 (Acquiring lock):
Acquiring lock to perform this operation
Acquired lock to perform this operation
STEP 2 of 8 (Performing pre-checks):
node-device ED1491 is online
STEP 3 of 8 (Mastership switch-over):
node-device ED1491 is Server Node-group
STEP 4 of 8 (Gracefully offlining the node-device):
node-device is being offlined
node-device is successfully offlined
STEP 5 of 8 (Waiting for convergence):
Waiting for convergence(this will take few minutes)
Convergence complete
STEP 6 of 8 (Powering-off the node-device):
Now, powering-off the node-device
Powered-off the node-device
STEP 7 of 8 (Updating inventory):
Removing the node-device - ED1491 from inventory
node-device - ED1491 is removed from inventory
```

STEP 8 of 8 (Releasing lock):  
Releasing the lock

| <b>Description</b>               | <div>Stop the router or switch software.</div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

**NOTE:** When you issue this command on an individual component—for example, a Node device—in a QFabric system, you will receive a warning that says “Hardware-based members will halt, Virtual Junos Routing Engines will reboot.” If you want to halt only one member of a Node group, issue this command with the **member** option on the Node device CLI, because you cannot issue this command from the QFabric CLI. Also, issuing this command might cause traffic loss on an individual component.

When you issue this command on a QFX5100 switch, you are not prompted to reboot. You must power cycle the switch to reboot.

**Options** **none**—Stop the router or switch software immediately.

**all-chassis**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Halt all chassis.

**all-lcc**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, halt all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, halt all T1600 or T4000 routers connected to the TX Matrix Plus router.

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Halt all members of the Virtual Chassis configuration.

**at time** —(Optional) Time at which to stop the software, specified in one of the following ways:

- **now**—Stop the software immediately. This is the default.
- **+minutes**—Number of minutes from now to stop the software.
- **yymmddhhmm**—Absolute time at which to stop the software, specified as year, month, day, hour, and minute.
- **hh:mm**—Absolute time on the current day at which to stop the software.

**backup-routing-engine**—(Optional) Halt the backup Routing Engine. This command halts the backup Routing Engine, regardless from which Routing Engine the command is executed. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is halted. If you issue the command from the backup Routing Engine, the backup Routing Engine is halted.

**both-routing-engines**—(Optional) Halt both Routing Engines at the same time.

**director-device** *director-device-id*—(QFabric systems only) Halt a specific Director device.

**lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, halt a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, halt a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Halt the local Virtual Chassis member.

**in *minutes***—(Optional) Number of minutes from now to stop the software. This option is an alias for the at *+minutes* option.

**media (compact-flash | disk | removable-compact-flash | usb)**—(Optional) Boot medium for the next boot. (The options **removable-compact-flash** and **usb** pertain to J Series routers only.)

**media (external | internal)**—(EX Series and QFX Series switches and MX Series routers only) (Optional) Halt the boot media:

- **external**—Halt the external mass storage device.
- **internal**—Halt the internal flash device.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Halt the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**message "*text*"**—(Optional) Message to display to all system users before stopping the software.

**other-routing-engine**—(Optional) Halt the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is halted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is halted.

**scc**—(TX Matrix routers only) (Optional) Halt the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Halt the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

**slice *slice***—(EX Series and QFX Series switches only) (Optional) Halt a partition on the boot media. This option has the following suboptions:

- 1—Halt partition 1.
- 2—Halt partition 2.

- **alternate**—Reboot from the alternate partition.

**Additional Information** On the M7i router, the **request system halt** command does not immediately power down the Packet Forwarding Engine. The power-down process can take as long as 5 minutes.

On a TX Matrix router and TX Matrix Plus router if you issue the **request system halt** command on the master Routing Engine, all the master Routing Engines connected to the routing matrix are halted. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are halted.

**NOTE:** If you have a router or switch with two Routing Engines and you want to shut the power off to the router or switch or remove a Routing Engine, you must first halt the backup Routing Engine (if it has been upgraded), and then halt the master Routing Engine. To halt a Routing Engine, issue the **request system halt** command. You can also halt both Routing Engines at the same time by issuing the **request system halt both-routing-engines** command.

**Required Privilege Level** maintenance

**List of Sample Output**

- [request system halt on page 408](#)
- [request system halt \(In 2 Hours\) on page 408](#)
- [request system halt \(Immediately\) on page 408](#)
- [request system halt \(At 1:20 AM\) on page 408](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system halt

```
user@host> request system halt
Halt the system ? [yes,no] (no) yes

*** FINAL System shutdown message from root@section2 ***
System going down IMMEDIATELY
Terminated
...
syncing disks... 11 8 done
The operating system has halted.
Please press any key to reboot.
```

### request system halt (In 2 Hours)

The following example, which assumes that the time is 5 PM (1700), illustrates three different ways to request that the system stop 2 hours from now:

```
user@host> request system halt at +120
user@host> request system halt in 120
user@host> request system halt at 19:00
```

### request system halt (Immediately)

```
user@host> request system halt at now
```

### request system halt (At 1:20 AM)

To stop the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

```
user@host> request system halt at yymmdd120
request system halt at 120
Halt the system at 120? [yes,no] (no) yes
```

| <b>Description</b>         | Power off the software.                                                                                                                                                                                                                                      |

**NOTE:** When you issue this command on an individual component in a QFabric system, you will receive a warning that says “Hardware-based members will halt, Virtual Junos Routing Engines will reboot.” If you want to halt only one member, use the `member` option. You cannot issue this command from the QFabric CLI.

**NOTE:** For a standalone chassis (such as MX Series, PTX Series, and T Series routers), the request to power off the system is applicable only to the Routing Engines. When you request to power off both Routing Engines, all the FPCs in the chassis shut down after approximately 10 minutes and the chassis fans run at full speed. The FPCs shut down because they no longer have communication with the Routing Engines and an Inter-Integrated Circuit (I2C) timeout occurred.

|                |                                                                                                                                                                                                                                                                                                          |
|----------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Options</b> | <b>none</b> —Power off the router or switch software immediately.                                                                                                                                                                                                                                        |
|                | <b>all-chassis</b> —(Optional) (TX Matrix and TX Matrix Plus router only) Power off all Routing Engines in the chassis.                                                                                                                                                                                  |
|                | <b>all-lcc</b> —(Optional) (TX Matrix and TX Matrix Plus router only) On a TX Matrix router, power off all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, power off all T1600 routers (or line-card chassis) connected to the TX Matrix Plus router. |
|                | <b>all-members</b> —(EX4200 switches and MX Series routers only) (Optional) Power off all members of the Virtual Chassis configuration.                                                                                                                                                                  |
|                | <b>at <i>time</i></b> —(Optional) Time at which to power off the software, specified in one of the following ways:                                                                                                                                                                                       |

- **now**—Power off the software immediately. This is the default.
- **+minutes**—Number of minutes from now to power off the software.
- **yymmddhhmm**—Absolute time at which to power off the software, specified as year, month, day, hour, and minute.
- **hh:mm**—Absolute time on the current day at which to power off the software.

**both-routing-engines**—(Optional) Power off both Routing Engines at the same time.

**in minutes**—(Optional) Number of minutes from now to power off the software. This option is an alias for the **at +minutes** option.

**lcc number**—(Optional) (TX Matrix and TX Matrix Plus router only) On a TX Matrix router, power off a T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, power off a specific router that is connected to the TX Matrix Plus router. Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Power off the local Virtual Chassis member.

**media (compact-flash | disk | removable-compact-flash | usb)**—(Optional) Boot medium for the next boot. (The options **removable-compact-flash** and **usb** pertain to the J Series routers only.)

**media (external | internal)**—(EX Series and QFX Series switches and MX Series routers only) (Optional) Power off the boot media:

- **external**—Power off the external mass storage device.
- **internal**—Power off the internal flash device.

**member member-id**—(EX4200 switches and MX Series routers only) (Optional) Power off the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**message "text"**—(Optional) Message to display to all system users before powering off the software.

**other-routing-engine**—(Optional) Power off the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is halted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is halted.

**scc**—(Optional) (TX Matrix router only) Power off only the master Routing Engine or the backup Routing Engine on the TX Matrix router (or switch-card chassis). If you issue the command from the master Routing Engine, the master SCC is powered off. If you issue the command from the backup Routing Engine, the backup SCC is powered off.

**sfc number**—(Optional) (TX Matrix Plus router only) Power off only the master Routing Engine or the backup Routing Engine on the TX Matrix Plus router (or switch-fabric chassis). If you issue the command from the master Routing Engine, the master SFC is powered off. If you issue the command from the backup Routing Engine, the backup SFC is powered off. Replace *number* with zero.

**slice slice**—(EX Series and QFX Series switches only) (Optional) Power off a partition on the boot media. This option has the following suboptions:

- **1**—Power off partition 1.
- **2**—Power off partition 2.
- **alternate**—Reboot from the alternate partition.

**Additional Information** On a routing matrix composed of a TX Matrix router and T640 routers, if you issue the **request system power-off** command on the TX Matrix master Routing Engine, all the master Routing Engines connected to the routing matrix are powered off. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are powered off.

Likewise, on a routing matrix composed of a TX Matrix Plus router and T1600 routers, if you issue the **request system power-off** command on the TX Matrix Plus master Routing Engine, all the master Routing Engines connected to the routing matrix are powered off. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are powered off.

If you issue the **request system power-off both-routing-engines** command on the TX Matrix or TX Matrix Plus router, all the Routing Engines on the routing matrix are powered off.

**Required Privilege Level** maintenance

**List of Sample Output** [request system power-off on page 417](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system power-off

```
user@host> request system power-off message "This router will be powered off in 30 minutes.  
Please save your data and log out immediately."  
warning: This command will not halt the other routing-engine.  
If planning to switch off power, use the both-routing-engines option.  
Power Off the system ? [yes,no] (no) yes  
  
*** FINAL System shutdown message from remote@nutmeg ***  
System going down IMMEDIATELY  
  
This router will be powered off in 30 minutes. Please save your data and log out  
immediately.  
  
Shutdown NOW!  
[pid 5177]
```

## request system reboot

---

**Syntax (QFX Series and EX4600)**    request system reboot  
                         <all <graceful>>  
                         <all-members | local | member *member-id*>  
                         <at time>  
                         <both-routing-engines>  
                         <director-device *name*>  
                         <director-group <graceful>>  
                         <fabric <graceful>>  
                         <fast-boot>  
                         <in minutes>  
                         <media >  
                         <message "text">  
                         <node-group *name*>  
                         <other-routing-engine>  
                         <slice (1 | 2 | alternate)>

**Release Information**    Command introduced in Junos OS Release 11.1 for the QFX Series.  
                         Command introduced in Junos OS Release 13.2X51-D25 for EX4600 switches.

**Description**    Reboot the Junos OS.

**NOTE:** On a QFabric system, to avoid traffic loss on the network Node group, switch mastership of the Routing Engine to the backup Routing Engine, and then reboot.

---

Reboot requests are recorded in the system log files, which you can view with the **show log messages** command. You can view the process names with the **show system processes** command.

**Options**    **none**—Reboots the software immediately.

**all**—(QFabric systems only) (Optional) Reboots the software on the Director group, fabric control Routing Engines, fabric manager Routing Engines, Interconnect devices, and network and server Node groups.

**all-members | local | member *member-id***—(Optional) Specify which member of the Virtual Chassis to reboot:

- **all-members**—Reboots each switch that is a member of the Virtual Chassis.
- **local**—Reboots the local switch, meaning the switch you are logged into, only.
- **member *member-id***—Reboots the specified member switch of the Virtual Chassis.

**at time**—(Optional) Time at which to reboot the software, specified in one of the following ways:

- **+minutes**—Number of minutes from now to reboot the software.
- **hh:mm**—Absolute time on the current day at which to reboot the software, specified in 24-hour time.
- **now**—Stop or reboot the software immediately. This is the default.
- **yymmddhhmm**—Absolute time at which to reboot the software, specified as year, month, day, hour, and minute.

**both-routing-engines**—(Optional) Reboot both Routing Engines at the same time.

**director-device *name***—(QFabric systems only) (Optional) Reboots the software on the Director device and the default partition (QFabric CLI).

**director-group**—(QFabric systems only) (Optional) Reboots the software on the Director group and the default partition (QFabric CLI).

**fabric**—(QFabric systems only) (Optional) Reboots the fabric control Routing Engines and the Interconnect devices.

**fast-boot**—(QFX5100 only) (Optional) Enhances the reboot time. The switch reboots in such a way as to minimize downtime of network ports by not bringing the network ports down immediately as in the normal reboot option. There is minimal traffic loss while the forwarding device is reprogrammed.

**graceful**—(QFabric systems only) (Optional) Allows the QFabric component to reboot with minimal impact to network traffic. This option is only available for the **all**, **fabric**, and **director-group** options.

**in minutes**—(Optional) Number of minutes from now to reboot the software. This option is an alias for the **at +minutes** option.

**media (external | internal)**—(Optional) Boot medium for the next boot. The external option reboots the switch using a software package stored on an external boot source, such as a USB flash drive. The internal option reboots the switch using a software package stored in an internal memory source.

**message "text"**—(Optional) Message to display to all system users before rebooting the software.

**node-group *name***—(QFabric systems only) (Optional) Reboots the software on a server Node group or a network Node group.

**other-routing-engine**—(Optional) Reboot the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is rebooted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is rebooted.

**routing-engine**—(Optional) Reboot the Routing Engine.

**slice (1 | 2 | alternate)**—(Optional) Reboot using the specified partition on the boot media. This option has the following suboptions:

**NOTE:** The slice option is not supported on the QFX5100 switch or the EX4600 switch, because there is no alternate slice when Junos OS boots as a Virtual Machine (VM). To switch to a previous version of Junos OS, issue the `request system software rollback` command.

- 1—Reboot from partition 1.
- 2—Reboot from partition 2.
- **alternate**—Reboot from the alternate partition, which is the partition that did not boot the switch at the last bootup.

**Required Privilege Level** maintenance

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system reboot

```
user@switch> request system reboot
Reboot the system ? [yes,no] (no)
```

### request system reboot (At 2300)

```
user@switch> request system reboot at 2300 message ?Maintenance time!?
Reboot the system ? [yes,no] (no) yes

shutdown: [pid 186]
*** System shutdown message from root@berry.network.net ***
System going down at 23:00
```

### request system reboot (In 2 Hours)

The following example, which assumes that the time is 5 PM (1700), illustrates three different ways to request the system to reboot in 2 hours:

```
user@switch> request system reboot at +120
user@switch> request system reboot in 120
user@switch> request system reboot at 19:00
```

### request system reboot (Immediately)

```
user@switch> request system reboot at now
```

### request system reboot (At 1:20 AM)

To reboot the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

```
user@switch> request system reboot at 06060120
request system reboot at 120
Reboot the system at 120? [yes,no] (no) yes
```

#### request system reboot director-device

```
user@switch> request system reboot director-device Node1
Issuing this command may interrupt traffic forwarding.
Continue? [yes,no] (no)
```

#### request system reboot director-group

```
user@switch> request system reboot director-group
Issuing this command may interrupt traffic forwarding.
Continue? [yes,no] (no)
```

#### request system reboot director-group graceful

```
user@switch> request system reboot director-group graceful
Issuing this command may interrupt this traffic forwarding.
Continue? [yes,no] (no)
```

| <b>Release Information</b>      | Command introduced in Junos OS Release 11.3 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b>              | Copy the currently running Junos OS and configuration to alternate media. This command takes a snapshot of the contents of the / (root), and <b>/var</b> partitions on the media used to boot the switch and then copies the snapshot to alternate media. If the switch was booted from internal flash memory, the snapshot is copied to an external USB flash drive. If the switch was booted from an external USB flash drive, the snapshot is copied to internal flash memory.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>                  | <p><b>none</b>—Create a snapshot on the alternate media—that is, the external media if you booted the switch using software stored on internal media or internal media if you booted the switch using software stored on external media.</p> <p><b>config-partition</b>—(Optional) Create a snapshot of the configuration partition only and store it onto the default /altconfig on the hard disk device or an /altconfig on a USB device.</p> <p><b>media type</b>—(Optional) Specify the boot device the software is copied to:</p> <ul style="list-style-type: none"><li>• compact-flash—Copy software to the primary compact flash drive.</li><li>• external—Copy software to an external mass storage device, such as a USB flash drive. If a USB drive is not connected, the switch displays an error message.</li><li>• internal—Copy software to an internal flash drive.</li><li>• removable-compact-flash—Copy software to the removable compact flash drive.</li></ul> <p><b>partition</b>—(Optional) Partition the destination media before copying over the snapshot.</p> <p><b>root-partition</b>—(Optional) Create a snapshot of the root partition only and store it onto the default /altroot on the hard disk device or an /altroot on a USB device.</p> <p><b>slice alternate</b>—(Optional) Take a snapshot of the active root partition and copy it to the alternate slice on the boot media.</p> |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Release Information** Command introduced before Junos OS Release 7.4.

**best-effort-load** and **unlink** options added in Junos OS Release 7.4.

Command introduced in Junos OS Release 9.0 for EX Series switches.

**sfc** option introduced for the TX Matrix Plus router in Junos OS Release 9.6.

Command introduced in Junos OS Release 11.1 for the QFX Series.

**set [*package-name package-name*]** option added in Junos OS Release 11.1 for EX Series switches.

**set [*package-name package-name*]** option added in Junos OS Release 12.2 for M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways.

**NOTE:** On EX Series switches, the set `[package-name package-name]` option allows you to install only two software packages on a mixed EX4200 and EX4500 Virtual Chassis, whereas, on M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways, the set `[package-name package-name]` option allows you to install multiple software packages and software add-on packages at the same time.

`upgrade-with-config` and `upgrade-with-config-format` *format* options added in Junos OS Release 12.3 for M Series routers, MX Series routers, T Series routers, EX Series Ethernet switches, and QFX Series devices.

---

Description

**NOTE:** We recommend that you always download the software image to `/var/tmp` only. On EX Series and QFX Series switches, you must use the `/var/tmp` directory. Other directories are not supported.

Install a software package or bundle on the router or switch.

**WARNING:** Any configuration changes performed after inputting the `request system software add` command will be lost when the system reboots with an upgraded version of JUNOS.

---

**Options**    *package-name*—Location from which the software package or bundle is to be installed.

For example:

- `/var/tmp/package-name`—For a software package or bundle that is being installed from a local directory on the router or switch.
- `protocol://hostname/pathname/package-name`—For a software package or bundle that is to be downloaded and installed from a remote location. Replace *protocol* with one of the following:
  - **ftp**—File Transfer Protocol.  
Use `ftp://hostname/pathname/package-name`. To specify authentication credentials, use `ftp://<username>:<password>@hostname/pathname/package-name`. To have the system prompt you for the password, specify **prompt** in place of the password. If a password is required, and you do not specify the password or **prompt**, an error message is displayed.
  - **http**—Hypertext Transfer Protocol.  
Use `http://hostname/pathname/package-name`. To specify authentication credentials, use `http://<username>:<password>@hostname/pathname/package-name`. If a password is required and you omit it, you are prompted for it.

- **scp**—Secure copy (available only for Canada and U.S. version).  
Use **scp://hostname/pathname/package-name**. To specify authentication credentials, use  
**scp://<username>:<password>@hostname/pathname/package-name**.

**NOTE:**

- The **pathname** in the protocol is the relative path to the user's home directory on the remote system and not the root directory.
- Do not use the **scp** protocol in the **request system software add** command to download and install a software package or bundle from a remote location. The previous statement does not apply to the QFabric switch. The software upgrade is handled by the MGD process which does not support **scp**.  
Use the **file copy** command to copy the software package or bundle from the remote location to the **/var/tmp** directory on the hard disk:  
**file copy scp://source/package-name /var/tmp**  
Then install the software package or bundle using the **request system software add** command:  
**request system software add /var/tmp/package-name**
- On a J Series Services Router, when you install the software from a remote location, the package is removed at the earliest opportunity in order to make room for the installation to be completed. If you copy the software to a local directory on the router and then install the new package, use the **unlink** option to achieve the same effect and allow the installation to be completed.

**best-effort-load**—(Optional) Activate a partial load and treat parsing errors as warnings instead of errors.

**component all**—(QFabric systems only) (Optional) Install software package on all of the QFabric components.

**delay-restart**—(Optional) Install a software package or bundle, but do not restart software processes.

**force**—(Optional) Force the addition of the software package or bundle (ignore warnings).

**force-host**—(Optional) Force the addition of host software package or bundle (ignore warnings) on the QFX5100 device.

**lcc number** —(TX Matrix routers and TX Matrix Plus routers only) (Optional) In a routing matrix based on the TX Matrix router, install a software package or bundle on a T640 router that is connected to the TX Matrix router. In a routing matrix based on the TX Matrix Plus router, install a software package or bundle on a router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**member *member-id***—(MX Series routers only) (Optional) Install a software package on the specified Virtual Chassis member. Replace *member-id* with a value of 0 or 1.

**partition**—(QFX3500 switches only) (Optional) Format and repartition the media before installation.

**scc**—(TX Matrix routers only) (Optional) Install a software package or bundle on a Routing Engine on a TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Install a software package or bundle on a Routing Engine on a TX Matrix Plus router. Replace *number* with 0.

**no-copy**—(Optional) Install a software package or bundle, but do not save copies of the package or bundle files.

**no-validate**—(Optional) When loading a software package or bundle with a different release, suppress the default behavior of the **validate** option.

**re0 | re1**—(Optional) On routers or switches that support dual or redundant Routing Engines, load a software package or bundle on the Routing Engine in slot 0 (re0) or the Routing Engine in slot 1 (re1).

**reboot**—(Optional) After adding the software package or bundle, reboot the system. On a QFabric switch, the software installation is not complete until you reboot the component for which you have installed the software.

**set [*package-name package-name*]**—(Mixed EX4200 and EX4500 Virtual Chassis only) (Optional) Install two software packages—a package for an EX4200 switch and the same release of the package for an EX4500 switch—to upgrade all member switches in a mixed EX4200 and EX4500 Virtual Chassis.

**set [*package-name package-name*]**—(M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways only) (Optional) Install multiple software packages and software add-on packages at the same time.

**unlink**—(Optional) On J Series Services Routers, this option ensures that the software package is removed at the earliest opportunity in order to make room for the installation to be completed. On M Series, T Series, and MX Series routers, use the

**unlink** option to remove the software package from this directory after a successful upgrade is completed.

**upgrade-with-config**—(Optional) Install one or more configuration files.

**upgrade-with-config-format *format***—(Optional) Specify the configuration file format, **text** or **xml**. The default format is **text**.

**NOTE:** The **upgrade-with-config** and **upgrade-with-config-format** options are only available locally on the router or switch. In a routing matrix, the configuration is applied only to the local router and is not propagated to other routers.

The options are validated during the validation process and applied to the router or switch during the upgrade process. If the upgrade process is successful, the options are removed from the configuration. If the upgrade process fails, the configuration file is renamed with the **.failed** suffix.

**validate**—(Optional) Validate the software package or bundle against the current configuration as a prerequisite to adding the software package or bundle. This is the default behavior when the software package or bundle being added is a different release.

**NOTE:** The **validate** option only works on systems that do not have **graceful-switchover (GRES)** enabled. To use the **validate** option on a system with GRES, either disable GRES for the duration of the installation, or install using the command **request system software in-service-upgrade**, which requires nonstop active routing (NSR) to be enabled when using GRES.

**Additional Information** Before upgrading the software on the router or switch, when you have a known stable system, issue the **request system snapshot** command to back up the software, including the configuration, to the **/altroot** and **/altconfig** file systems. After you have upgraded the software on the router or switch and are satisfied that the new package or bundle is successfully installed and running, issue the **request system snapshot** command again to back up the new software to the **/altroot** and **/altconfig** file systems.

**NOTE:** The **request system snapshot** command is currently not supported on the QFabric system. Also, you cannot add or install multiple packages on a QFabric system.

After you run the **request system snapshot** command, you cannot return to the previous version of the software, because the running and backup copies of the software are identical.

If you are upgrading more than one package at the same time, delete the operating system package, jkernel, last. Add the operating system package, jkernel, first and the routing software package, jroute, last. If you are upgrading all packages at once, delete and add them in the following order:

```
user@host> request system software add /var/tmp/jbase
user@host> request system software add /var/tmp/jkernel
user@host> request system software add /var/tmp/jpfe
user@host> request system software add /var/tmp/jdocs
user@host> request system software add /var/tmp/jroute
user@host> request system software add /var/tmp/jcrypto
```

By default, when you issue the **request system software add *package-name*** command on a TX Matrix master Routing Engine, all the T640 master Routing Engines that are connected to it are upgraded to the same version of software. If you issue the same command on the TX Matrix backup Routing Engine, all the T640 backup Routing Engines that are connected to it are upgraded to the same version of software.

Likewise, when you issue the **request system software add *package-name*** command on a TX Matrix Plus master Routing Engine, all the T1600 or T4000 master Routing Engines that are connected to it are upgraded to the same version of software. If you issue the same command on the TX Matrix Plus backup Routing Engine, all the T1600 or T4000 backup Routing Engines that are connected to it are upgraded to the same version of software.

| <b>Description</b>                    | Remove a software package or bundle from the router or switch.                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

**CAUTION:** Before removing a software package or bundle, make sure that you have already placed the new software package or bundle that you intend to load onto the router or switch.

- Options** *software-package*—Software package or bundle name. You can delete any or all of the following software bundles or packages:
- **jbase**—(Optional) Junos base software suite
  - **jcrypto**—(Optional, in domestic version only) Junos security software
  - **jdocs**—(Optional) Junos online documentation file
  - **jkernel**—(Optional) Junos kernel software suite
  - **jpfe**—(Optional) Junos Packet Forwarding Engine support

- **jroute**—(Optional) Junos routing software suite
- **junos**—(Optional) Junos base software

**NOTE:** On EX Series switches, some of the package names are different than those listed. To see the list of packages that you can delete on an EX Series switch, enter the command **show system software**.

**force**—(Optional) Ignore warnings and force removal of the software.

**lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, remove an extension or upgrade package from a specific T640 router (line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, remove an extension or upgrade package from a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**reboot**—As of Junos OS 12.3 and greater, automatically reboot upon completing the **request system software delete** command.

**scc**—(TX Matrix routers only) (Optional) Remove an extension or upgrade package from the TX Matrix router (or switch-card chassis).

**set [package-name package-name]**—(M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways only) (Optional) Install multiple software packages or software add-on packages at the same time.

**sfc number**—(TX Matrix Plus routers only) (Optional) Remove an extension or upgrade package from the TX Matrix Plus router. Replace *number* with 0.

#### Additional Information

Before upgrading the software on the router or switch, when you have a known stable system, issue the **request system snapshot** command to back up the software, including the configuration, to the `/altroot` and `/altconfig` file systems (on routers) or the `/`, `/altroot`, `/config`, `/var`, and `/var/tmp` file systems (on switches). After you have upgraded the software on the router or switch and are satisfied that the new packages are successfully installed and running, issue the **request system snapshot** command again to back up the new software to the `/altroot` and `/altconfig` file systems (on routers) or the `/`, `/altroot`,

/config, /var, and /var/tmp file systems (on switches). After you run the **request system snapshot** command, you cannot return to the previous version of the software, because the running and backup copies of the software are identical.

**Required Privilege Level** maintenance

| <b>Syntax (QFabric System)</b>  | request system software download <i>path package-name</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Release Information</b>      | Command introduced in Junos OS Release 11.3 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | Download a software package from a location on the Director device, mounted external USB flash drive, remote FTP or SCP location, or other location.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>                  | <p><b>path</b>—Location where the software package is located. For example:</p> <ul style="list-style-type: none"> <li>• <b>/pbdata/packages/package-name</b>—For a software package that is being installed from a local directory on the switch.</li> <li>• <b>protocol://hostname/pathname/package-name</b>—For a software package or bundle that is to be downloaded and installed from a remote location. Replace <b>protocol</b> with one of the following: <ul style="list-style-type: none"> <li>• <b>ftp</b>—File Transfer Protocol.<br/>Use <b>ftp://hostname/pathname/package-name</b>. To specify authentication credentials, use <b>ftp://&lt;username&gt;:&lt;password&gt;@hostname/pathname/package-name</b>. To have the system prompt you for the password, specify <b>prompt</b> in place of the password. If a password is required, and you do not specify the password or <b>prompt</b>, an error message is displayed.</li> <li>• <b>scp</b>—Secure copy (available only for Canada and U.S. version).<br/>Use <b>scp://hostname/pathname/package-name</b>. To specify authentication credentials, use <b>scp://&lt;username&gt;:&lt;password&gt;@hostname/pathname/package-name</b>.</li> </ul> </li> </ul> |
| <b>Required Privilege Level</b> | maintenance                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Release Information</b> | Command introduced in Junos OS Release 12.2 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>         | Nonstop software upgrade enables you to upgrade a QFabric system with minimal packet loss and maximum uptime. You should upgrade the devices in the following order: Director group, fabric controls and Interconnect devices, and network and server Node groups.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>             | <p><b><i>package-name</i></b>—Location from which the software is to be installed. For example:</p> <ul style="list-style-type: none"> <li>• <b><i>protocol://hostname/pathname/package-name</i></b>—For a software package or bundle that is to be downloaded and installed from a remote location. Replace <b><i>protocol</i></b> with one of the following: <ul style="list-style-type: none"> <li>• <b>ftp</b>—File Transfer Protocol.<br/>Use <b>ftp://hostname/pathname/package-name</b>. To specify authentication credentials, use <b>ftp://&lt;username&gt;:&lt;password&gt;@hostname/pathname/package-name</b>. To have the system prompt you for the password, specify <b>prompt</b> in place of the password. If a password is required, and you do not specify the password or <b>prompt</b>, an error message is displayed.</li> <li>• <b>http</b>—Hypertext Transfer Protocol.<br/>Use <b>http://hostname/pathname/package-name</b>. To specify authentication credentials, use <b>http://&lt;username&gt;:&lt;password&gt;@hostname/pathname/package-name</b>. If a password is required and you omit it, you are prompted for it.</li> <li>• <b>scp</b>—Secure copy (available only for Canada and U.S. version).<br/>Use <b>scp://hostname/pathname/package-name</b>. To specify authentication credentials, use <b>scp://&lt;username&gt;:&lt;password&gt;@hostname/pathname/package-name</b>.</li> </ul> </li> </ul> |

### NOTE:

- The ***pathname*** in the protocol is the relative path to the user's home directory on the remote system and not the root directory.

**director-group**—Install software package on the Director group and Fabric managers.

**fabric**—Install software package on the Interconnect devices and Fabric controls.

**node-group *name*** —Install software package on the redundant server Node group, server Node group, or network Node group.

## Sample Output

### [request system software nonstop-upgrade director-group](#)

```
user@qfabric> request system software nonstop-upgrade director-group
jinstall-qfabric-12.2X50-D10.3.rpm
Validating update package jinstall-qfabric-12.2X50-D10.3.rpm
Installing update package jinstall-qfabric-12.2X50-D10.3.rpm
Installing fabric images version 12.2X50-D10.3
Performing cleanup
Package install complete
Installing update package jinstall-qfabric-12.2X50-D10.3.rpm on peer
Triggering Initial Stage of Fabric Manager Upgrade
Updating CCIF default image to 12.2X50-D10.3
Updating FM-0 to Junos version 12.2X50-D10.3
[Status 2012-06-05 15:25:29]: Fabric Manager: Upgrade Initial Stage started
[FM-0 2012-06-05 15:25:38]: FM-0 Master already running on LOCAL DG
[NW-NG-0 2012-06-05 15:25:45]: NW-NG-0 Master already running on LOCAL DG
[FM-0 2012-06-05 15:26:12]: Retrieving package
[FM-0 2012-06-05 15:27:11]: Pushing bundle to re0
[Status 2012-06-05 15:29:06]: Load completed with 0 errors...
[Status 2012-06-05 15:29:06]: Reboot is required to complete upgrade ...
[Status 2012-06-05 15:29:07]: Trying to Connect to Node: FM-0
[Status 2012-06-05 15:29:13]: Rebooting FM-0
[FM-0 2012-06-05 15:29:13]: Waiting for FM-0 to terminate ...
Starting Peer upgrade

Initiating rolling upgrade of Director peer: version 12.2X50-D10.3

Inform CCIF regarding rolling upgrade
[Peer Update Status]: Validating install package jinstall-qfabric-12.2X50-D10.3.rpm
[Peer Update Status]: Cleaning up node for rolling phase one upgrade
[Peer Update Status]: Director group upgrade complete
[Peer Update Status]: COMPLETED

### Sample Output

#### request system software recover-from-restore-point

```

root@qfabric> request system software recover-from-restore-point
Start Restore
Checking if the restore-point exists
  LogVol100 has the root filesystem
Found Restore-Point:  Fri Aug 15 07:42:39 UTC 2014 /dev/VolGroup00/LogVol103
Mounting restore-volume LogVol103
Checking the sanity of restore-point
  Checking if the restore DB is present
  Checking if the restore grub is present
Checking the current state of the system
Checking the state of cluster services
Checking the inventory
Checking if the peer is reachable
  Checking if peer is reachable via Compute Node Monitor
  Successfully communicated with peer over 169.254.0.2
Intimating the peer to do stage INITIATE_PEER_INITIAL_STAGE of downgrade
Preparing the system to downgrade
Prepping all Junos devices
Checking status at Peer
  Downgrade first stage at peer concluded successfully
Initiating final stage of downgrade in peer
Intimating the peer to do stage INITIATE_PEER_FINAL_STAGE of downgrade
Modify loader to boot from restore-point
Move mount points to new filesystem
Force Reboot
Rebooting....

```

## request system software restore-point

performing physical volume creation
Physical volume "/dev/sda4" successfully created
"/dev/sda4" is a new physical volume of "476.84 GB"
PV Name                /dev/sda4
extending volume group 00
Volume group "VolGroup00" successfully extended
Creating Logical Volume
Logical volume "LogVo103" created
LV Name                /dev/VolGroup00/LogVo103
Restore volume selected is /dev/VolGroup00/LogVo103
Formatting restore volume
mke2fs 1.39 (29-May-2006)
Filesystem label=
```

```
OS type: Linux
Block size=4096 (log=2)
Fragment size=4096 (log=2)
62504960 inodes, 124993536 blocks
6249676 blocks (5.00%) reserved for the super user
First data block=0
Maximum filesystem blocks=4294967296
3815 block groups
32768 blocks per group, 32768 fragments per group
16384 inodes per group
Superblock backups stored on blocks:
    32768, 98304, 163840, 229376, 294912, 819200, 884736, 1605632, 2654208,
    4096000, 7962624, 11239424, 20480000, 23887872, 71663616, 78675968,
    102400000

Creating journal (32768 blocks): done
Writing superblocks and filesystem accounting information: done

This filesystem will be automatically checked every 22 mounts or
180 days, whichever comes first.  Use tune2fs -c or -i to override.
/dev/VolGroup00/LogVol03: UUID="a9fafbaf-da3c-417f-bd53-def01fbf3936"
SEC_TYPE="ext2" TYPE="ext3"
Restore Volume mounted
backing up root filesystem..this will take a few minutes
Copying files from tmp..this may take a few minutes
Dumping databases...this may take a few minutes
backing up shared filesystem..this may take a few minutes
Restore point creation finished for dg0 on /dev/VolGroup00/LogVol03
waiting 10 mins for peer dg to finish
Restore point creation success on both DGs
```

| <b>Release Information</b>            | Command introduced before Junos OS Release 7.4.<br>Command introduced in Junos OS Release 9.0 for EX Series switches.<br>Option <b>sfc</b> introduced for the TX Matrix Plus router in Junos OS Release 9.6.<br>Command introduced in Junos OS Release 11.1 for the QFX Series.<br>Command behavior changed in Junos OS Release 12.1.<br>Option <b>reboot</b> introduced in Junos OS Release 12.3.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b>                    | <p>For all versions of Junos OS up to and including Junos OS 11.4, revert to the software that was loaded at the last successful <b>request system software add</b> command.</p> <p>As of Junos OS 12.1 and greater, revert to the last known good state before the most recent <b>request system software (add   delete)</b> command. For example, using rollback in Junos OS 12.1 after using <b>request system software add</b> restores the system to a known good state prior to using the <b>add</b> command. Similarly, using rollback in Junos OS 12.1 after using <b>request system software delete</b> restores the system to a known good state prior to using the <b>delete</b> command.</p> <p>A software rollback fails if any required package (or a <b>bundle</b> package containing the required package) cannot be found in <code>/var/sw/pkg</code>.</p> <p><i>Additional Information</i></p> |

- On M Series and T Series routers, if **request system software add <jinstall> reboot** was used for the previous installation, then **request system software rollback** has no effect. In this case, use **jinstall** to reinstall the required package.
- On M Series and T Series routers, if **request system software add <sdk1>** was used for the previous installation, then **request system software rollback** removes the last installed SDK package (**sdk1** in this example).
- On SRX Series devices with dual root systems, when **request system software rollback** is run, the system switches to the alternate root. Each root can have a different version of Junos OS. Rollback takes each root back to the previously installed image.
- On QFX3500 and QFX3600 devices in a mixed Virtual Chassis, when the **request system software rollback** command is issued, the system does not rollback to the image stored in the alternate partition.
- On QFX5100 switches, the **reboot** option has been removed. To reboot the switch after a software rollback, issue the **request system reboot** command as a separate, secondary command.

**Options** **all-members**—(EX4200 switches and MX Series routers only) (Optional) Attempt to roll back to the previous set of packages on all members of the Virtual Chassis configuration.

**lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, attempt to roll back to the previous set of packages on a T640 router connected to the TX Matrix router. On a TX Matrix Plus router, attempt to roll back to the previous set of packages on a connected router connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Attempt to roll back to the previous set of packages on the local Virtual Chassis member.

**member member-id**—(EX4200 switches and MX Series routers only) (Optional) Attempt to roll back to the previous set of packages on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**none**—For all versions of Junos OS up to and including Junos OS 11.4, revert to the set of software as of the last successful **request system software add**. As of Junos OS 12.1 and greater, revert to the last known good state before the most recent **request system software (add | delete)** command.

**reboot**—As of Junos OS 12.3 and greater, automatically reboot upon completing the **request system software rollback** command.

**scc**—(TX Matrix routers only) (Optional) Attempt to roll back to the previous set of packages on the TX Matrix router (or switch-card chassis).

**sfc number**—(TX Matrix Plus routers only) (Optional) Attempt to roll back to the previous set of packages on the TX Matrix Plus router. Replace *number* with 0.

**Required Privilege Level**

maintenance

| <b>Release Information</b>            | Command introduced before Junos OS Release 7.4.<br><b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6.<br>Command introduced in Junos OS Release 11.1 for the QFX Series.<br><b>set [<i>package-name package-name</i>]</b> option added in Junos OS Release 12.2 for M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways.<br><b>upgrade-with-config</b> and <b>upgrade-with-config-format <i>format</i></b> options added in Junos OS Release 12.3 for M Series routers, MX Series routers, and T Series routers.                                                                                                                                                           |
| <b>Description</b>                    | Validate candidate software against the current configuration of the router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>                        | <b>lcc <i>number</i></b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, validate the software bundle or package on a specific T640 router (or line-card chassis) that is connected to the TX Matrix router. On a TX Matrix Plus router, validate the software bundle or package for a specific router that is connected to the TX Matrix Plus router.<br>Replace <i>number</i> with the following values depending on the LCC configuration: <ul style="list-style-type: none"><li>• 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.</li><li>• 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.</li></ul> |

- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**member *member-id***—(MX Series routers only) (Optional) Validate the software bundle or package on the specified member of the Virtual Chassis configuration. For an MX Series Virtual Chassis, replace ***member-id*** with a value of 0 or 1.

***package-name***—Name of the software bundle or package to test.

**scc**—(TX Matrix routers only) (Optional) Validate the software bundle or package for the TX Matrix router (or switch-card chassis).

**set [*package-name package-name*]**—(M Series, MX Series, T Series routers, and Branch SRX Series Services Gateways only) (Optional) Install multiple software packages or software add-on packages at the same time.

**sfc *number***—(TX Matrix Plus routers only) (Optional) Validate the software bundle or package for the TX Matrix Plus router.

**upgrade-with-config**—(Optional) Install one or more configuration files.

**upgrade-with-config-format *format***—(Optional) Specify the configuration file format, **text** or **xml**. The default format is **text**.

**NOTE:** The **upgrade-with-config** and **upgrade-with-config-format** options are only available locally on the router or switch. In a routing matrix, the configuration is applied only to the local router and is not propagated to other routers.

The options are validated during the validation process and applied to the router or switch during the upgrade process. If the upgrade process is successful, the options are removed from the configuration. If the upgrade process fails, the configuration file is renamed with the **.failed** suffix.

**Additional Information** By default, when you issue the **request system software validate** command on a TX Matrix master Routing Engine, all the T640 master Routing Engines that are connected to it are validated. If you issue the same command on the TX Matrix backup Routing Engine, all the T640 backup Routing Engines that are connected to it are upgraded to the same version of software.

Likewise, if you issue the **request system software validate** command on a TX Matrix Plus master Routing Engine, all the T1600 or T4000 master Routing Engines that are connected to it are validated. If you issue the same command on a TX Matrix Plus backup Routing Engine, all the T1600 or T4000 backup Routing Engines that are connected to it are upgraded to the same version of software.

## Sample Output

### request system software validate (Successful Case)

```
user@host> request system software validate /var/sw/pkg/jbundle-5.3I20020124_0520_sjg.tgz
Checking compatibility with configuration
Initializing...
Using /packages/jbase-5.3I20020122_1901_sjg
Using /var/sw/pkg/jbundle-5.3I20020124_0520_sjg.tgz
Using /var/chroot/var/tmp/jbundle/jbase-5.3I20020124_0520_sjg.tgz
Using /var/chroot/var/tmp/jbundle/jkernel-5.3I20020124_0520_sjg.tgz
Using /var/chroot/var/tmp/jbundle/jcrypto-5.3I20020124_0520_sjg.tgz
Using /var/chroot/var/tmp/jbundle/jpfe-5.3I20020124_0520_sjg.tgz
Using /var/chroot/var/tmp/jbundle/jdocs-5.3I20020124_0520_sjg.tgz
Using /var/chroot/var/tmp/jbundle/jroute-5.3I20020124_0520_sjg.tgz
Validating against /config/juniper.conf.gz
mgd: commit complete

WARNING: cli has been replaced by an updated version:
CLI release 5.3I0 built by sjg on 2002-01-24 05:23:53 UTC
Restart cli using the new version ? [yes,no] (yes)
```

### request system software validate (Failure Case)

```
user@host> request system software validate 6.3/
Pushing bundle to lcc0-re0
error: Failed to transfer package to lcc0-re0

user@host> request system software validate test
Pushing bundle to lcc0-re0
Pushing bundle to lcc2-re0

lcc0-re0:
gzip: stdin: not in gzip format
tar: child returned status 1
ERROR: Not a valid package: /var/tmp/test
```

## request system storage cleanup

| <b>Release Information</b>         | Command introduced in Junos OS Release 7.4.<br><b>dry-run</b> option introduced in Junos OS Release 7.6.<br>Command introduced in Junos OS Release 9.0 for EX Series switches.<br>Command introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                          |
| <b>Description</b>                 | Free storage space on the router or switch by rotating log files and proposing a list of files for deletion. User input is required for file deletion. On a QFabric system, you can delete debug files located on individual devices or on the entire QFabric system.                                                                                                                      |
| <b>Options</b>                     | <b>all-members</b> —(EX4200 switches and MX Series routers only) (Optional) Delete files on the Virtual Chassis master Routing Engine only.                                                                                                                                                                                                                                                |

**NOTE:** To delete files on the other members of the Virtual Chassis configuration, log in to each backup Routing Engine and delete the files using the **request system storage cleanup local** command.

**component** (*UUID | serial number | all*)—(QFabric systems only) (Optional) Delete files located on individual QFabric system devices or on the entire QFabric system.

**director-group** *name*—(QFabric systems only) (Optional) Delete files on the Director group.

**dry-run**—(Optional) List files proposed for deletion (without deleting them).

**infrastructure** *name*—(QFabric systems only) (Optional) Delete files on the fabric control Routing Engine and fabric manager Routing Engine.

**interconnect-device** *name*—(QFabric systems only) (Optional) Delete files on the Interconnect device.

**local**—(EX4200 switches and MX Series routers only) (Optional) Delete files on the local Virtual Chassis member.

**member** *member-id*—(EX4200 switches and MX Series routers only) (Optional) Delete files on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**name-tag** *name-tag*—(QFabric systems only) (Optional) Delete debug files that match a specific regular expression.

**node-group** *name*—(QFabric systems only) (Optional) Delete files on the Node group.

**prune**—(QFabric systems only) (Optional) Delete debug files located in either the core or log debug repositories of a QFabric system device.

**qfabric component** *name*—(QFabric systems only) (Optional) Delete debug files located in the debug repositories of a QFabric system device.

**repository** (*core | log*)—(QFabric systems only) (Optional) Specify the repository on the QFabric system device for which you want to delete debug files.

**Additional Information** If logging is configured and being used, the **dry-run** option rotates the log files. In that case, the output displays the message “Currently rotating log files, please wait.” If no logging is currently under way, the output displays only a list of files to delete.

**Required Privilege Level** maintenance

| <b>Description</b>              | <p> <b>NOTE:</b> The <b>media</b> option is not available on the QFX Series.</p> <p>Remove all configuration information on the Routing Engines and reset all key values. If the device has dual Routing Engines, the command is broadcast to all Routing Engines on the device. The command removes all data files, including customized configuration and log files, by unlinking the files from their directories. The command removes all user-created files from the system including all plain-text passwords, secrets, and private keys for SSH, local encryption, local authentication, IPsec, RADIUS, TACACS+, and SNMP.</p> <p>This command reboots the device and sets it to the factory default configuration. After the reboot, you cannot access the device through the management Ethernet interface. Log in through the console as <b>root</b> and start the Junos OS CLI by typing <b>cli</b> at the prompt.</p> <p>To completely erase user-created data so that it is unrecoverable, use the <b>media</b> option.</p> <p><b>Options</b></p> <p><b>media</b>—(Optional) In addition to removing all configuration and log files, causes memory and the media to be scrubbed, removing all traces of any user-created files. Every storage device attached to the system is scrubbed, including disks, flash drives, removable USBs, and so on. The duration of the scrubbing process is dependent on the size of the media being erased. As a result, the <b>request system zeroize media</b> operation can take considerably more time than the <b>request system zeroize</b> operation. However, the critical security parameters are all removed at the beginning of the process.</p> <p><b>local</b>—(Optional) Remove all the configuration information and restore all the key values on the active Routing Engine.</p> |
| <b>Required Privilege Level</b> | maintenance                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

**Release Information**

Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 11.1 for the QFX Series.  
Command introduced in Junos OS Release 12.2 for ACX Series routers.  
Options added:

- **dynamic-flow-capture** in Junos OS Release 7.4.
- **dlsr** in Junos OS Release 7.5.
- **event-processing** in Junos OS Release 7.5.
- **ppp** in Junos OS Release 7.5.
- **l2ald** in Junos OS Release 8.0.
- **link-management** in Release 8.0.
- **pgcp-service** in Junos OS Release 8.4.
- **sbc-configuration-process** in Junos OS Release 9.5.
- **services pgcp gateway** in Junos OS Release 9.6.
- **sfc** and **all-sfc** for the TX Matrix Router in Junos OS Release 9.6.

**Description** Restart a Junos OS process.

**CAUTION:** Never restart a software process unless instructed to do so by a customer support engineer. A restart might cause the router or switch to drop calls and interrupt transmission, resulting in possible loss of data.

**Options** **none**—Same as **gracefully**.

**adaptive-services**—(Optional) Restart the configuration management process that manages the configuration for stateful firewall, Network Address Translation (NAT), intrusion detection services (IDS), and IP Security (IPsec) services on the Adaptive Services PIC.

**all-chassis**—(TX Matrix and TX Matrix Plus routers only) (Optional) Restart the software process on all chassis.

**all-lcc**—(TX Matrix and TX Matrix Plus routers only) (Optional) For a TX Matrix router, restart the software process on all T640 routers connected to the TX Matrix router. For a TX Matrix Plus router, restart the software process on all T1600 routers connected to the TX Matrix Plus router.

**all-members**—(MX Series routers only) (Optional) Restart the software process for all members of the Virtual Chassis configuration.

**all-sfc**—(TX Matrix Plus routers only) (Optional) For a TX Matrix Plus router, restart the software processes for the TX Matrix Plus router (or switch-fabric chassis).

**ancpd-service**—(Optional) Restart the Access Node Control Protocol (ANCP) process, which works with a special Internet Group Management Protocol (IGMP) session to collect outgoing interface mapping events in a scalable manner.

**application-identification**—(Optional) Restart the process that identifies an application using intrusion detection and prevention (IDP) to allow or deny traffic based on applications running on standard or nonstandard ports.

**audit-process**—(Optional) Restart the RADIUS accounting process that gathers statistical data that can be used for general network monitoring, analyzing, and tracking usage patterns, for billing a user based on the amount of time or type of services accessed.

**auto-configuration**—(Optional) Restart the Interface Auto-Configuration process.

**autoinstallation**—(EX Series switches only) (Optional) Restart the autoinstallation process.

**captive-portal-content-delivery**—(Optional) Restart the HTTP redirect service by specifying the location to which a subscriber's initial Web browser session is redirected, enabling initial provisioning and service selection for the subscriber.

**ce-l2tp-service**—(M10, M10i, M7i, and MX Series routers only) (Optional) Restart the Universal Edge Layer 2 Tunneling Protocol (L2TP) process, which establishes L2TP tunnels and Point-to-Point Protocol (PPP) sessions through L2TP tunnels.

**chassis-control**—(Optional) Restart the chassis management process.

**class-of-service**—(Optional) Restart the class-of-service (CoS) process, which controls the router's or switch's CoS configuration.

**clksyncd-service**—(Optional) Restart the external clock synchronization process, which uses synchronous Ethernet (SyncE).

**database-replication**—(EX Series switches and MX Series routers only) (Optional) Restart the database replication process.

**datapath-trace-service**—(Optional) Restart the packet path tracing process.

**dhcp**—(J Series routers and EX Series switches only) (Optional) Restart the software process for a Dynamic Host Configuration Protocol (DHCP) server. A DHCP server allocates network IP addresses and delivers configuration settings to client hosts without user intervention.

**dhcp-service**—(Optional) Restart the Dynamic Host Configuration Protocol process.

**dialer-services**—(J Series routers and EX Series switches only) (Optional) Restart the ISDN dial-out process.

**diameter-service**—(Optional) Restart the diameter process.

**disk-monitoring**—(Optional) Restart disk monitoring, which checks the health of the hard disk drive on the Routing Engine.

**dlsw**—(J Series routers and QFX Series only) (Optional) Restart the data link switching (DLSw) service.

**dot1x-protocol**—(EX Series switches only) (Optional) Restart the port-based network access control process.

**dynamic-flow-capture**—(Optional) Restart the dynamic flow capture (DFC) process, which controls DFC configurations on Monitoring Services III PICs.

**ecc-error-logging**—(Optional) Restart the error checking and correction (ECC) process, which logs ECC parity errors in memory on the Routing Engine.

**ethernet-connectivity-fault-management**—(Optional) Restart the process that provides IEEE 802.1ag Operation, Administration, and Management (OAM) connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.

**ethernet-link-fault-management**—(EX Series switches and MX Series routers only) (Optional) Restart the process that provides the OAM link fault management (LFM) information for Ethernet interfaces.

**ethernet-switching**—(EX Series switches only) (Optional) Restart the Ethernet switching process.

**event-processing**—(Optional) Restart the event process (eventd).

**fibre-channel**—(QFX Series only) (Optional) Restart the Fibre Channel process.

**firewall**—(Optional) Restart the firewall management process, which manages the firewall configuration and enables accepting or rejecting packets that are transiting an interface on a router or switch.

**general-authentication-service**—(EX Series switches and MX Series routers only) (Optional) Restart the general authentication process.

**gracefully**—(Optional) Restart the software process.

**iccp-service**—(Optional) Restart the Inter-Chassis Communication Protocol (ICCP) process.

**idp-policy**—(Optional) Restart the intrusion detection and prevention (IDP) protocol process.

**immediately**—(Optional) Immediately restart the software process.

**interface-control**—(Optional) Restart the interface process, which controls the router's or switch's physical interface devices and logical interfaces.

**ipsec-key-management**—(Optional) Restart the IPsec key management process.

**isdn-signaling**—(J Series routers and QFX Series only) (Optional) Restart the ISDN signaling process, which initiates ISDN connections.

**kernel-replication**—(Optional) Restart the kernel replication process, which replicates the state of the backup Routing Engine when graceful Routing Engine switchover (GRES) is configured.

**l2-learning**—(Optional) Restart the Layer 2 address flooding and learning process.

**l2cpd-service**—(Optional) Restart the Layer 2 Control Protocol process, which enables features such as Layer 2 protocol tunneling and nonstop bridging.

**l2tp-service**—(M10, M10i, M7i, and MX Series routers only) (Optional) Restart the Layer 2 Tunneling Protocol (L2TP) process, which sets up client services for establishing Point-to-Point Protocol (PPP) tunnels across a network and negotiating Multilink PPP if it is implemented.

**l2tp-universal-edge**—(MX Series routers only) (Optional) Restart the L2TP process, which establishes L2TP tunnels and PPP sessions through L2TP tunnels.

**lACP**—(Optional) Restart the Link Aggregation Control Protocol (LACP) process. LACP provides a standardized means for exchanging information between partner systems on a link to allow their link aggregation control instances to reach agreement on the identity of the LAG to which the link belongs, and then to move the link to that LAG,

and to enable the transmission and reception processes for the link to function in an orderly manner.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) For a TX Matrix router, restart the software process for a specific T640 router that is connected to the TX Matrix router. For a TX Matrix Plus router, restart the software process for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**license-service**—(EX Series switches only) (Optional) Restart the feature license management process.

**link-management**—(TX Matrix and TX Matrix Plus routers and EX Series switches only) (Optional) Restart the Link Management Protocol (LMP) process, which establishes and maintains LMP control channels.

**lldpd-service**—(EX Series switches only) (Optional) Restart the Link Layer Discovery Protocol (LLDP) process.

**local**—(MX Series routers only) (Optional) Restart the software process for the local Virtual Chassis member.

**local-policy-decision-function**—(Optional) Restart the process for the Local Policy Decision Function, which regulates collection of statistics related to applications and application groups and tracking of information about dynamic subscribers and static interfaces.

**mac-validation**—(Optional) Restart the Media Access Control (MAC) validation process, which configures MAC address validation for subscriber interfaces created on demux interfaces in dynamic profiles on MX Series routers.

**member *member-id***—(MX Series routers only) (Optional) Restart the software process for a specific member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**mib-process**—(Optional) Restart the Management Information Base (MIB) version II process, which provides the router's MIB II agent.

**mobile-ip**—(Optional) Restart the Mobile IP process, which configures Junos OS Mobile IP features.

**mountd-service**—(EX Series switches and MX Series routers only) (Optional) Restart the service for NFS mount requests.

**mpls-traceroute**—(Optional) Restart the MPLS Periodic Traceroute process.

**mspd**—(Optional) Restart the Multiservice process.

**multicast-snooping**—(EX Series switches and MX Series routers only) (Optional) Restart the multicast snooping process, which makes Layer 2 devices, such as VLAN switches, aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.

**named-service**—(Optional) Restart the DNS Server process, which is used by a router or a switch to resolve hostnames into addresses.

**network-access-service**—(J Series routers and QFX Series only) (Optional) Restart the network access process, which provides the router's Challenge Handshake Authentication Protocol (CHAP) authentication service.

**nfsd-service**—(Optional) Restart the Remote NFS Server process, which provides remote file access for applications that need NFS-based transport.

**packet-triggered-subscribers**—(Optional) Restart the packet-triggered subscribers and policy control (PTSP) process, which allows the application of policies to dynamic subscribers that are controlled by a subscriber termination device.

**peer-selection-service**—(Optional) Restart the Peer Selection Service process.

**pgcp-service**—(Optional) Restart the pgcpd service process running on the Routing Engine. This option does not restart pgcpd processes running on mobile station PICs. To restart pgcpd processes running on mobile station PICs, use the **services pgcp gateway** option.

**pgm**—(Optional) Restart the process that implements the Pragmatic General Multicast (PGM) protocol for assisting in the reliable delivery of multicast packets.

**pic-services-logging**—(Optional) Restart the logging process for some PICs. With this process, also known as fsad (the file system access daemon), PICs send special logging information to the Routing Engine for archiving on the hard disk.

**pki-service**—(Optional) Restart the PKI Service process.

**ppp**—(Optional) Restart the Point-to-Point Protocol (PPP) process, which is the encapsulation protocol process for transporting IP traffic across point-to-point links.

**ppp-service**—(Optional) Restart the Universal Edge PPP process, which is the encapsulation protocol process for transporting IP traffic across Universal Edge routers.

**pppoe**—(Optional) Restart the Point-to-Point Protocol over Ethernet (PPPoE) process, which combines PPP that typically runs over broadband connections with the Ethernet link-layer protocol that allows users to connect to a network of hosts over a bridge or access concentrator.

**protected-system-domain-service**—(Optional) Restart the Protected System Domain (PSD) process.

**redundancy-interface-process**—(Optional) Restart the ASP redundancy process.

**remote-operations**—(Optional) Restart the remote operations process, which provides the ping and traceroute MIBs.

**root-system-domain-service**—(Optional) Restart the Root System Domain (RSD) service.

**routing**—(ACX Series routers, QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the routing protocol process.

**routing <logical-system *logical-system-name*>**—(Optional) Restart the routing protocol process, which controls the routing protocols that run on the router or switch and maintains the routing tables. Optionally, restart the routing protocol process for the specified logical system only.

**sampling**—(Optional) Restart the sampling process, which performs packet sampling based on particular input interfaces and various fields in the packet header.

**sbc-configuration-process**—(Optional) Restart the session border controller (SBC) process of the border signaling gateway (BSG).

**scc**—(TX Matrix routers only) (Optional) Restart the software process on the TX Matrix router (or switch-card chassis).

**sdk-service**—(Optional) Restart the SDK Service process, which runs on the Routing Engine and is responsible for communications between the SDK application and Junos OS. Although the SDK Service process is present on the router, it is turned off by default.

**secure-neighbor-discovery**—(QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the secure Neighbor Discovery Protocol (NDP) process, which provides support for protecting NDP messages.

**sfc number**—(TX Matrix Plus routers only) (Optional) Restart the software process on the TX Matrix Plus router (or switch-fabric chassis). Replace **number** with **0**.

**service-deployment**—(Optional) Restart the service deployment process, which enables Junos OS to work with the Session and Resource Control (SRC) software.

**services**—(Optional) Restart a service.

**services pgcp gateway *gateway-name***—(Optional) Restart the pgcpd process for a specific border gateway function (BGF) running on an MS-PIC. This option does not restart the pgcpd process running on the Routing Engine. To restart the pgcpd process on the Routing Engine, use the **pgcp-service** option.

**sflow-service**—(EX Series switches only) (Optional) Restart the flow sampling (sFlow technology) process.

**snmp**—(Optional) Restart the SNMP process, which enables the monitoring of network devices from a central location and provides the router's or switch's SNMP master agent.

**soft**—(Optional) Reread and reactivate the configuration without completely restarting the software processes. For example, BGP peers stay up and the routing table stays constant. Omitting this option results in a graceful restart of the software process.

**static-subscribers**—(Optional) Restart the static subscribers process, which associates subscribers with statically configured interfaces and provides dynamic service activation and activation for these subscribers.

**statistics-service**—(Optional) Restart the process that manages the Packet Forwarding Engine statistics.

**subscriber-management**—(Optional) Restart the Subscriber Management process.

**subscriber-management-helper**—(Optional) Restart the Subscriber Management Helper process.

**tunnel-oamd**—(Optional) Restart the Tunnel OAM process, which enables the Operations, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol tunneling (L2PT) allows service providers to send Layer 2 PDUs across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.

**usb-control**—(J Series routers and MX Series routers only) (Optional) Restart the USB control process.

**vrrp**—(ACX Series routers, EX Series switches, and MX Series routers only) (Optional) Restart the Virtual Router Redundancy Protocol (VRRP) process, which enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.

**web-management**—(J Series routers, QFX Series, EX Series switches, and MX Series routers only) (Optional) Restart the Web management process.

**Required Privilege Level** reset

**Related Documentation** [• Overview of Junos OS CLI Operational Mode Commands on page 52](#)

**List of Sample Output** [restart interfaces on page 481](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### restart interfaces

```
user@host> restart interfaces
interfaces process terminated
interfaces process restarted
```

## rollback

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| <b>Syntax</b>                   | <code>rollback &lt;number   rescue&gt;</code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Release Information</b>      | <p>Command introduced before Junos OS Release 7.4.</p> <p>Command introduced in Junos OS Release 11.1 for the QFX Series.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>              | <p>Return to a previously committed configuration. The software saves the last 50 committed configurations, including the rollback number, date, time, and name of the user who issued the <b>commit</b> configuration command.</p> <p>The currently operational Junos OS configuration is stored in the file <b>juniper.conf</b>, and the last three committed configurations are stored in the files <b>juniper.conf.1</b>, <b>juniper.conf.2</b>, and <b>juniper.conf.3</b>. These four files are located in the directory <b>/config</b>, which is on the router's flash drive. The remaining 46 previous committed configurations, the files <b>juniper.conf.4</b> through <b>juniper.conf.49</b>, are stored in the directory <b>/var/db/config</b>, which is on the router's hard disk.</p> <p>During rollback, the configuration you specify is loaded from the associated file. Only objects in the rollback configuration that differ from the previously loaded configuration are marked as changed (equivalent to <b>load update</b>).</p> |
| <b>Options</b>                  | <p><b>none</b> (Optional)—Return to the most recently saved configuration.</p> <p><b>number</b>—(Optional) Configuration to return to. The range of values is from <b>0</b> through <b>49</b>. The most recently saved configuration is number <b>0</b>, and the oldest saved configuration is number <b>49</b>. The default is <b>0</b>.</p> <p><b>rescue</b>—(Optional) Return to the rescue configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Required Privilege Level</b> | rollback—To roll back to configurations other than the one most recently committed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## save

---

**Syntax**    `save filename`

**QFX Series**    `save (dhcp-snooping filename)`

**Release Information**    Command introduced before Junos OS Release 7.4.  
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Save the configuration to an ASCII file. The contents of the current level of the statement hierarchy (and below) are saved, along with the statement hierarchy containing it. This allows a section of the configuration to be saved, while fully specifying the statement hierarchy.

When saving a file to a remote system, the software uses the **scp/ssh** protocol.

**Options**    *filename*—Name of the saved file. You can specify a filename in one of the following ways:

- *filename*—File in the user's home directory (the current directory) on the local flash drive.
- *path/filename*—File on the local flash drive.
- */var/filename* or */var/path/filename*—File on the local hard disk.
- *a:filename* or *a:path/filename*—File on the local drive. The default path is */* (the root-level directory). The removable media can be in MS-DOS or UNIX (UFS) format.
- *hostname:/path/filename*, *hostname:filename*, *hostname:path/filename*, or *scp://hostname/path/filename*—File on an **scp/ssh** client. This form is not available in the worldwide version of Junos OS. The default path is the user's home directory on the remote system. You can also specify *hostname* as *username@hostname*.
- *ftp://hostname/path/filename*—File on an FTP server. You can also specify *hostname* as *username @hostname* or *username:password @hostname*. The default path is the user's home directory. To specify an absolute path, the path must start with the string *%2F*; for example, *ftp://hostname/%2Fpath/filename*. To have the system prompt you for the password, specify **prompt** in place of the password. If a password is required, and you do not specify the password or **prompt**, an error message is displayed:

```
user@host> file copy ftp://username@ftp.hostname.net//filename
file copy ftp.hostname.net: Not logged in.
user@host> file copy ftp://username:prompt@ftphostname.net//filename
```

Password for *username@ftp.hostname.net*:

- *http://hostname/path/filename*—File on a Hypertext Transfer Protocol (HTTP) server. You can also specify *hostname* as *username@hostname* or *username:password@hostname*. If a password is required and you omit it, you are prompted for it.
- *re0:/path/filename* or *re1:/path/filename*—File on a local Routing Engine.

**Required Privilege Level**    configure—To enter configuration mode.

**Related Documentation**    • *Deactivating and Reactivating Statements and Identifiers in a Junos OS Configuration*

## show chassis alarms

|                               | Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>            | Display information about the conditions that have been configured to trigger alarms.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>                | <p><b>none</b>—Display information about the conditions that have been configured to trigger alarms.</p> <p><b>all-members</b>—(MX Series routers only) (Optional) Display information about alarm conditions for all the member routers of the Virtual Chassis configuration.</p> <p><b>interconnect-device <i>name</i></b>—(QFabric systems only) (Optional) Display information about alarm conditions for the Interconnect device.</p> <p><b>lcc <i>number</i></b>—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.<br/>Replace <i>number</i> with the following values depending on the LCC configuration:</p> <ul style="list-style-type: none"> <li>• 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.</li> <li>• 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.</li> <li>• 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.</li> <li>• 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.</li> </ul> <p><b>local</b>—(MX Series routers only) (Optional) Display information about alarm conditions for the local Virtual Chassis member.</p> <p><b>member <i>member-id</i></b>—(MX Series routers only) (Optional) Display information about alarm conditions for the specified member of the Virtual Chassis configuration. Replace <i>member-id</i> variable with a value of 0 or 1.</p> <p><b>node-device <i>name</i></b>—(QFabric systems only) (Optional) Display information about alarm conditions for the Node device.</p> <p><b>scc</b>—(TX Matrix router only) (Optional) Show information about the TX Matrix router (switch-card chassis).</p> <p><b>sfc <i>number</i></b>—(TX Matrix Plus router only) (Optional) Show information about the respective TX Matrix Plus router, which is the switch-fabric chassis. Replace <i>number</i> variable with 0.</p> |
| <b>Additional Information</b> | <p>You cannot clear the alarms for chassis components. Instead, you must remedy the cause of the alarm. When a chassis alarm LED is lit, it indicates that you are running the router or switch in a manner that we do not recommend.</p> <p>On routers, you can manually silence external devices connected to the alarm relay contacts by pressing the alarm cutoff button, located on the craft interface. Silencing the device does not remove the alarm messages from the display (if present on the</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

router) or extinguish the alarm LEDs. In addition, new alarms that occur after you silence an external device reactivate the external device.

In Junos OS release 11.1 and later, alarms for fans also show the slot number of the fans in the CLI output.

In Junos OS Release 11.2 and later, the command output on EX8200 switches shows the detailed location (**Plane/FPC/PFE**) for link errors in the chassis.

In Junos OS Release 10.2 and later, an alarm is shown on T Series routers for a standby sonic clock generator (SCG) that is offline or absent.

You may often see the following error messages, in which only the error code is shown and no other information is provided:

```
Apr 12 08:04:10 send: red alarm set, device FPC 6, reason FPC 6 Major Errors - Error code:
257
Apr 12 08:04:19 send: red alarm set, device FPC 1, reason FPC 1 Major Errors - Error code:
559
```

To understand what CM\_ALARM error codes mean, you need to first identify the structure of the CM Alarm codes. A CM\_ALARM code has the following structure:

| Bits: | Error type: |
|-------|-------------|
| 1-31  | Major (1)   |
| 0     | Minor (0)   |

According to the table above, the LSB (bit 0) identifies the **Error Type** (major alarm, if the bit is set and minor alarm if the bit is unset). The rest of the bits (1 - 31) identify the actual error code.

Take an example of the following error code, which was logged on a T1600:

```
Apr 12 08:04:10 send: red alarm set, device FPC 1, reason FPC 1 Major Errors - Error code:
559
```

First, you have to convert 559 to binary; that is **100010111**. The LSB in this case is 1, which means that this is a major alarm. After removing the LSB, you are left with **10001011**, which is equal to 279 in decimal. This is the actual error code, its meaning can be found from the following list:

| Chip Type: L Chip                        | Code |
|------------------------------------------|------|
| CMALARM_LCHIP_LOUT_DESRD_PARITY_ERR      | 1    |
| CMALARM_LCHIP_LOUT_DESRD_UNINIT_ERR      | 2    |
| CMALARM_LCHIP_LOUT_DESRD_ILLEGALLINK_ERR | 3    |
| CMALARM_LCHIP_LOUT_DESRD_ILLEGALSIZE_ERR | 4    |

|                                            |    |
|--------------------------------------------|----|
| CMALARM_LCHIP_LOUT_HDRF_TOERR_ERR          | 5  |
| CMALARM_LCHIP_LOUT_HDRF_PARITY_ERR         | 6  |
| CMALARM_LCHIP_LOUT_HDRF_UCERR_ERR          | 7  |
| CMALARM_LCHIP_LOUT_NLIF_CRCDROP_ERR        | 8  |
| CMALARM_LCHIP_LOUT_NLIF_CRCERR_ERR         | 9  |
| CMALARM_LCHIP_UCODE_TIMEOUT_ERR            | 10 |
| CMALARM_LCHIP_LIN_SRCTL_ACCT_DROP_ERR      | 11 |
| CMALARM_LCHIP_LIN_SRCTL_ACCT_ADDR_SIZE_ERR | 12 |
| CMALARM_LCHIP_SRAM_PARITY_ERR              | 13 |
| CMALARM_LCHIP_UCODE_OVFLW_ERR              | 14 |
| CMALARM_LCHIP_LOUT_HDRF_MTU_ERR            | 15 |

| Chip Type: M Chip               | Code |
|---------------------------------|------|
| CMALARM_MCHIP_ECC_UNCORRECT_ERR | 128  |

| Chip Type: N Chip                    | Code |
|--------------------------------------|------|
| CMALARM_NCHIP_RDDMA_JBUS_TIMEOUT_ERR | 256  |
| CMALARM_NCHIP_RDDMA_FIFO_OVFLW_ERR   | 257  |
| CMALARM_NCHIP_RDDMA_FIFO_UNFLW_ERR   | 258  |
| CMALARM_NCHIP_RDDMA_SIZE_ERR         | 259  |
| CMALARM_NCHIP_RDDMA_JBUS_CRC_ERR     | 260  |
| CMALARM_NCHIP_WRDMA_PKTR_ERR         | 261  |
| CMALARM_NCHIP_WRDMA_PKT_CRC_ERR      | 262  |
| CMALARM_NCHIP_WRDMA_JBUS_TIMEOUT_ERR | 263  |
| CMALARM_NCHIP_WRDMA_FIFO_OVFLW_ERR   | 264  |
| CMALARM_NCHIP_WRDMA_FIFO_UNFLW_ERR   | 265  |
| CMALARM_NCHIP_WRDMA_PKT_LEN_ERR      | 266  |

|                                           |             |
|-------------------------------------------|-------------|
| CMALARM_NCHIP_WRDMA_JBUS_CRC_ERR          | 267         |
| CMALARM_NCHIP_PKTR_DMA_AGE_ERR            | 268         |
| CMALARM_NCHIP_PKTR_ICELLSIG_ERR           | 269         |
| CMALARM_NCHIP_PKTR_FTTL_ERR               | 270         |
| CMALARM_NCHIP_RODR_OFFSET_OVFLW_ERR       | 271         |
| CMALARM_NCHIP_PKTR_TMO_CELL_ERR           | 272         |
| CMALARM_NCHIP_PKTR_TMO_OUTRANGE_ERR       | 273         |
| CMALARM_NCHIP_PKTR_MD_REQUEST_Q_OVFLW_ERR | 274         |
| CMALARM_NCHIP_PKTR_DMA_BUFFER_OVFLW_ERR   | 275         |
| CMALARM_NCHIP_PKTR_GRT_OVFLW_ERR          | 276         |
| CMALARM_NCHIP_FRQ_ERR                     | 277         |
| CMALARM_NCHIP_RODR_IN_Q_OVFLW_ERR         | 278         |
| CMALARM_NCHIP_DBUF_CRC_ERR                | 279         |
| <hr/>                                     |             |
| <b>Chip Type: R Chip</b>                  | <b>Code</b> |
| CMALARM_RCHIP_SRAM_PARITY_ERR             | 512         |
| <hr/>                                     |             |
| <b>Chip Type: R Chip</b>                  | <b>Code</b> |
| CMALARM_ICHIP_WO_DESRD_ID_ERR             | 601         |
| CMALARM_ICHIP_WO_DESRD_DATA_ERR           | 602         |
| CMALARM_ICHIP_WO_DESRD_OFLOW_ERR          | 603         |
| CMALARM_ICHIP_WO_HDRF_UCERR_ERR           | 604         |
| CMALARM_ICHIP_WO_HDRF_MTUERR_ERR          | 605         |
| CMALARM_ICHIP_WO_HDRF_PARITY_ERR          | 606         |
| CMALARM_ICHIP_WO_HDRF_TOERR_ERR           | 607         |
| CMALARM_ICHIP_WO_IP_CRC_ERR               | 608         |
| CMALARM_ICHIP_WO_IP_INTER_ERR             | 609         |

|                                   |     |
|-----------------------------------|-----|
| CMALARM_ICHIP_WI_WAN_TIMEOUT_ERR  | 625 |
| CMALARM_ICHIP_WI_FAB_TIMEOUT_ERR  | 626 |
| CMALARM_ICHIP_RLDRAM_BIST_ERR     | 630 |
| CMALARM_ICHIP_SDRAM_BIST_ERR      | 631 |
| CMALARM_ICHIP_RLDRAM_PARITY_ERR   | 632 |
| CMALARM_ICHIP_SDRAM_UNCORRECT_ERR | 633 |
| CMALARM_ICHIP_SDRAM_CORRECT_ERR   | 634 |
| CMALARM_ICHIP_FUSE_DONE_ERR       | 635 |

According to the table above, the **279** error code corresponds to **CMALARM\_NCHIP\_DBUF\_CRC\_ERR**; this means that new CRC errors were seen on the NCHIP of this particular FPC, which is FPC as per the logs.

If you do not want to convert decimal to binary and vice versa, you may use the following shortcut:

For major alarms, the **Actual Error Code = (Error Code - 1)/2**, where **Error Code** is the code that you get in the log message. For example, if you get the following log:

Apr 12 08:04:10 send: red alarm set, device FPC 6, reason FPC 6 Major Errors - Error code: 257

Actual Error Code =  $(257-1)/2 = 128$ . Similarly, for minor alarms, Actual Error Code =  $(\text{Error Code})/2$

**Output Fields** [Table 21 on page 492](#) lists the output fields for the **show chassis alarms** command. Output fields are listed in the approximate order in which they appear.

**Table 21: show chassis alarms Output Fields**

| Field Name  | Field Description                                             |
|-------------|---------------------------------------------------------------|
| Alarm time  | Date and time the alarm was first recorded.                   |
| Class       | Severity class for this alarm: <b>Minor</b> or <b>Major</b> . |
| Description | Information about the alarm.                                  |

## Sample Output

**show chassis alarms (Alarms Active)**

```

user@host> show chassis alarms
3 alarms are currently active
Alarm time           Class  Description
2000-02-07 10:12:22 UTC Major fxp0: ethernet link down
2000-02-07 10:11:54 UTC Minor YELLOW ALARM - PEM 1 Removed
2000-02-07 10:11:03 UTC Minor YELLOW ALARM - Lower Fan Tray Removed

```

**show chassis alarms (No Alarms Active)**

```
user@host> show chassis alarms
No alarms are currently active
```

**show chassis alarms (Fan Tray)**

```
user@host> show chassis alarms
4 alarms currently active
Alarm time           Class Description
2010-11-11 20:27:38 UTC Major Side Fan Tray 7 Failure
2010-11-11 20:27:13 UTC Minor Side Fan Tray 7 Overspeed
2010-11-11 20:27:13 UTC Major Side Fan Tray 5 Failure
2010-11-11 20:27:13 UTC Major Side Fan Tray 0 Failure
```

**show chassis alarms (MX104 Router)**

```
user@host >show chassis alarms
1 alarms currently active
Alarm time           Class Description
2013-06-05 14:43:31 IST Minor Backup RE Active
```

**show chassis alarms (MX2010 Router)**

```
user@host> show chassis alarms
7 alarms currently active
Alarm time           Class Description
2012-08-07 00:46:06 PDT Major Fan Tray 2 Failure
2012-08-06 18:24:36 PDT Minor Redundant feed missing for PSM 6
2012-08-06 07:41:04 PDT Minor Redundant feed missing for PSM 8
2012-08-04 02:42:06 PDT Minor Redundant feed missing for PSM 5
2012-08-03 21:14:24 PDT Minor Loss of communication with Backup RE
2012-08-03 12:26:03 PDT Minor Redundant feed missing for PSM 4
2012-08-03 10:40:18 PDT Minor Redundant feed missing for PSM 7
```

**show chassis alarms (MX2020 Router)**

```
user@host> show chassis alarms
1 alarms currently active
Alarm time Class Description
2012-10-03 12:14:59 PDT Minor Plane 0 not online
```

**show chassis alarms (MX960, MX480, and MX240 Routers showing Major CB Failure)**

A Major CB 0 Failure alarm occurs in the event of a bad CB (unknown or mismatched CBs do not trigger this alarm in Junos Release 12.3R9 and later). Following GRES/recovery, if the hardware issue persists, the traffic moves to the good CB and continues. If the alarm was triggered by something transient like a power zone budget on GRES, bringing the CB back online can clear the alarm. Otherwise, replace the bad CB. Note that fabric link speed is not impacted by an offline SCB. The alarm may be raised on CB0, CB1, and CB2.

```
user@host> show chassis alarms
6 alarms currently active

### show chassis alarms (Alarms on a T4000 Router After the enhanced-mode Statement is Enabled)

To enable improved virtual private LAN service (VPLS) MAC address learning on T4000 routers, you must include the **enhanced-mode** statement at the **[edit chassis network-services]** hierarchy level and reboot the router. When router reboots, only the T4000 Type 5 FPCs are required to be present on the router. If there are any other FPCs (apart from T4000 Type 5 FPCs) on the T4000 router, such FPCs become offline, and FPC misconfiguration alarms are generated. The **show chassis alarm** command output displays FPC misconfiguration (**FPC *fpc-slot* misconfig**) as the reason for the generation of the alarms.

```

2013-03-19 23:03:47 PDT Minor PDU 1 PSM 0 Absent
2013-03-19 23:03:46 PDT Major No CG Online
```

### show chassis alarms (PDU Converter Failed Alarm on a PTX5000 Packet Transport Router with FPC2-PTX-PIA)

The **PDU Converter Failed** alarm is raised when one or more 36 V booster converter of a DC PDU fails. If two or more 36 V booster converter fails, fan trays fail and the router might get over heated. Therefore, when this alarm is raised, check the PDU and replace it, if required.

```
user@host> show chassis alarms

## show chassis beacon

**show chassis beacon**  
(QFX Series)

```
show chassis beacon
<cb slot-number>
<fpc slot-number>
<interconnect-device name (cb slot-number | fpc slot-number)>
<node-device name>
```

**Release Information** Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Display the beacon LED status on a QFX3500 standalone switch, Node device, and an Interconnect device. You can also display the beacon LED status of the Control Boards and Flexible PIC Concentrators on the Interconnect device.

**Options**

**cb slot-number**— (QFabric systems only) (Optional) Display the status of the beacon LEDs for the Control Board on the Interconnect device.

**fpc slot-number**— (QFabric systems only) (Optional) Display the status of the beacon LEDs for the Flexible PIC Concentrator (FPC) on the Interconnect device. (QFX3500 switches only) (Optional) Display the status of the beacon LEDs for the Flexible PIC Concentrator on the standalone switch.

**interconnect-device name**— (QFabric systems only) (Optional) Display the status of the beacon LEDs for the Interconnect device.

**node-device name**— (QFabric systems only) (Optional) Display the status of the beacon LEDs for the Node device.

**Required Privilege Level** view

**Output Fields** [Table 22 on page 501](#) lists the output fields for the **show chassis beacon** command. Output fields are listed in the approximate order in which they appear.

**Table 22: show chassis led Output Fields**

| Field Name | Field Description                                                                                                       |
|------------|-------------------------------------------------------------------------------------------------------------------------|
| Slot       | FPC slot number of the device whose content is being displayed. On QFX3500 standalone switches, the number is always 0. |

Table 22: show chassis led Output Fields (*continued*)

| Field Name          | Field Description                                                                                                                                |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Beacon State</b> | Status of the beacon state: <ul style="list-style-type: none"> <li>Off—The beacon is <b>OFF</b>.</li> <li>On—The beacon is <b>ON</b>.</li> </ul> |

## Sample Output

### show chassis beacon (QFX Series)

```
user@switch> show chassis beacon
Slot          Beacon State
FPC          0          OFF
```

### show chassis beacon interconnect-device (QFabric System)

```
user@switch> show chassis beacon interconnect-device interconnect1
Chassis              OFF
CB 0                  OFF
CB 1                  OFF
FC 0 FPC 0            OFF
FC 1 FPC 1            OFF
RC 0 FPC 8            OFF
RC 1 FPC 9            OFF
```

### show chassis beacon interconnect-device fpc (QFabric System)

```
user@switch> show chassis beacon interconnect-device interconnect1 fpc 0
FPC 0                ON
```

### show chassis beacon node-device (QFabric System)

```
user@switch> show chassis beacon node-device node1
node1                ON
```

### show chassis beacon node-device fpc (QFabric System)

```
user@switch> show chassis beacon node-device node1 fpc 0
FPC 0                ON
```

| Speed is                                   | Speed at which the Ethernet link is running: <b>10 Mb</b> When the device is <b>RE</b> or <b>Other RE</b> on the TX Matrix router, the speed is <b>1000 Mb</b> .                                                                                                                                                                                                                                                                |
| Duplex is                                  | Duplex type of the Ethernet link: <b>full</b> or <b>half</b> .                                                                                                                                                                                                                                                                                                                                                                  |
| Autonegotiate is Enabled (or Disabled)     | By default, built-in Fast Ethernet ports on a PIC autonegotiate whether to operate at 10 Mbps or 100 Mbps. All other interfaces automatically choose the correct speed based on the PIC type and whether the PIC is configured to operate in multiplexed mode (using the <b>no-concatenate</b> statement at the <b>[edit chassis]</b> hierarchy level, as described in the <i>Junos OS System Basics Configuration Guide</i> ). |
| TX Octets                                  | Number of octets sent.                                                                                                                                                                                                                                                                                                                                                                                                          |
| TX Packets 64 Octets                       | Number of transmitted frames of size 64 octets.                                                                                                                                                                                                                                                                                                                                                                                 |
| TX Packets 65-127 Octets                   | Number of transmitted frames of size 65 through 127 octets.                                                                                                                                                                                                                                                                                                                                                                     |
| TX Packets 128-255 Octets                  | Number of transmitted frames of size 128 through 255 octets.                                                                                                                                                                                                                                                                                                                                                                    |
| TX Packets 256-511 Octets                  | Number of transmitted frames of size 256 through 511 octets.                                                                                                                                                                                                                                                                                                                                                                    |
| TX Packets 512-1023 Octets                 | Number of transmitted frames of size 512 through 1023 octets.                                                                                                                                                                                                                                                                                                                                                                   |
| TX Packets 1024-1518 Octets                | Number of transmitted frames of size 1024 through 1518 octets.                                                                                                                                                                                                                                                                                                                                                                  |
| TX Packets 1519-2047 Octets                | Number of transmitted frames of size 1519 through 2047 octets.                                                                                                                                                                                                                                                                                                                                                                  |
| TX Packets 2048-4095 Octets                | Number of transmitted frames of size 2048 through 4095 octets.                                                                                                                                                                                                                                                                                                                                                                  |
| TX Packets 4096-9216 Octets                | Number of transmitted frames of size 4096 through 9216 octets.                                                                                                                                                                                                                                                                                                                                                                  |
| TX Packets 9217-16383 Octets               | Number of transmitted frames of size 9217 through 16383 octets.                                                                                                                                                                                                                                                                                                                                                                 |
| TX Multicast packets                       | Number of multicast packets sent.                                                                                                                                                                                                                                                                                                                                                                                               |

Table 23: show chassis ethernet-switch interconnect-device fpc Output Fields (*continued*)

| Field Name                 | Field Description                                                                       |
|----------------------------|-----------------------------------------------------------------------------------------|
| TX Broadcast packets       | Number of broadcast packets sent.                                                       |
| TX Single Collision frames | Number of packets sent after one collision.                                             |
| TX Mult. Collision frames  | Number of packets sent after multiple collisions.                                       |
| TX Late Collision Frames   | Number of packets aborted during sending because of collisions after 64 bytes.          |
| TX Excessive collisions    | Number of packets not sent because of too many collisions.                              |
| TX Collision frames        | Number of collision packets sent.                                                       |
| TX PAUSEMAC Ctrl Frames    | Number of Media Access Control (MAC) frames containing PAUSE commands sent.             |
| TX MAC ctrl frames         | Number of MAC control packets sent.                                                     |
| TX Frame deferred Xmns     | Number of frames deferred in x milliseconds.                                            |
| TX Oversize Packets        | Number of oversized packets sent.                                                       |
| TX Jabbers                 | Total number of frames sent that exceed the maximum byte count and contain CRC errors . |
| TX FCS Error Counter       | Number of packets discarded because of frame check sequence errors.                     |
| TX Fragment Counter        | Number of fragmented packets sent.                                                      |
| TX Byte Counter            | Number of bytes sent.                                                                   |
| RX Octets                  | Number of octets received.                                                              |
| RX Packets 64 Octets       | Number of received packets of size 64 octets.                                           |
| RX Packets 65-127 Octets   | Number of received packets of size 65 through 127 octets.                               |
| RX Packets 128-255 Octets  | Number of received packets of size 128 through 255 octets.                              |
| RX Packets 256-511 Octets  | Number of received packets of size 256 through 511 octets.                              |
| RX Packets 512-1023 Octets | Number of received packets of size 512 through 1023 octets.                             |

Table 23: show chassis ethernet-switch interconnect-device fpc Output Fields (*continued*)

| Field Name                  | Field Description                                                                           |
|-----------------------------|---------------------------------------------------------------------------------------------|
| RX Packets 1024-1518 Octets | Number of received packets of size 65 through 127 octets.                                   |
| RX Packets 1519-2047 Octets | Number of received packets of size 1519 through 2047 octets.                                |
| RX Packets 2048-4095 Octets | Number of received packets of size 2048 through 4095 octets.                                |
| RX Packets 4096-9216 Octets | Number of received packets of size 4096 through 9216 octets.                                |
| RX Multicast Packets        | Number of multicast packets received.                                                       |
| RX Broadcast Packets        | Number of broadcast packets received.                                                       |
| RX FCS Errors               | Number of packets discarded because of frame check sequence errors.                         |
| RX Align Errors             | Number of incomplete octets received.                                                       |
| RX Fragments                | Number of fragmented packets received.                                                      |
| RX Symbol errors            | Number of symbols received that the router did not correctly decode.                        |
| RX Unsupported opcodes      | Number of packets received with unsupported op codes.                                       |
| RX Out of Range Length      | Number of packets received with an out of range length.                                     |
| RX False Carrier Errors     | Number of packets received with false carrier errors.                                       |
| RX Undersize Packets        | Number of undersized packets received.                                                      |
| RX Oversize Packets         | Number of oversized packets received.                                                       |
| RX Jabbers                  | Total number of frames received that exceed the maximum byte count and contain CRC errors . |
| RX 1519-1522 Good Vlan frms | Number of transmitted frames of size 1519 through 1522 octets that are good VLAN frames.    |
| RX MTU Exceed Counter       | Number of packets received that exceed the MTU.                                             |
| RX Control Frame Counter    | Number of control frames received.                                                          |
| RX Pause Frame Counter      | Number of pause frames received.                                                            |

Table 23: show chassis ethernet-switch interconnect-device fpc Output Fields (*continued*)

| Field Name      | Field Description         |
|-----------------|---------------------------|
| RX Byte Counter | Number of bytes received. |

## Sample Output

### show chassis ethernet-switch interconnect-device fpc

```

user@qfabric> show chassis ethernet-switch interconnect-device IC-WS001 fpc
Summary for switch on FC0
Link is good on GE port 2 connected to device: FWD-SWITCH-0
  Speed is 1000Mb
  Duplex is full
  Autonegotiate is Disabled
  Flow Control TX is Disabled
  Flow Control RX is Disabled
  TX Octets          124638
  RX Octets          86496

user@qfabric> show chassis ethernet-switch fpc interconnect-device IC-WS001 port 2
Summary for switch on FC0
Link is good on GE port 2 connected to device: FWD-SWITCH-0
  Speed is 1000Mb
  Duplex is full
  Autonegotiate is Disabled
  Flow Control TX is Disabled
  Flow Control RX is Disabled
  TX Octets          319466
  RX Octets          221869

Link is good on GE port 4 connected to device: FWD-SWITCH-1
  Speed is 1000Mb
  Duplex is full
  Autonegotiate is Disabled
  Flow Control TX is Disabled
  Flow Control RX is Disabled
  TX Octets          210295
  RX Octets          151164

Link is good on XE port 28 connected to device: CB0
  Speed is 10000Mb
  Duplex is full
  Autonegotiate is Enabled
  Flow Control TX is Disabled
  Flow Control RX is Disabled
  TX Octets          373033
  RX Octets          529760

Link is good on XE port 29 connected to device: CB1
  Speed is 10000Mb
  Duplex is full
  Autonegotiate is Enabled
  Flow Control TX is Disabled
  Flow Control RX is Disabled
  TX Octets           1
  RX Octets           0

Summary for switch on FC1
Link is good on GE port 2 connected to device: FWD-SWITCH-0
  Speed is 1000Mb
  Duplex is full
  Autonegotiate is Disabled
  Flow Control TX is Disabled
  Flow Control RX is Disabled

| Link is good on port n connected to device | <p>Information about the link between each port on the FPC's Ethernet switch and one of the following devices:</p> <ul style="list-style-type: none"> <li>• FWD-SWITCH-0</li> <li>• FWD-SWITCH-1</li> <li>• CB0</li> <li>• CB1</li> </ul> |

Table 24: show chassis ethernet-switch interconnect-device fpc Output Fields (*continued*)

| Field Name                               | Field Description                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Speed is                                 | Speed at which the Ethernet link is running: <b>10 Mb</b> When the device is <b>RE</b> or <b>Other RE</b> on the TX Matrix router, the speed is <b>1000 Mb</b> .                                                                                                                                                                                                                                                                |
| Duplex is                                | Duplex type of the Ethernet link: <b>full</b> or <b>half</b> .                                                                                                                                                                                                                                                                                                                                                                  |
| Autonegotiate is Enabled (or Disabled)   | By default, built-in Fast Ethernet ports on a PIC autonegotiate whether to operate at 10 Mbps or 100 Mbps. All other interfaces automatically choose the correct speed based on the PIC type and whether the PIC is configured to operate in multiplexed mode (using the <b>no-concatenate</b> statement at the <b>[edit chassis]</b> hierarchy level, as described in the <i>Junos OS System Basics Configuration Guide</i> ). |
| Flow Control TX is Enabled (or Disabled) | Flow control in the transmit direction is enabled (or disabled). Flow control regulates the flow of packets from the switch to the remote side of the connection.                                                                                                                                                                                                                                                               |
| Flow Control RX is Enabled (or Disabled) | Flow control in the receive direction is enabled (or disabled). Flow control regulates the flow of packets from the remote side of the connection to the switch.                                                                                                                                                                                                                                                                |
| TX Octets                                | Number of octets sent.                                                                                                                                                                                                                                                                                                                                                                                                          |
| TX Packets 64 Octets                     | Number of transmitted packets of size 64 octets.                                                                                                                                                                                                                                                                                                                                                                                |
| TX Packets 65-127 Octets                 | Number of transmitted frames of size 65 through 127 octets.                                                                                                                                                                                                                                                                                                                                                                     |
| TX Packets 128-255 Octets                | Number of transmitted frames of size 128 through 255 octets.                                                                                                                                                                                                                                                                                                                                                                    |
| TX Packets 256-511 Octets                | Number of transmitted frames of size 256 through 511 octets.                                                                                                                                                                                                                                                                                                                                                                    |
| TX Packets 512-1023 Octets               | Number of transmitted frames of size 512 through 1023 octets.                                                                                                                                                                                                                                                                                                                                                                   |
| TX Packets 1024-1518 Octets              | Number of transmitted frames of size 1024 through 1518 octets.                                                                                                                                                                                                                                                                                                                                                                  |
| TX Packets 1519-2047 Octets              | Number of transmitted frames of size 1519 through 2047 octets.                                                                                                                                                                                                                                                                                                                                                                  |
| TX Packets 2048-4095 Octets              | Number of transmitted frames of size 2048 through 4095 octets.                                                                                                                                                                                                                                                                                                                                                                  |
| TX Packets 4096-9216 Octets              | Number of transmitted frames of size 4096 through 9216 octets.                                                                                                                                                                                                                                                                                                                                                                  |
| TX Packets 9217-16383 Octets             | Number of transmitted frames of size 9217 through 16383 octets.                                                                                                                                                                                                                                                                                                                                                                 |
| TX Multicast packets                     | Number of multicast packets sent.                                                                                                                                                                                                                                                                                                                                                                                               |

Table 24: show chassis ethernet-switch interconnect-device fpc Output Fields (*continued*)

| Field Name                 | Field Description                                                                       |
|----------------------------|-----------------------------------------------------------------------------------------|
| TX Broadcast packets       | Number of broadcast packets sent.                                                       |
| TX Single Collision frames | Number of packets sent after one collision.                                             |
| TX Mult. Collision frames  | Number of packets sent after multiple collisions.                                       |
| TX Late Collision Frames   | Number of packets aborted during sending because of collisions after 64 bytes.          |
| TX Excessive collisions    | Number of packets not sent because of too many collisions.                              |
| TX Collision frames        | Number of collision packets sent.                                                       |
| TX PAUSEMAC Ctrl Frames    | Number of Media Access Control (MAC) frames containing PAUSE commands sent.             |
| TX MAC ctrl frames         | Number of MAC control packets sent.                                                     |
| TX Frame deferred Xmns     | Number of frames deferred in x milliseconds.                                            |
| TX Oversize Packets        | Number of oversized packets sent.                                                       |
| TX Jabbers                 | Total number of frames sent that exceed the maximum byte count and contain CRC errors . |
| TX FCS Error Counter       | Number of packets discarded because of frame check sequence errors.                     |
| TX Fragment Counter        | Number of fragmented packets sent.                                                      |
| TX Byte Counter            | Number of bytes sent.                                                                   |
| RX Octets                  | Number of octets received.                                                              |
| RX Packets 64 Octets       | Number of received packets of size 64 octets.                                           |
| RX Packets 65-127 Octets   | Number of received packets of size 65 through 127 octets.                               |
| RX Packets 128-255 Octets  | Number of received packets of size 128 through 255 octets.                              |
| RX Packets 256-511 Octets  | Number of received packets of size 256 through 511 octets.                              |
| RX Packets 512-1023 Octets | Number of received packets of size 512 through 1023 octets.                             |

Table 24: show chassis ethernet-switch interconnect-device fpc Output Fields (*continued*)

| Field Name                  | Field Description                                                                           |
|-----------------------------|---------------------------------------------------------------------------------------------|
| RX Packets 1024-1518 Octets | Number of received packets of size 65 through 127 octets.                                   |
| RX Packets 1519-2047 Octets | Number of received packets of size 1519 through 2047 octets.                                |
| RX Packets 2048-4095 Octets | Number of received packets of size 2048 through 4095 octets.                                |
| RX Packets 4096-9216 Octets | Number of received packets of size 4096 through 9216 octets.                                |
| RX Multicast Packets        | Number of multicast packets received.                                                       |
| RX Broadcast Packets        | Number of broadcast packets received.                                                       |
| RX FCS Errors               | Number of packets discarded because of frame check sequence errors.                         |
| RX Align Errors             | Number of incomplete octets received.                                                       |
| RX Fragments                | Number of fragmented packets received.                                                      |
| RX Symbol errors            | Number of symbols received that the router did not correctly decode.                        |
| RX Unsupported opcodes      | Number of packets received with unsupported op codes.                                       |
| RX Out of Range Length      | Number of packets received with an out of range length.                                     |
| RX False Carrier Errors     | Number of packets received with false carrier errors.                                       |
| RX Undersize Packets        | Number of undersized packets received.                                                      |
| RX Oversize Packets         | Number of oversized packets received.                                                       |
| RX Jabbers                  | Total number of frames received that exceed the maximum byte count and contain CRC errors . |
| RX 1519-1522 Good Vlan frms |                                                                                             |
| RX MTU Exceed Counter       | Number of packets received that exceed the MTU.                                             |
| RX Control Frame Counter    | Number of control frames received.                                                          |
| RX Pause Frame Counter      | Number of pause frames received.                                                            |

Table 24: show chassis ethernet-switch interconnect-device fpc Output Fields (*continued*)

| Field Name      | Field Description         |
|-----------------|---------------------------|
| RX Byte Counter | Number of bytes received. |

## Sample Output

### show chassis ethernet-switch interconnect-device cb

Command introduced in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers.

**monitored** option added in Junos OS Release 12.1x48 for PTX Series Packet Transport Routers.

Command introduced in Junos OS Release 12.1 for T4000 Core Routers.

Command introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.

Command introduced in Junos OS Release 12.3 for MX2020 3D Universal Edge Routers.

Command introduced in Junos OS Release 12.3 for MX2010 3D Universal Edge Routers.

**pem** option introduced in Junos OS Release 12.3 for ACX4000 Universal Access Routers.

Command introduced in Junos OS Release 13.2 for MX104 3D Universal Edge Routers.

**Description** Display environmental information about the router or switch chassis, including the temperature and information about the fans, power supplies, and Routing Engine.

In addition, on ACX4000 routers, display temperature information about the different channels of a Modular Interface Card (MIC). The number of channels displayed depends on the type of MIC installed.

Starting with Junos OS Release 14.1, the **show chassis environment cb cb-slot-number | ccg ccg-slot-number | fpc fpc-slot-number | fpm | monitored | pdu pdu-slot-number | routing-engine re-slot-number | sib sib-slot-number** operational mode command output displays environmental information for the the new DC power supply module (PSM) and power distribution unit (PDU) that are added to provide power to the high-density FPC (FPC2-PTX-PIA) and other components in a PTX5000 Packet Transport Router.

**Options** **none**—Display environmental information about the router or switch chassis. On a TX Matrix router, display environmental information about the TX Matrix router and its attached T640 routers. On a TX Matrix Plus router, display environmental information about the TX Matrix Plus router and its attached routers.

**all-members**—(MX Series routers and EX Series switches only) (Optional) Display chassis environmental information for all the members of the Virtual Chassis configuration.

**adc adc-slot-number**—(MX2020 and MX2010 routers only) (Optional) Display chassis environmental information for the adapter cards. For MX2020 routers, replace **adc-slot-number** with a value from 0 through 19. For MX2010 routers, replace **adc-slot-number** with a value from 0 through 9.

**cb cb-slot-number**—(ACX Series Universal Access Routers, EX Series switches, M120, M320, and M40e routers, MX Series routers, MX2020 routers, MX2010 routers, PTX Series Packet Transport Routers, QFX Series, and T Series routers, and TX Matrix Plus routers only) (Optional) Display chassis environmental information for the Control Board. On devices other than EX Series switches, replace **cb-slot** with 0 or 1. For the EX Series switches, see *EX Series Switches Hardware and CLI Terminology Mapping* for information on CB slot numbering.

**cip cip-slot-number**—(TX Matrix Plus routers only) (Optional) Display chassis environmental information for the Connection Interface Panel (CIP). Replace the **cip-slot-number** variable with a value of 0 or 1.

**cb interconnect-device name**—(QFabric systems only) (Optional) Display chassis environmental information for the Control Board on an Interconnect device.

**ccg ccg-slot-number**—(PTX Series only) (Optional) Display chassis environmental information for the Centralized Clock Generator. Replace **cb-slot** with a value of 0 or 1.

**fpc fpc-slot**—(EX Series switches, M120, M320, and M40e routers, MX Series routers, MX2010 routers, MX2020 routers, PTX Series Packet Transport Routers, QFX Series, QFX3500 switches, QFabric systems, T Series routers, and TX Matrix Plus routers) (Optional) Display chassis environmental information for a specified Flexible PIC Concentrator. For MX2010 routers, replace **fpc-slot** with a value from 0 through 9. For MX2020 routers, replace **fpc-slot** with a value from 0 through 19. For information about FPC numbering, see [show chassis environment fpc](#). On a QFabric system, display chassis environmental information for a specified Flexible PIC Concentrator on an Interconnect device. On an EX Series switch, display chassis environmental information for a specified Flexible PIC Concentrator; see *EX Series Switches Hardware and CLI Terminology Mapping* for information on FPC numbering. On a TX Matrix Plus router with 3D SIBs replace **fpc-slot** with a value from 0 through 63.

**fpm**—(M120, M320, and M40e routers, MX2010 routers, MX2020 routers, PTX Series, Packet Transport Routers, T Series routers, and TX Matrix Plus routers only) (Optional) Display chassis environmental information for the craft interface (FPM).

**interconnect-device name**—(QFabric systems only) (Optional) Display chassis environmental information for the Interconnect device.

**monitored**—(MX2020 routers and PTX Series Packet Transport Routers only) (Optional) Display chassis environmental information for monitored temperatures only. Temperatures that are not included in temperature alarm computations are not displayed.

**lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers and EX Series switches) (Optional) Display chassis environmental information for the local Virtual Chassis member.

**member *member-id***—(MX Series routers and EX Series switches only) (Optional) Display chassis environmental information for the specified member of the Virtual Chassis configuration. On MX Series routers, replace *member-id* variable with a value of **0** or **1**. For EX Series switches, see *member* for member ID values.

**node-device *name***—(QFabric systems only) (Optional) Display chassis environmental information for the Node device.

**pdu *pdu-slot-number***—(PTX Series only) (Optional) Display chassis environmental information for the specified power distribution unit.

**pem**—(QFX3500 switches and QFabric systems only) (Optional) Display chassis environmental information for the Power Entry Module on the specified Interconnect device or Node device.

**pem *pem-slot-number***—(ACX Series Universal Access Routers, M120, M320, and M40e routers, MX Series routers, MX104 routers, QFX Series, and T Series routers only) (Optional) Display chassis environmental information for the Power Entry Module on the specified Power Entry Module. For information about the options, see [show chassis environment pem](#).

**psm *psm-slot-number***—(MX2020 and MX2010 routers only) (Optional) Display chassis environmental information for the power supply module. For MX2020 routers, replace *psm-slot-number* with a value from **0** through **17**. For MX2010 routers, replace *psm-slot-number* with a value from **0** through **8**.

**psu *psu-slot-number***—(EX Series switches only) (Optional) Display chassis environmental information for a specified power supply. See *EX Series Switches Hardware and CLI Terminology Mapping* for detailed information.

**routing-engine**—(QFX3500 switches and QFabric systems only) (Optional) Display chassis environmental information for the Routing Engine on the specified Interconnect device.

**routing-engine *re-slot-number***—(Optional) Display chassis environmental information for the specified Routing Engine. For information about the options, see [show chassis environment routing-engine](#).

**scg**—(T Series routers only) (Optional) Display chassis environmental information about the SONET Clock Generator.

**scc**—(TX Matrix routers only) (Optional) Display chassis environmental information about the TX Matrix router (switch-card chassis).

**sfb *sfb-slot-number***—(MX2020 and MX2010 routers only) (Optional) Display chassis environmental information for the power supply module. Replace *sfb-slot-number* with a value from **0** through **7**.

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display chassis environmental information about the respective TX Matrix Plus router ( switch-fabric chassis). Replace *number* variable with **0**.

**sib *sib-slot-number***—(M320 routers, PTX Series Packet Transport Routers, and T Series routers only) (Optional) Display chassis environmental information about the specified switch interface board. For information about the options, see *show chassis environment sib*.

**Output Fields** [Table 25 on page 552](#) lists the output fields for the **show chassis environment** command. Output fields are listed in the approximate order in which they appear.

Table 25: show chassis environment Output Fields

| Field Name   | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Class</b> | <p>Information about the category or class of chassis component:</p> <ul style="list-style-type: none"> <li>• <b>Power:</b> Power information: <ul style="list-style-type: none"> <li>• (M5, M10, M20, and M40 routers and EX Series switches only) Power supply status: <b>OK</b>, <b>Testing</b>, (during initial power-on), <b>Failed</b>, or <b>Absent</b>.</li> <li>• (M7i, M10i, M40e, M120, M160, M320, and T Series routers and EX Series switches only) Power Entry Modules status: <b>OK</b>, <b>Testing</b>, (during initial power-on), <b>Check</b>, <b>Failed</b>, or <b>Absent</b>.</li> <li>• (PTX Series only) Power information is reported in PDU or PSM combinations. The status is: <b>OK</b>, <b>Testing</b>, (during initial power-on), <b>Check</b>, <b>Failed</b>, or <b>Absent</b>.</li> </ul> </li> <li>• <b>Temp:</b> Temperature of air flowing through the chassis in degrees Celsius (C) and Fahrenheit (F). <ul style="list-style-type: none"> <li>• On PTX Series Packet Transport Routers and MX2010 and MX2020 Routers, multiple cooling zones are supported. FRU temperatures in each zone are coordinated with the fan speed of fan trays in those zones.</li> <li>• EX2200 switches have a side-to-rear cooling system. The <b>Local Intake</b> temperature is measured by the sensor on the right side of the chassis, and the <b>Remote Intake</b> temperature is measured by the sensor on the left side of the chassis.</li> </ul> </li> <li>• <b>Pic:</b> On ACX4000 Routers, multiple temperature channels on a MIC. The status is: <b>OK</b> and the <b>Measurement</b> is in degrees Celsius (C) and Fahrenheit (F).</li> <li>• <b>Fan:</b> Fan status: <b>OK</b>, <b>Testing</b> (during initial power-on), <b>Failed</b>, or <b>Absent</b>.<br/>On PTX Series Packet Transport Routers and MX2010 and MX2020 Routers, multiple fan trays are supported. Fan status is reported in Fan Tray or Fan combinations. <b>Measurement</b> indicates actual fan RPM (PTX and MX2010 and MX2020 Routers only).</li> <li>• <b>Misc:</b> Information about other components of the chassis. <ul style="list-style-type: none"> <li>• On some routers, this field indicates the status of one or more additional components.</li> <li>• On the M40e, M160, and M320 router, <b>Misc</b> includes <b>CIP</b> (Connector Interface Panel). <b>OK</b> indicates that the CIP is present. <b>Absent</b> indicates that the CIP is not present.</li> <li>• On T Series routers, <b>Misc</b> includes <b>CIP</b> and <b>SPMB</b> (Switch Processor Mezzanine Board). <b>OK</b> indicates that the <b>CIP</b> or <b>SPMB</b> is present. <b>Absent</b> indicates that the <b>CIP</b> or <b>SPMB</b> is not present.</li> <li>• On PTX Series Packet Transport Routers, <b>Misc</b> includes the <b>SPMB</b> (Switch Processor Mezzanine Board). The SPMB is located on the control boards. <b>OK</b> indicates that the control board is present. <b>Absent</b> indicates that the control board is not present.</li> </ul> </li> </ul> |
| <b>Item</b>  | <p>(MX2010 and MX2020 Routers) Information about the chassis component: Routing Engines, Controls Boards (CBs), Switch Fabric Boards (SFBs), PICs, Flexible PIC Concentrators (FPCs), and Adapter Cards (ADCs).</p> <p>(MX104 Routers) Information about the chassis components: Routing Engines, Control Board (CB), Power Entry Module (PEM), and Compact Forwarding Engine Board (AFEB).</p> <p>(QFabric Systems) Information about the chassis component: Control Boards, Routing Engines, Flexible PIC Concentrators (FPCs), and Power Entry Modules (PEMs), Node Devices, and Interconnect Devices.</p> <p>(QFX Series) Information about the chassis component: Flexible PIC Concentrators (FPCs), and Power Entry Modules (PEMs).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

Table 25: show chassis environment Output Fields (*continued*)

| Field Name         | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Status</b>      | <p>(MX104, MX2010, and MX2020 Routers) Status of the specified chassis component. For example, if the Class is Fan, the fan status can be:</p> <ul style="list-style-type: none"> <li>• <b>OK:</b> The fans are operational.</li> <li>• <b>Testing:</b> The fans are being tested during initial power-on.</li> <li>• <b>Failed:</b> The fans have failed or the fans are not spinning.</li> <li>• <b>Absent:</b> The fan tray is not installed.</li> </ul> <p>If the Class is Power, the power supply status can be:</p> <ul style="list-style-type: none"> <li>• <b>OK:</b> The power component is operational.</li> <li>• <b>Testing:</b> The power component is being tested during initial power-on.</li> <li>• <b>Check:</b> There is insufficient power---that is, fewer than the minimum required feeds are connected.</li> <li>• <b>Failed:</b> The inputs leads have failed.</li> <li>• <b>Absent:</b> The power component is not installed.</li> </ul> |
| <b>Measurement</b> | <p>(MX104, MX2010, and MX2020 Routers) Dependant on the Class. For example, if the Class is Temp, indicates the temperature in degree Celsius and degrees Fahrenheit. If the Class is Fan, indicates actual fan RPM.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Sample Output

### show chassis environment (J2300 Router)

```

user@host> show chassis environment
Class Item           Status Measurement
Temp Routing Engine   OK      40 degrees C / 104 degrees F
Fan  Fan             OK

```

### show chassis environment (J4300 or J6300 Router)

```

user@host> show chassis environment
Class Item           Status Measurement
Temp Routing Engine   OK      41 degrees C / 105 degrees F
Fan  Fan 0           OK
     Fan 1           OK

```

### show chassis environment (M5 Router)

```

user@host> show chassis environment
Class Item           Status Measurement
Power Power Supply A   OK
Power Power Supply B   Absent
Temp  FPC 0            OK      30 degrees C / 86 degrees F
      FEB             OK      33 degrees C / 91 degrees F
      PS Intake        OK      27 degrees C / 80 degrees F
      PS Exhaust        OK      27 degrees C / 80 degrees F
      Routing Engine    OK      34 degrees C / 93 degrees F
Fans  Left Fan 1        OK      Spinning at normal speed
      Left Fan 2        OK      Spinning at normal speed
      Left Fan 3        OK      Spinning at normal speed
      Left Fan 4        OK      Spinning at normal speed
Misc  Craft Interface   OK

```

**show chassis environment (M7i Router)**

```

user@host> show chassis environment
Class Item                Status      Measurement
Power Power Supply 0       OK
      Power Supply 1       Absent
Temp  Intake               OK          22 degrees C / 71 degrees F
      FPC 0                OK          23 degrees C / 73 degrees F
      Power Supplies        OK          23 degrees C / 73 degrees F
