| <b>Output Fields</b>            | Table 561 on page 6413 describes the output fields for the <b>show class-of-service forwarding-class</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Table 561: show class-of-service forwarding-class Output Fields**

| Field Name               | Field Description                                                                                                                                                  |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Forwarding class</b>  | Name of the forwarding class.                                                                                                                                      |
| <b>ID</b>                | Forwarding class identifier.                                                                                                                                       |
| <b>Queue</b>             | CoS queue mapped to the forwarding class.                                                                                                                          |
| <b>Policing priority</b> | Not supported on EX Series switches or the QFX Series and can be ignored.                                                                                          |
| <b>Fabric priority</b>   | (EX8200 switches only) Fabric priority for the forwarding class, either <b>high</b> or <b>low</b> . Determines the priority of packets entering the switch fabric. |

Table 561: show class-of-service forwarding-class Output Fields (*continued*)

| Field Name     | Field Description                                                                                                                                                                                                                                                                                                                                                                                               |
|----------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>No-Loss</b> | <p>(QFX Series only) Packet loss attribute to differentiate lossless forwarding classes from lossy forwarding classes:</p> <ul style="list-style-type: none"> <li>Disabled—Lossless transport is not configured on the forwarding class (packet drop attribute is <b>drop</b>).</li> <li>Enabled—Lossless transport is configured on the forwarding class (packet drop attribute is <b>no-loss</b>).</li> </ul> |

## Sample Output

### show class-of-service forwarding-class

```

user@switch> show class-of-service forwarding-class
Forwarding class      ID      Queue Policing priority
best-effort           0        0      0      normal
expedited-forwarding  1        5      5      normal
assured-forwarding    2        1      1      normal
network-control       3        7      7      normal

```

## Sample Output

### show class-of-service forwarding-class (EX8200 Switch)

```

user@switch> show class-of-service forwarding-class
Forwarding class      ID      Queue Fabric priority
best-effort           0        0      low
expedited-forwarding  1        5      low
assured-forwarding    2        1      low
network-control       3        7      low
mcast-be              4        2      low
mcast-ef              5        4      low
mcast-af              6        6      low

```

## Sample Output

### show class-of-service forwarding-class (QFX Series)

```

user@switch> show class-of-service forwarding-class
Forwarding class      ID      Queue Policing priority No-Loss
best-effort           0        0      normal      Disabled
fcoe                  1        3      normal      Enabled
no-loss               2        4      normal      Enabled
network-control       3        7      normal      Disabled
mcast                 8        8      normal      Disabled

```

| <b>Output Fields</b>            | <a href="#">Table 563 on page 6421</a> describes the output fields for the <b>show class-of-service forwarding-table classifier</b> command. Output fields are listed in the approximate order in which they appear. |

**Table 563: show class-of-service forwarding-table classifier Output Fields**

| Field Name             | Field Description                                                                                                                                                                                                                                                                                                                                                                |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Classifier table index | Index of the classifier table.                                                                                                                                                                                                                                                                                                                                                   |
| entries                | Total number of entries.                                                                                                                                                                                                                                                                                                                                                         |
| Table type             | Type of code points in the table: <b>DSCP</b> , <b>EXP</b> (not on the QFX Series), <b>IEEE 802.1</b> , <b>IPv4 precedence</b> (not on the QFX Series), or <b>IPv6 DSCP</b> .                                                                                                                                                                                                    |
| Entry #                | Entry number.                                                                                                                                                                                                                                                                                                                                                                    |
| Code point             | Code point value used for classification.                                                                                                                                                                                                                                                                                                                                        |
| Forwarding-class #     | Forwarding class to which the code point is assigned.                                                                                                                                                                                                                                                                                                                            |
| PLP                    | Packet loss priority value set by classification. For most platforms, the value can be <b>0</b> or <b>1</b> . For some platforms, the value is <b>0</b> , <b>1</b> , <b>2</b> , or <b>3</b> . The value <b>0</b> represents low PLP. The value <b>1</b> represents <b>high</b> PLP. The value <b>2</b> represents medium-low PLP. The value <b>3</b> represents medium-high PLP. |

## Sample Output

### show class-of-service forwarding-table classifier

```

user@host> show class-of-service forwarding-table classifier
Classifier table index: 62436, # entries: 64, Table type: DSCP

Entry #   Code point   Forwarding-class #   PLP

```

| <b>Description</b>              | For each physical interface, display the scheduler map information as it exists in the forwarding table.                                                                                                                |
| <b>Options</b>                  | This command has no options.                                                                                                                                                                                            |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                    |
| <b>List of Sample Output</b>    | <a href="#">show class-of-service forwarding-table scheduler-map on page 6431</a>                                                                                                                                       |
| <b>Output Fields</b>            | <a href="#">Table 568 on page 6430</a> describes the output fields for the <b>show class-of-service forwarding-table scheduler-map</b> command. Output fields are listed in the approximate order in which they appear. |

**Table 568: show class-of-service forwarding-table scheduler-map Output Fields**

| Field Name         | Field Description                                                                                                                                                                                                                                                                           |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interface          | Name of the physical interface.                                                                                                                                                                                                                                                             |
| Index              | Physical interface index.                                                                                                                                                                                                                                                                   |
| Map index          | Scheduler map index.                                                                                                                                                                                                                                                                        |
| Num of queues      | Number of queues defined in this scheduler map.                                                                                                                                                                                                                                             |
| Entry              | Number of this entry in the scheduler map.                                                                                                                                                                                                                                                  |
| Scheduler index    | Scheduler policy index.                                                                                                                                                                                                                                                                     |
| Forwarding-class # | Forwarding class number to which this entry is applied.                                                                                                                                                                                                                                     |
| Tx rate            | Configured transmit rate of the scheduler (in bps). The rate is a percentage of the total interface bandwidth, or the keyword <b>remainder</b> , which indicates that the scheduler receives the remaining bandwidth of the interface.                                                      |
| Max buffer delay   | Amount of transmit delay (in milliseconds) or buffer size of the queue. This amount is a percentage of the total interface buffer allocation or the keyword <b>remainder</b> , which indicates that the buffer is sized according to what remains after other scheduler buffer allocations. |
| Priority           | <ul style="list-style-type: none"> <li><b>high</b>—Queue priority is high.</li> <li><b>low</b>—Queue priority is low.</li> </ul>                                                                                                                                                            |
| PLP high           | Drop profile index for a high packet loss priority profile.                                                                                                                                                                                                                                 |

Table 568: show class-of-service forwarding-table scheduler-map Output Fields (*continued*)

| Field Name      | Field Description                                                                                           |
|-----------------|-------------------------------------------------------------------------------------------------------------|
| PLP low         | Drop profile index for a low packet loss priority profile.                                                  |
| PLP medium-high | Drop profile index for a medium-high packet loss priority profile.                                          |
| PLP medium-low  | Drop profile index for a medium-low packet loss priority profile.                                           |
| TCP PLP high    | Drop profile index for a high TCP packet loss priority profile.                                             |
| TCP PLP low     | Drop profile index for a low TCP packet loss priority profile.                                              |
| Policy is exact | If this line appears in the output, exact rate limiting is enabled. Otherwise, no rate limiting is enabled. |

## Sample Output

### show class-of-service forwarding-table scheduler-map

```

user@host> show class-of-service forwarding-table scheduler-map
Interface: so-5/0/0 (Index: 9, Map index: 17638, Num of queues: 2):
  Entry 0 (Scheduler index: 6090, Forwarding-class #: 0):
    Tx rate: 0 Kb (30%), Max buffer delay: 39 bytes (0%)
    Priority low
    PLP high: 25393, PLP low: 24627, TCP PLP high: 25393, TCP PLP low: 8742
    Policy is exact
  Entry 1 (Scheduler index: 38372, Forwarding-class #: 1):

**Output Fields** [Table 569 on page 6433](#) describes the output fields for the **show class-of-service interface** command. Output fields are listed in the approximate order in which they appear.

**Table 569: show class-of-service interface Output Fields**

| Field Name                                 | Field Description                                                                                                                                                                                                                                                                             |
|--------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Physical interface</b>                  | Name of a physical interface.                                                                                                                                                                                                                                                                 |
| <b>Index</b>                               | Index of this interface or the internal index of this object.                                                                                                                                                                                                                                 |
| <b>Dedicated Queues</b>                    | Status of dedicated queues configured on an interface. Supported only on Trio MPC/MIC interfaces on MX Series routers.                                                                                                                                                                        |
| <b>Queues supported</b>                    | Number of queues you can configure on the interface.                                                                                                                                                                                                                                          |
| <b>Queues in use</b>                       | Number of queues currently configured.                                                                                                                                                                                                                                                        |
| <b>Total non-default queues created</b>    | Number of queues created in addition to the default queues. Supported only on Trio MPC/MIC interfaces on MX Series routers.                                                                                                                                                                   |
| <b>Rewrite Input IEEE Code-point</b>       | (QFX Series only) IEEE 802.1p code point (priority) rewrite value. Incoming traffic from the Fibre Channel (FC) SAN is classified into the forwarding class specified in the native FC interface (NP_Port) fixed classifier and uses the priority specified as the IEEE 802.1p rewrite value. |
| <b>Shaping rate</b>                        | Maximum transmission rate on the physical interface. You can configure the shaping rate on the physical interface, or on the logical interface, but not on both. Therefore, the <b>Shaping rate</b> field is displayed for either the physical interface or the logical interface.            |
| <b>Scheduler map</b>                       | Name of the output scheduler map associated with this interface.                                                                                                                                                                                                                              |
| <b>Scheduler map forwarding class sets</b> | (QFX Series only) Name of the fabric forwarding class set scheduler map associated with a QFabric system Interconnect device interface.                                                                                                                                                       |
| <b>Input shaping rate</b>                  | For Gigabit Ethernet IQ2 PICs, maximum transmission rate on the input interface.                                                                                                                                                                                                              |
| <b>Input scheduler map</b>                 | For Gigabit Ethernet IQ2 PICs, name of the input scheduler map associated with this interface.                                                                                                                                                                                                |
| <b>Chassis scheduler map</b>               | Name of the scheduler map associated with the packet forwarding component queues.                                                                                                                                                                                                             |
| <b>Rewrite</b>                             | Name and type of the rewrite rules associated with this interface.                                                                                                                                                                                                                            |
| <b>Classifier</b>                          | Name and type of classifiers associated with this interface.                                                                                                                                                                                                                                  |

Table 569: show class-of-service interface Output Fields (*continued*)

| Field Name                     | Field Description                                                                                                                                                                                                                                   |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Forwarding-class-map</b>    | Name of the forwarding map associated with this interface.                                                                                                                                                                                          |
| <b>Congestion-notification</b> | (QFX Series only) Congestion notification state, <b>enabled</b> or <b>disabled</b> .                                                                                                                                                                |
| <b>Logical interface</b>       | Name of a logical interface.                                                                                                                                                                                                                        |
| <b>Object</b>                  | Category of an object: <b>Classifier</b> , <b>Fragmentation-map</b> (for LSQ interfaces only), <b>Scheduler-map</b> , <b>Rewrite</b> , or <b>Translation Table</b> (for IQE PICs only).                                                             |
| <b>Name</b>                    | Name of an object.                                                                                                                                                                                                                                  |
| <b>Type</b>                    | Type of an object: <b>dscp</b> , <b>dscp-ipv6</b> , <b>exp</b> , <b>ieee-802.1</b> , <b>ip</b> , or <b>inet-precedence</b> .                                                                                                                        |
| <b>Link-level type</b>         | Encapsulation on the physical interface.                                                                                                                                                                                                            |
| <b>MTU</b>                     | MTU size on the physical interface.                                                                                                                                                                                                                 |
| <b>Speed</b>                   | Speed at which the interface is running.                                                                                                                                                                                                            |
| <b>Loopback</b>                | Whether loopback is enabled and the type of loopback.                                                                                                                                                                                               |
| <b>Source filtering</b>        | Whether source filtering is enabled or disabled.                                                                                                                                                                                                    |
| <b>Flow control</b>            | Whether flow control is enabled or disabled.                                                                                                                                                                                                        |
| <b>Auto-negotiation</b>        | (Gigabit Ethernet interfaces) Whether autonegotiation is enabled or disabled.                                                                                                                                                                       |
| <b>Remote-fault</b>            | (Gigabit Ethernet interfaces) Remote fault status. <ul style="list-style-type: none"> <li>• <b>Online</b>—Autonegotiation is manually configured as online.</li> <li>• <b>Offline</b>—Autonegotiation is manually configured as offline.</li> </ul> |

Table 569: show class-of-service interface Output Fields (*continued*)

| Field Name             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Device flags</b>    | <p>The <b>Device flags</b> field provides information about the physical device and displays one or more of the following values:</p> <ul style="list-style-type: none"> <li>• <b>Down</b>—Device has been administratively disabled.</li> <li>• <b>Hear-Own-Xmit</b>—Device receives its own transmissions.</li> <li>• <b>Link-Layer-Down</b>—The link-layer protocol has failed to connect with the remote endpoint.</li> <li>• <b>Loopback</b>—Device is in physical loopback.</li> <li>• <b>Loop-Detected</b>—The link layer has received frames that it sent, thereby detecting a physical loopback.</li> <li>• <b>No-Carrier</b>—On media that support carrier recognition, no carrier is currently detected.</li> <li>• <b>No-Multicast</b>—Device does not support multicast traffic.</li> <li>• <b>Present</b>—Device is physically present and recognized.</li> <li>• <b>Promiscuous</b>—Device is in promiscuous mode and recognizes frames addressed to all physical addresses on the media.</li> <li>• <b>Quench</b>—Transmission on the device is quenched because the output buffer is overflowing.</li> <li>• <b>Recv-All-Multicasts</b>—Device is in multicast promiscuous mode and therefore provides no multicast filtering.</li> <li>• <b>Running</b>—Device is active and enabled.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Interface flags</b> | <p>The <b>Interface flags</b> field provides information about the physical interface and displays one or more of the following values:</p> <ul style="list-style-type: none"> <li>• <b>Admin-Test</b>—Interface is in test mode and some sanity checking, such as loop detection, is disabled.</li> <li>• <b>Disabled</b>—Interface is administratively disabled.</li> <li>• <b>Down</b>—A hardware failure has occurred.</li> <li>• <b>Hardware-Down</b>—Interface is nonfunctional or incorrectly connected.</li> <li>• <b>Link-Layer-Down</b>—Interface keepalives have indicated that the link is incomplete.</li> <li>• <b>No-Multicast</b>—Interface does not support multicast traffic.</li> <li>• <b>No-receive No-transmit</b>—Passive monitor mode is configured on the interface.</li> <li>• <b>Point-To-Point</b>—Interface is point-to-point.</li> <li>• <b>Pop all MPLS labels from packets of depth</b>—MPLS labels are removed as packets arrive on an interface that has the <b>pop-all-labels</b> statement configured. The depth value can be one of the following: <ul style="list-style-type: none"> <li>• <b>1</b>—Takes effect for incoming packets with one label only.</li> <li>• <b>2</b>—Takes effect for incoming packets with two labels only.</li> <li>• <b>[ 1 2 ]</b>—Takes effect for incoming packets with either one or two labels.</li> </ul> </li> <li>• <b>Promiscuous</b>—Interface is in promiscuous mode and recognizes frames addressed to all physical addresses.</li> <li>• <b>Recv-All-Multicasts</b>—Interface is in multicast promiscuous mode and provides no multicast filtering.</li> <li>• <b>SNMP-Traps</b>—SNMP trap notifications are enabled.</li> <li>• <b>Up</b>—Interface is enabled and operational.</li> </ul> |

Table 569: show class-of-service interface Output Fields (*continued*)

| Field Name           | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| <b>IPv6 transit statistics</b> | Number of IPv6 transit bytes and packets received and transmitted on the logical interface if IPv6 statistics tracking is enabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Input errors</b>            | Input errors on the interface. The labels are explained in the following list: <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Giants</b>—Number of frames received that are larger than the giant threshold.</li> <li>• <b>Bucket Drops</b>—Drops resulting from the traffic load exceeding the interface transmit or receive leaky bucket configuration.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle.</li> <li>• <b>L3 incompletes</b>—Number of incoming packets discarded because they failed Layer 3 (usually IPv4) sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. Layer 3 incomplete errors can be ignored by configuring the <b>ignore-l3-incompletes</b> statement.</li> <li>• <b>L2 channel errors</b>—Number of times the software did not find a valid logical interface for an incoming frame.</li> <li>• <b>L2 mismatch timeouts</b>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</li> <li>• <b>HS link CRC errors</b>—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.</li> <li>• <b>HS link FIFO overflows</b>—Number of FIFO overflows on the high-speed links between the ASICs responsible for handling the router interfaces.</li> </ul> |

Table 569: show class-of-service interface Output Fields (*continued*)

| Field Name                                  | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Output errors</b>                        | <p>Output errors on the interface. The labels are explained in the following list:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), the <b>Drops</b> field does not always use the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p> <ul style="list-style-type: none"> <li>• <b>Aged packets</b>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>• <b>HS link FIFO underflows</b>—Number of FIFO underflows on the high-speed links between the ASICs responsible for handling the router interfaces.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeds the MTU of the interface.</li> </ul> |
| <b>Egress queues</b>                        | Total number of egress queues supported on the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Queue counters</b>                       | <p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), the <b>Dropped packets</b> field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>SONET alarms</b><br><b>SONET defects</b> | <p>(SONET) SONET media-specific alarms and defects that prevent the interface from passing packets. When a defect persists for a certain period, it is promoted to an alarm. Based on the router configuration, an alarm can ring the red or yellow alarm bell on the router or light the red or yellow alarm LED on the craft interface. See these fields for possible alarms and defects: <b>SONET PHY</b>, <b>SONET section</b>, <b>SONET line</b>, and <b>SONET path</b>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

Allocated to identify the construction and content of the STS-level SPE and for PDI-P.</li> <li>• <b>F1</b>—Section user channel byte. This byte is set aside for the purposes of users.</li> <li>• <b>K1</b> and <b>K2</b>—These bytes are allocated for APS signaling for the protection of the multiplex section.</li> <li>• <b>J0</b>—Section trace. This byte is defined for STS-1 number 1 of an STS-<i>N</i> signal. Used to transmit a 1-byte fixed-length string or a 16-byte message so that a receiving terminal in a section can verify its continued connection to the intended transmitter.</li> <li>• <b>S1</b>—Synchronization status. The S1 byte is located in the first STS-1 number of an STS-<i>N</i> signal.</li> <li>• <b>Z3</b> and <b>Z4</b>—Allocated for future use.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Received path trace</b><br><br><b>Transmitted path trace</b>         | <p>SONET/SDH interfaces allow path trace bytes to be sent inband across the SONET/SDH link. Juniper Networks and other router manufacturers use these bytes to help diagnose misconfigurations and network errors by setting the transmitted path trace message so that it contains the system hostname and name of the physical interface. The received path trace value is the message received from the router at the other end of the fiber. The transmitted path trace value is the message that this router transmits.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

Possible values are <b>none</b> and <b>exact</b>. If <b>exact</b> is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If <b>none</b> is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.</li> </ul> |
| <b>Forwarding classes</b>                     | Total number of forwarding classes supported on the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Egress queues</b>                          | Total number of egress queues supported on the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Queue</b>                                  | Queue number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Forwarding classes</b>                     | Forwarding class name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Queued Packets</b>                         | Number of packets queued to this queue.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Queued Bytes</b>                           | Number of bytes queued to this queue. The byte counts vary by PIC type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Transmitted Packets</b>                    | Number of packets transmitted by this queue. When fragmentation occurs on the egress interface, the first set of packet counters shows the postfragmentation values. The second set of packet counters (displayed under the <b>Packet Forwarding Engine Chassis Queues</b> field) shows the prefragmentation values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Transmitted Bytes</b>                      | Number of bytes transmitted by this queue. The byte counts vary by PIC type.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Tail-dropped packets</b>                   | Number of packets dropped because of tail drop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Table 569: show class-of-service interface Output Fields (*continued*)

| Field Name                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Output Fields</b>            | <a href="#">Table 572 on page 6463</a> describes the output fields for the <b>show class-of-service scheduler-map</b> command. Output fields are listed in the approximate order in which they appear. |

Table 572: show class-of-service scheduler-map Output Fields

| Field Name                  | Field Description                                                                                                                                                                                                                                                                                          |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Scheduler map</b>        | Name of the scheduler map.                                                                                                                                                                                                                                                                                 |
| <b>Index</b>                | Index of the indicated object. Objects having indexes in this output include scheduler maps, schedulers, and drop profiles.                                                                                                                                                                                |
| <b>Scheduler</b>            | Name of the scheduler.                                                                                                                                                                                                                                                                                     |
| <b>Forwarding class</b>     | Classification of a packet affecting the forwarding, scheduling, and marking policies applied as the packet transits the router.                                                                                                                                                                           |
| <b>Transmit rate</b>        | Configured transmit rate of the scheduler (in bps). The rate is a percentage of the total interface bandwidth, or the keyword <b>remainder</b> , which indicates that the scheduler receives the remaining bandwidth of the interface.                                                                     |
| <b>Rate Limit</b>           | Rate limiting configuration of the queue. Possible values are <b>none</b> , meaning no rate limiting, and <b>exact</b> , meaning the queue only transmits at the configured rate.                                                                                                                          |
| <b>Maximum buffer delay</b> | Amount of transmit delay (in milliseconds) or the buffer size of the queue. The buffer size is shown as a percentage of the total interface buffer allocation, or by the keyword <b>remainder</b> to indicate that the buffer is sized according to what remains after other scheduler buffer allocations. |
| <b>Priority</b>             | Scheduling priority: <b>low</b> or <b>high</b> .                                                                                                                                                                                                                                                           |

Table 572: show class-of-service scheduler-map Output Fields (*continued*)

| Field Name                       | Field Description                                                                                                                                                                                                                                          |
|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Excess priority                  | Priority of excess bandwidth: <b>low</b> , <b>medium-low</b> , <b>medium-high</b> , <b>high</b> , or <b>none</b> .                                                                                                                                         |
| Explicit Congestion Notification | (QFX Series only) Explicit congestion notification (ECN) state: <ul style="list-style-type: none"> <li>Disable—ECN is disabled on the specified scheduler</li> <li>Enable—ECN is enabled on the specified scheduler</li> </ul> ECN is disabled by default. |
| Adjust minimum                   | Minimum shaping rate for an adjusted queue, in bps.                                                                                                                                                                                                        |
| Adjust percent                   | Bandwidth adjustment applied to a queue, in percent.                                                                                                                                                                                                       |
| Drop profiles                    | Table displaying the assignment of drop profiles by name and index to a given loss priority and protocol pair.                                                                                                                                             |
| Loss priority                    | Packet loss priority for drop profile assignment.                                                                                                                                                                                                          |
| Protocol                         | Transport protocol for drop profile assignment.                                                                                                                                                                                                            |
| Name                             | Name of the drop profile.                                                                                                                                                                                                                                  |

## Sample Output

### show class-of-service scheduler-map

```

user@host> show class-of-service scheduler-map
Scheduler map: dd-scheduler-map, Index: 84

Scheduler: aa-scheduler, Index: 8721, Forwarding class: aa-forwarding-class
Transmit rate: 30 percent, Rate Limit: none, Maximum buffer delay: 39 ms,
Priority: high
Drop profiles:
  Loss priority  Protocol  Index  Name
  Low           non-TCP   8724   aa-drop-profile

| <b>Output Fields</b>            | Table 573 on page 6465 describes the output fields for the <b>show class-of-service shared-buffer</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

**Table 573: show class-of-service shared-buffer Output Fields**

| Field Name       | Field Description                                                                                                   |
|------------------|---------------------------------------------------------------------------------------------------------------------|
| Ingress          | Ingress shared buffer configuration.                                                                                |
| Total Buffer     | Total buffer space available to the ports in KB. This is the combined dedicated buffer pool and shared buffer pool. |
| Dedicated Buffer | Buffer space allocated to the dedicated buffer pool in KB.                                                          |
| Shared Buffer    | Buffer space allocated to the shared buffer pool in KB.                                                             |
| Lossless         | Buffer space allocated to the lossless traffic buffer pool in KB.                                                   |

Table 573: show class-of-service shared-buffer Output Fields (*continued*)

| Field Name                           | Field Description                                                                                                                                                                                           |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Lossless Headroom</b>             | Buffer space allocated to the lossless headroom traffic buffer pool to support priority-based flow control (PFC) and Ethernet PAUSE in KB. (Ingress ports only.)                                            |
| <b>Lossy</b>                         | Buffer space allocated to the lossy (best-effort) traffic buffer pool in KB.                                                                                                                                |
| <b>Lossless Headroom Utilization</b> | Utilization of the ingress lossless headroom buffer pool. (These fields can help you to determine how much headroom buffer space you need to reserve to support PFC and Ethernet PAUSE for lossless flows.) |
| <b>Node Device</b>                   | Index number that identifies the switch. On a QFX3500 switch, this field always has a value of zero (0).                                                                                                    |
| <b>Total</b>                         | Size of the lossless headroom ingress buffer pool in KB.                                                                                                                                                    |
| <b>Used</b>                          | Amount in KB of lossless headroom ingress buffer used.                                                                                                                                                      |
| <b>Free</b>                          | Amount in KB of lossless headroom ingress buffer free (unused).                                                                                                                                             |
| <b>Egress</b>                        | Egress shared buffer configuration.                                                                                                                                                                         |
| <b>Multicast</b>                     | Buffer space allocated to the multicast traffic buffer pool in KB. (Egress ports only.)                                                                                                                     |

## Sample Output

### show class-of-service shared-buffer

```
user@switch> show class-of-service shared-buffer
```

```
Ingress:
```

```
Total Buffer      : 9360.00 KB
Dedicated Buffer   : 2158.00 KB
Shared Buffer      : 7202.00 KB
  Lossless        : 648.18 KB
  Lossless Headroom : 3240.90 KB
  Lossy           : 3312.92 KB
```

```
Lossless Headroom Utilization:
```

```
Node Device      Total      Used      Free
0                3240.90 KB  0.00 KB  3240.90 KB
```

```
Egress:
```

```
Total Buffer      : 9360.00 KB
Dedicated Buffer   : 2704.00 KB
Shared Buffer      : 6656.00 KB
  Lossless        : 3328.00 KB
  Multicast       : 1264.64 KB
  Lossy           : 2063.36 KB
```

| <b>Shaping rate priority high</b>   | Configured shaping rate for high-priority traffic, in bps.                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Shaping rate priority medium</b> | Configured shaping rate for medium-priority traffic, in bps.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Shaping rate priority low</b>    | Configured shaping rate for low-priority traffic, in bps.                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Shaping rate excess high</b>     | Configured shaping rate for high-priority excess traffic, in bps.                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Shaping rate excess low</b>      | Configured shaping rate for low-priority excess traffic, in bps.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Scheduler map</b>                | Name of the associated scheduler map.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Delay Buffer rate</b>            | Configured delay buffer rate, in bps.                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Excess rate</b>                  | Configured excess rate, in percent or proportion.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Excess rate high</b>             | Configured excess rate for high priority traffic, in percent or proportion.                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Excess rate low</b>              | Configured excess rate for low priority traffic, in percent or proportion.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Guaranteed rate</b>              | Configured guaranteed rate, in bps or cps.<br><br><b>NOTE:</b> (MX Series routers with ATM Multi-Rate CE MIC) This value depends on the ATM service category chosen. Possible values: <ul style="list-style-type: none"> <li>• <b>cbr</b>—Guaranteed rate is equal to the configured peak rate in cps.</li> <li>• <b>rtvbr</b>—Guaranteed rate is equal to the configured sustained rate in cps.</li> <li>• <b>nrtvbr</b>—Guaranteed rate is equal to the configured sustained rate in cps.</li> </ul> |
| <b>Guaranteed rate burst</b>        | Configured burst size for the guaranteed rate, in bytes.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>adjust-minimum</b>               | Configured minimum shaping rate for an adjusted queue, in bps.                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Table 574: show class-of-service traffic-control-profile Output Fields (*continued*)

| Field Name               | Field Description                                                |
|--------------------------|------------------------------------------------------------------|
| overhead accounting mode | Configured shaping mode: <b>Frame Mode</b> or <b>Cell Mode</b> . |
| Overhead bytes           | Configured byte adjustment value.                                |

## Sample Output

### show class-of-service traffic-control-profile

```

user@host> show class-of-service traffic-control-profile
Traffic control profile: Profile1, Index: 57625
  Scheduler map: m1
  Delay Buffer rate: 500000
  Guaranteed rate: 1000000

Traffic control profile: Profile2, Index: 57624
  Scheduler map: m2
  Delay Buffer rate: 600000
  Guaranteed rate: 2000000

Traffic control profile: Profile3, Index: 57627
  Scheduler map: m3
  Delay Buffer rate: 800000
  Guaranteed rate: 3000000
  .Excess rate high: proportion 4

Traffic control profile: Profile4, Index: 57626
  Scheduler map: m4
  Delay Buffer rate: 750000
  Guaranteed rate: 4000000
  ..adjust-minimum 20000000

```

### show class-of-service traffic-control-profile (MX Series routers with Clear Channel Multi-Rate CE MIC)

```

user@host> show class-of-service traffic-control-profile
Traffic control profile: at-vbr1, Index: 11395
  ATM Service: RTVBR
  Scheduler map: m3
  overhead accounting mode: Frame Mode
  Shaping rate: 1000 cps
  Shaping rate burst: 500 cells
  Delay Buffer rate: 2000 cps
  Guaranteed rate: 1000 cps

Traffic control profile: foo, Index: 38286
  ATM Service: UBR
  Scheduler map: m3
  overhead accounting mode: Frame Mode

```

### show class-of-service traffic-control-profile (ACX Series routers with ATM IMA pseudowire interfaces)

```

user@host> show class-of-service traffic-control-profile
Traffic control profile: foo, Index: 38286
  ATM Service: RTVBR
  Shaping rate: 2000 cps

```

Shaping rate burst: 200 cells  
Scheduler map: <default>  
Delay Buffer rate: 1000 cps  
Guaranteed rate: 1700 cps

Table 576: show dcbx neighbors Output Fields (*continued*)

| Field Name                            | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Ethernet-Type</b>                  | <p>(DCBX Version 1.01 only)</p> <p>Ethernet type (EtherType) of the application. For example, <b>0x8906</b> indicates the EtherType for the FCoE application. Either the EtherType (for Layer 2 applications) or the Socket Number (for Layer 4 applications) of the application is displayed in the output.</p>                                                                                                                                                                                                                                                            |
| <b>Socket-Number</b>                  | <p>Destination port socket number of the application, if applicable. Either the EtherType (for Layer 2 applications) or the Socket Number (for Layer 4 applications) of the application is displayed in the output.</p>                                                                                                                                                                                                                                                                                                                                                     |
| <b>Priority-Field or Priority-Map</b> | <p>Priority assigned to the application.</p> <p>For EX Series switches, the priority of the FCoE application is determined by the PFC congestion notification profile that has been configured and associated with the FCoE interface. For other applications, the priority is based on the application map.</p>                                                                                                                                                                                                                                                            |
| <b>Status</b>                         | <p>(DCBX Version 1.01 only)</p> <p>Local status when autonegotiation is enabled:</p> <ul style="list-style-type: none"> <li>• <b>Enabled</b>—The application feature is enabled on both the local interface and the peer interface. (The local configuration and the peer configuration match.)</li> <li>• <b>Disabled</b>—The local configuration and the peer configuration do not match.</li> </ul> <p><b>NOTE:</b> If there is a configuration mismatch in one application between the switch and the peer, all the other applications including FCoE are disabled.</p> |
| <b>Peer-Advertisement</b>             | <p>Status of advertisements that the peer sends to the local interface.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Enable</b>                         | <p>(DCBX Version 1.01 only)</p> <p>State that the peer advertises to the local interface:</p> <ul style="list-style-type: none"> <li>• <b>Yes</b>—The feature is enabled.</li> <li>• <b>No</b>—The feature is disabled.</li> </ul>                                                                                                                                                                                                                                                                                                                                          |
| <b>Willing</b>                        | <p>(DCBX Version 1.01 only)</p> <p>Willingness of the peer to learn the FCoE interface state from the local interface using DCBX:</p> <ul style="list-style-type: none"> <li>• <b>Yes</b>—The peer is willing to learn the FCoE interface state from the local interface.</li> <li>• <b>No</b>—The peer is not willing to learn the FCoE interface state from the local interface.</li> </ul>                                                                                                                                                                               |

## show interfaces queue

---

**Syntax**    show interfaces queue  
              <aggregate | remaining-traffic>  
              <both-ingress-egress>  
              <egress>  
              <forwarding-class *forwarding-class*>  
              <ingress>  
              <interface-name *interface-name*>  
              <l2-statistics>

**Release Information**    Command introduced before Junos OS Release 7.4.  
                              **both-ingress-egress**, **egress**, and **ingress** options introduced in Junos OS Release 7.6.  
                              Command introduced in Junos OS Release 11.1 for the QFX Series.  
                              **l2-statistics** option introduced in Junos OS Release 12.1.

**Description**    Display class-of-service (CoS) queue information for physical interfaces.

**Options**    **none**—Show detailed CoS queue statistics for all physical interfaces.

**aggregate**—(Optional) Display the aggregated queuing statistics of all logical interfaces that have traffic-control profiles configured. (Not on the QFX Series.)

**both-ingress-egress**—(Optional) On Gigabit Ethernet Intelligent Queuing 2 (IQ2) PICs, display both ingress and egress queue statistics. (Not on the QFX Series.)

**egress**—(Optional) Display egress queue statistics.

**forwarding-class *forwarding-class***—(Optional) Forwarding class name for this queue. Shows detailed CoS statistics for the queue associated with the specified forwarding class.

**ingress**—(Optional) On Gigabit Ethernet IQ2 PICs, display ingress queue statistics. (Not on the QFX Series.)

**interface-name *interface-name***—(Optional) Show detailed CoS queue statistics for the specified interface.

**l2-statistics**—(Optional) Display Layer 2 statistics for MLPPP, FRF.15, and FRF.16 bundles

**remaining-traffic**—(Optional) Display the remaining-traffic queue statistics of all logical interfaces that have traffic-control profiles configured.

### Overhead for Layer 2 Statistics

Transmitted packets and transmitted byte counts are displayed for the Layer 2 level with the addition of encapsulation overheads applied for fragmentation, as shown in [Table 232 on page 2958](#). Others counters, such as packets and bytes queued (input) and drop counters, are displayed at the Layer 3 level. In the case of link fragmentation and interleaving (LFI) for which fragmentation is not applied, corresponding Layer 2 overheads are added, as shown in [Table 232 on page 2958](#).

Table 577: Layer 2 Overhead, Transmitted Packets/Bytes

| Protocol       | Fragmentation       |                                   | LFI |
|----------------|---------------------|-----------------------------------|-----|
|                | First fragmentation | Second to <i>n</i> fragmentations |     |
|                | Bytes               | Bytes                             |     |
| MLPPP (Long)   | 13                  | 12                                | 8   |
| MLPPP (short)  | 11                  | 10                                | 8   |
| MLFR (FRF15)   | 12                  | 10                                | 8   |
| MFR (FRF16)    | 10                  | 8                                 | -   |
| MCMLPPP(Long)  | 13                  | 12                                | -   |
| MCMLPPP(Short) | 11                  | 10                                | -   |

## Layer 2 Statistics—Fragmentation Overhead Calculation

## MLPPP/MC-MLPPP Overhead details:

=====

## Fragment 1:

Outer PPP header : 4 bytes  
 Long or short sequence MLPPP header : 4 bytes or 2 bytes  
 Inner PPP header : 1 byte  
 HDLC flag and FCS bytes : 4 bytes

## Fragments 2 .. n :

Outer PPP header : 4 bytes  
 Long or short sequence MLPPP header : 4 bytes or 2 bytes  
 HDLC flag and FCS bytes : 4 bytes

## MLFR (FRF15) Overhead details:

=====

## Fragment 1:

Framereley header : 2 bytes  
 Control,NLPID : 2 bytes  
 Fragmentaion header : 2 bytes  
 Inner proto : 2 bytes  
 HDLC flag and FCS : 4 bytes

## Fragments 2 ...n :

Framereley header : 2 bytes  
 Control,NLPID : 2 bytes  
 Fragmentaion header : 2 bytes  
 HDLC flag and FCS : 4 bytes

## MFR (FRF16) Overhead details:

=====

```
Fragment 1:
  Fragmentation header : 2 bytes
  Framereelay header   : 2 bytes
  Inner proto          : 2 bytes
  HDLC flag and FCS    : 4 bytes

Fragments 2 ...n :
  Fragmentation header : 2 bytes
  Framereelay header   : 2 bytes
  HDLC flag and FCS    : 4 bytes
```

## Overhead with LFI

```
MLPPP(Long & short sequence):
=====
  Outer PPP header      : 4 bytes
  HDLC flag and FCS     : 4 bytes
```

```
MLFR (FRF15):
=====
  Framereelay header    : 2 bytes
  Control,NLPID         : 2 bytes
  HDLC flag and FCS     : 4 bytes
```

The following examples show overhead for different cases:

- A 1000-byte packet is sent to a mlppp bundle without any fragmentation. At the Layer 2 level, bytes transmitted is 1013 in 1 packet. This overhead is for MLPPP long sequence encap.
- A 1000-byte packet is sent to a mlppp bundle with a fragment threshold of 250byte. At the Layer 2 level, bytes transmitted is 1061 bytes in 5 packets.
- A 1000-byte LFI packet is sent to an mlppp bundle. At the Layer 2 level, bytes transmitted is 1008 in 1 packet.

**remaining-traffic**—(Optional) Display the queuing statistics of all logical interfaces that do not have traffic-control profiles configured. (Not on the QFX Series.)

## Additional Information

For rate-limited interfaces hosted on Modular Interface Cards (MICs), Modular Port Concentrators (MPCs), or Enhanced Queuing DPCs, rate-limit packet-drop operations occur *before* packets are queued for transmission scheduling. For such interfaces, the statistics for queued traffic do not include the packets that have already been dropped due to rate limiting, and consequently the displayed statistics for queued traffic are the same as the displayed statistics for transmitted traffic.

**NOTE:** For rate-limited interfaces hosted on other types of hardware, rate-limit packet-drop operations occur *after* packets are queued for transmission scheduling. For these other interface types, the statistics for queued traffic include the packets that are later dropped due to rate limiting, and consequently the displayed statistics for queued traffic equals the sum of the statistics for transmitted and rate-limited traffic.

On M Series routers (except for the M320 and M120 routers), this command is valid only for a PIC installed on an enhanced Flexible PIC Concentrator (FPC).

Queue statistics for aggregated interfaces are supported on the M Series and T Series routers only. Statistics for an aggregated interface are the summation of the queue statistics of the child links of that aggregated interface. You can view the statistics for a child interface by using the **show interfaces statistics** command for that child interface.

When you configure tricolor marking on a 10-port 1-Gigabit Ethernet PIC, for queues 6 and 7 only, the output does not display the number of queued bytes and packets, or the number of bytes and packets dropped because of RED. If you do not configure tricolor marking on the interface, these statistics are available for all queues.

For the 4-port Channelized OC12 IQE PIC and 1-port Channelized OC48 IQE PIC, the **Packet Forwarding Engine Chassis Queues** field represents traffic bound for a particular physical interface on the PIC. For all other PICs, the **Packet Forwarding Engine Chassis Queues** field represents the total traffic bound for the PIC.

For Gigabit Ethernet IQ2 PICs, the **show interfaces queue** command output does not display the number of tail-dropped packets. This limitation does not apply to Packet Forwarding Engine chassis queues.

When fragmentation occurs on the egress interface, the first set of packet counters shows the postfragmentation values. The second set of packet counters (under the **Packet Forwarding Engine Chassis Queues** field) shows the prefragmentation values.

The behavior of the **egress** queues for the **Routing Engine-Generated Traffic** is not same as the configured queue for MLPPP and MFR configurations.

For information about how to configure CoS, see the *Junos OS Network Interfaces Library for Routing Devices*. For related CoS operational mode commands, see the [CLI Explorer](#).

Table 578: show interfaces queue Output Fields (*continued*)

| Field Name                  | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Queued Packets</b>       | <p>Number of packets queued to this queue.</p> <p><b>NOTE:</b> For Gigabit Ethernet IQ2 interfaces, the Queued Packets count is calculated by the Junos OS interpreting one frame buffer as one packet. If the queued packets are very large or very small, the calculation might not be completely accurate for transit traffic. The count is completely accurate for traffic terminated on the router.</p> <p>For rate-limited interfaces hosted on MICs or MPCs only, this statistic does not include traffic dropped due to rate limiting. For more information, see <a href="#">"Additional Information" on page 2959</a>.</p> |
| <b>Queued Bytes</b>         | <p>Number of bytes queued to this queue. The byte counts vary by interface hardware. For more information, see <a href="#">Table 234 on page 2964</a>.</p> <p>For rate-limited interfaces hosted on MICs or MPCs only, this statistic does not include traffic dropped due to rate limiting. For more information, see <a href="#">"Additional Information" on page 2959</a>.</p>                                                                                                                                                                                                                                                   |
| <b>Transmitted Packets</b>  | <p>Number of packets transmitted by this queue. When fragmentation occurs on the egress interface, the first set of packet counters shows the postfragmentation values. The second set of packet counters (displayed under the <b>Packet Forwarding Engine Chassis Queues</b> field) shows the prefragmentation values.</p> <p><b>NOTE:</b> For Layer 2 statistics, see <a href="#">"Overhead for Layer 2 Statistics" on page 2957</a></p>                                                                                                                                                                                          |
| <b>Transmitted Bytes</b>    | <p>Number of bytes transmitted by this queue. The byte counts vary by interface hardware. For more information, see <a href="#">Table 234 on page 2964</a>.</p> <p><b>NOTE:</b> On MX Series routers, this number can be inaccurate when you issue the command for a physical interface repeatedly and in quick succession, because the statistics for the child nodes are collected infrequently. Wait ten seconds between successive iterations to avoid this situation.</p> <p><b>NOTE:</b> For Layer 2 statistics, see <a href="#">"Overhead for Layer 2 Statistics" on page 2957</a></p>                                       |
| <b>Tail-dropped packets</b> | Number of packets dropped because of tail drop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>RL-dropped packets</b>   | <p>Number of packets dropped due to rate limiting.</p> <p>For rate-limited interfaces hosted on MICs, MPCs, and Enhanced Queuing DPCs only, this statistic is not included in the queued traffic statistics. For more information, see <a href="#">"Additional Information" on page 2959</a>.</p>                                                                                                                                                                                                                                                                                                                                   |
| <b>RL-dropped bytes</b>     | <p>Number of bytes dropped due to rate limiting.</p> <p>For rate-limited interfaces hosted on MICs, MPCs, and Enhanced Queuing DPCs only, this statistic is not included in the queued traffic statistics. For more information, see <a href="#">"Additional Information" on page 2959</a>.</p>                                                                                                                                                                                                                                                                                                                                     |

Table 578: show interfaces queue Output Fields (*continued*)

| Field Name          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RED-dropped packets | <p>Number of packets dropped because of random early detection (RED).</p> <ul style="list-style-type: none"> <li>(M Series and T Series routers only) On M320 and M120 routers and the T Series routers, the total number of dropped packets is displayed. On all other M Series routers, the output classifies dropped packets into the following categories: <ul style="list-style-type: none"> <li><b>Low, non-TCP</b>—Number of low-loss priority non-TCP packets dropped because of RED.</li> <li><b>Low, TCP</b>—Number of low-loss priority TCP packets dropped because of RED.</li> <li><b>High, non-TCP</b>—Number of high-loss priority non-TCP packets dropped because of RED.</li> <li><b>High, TCP</b>—Number of high-loss priority TCP packets dropped because of RED.</li> </ul> </li> <li>(J Series routers and MX Series routers with enhanced DPCs, and T Series routers with enhanced FPCs only) The output classifies dropped packets into the following categories: <ul style="list-style-type: none"> <li><b>Low</b>—Number of low-loss priority packets dropped because of RED.</li> <li><b>Medium-low</b>—Number of medium-low loss priority packets dropped because of RED.</li> <li><b>Medium-high</b>—Number of medium-high loss priority packets dropped because of RED.</li> <li><b>High</b>—Number of high-loss priority packets dropped because of RED.</li> </ul> </li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), this field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p> |
| RED-dropped bytes   | <p>Number of bytes dropped because of RED. The byte counts vary by interface hardware. For more information, see <a href="#">Table 234 on page 2964</a>.</p> <ul style="list-style-type: none"> <li>(M Series and T Series routers only) On M320 and M120 routers and the T Series routers, only the total number of dropped bytes is displayed. Byte counts vary by interface hardware. [Table 234 on page 2964](#) shows how the byte counts on the outbound interfaces vary depending on the interface hardware.

[Table 234 on page 2964](#) is based on the assumption that outbound interfaces are sending IP traffic with 478 bytes per packet.

Table 579: Byte Count by Interface Hardware

| Interface Hardware               | Output Level                | Byte Count Includes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Comments                                                                                                                                                                                                     |

## Sample Output

### show interfaces queue (Rate-Limited Interface on a Gigabit Ethernet MIC in an MPC)

The following example shows queue information for the rate-limited interface ge-4/2/0 on a Gigabit Ethernet MIC in an MPC. For rate-limited queues for interfaces hosted on MICs or MPCs, rate-limit packet drops occur prior to packet output queuing. In the

command output, the nonzero statistics displayed in the **RL-dropped packets** and **RL-dropped bytes** fields quantify the traffic dropped to rate-limit queue 0 output to 10 percent of 1 gigabyte (100 megabits) per second. Because the RL-dropped traffic is not included in the **Queued** statistics, the statistics displayed for queued traffic are the same as the statistics for transmitted traffic.

| <b>Description</b>                                   | Display Packet Forwarding Engine next-hop information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Options</b>                                       | <p><b>none</b>—Display all Packet Forwarding Engine next-hop information.</p> <p><b>fpc <i>slot</i></b>—(TX Matrix and TX Matrix Plus routers only) (Optional) Show the next hops for a Flexible PIC Concentrator (FPC) slot.</p> <ul style="list-style-type: none"><li>On a TX Matrix router, if you specify the number of a T640 router by using the <b>lcc <i>number</i></b> option (the recommended method), replace <b><i>slot</i></b> with a value from <b>0</b> through <b>7</b>. Otherwise, replace <b><i>slot</i></b> with a value from <b>0</b> through <b>31</b>.</li><li>On a TX Matrix Plus router, if you specify the number of a T1600 router by using the <b>lcc <i>number</i></b> option (the recommended method), replace <b><i>slot</i></b> with a value from <b>0</b> through <b>7</b>. Otherwise, replace <b><i>slot</i></b> with a value from <b>0</b> through <b>31</b>.</li><li>On a TX Matrix Plus router in the TXP-T1600-3D, TXP-T4000-3D, or TXP-Mixed-LCC-3D configuration, if you specify the number of a T1600 or T4000 router by using the <b>lcc <i>number</i></b> option (the recommended method), replace <b><i>slot</i></b> with a value from <b>0</b> through <b>7</b>. Otherwise, replace <b><i>slot</i></b> with a value from <b>0</b> through <b>63</b>.</li></ul> <p>For example, the following commands have the same result:</p> <pre>user@host&gt; show pfe next-hop fpc 1 lcc 1 user@host&gt; show pfe next-hop fpc 9</pre> <p><b>interface <i>interface-name</i></b>—(Optional) Display the Packet Forwarding Engine next-hop interface.</p> <p><b>lcc <i>number</i></b>—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display Packet Forwarding Engine next-hop interface for a specific T640 router (or line-card chassis) that is connected to a TX Matrix router. On a TX Matrix Plus router, display Packet Forwarding Engine next-hop interface for the router (or line-card chassis) that is connected to a TX Matrix Plus router.</p> |

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

[show pfe next-hop fpc \(TX Matrix Plus Router\) on page 6537](#)

**Output Fields** Table 580 on page 6536 lists the output fields for the **show pfe next hop** command. Output fields are listed in the approximate order in which they appear.

**Table 580: show pfe next-hop Output Fields**

| Field Name    | Field Description                                      |
|---------------|--------------------------------------------------------|
| ID            | The next-hop ID for the entry.                         |
| Type          | The next-hop type for the entry.                       |
| Interface     | The interface to which the next-hop entry is assigned. |
| Protocol      | The protocol type for the next-hop entry.              |
| Encap         | Encapsulation type for the next-hop entry.             |
| Next Hop Addr | Next-hop address for the next-hop entry.               |
| MTU           | MTU value for the nexthop entry.                       |

## Sample Output

### show pfe next-hop

```

| <b>Description</b>                                   | <p>Display the routes in the Packet Forwarding Engine forwarding table. The Packet Forwarding Engine forwards packets between input and output interfaces.</p>                                                                                                                                                                                                               |

**NOTE:** The Routing Engine maintains a master copy of the forwarding table. It copies the forwarding table to the Packet Forwarding Engine, which is the part of the router or switch responsible for forwarding packets. To display the routes in the Routing Engine forwarding table, use the **show route forwarding table** command. For more information, see the [CLI Explorer](#).

**Options** **none**—Display all Packet Forwarding Engine forwarding table information.

**clnp**—(Optional) Show International Standards Organization (ISO) connectionless-mode network protocol (CLNP) route table information.

**dhcp**—(Optional) Display Packet Forwarding Engine DHCP-Snooping route table information.

**fpc slot**—(TX Matrix and TX Matrix Plus routers only) (Optional) Show the next hops for a Flexible PIC Concentrator (FPC) slot.

- On a TX Matrix router, if you specify the number of a T640 router by using the **lcc number** option (the recommended method), replace **slot** with a value from **0** through **7**. Otherwise, replace **slot** with a value from **0** through **31**.
- On a TX Matrix Plus router, if you specify the number of a T1600 router by using the **lcc number** option (the recommended method), replace **slot** with a value from **0** through **7**. Otherwise, replace **slot** with a value from **0** through **31**.
- On a TX Matrix Plus router in the TXP-T1600-3D, TXP-T4000-3D, or TXP-Mixed-LCC-3D configuration, if you specify the number of a T1600 or T4000 router by using the **lcc number** option (the recommended method), replace **slot** with a value from **0** through **7**. Otherwise, replace **slot** with a value from **0** through **63**.

For example, the following commands have the same result:

```
user@host> show pfe route fpc 1 lcc 1
user@host> show pfe route fpc 9
```

**host**—(QFX standalone switches, pure mode QFX5100-only VCF and VC, and pure mode QFX3500-only VC) (Optional) Display host routes installed in the on-chip hardware table.

**hw**—(QFX standalone switches, pure mode QFX5100-only VCF and VC, and pure mode QFX3500-only VC) (Optional) Display routes installed in the on-chip hardware table (as opposed to displaying routes from the routing table and the PFE forwarding table before they are installed in the hardware).

**index index**—(Optional) Display table index.

**inet6**—(Optional) Display Packet Forwarding Engine IPv6 routes.

**ip**—(Optional) Display Packet Forwarding Engine IPv4 routes.

**iso**—(Optional) Display ISO version routing tables.

**lcc *number***—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, the slot number of the T640 router (or line-card chassis) that houses the FPC. On a TX Matrix Plus router, the slot number of the router (line-card chassis) that houses the FPC.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**lpm**—(QFX standalone switches, pure mode QFX5100-only VCF and VC, and pure mode QFX3500-only VC) (Optional) Display longest prefix match (LPM) routes installed in the on-chip hardware table.

**mpls**—(Optional) Display Packet Forwarding Engine MPLS information.

**multicast**—(QFX standalone switches, pure mode QFX5100-only VCF and VC, and pure mode QFX3500-only VC) (Optional) Display multicast routes installed in the on-chip hardware table.

**prefix *prefix***—(Optional) IPv4 or IPv6 prefix for which to show table entries.

**summary**—(Optional) Display summary of Packet Forwarding Engine information.

**table <*table-name*>**—(Optional) Display table information.

**Required Privilege Level**

**Output Fields** [Table 581 on page 6542](#) lists the output fields for the **show pfe route** command. Output fields are listed in the approximate order in which they appear.

**Table 581: show pfe route Output Fields**

| Field Name         | Field Description                                  |
|--------------------|----------------------------------------------------|
| <b>Destination</b> | Destination address for the entry.                 |
| <b>NH IP Addr</b>  | Next-hop IP address for the entry.                 |
| <b>Type</b>        | Next-hop type for the entry                        |
| <b>NH ID</b>       | Next-hop ID for the entry                          |
| <b>Encap</b>       | Encapsulation type for the next-hop entry.         |
| <b>Interface</b>   | Interface to which the next-hop entry is assigned. |

[Table 582 on page 6542](#) lists the output fields for the QFX Series **show pfe route** hardware table (**hw**) commands. Output fields are listed in the approximate order in which they appear.

**Table 582: QFX Series show pfe route Hardware Table Output Fields**

| Field Name         | Field Description                                                                                                                                                                                   |
|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Max</b>         | Maximum routing entries per route type.                                                                                                                                                             |
| <b>Used</b>        | Number of routing entries consumed per route type.                                                                                                                                                  |
| <b>Free</b>        | Number of unused routing entries per route type.                                                                                                                                                    |
| <b>% Free</b>      | Percentage of unused routing entries per route type.                                                                                                                                                |
| <b>Rtt</b>         | Internal routing engine index number of the route table.                                                                                                                                            |
| <b>VRF</b>         | Internal hardware index number for the corresponding route table.                                                                                                                                   |
| <b>Destination</b> | Destination address for the entry.                                                                                                                                                                  |
| <b>Type</b>        | ( <b>show pfe route summary hw</b> )—Route type for the entry: IPv4 or IPv6 route, and host, LPM, or multicast route.<br><br>( <b>show pfe route (ip   inet6) hw</b> )—Next-hop type for the entry. |
| <b>NH ID</b>       | Next-hop ID for the entry                                                                                                                                                                           |
| <b>Interface</b>   | Interface to which the next-hop entry is assigned.                                                                                                                                                  |

Table 582: QFX Series show pfe route Hardware Table Output Fields (*continued*)

| Field Name      | Field Description                                               |
|-----------------|-----------------------------------------------------------------|
| HW NH-ID        | Internal hardware index number of the next-hop.                 |
| Src-MAC-Address | Source MAC address.                                             |
| Port            | Port number.                                                    |
| Dst-MAC-Address | Destination MAC address.                                        |
| VLAN            | ID of the multicast group VLAN.                                 |
| GROUP           | Internal hardware index number of the multicast group next-hop. |
| CLASS           | Internal class number of the multicast group.                   |

## Sample Output

### show pfe route ip

```
user@host> show pfe route ip
```

```
IPv4 Route Table 0, default.0, 0x0:
```

| Destination      | NH IP Addr     | Type    | NH ID | Interface  |
|------------------|----------------|---------|-------|------------|
| default          |                | Discard | 8     |            |

| <b>Output Fields</b>            | <a href="#">Table 583 on page 6551</a> describes the output fields for the <b>show class-of-service scheduler-map fc-set</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                        |

**Table 583: show class-of-service scheduler-map-fcset Output Fields**

| Field Name                  | Field Description                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Scheduler map fcset</b>  | Name of the fabric scheduler map.                                                                                                                                                                                                                                                                                                                                |
| <b>Index</b>                | Internal index of the indicated object. Objects having indexes in this output include fabric scheduler maps, schedulers, and drop profiles.                                                                                                                                                                                                                      |
| <b>Scheduler</b>            | Name of the scheduler.                                                                                                                                                                                                                                                                                                                                           |
| <b>Forwarding class set</b> | Name of the fabric forwarding class set (fabric fc-set) mapped to the scheduler.                                                                                                                                                                                                                                                                                 |
| <b>Transmit rate</b>        | Configured transmit rate of the scheduler (percentage). The transmit rate of a fabric scheduler determines the proportion of class group (priority group) bandwidth that the associated fabric fc-set receives. The sum of the fabric fc-set transmit rates in a class group determines the percentage of available port bandwidth allocated to the class group. |
| <b>Rate Limit</b>           | Rate limiting configuration of the queue. Possible values are <b>none</b> , meaning no rate limiting, and <b>exact</b> , meaning the queue only transmits at the configured rate.                                                                                                                                                                                |
| <b>Buffer size</b>          | Egress queue buffer size (percentage).                                                                                                                                                                                                                                                                                                                           |

Table 583: show class-of-service scheduler-map-fcset Output Fields (*continued*)

| Field Name             | Field Description                                                                                                                                                                         |
|------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Buffer limit</b>    | Buffer limiting configuration of the queue. Possible values are <b>none</b> , meaning no buffer limiting, and <b>exact</b> , meaning the buffer is limited to the configured buffer size. |
| <b>Priority</b>        | Scheduling priority: <b>low</b> or <b>high</b> (default value only; value is not user-configurable).                                                                                      |
| <b>Excess priority</b> | Priority of excess bandwidth: <b>low</b> , <b>medium-low</b> , <b>medium-high</b> , <b>high</b> , or <b>none</b> (default value only; value is not user-configurable).                    |
| <b>Shaping rate</b>    | Maximum bandwidth allowed to traffic mapped to the scheduler.                                                                                                                             |
| <b>Drop profiles</b>   | Table displaying the assignment of drop profiles by name and index to a given loss priority and protocol pair.                                                                            |
| <b>Loss priority</b>   | Packet loss priority for drop profile assignment.                                                                                                                                         |
| <b>Protocol</b>        | Transport protocol for drop profile assignment.                                                                                                                                           |
| <b>Name</b>            | Name of the drop profile.                                                                                                                                                                 |

## Troubleshooting Dropped FCoE Traffic

**Problem**    **Description:** Fibre Channel over Ethernet (FCoE) traffic for which you want guaranteed delivery is dropped.

**Cause**    There are several possible causes of dropped FCoE traffic (the list numbers of the possible causes correspond to the list numbers of the solutions in the *Solution* section.):

1. Priority-based flow control (PFC) is not enabled on the FCoE priority (IEEE 802.1p code point) in both the input and output stanzas of the congestion notification profile.
2. The FCoE traffic is not classified correctly at the ingress interface. FCoE traffic should either use the default **fcoe** forwarding class and classifier configuration (maps the **fcoe** forwarding class to IEEE 802.1p code point 011) or be mapped to a lossless forwarding class and to the code point enabled for PFC on the input and output interfaces.
3. The congestion notification profile that enables PFC on the FCoE priority is not attached to the interface.
4. The forwarding class set (priority group) used for guaranteed delivery traffic does not include the forwarding class used for FCoE traffic.

5. Insufficient bandwidth has been allocated for the FCoE queue or for the forwarding class set to which the FCoE queue belongs.
6. If you are using Junos OS Release 12.2, the **fcoe** forwarding class has been explicitly configured instead of using the default **fcoe** forwarding class configuration (forwarding-class-to-queue mapping).

**NOTE:** If you are using Junos OS Release 12.2, use the default forwarding-class-to-queue mapping for the lossless **fcoe** and **no-loss** forwarding classes. If you explicitly configure the lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (best effort) traffic and does *not* receive lossless treatment.

---

7. If you are using Junos OS Release 12.3 or later and you are not using the default **fcoe** forwarding class configuration, the forwarding class used for FCoE is not configured with the **no-loss** packet drop attribute. In Junos OS 12.3 or later, explicit forwarding classes configurations must include the **no-loss** packet drop attribute to be treated as lossless forwarding classes.

**Solution** The list numbers of the possible solutions correspond to the list numbers of the causes in the *Cause* section.

1. Check the congestion notification profile (CNP) to see if PFC is enabled on the FCoE priority (the correct IEEE 802.1p code point) on both input and output interfaces. Use the **show class-of-service congestion-notification** operational command to show the code points that are enabled for PFC in each CNP.

If you are using the default configuration, FCoE traffic is mapped to code point 011 (priority 3). In this case, the input stanza of the CNP should show that PFC is enabled on code point 011, and the output stanza should show that priority 011 is mapped to flow control queue 3.

If you explicitly configured a forwarding class for FCoE traffic, ensure that:

- You specified the **no-loss** packet drop attribute in the forwarding class configuration
- The code point mapped to the FCoE forwarding class in the ingress classifier is the code point enabled for PFC in the CNP input stanza
- The code point and output queue used for FCoE traffic are mapped to each other in the CNP output stanza (if you are not using the default priority and queue, you must explicitly configure each output queue that you want to respond to PFC messages)

For example, if you explicitly configure a forwarding class for FCoE traffic that is mapped to output queue 5 and to code point 101 (priority 5), the output of the **show class-of-service congestion-notification** looks like:

```
Name: fcoe_p5_cnp, Index: 12183
Type: Input
Cable Length: 100 m
  Priority  PFC      MRU
  000      Disabled
  001      Disabled
  010      Disabled
  011      Disabled
  100      Disabled
  101      Enabled   2500
  110      Disabled
  111      Disabled
Type: Output
  Priority  Flow-Control-Queues
  101      5
```

2. Use the **show class-of-service classifier type ieee-802.1p** operational command to check if the classifier maps the forwarding class used for FCoE traffic to the correct IEEE 802.1p code point.
3. Ensure that the congestion notification profile and classifier are attached to the correct ingress interface. Use the operational command **show configuration class-of-service interfaces interface-name**.
4. Check that the forwarding class set includes the forwarding class used for FCoE traffic. Use the operational command **show configuration class-of-service forwarding-class-sets** to show the configured priority groups and their forwarding classes.

5. Verify the amount of bandwidth allocated to the queue mapped to the FCoE forwarding class and to the forwarding class set to which the FCoE traffic queue belongs. Use the **show configuration class-of-service schedulers *scheduler-name*** operational command (specify the scheduler for FCoE traffic as the *scheduler-name*) to see the minimum guaranteed bandwidth (**transmit-rate**) and maximum bandwidth (**shaping-rate**) for the queue.

Use the **show configuration class-of-service traffic-control-profiles *traffic-control-profile*** operational command (specify the traffic control profile used for FCoE traffic as the *traffic-control-profile*) to see the minimum guaranteed bandwidth (**guaranteed-rate**) and maximum bandwidth (**shaping-rate**) for the forwarding class set.

6. Delete the explicit FCoE forwarding-class-to-queue mapping so that the system uses the default FCoE forwarding-class-to-queue mapping. Include the **delete forwarding-classes class fcoe queue-num 3** statement at the **[edit class-of-service]** hierarchy level to remove the explicit configuration. The system then uses the default configuration for the FCoE forwarding class and preserves the lossless treatment of FCoE traffic.
7. Use the **show class-of-service forwarding-class** operational command to display the configured forwarding classes. The *No-Loss* column shows whether lossless transport is enabled or disabled for each forwarding class. If the forwarding class used for FCoE traffic is not enabled for lossless transport, include the **no-loss** packet drop attribute in the forwarding class configuration (**set class-of-service forwarding-classes class *fcoe-forwarding-class-name* queue-num *queue-number* no-loss**).

See “[Example: Configuring CoS PFC for FCoE Traffic](#)” on page 5441 for step-by-step instructions on how to configure PFC for FCoE traffic, including classifier, interface, congestion notification profile, PFC, and bandwidth scheduling configuration.

## Troubleshooting Egress Bandwidth That Exceeds the Configured Maximum Bandwidth

**Problem**     **Description:** The maximum bandwidth of a queue when measured at the egress port exceeds the maximum bandwidth (shaping rate) configured for the queue.

**Cause**        When you configure bandwidth for a queue or a priority group, the switch accounts for the configured bandwidth as data only. The switch does not rate-shape the preamble and the interframe gap (IFG) associated with frames, so the switch does not account for the bandwidth consumed by the preamble and the IFG in its maximum bandwidth calculations.

The measured egress bandwidth can exceed the configured maximum bandwidth when small packet sizes (64 or 128 bytes) are transmitted because the preamble and the IFG are a larger percentage of the total traffic. For larger packet sizes, the preamble and IFG overhead are a small portion of the total traffic, and the effect on egress bandwidth is minor.

**Solution** When you calculate the bandwidth requirements for queues on which you expect a significant amount of traffic with small packet sizes, consider the shaping rate as the maximum bandwidth for the data only. Add sufficient bandwidth to your calculations to account for the preamble and IFG so that the port bandwidth is sufficient to handle the combined maximum data rate (shaping rate) and the preamble and IFG.

If the maximum bandwidth measured at the egress port exceeds the amount of bandwidth that you want to allocate to the queue, reduce the shaping rate for that queue.

## Troubleshooting Egress Bandwidth That Exceeds the Configured Minimum Bandwidth

**Problem** **Description:** The minimum bandwidth of a queue or a priority group when measured at the egress port exceeds the minimum bandwidth configured for the queue (transmit-rate) or for the priority group (guaranteed-rate).

**Cause** When you configure bandwidth for a queue or a priority group, the switch accounts for the configured bandwidth as data only. The switch does not include the preamble and the interframe gap (IFG) associated with frames, so the switch does not account for the bandwidth consumed by the preamble and the IFG in its minimum bandwidth calculations.

The measured egress bandwidth can exceed the configured minimum bandwidth when small packet sizes (64 or 128 bytes) are transmitted because the preamble and the IFG are a larger percentage of the total traffic. For larger packet sizes, the preamble and IFG overhead are a small portion of the total traffic, and the effect on egress bandwidth is minor.

**NOTE:** The sum of the queue transmit rates in a priority group should not exceed the guaranteed rate for the priority group. (You cannot guarantee a minimum bandwidth for the queues that is greater than the minimum bandwidth guaranteed for the entire set of queues.)

**Solution** When you calculate the bandwidth requirements for queues and priority groups on which you expect a significant amount of traffic with small packet sizes, consider the transmit

rate and the guaranteed rate as the minimum bandwidth for the data only. Add sufficient bandwidth to your calculations to account for the preamble and IFG so that the port bandwidth is sufficient to handle the combined minimum data rate and the preamble and IFG.

If the minimum bandwidth measured at the egress port exceeds the amount of bandwidth that you want to allocate to a queue or to a priority group, reduce the transmit rate for that queue and reduce the guaranteed rate of the priority group that contains the queue.

## Troubleshooting Egress Queue Bandwidth Impacted by Congestion

**Problem**    **Description:** Congestion on an egress port causes egress queues to receive less bandwidth than expected. Egress port congestion can impact the amount of bandwidth allocated to queues on the congested port and, in some cases, on ports that are not congested.

**Cause**       Egress queue congestion can cause the ingress port buffer to fill above a certain threshold and affect the flow to the queues on the egress port. One queue receives its configured bandwidth, but the other queues on the egress port are affected and do not receive their configured share of bandwidth.

**Solution**    The solution is to configure a drop profile to apply weighted random early detection (WRED) to the queue or queues on the congested ports.

Configure a drop profile on the queue that is receiving its configured bandwidth. This queue is preventing the other queues from receiving their expected bandwidth. The drop profile prevents the queue from affecting the other queues on the port.

To configure a WRED profile using the CLI:

- Name the drop profile and set the drop start point, drop end point, minimum drop rate, and maximum drop rate for the drop profile:

```
[edit class-of-service]
user@switch# set drop-profile drop-profile-name interpolate fill-level percentage fill-level
percentage drop-probability 0 drop-probability percentage
```

## Troubleshooting an Unexpected Rewrite Value

**Problem**    **Description:** Traffic from one or more forwarding classes on an egress port is assigned an unexpected rewrite value.

**NOTE:** For packets that carry both an inner VLAN tag and an outer VLAN tag, the rewrite rules rewrite only the outer VLAN tag.

**Cause**    If you configure a rewrite rule for a forwarding class on an egress port but you do not configure a rewrite rule for every forwarding class on that egress port, then the forwarding classes that do not have a configured rewrite rule are assigned random rewrite values.

For example:

1. Configure forwarding classes **fc1**, **fc2**, and **fc3**.
2. Configure rewrite rules for forwarding classes **fc1** and **fc2**, but not for forwarding class **fc3**.
3. Assign forwarding classes **fc1**, **fc2**, and **fc3** to a port.

When traffic for these forwarding classes flows through the port, traffic for forwarding classes **fc1** and **fc2** is rewritten correctly. However, traffic for forwarding class **fc3** is assigned a random rewrite value.

**Solution**    If any forwarding class on an egress port has a configured rewrite rule, then all forwarding classes on that egress port must have a configured rewrite rule. Configuring a rewrite rule for any forwarding class that is assigned a random rewrite value solves the problem.

**TIP:** If you want the forwarding class to use the same code point value assigned to it by the ingress classifier, specify that value as the rewrite rule value. For example, if a forwarding class has the IEEE 802.1 ingress classifier code point value 011, configure a rewrite rule for that forwarding class that uses the IEEE 802.1p code point value 011.

**NOTE:** There are no default rewrite rules. You can bind one rewrite rule for each type (DSCP and IEEE 802.1) to a given interface. A rewrite rule can contain multiple forwarding-class-to-rewrite-value associations.

1. Assign a rewrite value to a forwarding class. Add the new rewrite value to the same rewrite rule as the other forwarding classes on the port:

```
[edit class-of-service rewrite-rules]
```

```
user@switch# set (dscp | ieee-802.1) rewrite-name forwarding-class class-name loss-priority
priority code-point (alias | bits)
```

For example, if the other forwarding classes on the port use rewrite values defined in the rewrite rule **custom-rw**, the forwarding class **fcoe** is being randomly rewritten, and you want to use IEEE 802.1 code point **011** for the **fcoe** forwarding class:

```
[edit class-of-service rewrite-rules]
user@switch# set ieee-802.1 custom-rw forwarding-class fcoe loss-priority high code-point
011
```

2. Enable the rewrite rule on an interface if it is not already enabled on the desired interface:

```
[edit]
user@switch# set class-of-service interfaces interface-name unit unit rewrite-rules (dscp |
ieee-802.1) rewrite-rule-name
```

For example, to enable the rewrite rule **custom-rw** on interface **xe-0/0/24.0**:

```
[edit]
user@switch# set class-of-service interfaces xe-0/0/24 unit 0 rewrite-rules ieee-802.1
custom-rw
```

## Troubleshooting a Port Reset on QFabric Systems When a Queue Stops Transmitting Traffic

**Problem**    **Description:** In QFabric systems, if any queue that contains outgoing packets does not transmit packets for 12 consecutive seconds, the port automatically resets.

**Cause**      Failure of a queue to transmit packets for 12 consecutive seconds may be due to:

- A strict-high priority queue consuming all of the port bandwidth
- Several queues consuming all of the port bandwidth
- Any queue or port receiving continuous priority-based flow control (PFC) or 802.3x Ethernet PAUSE messages (received PFC and PAUSE messages prevent a queue or a port, respectively, from transmitting packets because of network congestion)
- Other conditions that prevent a queue from obtaining port bandwidth for 12 consecutive seconds

**Solution**    If the cause is a strict-high priority queue or other queues consuming all of the port bandwidth, you can use rate shaping to configure a maximum rate for the queues that are using all of the port bandwidth and preventing other queues from obtaining bandwidth on the port. You configure a maximum rate by creating a scheduler, using a scheduler map to apply it to a forwarding class (which maps to an output queue), and applying the scheduler map to the port using a forwarding class set and a traffic control profile.

To configure rate shaping using the CLI:

1. Name the existing scheduler or create a scheduler and define the maximum bandwidth as a rate or as a percentage:

```
[edit class-of-service]
user@switch# set schedulers scheduler-name shaping-rate (rate | percent percentage)
```

2. Configure a scheduler map to associate the scheduler with the forwarding class (queue) that is consuming all of the port bandwidth:

```
[edit class-of-service]
user@switch# set scheduler-maps scheduler-map-name forwarding-class
forwarding-class-name scheduler scheduler-name
```

3. Associate the scheduler map with a traffic control profile:

```
[edit class-of-service]
user@switch# set traffic-control-profiles traffic-control-profile-name scheduler-map
scheduler-map-name
```

4. Associate the traffic control profile (and thus the scheduler map that contains the rate shaping queue scheduler) with a forwarding class set and apply them to the interface that is being reset:

```
[edit class-of-service]
user@switch# set interfaces interface-name forwarding-class-set fc-set-name
output-traffic-control-profile traffic-control-profile-name
```

For example, a strict-high priority queue is using all of the bandwidth on interface **shpnode:xe-0/0/10** and preventing other queues from transmitting for 12 consecutive seconds. You decide to set a maximum rate of 7 Gbps on the strict-high priority queue to ensure that at least 3 Gbps of the port bandwidth is available to service other queues.

[Table 584 on page 6561](#) shows the topology for this example:

**Table 584: Components of the Rate Shaping Troubleshooting Example**

| Component                                  | Settings                                                                                                                                                                                                                                                                                                                                          |

Table 584: Components of the Rate Shaping Troubleshooting Example (*continued*)

| Component            | Settings            |
|----------------------|---------------------|
| Forwarding class set | Name: <b>shp-pg</b> |

To configure the scheduler, map it to the strict-high priority forwarding class, and apply it to interface **shpnode:xe-0/0/10** using the CLI:

1. Specify the scheduler for the strict-high priority queue (**shp-sched**) with a maximum bandwidth of 7 Gbps:

```
[edit class-of-service schedulers]
user@switch# set shp-sched shaping-rate 7g
```

2. Configure a scheduler map (**shp-map**) that associates the scheduler (**shp-sched**) with the forwarding class (**strict-high**):

```
[edit class-of-service scheduler-maps]
user@switch# set shp-map forwarding-class strict-high scheduler shp-sched
```

3. Associate the scheduler map **shp-map** with a traffic control profile (**shp-tcp**):

```
[edit class-of-service traffic-control-profiles]
user@switch# set shp-tcp scheduler-map shp-map
```

4. Associate the traffic control profile **shp-tcp** with a forwarding class set (**shp-pg**) and the affected interface (**shpnode:xe-0/0/10**):

```
[edit class-of-service]
user@switch# set interfaces shpnode:xe-0/0/10 forwarding-class-set shp-pg
output-traffic-control-profile shp-tcp
```

Understanding Device and Network Management Features

After you install a QFX Series product or EX4600 switch in your network, you need to manage the device. The products support features that you use to manage the device within the network, including the management of configuration, system performance, fault monitoring, and remote access.

[Table 585 on page 6565](#) lists the device and network management features on the QFX Series and EX4600.

Table 585: Device and Network Management Features on the QFX Series and EX4600

| Feature                                                                                                                                                                                                                                                          | Typical Uses     | Documentation                                                       |

| Alarms and LEDs on the switch—Show status of hardware components and indicate warning or error conditions.                                                                                                                                                                                                                                                                  | Fault management                                                                                                                                                                     | <a href="#">“Chassis Alarm Messages on a QFX3500 Device” on page 6982</a>                                                                                                                                                                        |
| Firewall filters—Control the packets that are sent to and from the network, balance network traffic, and optimize performance.                                                                                                                                                                                                                                              | Performance management                                                                                                                                                               | <ul style="list-style-type: none"> <li>• <a href="#">Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices</a></li> <li>• <a href="#">Overview of Firewall Filters on page 4929</a></li> </ul>              |
| In-band management—Enables connection to the switch using the same interfaces through which customer traffic flows. Communication between the switch and a remote console is typically enabled using SSH and Telnet services. SSH provides secure encrypted communications, whereas Telnet provides unencrypted, and therefore less secure, access to the switch.           | Remote access management                                                                                                                                                             | <ul style="list-style-type: none"> <li>• <a href="#">Configuring SSH Service for Remote Access to the Router or Switch on page 1853</a></li> <li>• <a href="#">Configuring Telnet Service for Remote Access to a Router or Switch</a></li> </ul> |
| Juniper Networks Junos OS automation scripts—Configuration and operations automation tools provided by Junos OS. These tools include commit scripts, operation scripts, event scripts, and event policies. Commit scripts enforce custom configuration rules, whereas operation scripts, event policies, and event scripts automate network troubleshooting and management. | <ul style="list-style-type: none"> <li>• Configuration management</li> <li>• Performance management</li> <li>• Fault management</li> </ul>                                           | <a href="#">Junos OS Automation Library</a>                                                                                                                                                                                                      |
| Junos OS command-line interface (CLI)—CLI configuration statements that enable you to configure the switch based on your networking requirements, such as security, service, and performance.                                                                                                                                                                               | <ul style="list-style-type: none"> <li>• Configuration management</li> <li>• Performance management</li> <li>• User access management</li> <li>• Remote access management</li> </ul> | <a href="#">CLI User Guide</a>                                                                                                                                                                                                                   |
| Junos Space software—Multipurpose GUI-based network management system that includes a base platform, the Network Application Platform, and other optional applications such as Ethernet Design, Service Now, Service Insight, and Virtual Control.                                                                                                                          | <ul style="list-style-type: none"> <li>• Configuration management</li> <li>• Performance management</li> <li>• Fault management</li> </ul>                                           | <ul style="list-style-type: none"> <li>• <a href="#">Understanding Junos Space Support on page 6590</a></li> <li>• <a href="#">Junos Space Network Application Platform User Guide</a></li> </ul>                                                |

**Table 585: Device and Network Management Features on the QFX Series and EX4600 (*continued*)**

| Feature                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Typical Uses                                                                                                                               | Documentation                                                                                                                                                                                |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Junos XML API—XML representation of Junos OS configuration statements and operational mode commands. Junos XML configuration tag elements are the content to which the Junos XML protocol operations apply. Junos XML operational tag elements are equivalent in function to operational mode commands in the CLI, which you can use to retrieve status information for a device. The Junos XML API also includes tag elements that are the counterpart to Junos CLI configuration statements.                                                                                                                        | <ul style="list-style-type: none"> <li>• Configuration management</li> <li>• Performance management</li> <li>• Fault management</li> </ul> | <ul style="list-style-type: none"> <li>• <a href="#">Junos XML API Configuration Developer Reference</a></li> <li>• <a href="#">Junos XML API Operational Developer Reference</a></li> </ul> |
| NETCONF XML management protocol—XML-based management protocol that client applications use to request and change configuration information on routing, switching, and security platforms running Junos OS. The NETCONF XML management protocol defines basic operations that are equivalent to Junos OS CLI configuration mode commands. Client applications use the protocol operations to display, edit, and commit configuration statements (among other operations), just as administrators use CLI configuration mode commands such as <b>show</b> , <b>set</b> , and <b>commit</b> to perform those operations. | <ul style="list-style-type: none"> <li>• Configuration management</li> <li>• Performance management</li> <li>• Fault management</li> </ul> | <a href="#">NETCONF XML Management Protocol Developer Guide</a>                                                                                                                              |
| Operational mode commands—May be used to do the following: <ul style="list-style-type: none"> <li>• Monitor switch performance. For example, the <b>show chassis routing-engine</b> command shows the CPU utilization of the Routing Engine. High CPU utilization of the Routing Engine can affect performance of the switch.</li> <li>• View current activity and status of the device or network. For example, you can use the <b>ping</b> command to monitor and diagnose connectivity problems, and the <b>traceroute</b> command to locate points of failure on the network.</li> </ul>                          | <ul style="list-style-type: none"> <li>• Performance management</li> <li>• Fault management</li> </ul>                                     | <a href="#">CLI Explorer</a>                                                                                                                                                                 |

**Table 585: Device and Network Management Features on the QFX Series and EX4600 (*continued*)**

| Feature                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Typical Uses                                                                                           | Documentation                                                                                                                                                                                                                                                                                                       |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Out-of-band management—Enables connection to the switch through a management interface. Out-of-band management is supported on two dedicated management Ethernet interfaces as well as on the console and auxiliary ports. The management Ethernet interfaces connect directly to the Routing Engine. No transit traffic is allowed through the interfaces, separating customer and management traffic and ensuring that congestion or failures in the transit network do not affect the management of the switch. | Remote access management                                                                               | <ul style="list-style-type: none"> <li>• <a href="#">Connecting a QFX3500 Device to a Network for Out-of-Band Management</a></li> <li>• <a href="#">Connecting a QFX Series Device to a Management Console</a></li> <li>• <a href="#">Configuring Console and Auxiliary Port Properties on page 6665</a></li> </ul> |
| SNMP Configuration Management MIB—Provides notification for configuration changes in the form of SNMP traps. Each trap contains the time at which the configuration change was committed, the name of the user who made the change, and the method by which the change was made. A history of the last 32 configuration changes is kept in jnxCmChgEventTable.                                                                                                                                                     | Configuration management                                                                               | <a href="#">SNMP MIBs and Traps Reference</a>                                                                                                                                                                                                                                                                       |
| SNMP MIBs and traps—Enable the monitoring of network devices from a central location. Use SNMP requests such as <b>get</b> and <b>walk</b> to monitor and view system activity.<br><br>The QFX3500 switch supports SNMP Version 1 (v1), v2, and v3, and both standard and Juniper Networks enterprise-specific MIBs and traps.                                                                                                                                                                                     | Fault management                                                                                       | <ul style="list-style-type: none"> <li>• <a href="#">SNMP MIBs and Traps Reference</a></li> <li>• <a href="#">Understanding the Implementation of SNMP on page 6595</a></li> </ul>                                                                                                                                  |
| System log messages—Log details of system and user events, including errors. You can specify the severity and type of system log messages you wish to view or save, and configure the output to be sent to local or remote hosts.                                                                                                                                                                                                                                                                                  | <ul style="list-style-type: none"> <li>• Fault management</li> <li>• User access management</li> </ul> | <ul style="list-style-type: none"> <li>• <a href="#">Junos OS System Log Messages Reference</a></li> <li>• <a href="#">Overview of Junos OS System Log Messages on page 6642</a></li> <li>• <a href="#">Overview of Single-Chassis System Logging Configuration on page 6643</a></li> </ul>                         |

## Understanding Network Management Implementation on the QFabric System

This topic describes network management features on the QFabric system that are implemented differently than on other devices running Junos OS.

The following network management features are supported on the QFabric system:

- **System log messages**—The QFabric system monitors events that occur on its component devices, distributes system log messages about those events to all external system log message servers (hosts) that are configured, and archives the messages. Component devices include Node devices, Interconnect devices, Director devices, and

the Virtual Chassis. You configure system log messages at the **[edit system syslog]** hierarchy level. Use the **show log filename** operational mode command to view messages.

- **Simple Network Management Protocol (SNMP) Version 1 (v1) and v2c**—SNMP monitors network devices from a central location. The SNMP implementation on the QFabric system supports the basic SNMP architecture of Junos OS with some limitations, including a reduced set of MIB objects, read-only access for SNMP communities, and limited support for SNMP requests. You configure SNMP at the **[edit snmp]** hierarchy level. Only the **show snmp statistics** operational mode command is supported, but you can issue SNMP requests using external SNMP client applications.
- **Advanced Insight Solutions (AIS)**—AIS provides tools and processes to automate the delivery of support services for the QFabric system. AIS components include Advanced Insight Scripts (AI-Scripts) and Advanced Insight Manager (AIM). You install AI-Scripts using the **request system scripts add** operational mode command. However, the **jais-activate-scripts.slax** file used during installation is preconfigured for the QFabric system and cannot be changed.

**NOTE:** Do not install Junos Space and AIS on the control plane network EX4200 switches or EX4200 Virtual Chassis in a QFX3000 QFabric system

## Understanding Telnet on the QFabric System

This topic describes the support for the Telnet protocol on QFabric systems.

Telnet service is available for devices running Junos OS, including QFX Series devices. However, on QFabric systems, Telnet support is limited and the following conditions apply:

- You can telnet from a QFabric system to external devices that are connected to the QFabric system by way of the network Node group. To connect to these external devices, issue the **telnet** command from the QFabric default partition CLI.
- You cannot use the Telnet protocol to connect from the QFabric system default partition CLI to individual components. To access system components, you must issue the **request component login** command instead.

## Understanding Tracing and Logging Operations

Tracing and logging operations enable you to track events that occur in the switch—both normal operations and error conditions—and to track the packets that are generated by or passed through the switch. The results of tracing and logging operations are placed in files in the `/var/log` directory on the switch.

The Junos OS supports remote tracing for the following processes:

- **chassisd**—Chassis-control process
- **eventd**—Event-processing process
- **cosd**—Class-of-service process

You configure remote tracing by using the **tracing** statement at the **[edit system]** hierarchy level.

**NOTE:** The **tracing** statement is not supported on the QFX3000 QFabric system.

If you enabled remote tracing but wish to disable it for specific processes on the switch, use the **no-remote-trace** statement at the **[edit process-name traceoptions]** hierarchy level. This feature does not alter local tracing functionality in any way, and logging files are stored on the switch.

Logging operations use a system logging mechanism similar to the UNIX **syslogd** utility to record systemwide, high-level operations, such as interfaces going up or down and users logging in to or out of the switch. You configure these operations by using the **syslog** statement at the **[edit system]** hierarchy level and by using the **options** statement at the **[edit ethernet-switching-options]** hierarchy level.

Tracing operations record more detailed information about the operations of the switch, including packet forwarding and routing information. To configure tracing operations, use the **traceoptions** statement.

**NOTE:** The **traceoptions** statement is not supported on the QFX3000 QFabric system.

You can define tracing operations in different portions of the switch configuration:

- **SNMP agent activity tracing operations**—Define tracing of the activities of SNMP agents on the switch. You configure SNMP agent activity tracing operations at the **[edit snmp]** hierarchy level.
- **Global switching tracing operations**—Define tracing for all switching operations. You configure global switching tracing operations at the **[edit ethernet-switching-options]** hierarchy level of the configuration.

- Protocol-specific tracing operations—Define tracing for a specific routing protocol. You configure protocol-specific tracing operations in the **[edit protocols]** hierarchy when configuring the individual routing protocol. Protocol-specific tracing operations override any equivalent operations that you specify in the global **traceoptions** statement. If there are no equivalent operations, they supplement the global tracing options. If you do not specify any protocol-specific tracing, the routing protocol inherits all the global tracing operations.
- Tracing operations within individual routing protocol entities—Some protocols allow you to define more granular tracing operations. For example, in Border Gateway Protocol (BGP), you can configure peer-specific tracing operations. These operations override any equivalent BGP-wide operations or, if there are no equivalents, supplement them. If you do not specify any peer-specific tracing operations, the peers inherit, first, all the BGP-wide tracing operations and, second, the global tracing operations.
- Interface tracing operations—Define tracing for individual interfaces and for the interface process itself. You define interface tracing operations at the **[edit interfaces]** hierarchy level of the configuration.
- Remote tracing—To enable system-wide remote tracing, configure the **destination-override syslog host** statement at the **[edit system tracing]** hierarchy level. This specifies the remote host running the system log process (syslogd), which collects the traces. Traces are written to files on the remote host in accordance with the syslogd configuration in **/etc/syslog.conf**. By default, remote tracing is not configured.

To override the system-wide remote tracing configuration for a particular process, include the **no-remote-trace** statement at the **[edit process-name traceoptions]** hierarchy. When **no-remote-trace** is enabled, the process does local tracing.

To collect traces, use the **local0** facility as the selector in the **/etc/syslog.conf** file on the remote host. To separate traces from various processes into different files, include the process name or trace-file name (if it is specified at the **[edit process-name traceoptions file]** hierarchy level) in the Program field in the **/etc/syslog.conf** file. If your system log server supports parsing hostname and program name, then you can separate traces from the various processes.

**NOTE:** During a commit check, warnings about the **traceoptions** configuration (for example, mismatch in trace file sizes or number of trace files) are not displayed on the console. However, these warnings are logged in the system log messages when the new configuration is committed.

## Understanding Automation Scripts Support

This document describes the support for the Junos OS automation scripts on the QFabric system Director devices.

Junos OS automation consists of a suite of tools used to automate operational and configuration tasks on network devices running Junos OS. The automation tools, which leverage the native XML capabilities of the Junos OS, include commit scripts, operation (op) scripts, event policies and event scripts, and macros.

**NOTE:** Event policies and event scripts are not supported on the QFabric system at this time.

The QFabric system supports Junos OS automation scripts that are written in Stylesheet Language Alternative Syntax (SLAX) version 1.0.

Commit scripts automate the commit process and enforce custom configuration rules. You can use commit scripts to generate specific errors and warnings, and customize configurations and configuration templates. When a candidate configuration is committed, it is inspected by each active commit script. If a configuration violates your custom rules and the scripts generate an error, the commit fails. If the commit is successful, any configuration changes (both transient and permanent) are incorporated into the active configuration before it is passed to the Director software, which distributes the configuration to all applicable QFabric system components, including Node devices and Node servers.

Op scripts automate operational and troubleshooting tasks. Op scripts can be executed manually from the Junos OS CLI or NETCONF XML management protocol, or they can be called from another script.

The QFabric system supports the following automation script features:

- Commit scripts and op scripts are supported.
- Scripts written in SLAX version 1 are supported.
- Scripts are configured and deployed from the Director group. Since there is more than one Director device in a Director group, scripts must be deployed by each Director device or deployed in the shared media space.
- Scripts are stored in the shared media at this location:  
`/pbdata/mgd_shared/partition-ip/var/db/scripts`. Under this directory, commit scripts are stored in the **commit** subdirectory, and op scripts are stored in the **op** subdirectory.
- Scripts are not stored in flash memory.

## How Commit Scripts Work

You enable commit scripts by listing the names of one or more commit script files at the **[edit system scripts commit]** hierarchy level. These scripts contain instructions that enforce custom configuration rules. Commit scripts are invoked during the commit process before the standard Junos OS validity checks are performed.

When you perform a commit operation, Junos OS executes each script in turn, passing the information in the candidate configuration to the scripts. The script inspects the configuration, performs the necessary tests and validations, and generates a set of instructions for performing certain actions. These actions include generating error, warning, and system log messages. If errors are generated, the commit operation fails and the candidate configuration remains unchanged. This is the same behavior that occurs with standard commit errors.

Commit scripts can also generate changes to the system configuration. Because the changes are loaded before the standard validation checks are performed, they are validated for correct syntax, just like statements already present in the configuration before the script is applied. If the syntax is correct, the configuration is activated and becomes the active, operational device configuration.

[Figure 241 on page 6573](#) shows the flow of commit script input and output.

**Figure 241: Commit Script Input and Output**

Commit scripts cannot make configuration changes to protected statements or within protected hierarchies. If a commit script attempts to modify or delete a protected statement or hierarchy, Junos OS issues a warning that the change cannot be made. Failure to modify a protected configuration element does not halt the commit script or the commit process.

The following sections discuss several important concepts related to the commit script input and output:

- [Commit Script Input on page 6574](#)
- [Commit Script Output on page 6574](#)
- [Commit Scripts and the Junos OS Commit Model on page 6575](#)

### Commit Script Input

---

The input for a commit script is the postinheritance candidate configuration in Junos XML API format. The term *postinheritance* means that all configuration group values have been inherited by their targets in the candidate configuration and the inactive portions of the configuration have been removed. For more information about configuration groups, see the *CLI User Guide*.

When you issue the **commit** command, Junos OS automatically generates the candidate configuration in XML format and reads it into the management (mgd) process, at which time the input is evaluated by any commit scripts.

To display the XML format of the postinheritance configuration, issue the **show | display commit-scripts view** command:

```
[edit]
user@host# show | display commit-scripts view
```

To display all configuration groups data, including script-generated changes to the groups, issue the **show groups | display commit-scripts** command:

```
[edit]
user@host# show groups | display commit-scripts
```

To save the commit script input to a file, add the **save** command to the command line:

```
[edit]
user@host# show | display commit-scripts view | save filename.xml
```

By default, the file is placed in your home directory on the switch, router, or security device.

### Commit Script Output

---

To specify the desired commit script output—including warning, error, and system log messages, persistent changes, and transient changes—the script can contain tags that appear in any order, in any number. The tags for specifying output are as follows:

- **<xnm:warning>**—Generates a warning message
- **<xnm:error>**—Generates an error message.
- **<syslog><message>**—Generates a system log message.
- **<change>**—Generates a persistent change to the configuration.
- **<transient-change>**—Generates a transient change to the configuration.
- **<xsl:call-template name="jcs:emit-change">**  
    **<xsl:with-param name="content">**—Generates a persistent change relative to the current context node as defined by an XPath expression.

- `<xsl:call-template name="jcs:emit-change">`  
`<xsl:with-param name="tag" select="'transient-change'"/>`  
`<xsl:with-param name="content">`—Generates a transient change relative to the current context node as defined by an XPath expression.
- `<xsl:call-template name="jcs:emit-change">`  
`<xsl:with-param name="message">`  
`<xsl:text>`—Generates a warning message in conjunction with a configuration change. You can use this set of tags to generate a notification that the configuration has been changed.

Junos OS processes this output and performs the appropriate actions. Errors and warnings are passed back to the Junos OS CLI or to a Junos XML protocol client application. The presence of an error automatically causes the commit operation to fail. Persistent and transient changes are loaded into the appropriate configuration database.

To test the output of error, warning, and system log messages from commit scripts, issue the **commit check | display xml** command:

```
[edit]
user@host# commit check | display xml
```

To display a detailed trace of commit script processing, issue the **commit check | display detail** command:

```
[edit]
user@host# commit check | display detail
```

**NOTE:** System log messages do not appear in the trace output, so you cannot use the commit check operation to test script-generated system log messages. Furthermore, system log messages are written to the system log during a commit operation, but not during a commit check operation.

### Commit Scripts and the Junos OS Commit Model

Junos OS uses a commit model to update the device's configuration. This model allows you to make a series of changes to a candidate configuration without affecting the operation of the device. When the changes are complete, you can commit the configuration. The commit operation saves the candidate configuration changes into the current configuration.

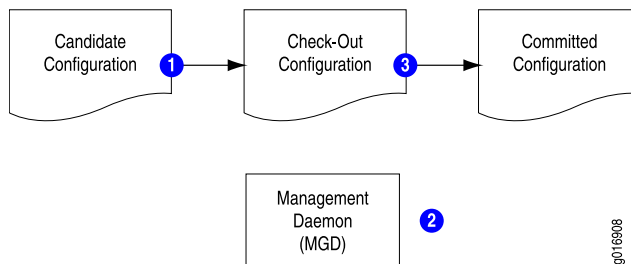

When you commit a set of changes in the candidate configuration, two methods are used to forward these changes to the current configuration:

- Standard commit model—Used when no commit scripts are active on the device.
- Commit script model—Incorporates commit scripts into the commit model.

### Standard Commit Model

In the standard commit model, the management (mgd) process validates the candidate configuration based on standard Junos validation rules. If the configuration file is valid, it becomes the current active configuration. [Figure 242 on page 6576](#) and the accompanying discussion explain how the standard commit model works:

**Figure 242: Standard Commit Model**

In the standard commit model, the software performs the following steps:

1. When the candidate configuration is committed, it is copied to become the checkout configuration.
2. The mgd process validates the checkout configuration.
3. If no error occurs, the checkout configuration is copied as the current active configuration.

### Commit Model with Commit Scripts

When commit scripts are added to the standard commit model, the process becomes more complex. The mgd process first passes an XML-formatted checkout configuration to a script driver, which handles the verification of the checkout configuration by the commit scripts. When verification is complete, the script driver returns an XML *action file* to the mgd process. The mgd process follows the instructions in the action file to update the candidate and checkout configurations, issue messages to the CLI, and write information to the system log as required. After processing the action file, the mgd process performs the standard Junos OS validation. [Figure 243 on page 6577](#) and the accompanying discussion explain this process.

Figure 243: Commit Model with Commit Scripts Added

In the commit script model, Junos OS performs the following steps:

1. When the candidate configuration is committed, the mgd process sends the XML-formatted candidate configuration to the script driver.
2. Each enabled commit script is invoked against the candidate configuration, and each script can generate a set of actions for the mgd process to perform. The actions are collected in an XML action file.
3. The mgd process performs the following actions in response to **<error>**, **<warning>**, and **<syslog>** tag elements in the action file:
  - **<error>**—The mgd process halts the commit process (that is, the commit operation fails), returns an error message to the CLI or Junos XML protocol client, and takes no further action.
  - **<warning>**—The mgd process forwards the message to the CLI or the Junos XML protocol client.
  - **<syslog>**—The mgd process forwards the message to the system log process.
4. If the action file includes any **<change>** tag elements, the mgd process loads the requested changes into the candidate configuration.
5. The candidate configuration is copied to become the checkout configuration.
6. If the action file includes any **<transient-change>** tag elements, the mgd process loads the requested changes into the checkout configuration.
7. The mgd process validates the checkout configuration.
8. If there are no validation errors, the checkout configuration is copied to become the current active configuration.

**NOTE:** Commit scripts cannot make configuration changes to protected statements or within protected hierarchies. If a commit script attempts to modify or delete a protected statement or hierarchy, Junos OS issues a warning that the change cannot be made. Failure to modify a protected configuration element does not halt the commit script or the commit process.

Changes that are made to the candidate configuration during the commit operation are not evaluated by the custom rules during that commit operation. However, persistent changes are maintained in the candidate configuration and are evaluated by the custom rules during subsequent commit operations. For more information about how commit scripts change the candidate configuration, see [“Avoiding Potential Conflicts When Using Multiple Commit Scripts” on page 6578](#).

Transient changes are never evaluated by the custom rules in commit scripts, because they are made to the checkout configuration only after the commit scripts have evaluated the candidate configuration and the candidate is copied to become the checkout configuration. To remove a transient change from the configuration, remove, disable, or deactivate the commit script (as discussed in *Controlling Execution of Commit Scripts During Commit Operations*), or comment out the code that generates the transient change.

For more information about differences between persistent and transient changes, see [“Overview of Generating Persistent or Transient Configuration Changes” on page 6579](#).

**Related  
Documentation**

- [Avoiding Potential Conflicts When Using Multiple Commit Scripts on page 6578](#)

## Avoiding Potential Conflicts When Using Multiple Commit Scripts

When you use multiple commit scripts, each script evaluates the original candidate configuration file. Changes made by one script are not evaluated by the other scripts. This means that conflicts between scripts might not be resolved when the scripts are first applied to the configuration. The commit scripts are executed in the order they are listed at the **[edit system scripts commit]** hierarchy level, as illustrated in [Figure 244 on page 6579](#).

Figure 244: Configuration Evaluation by Multiple Commit Scripts

As an example of a conflict between commit scripts, suppose that commit script **A.xsl** is created to ensure that the device uses the domain name server with IP address 192.168.0.255. Later, the DNS server's address is changed to 192.168.255.255 and a second script, **B.xsl**, is added to check that the device uses the DNS server with that address. However, script **A.xsl** is not removed or disabled.

Because each commit script evaluates the original candidate configuration, the final result of executing both scripts **A.xsl** and **B.xsl** depends on which DNS server address is configured in the original candidate configuration. If the now outdated address of 192.168.0.255 is configured, script **B.xsl** changes it to 192.168.255.255. However, if the correct address of 192.168.255.255 is configured, script **A.xsl** changes it to the incorrect value 192.168.0.255.

As another example of a potential conflict between commit scripts, suppose that a commit script protects a hierarchy using the **protect** attribute. If a second commit script attempts to modify or delete the hierarchy or the statements within the hierarchy, Junos OS issues a warning during the commit process and prevents the configuration change.

Exercise care to ensure that you do not introduce conflicts between scripts like those described in the examples. As a method of checking for conflicts with persistent changes, you can issue two separate **commit** commands.

**Related Documentation**

## Overview of Generating Persistent or Transient Configuration Changes

Junos OS commit scripts enforce custom configuration rules. When a candidate configuration includes statements that you have decided must not be included in your configuration, or when the candidate configuration omits statements that you have

decided are required, commit scripts can automatically change the configuration and thereby correct the problem.

- [Differences Between Persistent and Transient Changes on page 6580](#)

- [Tag Elements and Templates for Generating Changes on page 6583](#)

---

### Differences Between Persistent and Transient Changes

---

Configuration changes made by commit scripts can be *persistent* or *transient*.

A persistent change remains in the candidate configuration and affects routing operations until you explicitly delete it, even if you subsequently remove or disable the commit script that generated the change and reissue the **commit** command. In other words, removing the commit script does not cause a persistent change to be removed from the configuration.

A transient change, in contrast, is made in the *checkout configuration* but not in the candidate configuration. The checkout configuration is the configuration database that is inspected for standard Junos OS syntax just before it is copied to become the active configuration on the device. If you subsequently remove or disable the commit script that made the change and reissue the **commit** command, the change is no longer made to the checkout configuration and so does not affect the active configuration. In other words, removing the commit script effectively removes a transient change from the configuration.

A common use for transient changes is to eliminate the need to repeatedly configure and display well-known policies, thus allowing these policies to be enforced implicitly. For example, if MPLS must be enabled on every interface with an International Organization for Standardization (ISO) protocol enabled, the change can be transient, so that the repetitive or redundant configuration data need not be carried or displayed in the candidate configuration. Furthermore, transient changes allow you to write script instructions that apply the change only if a set of conditions is met.

Persistent and transient changes are loaded into the configuration in the same manner that the **load replace** configuration mode command loads an incoming configuration. When generating a persistent or transient change, adding the **replace="replace"** attribute to a configuration element produces the same behavior as a **replace:** tag in a **load replace** operation.

By default, Junos OS merges the incoming configuration and the candidate configuration. New statements and hierarchies are added, and conflicting statements are overridden. When generating a persistent or transient change, if you add the **replace="replace"** attribute to a configuration element, Junos OS replaces the existing configuration element with the incoming configuration element. If the **replace="replace"** attribute is added to a configuration element, but there is no existing element of the same name in the current configuration, the incoming configuration element is added into the configuration. Elements that do not have the **replace** attribute are merged into the configuration.

Persistent and transient changes are loaded before the standard Junos validation checks are performed. This means any configuration changes introduced by a commit script are

validated for correct syntax. If the syntax is correct, the new configuration becomes the active, operational device configuration.

Protected elements in the configuration hierarchy cannot be modified or deleted by either a persistent or a transient change. If a commit script attempts to modify or delete a protected statement or hierarchy, Junos OS issues a warning that the change cannot be made, and proceeds with the commit.

Persistent and transient changes have several important differences, as described in [Table 586 on page 6581](#).

**Table 586: Differences Between Persistent and Transient Changes**

| Persistent Changes                                                                                                                                                                                                                                                                                                                                           | Transient Changes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| <p>You can use persistent changes to perform any Junos XML protocol operation, such as activate, deactivate, delete, insert (reorder), comment (annotate), and replace sections of the configuration.</p>                                                                                                                                                    | <p>Like persistent changes, you can use transient changes to perform any Junos XML protocol operation. However, some Junos XML protocol operations do not make sense to use with transient changes, such as generating comments and inactive settings.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <p>Persistent changes are always loaded during the commit process if no errors are generated by any commit scripts or by the standard Junos OS validity check.</p>                                                                                                                                                                                           | <p>For transient changes to be loaded, you must include the <b>allow-transients</b> statement at the <b>[edit system scripts commit]</b> hierarchy level. If you enable a commit script that generates transient changes and you do not include the <b>allow-transients</b> statement in the configuration, the CLI generates an error message and the commit operation fails.</p> <p>Like persistent changes, transient changes must pass the standard Junos OS validity check.</p> <p>You cannot use a commit script to generate the <b>allow-transients</b> statement at the <b>[edit system scripts commit]</b> hierarchy level. Rather, you must include this statement directly by using the CLI.</p> |

Table 586: Differences Between Persistent and Transient Changes (*continued*)

| Persistent Changes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Transient Changes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>Persistent changes work like the <b>load replace</b> configuration mode command, and the change is added to the candidate configuration.</p> <p>When generating a persistent change, if you add the <b>replace="replace"</b> attribute to a configuration element, Junos OS replaces the existing element in the candidate configuration with the incoming configuration element. If there is no existing element of the same name in the candidate configuration, the incoming configuration element is added into the configuration. Elements that do not have the <b>replace</b> attribute are merged into the configuration.</p> | <p>Transient changes work like the <b>load replace</b> configuration mode command, and the change is added to the checkout configuration.</p> <p>When generating a transient change, if you add the <b>replace="replace"</b> attribute to a configuration element, Junos OS replaces the existing element in the checkout configuration with the incoming configuration element. If there is no existing element of the same name in the checkout configuration, the incoming configuration element is added into the configuration. Elements that do not have the <b>replace</b> attribute are merged into the configuration.</p> <p>Transient changes are not copied to the candidate configuration. For this reason, transient changes are not saved in the configuration if the associated commit script is deleted or deactivated.</p> |
| <p>After a persistent change is committed, the software treats it like a change you make by directly editing and committing the candidate configuration.</p> <p>After the persistent changes are copied to the candidate configuration, they are copied to the checkout configuration. If the changes pass the standard Junos OS validity checks, the changes are propagated to the switch, router, or security device components.</p>                                                                                                                                                                                                  | <p>Each time a transient change is committed, the software updates the checkout configuration database. After the transient changes pass the standard Junos OS validity checks, the changes are propagated to the device components.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <p>After committing a script that causes a persistent change to be generated, you can view the persistent change by issuing the <b>show</b> configuration mode command:</p> <pre>user@host# show</pre> <p>This command displays persistent changes only, not transient changes.</p>                                                                                                                                                                                                                                                                                                                                                     | <p>After committing a script that causes a transient change to be generated, you can view the transient change by issuing the <b>show   display commit-scripts</b> configuration mode command:</p> <pre>user@host# show   display commit-scripts</pre> <p>This command displays both persistent and transient changes.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <p>Persistent changes must conform to your custom configuration design rules as dictated by commit scripts.</p> <p>This does not become apparent until after a second commit operation because persistent changes are not evaluated by commit script rules on the current commit operation. The subsequent commit operation fails if the persistent changes do not conform to the rules imposed by the commit scripts configured during the first commit operation.</p>                                                                                                                                                                 | <p>Transient changes are never tested by and do not need to conform to your custom rules. This is caused by the order of operations in the Junos OS commit model, which is explained in detail in <a href="#">“Commit Scripts and the Junos OS Commit Model” on page 6575</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <p>A persistent change remains in the configuration even if you delete, disable, or deactivate the commit script instructions that generated the change.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <p>If you delete, disable, or deactivate the commit script instructions that generate a transient change, the change is removed from the configuration after the next commit operation. In short, if the associated instructions or the entire commit script is removed, the transient change is also removed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Table 586: Differences Between Persistent and Transient Changes (*continued*)

| Persistent Changes                                                                                                                                                                                                                                                                                                                                                                                                                       | Transient Changes                                                                                                                                                                                                                                                                              |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| As with direct CLI configuration, you can remove a persistent change by rolling back to a previous configuration that did not include the change and issuing the <b>commit</b> command. However, if you do not disable or deactivate the associated commit script, and the problem that originally caused the change to be generated still exists, the change is automatically regenerated when you issue another <b>commit</b> command. | You cannot remove a transient change by rolling back to a previous configuration.                                                                                                                                                                                                              |
| You can alter persistent changes directly by editing the configuration using the CLI.                                                                                                                                                                                                                                                                                                                                                    | <p>You cannot directly alter or delete a transient change by using the Junos OS CLI, because the change is not in the candidate configuration.</p> <p>To alter the contents of a transient change, you must alter the statements in the commit script that generates the transient change.</p> |

### Interaction of Configuration Changes and Configuration Groups

Any configuration change you can make by directly editing the configuration using the Junos OS command-line interface (CLI) can also be generated by a commit script as a persistent or transient change. This includes values specified at a specific hierarchy level or in configuration groups. As with direct CLI configuration, values specified in the *target* override values inherited from a configuration group. The target is the statement to which you apply a configuration group by including the **apply-groups** statement.

If you define persistent or transient changes as belonging to a configuration group, the configuration groups are applied in the order you specify in the **apply-groups** statements, which you can include at any hierarchy level except the top level. You can also disable inheritance of a configuration group by including the **apply-groups-except** statement at any hierarchy level except the top level.

**CAUTION:** Each commit script inspects the postinheritance view of the configuration. If a candidate configuration contains a configuration group, be careful when using a commit script to change the related target configuration, because doing so might alter the intended inheritance from the configuration group.

Also be careful when using a commit script to change a configuration group, because the configuration group might be generated by an application that performs a load replace operation on the group during each commit operation.

For more information about configuration groups, see the *CLI User Guide*.

### Tag Elements and Templates for Generating Changes

To generate changes, you can use the **jcs:emit-change** template, which implicitly includes **<change>** and **<transient-change>** XML elements; or you can explicitly include **<change>**

and **<transient-change>** XML elements. Using the **jcs:emit-change** template allows you to set the hierarchical context of the change once rather than multiple times.

The **<change>** and **<transient-change>** elements are similar to the **<load-configuration>** operation defined by the Junos XML management protocol. The possible contents of the **<change>** and **<transient-change>** elements are the same as the contents of the **<configuration>** tag element used in the Junos XML protocol operation **<load-configuration>**. For complete details about the **<load-configuration>** element, see the *Junos XML Management Protocol Developer Guide*.

## Required Boilerplate for Commit Scripts

When you write commit scripts, you use Extensible Stylesheet Language Transformations (XSLT) or Stylesheet Language Alternative Syntax (SLAX) tools provided with Junos OS. These tools include basic boilerplate that you must include in all commit scripts, optional extension functions that accomplish scripting tasks more easily, and named templates that make commit scripts easier to read and write, which you import from a file called **junos.xml**. For more information about the extension functions and templates, see *Junos Script Automation: Understanding Extension Functions in the jcs and slax Namespaces* and *Junos Script Automation: Named Templates in the jcs Namespace Overview*.

Commit scripts are based on Junos XML and Junos XML protocol tag elements. Like all XML elements, angle brackets enclose the name of a Junos XML or Junos XML protocol tag element in its opening and closing tags. This is an XML convention, and the brackets are a required part of the complete tag element name. They are not to be confused with the angle brackets used in the documentation to indicate optional parts of Junos OS CLI command strings.

You must include either XSLT or SLAX boilerplate as the starting point for all commit scripts that you create. The XSLT boilerplate follows:

### XSLT Boilerplate for Commit Scripts

```
1 <?xml version="1.0" standalone="yes"?>
2 <xsl:stylesheet version="1.0"
3   xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
4   xmlns:junos="http://xml.juniper.net/junos/*/junos"
5   xmlns:xnm="http://xml.juniper.net/xnm/1.1/xnm"
6   xmlns:jcs="http://xml.juniper.net/junos/commit-scripts/1.0">
7   <xsl:import href="../../../import/junos.xml"/>
8
9   <xsl:template match="configuration">
10     <!-- ... Insert your code here ... -->
11   </xsl:template>
12 </xsl:stylesheet>
```

Line 1 is the Extensible Markup Language (XML) processing instruction (PI). This PI specifies that the code is written in XML using version 1.0. The XML PI, if present, must be the first noncomment token in the script file.

```
1 <?xml version="1.0"?>
```

Lines 2 through 6 set the style sheet element and the associated namespaces. Line 2 sets the style sheet version as 1.0. Lines 3 through 6 list all the namespace mappings commonly used in commit scripts. Not all of these prefixes are used in this example, but it is not an error to list namespace mappings that are not referenced. Listing all namespace mappings prevents errors if the mappings are used in later versions of the script.

```

2 <xsl:stylesheet version="1.0"
3   xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
4   xmlns:junos="http://xml.juniper.net/junos/*/junos"
5   xmlns:xnm="http://xml.juniper.net/xnm/1.1/xnm"
6   xmlns:jcs="http://xml.juniper.net/junos/commit-scripts/1.0">

```

Line 7 is an XSLT import statement. It loads the templates and variables from the file referenced as `../import/junos.xsl`, which ships as part of the Junos OS. The `junos.xsl` file contains a set of named templates you can call in your scripts. These named templates are discussed in *Junos Script Automation: Named Templates in the jcs Namespace Overview* and *Junos Named Templates in the jcs Namespace Summary*.

```

7 <xsl:import href="../import/junos.xsl"/>

```

Line 8 defines a template that matches the `<configuration>` element, which is the node selected by the `<xsl:template match="/">` template, contained in the `junos.xsl` import file. The `<xsl:template match="configuration">` element allows you to exclude the `/configuration/` root element from all XML Path Language (XPath) expressions in the script and begin XPath expressions with the top Junos OS hierarchy level. For more information, see *XPath Overview*.

```

8 <xsl:template match="configuration">

```

Add your code between Lines 8 and 9.

Line 9 closes the template.

```

9 </xsl:template>

```

Line 10 closes the style sheet and the commit script.

```

10 </xsl:stylesheet>

```

### SLAX Boilerplate for Commit Scripts

The corresponding SLAX boilerplate is as follows:

```

version 1.0;
ns junos = "http://xml.juniper.net/junos/*/junos";
ns xnm = "http://xml.juniper.net/xnm/1.1/xnm";
ns jcs = "http://xml.juniper.net/junos/commit-scripts/1.0";
import "../import/junos.xsl";

match configuration {
  /*
   * Insert your code here
   */
}

```

## How Op Scripts Work

Op scripts execute Junos OS operational commands and inspect the resulting output. After inspection, op scripts can automatically correct errors within the device running Junos OS based on this output.

You add op scripts to device operations by listing the filenames of one or more op script files within the **[edit system scripts op]** hierarchy level. These files must be added to the appropriate op script file directory. For more information about op script file directories, see *Storing Scripts in Flash Memory*. Once added to the device, op scripts are invoked from the command line, using the **op filename** command.

You can use op scripts to generate changes to the device configuration by including the **<load-configuration>** tag element. Because the changes are loaded before the standard validation checks are performed, they are validated for correct syntax, just like statements already present in the configuration before the script is applied. If the syntax is correct, the configuration is activated and becomes the active, operational device configuration.

Figure 245 on page 6586 shows a high-level view of the flow of op script input and output.

**Figure 245: Op Script Input and Output**

## Required Boilerplate for Op Scripts

When you write operation (op) scripts, you use Extensible Stylesheet Language Transformations (XSLT) or Stylesheet Language Alternative Syntax (SLAX) tools provided with Junos OS. These tools include basic boilerplate that you must include in all op scripts, optional extension functions that accomplish scripting tasks more easily, and named templates that make scripts easier to read and write, which you import from a file called **junos.xml**. For more information about the extension functions and templates, see *Junos Script Automation: Understanding Extension Functions in the jcs and slax Namespaces* and *Junos Script Automation: Named Templates in the jcs Namespace Overview*.

Op scripts are based on Junos XML and Junos XML protocol tag elements. Like all XML elements, angle brackets enclose the name of a Junos XML or Junos XML protocol tag element in its opening and closing tags. This is an XML convention, and the brackets are a required part of the complete tag element name. They are not to be confused with the angle brackets used in the documentation to indicate optional parts of Junos OS CLI command strings.

You must include either XSLT or SLAX boilerplate as the starting point for all op scripts that you create. The XSLT boilerplate follows:

### XSLT Boilerplate for Op Scripts

```

1 <?xml version="1.0" standalone="yes"?>
2 <xsl:stylesheet version="1.0"
3   xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
4   xmlns:junos="http://xml.juniper.net/junos/*/junos"
5   xmlns:xnm="http://xml.juniper.net/xnm/1.1/xnm"
6   xmlns:jcs="http://xml.juniper.net/junos/commit-scripts/1.0">
7   <xsl:import href="../import/junos.xml"/>
8   <xsl:template match="/">

```

```

9      <op-script-results>
        <!-- ... insert your code here ... -->
10     </op-script-results>
11  </xsl:template>
        <!-- ... insert additional template definitions here ... -->
12 </xsl:stylesheet>

```

Line 1 is the Extensible Markup Language (XML) processing instruction (PI), which marks this file as XML and specifies the version of XML as 1.0. The XML PI, if present, must be the first non-comment token in the script file.

```
1 <?xml version="1.0"?>
```

Line 2 opens the style sheet and specifies the XSLT version as 1.0.

```
2 <xsl:stylesheet version="1.0"
```

Lines 3 through 6 list all the namespace mappings commonly used in operation scripts. Not all of these prefixes are used in this example, but it is not an error to list namespace mappings that are not referenced. Listing all namespace mappings prevents errors if the mappings are used in later versions of the script.

```

3  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
4  xmlns:junos="http://xml.juniper.net/junos/*/junos"
5  xmlns:xnm="http://xml.juniper.net/xnm/1.1/xnm"
6  xmlns:jcs="http://xml.juniper.net/junos/commit-scripts/1.0">

```

Line 7 is an XSLT import statement. It loads the templates and variables from the file referenced as `../import/junos.xsl`, which ships as part of Junos OS (in the file `/usr/libdata/cscript/import/junos.xsl`). The `junos.xsl` file contains a set of named templates you can call in your scripts. These named templates are discussed in *Junos Script Automation: Named Templates in the jcs Namespace Overview* and *Junos Named Templates in the jcs Namespace Summary*.

```
7 <xsl:import href="../import/junos.xsl"/>
```

Line 8 defines a template that matches the `</>` element. The `<xsl:template match="/">` element is the root element and represents the top level of the XML hierarchy. All XML Path Language (XPath) expressions in the script must start at the top level. This allows the script to access all possible Junos XML and Junos XML protocol remote procedure calls (RPCs). For more information, see *XPath Overview*.

```
8 <xsl:template match="/">
```

After the `<xsl:template match="/">` tag element, the `<op-script-results>` and `</op-script-results>` container tags must be the top-level child tags, as shown in Lines 9 and 10.

```

9      <op-script-results>
        <!-- ... insert your code here ... -->
10     </op-script-results>

```

Line 11 closes the template.

```
11 </xsl:template>
```

Between Line 11 and Line 12, you can define additional XSLT templates that are called from within the `<xsl:template match="/">` template.

Line 12 closes the style sheet and the op script.

```
12 </xsl:stylesheet>
```

#### SLAX Boilerplate for Op Scripts

The corresponding SLAX boilerplate is as follows:

```
version 1.0;

ns junos = "http://xml.juniper.net/junos/*/junos";
ns xnm = "http://xml.juniper.net/xnm/1.1/xnm";
ns jcs = "http://xml.juniper.net/junos/commit-scripts/1.0";
import "../import/junos.xsl";

match / {
  <op-script-results> {
    /*
     * Insert your code here
     */
  }
}
```

---

## Fabric OAM

- [Overview of Internal Fabric Monitoring on page 6588](#)

### Overview of Internal Fabric Monitoring

Internal fabric monitoring is a feature of the Operation, Administration, and Maintenance (OAM) of the QFabric system. This feature enables you to validate the flow path of protocol data units (PDUs) across a given VLAN on the QFabric system using the unicast ping, multicast ping, and traceroute operations.

Internal fabric monitoring is useful for fault detection on the QFabric system. For example, if a PDU reaches a destination that is not part of the VLAN configuration, the operation (unicast ping, multicast ping, or traceroute) displays the exception on the console at runtime.

The unicast and multicast ping operations send PDUs from a source interface (called the source fabric maintenance endpoint [FMEP]) to a destination FMEP. The destination FMEP sends a response to the source FMEP when the PDUs are received.

The traceroute operation, also called a flow linktrace, traces the path taken by a specific, learned unicast flow from a source FMEP to a destination FMEP in a VLAN. The source and destination FMEPs may be on the same Node device, different Node devices connected to the same Interconnect device, or different Node devices connected to different Interconnect devices. The flow path is the sequence of Packet Forwarding Engine forwarding hops along which the PDU travels. The hop-by-hop sequence and number of hops are reported in terms of fabric maintenance intermediate points (FMIPs), which are interfaces on the Packet Forwarding Engine of the Interconnect device. An FMIP sends a response to the source FMEP when the traceroute PDU is received.

The following internal fabric monitoring commands are supported:

- **show oam fabric flow specification**
- **show oam fabric interfaces**
- **ping fabric unicast-flow**
- **ping fabric multicast-flow**
- **traceroute fabric unicast-flow**

The following are the main components of the internal fabric monitoring feature:

- **FMEP**—Represents the source or destination point (endpoint) in the monitoring operations. An FMEP is an interface through which PDUs are sent (source FMEP) or received (destination FMEP). Upon receipt of the PDUs, the destination FMEP sends a response to the source FMEP to validate the monitoring flow. FMEPs are associated with a VLAN in the fabric maintenance association (FMA) configuration, and the source and destination FMEP addresses are configured in the flow specification.
- **FMA**—Associates a set of FMEPs with a VLAN. The FMA defines the VLAN and FMEP parameters, including the VLAN name, FMEP identifiers, FMEP names, and the interface names of the FMEPs. The FMEPs defined in the FMA are the source and destination FMEPs used in the monitoring commands.

**NOTE:** A default FMA is automatically created for each Node group in the QFabric system. The default FMA is used to send error response PDUs (for example, in the case of a VLAN leak) and responses to PDUs that are not mapped to a specific interface in the QFabric system.

- **Flow specification**—Configures the flow type and FMEP addressing parameters. Unicast flow types include an Ethernet type (other than IPv4) and Ethernet IPv4. Multicast flow types include the Ethernet IPv4 and VLAN flood type. The flow specification also defines parameters within each flow type, such as MAC or IPv4 addresses of the source and destination FMEPs. The names and identifiers of these FMEPs are configured in the FMA parameters.

To enable internal fabric monitoring, configure the **fabric-maintenance-associations** and **flow-specs** statements at the **[edit protocols oam fabric]** hierarchy level.

The **ping fabric unicast-flow**, **ping fabric multicast-flow**, and **traceroute fabric unicast-flow** commands require that you specify the flow specification and FMA names, as well as the source and destination FMEP names.

## Junos Space

---

- [Understanding Junos Space Support on page 6590](#)
- [Preparing the Device for Junos Space Management on page 6591](#)

### Understanding Junos Space Support

The Juniper Networks Junos Space application, running on a JA1500 appliance or a Junos Space Virtual Appliance, is a comprehensive platform for building and deploying applications for collaboration, productivity, and network infrastructure and operations management. Junos Space provides a runtime environment implemented as a fabric of virtual and physical appliances.

The Junos Space Network Management Platform software comprises various applications for network management and configuration, including:

- Junos Space Administration—Provides management of Junos Space fabric, databases, licenses, applications, authentication servers, tags, permission labels, DMI schemas, and troubleshooting.
- Network Director—Provides unified management of supported Juniper Networks devices in your network. By providing full network life cycle management, Network Director simplifies the discovery, configuration, visualization, monitoring, and administration of large networks.
- Service Automation—Provides an end-to-end solution designed to streamline operations and enable proactive network management for Junos OS devices. The solution consists of Advanced Insight Scripts (AI-Scripts), Junos Space Service Now and Service Insight applications, and Juniper Support Systems (JSS).

**NOTE:** Do not install Junos Space and AI-Scripts on the control plane network EX4200 switches or EX4200 Virtual Chassis in a QFX3000 QFabric system

Before you can use Junos Space Network Director to manage the QFX Series device, you must ensure that the configuration on the device meets the requirements for all managed devices. For example:

- The device configuration has a static management IP address that is reachable from the Junos Space server.
- There is a user with full administrative privileges for Junos Space administration.
- SNMP is enabled (only if you plan on using SNMP as part of the device discovery).
- In Junos Space, set up a default device management interface (DMI) schema for the QFX Series device.

For more information about Network Director requirements, see the *Network Director Quick Start Guide* at:

[http://www.juniper.net/techpubs/en\\_US/network-director1.5/information-products/pathway-pages/index.html](http://www.juniper.net/techpubs/en_US/network-director1.5/information-products/pathway-pages/index.html)

For more information about Junos Space, go to:

[http://www.juniper.net/techpubs/en\\_US/release-independent/junos-space/index.html](http://www.juniper.net/techpubs/en_US/release-independent/junos-space/index.html)

**Related  
Documentation**

- [Configuring SNMP on page 1848](#)
- [Configuring SSH Service for Remote Access to the Router or Switch on page 1853](#)

## Preparing the Device for Junos Space Management

Before you can use the Juniper Networks Junos Space application to manage the QFX Series device, you must ensure that the configuration on the device meets the following requirements for device discovery in Junos Space:

- The device configuration has a static management IP address that is reachable from the Junos Space server.
- There is a user with full administrative privileges for Junos Space administration.
- SNMP is enabled (only if you plan on using SNMP as part of the device discovery).
- In Junos Space, set up a default device management interface (DMI) schema for the QFX Series device.

**NOTE:** Do not install Junos Space and AI-Scripts (AIS) on the control plane network EX4200 switches or EX4200 Virtual Chassis in a QFX3000 QFabric system

To prepare the device before using Junos Space:

1. Perform the initial configuration of the device through the console port using the Junos OS CLI. This task includes the configuration of a static management IP address and a user with root administrative privileges.

For the QFX3500 switch, see [“Configuring a QFX3500 Device as a Standalone Switch” on page 178](#).

For the QFabric system, see [“QFabric System Initial and Default Configuration Information” on page 1391](#) and [“Performing the QFabric System Initial Setup on a QFX3100 Director Group” on page 1471](#).

2. (Optional) Configure SNMP if you plan on using SNMP to probe devices during device discovery.

See [“Configuring SNMP” on page 1848](#).

3. (Optional) Enable SSH if you wish to use the Secure Console feature in Junos Space.

See “Configuring SSH Service for Remote Access to the Router or Switch” on page 1853.

4. In Junos Space, set up a default DMI schema. For more information about managing DMI schemas, see:

[http://www.juniper.net/techpubs/en\\_US/junos-space33/platform/information-products/pathway/pages/junos-space-administration-pwgh.html](http://www.juniper.net/techpubs/en_US/junos-space33/platform/information-products/pathway/pages/junos-space-administration-pwgh.html)

## sFlow Technology

- [Overview of sFlow Technology on page 6592](#)

### Overview of sFlow Technology

The sFlow technology is a monitoring technology for high-speed switched or routed networks. sFlow monitoring technology collects samples of network packets and sends them in a UDP datagram to a monitoring station called a *collector*. You can configure sFlow technology on a device to monitor traffic continuously at wire speed on all interfaces simultaneously. You must enable sFlow monitoring on each interface individually; you cannot globally enable sFlow monitoring on all interfaces with a single configuration statement. Junos OS fully supports the sFlow technology standard described in RFC 3176, *InMon Corporation's sFlow: A Method for Monitoring Traffic in Switched and Routed Networks*.

sFlow technology implements the following two sampling mechanisms:

- **Packet-based sampling**—Samples one packet out of a specified number of packets from an interface enabled for sFlow technology. Only the first 128 bytes of each packet are sent to the collector. Data collected include the Ethernet, IP, and TCP headers, along with other application-level headers (if present). Although this type of sampling might not capture infrequent packet flows, the majority of flows are reported over time, allowing the collector to generate a reasonably accurate representation of network activity. You configure packet-based sampling when you specify a sample rate.
- **Time-based sampling**—Samples interface statistics (counters) at a specified interval from an interface enabled for sFlow technology. Statistics such as Ethernet interface errors are captured. You configure time-based sampling when you specify a polling interval.

An sFlow monitoring system consists of an sFlow agent embedded in the device and up to four external collectors. On a QFX Series standalone switch, the sFlow agent performs packet sampling and gathers interface statistics, and then combines the information into UDP datagrams that are sent to the sFlow collectors. An sFlow collector can be

connected to the switch through the management network or data network. The software forwarding infrastructure daemon (SFID) on the switch looks up the next-hop address for the specified collector IP address to determine whether the collector is reachable by way of the management network or data network.

**NOTE:** On the QFX Series standalone switches, if you configure sFlow technology monitoring on multiple interfaces and a high sampling rate, we recommend that you specify a collector that is on the data network instead of the management network. Having a high volume of sFlow technology monitoring traffic on the management network might interfere with other management interface traffic.

On a QFabric system, the sFlow technology architecture is distributed. The global sFlow technology configuration defined on the QFabric system Director device is distributed to Node groups that have sFlow sampling configured on their interfaces. The sFlow agent has a separate sampling entity, known as a *subagent*, running on each Node device. Each subagent has its own independent state and forwards its own sample information (datagrams) directly to the sFlow collectors.

On the QFabric system, an sFlow collector must be reachable through the data network. Because each Node device has all routes stored in the default routing instance, the collector IP address should be included in the default routing instance to ensure the collector's reachability from the Node device.

Regardless of the rate of traffic or the configured sampling interval, a datagram is sent whenever its size reaches the maximum Ethernet transmission unit (MTU) of 1500 bytes, or whenever a 250-ms timer expires, whichever occurs first. The timer ensures that a collector receives regularly sampled data.

To ensure sampling accuracy and efficiency, QFX Series devices use adaptive sFlow sampling. Adaptive sampling monitors the overall incoming traffic rate on the device and provides feedback to the interfaces to dynamically adapt their sampling rate to traffic conditions. The sFlow agent reads the statistics on the interfaces every 5 seconds and identifies five interfaces with the highest number of samples. On a standalone switch, when the CPU processing limit is reached, a binary backoff algorithm is implemented to reduce the sampling load of the top five interfaces by half. The adapted sampling rate is then applied to other interfaces.

On a QFabric system, sFlow technology monitors the interfaces on each Node device as a group, and implements the binary backoff algorithm based on the traffic on that group of interfaces.

Using adaptive sampling prevents overloading of the CPU and keeps the device operating at its optimum level even when there is a change in traffic patterns on the interfaces. The reduced sampling rate is used until the device is rebooted or when a new sampling rate is configured.

The sFlow collector uses the IP address of the sFlow agent to determine the source of the sFlow data. You can configure the IP address of the sFlow agent to ensure that the agent ID for the sFlow agent remains constant. If you do not assign an IP address to the agent, an IP address will be assigned to the agent using the IP address of a configured interface.

On the QFX Series standalone switches, the following priority is used to determine which interface will be used:

1. Management Ethernet interface me0 IP address
2. Any Layer 3 interface if the me0 IP address is not available

If a particular interface is not configured, the IP address of the next interface in the priority list is used as the IP address for the agent. Once an IP address is assigned to the agent, the agent ID is not modified until the sFlow service is restarted. At least one interface has to be configured for an IP address to be assigned to the agent.

In addition, you can explicitly configure the IP address for the source data (sFlow datagrams). On the QFX Series standalone switches, if you do not configure that address, the following priority is used:

- Any Layer 3 interface IP address
- The me0 IP address if no Layer 3 interface IP address is available

On the QFabric system, the following default values are used if the optional parameters are not configured:

- Agent ID is the management IP address of the default partition.
- Source IP is the management IP address of the default partition.

In addition, the QFabric system subagent ID (which is included in the sFlow datagrams) is the ID of the Node group from which the datagram is sent to the collector.

**NOTE:** On QFX5100 standalone switches and the QFX Series Virtual Chassis (with QFX3500 and QFX3600 switches), egress firewall filters are not applied to sFlow sampling packets. On these platforms, the software architecture is different from that on other QFX Series devices, and sFlow packets are sent by the Routing Engine (not the line card on the host) and are not transiting the switch. Egress firewall filters affect data packets that are transiting a switch but do not affect packets sent by the Routing Engine. As a result, sFlow sampling packets are always sent to the sFlow collector.

---

On the QFX Series, limitations of sFlow traffic sampling include:

- sFlow sampling on ingress interfaces does not capture CPU-bound traffic.
- sFlow sampling on egress interfaces does not support broadcast and multicast packets.
- Egress samples do not contain modifications made to the packet in the egress pipeline.

- If a packet is discarded because of a firewall filter, the reason code for discarding the packet is not sent to the collector.
- The **out-priority** field for a VLAN is always set to 0 (zero) on ingress and egress samples.
- You cannot configure sFlow monitoring on a link aggregation group (LAG), but you can configure it individually on a LAG member interface.

## Understanding the Implementation of SNMP

The QFX Series products support the Simple Network Management Protocol (SNMP) that is implemented in the Junos OS software.

**NOTE:** By default, SNMP is not enabled on devices running Junos OS. For information on enabling SNMP on a device running Junos OS, see [“Configuring SNMP” on page 1848](#).

A typical SNMP implementation includes the following components:

- **Network management system (NMS)**—The NMS is a combination of hardware and software that is used to monitor and administer a network. Software running on the NMS includes the SNMP manager, which collects information about network connectivity, activity, and events by polling the managed devices.
- **Managed device**—A managed device (also called a network element) is any device managed by the NMS. Routers and switches are common examples of managed

devices. The SNMP agent is the SNMP process that resides on the managed device and communicates with the NMS.

- **SNMP agent**—The SNMP agent exchanges network management information with SNMP manager software running on an NMS, or host. The agent responds to requests for information and actions from the manager. The agent also controls access to the agent's MIB, the collection of objects that can be viewed or changed by the SNMP manager.

SNMP data is stored in a highly structured, hierarchical format known as a management information base (MIB). The MIB structure is based on a tree structure, which defines a grouping of objects into related sets. Each object in the MIB is associated with an object identifier (OID), which names the object. The “leaf” in the tree structure is the actual managed object instance, which represents a resource, event, or activity that occurs in your network device. The SNMP implementation in Junos OS uses both standard (developed by IETF and documented in RFCs) and Juniper Networks enterprise-specific MIBs.

Communication between the agent and the manager occurs in one of the following forms:

- **Get, GetBulk, and GetNext** requests—The manager requests information from the agent; the agent returns the information in a **Get** response message.
- **Set** requests—The manager changes the value of a MIB object controlled by the agent; the agent indicates status in a **Set** response message.
- **Traps** notification—The agent sends traps to notify the manager of significant events that occur on the network device.

The processes maintaining the SNMP management data include:

- A master SNMP agent (known as SNMP process, or `snmpd`) that resides on the managed device and is managed by the NMS or host.
- Various subagents that reside on different modules of Junos OS, such as the Routing Engine, and are managed by the master SNMP agent.
- Junos OS processes that share data with the subagents when polled for SNMP data (for example, interface-related MIBs).

When an NMS polls the master agent for data, the master agent immediately shares the data with the NMS if the requested data is available from the master agent or one of the subagents. However, if the requested data is not maintained by the master agent or subagents, the subagent polls the Junos OS kernel or the process that maintains that data. The Junos OS kernel may need to get the data from the Packet Forwarding Engine. On receiving the required data, the subagent passes the response back on to the master agent, which in turn passes it on to the NMS.

[Figure 246 on page 6597](#) shows the communication flow among the NMS, SNMP master agent (`snmpd`), SNMP subagents, Junos OS kernel, and Packet Forwarding Engine.

Figure 246: SNMP Communication Flow

When a significant event, most often an error or a failure, occurs on a network device, the SNMP agent sends notifications to the SNMP manager. SNMP notifications can be sent as traps (unconfirmed notifications) or inform requests (confirmed notifications).

Junos OS supports trap queuing to ensure that traps are not lost because of temporary unavailability of routes. Two types of queues, destination queues and a throttle queue, are formed to ensure delivery of traps and control the trap traffic. On QFX Series products, the maximum size of trap queues (throttle queue plus destination queue) is 40,960 traps. The maximum size of any one queue is 20,480 traps.

Junos OS forms a destination queue when a trap to a particular destination is returned because the host is not reachable, and it adds the subsequent traps to the same destination to the queue. Junos OS checks for availability of routes every 30 seconds, and sends the traps from the destination queue in a round-robin fashion.

If the trap delivery fails, the trap is added back to the queue, and the delivery attempt counter and the next delivery attempt timer for the queue are reset. Subsequent attempts occur at progressive intervals of 1 minute, 2 minutes, 4 minutes, and 8 minutes. The maximum delay between the attempts is 8 minutes, and the maximum number of attempts is ten. After ten unsuccessful attempts, the destination queue and all the traps in the queue are deleted.

Junos OS also has a throttle mechanism to control the number of traps (throttle threshold) sent during a particular time period (throttle interval). The throttle mechanism ensures consistency in trap traffic, especially when large numbers of traps are generated because of interface status changes. The throttle interval period begins when the first trap arrives at the throttle. All traps within the trap threshold are processed, and the traps beyond the threshold limit are queued. The default throttle threshold is 500 traps, and the throttle interval default is 5 seconds.

**NOTE:** You cannot configure trap queueing in Junos OS. You cannot view information about trap queues except for what is provided in the system logs.

## Understanding the Implementation of SNMP on the QFabric System

SNMP monitors network devices from a central location. The QFabric system supports the basic SNMP architecture of Junos OS, but its implementation of SNMP differs from that of other devices running Junos OS. This topic provides an overview of the SNMP implementation on the QFabric system.

As in other SNMP systems, the SNMP manager resides on the network management system (NMS) of the network to which the QFabric system belongs. The SNMP agent resides in the QFabric Director software and is responsible for receiving and distributing all traps as well as responding to all the queries of the SNMP manager. For example, traps that are generated by a Node device are sent to the SNMP agent in the Director software, which in turn processes and sends them to the target IP addresses that are defined in the SNMP configuration.

**NOTE:** In its SNMP implementation, the QFabric system acts as an SNMP proxy server, and requires more time to process SNMP requests than a typical Junos OS device does. The default timeout setting on most SNMP client applications is 3 seconds, which is not enough time for the QFabric system to respond to SNMP requests, so the results of your `mibwalk` command may be incomplete. For this reason, we recommend that you change the SNMP timeout setting to 5 seconds or longer for the QFabric system to complete the responses to your requests.

Support for SNMP on the QFabric system includes:

- Support for the SNMP Version 1 (v1) and v2.

**NOTE:** Only SNMPv2 traps are supported on the QFabric system.

- Support for the following standard MIBs:
  - RFC 1155, *Structure and Identification of Management Information for TCP/IP-based Internets*
  - RFC 1157, *A Simple Network Management Protocol (SNMP)*
  - RFC 1212, *Concise MIB Definitions*
  - RFC 1213, *Management Information Base for Network Management of TCP/IP-Based Internets: MIB-II* (partial support, including the system group and interfaces group)
  - RFC 1215, *A Convention for Defining Traps for use with the SNMP*
  - RFC 1901, *Introduction to Community-based SNMPv2*
  - RFC 1905, *Protocol Operations for Version 2 of the Simple Network Management Protocol (SNMPv2)*

- RFC 1907, *Management Information Base for Version 2 of the Simple Network Management Protocol (SNMPv2)*
- RFC 2011, *SNMPv2 Management Information Base for the Internet Protocol Using SMIv2*
- RFC 2012, *SNMPv2 Management Information Base for the Transmission Control Protocol Using SMIv2*
- RFC 2013, *SNMPv2 Management Information Base for the User Datagram Protocol Using SMIv2*
- RFC 2233, *The Interfaces Group MIB Using SMIv2*
- RFC 2571, *An Architecture for Describing SNMP Management Frameworks* (read-only access) (excluding SNMPv3)
- RFC 2572, *Message Processing and Dispatching for the Simple Network Management Protocol (SNMP)* (read-only access) (excluding SNMPv3)
- RFC 2576, *Coexistence between Version 1, Version 2, and Version 3 of the Internet-standard Network Management Framework* (excluding SNMPv3)
- RFC 2578, *Structure of Management Information Version 2 (SMIv2)*
- RFC 2579, *Textual Conventions for SMIv2*
- RFC 2580, *Conformance Statements for SMIv2*
- RFC 2665, *Definitions of Managed Objects for the Ethernet-like Interface Types*
- RFC 2863, *The Interfaces Group MIB*
- RFC 3410, *Introduction and Applicability Statements for Internet Standard Management Framework* (excluding SNMPv3)
- RFC 3411, *An Architecture for Describing Simple Network Management Protocol (SNMP) Management Framework* (excluding SNMPv3)
- RFC 3412, *Message Processing and Dispatching for the Simple Network Management Protocol (SNMP)* (excluding SNMPv3)
- RFC 3413, *Simple Network Management Protocol (SNMP) Applications* (excluding SNMPv3)
- RFC 3416, *Version 2 of the Protocol Operations for the Simple Network Management Protocol (SNMP)*
- RFC 3417, *Transport Mappings for the Simple Network Management Protocol (SNMP)*
- RFC 3418, *Management Information Base (MIB) for the Simple Network Management Protocol (SNMP)*
- RFC 3584, *Coexistence between Version 1, Version 2, and Version 3 of the Internet-standard Network Management Framework* (excluding SNMPv3)
- RFC 4188, *Definitions of Managed Objects for Bridges*
- RFC 4293, *Management Information Base for the Internet Protocol (IP)*
- RFC 4363b, *Q-Bridge VLAN MIB*

- Support for the following Juniper Networks enterprise-specific MIBs:
  - Chassis MIB (mib-jnx-chassis.txt)
  - Class-of-Service MIB (mib-jnx-cos.txt)
  - Configuration Management MIB (mib-jnx-cfgmgmt.txt)
  - Fabric Chassis MIB (mib-jnx-fabric-chassis.txt)
  - Interface MIB Extensions (mib-jnx-if-extensions.txt)
  - Power Supply Unit MIB (mib-jnx-power-supply-unit.txt)
  - QFabric MIB (mib-jnx-ql-smi.txt)
  - Utility MIB (mib-jnx-util.txt)
- Support for operational mode commands—Limited to the **show snmp statistics** command. You may issue other SNMP requests, including **get**, **get next**, and **walk** requests, by using external SNMP client applications.

## Fabric Chassis MIB

The Juniper Networks enterprise-specific SNMP Fabric Chassis MIB (mib-jnx-fabric-chassis) provides hardware information about the QFabric system and its component devices in a single MIB. The Fabric Chassis MIB is based on the Juniper Networks enterprise-specific Chassis MIB that provides information for individual devices. Unlike the Chassis MIB, the Fabric Chassis MIB represents the QFabric system component devices as part of the QFabric system. Only the information from the Fabric Chassis MIB (and not from individual Chassis MIBs) is available to SNMP management clients of the QFabric system.

The Fabric Chassis MIB uses the basic information structure of the Chassis MIB, but adds another level of indexing that provides detailed information about QFabric system devices. Each physical device in a QFabric system (such as a Node device or an Interconnect device) is represented with its hardware components, including the power supply, fans, and front and rear cards.

As in other SNMP systems, the SNMP manager resides on the network management system (NMS) of the network to which the QFabric system belongs. The SNMP agent (snmpd) resides in the QFabric system Director software and is responsible for receiving and distributing all traps as well as responding to all queries from the SNMP manager. In addition, there is an SNMP subagent running in the Routing Engine of each Node group and Interconnect device. The SNMP subagent manages the information about the component device, and that information is communicated to the SNMP agent in the Director software as needed. Traps that are generated by a Node device are sent to the SNMP agent in the Director software, which in turn processes and sends them to the target IP addresses that are defined in the SNMP configuration.

Table 587 on page 6601 describes the tables and objects in the Fabric Chassis MIB.

**Table 587: Fabric Chassis MIB Tables and Objects**

| Table or Object Name                               | Root OID                    | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Utility MIB

The Juniper Networks enterprise-specific Utility MIB, whose object ID is {jnxUtilMibRoot 1}, defines objects for counters, integers, and strings. The Utility MIB contains one table for each of the following five data types:

- 32-bit counters
- 64-bit counters
- Signed integers
- Unsigned integers
- Octet strings

Each data type has an arbitrary ASCII name, which is defined when the data is populated, and a timestamp that shows the last time when the data instance was modified. For a downloadable version of this MIB, see

[http://www.juniper.net/techpubs/en\\_US/junos14.1/topics/reference/mibs/mib-jnx-util.txt](http://www.juniper.net/techpubs/en_US/junos14.1/topics/reference/mibs/mib-jnx-util.txt).

## SNMPv3 Overview

The QFX3500 switch supports SNMP version 3 (SNMPv3). SNMPv3 enhances the functionality of SNMPv1 and SNMPv2c by supporting user authentication and data encryption. SNMPv3 uses the user-based security model (USM) to provide security for SNMP messages, and the view-based access control model (VACM) for user access control.

SNMPv3 features include:

- With USM, the SNMP messages between the SNMP manager and the agent can have the message source authenticated and the data integrity checked. USM reduces messaging delays and message replays by enforcing timeout limits and by checking for duplicate message request IDs.
- VACM complements USM by providing user access control for SNMP queries to the agent. You define access privileges that you wish to extend to a group of one or more users. Access privileges are determined by the security model parameters (**usm**, **v1**, or **v2**) and security level parameters (**authentication**, **privacy**, or **none**). For each security level, you must associate one MIB view for the group. Associating a MIB view with a group grants the read, write, or notify permission to a set of MIB objects for the group.
- You configure security parameters for each user, including the username, authentication type and authentication password, and privacy type and privacy password. The username given to each user is in a format that is dependent on the security model configured for that user.
- To ensure messaging security, another type of username, called the security name, is included in the messaging data that is sent between the local SNMP server and the destination SNMP server. Each user name is mapped to a security name, but the security name is in a format that is independent of the security model.
- Trap entries in SNMPv3 are created by configuring the notify, notify filter, target address, and target parameters. The **notify** statement specifies the type of notification (trap) and contains a single tag that defines a set of target addresses to receive a trap. The notify filter defines access to a collection of trap object identifiers (OIDs). The target address defines the address of an SNMP management application and other attributes used in sending notifications. Target parameters define the message processing and security parameters used in sending notifications to a particular target.

## Minimum SNMPv3 Configuration on a Device Running Junos OS

To configure the minimum requirements for SNMPv3, include the following statements at the `[edit snmp v3]` and `[edit snmp]` hierarchy levels:

**NOTE:** You must configure at least one view (notify, read, or write) at the `[edit snmp view-name]` hierarchy level.

```
[edit snmp]
view view-name {
  oid object-identifier (include | exclude);
}
[edit snmp v3]
notify name {
  tag tag-name;
}
notify-filter profile-name {
  oid object-identifier (include | exclude);
}
snmp-community community-index {
  security-name security-name;
}
target-address target-address-name {
  address address;
  target-parameters target-parameters-name;
}
target-parameters target-parameters-name {
  notify-filter profile-name;
  parameters {
    message-processing-model (v1 | v2c | v3);
    security-level (authentication | none | privacy);
    security-model (usm | v1 | v2c);
    security-name security-name;
  }
}
usm {
  local-engine {
    user username {
    }
  }
}
vacm {
  access {
    group group-name {
      (default-context-prefix | context-prefix context-prefix){
        security-model (any | usm | v1 | v2c) {
          security-level (authentication | none | privacy) {
            notify-view view-name;
            read-view view-name;
            write-view view-name;
          }
        }
      }
    }
  }
}
```

```

    }
  }
  security-to-group {
    security-model (usm | v1 | v2c) {
      security-name security-name {
        group group-name;
      }
    }
  }
}

```

## Understanding RMON

- [RMON Overview on page 6607](#)
- [Alarm Thresholds and Events on page 6608](#)

### RMON Overview

The Junos OS supports the *Remote Network Monitoring* (RMON) MIB (RFC 2819), which allows a management device to monitor the values of MIB objects, or variables, against configured thresholds. When the value of a variable crosses a threshold, an alarm and its corresponding event are generated. The event can be logged and can generate an SNMP trap.

An operational support system (OSS) or a fault-monitoring system can be used to automatically monitor events that track many different metrics, including performance, availability, faults, and environmental data. For example, an administrator might want to know when the internal temperature of a chassis has risen above a configured threshold, which might indicate that a chassis fan tray is faulty, the chassis air flow is impeded, or the facility cooling system in the vicinity of the chassis is not operating normally.

The RMON MIB also defines tables that store various statistics for Ethernet interfaces, including the **etherStatsTable** and the **etherHistoryTable**. The **etherStatsTable** contains cumulative real-time statistics for Ethernet interfaces, such as the number of unicast, multicast, and broadcast packets received on an interface. The **etherHistoryTable** maintains a historical sample of statistics for Ethernet interfaces. The control of the **etherHistoryTable**, including the interfaces to track and the sampling interval, is defined by the RMON **historyControlTable**.

To enable RMON alarms, you perform the following steps:

1. Configure SNMP, including trap groups. You configure SNMP at the `[edit snmp]` hierarchy level.
2. Configure rising and falling events in the `eventTable`, including the event types and trap groups. You can also configure events using the CLI at the `[edit snmp rmon event]` hierarchy level.
3. Configure alarms in the `alarmTable`, including the variables to monitor, rising and falling thresholds, the sampling types and intervals, and the corresponding events to generate when alarms occur. You can also configure alarms using the CLI at the `[edit snmp rmon alarm]` hierarchy level.

Extensions to the `alarmTable` are defined in the Juniper Networks enterprise-specific MIB `jnxRmon` (`mib-jnx-rmon.txt`).

### Alarm Thresholds and Events

By setting a rising and a falling threshold for a monitored variable, you can be alerted whenever the value of the variable falls outside the allowable operational range (see [Figure 247 on page 6608](#)).

Figure 247: Setting Thresholds

Events are only generated when the alarm threshold is first crossed in any one direction rather than after each sample interval. For example, if a rising threshold alarm, along with its corresponding event, is raised, no more threshold crossing events occur until a corresponding falling alarm occurs. This considerably reduces the quantity of events that are produced by the system, making it easier for operations staff to react when events do occur.

Before you configure remote monitoring, you should identify what variables need to be monitored and their allowable operational range. This requires some period of baselining to determine the allowable operational ranges. An initial baseline period of at least

3 months is not unusual when you first identify the operational ranges and define thresholds, but baseline monitoring should continue over the life span of each monitored variable.

## RMON MIB Event, Alarm, Log, and History Control Tables

The Junos OS supports the *Remote Network Monitoring* (RMON) MIB (RFC 2819), which allows a management device to monitor the values of MIB objects, or variables, against configured thresholds. When the value of a variable crosses a threshold, an alarm and its corresponding event are generated. The event can be logged and can generate an SNMP trap.

[Table 589 on page 6609](#) provides each field in the RMON eventTable, the description of the field, and the corresponding Junos OS statement that you can use to configure the field. The Junos OS statements reside at the `[edit snmp rmon]` hierarchy level.

**Table 589: RMON Event Table**

| Field            | Description                                                                                                                     | Statement [edit snmp rmon] |
|------------------|---------------------------------------------------------------------------------------------------------------------------------|----------------------------|
| eventDescription | Text description of this event.                                                                                                 | <b>description</b>         |
| eventType        | Type of event (for example, log, trap, or log and trap).                                                                        | <b>type</b>                |
| eventCommunity   | Trap group to which to send this event, as defined in the Junos OS configuration. (This is not the same as the SNMP community.) | <b>community</b>           |
| eventOwner       | Entity (for example, manager) that created this event.                                                                          | —                          |
| eventStatus      | Status of this row (for example, valid, invalid, or createRequest).                                                             | —                          |

[Table 590 on page 6609](#) provides each field in the RMON alarmTable, the description of the field, and the corresponding Junos OS statement that you can use to configure the field. The Junos OS statements reside at the `[edit snmp rmon]` hierarchy level.

**Table 590: RMON Alarm Table**

| Field         | Description                                                          | Statement [edit snmp rmon] |
|---------------|----------------------------------------------------------------------|----------------------------|
| alarmStatus   | Status of this row (for example, valid, invalid, or createRequest)   | —                          |
| alarmInterval | Sampling period (in seconds) of the monitored variable               | <b>interval</b>            |
| alarmVariable | Object identifier (OID) and instance of the variable to be monitored | —                          |

Table 590: RMON Alarm Table (*continued*)

| Field                  | Description                                          | Statement [edit snmp rmon] |
|------------------------|------------------------------------------------------|----------------------------|
| alarmValue             | Actual value of the sampled variable                 | —                          |
| alarmSampleType        | Sample type (absolute or delta changes)              | <b>sample-type</b>         |
| alarmStartupAlarm      | Initial alarm (rising, falling, or either)           | <b>startup-alarm</b>       |
| alarmRisingThreshold   | Rising threshold against which to compare the value  | <b>rising-threshold</b>    |
| alarmFallingThreshold  | Falling threshold against which to compare the value | <b>falling-threshold</b>   |
| alarmRisingEventIndex  | Index (row) of the rising event in the event table   | <b>rising-event-index</b>  |
| alarmFallingEventIndex | Index (row) of the falling event in the event table  | <b>falling-event-index</b> |

Table 591 on page 6610 provides each field in the jnxRmon jnxRmonAlarmTable, which is an extension to the RMON alarmTable. You can troubleshoot the RMON agent, rmopd, that runs on a switch by inspecting the contents of the jnxRmonAlarmTable object.

Table 591: jnxRmon Alarm Table

| Field                     | Description                                                                |
|---------------------------|----------------------------------------------------------------------------|
| jnxRmonAlarmGetFailCnt    | Number of times the internal <b>Get</b> request for the variable failed    |
| jnxRmonAlarmGetFailTime   | Value of the sysUpTime object when the last failure occurred               |
| jnxRmonAlarmGetFailReason | Reason why the <b>Get</b> request failed                                   |
| jnxRmonAlarmGetOkTime     | Value of the sysUpTime object when the variable moved out of failure state |
| jnxRmonAlarmState         | Status of this alarm entry                                                 |

Table 592 on page 6610 provides each field in the RMON historyControlTable, the description of the field, and the corresponding Junos OS statement that you can use to configure the field. The Junos OS statements reside at the [edit snmp rmon history] hierarchy level. The historyControlTable controls the RMON etherHistoryTable.

Table 592: RMON History Control Table

| Field                    | Description                                                                | Statement [edit snmp rmon history] |
|--------------------------|----------------------------------------------------------------------------|------------------------------------|
| historyControlDataSource | Identifies the source of the data for which historical data was collected. | <b>interface</b>                   |

Table 592: RMON History Control Table (*continued*)

| Field                          | Description                                                                 | Statement [edit snmp rmon history] |
|--------------------------------|-----------------------------------------------------------------------------|------------------------------------|
| historyControlBucketsRequested | Requested number of discrete time intervals over which data is to be saved. | <b>bucket-size</b>                 |
| historyControlBucketsGranted   | Number of discrete sampling intervals over which data is to be saved.       | —                                  |
| historyControlInterval         | Interval, in seconds, over which the data is sampled for each bucket.       | <b>interval</b>                    |
| historyControlOwner            | Entity that configured this entry.                                          | <b>owner</b>                       |
| historyControlStatus           | Status of this entry.                                                       | —                                  |

## Understanding Health Monitoring

Health monitoring is an SNMP feature that extends the RMON alarm infrastructure to provide monitoring for a predefined set of objects (such as file system usage, CPU usage, and memory usage), and for Junos OS processes.

You enable the health monitor feature using the **health-monitor** statement at the **[edit snmp]** hierarchy level. You can also configure health monitor parameters such as a falling threshold, rising threshold, and interval. If the value of a monitored object exceeds the rising or falling threshold, an alarm is triggered and an event may be logged.

The falling threshold is the lower threshold for the monitored object instance. The rising threshold is the upper threshold for the monitored object instance. Each threshold is expressed as a percentage of the maximum possible value. The interval represents the period of time, in seconds, over which the object instance is sampled and compared with the rising and falling thresholds.

Events are only generated when a threshold is first crossed in any one direction, rather than after each sample interval. For example, if a rising threshold alarm, along with its corresponding event, is raised, no more threshold crossing events occur until a corresponding falling alarm occurs.

System log entries for health monitor events have a corresponding HEALTHMONITOR tag and not a generic SNMPD\_RMON\_EVENTLOG tag. However, the health monitor sends generic RMON risingThreshold and fallingThreshold traps. You can use the **show snmp health-monitor** operational command to view information about health monitor alarms and logs.

When you configure the health monitor, monitoring information for certain object instances is available, as shown in [Table 593 on page 6612](#).

**Table 593: Monitored Object Instances**

| Object                    | Description                                                                                                                                         |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| jnxHrStoragePercentUsed.1 | Monitors the <b>/dev/ad0s1a:</b> file system on the switch. This is the root file system mounted on <b>/</b> .                                      |
| jnxHrStoragePercentUsed.2 | Monitors the <b>/dev/ad0s1e:</b> file system on the switch. This is the configuration file system mounted on <b>/config</b> .                       |
| jnxOperatingCPU (RE0)     | Monitors CPU usage by the Routing Engine (RE0).                                                                                                     |
| jnxOperatingBuffer (RE0)  | Monitors the amount of memory available on the Routing Engine (RE0).                                                                                |
| sysApplElmtRunCPU         | Monitors the CPU usage for each Junos OS process (also called daemon). Multiple instances of the same process are monitored and indexed separately. |
| sysApplElmtRunMemory      | Monitors the memory usage for each Junos OS process. Multiple instances of the same process are monitored and indexed separately.                   |

## SNMP MIBs Support

The QFX Series standalone switches, QFX Series Virtual Chassis, and QFabric systems support standard MIBs and Juniper Networks enterprise-specific MIBs.

For more information, see:

- [MIBs Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis on page 6612](#)
- [MIBs Supported on QFabric Systems on page 6621](#)

### MIBs Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis

The QFX Series standalone switches and QFX Series Virtual Chassis support both standard MIBs and Juniper Networks enterprise-specific MIBs. For more information, see:

- [Table 594 on page 6613](#) for standard MIBs.
- [Table 595 on page 6618](#) for Juniper Networks enterprise-specific MIBs.

| RFC 2933, <i>Internet Group Management Protocol (IGMP) MIB</i>                                                                 | —                                                                                                           |
| RFC 2934, <i>Protocol Independent Multicast MIB for IPv4</i>                                                                   | In Junos OS, RFC 2934 is implemented based on a draft version, <i>pimmib.mib</i> , of the now standard RFC. |
| RFC 3410, <i>Introduction and Applicability Statements for Internet Standard Management Framework</i>                          | —                                                                                                           |
| RFC 3411, <i>An Architecture for Describing Simple Network Management Protocol (SNMP) Management Frameworks</i>                | <b>NOTE:</b> RFC 3411 replaces RFC 2571. However, Junos OS supports both RFC 3411 and RFC 2571.             |
| RFC 3412, <i>Message Processing and Dispatching for the Simple Network Management Protocol (SNMP)</i>                          | <b>NOTE:</b> RFC 3412 replaces RFC 2572. However, Junos OS supports both RFC 3412 and RFC 2572.             |
| RFC 3413, <i>Simple Network Management Protocol (SNMP) Applications</i>                                                        | All MIBs are supported except for the Proxy MIB.                                                            |
| RFC 3414, <i>User-based Security Model (USM) for version 3 of the Simple Network Management Protocol (SNMPv3)</i>              | —                                                                                                           |
| RFC 3415, <i>View-based Access Control Model (VACM) for the Simple Network Management Protocol (SNMP)</i>                      | —                                                                                                           |
| RFC 3416, <i>Version 2 of the Protocol Operations for the Simple Network Management Protocol (SNMP)</i>                        | <b>NOTE:</b> RFC 3416 replaces RFC 1905, which was supported in earlier versions of Junos OS.               |
| RFC 3417, <i>Transport Mappings for the Simple Network Management Protocol (SNMP)</i>                                          | —                                                                                                           |
| RFC 3418, <i>Management Information Base (MIB) for the Simple Network Management Protocol (SNMP)</i>                           | <b>NOTE:</b> RFC 3418 replaces RFC 1907, which was supported in earlier versions of Junos OS.               |
| RFC 3584, <i>Coexistence between Version 1, Version 2, and Version 3 of the Internet-standard Network Management Framework</i> | —                                                                                                           |
| RFC 3826, <i>The Advanced Encryption Standard (AES) Cipher Algorithm in the SNMP User-based Security Model</i>                 | —                                                                                                           |

Table 594: Standard MIBs Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis (*continued*)

| RFC                                                                                                                                                                  | Additional Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RFC 4188, <i>Definitions of Managed Objects for Bridges</i>                                                                                                          | <p>The QFX3500 and QFX3600 switches support 802.1D STP (1998) and the following subtrees and objects only:</p> <ul style="list-style-type: none"> <li>• dot1dTp subtree—dot1dTpFdbAddress, dot1dTpFdbPort, and dot1dTpFdbStatus objects from the dot1dTpFdbTable table.</li> <li>• dot1dBase subtree—dot1dBasePort and dot1dBasePortIfIndex objects from the dot1dBasePortTable table.</li> </ul> <p><b>NOTE:</b> On QFX3500 and QFX3600 switches, the dot1dTpFdbTable table is populated only with MAC addresses learned on the default VLAN. To see the MAC addresses of all VLANs, specify the dot1qTpFdbTable table (RFC 4363b, <i>Q-Bridge VLAN MIB</i>) when you issue the <b>show snmp mib walk</b> command.</p> |
| RFC 4293, <i>Management Information Base for the Internet Protocol (IP)</i>                                                                                          | Supports the ipAddrTable table only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| RFC 4318, <i>Definitions of Managed Objects for Bridges with Rapid Spanning Tree Protocol</i>                                                                        | Supports 802.1w and 802.1t extensions for RSTP.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

**Table 595: Juniper Networks Enterprise-Specific MIBs Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis**

| MIB                                                             | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Alarm MIB (mib-jnx-chassis-alarm)                               | <p>Provides support for alarms from the switch.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-chassis-alarm.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-chassis-alarm.txt</a>.</p> <p>For more information, see <i>Alarm MIB</i>.</p>                                                                                                                                                                                                                                                             |
| Analyzer MIB (mib-jnx-analyzer)                                 | <p>Contains analyzer and remote analyzer data related to port mirroring.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-analyzer.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-analyzer.txt</a>.</p> <p>For more information, see <i>Analyzer MIB</i>.</p>                                                                                                                                                                                                                                           |
| Chassis MIB (mib-jnx-chassis)                                   | <p>Provides support for environmental monitoring (power supply state, board voltages, fans, temperatures, and airflow) and inventory support for the chassis, Flexible PIC Concentrators (FPCs), and PICs.</p> <p><b>NOTE:</b> The jnxLEDTable table has been deprecated.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-chassis.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-chassis.txt</a>.</p> <p>For more information, see <i>Chassis MIBs</i>.</p>                                            |
| Chassis Definitions for Router Model MIB (mib-jnx-chas-defines) | <p>Contains the object identifiers (OIDs) that are used by the Chassis MIB to identify routing and switching platforms and chassis components. The Chassis MIB provides information that changes often, whereas the Chassis Definitions for Router Model MIB provides information that changes less often.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-chas-defines.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-chas-defines.txt</a>.</p> <p>For more information, see <i>Chassis MIBs</i>.</p> |
| Class-of-Service MIB (mib-jnx-cos)                              | <p>Provides support for monitoring interface output queue statistics per interface and per forwarding class.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-cos.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-cos.txt</a>.</p> <p>For more information, see <i>Class-of-Service MIB</i>.</p>                                                                                                                                                                                                         |

**Table 595: Juniper Networks Enterprise-Specific MIBs Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis (*continued*)**

| MIB                                            | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Configuration Management MIB (mib-jnx-cfgmgmt) | <p>Provides notification for configuration changes and rescue configuration changes in the form of SNMP traps. Each trap contains the time at which the configuration change was committed, the name of the user who made the change, and the method by which the change was made.</p> <p>A history of the last 32 configuration changes is kept in jnxCmChgEventTable.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-cfgmgmt.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-cfgmgmt.txt</a>.</p> <p>For more information, see <i>Configuration Management MIB</i>.</p>                                                   |
| Ethernet MAC MIB (mib-jnx-mac)                 | <p>Monitors media access control (MAC) statistics on Gigabit Ethernet intelligent queuing (IQ) interfaces. It collects MAC statistics; for example, inoctets, inframes, outoctets, and outframes on each source MAC address and virtual LAN (VLAN) ID for each Ethernet port.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-mac.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-mac.txt</a>.</p> <p>For more information, see <i>Ethernet MAC MIB</i>.</p>                                                                                                                                                                 |
| Event MIB (mib-jnx-event)                      | <p>Defines a generic trap that can be generated using an operations script or event policy. This MIB provides the ability to specify a system log string and raise a trap if that system log string is found.</p> <p>In Junos OS release 13.2X51-D10 or later, if you configured an event policy to raise a trap when a new SNMP trap target is added, the SNMPD_TRAP_TARGET_ADD_NOTICE trap is generated with information about the new target.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-event.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-event.txt</a>.</p> <p>For more information, see <i>Event MIB</i>.</p> |
| Firewall MIB (mib-jnx-firewall)                | <p>Provides support for monitoring firewall filter counters.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-firewall.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-firewall.txt</a>.</p> <p>For more information, see <i>Firewall MIB</i>.</p>                                                                                                                                                                                                                                                                                                                                                                            |

**Table 595: Juniper Networks Enterprise-Specific MIBs Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis (*continued*)**

| MIB                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Host Resources MIB<br>(mib-jnx-hostresources)         | <p>Extends the hrStorageTable object, providing a measure of the usage of each file system on the switch as a percentage. Previously, the objects in the hrStorageTable measured the usage in allocation units—hrStorageUsed and hrStorageAllocationUnits—only. Using the percentage measurement, you can more easily monitor and apply thresholds on usage.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-hostresources.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-hostresources.txt</a>.</p> <p>For more information, see <i>Host Resources MIB</i>.</p> |
| Interface MIB (Extensions)<br>(mib-jnx-if-extensions) | <p>Extends the standard ifTable (RFC 2863) with additional statistics and Juniper Networks enterprise-specific chassis information in the ifJnxTable and ifChassisTable tables.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-if-extensions.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-if-extensions.txt</a>.</p> <p>For more information, see <i>Interface MIB</i>.</p>                                                                                                                                                                                   |
| MPLS MIB (mib-jnx-mpls)                               | <p>Provides MPLS information and defines MPLS notifications.</p> <p><b>NOTE:</b> This MIB is not supported on the QFX5100 switch.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-mpls.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-mpls.txt</a>.</p> <p>For more information, see <i>MPLS MIB</i>.</p>                                                                                                                                                                                                                                                        |
| MPLS LDP MIB (mib-jnx-mpls-ldp)                       | <p>Contains object definitions as described in RFC 3815, <i>Definitions of Managed Objects for the Multiprotocol Label Switching (MPLS), Label Distribution Protocol (LDP)</i>.</p> <p><b>NOTE:</b> This MIB is not supported on the QFX5100 switch.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-mpls-ldp.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-mpls-ldp.txt</a>.</p> <p>For more information, see <i>MPLS LDP MIB</i>.</p>                                                                                                                         |
| Ping MIB (mib-jnx-ping)                               | <p>Extends the standard Ping MIB control table (RFC 2925). Items in this MIB are created when entries are created in pingCtlTable of the Ping MIB. Each item is indexed exactly as it is in the Ping MIB.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-ping.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-ping.txt</a>.</p> <p>For more information, see <i>PING MIB</i>.</p>                                                                                                                                                                                |

**Table 595: Juniper Networks Enterprise-Specific MIBs Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis (*continued*)**

| MIB                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RMON Events and Alarms MIB (mib-jnx-rmon)             | <p>Supports Junos OS extensions to the standard Remote Monitoring (RMON) Events and Alarms MIB (RFC 2819). The extension augments the alarmTable object with additional information about each alarm. Two additional traps are also defined to indicate when problems are encountered with an alarm.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-rmon.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-rmon.txt</a>.</p> <p>For more information, see <i>RMON Events and Alarms MIB</i>.</p>                                       |
| Structure of Management Information MIB (mib-jnx-smi) | <p>Explains how the Juniper Networks enterprise-specific MIBs are structured.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-smi.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-smi.txt</a>.</p> <p>For more information, see <i>Structure of Management Information MIB</i>.</p>                                                                                                                                                                                                                                                   |
| System Log MIB (mib-jnx-syslog)                       | <p>Enables notification of an SNMP trap-based application when an important system log message occurs.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-syslog.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-syslog.txt</a>.</p> <p>For more information, see <i>System Log MIB</i>.</p>                                                                                                                                                                                                                                             |
| Utility MIB (mib-jnx-util)                            | <p>Provides you with SNMP MIB container objects of the following types: 32-bit counters, 64-bit counters, signed integers, unsigned integers, and octet strings. You can use these objects to store data that can be retrieved using other SNMP operations.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-util.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-util.txt</a>.</p> <p>For more information, see “Utility MIB” on page 6604 and “Using the Enterprise-Specific Utility MIB to Enhance SNMP Coverage” on page 6888.</p> |
| VLAN MIB (mib-jnx-vlan)                               | <p>Contains information about prestandard IEEE 802.10 VLANs and their association with LAN emulation clients.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-vlan.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-vlan.txt</a>.</p> <p>For more information, see <i>VLAN MIB</i>.</p>                                                                                                                                                                                                                                                |

### MIBs Supported on QFabric Systems

The QFabric systems support both standard MIBs and Juniper Networks enterprise-specific MIBs. For more information, see:

- [Table 596 on page 6622](#) for standard MIBs.
- [Table 597 on page 6625](#) for Juniper Networks enterprise-specific MIBs.

**Table 596: Standard MIBs Supported on QFabric Systems**

| RFC                                                                                                           | Additional Information                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RFC 1155, <i>Structure and Identification of Management Information for TCP/IP-based Internets</i>            | —                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| RFC 1157, <i>A Simple Network Management Protocol (SNMP)</i>                                                  | —                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Class-of-Service MIB (mib-jnx-cos)             | <p>Provides support for monitoring interface output queue statistics per interface and per forwarding class.</p> <p>The QFabric system supports the following tables and objects:</p> <ul style="list-style-type: none"> <li>• Jnxcosifstatflagtable—jnxCosIfstatFlags and jnxCosIfIndex.</li> <li>• Jnxcosqstattable—jnxCosQstatTxedPkts, jnxCosQstatTxedPktRate, jnxCosQstatTxedBytes, and jnxCosQstatTxedByteRate.</li> <li>• Jnxcosfcidtable—jnxCosFcIdToFcName.</li> <li>• Jnxcosfctable—jnxCosFcQueueNr.</li> </ul> <p>The QFabric system does not support any traps for this MIB.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-cos.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-cos.txt</a>.</p> <p>For more information, see <i>Class-of-Service MIB</i>.</p>                                                                                                                                                                                                                                                                |
| Configuration Management MIB (mib-jnx-cfgmgmt) | <p>Provides notification for configuration changes and rescue configuration changes in the form of SNMP traps. Each trap contains the time at which the configuration change was committed, the name of the user who made the change, and the method by which the change was made.</p> <p>A history of the last 32 configuration changes is kept in jnxCmChgEventTable.</p> <p><b>NOTE:</b> On the QFabric system, these conditions apply:</p> <ul style="list-style-type: none"> <li>• All scalar variables under the jnxCmCfgChg table are supported.</li> <li>• Supported scalar OIDs are jnxCmCfgChgLatestIndex, jnxCmCfgChgLatestTime, jnxCmCfgChgLatestDate, jnxCmCfgChgLatestSource, jnxCmCfgChgLatestUser, and jnxCmCfgChgMaxEventEntries.</li> <li>• Scalar variables under the jnxCmRescueChg table are not supported.</li> </ul> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-cfgmgmt.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-cfgmgmt.txt</a>.</p> <p>For more information, see <i>Configuration Management MIB</i>.</p> |
| Fabric Chassis MIB (mib-jnx-fabric-chassis)    | <p>Provides hardware information about the QFabric system and its component devices. This MIB is based on the Juniper Networks enterprise-specific Chassis MIB but adds another level of indexing that provides information for QFabric system component devices.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-fabric-chassis.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-fabric-chassis.txt</a>.</p> <p>For more information, see “Fabric Chassis MIB” on page 6600.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

**Table 597: Juniper Networks Enterprise-Specific MIBs Supported on QFabric Systems (*continued*)**

| MIB                                                   | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|-------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Host Resources MIB<br>(mib-jnx-hostresources)         | <p>Extends the hrStorageTable object, providing a measure of the usage of each file system on the switch as a percentage. Previously, the objects in the hrStorageTable measured the usage in allocation units—hrStorageUsed and hrStorageAllocationUnits—only. Using the percentage measurement, you can more easily monitor and apply thresholds on usage.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-hostresources.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-hostresources.txt</a>.</p> <p>For more information, see <i>Host Resources MIB</i>.</p> |
| Interface MIB (Extensions)<br>(mib-jnx-if-extensions) | <p>Extends the standard ifTable (RFC 2863) with additional statistics and Juniper Networks enterprise-specific chassis information in the ifJnxTable and ifChassisTable tables.</p> <p><b>NOTE:</b> On the QFabric system, scalar variables are not supported.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-if-extensions.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-if-extensions.txt</a>.</p> <p>For more information, see <i>Interface MIB</i>.</p>                                                                                                    |
| Power Supply Unit MIB<br>(mib-jnx-power-supply-unit)  | <p>Provides support for environmental monitoring of the power supply unit for the Interconnect device of the QFabric system.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-power-supply-unit.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-power-supply-unit.txt</a>.</p> <p>For more information, see <i>Power Supply Unit MIB</i>.</p> <p><b>NOTE:</b> On the QFabric system, scalar variables for the jnxPsuObjects 1 object ID in the jnxPsuScalars table are not supported.</p>                                                                          |
| QFabric MIB (jnx-qf-smi)                              | <p>Explains how the Juniper Networks enterprise-specific QFabric MIBs are structured. Defines the MIB objects that are reported by the QFabric system and the contents of the traps that can be issued by the QFabric system.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-qf-smi.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-qf-smi.txt</a>.</p>                                                                                                                                                                                                          |
| Utility MIB (mib-jnx-util)                            | <p>Provides you with SNMP MIB container objects of the following types: 32-bit counters, 64-bit counters, signed integers, unsigned integers, and octet strings. You can use these objects to store data that can be retrieved using other SNMP operations.</p> <p>For a downloadable version of this MIB, see <a href="http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-util.txt">http://www.juniper.net/techpubs/en_US/junos13.2/topics/reference/mibs/mib-jnx-util.txt</a>.</p> <p>For more information, see “Utility MIB” on page 6604 and “Using the Enterprise-Specific Utility MIB to Enhance SNMP Coverage” on page 6888.</p>                             |

SNMP Traps Support

The QFX Series standalone switches, QFX Series Virtual Chassis, and QFabric systems support standard SNMP traps and Juniper Networks enterprise-specific traps.

For more information, see:

- [SNMP Traps Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis on page 6628](#)
- [SNMP Traps Supported on QFabric Systems on page 6636](#)

SNMP Traps Supported on QFX Series Standalone Switches and QFX Series Virtual Chassis

QFX Series standalone switches and QFX Series Virtual Chassis support SNMPv1 and v2 traps. For more information, see:

- [SNMPv1 Traps on page 6628](#)
- [SNMPv2 Traps on page 6632](#)

SNMPv1 Traps

QFX Series standalone switches and QFX Series Virtual Chassis support both standard SNMPv1 traps and Juniper Networks enterprise-specific SNMPv1 traps. See:

- [Table 598 on page 6628](#) for standard SNMPv1 traps.
- [Table 599 on page 6631](#) for enterprise-specific SNMPv1 traps.

The traps are organized first by trap category and then by trap name. The system logging severity levels are listed for those traps that have them. Traps that do not have corresponding system logging severity levels are marked with an en dash (–).

### SNMP Traps Supported on QFabric Systems

QFabric systems support standard SNMPv2 traps and Juniper Networks enterprise-specific SNMPv2 traps.

**NOTE:** QFabric systems do not support SNMPv1 traps.

For more information, see:

- [Table 602 on page 6637](#) for standard SNMPv2 traps
- [Table 603 on page 6638](#) for Juniper Networks enterprise-specific SNMPv2 traps

**Table 602: Standard SNMPv2 Traps Supported on QFabric Systems**

| Defined in                                                                                                    | Trap Name             | SNMP Trap OID       | System Logging Severity Level | Syslog Tag             |
|---------------------------------------------------------------------------------------------------------------|-----------------------|---------------------|-------------------------------|------------------------|
| <b>Link Notifications</b>                                                                                     |                       |                     |                               |                        |
| RFC 2863, <i>The Interfaces Group MIB</i>                                                                     | linkDown              | 1.3.6.1.6.3.1.1.5.3 | Warning                       | SNMP_TRAP_LINK_DOWN    |
|                                                                                                               | linkUp                | 1.3.6.1.6.3.1.1.5.4 | Info                          | SNMP_TRAP_LINK_UP      |
| <b>Startup Notifications</b>                                                                                  |                       |                     |                               |                        |

jnxQFX3100SlotCPU       OBJECT IDENTIFIER ::= { jnxSlotQFX3100    1 }
jnxQFX3100SlotMemory    OBJECT IDENTIFIER ::= { jnxSlotQFX3100    2 }
jnxQFX3100SlotPower     OBJECT IDENTIFIER ::= { jnxSlotQFX3100    3 }
jnxQFX3100SlotFan       OBJECT IDENTIFIER ::= { jnxSlotQFX3100    4 }
jnxQFX3100SlotHardDisk  OBJECT IDENTIFIER ::= { jnxSlotQFX3100    5 }
jnxQFX3100SlotNIC       OBJECT IDENTIFIER ::= { jnxSlotQFX3100    6 }
```

### QFabric System QFX3008-I Interconnect Device

```
jnxProductLineQFXInterconnect OBJECT IDENTIFIER ::= { jnxProductLine      60 }
jnxProductNameQFXInterconnect OBJECT IDENTIFIER ::= { jnxProductName      60 }
jnxProductModelQFXInterconnect OBJECT IDENTIFIER ::= { jnxProductModel    60 }
jnxProductVariationQFXInterconnect OBJECT IDENTIFIER ::= { jnxProductVariation 60 }
jnxProductQFX3008          OBJECT IDENTIFIER ::= { jnxProductVariationQFXInterconnect 1 }
jnxProductQFXC083008       OBJECT IDENTIFIER ::= { jnxProductVariationQFXInterconnect 2 }
jnxProductQFX3008I         OBJECT IDENTIFIER ::= { jnxProductVariationQFXInterconnect 3 }

jnxChassisQFXInterconnect   OBJECT IDENTIFIER ::= { jnxChassis        60 }

jnxSlotQFXInterconnect      OBJECT IDENTIFIER ::= { jnxSlot           60 }
jnxQFXInterconnectSlotFPC   OBJECT IDENTIFIER ::= { jnxSlotQFXInterconnect 1 }
jnxQFXInterconnectSlotHBM   OBJECT IDENTIFIER ::= { jnxSlotQFXInterconnect 2 }
jnxQFXInterconnectSlotPower OBJECT IDENTIFIER ::= { jnxSlotQFXInterconnect 3 }
jnxQFXInterconnectSlotFan   OBJECT IDENTIFIER ::= { jnxSlotQFXInterconnect 4 }
jnxQFXInterconnectSlotCBD   OBJECT IDENTIFIER ::= { jnxSlotQFXInterconnect 5 }
jnxQFXInterconnectSlotFPB   OBJECT IDENTIFIER ::= { jnxSlotQFXInterconnect 6 }

jnxMediaCardSpaceQFXInterconnect OBJECT IDENTIFIER ::= { jnxMediaCardSpace 60 }
jnxQFXInterconnectMediaCardSpacePIC OBJECT IDENTIFIER ::= { jnxMediaCardSpaceQFXInterconnect 1 }

jnxMidplaneQFXInterconnect  OBJECT IDENTIFIER ::= { jnxBackplane      60 }
```

### QFabric System QFX3600-I Interconnect Device

```
jnxProductLineQFXMInterconnect OBJECT IDENTIFIER ::= { jnxProductLine      91 }
jnxProductNameQFXMInterconnect OBJECT IDENTIFIER ::= { jnxProductName      91 }
jnxProductModelQFXMInterconnect OBJECT IDENTIFIER ::= { jnxProductModel    91 }
jnxProductVariationQFXMInterconnect OBJECT IDENTIFIER ::= { jnxProductVariation 91 }
jnxProductQFX3600I         OBJECT IDENTIFIER ::= { jnxProductVariationQFXMInterconnect 1 }

jnxChassisQFXMInterconnect   OBJECT IDENTIFIER ::= { jnxChassis        91 }

jnxSlotQFXMInterconnect      OBJECT IDENTIFIER ::= { jnxSlot           91 }
jnxQFXMInterconnectSlotFPC   OBJECT IDENTIFIER ::= { jnxSlotQFXMInterconnect 1 }
jnxQFXMInterconnectSlotHBM   OBJECT IDENTIFIER ::= { jnxSlotQFXMInterconnect 2 }
jnxQFXMInterconnectSlotPower OBJECT IDENTIFIER ::= { jnxSlotQFXMInterconnect 3 }
jnxQFXMInterconnectSlotFan   OBJECT IDENTIFIER ::= { jnxSlotQFXMInterconnect 4 }
jnxQFXMInterconnectSlotFPB   OBJECT IDENTIFIER ::= { jnxSlotQFXMInterconnect 5 }
```

```
jnxMediaCardSpaceQFXMInterconnect OBJECT IDENTIFIER ::= { jnxMediaCardSpace 91 }
jnxQFXMInterconnectMediaCardSpacePIC OBJECT IDENTIFIER ::= { jnxMediaCardSpaceQFXMInterconnect 1 }
```

### QFabric System Node Devices

```
jnxProductLineQFXNode OBJECT IDENTIFIER ::= { jnxProductLine 61 }
jnxProductNameQFXNode OBJECT IDENTIFIER ::= { jnxProductName 61 }
jnxProductModelQFXNode OBJECT IDENTIFIER ::= { jnxProductModel 61 }
jnxProductVariationQFXNode OBJECT IDENTIFIER ::= { jnxProductVariation 61 }
jnxProductQFX3500 OBJECT IDENTIFIER ::= { jnxProductVariationQFXNode 1 }
jnxProductQFX360016Q OBJECT IDENTIFIER ::= { jnxProductVariationQFXNode 3 }

jnxChassisQFXNode OBJECT IDENTIFIER ::= { jnxChassis 61 }

jnxSlotQFXNode OBJECT IDENTIFIER ::= { jnxSlot 61 }
jnxQFXNodeSlotFPC OBJECT IDENTIFIER ::= { jnxSlotQFXNode 1 }
jnxQFXNodeSlotHM OBJECT IDENTIFIER ::= { jnxSlotQFXNode 2 }
jnxQFXNodeSlotPower OBJECT IDENTIFIER ::= { jnxSlotQFXNode 3 }
jnxQFXNodeSlotFan OBJECT IDENTIFIER ::= { jnxSlotQFXNode 4 }
jnxQFXNodeSlotFPB OBJECT IDENTIFIER ::= { jnxSlotQFXNode 5 }

jnxMediaCardSpaceQFXNode OBJECT IDENTIFIER ::= { jnxMediaCardSpace 61 }
jnxQFXNodeMediaCardSpacePIC OBJECT IDENTIFIER ::= { jnxMediaCardSpaceQFXNode 1 }
```

- [Overview of Single-Chassis System Logging Configuration on page 6643](#)
- [Understanding the Implementation of System Log Messages on the QFabric System on page 6644](#)

### Overview of Junos OS System Log Messages

The Junos OS generates system log messages (also called *syslog messages*) to record events that occur on the switch, including the following:

- Routine operations, such as a user login into the configuration database.
- Failure and error conditions, such as failure to access a configuration file.
- Emergency or critical conditions, such as power-down of the switch due to excessive temperature.

Each system log message identifies the Junos OS process that generated the message and briefly describes the operation or error that occurred. For detailed information about specific system log messages, see the *Junos OS System Log Messages Reference*.

  - [Junos OS Minimum System Logging Configuration on page 6697](#)

## Overview of Single-Chassis System Logging Configuration

The Junos OS system logging utility on the QFX Series is similar to the UNIX **syslogd** utility. This topic describes how to configure system logging for a single-chassis system that runs the Junos OS.

Each system log message belongs to a *facility*, which groups together related messages. Each message is also preassigned a *severity level*, which indicates how seriously the triggering event affects router functions. You always specify the facility and severity of the messages to include in the log. For more information, see *Specifying the Facility and Severity of Messages to Include in the Log*.

You direct messages to one or more destinations by including the appropriate statement at the **[edit system syslog]** hierarchy level:

- To a named file in a local file system, by including the **file** statement. See [“Directing System Log Messages to a Log File” on page 6699](#).
- To the terminal session of one or more specific users (or all users) when they are logged in to the switch, by including the **user** statement. See [“Directing System Log Messages to a User Terminal” on page 6701](#).
- To the switch console, by including the **console** statement. See [“Directing System Log Messages to the Console” on page 6701](#).
- To a remote machine that is running the **syslogd** utility, by including the **host** statement. See [“Directing System Log Messages to a Remote Machine” on page 6700](#).

By default, messages are logged in a standard format, which is based on a UNIX system log format; for detailed information about message formatting, see the *Junos OS System Log Messages Reference*. You can alter the content and format of logged messages in the following ways:

- You can log messages to a file in structured-data format instead of the standard Junos OS format. Structured-data format provides more information without adding significant length, and makes it easier for automated applications to extract information from the message. For more information, see [“Logging Messages in Structured-Data Format” on page 6705](#).
- A message’s facility and severity level are together referred to as its *priority*. By default, the standard Junos OS format for messages does not include priority information (structured-data format includes a priority code by default). To include priority information in standard-format messages directed to a file or a remote destination, include the **explicit-priority** statement. For more information, see [“Including Priority Information in System Log Messages” on page 6703](#).
- By default, the standard Junos OS format for messages specifies the month, date, hour, minute, and second when the message was logged. You can modify the timestamp on standard-format system log messages to include the year, the millisecond, or both. (Structured-data format specifies the year and millisecond by default.) For more information, see [“Including the Year or Millisecond in Timestamps” on page 6704](#).

- When directing messages to a remote machine, you can specify the IP address that is reported in messages as their source. You can also configure features that make it easier to separate messages generated by Junos OS or messages generated on particular switches. For more information, see [“Directing System Log Messages to a Remote Machine” on page 6700](#).
- The predefined facilities group together related messages, but you can also use regular expressions to specify more exactly which messages from a facility are logged to a file, a user terminal, or a remote destination. For more information, see [“Using Regular Expressions to Refine the Set of Logged Messages” on page 6717](#).

**NOTE:** During a commit check, warnings about the `traceoptions` configuration (for example, mismatch in trace file sizes or number of trace files) are not displayed on the console. However, these warnings are logged in the system log messages when the new configuration is committed.

## Understanding the Implementation of System Log Messages on the QFabric System

This topic provides an overview of system log (syslog) messages as implemented on the QFabric system.

The QFabric system monitors events that occur on its component devices and distributes system log messages about those events to all external system log message servers (hosts) that are configured. Component devices may include Node devices, Interconnect devices, Director devices, and the Virtual Chassis. Messages are stored for viewing only in the QFabric system database. To view the messages, issue the **show log** command.

You configure system log messages by using the **host** and **file** statements at the **[edit system syslog]** hierarchy level. Use the **show log filename** operational mode command to view the messages.

**NOTE:** On the QFabric system, a syslog file named **messages** with a size of 100 MB is configured by default. If you do not configure a filename, you can use the default filename **messages** with the **show log filename** command.

All messages with a severity level of **notice** or higher are logged. Messages with a facility level of **interactive-commands** on Node devices are not logged.

The QFabric system supports the following system log message features:

- The **file filename** and **host hostname** statements at the **[edit system syslog]** hierarchy level are supported. Other statements at that hierarchy level are not supported.
- You can specify the maximum amount of data that is displayed when you issue the **show log filename** command by configuring the **file filename archive maximum-file-size** statement.
- You can specify that one or more system log message servers receive messages, which are sent to each server that is configured.
- If you configured an alias for a device or interface, the alias is displayed in the message for the device or interface.
- The level of detail that is included in a message depends on the facility and severity levels that are configured. Messages include the highest level of detail available for the configured facility and severity levels.
- The unit of time is measured and displayed in seconds, and not milliseconds. If you attempt to configure the **time-format** option in milliseconds, the log output displays **000**.

Starting in Junos OS Release 13.1, the QFabric system supports these additional syslog features:

- You can filter the output of the **show log filename** operational mode command by device type and device ID or device alias when you specify the **device-type (device-id | device-alias)** optional parameters. Device types include **director-device**, **infrastructure-device**, **interconnect-device**, and **node-device**.
- You can specify the syslog structured data output format when you configure the **structured-data** statement at the **[edit system syslog file filename]** and **[edit system syslog host hostname]** hierarchy levels.

**NOTE:** Information displayed in the structured data output for system logs originating from the Director software may not be complete.

- You can filter the types of logs that the Director group collects from a component device when you configure the **filter all facility severity** or **filter all match "regular-expression"** statements at the **[edit system syslog]** hierarchy level.

Unsupported syslog features include:

- File access to syslog messages
- Monitoring of syslog messages

## Examples: Configuring System Logging

The system log provides an excellent way of tracking all management activity on the switch by recording events such as user authentication, access authorization, and command execution. Logged command executions include commands entered by users at the CLI prompt or by client applications such as the Junos XML protocol or NETCONF XML client. Because system log files contain information about commands executed on the switch and the user who executed the commands, checking system log files for failed authentication events can help identify attempts to hack in to the switch. You can also

analyze network activity by correlating executed commands with events and changes that occurred on the network at a particular time.

System log files are stored locally on the switch in the default `/var/log` directory.

The following example shows how to configure system log messages to record all commands entered by users and all authentication or authorization attempts. Logged commands include those entered by users at the CLI prompt and by client applications. Authentication and authorization attempts include events that are saved in the file named `cli-commands` and those that are sent to the terminal of a user who is logged in.

```
[edit system]
syslog {
  file cli-commands {
    interactive-commands info;
    authorization info;
  }
  user * {
    interactive-commands info;
    authorization info;
  }
}
```

The following example shows how to log all alarms state changes to the file `/var/log/alarms`:

```
[edit system]
syslog {
  file alarms {
    kernel warning;
  }
}
```

The following example shows how to configure the handling of messages of various types, as described in the comments. Information is logged to two files, to the terminal of user alex, to a remote machine, and to the console:

```
[edit system]
syslog {
  /* write all security-related messages to file /var/log/security */
  file security {
    authorization info;
    interactive-commands info;
  }
  /* write messages about potential problems to file /var/log/messages: */
  /* messages from "authorization" facility at level "notice"
  and above, */
  /* messages from all other facilities at level "warning" and above */
  file messages {
    authorization notice;
    any warning;
  }
  /* write all messages at level "critical" and above to terminal of user
  "alex" if */
  /* that user is logged in */
  user alex {
```

```

        any critical;
    }
    /* write all messages from the "daemon" facility at level "info"
    and above, and */
    /* messages from all other facilities at level "warning" and above, to the
    */
    /* machine monitor.mycompany.com */
    host monitor.mycompany.com {
        daemon info;
        any warning;
    }
    /* write all messages at level "error" and above to the system console */
    console {
        any error;
    }
}

```

The following example shows how to configure the handling of messages generated when users issue Junos OS CLI commands, by specifying the interactive-commands facility at the info, notice, and warning severity levels:

```

[edit system]
file user-actions {
    interactive-commands info;
}
user philip {
    interactive-commands notice;
}
console {
    interactive-commands warning;
}
}

```

The following list describes the security levels used in the example:

- **info**—Logs a message when users issue any command at the CLI operational or configuration mode prompt. The example writes the messages to the file `/var/log/user-actions`.
- **notice**—Logs a message when users issue the configuration mode command **commit**. The example writes the messages to the terminal of user philip.
- **warning**—Logs a message when users issue a command that restarts a software process. The example writes the messages to the console.

### Examples: Assigning an Alternative Facility

This topic contains examples of configuring system log messages to use an alternative facility for logging.

The following example shows how to log all messages generated on the switch at the **error** level or higher to the **local0** facility on the remote host called **monitor.mycompany.com**:

```
[edit system syslog]
host monitor.mycompany.com {
  any error;
  facility-override local0;
}
```

The following example contains two sets of statements that show how to configure switches located in California and in New York to send messages to a single remote host called **central-logger.mycompany.com**. The messages from California are assigned to alternative facility **local0** and the messages from New York are assigned to alternative facility **local2**.

- The following statements configure the California switch to aggregate messages in the **local0** facility:

```
[edit system syslog]
host central-logger.mycompany.com {
  change-log info;
  facility-override local0;
}
```

- The following statements configure the New York switch to aggregate messages in the **local2** facility:

```
[edit system syslog]
host central-logger.mycompany.com {
  change-log info;
  facility-override local2;
}
```

On the remote host named **central-logger** you can subsequently configure the system logging utility to write messages from the **local0** facility to one file (for example, **california-config**) and the messages from the **local2** facility to another file (for example, **new-york-config**).

## Example: Configuring System Log Messages

The QFabric system monitors events that occur on its component devices and distributes system log messages about those events to all external system log message servers (hosts) that are configured. Component devices may include Node devices, Interconnect devices, Director devices, and the Virtual Chassis. Messages are stored for viewing only in the QFabric system database. To view the messages, issue the **show log** command.

This example describes how to configure system log messages on the QFabric system.

- [Requirements on page 6651](#)
- [Overview on page 6651](#)
- [Configuration on page 6651](#)

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 12.2
- QFabric system
- External servers that can be configured as system log message hosts

### Overview

Component devices that generate system log message events may include Node devices, Interconnect devices, Director devices, and the control plane switches. The following configuration example includes these components in the QFabric system:

- Director software running on the Director group
- Control plane switches
- Interconnect device
- Multiple Node devices

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set system syslog host 10.1.1.12 any error
set system syslog file qflogs
set system syslog file qflogs structured-data brief
set system syslog file qflogs archive size 1g
```

#### Step-by-Step Procedure

The following example requires that you navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure system messages from the QFabric Director device:

1. Specify a host, any facility, and the **error** severity level.

```
[edit system syslog]
user@switch# set host 10.1.1.12 any error
```

**NOTE:** You can configure more than one system log message server (host). The QFabric system sends the messages to each server configured.

2. (Optional) Specify a filename to capture log messages.

**NOTE:** On the QFabric system, a syslog file named `messages` is configured implicitly with facility and severity levels of any any and a file size of 100 MBs. Therefore, you cannot specify the filename `messages` in your configuration, and automatic command completion does not work for that filename.

```
[edit system syslog]
user@switch# set file qflogs structured-data brief
user@switch# set file qflogs
```

3. (Optional) Configure the maximum size of your system log message archive file. This example specifies an archive size of 1 GB.

```
[edit system syslog]
user@switch# set file qflogs archive size 1g
```

**Results** From configuration mode, confirm your configuration by entering the **show system** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@switch# show system
syslog {
  file qflogs {
  }
  host 10.1.1.12 {
    any error;
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Example: Monitoring Network Traffic Using sFlow Technology

The sFlow technology is a monitoring technology for high-speed switched or routed networks. sFlow monitoring technology collects samples of network packets and sends them in a UDP datagram to a monitoring station called a *collector*. You can configure sFlow technology on a device to monitor traffic continuously at wire speed on all interfaces simultaneously. You must enable sFlow monitoring on each interface individually; you cannot globally enable sFlow monitoring on all interfaces with a single configuration statement. Junos OS fully supports the sFlow technology standard described in RFC 3176, *InMon Corporation's sFlow: A Method for Monitoring Traffic in Switched and Routed Networks*.

This example describes how to configure and use sFlow monitoring on a QFX3500 switch in standalone mode.

- [Requirements on page 6653](#)
- [Overview on page 6653](#)
- [Configuration on page 6654](#)
- [Verification on page 6655](#)

---

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 11.3 or later
- One QFX3500 switch

---

### Overview

An sFlow monitoring system consists of an sFlow agent embedded in the device and a centralized collector on the network. The two main activities of the sFlow agent are random sampling and statistics gathering. The sFlow agent combines interface counters and flow samples and sends them to the IP address and UDP destination port of the sFlow collector in UDP datagrams.

[Figure 248 on page 6654](#) depicts the basic elements of an sFlow system.

Figure 248: sFlow Technology Monitoring System

### Configuration

#### CLI Quick Configuration

To quickly configure sFlow technology, copy the following commands and paste them into the terminal window of the switch:

```
[edit protocols sflow]
set collector 10.204.32.46 udp-port 5600
set interfaces xe-0/0/1.0
set polling-interval 20
set sample-rate 1000
```

#### Step-by-Step Procedure

To configure sFlow features using the CLI:

1. Configure the IP address and UDP port of at least one collector:

```
[edit protocols sflow]
user@switch# set collector 10.204.32.46 udp-port 5600
```

The default UDP port assigned is 6343.

2. Enable sFlow technology on a specific interface:

```
[edit protocols sflow]
user@switch# set interfaces xe-0/0/1.0
```

**NOTE:** You cannot enable sFlow technology on a Layer 3 VLAN-tagged interface.

You cannot enable sFlow technology on a LAG interface (for example, ae0), but you can enable sFlow technology on the member interfaces of the LAG (for example, xe-0/0/1).

3. Specify how often (in seconds) the sFlow agent polls all interfaces at the global level:

```
[edit protocols sflow]
user@switch# set polling-interval 20
```

**NOTE:** Specify 0 if you do not want to poll the interface.

4. Specify the rate at which packets must be sampled at the global level. The following example sets a sample rate of 1 in 1000 packets:

```
[edit protocols sflow]
user@switch# set sample-rate 1000
```

**Results** Check the results of the configuration:

```
[edit]
user@switch# show protocols
sflow {
  collector 10.204.32.46 {
    udp-port 5600;
  }
  interfaces xe-0/0/1.0 {
    polling-interval 20;
    sample-rate 1000;
  }
}
```

## Verification

To confirm that the configuration is correct, perform these tasks:

- [Verifying That sFlow Technology Has Been Configured Properly on page 6655](#)
- [Verifying That sFlow Technology Is Enabled on an Interface on page 6656](#)
- [Verifying the sFlow Collector Configuration on page 6656](#)

### *Verifying That sFlow Technology Has Been Configured Properly*

**Purpose** Verify that sFlow technology has been configured properly.

**Action** Enter the **show sflow** operational mode command:

```
user@switch> show sflow
```

```
sFlow           : Enabled
Sample limit    : 300 packets/second
Polling interval : 20 second
Sample rate     : 1:1000
Agent ID        : 10.1.1.2
```

**NOTE:** The sample limit cannot be configured and is set to 300 packets per second.

**Meaning** The output shows that sFlow technology is enabled and specifies the values for the sampling limit, polling interval, and sampling rate.

#### *Verifying That sFlow Technology Is Enabled on an Interface*

**Purpose** Verify that sFlow technology is enabled on interfaces and display the sampling parameters.

**Action** Enter the **show sflow interface** operational mode command:

```
user@switch> show sflow interface
Interface      Status      Sample   Polling
                rate      interval
xe-0/0/1.0     Enabled     1000     20
```

**Meaning** The output indicates that sFlow technology is enabled on the **Node1:xe-0/0/1.0** interface on the Node device with a sampling rate of 1000 and a polling interval of 20 seconds.

#### *Verifying the sFlow Collector Configuration*

**Purpose** Verify the sFlow collector configuration.

**Action** Enter the **show sflow collector** operational mode command:

```
user@switch> show sflow collector
Collector      Udp-port   No. of samples
address
10.204.32.46   5600       7516
```

**Meaning** The output displays the IP address of the collector, the UDP port, and the number of samples collected.

## Example: Configuring SNMP

By default, SNMP is disabled on devices running Junos OS. This example describes the steps for configuring SNMP on the QFabric system.

- [Requirements on page 6657](#)
- [Overview on page 6657](#)
- [Configuration on page 6657](#)

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 12.2
- Network management system (NMS) (running the SNMP manager)
- QFabric system (running the SNMP agent) with multiple Node devices

### Overview

Because SNMP is disabled by default on devices running Junos OS, you must enable SNMP on your device by including configuration statements at the **[edit snmp]** hierarchy level. At a minimum, you must configure the **community public** statement. The community defined as public grants read-only access to MIB data to any client.

If no **clients** statement is configured, all clients are allowed. We recommend that you always include the **restrict** option to limit SNMP client access to the switch.

The network topology in this example includes an NMS, a QFabric system with four Node devices, and external SNMP servers that are configured for receiving traps.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set snmp name "snmp qfabric" description "qfabric0 switch"
set snmp location "Lab 4 Row 11" contact "qfabric-admin@qfabric0"
set snmp community public authorization read-only
set snmp client-list list0 192.168.0.0/24
set snmp community public client-list-name list0
set snmp community public clients 192.170.0.0/24 restrict
set snmp trap-group "qf-traps" destination-port 155 targets 192.168.0.100
```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure SNMP on the QFabric system:

**NOTE:** If the name, description, location, contact, or community name contains spaces, enclose the text in quotation marks (" ").

1. Configure the SNMP system name:

```
[edit snmp]
user@switch# set name "snmp qfabric"
```

2. Specify a description.

```
[edit snmp]
user@switch# set description "qfabric0 system"
```

This string is placed into the MIB II sysDescription object.

3. Specify the physical location of the QFabric system.

```
[edit snmp]
user@switch# set location "Lab 4 Row 11"
```

This string is placed into the MIB II sysLocation object.

4. Specify an administrative contact for the SNMP system.

```
[edit snmp]
user@switch# set contact "qfabric-admin@qfabric0"
```

This name is placed into the MIB II sysContact object.

5. Specify a unique SNMP community name and the read-only authorization level.

**NOTE:** The read-write option is not supported on the QFabric system.

```
[edit snmp]
user@switch# set community public authorization read-only
```

6. Create a client list with a set of IP addresses that can use the SNMP community.

```
[edit snmp]
user@switch# set client-list list0 192.168.0.0/24
user@switch# set community public client-list-name list0
```

7. Specify IP addresses of clients that are restricted from using the community.

```
[edit snmp]
user@switch# set community public clients 192.170.0.0/24 restrict
```

8. Configure a trap group, destination port, and a target to receive the SNMP traps in the trap group.

```
[edit snmp]
user@switch# set trap-group "qf-traps" destination-port 155 targets 192.168.0.100
```

**NOTE:** You do not need to include the `destination-port` statement if you use the default port 162.

The trap group `qf-traps` is configured to send traps to 192.168.0.100.

**Results** From configuration mode, confirm your configuration by entering the **show** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@switch# show
snmp {
  name "snmp qfabric";
  description "qfabric0 system";
  location "Lab 4 Row 11";
  contact "qfabric-admin@qfabric0";
  client-list list0 {
    192.168.0.0/24;
  }
  community public {
    authorization read-only;
    clients {
      197.170.0.0/24 restrict;
    }
  }
  trap-group qf-traps {
    destination-port 155;
    targets {
      192.168.0.100;
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Example: Configuring Internal Fabric OAM Monitoring

This example shows how to configure the internal fabric Operation, Administration, Maintenance (OAM) monitoring feature on the QFabric system, including the fabric maintenance association (FMA) and flow specifications for unicast Ethernet traffic.

Internal fabric monitoring enables you to validate the flow path of protocol data units (PDUs) across a given VLAN on the QFabric system using the ping operation.

Internal fabric monitoring is useful for fault detection on the QFabric system. For example, if a PDU reaches a destination that is not part of the VLAN configuration, the ping operation displays the exception on the console at runtime.

- [Requirements on page 6660](#)
- [Overview on page 6660](#)
- [Configuration on page 6662](#)
- [Verification on page 6664](#)

---

## Requirements

This example uses the following hardware and software components:

- One QFabric system with the following components:
  - A Director group (two Director devices)
  - Two QFabric system Interconnect devices
  - Node devices, including:
    - One Node device (Node-81) configured in a default network Node group (NNW-NG-0)
    - One Node device (Node-80) in an autogenerated server Node group (SNG-80)
    - Two Node devices (Node-83 and Node-84) configured in a redundant server Node group (RSNG-8384)
- Junos OS Release 12.2 or later

Before you configure the FMA, first configure a VLAN in which the internal fabric OAM monitoring occurs. You can usually configure a VLAN by specifying a VLAN ID or VLAN name. However, in the case of the VLAN used for internal fabric OAM monitoring, you must specify a VLAN name (not a VLAN ID). The FMA configuration requires a VLAN name and not a VLAN ID.

If you have already configured a VLAN ID for the VLAN, you must delete the VLAN ID from the associated interfaces and then add a VLAN name.

---

## Overview

On a QFabric system, enabling internal fabric OAM monitoring requires that you configure an FMA and a flow specification.

- The *FMA* associates a particular VLAN with a set of source and destination interfaces called fabric maintenance endpoints (FMEPs) that are used for tracing the data path between the endpoints. Configuration of the VLAN name is mandatory when you configure an FMA.
- A *flow specification* is used to determine the contents of a packet that is used for a particular operation. For example, an Ethernet type flow specification describes the contents of a pure Layer 2 packet, whereas an Ethernet IPv4 type flow specification describes an Ethernet IPv4 packet.

### Topology

This example uses the following topology:

- The QFabric system Node devices are connected to the Interconnect devices.
- Node device Node-80 is configured in the server Node group SNG-80.
- Node devices Node-83 and Node-84 are configured in a redundant server Node group RSNG-8384.
- The device with the unicast flow source IP address is connected to Node-80.
- The device with the unicast flow destination IP addresses is connected to Node-84.

Table 604 on page 6661 maps the association of the fabric OAM elements configured in this example.

**Table 604: Fabric OAM Configuration Elements**

| Interface         | FMA  | VLAN Name | FMEP ID | Flow Specifications                                                            |
|-------------------|------|-----------|---------|--------------------------------------------------------------------------------|
| Node-80:xe-0/0/22 | fma1 | v10       | 1       | <ul style="list-style-type: none"> <li>flowspec1</li> <li>flowspec2</li> </ul> |
| Node-84:xe-0/0/22 | fma1 | v10       | 2       | <ul style="list-style-type: none"> <li>flowspec1</li> <li>flowspec2</li> </ul> |

## Configuration

---

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set vlans v10 vlan-id 10
set interfaces Node-80:xe-0/0/22 unit 0 family ethernet-switching vlan members v10
set interfaces Node-84:xe-0/0/22 unit 0 family ethernet-switching vlan members v10
set protocols oam fabric fabric-maintenance-associations fma1 vlan-name v10
set protocols oam fabric fabric-maintenance-associations fma1
    fabric-maintenance-end-points 1 fmep-interface Node-80:xe-0/0/22.0
set protocols oam fabric fabric-maintenance-associations fma1
    fabric-maintenance-end-points 2 fmep-interface Node-84:xe-0/0/22.0
set protocols oam fabric flow-specs flowspec1 unicast-ethernet-ipv4 source-ip
    10.244.10.100
set protocols oam fabric flow-specs flowspec1 unicast-ethernet-ipv4 destination-ip
    10.244.10.110
set protocols oam fabric flow-specs flowspec1 unicast-ethernet-ipv4 destination-mac
    00:00:80:8d:2d:15
set protocols oam fabric flow-specs flowspec1 unicast-ethernet-ipv4 source-l4-port 60
set protocols oam fabric flow-specs flowspec1 unicast-ethernet-ipv4 destination-l4-port
    80
set protocols oam fabric flow-specs flowspec2 unicast-ethernet-ipv4 source-ip
    10.244.10.100
set protocols oam fabric flow-specs flowspec2 unicast-ethernet-ipv4 destination-ip
    10.244.10.111
set protocols oam fabric flow-specs flowspec2 unicast-ethernet-ipv4 destination-mac
    00:00:80:8d:2d:17
set protocols oam fabric flow-specs flowspec2 unicast-ethernet-ipv4 source-l4-port 60
set protocols oam fabric flow-specs flowspec2 unicast-ethernet-ipv4 destination-l4-port
    80
```

### Step-by-Step Procedure

To configure internal fabric OAM monitoring:

1. Configure a name and ID for the VLAN.  

```
[edit]
set vlans v10 vlan-id 10
```
2. Assign a set of interfaces to the VLAN.  

```
[edit]
set interfaces Node-80:xe-0/0/22 unit 0 family ethernet-switching vlan members
v10
set interfaces Node-84:xe-0/0/22 unit 0 family ethernet-switching vlan members
v10
```
3. Define the FMA and associate it with a VLAN name.  

```
[edit protocols oam fabric]
set fabric-maintenance-associations fma1 vlan-name v10
```
4. Configure FMEPs for the FMA.  

```
[edit protocols oam fabric]
```

```

set fabric-maintenance-associations fma1 fabric-maintenance-end-points 1
fmem-interface Node-80:xe-0/0/22.0
set fabric-maintenance-associations fma1 fabric-maintenance-end-points 2
fmem-interface Node-84:xe-0/0/22.0

```

5. Configure two IPv4 flow specifications for unicast traffic from FMEP 1 to FMEP 2.

```

[edit protocols oam fabric]
set flow-specs flowspec1 unicast-ethernet-ipv4 source-ip 10.244.10.100
set flow-specs flowspec1 unicast-ethernet-ipv4 destination-ip 10.244.10.110
set flow-specs flowspec1 unicast-ethernet-ipv4 destination-mac 00:00:80:8d:2d:15
set flow-specs flowspec1 unicast-ethernet-ipv4 source-l4-port 60
set flow-specs flowspec1 unicast-ethernet-ipv4 destination-l4-port 80
set flow-specs flowspec2 unicast-ethernet-ipv4 source-ip 10.244.10.100
set flow-specs flowspec2 unicast-ethernet-ipv4 destination-ip 10.244.10.111
set flow-specs flowspec2 unicast-ethernet-ipv4 destination-mac 00:00:80:8d:2d:17
set flow-specs flowspec2 unicast-ethernet-ipv4 source-l4-port 60
set flow-specs flowspec2 unicast-ethernet-ipv4 destination-l4-port 80

```

**Results** Display the results of the configuration.

```

root@qfabric> show protocols oam fabric
fabric-maintenance-associations {
  fma1 {
    vlan-name v10;
    fabric-maintenance-end-points {
      1 {
        fmem-interface Node-80:xe-0/0/22.0;
      }
      2 {
        fmem-interface Node-84:xe-0/0/22.0;
      }
    }
  }
}
flow-specs {
  flowspec1 {
    unicast-ethernet-ipv4 {
      source-ip 10.244.10.100;
      destination-ip 10.244.10.110;
      destination-mac 0:0:80:8d:2d:15;
      source-l4-port 60;
      destination-l4-port 80;
    }
  }
  flowspec2 {
    unicast-ethernet-ipv4 {
      source-ip 10.244.10.100;
      destination-ip 10.244.10.111;
      destination-mac 0:0:80:8d:2d:17;
      source-l4-port 60;
      destination-l4-port 80;
    }
  }
}

```

## Verification

Confirm that the configuration is working properly.

- [Verifying Configuration of Fabric OAM Interfaces on page 6664](#)
- [Verifying Configuration of the Fabric OAM Flow Specification on page 6664](#)
- [Verifying Operation of the Unicast ping Command on page 6665](#)

### Verifying Configuration of Fabric OAM Interfaces

**Purpose** Verify that the interfaces are associated with the FMA.

**Action** Display the fabric OAM interfaces.

```
root@qfabric> show oam fabric interfaces
```

| Interface-name      | Fabric-Maintenance Association | VLAN | Interface state | MEP Identifier | MEP Name               |
|---------------------|--------------------------------|------|-----------------|----------------|------------------------|
| NW-NG-0:NULL        | fma-default                    | *    | up              | 32790          | fmeop-default-BBAK8793 |
| NW-NG-0:NULL        | fma-default                    | *    | up              | 32791          | fmeop-default-BBAK8798 |
| RSNG-8384:NULL      | fma-default                    | *    | up              | 32794          | fmeop-default-BBAK8748 |
| RSNG-8384:NULL      | fma-default                    | *    | up              | 32795          | fmeop-default-BBAK0465 |
| Node-84:xe-0/0/22.0 | fma1                           | V10  | up              | 2              |                        |
| SNG-60:NULL         | fma-default                    | *    | up              | 32793          | fmeop-default-BBAK9603 |
| SNG-80:NULL         | fma-default                    | *    | up              | 32792          | fmeop-default-BBAK8728 |
| Node-80:xe-0/0/22.0 | fma1                           | V10  | up              | 1              |                        |

**Meaning** Interfaces Node-84:xe-0/0/22.0 and Node-80:xe-0/0/22.0 are associated with the FMA, FMEP, and VLAN as configured.

Interfaces that are not configured for fabric OAM monitoring (NW-NG-0:NULL, RSNG-8384:NULL, SNG-60:NULL, and SNG-80:NULL) display an asterisk (\*) in the VLAN column, and the default FMA and FMEP names in the Fabric-Maintenance Association and MEP Name columns.

### Verifying Configuration of the Fabric OAM Flow Specification

**Purpose** Verify the configuration of the flow specifications.

**Action** Display the fabric OAM flow specification configuration.

```
root@qfabric> show oam fabric flow-specification
Flow specification name : flowspec1 Type : Ethernet Unicast IPV4
Ethernet frame size : Unspecified
Source-IP : 10.244.10.100
Source-IP Mask : Unspecified
Destination-IP : 10.244.10.110
Destination-IP Mask : Unspecified
Destination-mac : 0:0:80:8d:2d:15
IP-protocol : Unspecified
Source-L4-port : 60
Destination-L4-port : 80
Flow specification name : flowspec2 Type : Ethernet Unicast IPV4
Ethernet frame size : Unspecified
Source-IP : 10.244.10.100
Source-IP Mask : Unspecified
```

```

Destination-IP : 10.244.10.111
Destination-IP Mask : Unspecified
Destination-mac : 0:0:80:8d:2d:17
IP-protocol : Unspecified
Source-L4-port : 60
Destination-L4-port : 80

```

**Meaning** The output shows that flow specifications were configured as the user intended.

### *Verifying Operation of the Unicast ping Command*

**Purpose** Verify that the fabric OAM unicast **ping** command works.

**Action** Issue the **ping fabric unicast-flow** command.

```

root@qfabric> ping fabric unicast-flow source-fmep-id 1 dest-fmep-id 2 flow-spec-name
flowspec1 fma-name fma1 count 3

```

```

Fabric flow ping between source Node-80 destination Node-84
received response from fmep-id 2...
received response from fmep-id 2...
received response from fmep-id 2...
sent 3 requests, received 3 responses

```

```

root@qfabric> ping fabric unicast-flow source-fmep-id 1 dest-fmep-id 2 fma-name
fma1 flow-spec-name flowspec2

```

```

Fabric flow ping between source Node-80 destination Node-84
received response from fmep-id 2...
sent 1 requests, received 1 responses

```

**Meaning** The fabric OAM unicast ping request from the source Node device (Node-80) to the destination Node device (Node-84) has been successful.

## Configuration Tasks for Network Management

- [Configuring Console and Auxiliary Port Properties on page 6665](#)
- [Configuring SSH Service for Remote Access to the Router or Switch on page 6666](#)
- [Configuring Telnet Service for Remote Access to a Switch on page 6668](#)

### Configuring Console and Auxiliary Port Properties

The console port and auxiliary port on a switch provide out-of-band remote access to the switch. You can configure the console and auxiliary ports so that an external data

terminal may be connected to the switch. The console port is enabled by default, and its speed is 9600 baud. The auxiliary port is disabled by default.

By default, terminal connections to the console and auxiliary ports are secure. When you configure the console and auxiliary ports as insecure, root logins are not allowed to establish terminal connections, and superusers and anyone with a user identifier (UID) of 0 are not allowed to establish terminal connections in multiuser mode.

To configure the console and auxiliary port properties on the switch:

1. To specify that the console port session should terminate if the connection to the data carrier is lost:

```
[edit system ports]
user@switch# set console log-out-on-disconnect
```

2. To specify the auxiliary port terminal type:

```
[edit system ports]
user@switch# set auxiliary type (ansi | small-xterm | vt100 | xterm)
```

For example, to specify the auxiliary port terminal type of **xterm** with a display of 80 columns by 65 rows:

```
[edit system ports]
user@switch# set auxiliary type xterm
```

3. To check the configuration:

```
[edit system ports]
user@switch# show
console log-out-on-disconnect;
auxiliary type xterm;
```

- Related Documentation**
- [auxiliary on page 263](#)
  - [console \(Physical Port\) on page 272](#)
  - [ports on page 302](#)

## Configuring SSH Service for Remote Access to the Router or Switch

To configure the router or switch to accept SSH as an access service, include the **ssh** statement at the **[edit system services]** hierarchy level:

```
[edit system services]
ssh {
  ciphers [ cipher-1 cipher-2 cipher-3 ...]
  client-alive-count-max number;
  client-alive-interval seconds;
  connection-limit limit;
  hostkey-algorithm <algorithm | no-algorithm>;
  key-exchange algorithm;
  macs algorithm;
  max-sessions-per-connection number;
  no-passwords;
  no-tcp-forwarding;
```

```

protocol-version [v1 v2];
rate-limit limit;
root-login <allow | deny | deny-password>;
}

```

By default, the router or switch supports a limited number of simultaneous SSH sessions and connection attempts per minute. Use the following statements to change the defaults:

- **connection-limit *limit***—Maximum number of simultaneous connections per protocol (IPv4 and IPv6). The range is a value from 1 through 250. The default is 75. When you configure a connection limit, the limit is applicable to the number of SSH sessions per protocol (IPv4 and IPv6). For example, a connection limit of 10 allows 10 IPv6 SSH sessions and 10 IPv4 SSH sessions.
- **max-sessions-per-connection *number***—Include this statement to specify the maximum number of SSH sessions allowed per single SSH connection. This allows you to limit the number of cloned sessions tunneled within a single SSH connection. The default value is 10.
- **rate-limit *limit***—Maximum number of connection attempts accepted per minute (a value from 1 through 250). The default is 150. When you configure a rate limit, the limit is applicable to the number of connection attempts per protocol (IPv4 and IPv6). For example, a rate limit of 10 allows 10 IPv6 SSH session connection attempts per minute and 10 IPv4 SSH session connection attempts per minute.

By default, a user can create an SSH tunnel over a CLI session to a router running Junos OS via SSH. This type of tunnel could be used to forward TCP traffic, bypassing any firewall filters or ACLs, allowing access to resources beyond the router. Use the **no-tcp-forwarding** option to prevent a user from creating an SSH tunnel to a router via SSH.

For information about other configuration settings, see the following topics:

- [Configuring the Root Login Through SSH on page 6667](#)
- [Configuring the SSH Protocol Version on page 6668](#)
- [Configuring the Client Alive Mechanism on page 6668](#)

### Configuring the Root Login Through SSH

By default, users are allowed to log in to the router or switch as **root** through SSH. To control user access through SSH, include the **root-login** statement at the **[edit system services ssh]** hierarchy level:

```

[edit system services ssh]
root-login (allow | deny | deny-password);

```

**allow**—Allows users to log in to the router or switch as root through SSH. The default is **allow**.

**deny**—Disables users from logging in to the router or switch as root through SSH.

**deny-password**—Allows users to log in to the router or switch as root through SSH when the authentication method (for example, RSA) does not require a password.

### Configuring the SSH Protocol Version

---

By default, both version 1 and version 2 of the SSH protocol are enabled. To configure the router or switch to use only version 1 of the SSH protocol, include the **protocol-version** statement and specify **v1** at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
protocol-version [ v1 ];
```

To configure the router or switch to use only version 2 of the SSH protocol, include the **protocol-version** statement and specify **v2** at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
protocol-version [ v2 ];
```

To explicitly configure the router or switch to use version 1 and 2 of the SSH protocol, include the **protocol-version** statement and specify **v1** and **v2** at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
protocol-version [ v1 v2 ];
```

For J Series Services Routers, the export license software supports SSH version 1 only.

### Configuring the Client Alive Mechanism

---

The client alive mechanism is valuable when the client or server depends on knowing when a connection has become inactive. It differs from the standard keepalive mechanism because the client alive messages are sent through the encrypted channel. The client alive mechanism is not enabled at default. To enable it, configure the **client-alive-count-max** and the **client-alive-interval**. This option applies to SSH protocol version 2 only.

In the following example, unresponsive SSH clients will be disconnected after approximately 100 seconds (20 x 5).

```
[edit system services ssh]
client-alive-count-max 5;
client-alive-interval 20;
```

### Configuring Telnet Service for Remote Access to a Switch

Telnet provides unencrypted access to network devices. Configuring Telnet service for a switch enables in-band remote access to the switch.

By default, the switch supports a limited number of simultaneous Telnet sessions and connection attempts per minute. Optionally, you can change the default Telnet settings by configuring the connection limit and rate limit at the **[edit system services telnet]** hierarchy level.

The connection limit is the maximum number of simultaneous connections per protocol (IPv4). The range is from 1 through 250. The default is 75.

The rate limit is the maximum number of connection attempts accepted per minute per protocol. The range is from 1 through 250. The default is 150.

To configure Telnet service:

1. To specify the connection limit:

```
[edit system services]
user@switch# set telnet connection-limit connection-limit
```

2. To specify the rate limit:

```
[edit system services]
user@switch# set telnet rate-limit rate-limit
```

3. Check that the Telnet connection limit and rate limit show the values you specified:

```
[edit system services]
user@switch# show
telnet {
  connection-limit 50;
  rate-limit 100;
}
```

## Configuration Tasks for Automation Scripts

- [Controlling the Execution of Commit Scripts on page 6669](#)

### Controlling the Execution of Commit Scripts

This document describes the tasks that affect the way commit scripts are executed. In the QFabric system, commit scripts are stored in the `/pbdata/mgd_shared/partition-ip/var/db/scripts/commit` directory that is shared among Director devices in a Director group.

To determine which commit scripts are currently enabled on the QFabric system, use the `show` command to display the files included at the `[edit system scripts commit]` hierarchy level. To ensure that the enabled files are on the device, list the contents of the `/pbdata/mgd_shared/partition-ip/var/db/scripts/commit` directory using the `file list` operational mode command.

See the following tasks:

- [Enabling Commit Scripts to Execute on page 6670](#)
- [Removing Commit Scripts from the Configuration on page 6670](#)
- [Deactivating Commit Scripts on page 6671](#)
- [Activating Inactive Commit Scripts on page 6671](#)

## Enabling Commit Scripts to Execute

---

The commit operation requires that all scripts be included in configuration at the **[edit system scripts commit file]** hierarchy level for all QFabric Director devices.

If you need to temporarily remove a script from a commit operation but do not want to remove it from the configuration permanently, you may configure the **optional** statement at the **[edit system scripts commit file filename]** hierarchy level to enable the commit operation to succeed even if a script is missing from the commit script directory.

**CAUTION:** When you include the **optional** statement at the **[edit system scripts commit file filename]** hierarchy level, no error message is generated during the commit operation if the file does not exist. As a result, you might not be aware that a script has not been executed as expected.

The filename of a commit script written in SLAX must include the **.slax** extension for the script to be executed.

To enable a commit script to execute during a commit operation:

1. Ensure that the commit script is located in the correct directory:  
**/pbdata/mgd\_shared/partition-ip/var/db/scripts/commit** directory on the Director device.
2. Configure the commit script.

```
[edit system scripts commit]
user@switch# set file filename <optional>
```

3. Commit the configuration.

```
[edit system scripts commit]
user@switch# top
[edit]
user@switch# commit
```

## Removing Commit Scripts from the Configuration

---

You can prevent commit scripts from executing during a commit operation by removing the scripts from the commit directory in the configuration.

**NOTE:** You can also deactivate a script using the **deactivate** statement instead of removing it from the configuration. Deactivated scripts may be reactivated later.

To prevent a commit script from executing during a commit operation:

1. Delete the commit script file from the commit directory in the configuration.

```
[edit system scripts commit]
user@switch# delete file filename
```

2. Commit the configuration.

```
[edit system scripts commit]
user@switch# top
[edit]
user@switch# commit
```

3. Remove the commit script from the `/pbdata/mgd_shared/` directory on the Director device.

**BEST PRACTICE:** Although removing the commit script is not necessary, we recommend deleting unused files from the system.

### Deactivating Commit Scripts

Deactivating a commit script results in its being marked as inactive in the configuration. The script is not executed during the commit operation, but you can reactivate the script by using the **activate** statement.

To deactivate the commit script:

1. Deactivate the script.

```
[edit]
user@switch deactivate system scripts commit file filename
```

2. Commit your changes.

```
[edit]
user@switch# commit
```

3. Verify that the commit script is deactivated.

```
[edit]
user@switch# show system scripts commit
inactive: file mycommit.slax
```

### Activating Inactive Commit Scripts

Deactivating a commit script results in its being marked as inactive in the configuration and is therefore not executed during the commit operation.

To activate an inactive commit script:

1. Activate the script.

```
[edit]
user@switch# activate system scripts commit file filename
```

2. Commit your changes.

```
[edit]
user@switch# commit
```

## Configuration Tasks for Fabric OAM

---

- [Configuring a Fabric Maintenance Association on page 6672](#)
- [Configuring Flow Specifications on page 6673](#)

### Configuring a Fabric Maintenance Association

On a QFabric system, enabling internal fabric monitoring using the ping and traceroute operations requires that a fabric maintenance association (FMA) be configured in addition to a flow specification. The FMA associates a particular VLAN with a set of source and destination interfaces called fabric maintenance endpoints (FMEPs) that are used for tracing the flow path between the endpoints. Configuration of the VLAN name is mandatory.

Before configuring the FMA, configure a VLAN name (and not a VLAN ID) for the VLAN in which the internal fabric monitoring occurs. If you already configured a VLAN ID instead of a VLAN name, you must first delete the VLAN ID and then specify a VLAN name before you configure the FMA.

**NOTE:** Because each FMA and VLAN have a one-to-one correspondence, an FMA in each QFabric system must be given a unique name.

To configure an FMA:

1. Configure an FMA name that is unique within the QFabric system:

```
[edit protocols oam fabric]
user@host# set fabric-maintenance-associations fma-name
```

2. (Optional) Configure the FMA description:

```
[edit protocols oam fabric]
user@host# set fabric-maintenance-associations fma-name description string
```

3. Configure the VLAN name:

```
[edit protocols oam fabric]
user@host# set fabric-maintenance-associations fma-name vlan-name vlan-name
```

4. Configure an FMEP, including the identifier, name, description, and associated interface:

```
[edit protocols oam fabric]
user@host# set fabric-maintenance-associations fma-name
  fabric-maintenance-end-points fmepe-id fmepe-name name description string
  fmepe-interface interface-name
```

5. Repeat Step 4 to configure additional FMEPs.

#### Related Documentation

- [ping fabric unicast-flow on page 6913](#)
- [traceroute fabric unicast-flow on page 6959](#)

## Configuring Flow Specifications

On a QFabric system, enabling internal fabric monitoring using the ping and traceroute operations requires that a flow specification be configured in addition to a fabric maintenance association (FMA). A flow specification is used to determine the contents of the packet that is used for a particular operation. For example, an Ethernet type flow specification describes the contents of a pure Layer 2 packet, whereas an Ethernet IPv4 type flow specification describes an Ethernet IPv4 packet.

**NOTE:** In the flow specification configuration, some parameters are optional. If you do not configure the optional parameters, the system generates random values that are used as PDU contents.

In order to replicate actual traffic behavior, internal fabric monitoring requires that the following flow specification fields be filled with the same values as the traffic packets:

- Unicast Ethernet—Source MAC address, destination MAC address, Ethertype
- Unicast IPv4—Source IP address, destination IP address, source L4 port, destination L4 port, destination MAC address

The configuration for each flow specification type includes parameters specific to that particular type. Use one of the following procedures to configure the flow specification for your flow type:

- [Configuring a Unicast Ethernet Flow Specification on page 6674](#)
- [Configuring a Unicast Ethernet IPv4 Flow Specification on page 6675](#)
- [Configuring a Multicast IPv4 Flow Specification on page 6676](#)
- [Configuring a Multicast VLAN Flood Flow Specification on page 6676](#)

## Configuring a Unicast Ethernet Flow Specification

This procedure describes how to configure a flow specification for a unicast Ethernet flow type. This configuration is applicable for the unicast ping and traceroute operations.

**NOTE:** Some parameters are optional. If you do not configure the optional parameters, the system generates random values that are used as PDU contents.

In order to replicate actual traffic behavior, internal fabric monitoring requires that the following flow specification fields be filled with the same values as the traffic packets: source MAC address, destination MAC address, and Ethertype.

To configure a unicast Ethernet flow specification:

1. Configure a flow specification name:

```
[edit protocols oam fabric]
user@host# set flow-specs flow-specification-name
```

2. (Optional) Set the Ethernet frame size:

```
[edit protocols oam fabric]
user@host# set ethernet-frame-size ethernet-frame-size
```

3. Set the flow specification type as unicast Ethernet and specify the EtherType:

```
[edit protocols oam fabric flow-specs flow-specification-name]
user@host# set unicast-ethernet ethertype ethertype
```

4. (Optional) Set the MAC address and the MAC address range of the source FMEP:

```
[edit protocols oam fabric flow-specs flow-specification-name unicast-ethernet]
user@host# set source-mac source-mac-address source-mac-mask source-mac-mask
```

**NOTE:** Configuration of the source-mac and source-mac-mask parameters is optional, but the source-mac-mask parameter can be specified only if the source-mac parameter is also configured.

5. (Optional) Set the MAC address or address range mask for the destination FMEP:

```
[edit protocols oam fabric flow-specs flow-specification-name unicast-ethernet]
user@host# set destination-mac destination-mac-address destination-mac-mask destination-mac-mask
```

**NOTE:** Configuration of the destination-mac and destination-mac-mask parameters is optional, but the destination-mac-mask parameter can be specified only if the destination-mac parameter is also configured.

## Configuring a Unicast Ethernet IPv4 Flow Specification

This procedure describes how to configure a flow specification for a unicast Ethernet IPv4 flow type. This configuration is applicable for the unicast ping and traceroute operations.

**NOTE:** All parameters except the flow specification name are optional. If you do not configure the optional parameters, the system generates random values that are used as PDU contents.

In order to replicate actual traffic behavior, internal fabric monitoring requires that the following flow specification fields be filled with the same values as the traffic packets: source IP address, destination IP address, source L4 port, destination L4 port, destination MAC address.

To configure a unicast Ethernet IPv4 flow specification:

1. Configure a flow specification name:

```
[edit protocols oam fabric]
user@host# set flow-specs flow-specification-name
```

2. (Optional) Set the Ethernet frame size:

```
[edit protocols oam fabric flow-specs flow-specification-name]
user@host# set ethernet-frame-size size
```

3. Set the flow specification type as unicast Ethernet IPv4:

```
[edit protocols oam fabric flow-specs flow-specification-name]
user@host# set unicast-ethernet-ipv4
```

4. (Optional) Set the IPv4 address or the address range of the source FMEP:

```
[edit protocols oam fabric flow-specs flow-specification-name unicast-ethernet-ipv4]
user@host# set source-ip source-ip-address
```

or

```
[edit protocols oam fabric flow-specs flow-specification-name unicast-ethernet-ipv4]
user@host# set source-ip-mask source-ip-mask
```

5. (Optional) Set the IPv4 address or the address range of the destination FMEP:

```
[edit protocols oam fabric flow-specs flow-specification-name unicast-ethernet-ipv4]
user@host# set destination-ip destination-ip-address
```

or

```
[edit protocols oam fabric flow-specs flow-specification-name unicast-ethernet-ipv4]
user@host# set destination-ip-mask destination-ip-mask
```

6. (Optional) Set the IPv4 protocol type:

```
[edit protocols oam fabric flow-specs flow-specification-name unicast-ethernet-ipv4]
user@host# ip-protocol protocol
```

7. (Optional) Set the L4 port (TCP or UDP port number) of the source FMEP:

```
[edit protocols oam fabric flow-specs flow-specification-name unicast-ethernet-ipv4]
user@host# source-l4-port source-l4-port-number
```

8. (Optional) Set the L4 port of the destination FMEP:

```
[edit protocols oam fabric flow-specs flow-specification-name unicast-ethernet-ipv4]
user@host# destination-l4-port destination-l4-port-number
```

---

### Configuring a Multicast IPv4 Flow Specification

This procedure describes how to configure a flow specification for a multicast IPv4 flow type.

**NOTE:** Some parameters are optional. If you do not configure the optional parameters, the system generates random values that are used as PDU contents.

To configure a multicast IPv4 flow specification:

1. Configure a flow specification name:

```
[edit protocols oam fabric]
user@host# set flow-specs flow-specification-name
```

2. Set the flow specification type as multicast IPv4:

```
[edit protocols oam fabric flow-specs flow-specification-name]
user@host# set multicast-ipv4
```

3. (Optional) Set the IPv4 address of the source FMEP:

```
[edit protocols oam fabric flow-specs flow-specification-name multicast-ipv4]
user@host# set source-ip ipv4-address
```

4. Set the IPv4 multicast group address:

```
[edit protocols oam fabric flow-specs flow-specification-name multicast-ipv4]
user@host# set dest-ip-multicast-group ipv4-mcast-address
```

---

### Configuring a Multicast VLAN Flood Flow Specification

This procedure describes how to configure a flow specification for a multicast VLAN flood flow type.

To configure a multicast VLAN flood flow specification:

1. Configure a flow specification name:

```
[edit protocols oam fabric]
user@host# set flow-specs flow-specification-name
```

2. Set the flow specification type as multicast VLAN flood:

```
[edit protocols oam fabric flow-specs flow-specification-name]
user@host# set multicast-vlan-flood
```

## Configuration Tasks for sFlow Technology

- [Configuring sFlow Technology on page 6677](#)

### Configuring sFlow Technology

The sFlow technology is a monitoring technology for high-speed switched or routed networks. sFlow monitoring technology collects samples of network packets and sends them in a UDP datagram to a monitoring station called a *collector*. You can configure sFlow technology on a device to monitor traffic continuously at wire speed on all interfaces simultaneously. You must enable sFlow monitoring on each interface individually; you cannot globally enable sFlow monitoring on all interfaces with a single configuration statement. Junos OS fully supports the sFlow technology standard described in RFC 3176, *InMon Corporation's sFlow: A Method for Monitoring Traffic in Switched and Routed Networks*.

On the QFabric system, the sFlow monitoring global configuration that is defined on the Director device is distributed to Node groups that have sFlow sampling configured on the interfaces.

To configure sFlow features using the CLI:

1. Configure the IP address and UDP port of at least one collector:

```
[edit protocols sflow]
user@host# set collector ip-address udp-port port-number
```

The default UDP port assigned is 6343.

2. Enable sFlow technology on a specific interface:

```
[edit protocols sflow]
user@host# set interfaces interface-name
```

**NOTE:** You cannot enable sFlow technology on a Layer 3 VLAN-tagged interface.

You cannot enable sFlow technology on a LAG interface (for example ae0), but you can enable sFlow technology on the member interfaces of the LAG (for example, xe-0/0/1).

3. Specify how often (in seconds) the sFlow agent polls all interfaces at the global level:

```
[edit protocols sflow]
user@host# set polling-interval seconds
```

NOTE: Specify 0 if you do not want to poll the interface.

4. Specify the rate at which packets are sampled at the global level. For example, configuring a **number** of 1000 sets a sample rate of 1 in 1000 packets.

```
[edit protocols sflow]
user@host# set sample-rate number
```

5. (Optional) You can also configure the polling interval and sample rate at the interface level:

```
[edit protocols sflow]
user@host# set interfaces interface-name polling-interval seconds sample-rate number
```

NOTE: The interface-level configuration overrides the global configuration for the specified interface.

## Configuring SNMP

SNMP is implemented in the Junos OS Software running on the QFX Series products. By default, SNMP is not enabled. To enable SNMP, you must include the SNMP configuration statements at the **[edit]** hierarchy level.

To configure the minimum requirements for SNMP, include the following statements at the **[edit]** hierarchy level of the configuration:

```
[edit]
snmp {
  community public;
}
```

To configure complete SNMP features, include the following statements at the **[edit]** hierarchy level of the configuration:

```
snmp {
  client-list client-list-name {

## Configuring the SNMP Community String

The SNMP community string defines the relationship between an SNMP server system and the client systems. This string acts like a password to control the clients' access to the server. To configure a community string in a Junos OS configuration, include the **community** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
```

```
community name {
  authorization authorization;
  clients {
    default restrict;
    address restrict;
  }
  view view-name;
}
```

If the community name contains spaces, enclose it in quotation marks (" ").

The default authorization level for a community is **read-only**. To allow **Set** requests within a community, you need to define that community as **authorization read-write**. For **Set** requests, you also need to include the specific MIB objects that are accessible with read-write privileges using the **view** statement. The default view includes all supported MIB objects that are accessible with read-only privileges; no MIB objects are accessible with read-write privileges. For more information about the **view** statement, see [“Configuring MIB Views” on page 6686](#).

The **clients** statement lists the IP addresses of the clients (community members) that are allowed to use this community. If no **clients** statement is present, all clients are allowed. For **address**, you must specify an IPv4 address, not a hostname. Include the **default restrict** option to deny access to all SNMP clients for which access is not explicitly granted. We recommend that you always include the **default restrict** option to limit SNMP client access to the local switch.

**NOTE:** Community names must be unique within each SNMP system.

**Related Documentation**

- [Configuring SNMP on page 1848](#)

## Configuring SNMP Trap Groups

Before any SNMP traps can be sent, you must configure a trap group, the categories of traps the group can receive, and the targets (systems) that will receive the traps. To create and name an SNMP trap group, include the **trap-group** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]
trap-group group-name {
  categories {
    category;
  }
  destination-port port-number;
  targets {
    address;
  }
  version (all | v1 | v2);
}
```

The trap group name can be any string and is embedded in the community name field of the trap. To configure your own trap group port, include the **destination-port** statement. The default destination port is port 162.

For each trap group that you define, you must include the **target** statement to define at least one system as the recipient of the SNMP traps in the trap group. Specify the IPv4 address of each recipient and not its hostname.

Specify the types of traps the trap group can receive in the **categories** statement.

A trap group can receive the following categories of traps:

- **authentication**—Authentication failures
- **chassis**—Chassis or environment notifications
- **configuration**—Configuration notifications
- **link**—Link-related notifications such as up-down transitions
- **remote-operations**—Remote operation notifications
- **startup**—System warm and cold starts

The **version** statement allows you to specify the SNMP version of the traps sent to targets of the trap group. If you specify **v1** only, SNMPv1 traps are sent. If you specify **v2** only, SNMPv2 traps are sent. If you specify **all**, both an SNMPv1 and an SNMPv2 trap are sent for every trap condition. For more information about the **version** statement, see [version](#).

## Adding a Group of Clients to an SNMP Community

Junos OS enables you to add one or more groups of clients to an SNMP community. You can include the **client-list-name** *name* statement at the **[edit snmp community community-name]** hierarchy level to add all the members of the client list or prefix list to an SNMP community.

To define a list of clients, include the **client-list** statement followed by the IP addresses of the clients at the **[edit snmp]** hierarchy level:

```
[edit snmp]
  client-list client-list-name {
    ip-addresses;
  }
```

You can configure a prefix list at the **[edit policy options]** hierarchy level. Support for prefix lists in the SNMP community configuration enables you to use a single list to configure the SNMP and routing policies. For more information about the **prefix-list**

statement, see the *Routing Policies, Firewall Filters, and Traffic Policers Feature Guide for Routing Devices*.

To add a client list or prefix list to an SNMP community, include the **client-list-name** statement at the **[edit snmp community *community-name*]** hierarchy level:

```
[edit snmp community community-name]
client-list-name client-list-name;
```

**NOTE:** The client list and prefix list must not have the same name.

The following example shows how to define a client list:

```
[edit]
snmp {
  client-list clientlist1 {
    10.1.1.1/32;
    10.2.2.2/32;
  }
}
```

The following example shows how to add a client list to an SNMP community:

```
[edit]
snmp {
  community community1 {
    authorization read-only;
    client-list-name clientlist1;
  }
}
```

The following example shows how to add a prefix list to an SNMP community:

```
[edit]
policy-options {
  prefix-list prefixlist {
    10.3.3.3/32;
    10.5.5.5/32;
  }
}
snmp {
  community community2 {
    client-list-name prefixlist;
  }
}
```

- Related Documentation**

  - [client-list-name on page 1910](#)

## Configuring the Interfaces on Which SNMP Requests Can Be Accepted

By default, all router or switch interfaces have SNMP access privileges. To limit the access through certain interfaces only, include the **interface** statement at the **[edit snmp]** hierarchy level:

```
[edit snmp]  
interface [ interface-names ];
```

Specify the names of any logical or physical interfaces that should have SNMP access privileges. Any SNMP requests entering the router or switch from interfaces not listed are discarded.

## Configuring MIB Views

SNMPv3 defines the concept of MIB views in RFC 3415, *View-based Access Control Model (VACM) for the Simple Network Management Protocol (SNMP)*. MIB views provide an agent better control over who can access specific branches and objects within its MIB tree. A view consists of a name and a collection of SNMP object identifiers, which are either explicitly included or excluded. Once defined, a view is then assigned to an SNMPv3 group or SNMPv1/v2c community (or multiple communities), automatically masking which parts of the agent's MIB tree members of the group or community can (or cannot) access.

By default, an SNMP community grants read access and denies write access to all supported MIB objects (even communities configured as **authorization read-write**). To restrict or grant read or write access to a set of MIB objects, you must configure a MIB view and associate the view with a community.

To create a MIB view and assign it to a community:

1. Configure a MIB view.

Although most network management systems use SNMPv3, Junos OS allows the use of MIB views with both SNMPv1 and SNMPv2c communities.

The **view** statement defines a MIB view and identifies a group of MIB objects. Each MIB object of a view has a common object identifier (OID) prefix. Each object identifier represents a subtree of the MIB object hierarchy. The subtree can be represented either by a sequence of dotted integers (such as 1.3.6.1.2.1.2) or by its subtree name (such as **interfaces**). A configuration statement uses a view to specify a group of MIB objects on which to define access. You can also use a wildcard character asterisk (\*) to include OIDs that match a particular pattern in the SNMP view. To enable a view, you must associate the view with a community.

To remove an OID completely, use the **delete view all oid oid-number** command but omit the **include** parameter.

```
[edit groups global snmp]  
user@host# set view view-name oid object-identifier (include | exclude)
```

The following example creates a MIB view called ping-mib-view. The **oid** statement does not require a dot at the beginning of the object identifier. The **snmp view** statement

includes the branch under the object identifier .1.3.6.1.2.1.80. This includes the entire DISMAN-PINGMIB subtree (as defined in RFC 2925, *Definitions of Managed Objects for Remote Ping, Traceroute, and Lookup Operations*), which effectively permits access to any object under that branch.

```
[edit groups global snmp]
user@host# set view ping-mib-view oid 1.3.6.1.2.1.80 include
```

The following example adds a second branch in the same MIB view.

```
[edit groups global snmp]
user@host# set view ping-mib-view oid jnxPingMIB include
```

2. Assign a MIB view to a community that you want to control.

```
[edit groups global snmp community community-name]
user@host# set view view-name
```

This example creates a new community ping-mib which has read-write access to create entries within the DISMAN-PING-MIB.

```
[edit groups global snmp community ping-mib]
user@host# set authorization read-write
```

This example associate the MIB view created earlier with the new community.

```
[edit groups global snmp community ping-mib]
user@host# set view ping-mib-view
```

3. At the top level of the configuration, apply the configuration group.

If you use a configuration group, you must apply it for it to take effect.

```
[edit]
user@host# set apply-groups global
```

4. Commit the configuration.

```
user@host# commit
```

5. To verify, make sure that any member of the ping-mib community has read/write access to the branches that you specified under ping-mib-view.

## Configuring RMON Alarms and Events

The Junos OS supports the *Remote Network Monitoring* (RMON) MIB (RFC 2819), which allows a management device to monitor the values of MIB objects, or variables, against configured thresholds. When the value of a variable crosses a threshold, an alarm and

its corresponding event are generated. The event can be logged and can generate an SNMP trap.

To configure RMON alarms and events using the CLI, perform these tasks:

1. [Configuring SNMP on page 6688](#)
2. [Configuring an Event on page 6688](#)
3. [Configuring an Alarm on page 6689](#)

---

## Configuring SNMP

To configure SNMP:

1. Grant read-only access to all SNMP clients:

```
[edit snmp]
user@switch# set community community-name authorization authorization
```

For example:

```
[edit snmp]
user@switch# set community public authorization read-only
```

2. Grant read-write access to the RMON and jnx-rmon MIBs:

```
[edit snmp]
user@switch# set view view-name oid object-identifier include
user@switch# set view view-name oid object-identifier include
user@switch# set community community-name authorization authorization view view-name
```

For example:

```
[edit snmp]
user@switch# set view rmon-mib-view oid .1.3.6.1.2.1.16 include
user@switch# set view rmon-mib-view oid .1.3.6.1.4.1.2636.13 include
user@switch# set community private authorization read-write view rmon-mib-view
```

OIDs 1.3.6.1.2.1.16 and 1.3.6.1.4.1.2636.13 correspond to the RMON and jnxRmon MIBs.

3. Configure an SNMP trap group:

```
[edit snmp]
user@switch# set trap-group group-name categories category
user@switch# set trap-group group-name targets address
```

For example:

```
[edit snmp]
user@switch# set trap-group rmon-trap-group categories rmon-alarm
user@switch# set trap-group rmon-trap-group targets 192.168.5.5
```

The trap group **rmon-trap-group** is configured to send RMON traps to 192.168.5.5.

---

## Configuring an Event

To configure an event:

1. Configure an event index, community name, and type:

```
[edit snmp rmon]
user@switch# set event index community community-name typetype
```

For example:

```
[edit snmp rmon]
```

```
user@switch# set event 1 community rmon-trap-group type log-and-trap
```

The event community corresponds to the SNMP trap group and is not the same as an SNMP community. This event generates an SNMP trap and adds an entry to the **logTable** in the RMON MIB.

2. Configure a description for the event:

```
[edit snmp rmon]
user@switch# set event index description description
```

For example:

```
[edit snmp rmon]
user@switch# set event 1 description "rmon event"
```

## Configuring an Alarm

To configure an alarm:

1. Configure an alarm index, the variable to monitor, the rising and falling thresholds, and the corresponding rising and falling events:

```
[edit snmp rmon]
user@switch# set alarm index variable oid-variable falling-threshold integer rising-threshold integer rising-event-index index falling-event-index index
```

For example:

```
[edit snmp rmon]
user@switch# set alarm 5 variable .1.3.6.1.4.1.2636.3.1.13.1.8.9.1.0.0 falling-threshold 75 rising-threshold 90 rising-event-index 1 falling-event-index 1
```

The variable **.1.3.6.1.4.1.2636.3.1.13.1.8.9.1.0.0** corresponds to the **jnxRmon** MIB object **jnxOperatingCPU**, which represents the CPU utilization of the Routing Engine. The falling and rising threshold integers are 75 and 90. The rising and falling events both generate the same event (event index 1).

2. Configure the sample interval and type and the alarm type:

```
[edit snmp rmon]
user@switch# set alarm index interval seconds sample-type (absolute-value | delta-value) startup-alarm (falling-alarm | rising-alarm | rising-or-falling-alarm)
```

For example:

```
[edit snmp rmon]
user@switch# set alarm 5 interval 30 sample-type absolute-value startup-alarm rising-or-falling-alarm
```

The absolute value of the monitored variable is sampled every 30 seconds. The initial alarm can occur because of rising above the rising threshold or falling below the falling threshold.

## Configuring Health Monitoring

This topic describes how to configure the health monitor feature for QFX Series devices.

The health monitor feature extends the SNMP RMON alarm infrastructure to provide predefined monitoring for a selected set of object instances (such as file system usage, CPU usage, and memory usage) and dynamic object instances (such as Junos OS processes).

To configure health monitoring:

1. Configure the health monitor:

```
[edit snmp]
user@switch# set health-monitor
```

2. Configure the falling threshold:

```
[edit snmp]
user@switch# set health-monitor falling-threshold percentage
```

For example:

```
user@switch# set health-monitor falling-threshold 85
```

3. Configure the rising threshold:

```
[edit snmp]
user@switch# set health-monitor rising-threshold percentage
```

For example:

```
user@switch# set health-monitor rising-threshold 75
```

4. Configure the interval:

```
[edit snmp]
user@switch# set health-monitor interval seconds
```

For example:

```
user@switch# set health-monitor interval 600
```

### Related Documentation

## Creating SNMPv3 Users

For each SNMPv3 user, you can specify the username, authentication type, authentication password, privacy type, and privacy password. After a user enters a password, a key based on the engine ID and password is generated and is written to the configuration file. After the generation of the key, the password is deleted from this configuration file.

**NOTE:** You can configure only one encryption type for each SNMPv3 user.

To create users, include the **user** statement at the **[edit snmp v3 usm local-engine]** hierarchy level:

```
[edit snmp v3 usm local-engine]
user username;
```

**username** is the name that identifies the SNMPv3 user.

To configure user authentication and encryption, include the following statements at the **[edit snmp v3 usm local-engine user username]** hierarchy level:

```
[edit snmp v3 usm local-engine user username]
authentication-md5 {
  authentication-password authentication-password;
}
authentication-sha {
  authentication-password authentication-password;
}
authentication-none;
privacy-aes128 {
  privacy-password privacy-password;
}
privacy-des {
  privacy-password privacy-password;
}
privacy-3des {
  privacy-password privacy-password;
}
privacy-none;
```

#### Related Documentation

## Configuring Access Privileges for a Group

In SNMPv3, you can configure a group that sets the same access privileges for one or more users. Configuring a group includes defining the security model and security level, and associating one or more MIB view permissions for the group.

**NOTE:** You must associate at least one MIB view with the group. You can associate multiple MIB views (read, notify, write) to authorize different permissions based on the view. The view name cannot exceed 32 characters.

To configure access privileges for a group:

1. To configure the group:

```
[edit snmp v3 vacm access]
user@switch# edit group group-name
```

2. To configure the context prefix of the SNMP instance for the group:

```
[edit snmp v3 vacm access group group-name]
user@switch# edit (default-context-prefix | context-prefix context-prefix)
```

For example, to configure the default context prefix:

```
[edit snmp v3 vacm access group group-name]
user@switch# edit default-context-prefix
```

3. To configure the security model:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix context-prefix)]
user@switch# edit security-model (any | usm | v1 | v2c)
```

For example, to configure the SNMPv3 user-based security model (USM):

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix context-prefix)]
user@switch# edit security-model usm
```

4. To configure the security level:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix context-prefix) security-model (any | usm | v1 | v2c)]
user@switch# edit security-level (authentication | none | privacy)
```

For example, to configure a security level requiring user authentication and encryption:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix context-prefix) security-model (any | usm | v1 | v2c)]
user@switch# edit security-level privacy
```

**NOTE:** Access privileges are granted to all packets with a security level equal to or greater than that configured. If you are configuring the SNMPv1 or v2c security model, use *none* as your security level. If you are configuring the SNMPv3 security model (USM), use the *authentication*, *none*, or *privacy* security level.

5. (Optional) To associate a read-only MIB view with an SNMP group:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication |
none | privacy)]
user@switch# edit read-view view-name
```

6. (Optional) To associate a MIB view with an SNMP notification permission for an SNMP group:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication |
none | privacy)]
user@switch# edit notify-view view-name
```

7. (Optional) To associate a MIB view with write permission for an SNMP group:

```
[edit snmp v3 vacm access group group-name (default-context-prefix | context-prefix
context-prefix) security-model (any | usm | v1 | v2c) security-level (authentication |
none | privacy)]
user@switch# edit write-view view-name
```

## Assigning a Security Name to a Group

In SNMPv3, each username is associated with a security name. The security name, together with the SNMP engine ID, is included in SNMP messages to ensure messaging security.

Before you assign a security name to a group, first create the security name. For an SNMPv3 client, the security name is the username configured at the **[edit snmp v3 usm local-engine user *username*]** hierarchy level. For SNMPv1 or v2c clients, the security name is the community string configured at the **[edit snmp v3 snmp-community *community-index*]** hierarchy level.

Assigning a security name to a group includes configuring a security model for the group, assigning the security name to the group, and configuring the group.

To assign an SNMP security name to a group:

1. To configure a security model for the group:

```
[edit snmp v3 vacm security-to-group]
user@switch# edit security-model (usm | v1 | v2c)
```

For example, to configure the SNMPv3 user-based security model (USM):

```
[edit snmp v3 vacm security-to-group]
user@switch# edit security-model usm
```

2. To associate the security name with a group:

```
[edit snmp v3 vacm security-to-group security-model (usm | v1 | v2c)]
user@switch# edit security-name security-name
```

3. To configure a group of SNMPv3 security names with the same security policy:

```
[edit snmp v3 vacm security-to-group security-model (usm | v1 | v2c) security-name
security-name]
user@switch# edit group group-name
```

## Configuring SNMPv3 Traps on a Device Running Junos OS

In SNMPv3, you create traps and informs by configuring the **notify**, **target-address**, and **target-parameters** parameters. Traps are unconfirmed notifications, whereas informs are confirmed notifications. This section describes how to configure SNMP traps. For information about configuring SNMP informs, see [“Configuring SNMP Informs” on page 6695](#).

The target address defines a management application’s address and parameters to be used in sending notifications. Target parameters define the message processing and security parameters that are used in sending notifications to a particular management target. SNMPv3 also lets you define SNMPv1 and SNMPv2c traps.

**NOTE:** When you configure SNMP traps, make sure your configured access privileges allow the traps to be sent. Access privileges are configured at the `[edit snmp v3 vacm access]` and `[edit snmp v3 vacm security-to-group]` hierarchy levels.

To configure SNMP traps, include the following statements at the `[edit snmp v3]` hierarchy level:

```
[edit snmp v3]
  notify name {
    tag tag-name;
    type trap;
  }
  notify-filter name {
    oid object-identifier (include | exclude);
  }
```

```

target-address target-address-name {
    address address;
    address-mask address-mask;
    logical-system (SNMP) logical-system;
    port port-number;
    routing-instance instance;
    tag-list tag-list;
    target-parameters target-parameters-name;
}
target-parameters target-parameters-name {
    notify-filter profile-name;
    parameters {
        message-processing-model (v1 | v2c | v3);
        security-level (authentication | none | privacy);
        security-model (usm | v1 | v2c);
        security-name security-name;
    }
}

```

## Configuring SNMP Informs

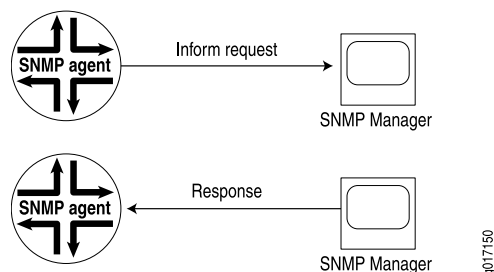

Junos OS supports two types of notifications: traps and informs. With traps, the receiver does not send any acknowledgment when it receives a trap. Therefore, the sender cannot determine if the trap was received. A trap may be lost because a problem occurred during transmission. To increase reliability, an inform is similar to a trap except that the inform is stored and retransmitted at regular intervals until one of these conditions occurs:

- The receiver (target) of the inform returns an acknowledgment to the SNMP agent.
- A specified number of unsuccessful retransmissions have been attempted and the agent discards the inform message.

If the sender never receives a response, the inform can be sent again. Thus, informs are more likely to reach their intended destination than traps are. Informs use the same communications channel as traps (same socket and port) but have different protocol data unit (PDU) types.

Informs are more reliable than traps, but they consume more network, router, and switch resources (see [Figure 249 on page 6696](#)). Unlike a trap, an inform is held in memory until a response is received or the timeout is reached. Also, traps are sent only once, whereas an inform may be retried several times. Use informs when it is important that the SNMP manager receive all notifications. However, if you are more concerned about network traffic, or router and switch memory, use traps.

**Figure 249: Inform Request and Response**

For information about configuring SNMP traps, see “[Configuring SNMPv3 Traps on a Device Running Junos OS](#)” on page 6694.

## Junos OS Minimum System Logging Configuration

To record or view system log messages, you must include the **syslog** statement at the **[edit system]** hierarchy level. Specify at least one destination for the messages, as described in [Table 605 on page 6697](#). For more information about the configuration statements, see *Single-Chassis System Logging Configuration Overview*.

**Table 605: Minimum Configuration Statements for System Logging**

| Destination                                                        | Minimum Configuration Statements                                                                |
|--------------------------------------------------------------------|-------------------------------------------------------------------------------------------------|
| File                                                               | <pre>[edit system syslog] file filename {   facility severity; }</pre>                          |
| Terminal session of one, several, or all users                     | <pre>[edit system syslog] user (username   *) {   facility severity; }</pre>                    |
| Router or switch console                                           | <pre>[edit system syslog] console {   facility severity; }</pre>                                |
| Remote machine or the other Routing Engine on the router or switch | <pre>[edit system syslog] host (hostname   other-routing-engine) {   facility severity; }</pre> |

## Junos OS System Log Configuration Statements

To configure the switch to log system messages, include the **syslog** statement at the **[edit system]** hierarchy level:

```
[edit system]
syslog {
  archive <files number> <size size> <world-readable | no-world-readable>;
  console {
    facility severity;
  }
  file filename {
    facility severity;
    archive <archive-sites (ftp-url <password password>)> <files number> <size size>
      <start-time "YYYY-MM-DD.hh:mm"> <transfer-interval minutes> <world-readable |
      no-world-readable>;
    explicit-priority;
    match "regular-expression";
    structured-data {
      brief;
    }
  }
  host hostname {
    facility severity;
    explicit-priority;
    facility-override facility;
    log-prefix string
    match "regular-expression";
  }
  source-address source-address;
  time-format (year | millisecond | year millisecond);
  user (username | *) {
    facility severity;
    match "regular-expression";
  }
}
```

**Related Documentation**

- [Overview of Junos OS System Log Messages on page 6642](#)

## Adding a Text String to System Log Messages Directed to a Remote Destination

To add a text string to every system log message directed to a remote machine or to the other Routing Engine, include the **log-prefix** statement at the **[edit system syslog host]** hierarchy level:

```
[edit system syslog host (hostname | other-routing-engine)]
facility severity;
log-prefix string;
```

The string can contain any alphanumeric or special character except the equal sign ( = ) and the colon ( : ). It also cannot include the space character; do not enclose the string in quotation marks ( " ") in an attempt to include spaces in it.

The Junos OS system logging utility automatically appends a colon and a space to the specified string when the system log messages are written to the log. The string is inserted after the identifier for the Routing Engine that generated the message.

The following example shows how to add the string M120 to all messages to indicate that the router is an M120 router, and direct the messages to the remote machine hardware-logger.mycompany.com:

```
[edit system syslog]
host hardware-logger.mycompany.com {
  any info;
  log-prefix M120;
}
```

When these configuration statements are included on an M120 router called origin1, a message in the system log on hardware-logger.mycompany.com looks like the following:

```
Mar 9 17:33:23 origin1 M120: mgd[477]: UI_CMDLINE_READ_LINE: user 'root', command 'run
show version'
```

- [Overview of Single-Chassis System Logging Configuration on page 6643](#)

## Directing System Log Messages to a Log File

To direct system log messages to a file in the `/var/log` directory of the local Routing Engine, include the `file` statement at the `[edit system syslog]` hierarchy level:

```
[edit system syslog]
file filename {
  facility severity;
  archive <archive-sites (ftp-url <password password>) > <files number> <size size>
    <start-time "YYYY-MM-DD.hh:mm"> <transfer-interval minutes> <world-readable |
    no-world-readable>;
  explicit-priority;
  match "regular-expression";
  structured-data {
    brief;
  }
}
```

For the list of facilities and severity levels, see *Specifying the Facility and Severity of Messages to Include in the Log*.

To prevent log files from growing too large, the Junos OS system logging utility by default writes messages to a sequence of files of a defined size. By including the `archive` statement, you can configure the number of files, their maximum size, and who can read them, either for all log files or for a certain log file. For more information, see [“Specifying Log File Size, Number, and Archiving Properties” on page 6710](#).

For information about the following statements, see the indicated sections:

- `explicit-priority`—See [“Including Priority Information in System Log Messages” on page 6703](#)
- `match`—See [“Using Regular Expressions to Refine the Set of Logged Messages” on page 6717](#)

- **structured-data**—See *Logging Messages in Structured-Data Format*

**Related Documentation**

- [Logging Messages in Structured-Data Format on page 6705](#)
- *Examples: Configuring System Logging*
- [Examples: Configuring System Logging on page 6647](#)

## Directing System Log Messages to a Remote Machine

To direct system log messages to a remote machine, include the **host** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
host (hostname | other-routing-engine) {
    facility severity;
    explicit-priority;
    facility-override facility;
    log-prefix string;
    match "regular-expression";
}
source-address source-address;
```

To direct system log messages to a remote machine, include the **host hostname** statement to specify the remote machine's IP version 4 (IPv4) address or fully qualified hostname. The remote machine must be running the standard **syslogd** utility. We do not recommend directing messages to another Juniper Networks switch. In each system log message directed to the remote machine, the hostname of the local Routing Engine appears after the timestamp to indicate that it is the source for the message.

For the list of logging facilities and severity levels to configure under the **host** statement, see *Specifying the Facility and Severity of Messages to Include in the Log*.

To record facility and severity level information in each message, include the **explicit-priority** statement. For more information, see [“Including Priority Information in System Log Messages” on page 6703](#).

For information about the **match** statement, see [“Using Regular Expressions to Refine the Set of Logged Messages” on page 6717](#).

When directing messages to remote machines, you can include the **source-address** statement to specify the IP address of the switch that is reported in the messages as their source. In each **host** statement, you can also include the **facility-override** statement to assign an alternative facility and the **log-prefix** statement to add a string to each message.

**Related Documentation**

- [Overview of Single-Chassis System Logging Configuration on page 6643](#)

## Directing System Log Messages to a User Terminal

To direct system log messages to the terminal session of one or more specific users (or all users) when they are logged in to the local Routing Engine, include the **user** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
user (username | *) {
    facility severity;
    match "regular-expression";
}
```

Specify one or more Junos OS usernames, separating multiple values with spaces, or use the asterisk (\*) to indicate all users who are logged in to the local Routing Engine.

For the list of logging facilities and severity levels, see *Specifying the Facility and Severity of Messages to Include in the Log*. For information about the **match** statement, see [“Using Regular Expressions to Refine the Set of Logged Messages” on page 6717](#).

- [Examples: Configuring System Logging on page 6647](#)

## Directing System Log Messages to the Console

To direct system log messages to the console of the local Routing Engine, include the **console** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
console {
    facility severity;
}
```

For the list of logging facilities and severity levels, see *Specifying the Facility and Severity of Messages to Include in the Log*.

- [Examples: Configuring System Logging on page 6647](#)

## Disabling the System Logging of a Facility

To disable the logging of messages that belong to a particular facility, include the **facility none** statement in the configuration. This statement is useful when, for example, you want to log messages that have the same severity level and belong to all but a few facilities. Instead of including a statement for each facility you want to log, you can include

the **any severity** statement and then a **facility none** statement for each facility that you do not want to log. For example, the following logs all messages at the **error** level or higher to the console, except for messages from the **daemon** and **kernel** facilities. Messages from those facilities are logged to the file **>/var/log/internals** instead:

```
[edit system syslog]
console {
  any error;
  daemon none;
  kernel none;
}
file internals {
  daemon info;
  kernel info;
}
```

- Related Documentation**
- [Single-Chassis System Logging Configuration Overview](#)

## Displaying a Log File from a Single-Chassis System

To display a log file stored on a single-chassis system, enter Junos OS CLI operational mode and issue the following commands:

```
user@switch> show log log-filename
user@switch> file show log-file-pathname
```

By default, the commands display the file stored on the local Routing Engine.

The following example shows the output from the **show log messages** command:

```
user@switch1> show log messages
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 1
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 2
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 3
...
Nov  4 11:52:53 switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon memory usage (Management
process): new instance detected (variable: sysAppElemRunMemory.5.6.2293)
Nov  4 11:52:53 switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon memory usage (Command-line
interface): new instance detected (variable: sysAppElemRunMemory.5.8.2292)
...
Nov  4 12:08:30 switch1 rpdf[957]: task_connect: task BGP_100.10.10.1.6+179 addr
10.10.1.6+179: Can't assign requested
address
Nov  4 12:08:30 switch1 rpdf[957]: bgp_connect_start: connect 10.10.1.6 (Internal
AS 100): Can't assign requested address
Nov  4 12:10:24 switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
'exit '
Nov  4 12:10:27 switch1 mgd[2293]: UI_DBASE_LOGOUT_EVENT: User 'jsmith' exiting
configuration mode
```

```
Nov  4 12:10:31 switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
'show log messages'
```

The following example shows the output from the **file show** command. The file in the pathname **/var/log/processes** has been previously configured to include messages from the daemon facility.

```
user@switch1> file show /var/log/processes
Feb 22 08:58:24 switch1 snmpd[359]: SNMPD_TRAP_WARM_START: trap_generate_warm:
SNMP trap: warm start
Feb 22 20:35:07 switch1 snmpd[359]: SNMPD_THROTTLE_QUEUE_DRAINED:
trap_throttle_timer_handler: cleared all throttled traps
Feb 23 07:34:56 switch1 snmpd[359]: SNMPD_TRAP_WARM_START: trap_generate_warm:
SNMP trap: warm start
Feb 23 07:38:19 switch1 snmpd[359]: SNMPD_TRAP_COLD_START: trap_generate_cold:
SNMP trap: cold start
...
```

- [Interpreting Messages Generated in Structured-Data Format on page 6706](#)

## Including Priority Information in System Log Messages

The facility and severity level of a message are together referred to as its *priority*. By default, messages logged in the standard Junos OS format do not include information about priority. To include priority information in standard-format messages directed to a file, include the **explicit-priority** statement at the **[edit system syslog file *filename*]** hierarchy level:

```
[edit system syslog file filename]
  facility severity;
  explicit-priority;
```

**NOTE:** Messages logged in structured-data format include priority information by default. If you include the **structured-data** statement at the **[edit system syslog file *filename*]** hierarchy level along with the **explicit-priority** statement, the **explicit-priority** statement is ignored and messages are logged in structured-data format.

For information about the **structured-data** statement, see *Logging Messages in Structured-Data Format*. For information about the contents of a structured-data message, see the *Junos OS System Log Messages Reference*.

To include priority information in messages directed to a remote machine or the other Routing Engine, include the **explicit-priority** statement at the **[edit system syslog host (*hostname* | other-routing-engine)]** hierarchy level:

```
[edit system syslog host (hostname | other-routing-engine)]
  facility severity;
  explicit-priority;
```

**NOTE:** The `other-routing-engine` option does not apply to the QFX Series.

The priority recorded in a message always indicates the original, local facility name. If the **facility-override** statement is included for messages directed to a remote destination, the Junos OS system logging utility still uses the alternative facility name for the messages themselves when directing them to the remote destination. For more information, see [“Changing the Alternative Facility Name for System Log Messages Directed to a Remote Destination” on page 6715](#).

When the **explicit-priority** statement is included, the Junos OS logging utility prepends codes for the facility name and severity level to the message tag name, if the message has one:

*FACILITY-severity[-TAG]*

(The tag is a unique identifier assigned to some Junos OS system log messages; for more information, see the *Junos OS System Log Messages Reference*.)

In the following example, the **CHASSISD\_PARSE\_COMPLETE** message belongs to the **daemon** facility and is assigned severity **info** (6):

```
Aug 21 12:36:30 router1 chassisd[522]: %DAEMON-6-CHASSISD_PARSE_COMPLETE:
Using new configuration
```

When the **explicit-priority** statement is not included, the priority does not appear in the message:

```
Aug 21 12:36:30 router1 chassisd[522]: CHASSISD_PARSE_COMPLETE: Using new
configuration
```

For more information about message formatting, see the *Junos OS System Log Messages Reference*.

- [Single-Chassis System Logging Configuration Overview](#)
- [Overview of Single-Chassis System Logging Configuration on page 6643](#)
- [Examples: Configuring System Logging](#)

## Including the Year or Millisecond in Timestamps

By default, the timestamp recorded in a standard-format system log message specifies the month, date, hour, minute, and second when the message was logged, as in the following example:

```
Aug 21 15:36:30
```

To include the year, the millisecond, or both, in the timestamp, include the **time-format** statement at the **[edit system syslog]** hierarchy level:

```
[edit system syslog]
time-format (year | millisecond | year millisecond);
```

The modified timestamp is used in messages directed to each destination configured by a **file**, **console**, or **user** statement at the **[edit system syslog]** hierarchy level, but not to destinations configured by a **host** statement.

The following example illustrates the format for a timestamp that includes both the millisecond (401) and the year (2010):

```
Aug 21 15:36:30.401 2010
```

**NOTE:** By default, messages logged in structured-data format include the year and millisecond. If you include the **structured-data** statement at the **[edit system syslog file *filename*]** hierarchy level along with the **time-format** statement, the **time-format** statement is ignored and messages are logged in structured-data format.

For information about the **structured-data** statement, see [“Logging Messages in Structured-Data Format” on page 6705](#). For information about interpreting messages in a structured-data format, see [“Interpreting Messages Generated in Structured-Data Format” on page 6706](#).

## Logging Messages in Structured-Data Format

You can log messages to a file in structured-data format instead of the standard Junos OS format. The structured-data format provides more information without adding significant length, and makes it easier for automated applications to extract information from a message.

The structured-data format complies with Internet draft **draft-ietf-syslog-protocol-21.txt**. The draft establishes a standard message format regardless of the source or transport protocol for logged messages.

To output messages to a file in structured-data format, include the **structured-data** statement at the **[edit system syslog file *filename*]** hierarchy level:

```
[edit system syslog file filename]
  facility severity;
  structured-data {
    brief;
  }
```

The optional **brief** statement suppresses the English-language text that appears by default at the end of a message to describe the error or event. For information about the fields in a structured-data-format message, see [“Interpreting Messages Generated in Structured-Data Format” on page 6706](#).

The structured format is used for all messages logged to the file that are generated by a Junos OS process or software library.

**NOTE:** If you include either or both of the **explicit-priority** and **time-format** statements along with the **structured-data** statement, they are ignored. These statements apply to the standard Junos OS system log format, not to structured-data format.

## Interpreting Messages Generated in Structured-Data Format

By default, Junos OS processes and software libraries write messages to the system log file in structured-data format. For information about the **structured-data** statement, see *Logging Messages in Structured-Data Format*.

Structured-format makes it easier for automated applications to extract information from the message. In particular, the standardized format for reporting the value of variables (elements in the English-language message that vary depending on the circumstances that triggered the message) makes it easy for an application to extract those values.

The structured-data format for a message includes the following fields (which appear here on two lines only for legibility):

```
<priority code>version timestamp hostname process processID TAG [junos@2636.platform
variable-value-pairs] message-text
```

Table 606 on page 6706 describes the fields. If the system logging utility cannot determine the value in a particular field, a hyphen ( - ) appears instead.

**Table 606: Fields in Structured-Data Messages**

| Field                        | Description                                                                                                                                                                                                                                                                                                                    | Examples                                                                                                 |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------|
| <b>&lt;priority code&gt;</b> | Number that indicates the facility and severity of a message. It is calculated by multiplying the facility number by 8 and then adding the numerical value of the severity. For a mapping of the numerical codes to facility and severity, see <i>Specifying the Facility and Severity of Messages to Include in the Log</i> . | <165> for a message from the <b>pfe</b> facility (facility=20) with severity <b>notice</b> (severity=5). |
| <b>version</b>               | Version of the Internet Engineering Task Force (IETF) system logging protocol specification.                                                                                                                                                                                                                                   | 1 for the initial version                                                                                |

Table 606: Fields in Structured-Data Messages (*continued*)

| Field                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Examples                                                                                                                                                                        |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>timestamp</i>            | Time when the message was generated, in one of two representations: <ul style="list-style-type: none"> <li>• <i>YYYY-MM-DDTHH:MM:SS.MSZ</i> is the year, month, day, hour, minute, second and millisecond in Universal Coordinated Time (UTC)</li> <li>• <i>YYYY-MM-DDTHH:MM:SS.MS+/-HH:MM</i> is the year, month, day, hour, minute, second and millisecond in local time; the hour and minute that follows the plus sign (+) or minus sign (-) is the offset of the local time zone from UTC</li> </ul> | 2007-02-15T09:17:15.719Z<br>is 9:17 AM UTC on 15 February 2007.<br>2007-02-15T01:17:15.719-08:00 is the same timestamp expressed as Pacific Standard Time in the United States. |
| <i>hostname</i>             | Name of the host that originally generated the message.                                                                                                                                                                                                                                                                                                                                                                                                                                                   | switch1                                                                                                                                                                         |
| <i>process</i>              | Name of the Junos OS process that generated the message.                                                                                                                                                                                                                                                                                                                                                                                                                                                  | mgd                                                                                                                                                                             |
| <i>processID</i>            | UNIX process ID (PID) of the Junos process that generated the message.                                                                                                                                                                                                                                                                                                                                                                                                                                    | 3046                                                                                                                                                                            |
| <i>TAG</i>                  | Junos OS system log message tag, which uniquely identifies the message.                                                                                                                                                                                                                                                                                                                                                                                                                                   | UI_DBASE_LOGOUT_EVENT                                                                                                                                                           |
| <i>junos@2636.platform</i>  | An identifier for the type of hardware platform that generated the message. The <i>junos@2636</i> prefix indicates that the platform runs the Junos OS. It is followed by a dot-separated numerical identifier for the platform type.                                                                                                                                                                                                                                                                     | junos@2636.1.1.1.2.18                                                                                                                                                           |
| <i>variable-value-pairs</i> | A variable-value pair for each element in the <i>message-text</i> string that varies depending on the circumstances that triggered the message. Each pair appears in the format <i>variable</i> = " <i>value</i> ".                                                                                                                                                                                                                                                                                       | username="regress"                                                                                                                                                              |
| <i>message-text</i>         | English-language description of the event or error (omitted if the brief statement is included at the [edit system syslog file <i>filename</i> structured-data] hierarchy level).                                                                                                                                                                                                                                                                                                                         | User 'regress' exiting configuration mode                                                                                                                                       |

By default, the structured-data version of a message includes English text at the end, as in the following example (which appears on multiple lines only for legibility):

```
<165>1 2007-02-15T09:17:15.719Z router1 mgd 3046 UI_DBASE_LOGOUT_EVENT
[junos@2636.1.1.1.2.18 username="regress"] User 'regress' exiting configuration mode
```

When the brief statement is included at the [edit system syslog file *filename* structured-data ] hierarchy level, the English text is omitted, as in this example:

```
<165>1 2007-02-15T09:17:15.719Z router1 mgd 3046 UI_DBASE_LOGOUT_EVENT
[junos@2636.1.1.1.2.18 username="regress"]
```

Table 607 on page 6708 maps the codes that appear in the *priority-code* field to facility and severity level.

**NOTE:** Not all of the facilities and severities listed in Table 607 on page 6708 can be included in statements at the [edit system syslog] hierarchy level (some are used by internal processes). For a list of the facilities and severity levels that can be included in the configuration, see *Specifying the Facility and Severity of Messages to Include in the Log*.

Table 607: Facility and Severity Codes in the priority-code Field

| Facility (number)          | Severity<br>emergency | alert | critical | error | warning | notice | info | debug |
|----------------------------|-----------------------|-------|----------|-------|---------|--------|------|-------|
| kernel (0)                 | 1                     | 1     | 2        | 3     | 4       | 5      | 6    | 7     |
| user (1)                   | 8                     | 9     | 10       | 11    | 12      | 13     | 14   | 15    |
| mail (2)                   | 16                    | 17    | 18       | 19    | 20      | 21     | 22   | 23    |
| daemon (3)                 | 24                    | 25    | 26       | 27    | 28      | 29     | 30   | 31    |

## Interpreting Messages Generated in Standard Format

The syntax of a standard-format message generated by a Junos OS process or subroutine library depends on whether it includes priority information:

- When the **explicit-priority** statement is included at the `[edit system syslog file filename]` or `[edit system syslog host hostname]` hierarchy level, a system log message has the following syntax:

```
timestamp message-source: %facility-severity-TAG: message-text
```

- When directed to the console or to users, or when the **explicit-priority** statement is not included for files or remote hosts, a system log message has the following syntax:

```
timestamp message-source: TAG: message-text
```

Table 608 on page 6709 describes the message fields.

**Table 608: Fields in Standard-Format Messages**

| Field                 | Description                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <i>timestamp</i>      | Time at which the message was logged.                                                                                                                                                                                                                                                                                                                                                           |
| <i>message-source</i> | Identifier of the process or component that generated the message and the routing platform on which the message was logged. This field includes two or more subfields: hostname, process and process ID (PID). If the process does not report its PID, the PID is not displayed. The message source subfields are displayed in the following format:<br><br><i>hostname process[process-ID]</i> |
| <i>facility</i>       | Code that specifies the facility to which the system log message belongs. For a mapping of codes to facility names, see Table: <b>Facility Codes Reported in Priority Information</b> in “Including Priority Information in System Log Messages” on page 6703.                                                                                                                                  |

Table 608: Fields in Standard-Format Messages (*continued*)

| Field               | Description                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>severity</b>     | Numerical code that represents the severity level assigned to the system log message. For a mapping of codes to severity names, see Table: <b>Numerical Codes for Severity Levels Reported in Priority Information</b> in “Including Priority Information in System Log Messages” on page 6703.                                                                                                 |
| <b>TAG</b>          | Text string that uniquely identifies the message, in all uppercase letters and using the underscore (_) to separate words. The tag name begins with a prefix that indicates the generating software process or library. The entries in this reference are ordered alphabetically by this prefix.<br><br>Not all processes on a routing platform use tags, so this field does not always appear. |
| <b>message-text</b> | Text of the message.                                                                                                                                                                                                                                                                                                                                                                            |

## Specifying Log File Size, Number, and Archiving Properties

To prevent log files from growing too large, by default the Junos system logging utility writes messages to a sequence of files of a defined size. The files in the sequence are referred to as *archive* files to distinguish them from the *active* file to which messages are currently being written. The default maximum size depends on the platform type:

- 128 kilobytes (KB) for EX Series switches and J Series routers
- 1 megabyte (MB) for M Series, MX Series, and T Series routers
- 10 MB for TX Matrix or TX Matrix Plus routers
- 1 MB for the QFX Series

When an active log file called **logfile** reaches the maximum size, the logging utility closes the file, compresses it, and names the compressed archive file **logfile.0.gz**. The logging utility then opens and writes to a new active file called **logfile**. This process is also known as file rotation. When the new **logfile** reaches the configured maximum size, **logfile.0.gz** is renamed **logfile.1.gz**, and the new **logfile** is closed, compressed, and renamed **logfile.0.gz**. By default, the logging utility creates up to 10 archive files in this manner. When the maximum number of archive files is reached and when the size of the active file reaches the configured maximum size, the contents of the last archived file are overwritten by the current active file. The logging utility by default also limits the users who can read log files to the **root** user and users who have the Junos OS **maintenance** permission.

Junos OS provides a configuration statement **log-rotate-frequency** that configures the system log file rotation frequency by configuring the time interval for checking the log file size. The frequency can be set to a value of 1 minute through 59 minutes. The default frequency is 15 minutes.

To configure the log rotation frequency, include the **log-rotate-frequency** statement at the **[edit system syslog]** hierarchy level.

You can include the **archive** statement to change the maximum size of each file, how many archive files are created, and who can read log files.

To configure values that apply to all log files, include the **archive** statement at the **[edit system syslog]** hierarchy level:

```
archive <files number> <size size> <world-readable | no-world-readable>;
```

To configure values that apply to a specific log file, include the **archive** statement at the **[edit system syslog file *filename*]** hierarchy level:

```
archive <archive-sites (ftp-url <password password>)> <files number> <size size>  
<start-time "YYYY-MM-DD.hh:mm"> <transfer-interval minutes> <world-readable |  
no-world-readable>;
```

**archive-sites *site-name*** specifies a list of archive sites that you want to use for storing files. The ***site-name*** value is any valid FTP URL to a destination. If more than one site name is configured, a list of archive sites for the system log files is created. When a file is archived, the router or switch attempts to transfer the file to the first URL in the list, moving to the next site only if the transfer does not succeed. The log file is stored at the archive site with the specified log filename. For information about how to specify valid FTP URLs, see [“Format for Specifying Filenames and URLs in Junos OS CLI Commands” on page 50](#).

**binary-data** Mark file as containing binary data. This allows proper archiving of binary files, such as WTMP files (login records for UNIX based systems). To restore the default setting, include the **no-binary-data** statement.

**files *number*** specifies the number of files to create before the oldest file is overwritten. The value can be from 1 through 1000.

**size *size*** specifies the maximum size of each file. The value can be from 64 KB (64k) through 1 gigabyte (1g); to represent megabytes, use the letter **m** after the integer. There is no space between the digits and the **k**, **m**, or **g** units letter.

**start-time "YYYY-MM-DD.hh:mm"** defines the date and time in the local time zone for a one-time transfer of the active log file to the first reachable site in the list of sites specified by the **archive-sites** statement.

**transfer-interval *interval*** defines the amount of time the current log file remains open (even if it has not reached the maximum possible size) and receives new statistics before it is closed and transferred to an archive site. This interval value can be from 5 through 2880 minutes.

**world-readable** enables all users to read log files. To restore the default permissions, include the **no-world-readable** statement.

## Specifying the Facility and Severity of Messages to Include in the Log

Each system log message belongs to a *facility*, which is a group of messages that are either generated by the same software process or concern a similar condition or activity (such as authentication attempts). Each message is also preassigned a *severity level*, which indicates how seriously the triggering event affects router functions.

When you configure logging for a facility and destination, you specify a severity level for each facility. Messages from the facility that are rated at that level or higher are logged to the destination:

```
[edit system syslog]
(console | file filename | host destination | user username) {
  facility severity;
}
```

## Junos OS System Logging Facilities and Message Severity Levels

Table 609 on page 6712 lists the Junos system logging facilities that you can specify in configuration statements at the **[edit system syslog]** hierarchy level.

**Table 609: Junos OS System Logging Facilities**

| Facility                    | Type of Event or Error                                                                                                                            |
|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>any</b>                  | All (messages from all facilities)                                                                                                                |
| <b>authorization</b>        | Authentication and authorization attempts                                                                                                         |
| <b>change-log</b>           | Changes to the Junos OS configuration                                                                                                             |
| <b>conflict-log</b>         | Specified configuration is invalid on the router type                                                                                             |
| <b>daemon</b>               | Actions performed or errors encountered by system processes                                                                                       |
| <b>dfc</b>                  | Events related to dynamic flow capture                                                                                                            |
| <b>firewall</b>             | Packet filtering actions performed by a firewall filter                                                                                           |
| <b>ftp</b>                  | Actions performed or errors encountered by the FTP process                                                                                        |
| <b>interactive-commands</b> | Commands issued at the Junos OS command-line interface (CLI) prompt or by a client application such as a Junos XML protocol or NETCONF XML client |

Table 609: Junos OS System Logging Facilities (*continued*)

| Facility      | Type of Event or Error                                                  |
|---------------|-------------------------------------------------------------------------|
| <b>kernel</b> | Actions performed or errors encountered by the Junos OS kernel          |
| <b>pfe</b>    | Actions performed or errors encountered by the Packet Forwarding Engine |
| <b>user</b>   | Actions performed or errors encountered by user-space processes         |

Table 610 on page 6713 lists the severity levels that you can specify in configuration statements at the **[edit system syslog]** hierarchy level. The levels from **emergency** through **info** are in order from highest severity (greatest effect on functioning) to lowest.

Unlike the other severity levels, the **none** level disables logging of a facility instead of indicating how seriously a triggering event affects routing functions. For more information, see “Disabling the System Logging of a Facility” on page 6701.

Table 610: System Log Message Severity Levels

| Severity Level   | Description                                                                                                             |
|------------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>any</b>       | Includes all severity levels                                                                                            |
| <b>none</b>      | Disables logging of the associated facility to a destination                                                            |
| <b>emergency</b> | System panic or other condition that causes the router to stop functioning                                              |
| <b>alert</b>     | Conditions that require immediate correction, such as a corrupted system database                                       |
| <b>critical</b>  | Critical conditions, such as hard errors                                                                                |
| <b>error</b>     | Error conditions that generally have less serious consequences than errors at the emergency, alert, and critical levels |
| <b>warning</b>   | Conditions that warrant monitoring                                                                                      |
| <b>notice</b>    | Conditions that are not errors but might warrant special handling                                                       |
| <b>info</b>      | Events or nonerror conditions of interest                                                                               |

Table 612: Facilities for the facility-override Statement (*continued*)

| Facility      | Description                                                     |
|---------------|-----------------------------------------------------------------|
| <b>local4</b> | Local facility number 4                                         |
| <b>local5</b> | Local facility number 5                                         |
| <b>local6</b> | Local facility number 6                                         |
| <b>local7</b> | Local facility number 7                                         |
| <b>user</b>   | Actions performed or errors encountered by user-space processes |

We do not recommend including the **facility-override** statement at the **[edit system syslog host other-routing-engine]** hierarchy level. It is not necessary to use alternative facility names when directing messages to the other Routing Engine, because its Junos OS system logging utility can interpret the Junos OS-specific names.

## Changing the Alternative Facility Name for System Log Messages Directed to a Remote Destination

Some facilities assigned to messages logged on the local router or switch have Junos OS-specific names (see [Table 609 on page 6712](#)). In the recommended configuration, a remote machine designated at the **[edit system syslog host *hostname*]** hierarchy level is not a Juniper Networks router or switch, so its syslogd utility cannot interpret the Junos OS-specific names. To enable the standard syslogd utility to handle messages from these facilities when messages are directed to a remote machine, a standard **localX** facility name is used instead of the Junos OS-specific facility name.

[Table 611 on page 6714](#) lists the default alternative facility name next to the Junos OS-specific facility name it is used for.

The syslogd utility on a remote machine handles all messages that belong to a facility in the same way, regardless of the source of the message (the Juniper Networks router or switch or the remote machine itself). For example, the following statements in the configuration of the router called **local-router** direct messages from the **authorization** facility to the remote machine *monitor.mycompany.com*:

```
[edit system syslog]
host monitor.mycompany.com {
    authorization info;
}
```

The default alternative facility for the local **authorization** facility is also **authorization**. If the syslogd utility on **monitor** is configured to write messages belonging to the **authorization** facility to the file `/var/log/auth-attempts`, then the file contains the messages generated when users log in to **local-router** and the messages generated when users log in to **monitor**. Although the name of the source machine appears in each system log message, the mixing of messages from multiple machines can make it more difficult to analyze the contents of the **auth-attempts** file.

To make it easier to separate the messages from each source, you can assign an alternative facility to all messages generated on **local-router** when they are directed to **monitor**. You can then configure the syslogd utility on **monitor** to write messages with the alternative facility to a different file from messages generated on **monitor** itself.

To change the facility used for all messages directed to a remote machine, include the **facility-override** statement at the `[edit system syslog host hostname]` hierarchy level:

```
[edit system syslog host hostname]  
  facility severity;  
  facility-override facility;
```

In general, it makes sense to specify an alternative facility that is not already in use on the remote machine, such as one of the **localX** facilities. On the remote machine, you must also configure the syslogd utility to handle the messages in the desired manner.

[Table 612 on page 6714](#) lists the facilities that you can specify in the **facility-override** statement.

We do not recommend including the **facility-override** statement at the `[edit system syslog host other-routing-engine]` hierarchy level. It is not necessary to use alternative facility names when directing messages to the other Routing Engine, because its Junos OS system logging utility can interpret the Junos OS-specific names.

The following example shows how to log all messages generated on the local router at the error level or higher to the local0 facility on the remote machine called `monitor.mycompany.com`:

```
[edit system syslog]  
host monitor.mycompany.com {  
  any error;  
  facility-override local0;  
}
```

The following example shows how to configure routers located in California and routers located in New York to send messages to a single remote machine called `central-logger.mycompany.com`. The messages from California are assigned to alternative facility `local0` and the messages from New York are assigned to alternative facility `local2`.

- Configure California routers to aggregate messages in the `local0` facility:

```
[edit system syslog]  
host central-logger.mycompany.com {  
  change-log info;  
  facility-override local0;  
}
```

- Configure New York routers to aggregate messages in the local2 facility:

```
[edit system syslog]
host central-logger.mycompany.com {
  change-log info;
  facility-override local2;
}
```

On central-logger, you can then configure the system logging utility to write messages from the local0 facility to the file **change-log** and the messages from the local2 facility to the file **new-york-config**.

## Using Regular Expressions to Refine the Set of Logged Messages

The predefined facilities group together related messages, but you can also use regular expression matching to specify more exactly which messages from a facility are logged to a file, a user terminal, or a remote destination.

To specify the text string that must (or must not) appear in a message for the message to be logged to a destination, include the **match** statement and specify the regular expression which the text string must match:

```
match "regular-expression";
```

You can include this statement at the following hierarchy levels:

- **[edit system syslog file *filename*]** (for a file)
- **[edit system syslog user (*username* | \*)]** (for a specific user session or for all user sessions on a terminal)
- **[edit system syslog host (*hostname* | other-routing-engine)]** (for a remote destination)

In specifying the regular expression, use the notation defined in POSIX Standard 1003.2 for extended (modern) UNIX regular expressions. Explaining regular expression syntax is beyond the scope of this document, but POSIX standards are available from the Institute of Electrical and Electronics Engineers (IEEE, <http://www.ieee.org>).

[Table 613 on page 6718](#) specifies which character or characters are matched by some of the regular expression operators that you can use in the match statement. In the descriptions, the term *term* refers to either a single alphanumeric character or a set of characters enclosed in square brackets, parentheses, or braces.

**NOTE:** The match statement is not case-sensitive.

**Table 613: Regular Expression Operators for the match Statement**

| Operator                     | Matches                                                                                                                                                                                                                              |
|------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| . (period)                   | One instance of any character except the space.                                                                                                                                                                                      |
| * (asterisk)                 | Zero or more instances of the immediately preceding term.                                                                                                                                                                            |
| + (plus sign)                | One or more instances of the immediately preceding term.                                                                                                                                                                             |
| ? (question mark)            | Zero or one instance of the immediately preceding term.                                                                                                                                                                              |
| (pipe)                       | One of the terms that appears on either side of the pipe operator.                                                                                                                                                                   |
| ! (exclamation point)        | Any string except the one specified by the expression, when the exclamation point appears at the start of the expression. Use of the exclamation point is Junos OS-specific.                                                         |
| ^ (caret)                    | Start of a line, when the caret appears outside square brackets.<br><br>One instance of any character that does not follow it within square brackets, when the caret is the first character inside square brackets.                  |
| \$ (dollar sign)             | End of a line.                                                                                                                                                                                                                       |
| [ ] (paired square brackets) | One instance of one of the enclosed alphanumeric characters. To indicate a range of characters, use a hyphen ( - ) to separate the beginning and ending characters of the range. For example, [a-z0-9] matches any letter or number. |
| ( ) (paired parentheses)     | One instance of the evaluated value of the enclosed term. Parentheses are used to indicate the order of evaluation in the regular expression.                                                                                        |

#### Using Regular Expressions

Filter messages that belong to the **interactive-commands** facility, directing those that include the string **configure** to the terminal of the root user:

```
[edit system syslog]
user root {
  interactive-commands any;
  match ".*configure.*";
}
```

Messages like the following appear on the **root** user's terminal when a user issues a **configure** command to enter configuration mode:

```
timestamp router-name mgd[PID]: UI_CMDLINE_READ_LINE: User 'user', command
'configure private'
```

Filter messages that belong to the **daemon** facility and have a severity of **error** or higher, directing them to the file **/var/log/process-errors**. Omit messages generated by the SNMP process (**snmpd**), instead directing them to the file **/var/log/snmpd-errors**:

```
[edit system syslog]
file process-errors {
  daemon error;
  match "!(.*snmpd.*)";
}
file snmpd-errors {
  daemon error;
  match ".*snmpd.*";
}
```

## ssh

---

**Syntax**    ssh {  
              ciphers [ *cipher-1 cipher-2 cipher-3 ...*];  
              client-alive-count-max *seconds*;  
              client-alive-interval *seconds*;  
              connection-limit *limit*;  
              hostkey-algorithm <*algorithm*|*no-algorithm*>;  
              key-exchange <*algorithm*>;  
              macs <*algorithm*>;  
              max-sessions-per-connection <*number*>;  
              no-passwords;  
              no-tcp-forwarding;  
              protocol-version [*v1 v2*];  
              rate-limit *limit*;  
              root-login (*allow* | *deny* | *deny-password*);  
              }

**Hierarchy Level**    [edit system services]

**Release Information**    Statement introduced before Junos OS Release 7.4.  
                              Statement introduced in Junos OS Release 9.0 for EX Series switches.  
                              Statement introduced in Junos OS Release 11.1 for the QFX Series.  
                              **client-alive-interval** and **client-alive-max-count** statements introduced in Junos OS Release 12.2.  
                              **no-passwords** statement introduced in Junos OS Release 13.3.

**Description**    Allow SSH requests from remote systems to the local router or switch.  
  
                      The remaining statements are explained separately.

**Required Privilege Level**    system—To view this statement in the configuration.  
                                  system-control—To add this statement to the configuration.

| <b>Hierarchy Level</b>          | [edit system scripts commit]                                                                                                                                                                                                                           |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                     |
| <b>Description</b>              | For Junos OS commit scripts, enable transient configuration changes to be committed.                                                                                                                                                                   |
| <b>Default</b>                  | Transient changes are disabled by default. If you do not include the <b>allow-transients</b> statement, and an enabled script generates transient changes, the command-line interface (CLI) generates an error message and the commit operation fails. |
| <b>Required Privilege Level</b> | maintenance—To view this statement in the configuration.<br>maintenance-control—To add this statement to the configuration.                                                                                                                            |

| <b>Description</b>              | <p>With commit script macros, use custom syntax in your configuration.</p> <p>Macros work by locating <b>apply-macro</b> statements that you include in the candidate configuration and using the values specified in the <b>apply-macro</b> statement as parameters to a set of instructions (the macro) defined in a commit script. The commit script alters your configuration from one that contains custom syntax into a full configuration containing standard Junos OS statements.</p> <p>In effect, your custom configuration syntax serves a dual purpose. The syntax allows you to simplify your configuration tasks, and it provides data (or <i>hooks</i>) that are used by commit script macros.</p> <p>You can include the <b>apply-macro</b> statement at any level of the configuration hierarchy. You can include multiple <b>apply-macro</b> statements at each level of the configuration hierarchy; however, each must have a unique name.</p> |
| <b>Options</b>                  | <p><b><i>apply-macro-name</i></b>—Name of the <b>apply-macro</b> statement.</p> <p><b><i>parameter-name</i></b>—One or more parameters. Parameters can be any text you want to include in your configuration.</p> <p><b><i>parameter-value</i></b>—A value that corresponds to the parameter name. Parameter values can be any text you want to include in your configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Required Privilege Level</b> | configure—To enter configuration mode; other required privilege levels depend on where the statement is located in the configuration hierarchy.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Description</b>              | For Junos OS commit scripts and op scripts, specify the MD5, SHA-1, or SHA-256 checksum hash. When it executes a local event, commit, or op script, Junos OS verifies the authenticity of the script by using the configured checksum hash.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Options</b>                  | <b>md5 hash</b> —MD5 checksum of this script.<br><br><b>sha-256 hash</b> —SHA-256 checksum of this script.<br><br><b>sha1 hash</b> —SHA-1 checksum of this script.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## file (Op Scripts)

---

**Syntax**    file *filename* {  
              arguments {  
                  *argument-name* {  
                    **description** *descriptive-text*;  
                  }  
              }  
              **checksum** (md5 | sha-256 | sha1) *hash*;  
              **command** *filename-alias*;  
              dampen {  
                  dampen-options {  
                    cpu-factor *cpu-factor*;  
                    line-interval *line-interval*;  
                    time-interval *time-interval*;  
                  }  
              }  
              **description** *descriptive-text*;  
              **refresh**;  
              **refresh-from** *url*;  
              **source** *url*;  
              }

**Hierarchy Level**    [edit system **scripts op**]

**Release Information**    Statement introduced in Junos OS Release 7.6.  
                              Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    For Junos OS op scripts, enable an op script that is located in the `/var/db/scripts/op` directory.

**Options**    **filename**—The name of an Extensible Stylesheet Language Transformations (XSLT) or Stylesheet Language Alternative Syntax (SLAX) file containing an op script.  
  
              The statements are explained separately.

**Required Privilege Level**    maintenance—To view this statement in the configuration.  
                                  maintenance-control—To add this statement to the configuration.

| <b>Release Information</b> | Statement introduced in Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                            |
| <b>Description</b>         | For Junos OS commit scripts, overwrite the local copy of all enabled commit scripts or a single enabled script located in the <code>/var/db/scripts/commit</code> directory with the copy located at the source URL, as specified in the <b>source</b> statement at the same hierarchy level. |

**NOTE:** Issuing the `set refresh` command does not add the `refresh` statement to the configuration. Thus the command behaves like an operational mode command by executing an operation, instead of adding a statement to the configuration.

The `set refresh` command is unique in the Junos OS CLI in that it behaves like an operational mode command and yet it can be executed from within configuration mode. All other Junos OS CLI operational mode commands can only be executed from command mode. The functionality is provided in this manner as a convenience to users developing commit scripts.

On the QFabric system, commit scripts are stored in the `/pbdata/mgd_shared/partition-ip/var/db/scripts/commit/` directory on the Director device.

| <b>Description</b>                                                                                                                                                                                                                                                        | <p>For Junos OS op scripts, overwrite the local copy of all enabled op scripts or a single enabled script located in the <code>/var/db/scripts/op</code> directory with the copy located at the source URL, specified in the <b>source</b> statement at the same hierarchy level.</p> <p>The update operation occurs as soon as you issue the <b>set refresh</b> configuration mode command. Issuing the <b>set refresh</b> command does not add the <b>refresh</b> statement to the configuration. Thus the command behaves like an operational mode command by executing an operation, instead of adding a statement to the configuration.</p> |
| <div>  <p><b>NOTE:</b> On the QFabric system, op scripts are stored in the <code>/pbdata/mgd_shared/partition-ip/var/db/scripts/op/</code> directory on the Director device.</p> </div> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| Description                                                                                                                                                      | <p>For Junos OS commit scripts, overwrite the local copy of all enabled commit scripts or a single enabled script located in the <code>/var/db/scripts/commit</code> directory with the copy located at a URL other than the URL specified in the <b>source</b> statement.</p> <p>The update operation occurs as soon as you issue the <b>set refresh-from url</b> configuration mode command. Issuing the <b>set refresh-from</b> command does not add the <b>refresh-from</b> statement to the configuration. Thus the command behaves like an operational mode command by executing an operation, instead of adding a statement to the configuration.</p> |

**Hierarchy Level** [edit system]

**Release Information** Statement introduced in Junos OS Release 7.4.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** For Junos OS commit or op scripts, configure scripting mechanisms.

**NOTE:** The `traceoptions` statement is not supported on QFabric systems.

**Options** The statements are explained separately.

**Required Privilege Level** maintenance—To view this statement in the configuration.  
maintenance-control—To add this statement to the configuration.

## fabric-maintenance-associations

```
Syntax fabric-maintenance-associations {
    fma-name {
        description string;
        fabric-maintenance-end-points {
            fmep-id {
                description string;
                fmep-interface interface-name;
                fmep-name name;
            }
        }
        vlan-name vlan-name;
    }
}
```

**Hierarchy Level** [edit protocols oam fabric]

**Release Information** Statement introduced in Junos OS Release 12.2 for the QFX Series.

**Description** Configure the fabric maintenance association (FMA) parameters for internal fabric monitoring. The FMA defines a set of QFabric system interfaces (fabric maintenance endpoints [FMEPs]) that are members of a given VLAN which are used in internal fabric monitoring operations. The FMA associates the set of FMEPs with a VLAN. Configuration of the VLAN is mandatory.

The remaining statements under this hierarchy level are explained separately.

**Options** **description *string***—Description of the FMA.

**Syntax:** 1 to 128 alphanumeric characters

**fma-name**—Name of the FMA.

**Syntax:** 1 to 20 alphanumeric characters

**vlan-name *vlan-name***—Name of the VLAN for which the FMA is defined.

**NOTE:** Configuring the VLAN option is mandatory.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.2 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b>              | Configure the fabric maintenance association endpoint (FMEP) parameters within a fabric maintenance association (FMA). The FMA associates the FMEP with a VLAN for purposes of internal fabric monitoring.                                                                                                                                                                                                                                                                                                                                      |
| <b>Options</b>                  | <p><b>description <i>string</i></b>—Description of the FMEP.<br/><b>Syntax:</b> 1 to 128 alphanumeric characters</p> <p><b>fmep-id</b>—32-bit integer that is used to identify an FMEP.<br/><b>Range:</b> 1 to 64,000</p> <p><b>fmep-name <i>name</i></b>—Name of the fabric maintenance association endpoint.<br/><b>Syntax:</b> 1 to 20 alphanumeric characters</p> <p><b>fmep-interface <i>interface-name</i></b>—Interface on a QFabric system Node device.<br/><b>Syntax:</b> <i>node-device-name:interface-type-fpc/pic/slot.unit</i></p> |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                         |

## flow-specs

```
Syntax  flow-specs {
        flow-specification-name {
            ethernet-frame-size ethernet-frame-size;
            multicast-ipv4 {
                dest-ip-multicast-group ipv4-mcast-address;
                source-ip ipv4-address;
            }
            multicast-vlan-flood;
            unicast-ethernet {
                destination-mac destination-mac-address destination-mac-mask
                    destination-mac-mask;
                ethertype ethertype;
                source-mac mac-address source-mac-mask source-mac-mask;
            }
            unicast-ethernet-ipv4 {
                destination-ip destination-ip-address destination-ip-mask destination-ip-mask;
                destination-l4-port destination-l4-port-number;
                destination-mac destination-mac-address;
                ip-proto protocol;
                source-ip source-ip-address source-ip-mask source-ip-mask;
                source-l4-port source-l4-port-number;
            }
        }
    }
```

**Hierarchy Level** [edit protocols oam fabric]

**Release Information** Statement introduced in Junos OS Release 12.2 for the QFX Series.

**Description** Configure the fabric flow specification parameters for internal fabric monitoring. The following conditions apply:

- You must specify a protocol type for each flow specification: **unicast-ethernet**, **unicast-ethernet-ipv4**, **multicast-ipv4**, or **multicast-vlan-flood**.
- You can specify only one type for each flow specification.
- All other parameters are optional.

The remaining statements under this hierarchy level are explained separately.

**Options** *flow-specification-name*—Name of the flow specification.

**Syntax:** 1 to 20 alphanumeric characters

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

The masked bits denote the range that needs to be generated. The other bits obtain their values from the corresponding source or destination IPv4 address parameter. The mask must be contiguous.

**Syntax:** Dotted decimal notation without the prefix

**Values:** Maximum of 6 contiguous masked bits, or a mask range of 64

| Release Information | Statement introduced in Junos OS Release 11.3 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Description         | Define tracing operations for sFlow technology.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Default             | The <b>tracoptions</b> feature is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Options             | <p><b>file <i>filename</i></b>—Name of the file to receive the tracing operation output. Enclose the name in quotation marks. Output files are located in the <b>/var/log/</b> directory.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>. Incoming trace file data is logged in the now empty <b>trace-file</b>. When <b>trace-file</b> again reaches its maximum size, <b>trace-file.0</b> is renamed <b>trace-file.1</b> and <b>trace-file</b> is renamed <b>trace-file.0</b>. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.</p> <p>If you specify the maximum number of files, you must also specify the maximum file size using the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 1 trace file</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements.</p> <ul style="list-style-type: none"><li>• <b>all</b>—Trace all sFlow monitoring events.</li><li>• <b>client-server</b>—Trace sFlow monitoring client-server events.</li><li>• <b>configuration</b>—Trace sFlow monitoring configuration events.</li><li>• <b>interface</b>—Trace sFlow monitoring interface events.</li><li>• <b>rtsock</b>—Trace routing socket code events.</li></ul> <p><b>no-stamp</b>—(Optional) Do not place timestamp information at the beginning of each line in the trace file.</p> <p><b>no-world-readable</b>—(Optional) Prevent any user from reading the trace file.</p> <p><b>replace</b>—(Optional) Replace an existing trace file if there is one.</p> <p><b>size <i>size</i></b>—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named <b>trace-file</b> reaches its maximum size, it</p> |

is renamed **trace-file.0**. Incoming trace file data is logged in the now empty **trace-file**. When **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size of 4 GB

**Default:** 128 KB

**world-readable**—(Optional) Allow any user to read the trace file.

**Required Privilege Level** routing and trace—To view this statement in the configuration.  
routing-control and trace-control—To add this statement to the configuration.

## udp-port

**Syntax** `udp-port port-number;`

**Hierarchy Level** [edit protocols [sflow collector](#)]

**Release Information** Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Configure the UDP port for a remote collector for sFlow network traffic monitoring. The device sends sFlow UDP datagrams to the collector for analysis.

**Default** Port 6343

**Options** *port-number*—UDP port number for this collector.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                      |
| <b>Description</b>              | Set the agent address of all SNMPv1 traps generated by this router or switch. Currently, the only option is <b>outgoing-interface</b> , which sets the agent address of each SNMPv1 trap to the address of the outgoing interface of that trap.                                                                                        |
| <b>Options</b>                  | <b>outgoing-interface</b> —Value of the agent address of all SNMPv1 traps generated by this router or switch. The <b>outgoing-interface</b> option sets the agent address of each SNMPv1 trap to the address of the outgoing interface of that trap.<br><b>Default:</b> Disabled (the agent address is not specified in SNMPv1 traps). |

| <b>Description</b>         | Configure the secure hash algorithm (SHA) as the authentication type for the SNMPv3 user.                                                                                                      |

**NOTE:** You can configure only one authentication type for each SNMPv3 user.

The remaining statement is explained separately.

## community (SNMP)

---

**Syntax**    `community community-name {  
                  authorization authorization;  
                  client-list-name client-list-name;  
                  clients {  
                      address restrict;  
                  }  
                  view view-name;  
                  }`

**Hierarchy Level**    [edit snmp]

**Release Information**    Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Define an SNMP community. An SNMP community authorizes SNMP clients based on the source IP address of incoming SNMP request packets. A community also defines which MIB objects are available and the operations (read-only or read-write) allowed on those objects.

**NOTE:** The **authorization read-write** option is not supported on the QFX3000 QFabric system.

---

The SNMP client application specifies an SNMP community name in **Get**, **GetBulk**, **GetNext**, and **Set** SNMP requests.

**Default**    If you omit the **community** statement, all SNMP requests are denied.

**Options**    **community-name**—Community string. If the name includes spaces, enclose it in quotation marks (" ").

The remaining statements are explained separately.

**Required Privilege Level**    snmp—To view this statement in the configuration.  
                                  snmp-control—To add this statement to the configuration.

**Related Documentation**    • [Configuring the SNMP Community String on page 6682](#)

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 11. for the QFX Series.                                                                                                                                                      |
| <b>Description</b>         | Define an SNMP community to authorize SNMPv1 or SNMPv2c clients in an SNMPv3 system. When you configure a community in SNMPv3, you can also specify a security name. The access privileges associated with the security name determine which MIB objects are available and which operations (read, write, or notify) are allowed on those objects. |
| <b>Options</b>             | <b><i>community-name</i></b> —Community string for an SNMPv1 or SNMPv2c community. If unconfigured, it is the same as the community index. If the name includes spaces, enclose the name in quotation marks (" ").                                                                                                                                 |

**NOTE:** Community names must be unique. You cannot configure the same community name at the `[edit snmp community]` and `[edit snmp v3 snmp-community community-index]` hierarchy levels.

The community name at the `[edit snmp v3 snmp-community community-index]` hierarchy level is encrypted and not displayed in the command-line interface (CLI).

| <b>Description</b>              | <p>Define a unique identifier for an SNMPv3 engine by configuring the suffix of the engine ID. The engine ID is used for identification only and not for addressing. There are two parts of an engine ID: the prefix and the suffix. The prefix is formatted according to the specifications defined in RFC 3411, <i>An Architecture for Describing Simple Network Management Protocol (SNMP) Management Frameworks</i> and cannot be configured. The suffix is configured here.</p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> <b>NOTE:</b> SNMPv3 authentication and encryption keys are generated based on the associated user passwords and the engine ID. If you configure or change the engine ID, you must commit the user passwords and new engine ID before you configure SNMPv3 users, or the authentication will fail.</p> <p>By default, the engine ID suffix is configured with the MAC address of the management interface (the use-mac-address option) on the QFX Series. You can override this configuration by using the local <i>engine-id-suffix</i> or use-default-ip-address option.</p> </div> |
| <b>Default</b>                  | use-mac-address                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| <b>Description</b>              | Associate a security name with a group composed of users with the same access privileges. The security name is used during authentication of SNMP messages, and is mapped to a username.                      |
| <b>Options</b>                  | <b>group-name</b> —Collection of SNMP security names that share the same SNMPv3 access privileges.                                                                                                            |
| <b>Required Privilege Level</b> | <p>snmp—To view this statement in the configuration.</p> <p>snmp-control—To add this statement to the configuration.</p>                                                                                      |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <i>Configuring the Group</i></li> </ul>                                                                                                                              |

## group (Configuring Access Privileges)

---

**Syntax**    `group group-name {  
                  (default-context-prefix | context-prefix context-prefix){  
                    security-model (any | usm | v1 | v2c) {  
                      security-level (authentication | none | privacy) {  
                        notify-view view-name;  
                        read-view view-name;  
                        write-view view-name;  
                      }  
                    }  
                  }  
          }`

**Hierarchy Level**    [edit snmp v3 vacm access]

**Release Information**    Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Assign the security name to a group, and specify the SNMPv3 context applicable to the group. The **default-context-prefix** statement, when included, adds all the contexts configured on the device to the group, whereas the **context-prefix context-prefix** statement enables you to specify a context and to add that particular context to the group.

(Not applicable to the QFX Series.) When the context prefix is specified as default (for example, **context-prefix default**), the context associated with the master routing instance is added to the group. To specify a routing instance that is part of a logical system, specify it as **logical system/routing instance**. For example, to specify routing instance ri1 in logical system ls1, include **context-prefix ls1/ri1**.

The remaining statements under this hierarchy are explained separately.

**Options**    *group-name*—SNMPv3 group name created for the SNMPv3 group.

**Required Privilege Level**    snmp—To view this statement in the configuration.  
snmp-control—To add this statement to the configuration.

**Related Documentation**    • *Configuring the Group*

| <b>Description</b>              | <p>Configure RMON history group entries. This RMON feature can be used with the Simple Network Management Protocol (SNMP) agent on the network to monitor all the traffic flowing among devices on all connected LAN segments. The RMON history feature collects statistics in accordance with user-configurable parameters.</p> <p>The history group controls the periodic statistical sampling of data from various types of networks. This group contains configuration entries that specify an interface, polling period, and other parameters. If you use the <b>history</b> statement, you must also configure the <b>interface <i>interface-name</i></b> statement.</p> |
| <b>Options</b>                  | <p><b>history-index</b>—Provide a number for this history entry.</p> <p><b>Range:</b> 1 through 65535</p> <p>The remaining statements are explained separately.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## rmon

```
Syntax  rmon {
        alarm index {
            description description;
            falling-event-index index;
            falling-threshold integer;
            falling-threshold-interval seconds;
            interval seconds;
            request-type;
            rising-event-index index;
            rising-threshold integer;
            sample-type (absolute-value | delta-value);
            startup-alarm (falling-alarm | rising-alarm | rising-or-falling alarm);
            syslog-subtag syslog-subtag;
            variable oid-variable;
        }
        event index {
            community community-name;
            description description;
            type (RMON Notification) type;
        }
        history history-index {
            bucket-size number;
            interface interface-name;
            interval seconds;
            owner owner-name;
        }
    }
```

**Hierarchy Level** [edit snmp]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Provide comprehensive network fault diagnosis, planning, and performance tuning information. RMON delivers this information in nine groups of monitoring elements, each providing specific sets of data to meet common network monitoring requirements. Each group is optional, so that vendors do not need to support all the groups within the MIB.

Junos OS supports the RMON statistics, history, alarm, and event groups.

The remaining statements are explained separately.

**Default** Disabled.

**Required Privilege Level** snmp—To view this statement in the configuration.  
snmp-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b>              | Set the source address of every SNMP trap packet sent by this switch to a single address regardless of the outgoing interface. If the source address is not specified, the default is to use the address of the outgoing interface as the source address.                                                                                                                                                                                       |
| <b>Options</b>                  | <i>address</i> —Source address of SNMP traps. You can configure the source address of trap packets two ways: <b>lo0</b> or a valid IPv4 address configured on one of the interfaces. The value <b>lo0</b> indicates that the source address of all SNMP trap packets is set to the lowest loopback address configured at interface <b>lo0</b> .<br><br><b>Default:</b> Disabled. (The source address is the address of the outgoing interface.) |
| <b>Required Privilege Level</b> | snmp—To view this statement in the configuration.<br>snmp-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                   |

## target-parameters

---

**Syntax** At the `[edit snmp v3]` hierarchy level:

```
target-parameters target-parameters-name {  
  profile-name;  
  parameters {  
    message-processing-model (v1 | v2c | V3);  
    security-level (authentication | none | privacy);  
    security-model (usm | v1 | v2c);  
    security-name security-name;  
  }  
}
```

At the `[edit snmp v3 target-address target-address-name]` hierarchy level:

```
target-parameters target-parameters-name;
```

**Hierarchy Level** `[edit snmp v3]`  
`[edit snmp v3 target-address target-address-name]`

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure the message processing and security parameters for sending notifications to a particular management target. The target parameters are configured at the `[edit snmp v3]` hierarchy level. The remaining statements at this level are explained separately.

Then apply the target parameters configured at the `[edit snmp v3 target-parameters target-parameters-name]` hierarchy level to the target address configuration at the `[edit snmp v3]` hierarchy level.

**Required Privilege Level** snmp—To view this statement in the configuration.  
snmp-control—To add this statement to the configuration.

## traceoptions (SNMP)

---

|                            |                                                                                                                                                                                                                                                                      |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <pre>traceoptions {<br/>    file <i>filename</i> &lt;files <i>number</i>&gt; &lt;match <i>regular-expression</i>&gt; &lt;size <i>size</i>&gt; &lt;world-readable  <br/>        no-world-readable&gt;;<br/>    flag <i>flag</i>;<br/>    no-remote-trace;<br/>}</pre> |
| <b>Hierarchy Level</b>     | [edit snmp]                                                                                                                                                                                                                                                          |
| <b>Release Information</b> | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                    |
| <b>Description</b>         | Track the activities of SNMP agents on the switch and record the information in log files.                                                                                                                                                                           |

**NOTE:** The **traceoptions** statement is not supported on the QFabric system.

The output of the tracing operations is placed into log files in the **/var/log** directory. Each log file is named after the SNMP agent that generates it. The following logs are created in the **/var/log** directory when the **traceoptions** statement is used:

- chassisd
- craftd
- ilmid
- mib2d
- rmopd
- serviced
- snmpd

**Options** **file *filename***—By default, the name of the log file that records trace output is the name of the process being traced (for example, mib2d or snmpd). Use this option to specify another name.

**files *number***—(Optional) Maximum number of trace files per SNMP subagent. When a trace file (for example, snmpd) reaches its maximum size, it is archived by being renamed to snmpd.0. The previous snmpd.1 is renamed to snmpd.2, and so on. The oldest archived file is deleted.

**Range:** 2 through 1000 files

**Default:** 10 files

**flag *flag***—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements:

- **all**—Log all SNMP events.

- **configuration**—Log reading of configuration at the **[edit snmp]** hierarchy level.
- **database**—Log events involving storage and retrieval in the events database.
- **events**—Log important events.
- **general**—Log general events.
- **interface-stats**—Log physical and logical interface statistics.
- **nonvolatile-sets**—Log nonvolatile SNMP set request handling.
- **pdu**—Log SNMP request and response packets.
- **policy**—Log policy processing.
- **protocol-timeouts**—Log SNMP response timeouts.
- **routing-socket**—Log routing socket calls.
- **server**—Log communication with processes that are generating events.
- **subagent**—Log subagent restarts.
- **timer-events**—Log internally generated events.
- **varbind-error**—Log variable binding errors.

**match *regular-expression***—(Optional) Refine the output to include lines that contain the regular expression.

**size *size***—(Optional) Maximum size, in kilobytes (KB), of each trace file before it is closed and archived.

**Range:** 10 KB through 1 GB

**Default:** 1000 KB

**world-readable | no-world-readable**—(Optional) By default, log files can be accessed only by the user who configures the tracing operation. The **world-readable** option enables any user to read the file. To explicitly set the default behavior, use the **no-world-readable** option.

**Required Privilege Level**    snmp—To view this statement in the configuration.  
                                          snmp-control—To add this statement to the configuration.

| <b>Description</b>                                                                                                                                                                                                                                       | Define a MIB view. A MIB view identifies a group of MIB objects. Each MIB object in a view has a common OID prefix. Each object identifier represents a subtree of the MIB object hierarchy. The <b>view</b> statement uses a view to specify a group of MIB objects on which to define access. To enable a view, you must associate the view with a community by including the <b>view</b> statement at the <b>[edit snmp community <i>community-name</i>]</b> hierarchy level. |
| <div>  <p><b>NOTE:</b> To remove an OID completely, use the <code>delete view all oid oid-number</code> command but omit the <code>include</code> parameter.</p> </div> |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

| <b>Description</b>         | Configure archiving properties for all system log files.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>             | <p><b>files <i>number</i></b>—Maximum number of archived log files to retain. When the Junos OS logging utility has written a defined maximum amount of data to a log file <i>logfile</i>, it closes the file, compresses it, and renames it <i>logfile.0.gz</i> (the amount of data is determined by the <b>size</b> statement at this hierarchy level). The utility then opens and writes to a new file called <i>logfile</i>. When the new file reaches the maximum size, the <i>logfile.0.gz</i> file is renamed to <i>logfile.1.gz</i>, and the new file is closed, compressed, and renamed <i>logfile.0.gz</i>. By default, the logging facility creates up to ten archive files in this manner. Once the maximum number of archive files exists, each time the active log file reaches the maximum size, the contents of the oldest archive file are lost (overwritten by the next oldest file).</p> <p><b>Range:</b> 1 through 1000</p> <p><b>Default:</b> 10 files</p> <p><b>size <i>size</i></b>—Maximum amount of data that the Junos OS logging utility writes to a log file <i>logfile</i> before archiving it (closing it, compressing it, and changing its name to <i>logfile.0.gz</i>). The utility then opens and writes to a new file called <i>logfile</i>.</p> <p><b>Syntax:</b> <i>x k</i> to specify the number of kilobytes, <i>x m</i> for the number of megabytes, or <i>x g</i> for the number of gigabytes</p> <p><b>Range:</b> 64 KB through 1 GB</p> <p><b>Default:</b></p> <ul style="list-style-type: none"><li>• 128 KB for EX Series switches and J Series routers</li><li>• 1 MB for M Series, MX Series, and T Series routers, and the QFX3500 switch</li><li>• 10 MB for TX Matrix and TX Matrix Plus routers</li></ul> <p><b>binary-data   no-binary-data</b>—Mark file as containing binary data. This allows proper archiving of binary files, such as WTMP files (login records for UNIX based systems)..</p> <p><b>Default:</b> no-binary-data</p> <p><b>world-readable   no-world-readable</b>—Grant all users permission to read archived log files, or restrict the permission only to the <b>root</b> user and users who have the Junos OS <b>maintenance</b> permission.</p> <p><b>Default:</b> no-world-readable</p> |

**Required Privilege** system—To view this statement in the configuration.

**Level** system-control—To add this statement to the configuration.

| <b>Description</b>         | Configure archiving properties for a specific system log file.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Options</b>             | <p><b>archive-sites site-name</b>—FTP URL representing the destination for the archived log file (for information about how to specify valid FTP URLs, see <a href="#">“Format for Specifying Filenames and URLs in Junos OS CLI Commands” on page 50</a>). If more than one site name is configured, a list of archive sites for the system log files is created. When a file is archived, the router attempts to transfer the file to the first URL in the list, moving to the next site only if the transfer does not succeed. The log file is stored at the archive site with the filename specified at the <a href="#">[edit system syslog]</a> hierarchy level.</p> <p><b>files number</b>—Maximum number of archived log files to retain. When the Junos OS logging utility has written a defined maximum amount of data to a log file <i>logfile</i>, it closes the file, compresses it, and renames it <i>logfile.0.gz</i> (the amount of data is determined by the <b>size</b> statement at this hierarchy level). The utility then opens and writes to a new file called <i>logfile</i>. When the new file reaches the maximum size, the <i>logfile.0.gz</i> file is renamed to <i>logfile.1.gz</i>, and the new file is closed, compressed, and renamed <i>logfile.0.gz</i>. By default, the logging facility creates up to ten archive files in this manner. Once the maximum number of archive files exists, each time the active log file reaches the maximum size, the contents of the oldest archive file are lost (overwritten by the next oldest file).</p> <p><b>Range:</b> 1 through 1000</p> <p><b>Default:</b> 10 files</p> <p><b>password password</b>—Password for authenticating with the site specified by the <b>archive-sites</b> statement.</p> <p><b>size size</b>—Maximum amount of data that the Junos OS logging utility writes to a log file <i>logfile</i> before archiving it (closing it, compressing it, and changing its name to <i>logfile.0.gz</i>). The utility then opens and writes to a new file called <i>logfile</i>.</p> <p><b>Syntax:</b> <b>xk</b> to specify the number of kilobytes, <b>xm</b> for the number of megabytes, or <b>xg</b> for the number of gigabytes</p> <p><b>Range:</b> 64 KB through 1 GB</p> <p><b>Default:</b> 128 KB for J Series routers; 1 MB for M Series, MX Series, and T Series routers, and the QFX3500 switch; 10 MB for TX Matrix and TX Matrix Plus routers</p> |

**start-time "YYYY-MM-DD.hh:mm"**—Date and time in the local time zone for a one-time transfer of the active log file to the first reachable site in the list of sites specified by the **archive-sites** statement.

**transfer-interval *interval***—Interval at which to transfer the log file to an archive site.

**Range:** 5 through 2880 minutes

**world-readable | no-world-readable**—Grant all users permission to read archived log files, or restrict the permission only to the **root** user and users who have the Junos OS **maintenance** permission.

**Default:** no-world-readable

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

## archive (QFabric System)

**Syntax** archive {  
size *size*;  
}

**Hierarchy Level** [edit system [syslog](#) file *filename*]

**Release Information** Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Configure the archiving properties for the system message log file.

**Options** **size *size***—Maximum amount of system log message data that the QFabric system stores in the log file.

**Syntax:** *xk* to specify the number of kilobytes, *xm* for the number of megabytes, or *xg* for the number of gigabytes

**Range:** 65 KB through 1 GB

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

| <b>Description</b>              | Configure the maximum number of archived log files to retain. When the Junos OS logging utility has written a defined maximum amount of data to a log file <i>logfile</i> , it closes the file, compresses it, and renames it to <i>logfile.0.gz</i> (for information about the maximum file size, see <a href="#">size</a> ). The utility then opens and writes to a new file called <i>logfile</i> . When the new file reaches the maximum size, the <i>logfile.0.gz</i> file is renamed to <i>logfile.1.gz</i> , and the new file is closed, compressed, and renamed <i>logfile.0.gz</i> . By default, the logging facility creates up to ten archive files in this manner. Once the maximum number of archive files exists, each time the active log file reaches the maximum size, the contents of the oldest archive file are lost (overwritten by the next oldest file). |
| <b>Options</b>                  | <i>number</i> —Maximum number of archived files.<br><b>Range:</b> 1 through 1000<br><b>Default:</b> 10 files                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Description</b>                             | Configure the logging of system messages to a remote destination.                                                                                                                                                                                                                               |

- Options**
- facility**—Class of messages to log. To specify multiple classes, include multiple **facility severity** statements. For a list of the facilities, see [Table 609 on page 6712](#).
  - hostname**—IPv4 address, IPv6 address, or fully qualified hostname of the remote machine to which to direct messages. To direct messages to multiple remote machines, include a **host** statement for each one.
  - other-routing-engine**—Direct messages to the other Routing Engine on a router or switch with two Routing Engines installed and operational.

**NOTE:** The **other-routing-engine** option is not applicable to the QFX Series.

---

- port**—Port number of the remote syslog server that can be modified.
- scc-master**—(TX Matrix routers only) On a T640 router that is part of a routing matrix, direct messages to the TX Matrix router.
- severity**—Severity of the messages that belong to the facility specified by the paired **facility** name. Messages with severities of the specified level and higher are logged. For a list of the severities, see [Table 610 on page 6713](#).
- sfc0-master**—(TX Matrix Plus routers only) On a T1600 or T4000 router that is part of a routing matrix, direct messages to the TX Matrix Plus router.

The remaining statements are explained separately.

- Required Privilege** system—To view this statement in the configuration.
- Level** system-control—To add this statement to the configuration.

| <b>Description</b>              | <p>Include the year, the millisecond, or both, in the timestamp on every standard-format system log message. The additional information is included for messages directed to each destination configured by a <b>file</b>, <b>console</b>, or <b>user</b> statement at the <code>[edit system syslog]</code> hierarchy level. As of Junos OS Release 11.4, the additional time information is also sent to destinations configured by a <b>host</b> statement.</p> <p>By default, the timestamp specifies the month, date, hour, minute, and second when the message was logged—for example, <b>Aug 21 12:36:30</b>. However, the timestamp for traceoption messages is specified in milliseconds by default, and is independent of the <code>[edit system syslog time-format]</code> statement.</p> |
|                                 | <p> <b>NOTE:</b> When the <code>structured-data</code> statement is included at the <code>[edit system syslog file filename]</code> hierarchy level, this statement is ignored for the file.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

### Displaying a Log File from a Single-Chassis System

To display a log file stored on a single-chassis system, enter Junos OS CLI operational mode and issue the following commands:

```
user@switch> show log log-filename
user@switch> file show log-file-pathname
```

By default, the commands display the file stored on the local Routing Engine.

The following example shows the output from the **show log messages** command:

```
user@switch1> show log messages
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 1
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 2
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 3
...
Nov  4 11:52:53 switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon memory usage (Management
```

```
process): new instance detected (variable: sysAppElemRunMemory.5.6.2293)
Nov  4 11:52:53 switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon memory usage (Command-line
interface): new instance detected (variable: sysAppElemRunMemory.5.8.2292)
...
Nov  4 12:08:30 switch1 rpdf[957]: task_connect: task BGP_100.10.10.1.6+179 addr
10.10.1.6+179: Can't assign requested
address
Nov  4 12:08:30 switch1 rpdf[957]: bgp_connect_start: connect 10.10.1.6 (Internal
AS 100): Can't assign requested address
Nov  4 12:10:24 switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
'exit '
Nov  4 12:10:27 switch1 mgd[2293]: UI_DBASE_LOGOUT_EVENT: User 'jsmith' exiting
configuration mode
Nov  4 12:10:31 switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
'show log messages
```

The following example shows the output from the **file show** command. The file in the pathname **/var/log/processes** has been previously configured to include messages from the daemon facility.

```
user@switch1> file show /var/log/processes
Feb 22 08:58:24 switch1 snmpd[359]: SNMPD_TRAP_WARM_START: trap_generate_warm:
SNMP trap: warm start
Feb 22 20:35:07 switch1 snmpd[359]: SNMPD_THROTTLE_QUEUE_DRAINED:
trap_throttle_timer_handler: cleared all throttled traps
Feb 23 07:34:56 switch1 snmpd[359]: SNMPD_TRAP_WARM_START: trap_generate_warm:
SNMP trap: warm start
Feb 23 07:38:19 switch1 snmpd[359]: SNMPD_TRAP_COLD_START: trap_generate_cold:
SNMP trap: cold start
...
```

## Monitoring Traffic Through the Router or Switch

To help with the diagnosis of a problem, display real-time statistics about the traffic passing through physical interfaces on the router or switch.

To display real-time statistics about physical interfaces, perform these tasks:

1. [Displaying Real-Time Statistics About All Interfaces on the Router or Switch on page 6878](#)
2. [Displaying Real-Time Statistics About an Interface on the Router or Switch on page 6879](#)

### Displaying Real-Time Statistics About All Interfaces on the Router or Switch

**Purpose** Display real-time statistics about traffic passing through all interfaces on the router or switch.

**Action** To display real-time statistics about traffic passing through all interfaces on the router or switch:

```
user@host> monitor interface traffic
```

## Sample Output

```

user@host> monitor interface traffic
host name                               Seconds: 15                               Time: 12:31:09
Interface  Link  Input packets  (pps)  Output packets  (pps)
so-1/0/0   Down    0              (0)     0              (0)
so-1/1/0   Down    0              (0)     0              (0)
so-1/1/1   Down    0              (0)     0              (0)
so-1/1/2   Down    0              (0)     0              (0)
so-1/1/3   Down    0              (0)     0              (0)
t3-1/2/0   Down    0              (0)     0              (0)
t3-1/2/1   Down    0              (0)     0              (0)
t3-1/2/2   Down    0              (0)     0              (0)
t3-1/2/3   Down    0              (0)     0              (0)
so-2/0/0   Up      211035         (1)     36778          (0)
so-2/0/1   Up      192753         (1)     36782          (0)
so-2/0/2   Up      211020         (1)     36779          (0)
so-2/0/3   Up      211029         (1)     36776          (0)
so-2/1/0   Up      189378         (1)     36349          (0)
so-2/1/1   Down    0              (0)     18747          (0)
so-2/1/2   Down    0              (0)     16078          (0)
so-2/1/3   Up      0              (0)     80338          (0)
at-2/3/0   Up      0              (0)     0              (0)
at-2/3/1   Down    0              (0)     0              (0)
Bytes=b, Clear=c, Delta=d, Packets=p, Quit=q or ESC, Rate=r, Up=^U, Down=^D

```

**Meaning** The sample output displays traffic data for active interfaces and the amount that each field has changed since the command started or since the counters were cleared by using the **C** key. In this example, the **monitor interface** command has been running for 15 seconds since the command was issued or since the counters last returned to zero.

## Displaying Real-Time Statistics About an Interface on the Router or Switch

**Purpose** Display real-time statistics about traffic passing through an interface on the router or switch.

**Action** To display traffic passing through an interface on the router or switch, use the following Junos OS CLI operational mode command:

```
user@host> monitor interface interface-name
```

## Sample Output

```

user@host> monitor interface so-0/0/1
Next='n', Quit='q' or ESC, Freeze='f', Thaw='t', Clear='c', Interface='i'

Input framing errors:                        0
Input runs:                                 0
Input giants:                                0
Policed discards:                           0
L3 incompletes:                             0
L2 channel errors:                          0
L2 mismatch timeouts:                       0
Carrier transitions:                         1
Output errors:                              0
Output drops:                              0
Aged packets:                               0
Active alarms : None
Active defects: None
SONET error counts/seconds:
  LOS count                                  1
  LOF count                                  1
  SEF count                                  1
  ES-S                                       77
  SES-S                                       77
SONET statistics:
  BIP-B1                                     0
  BIP-B2                                     0
  REI-L                                     0
  BIP-B3                                     0
  REI-P                                     0
Received SONET overhead:  F1                : 0x00  J0                : 0xZ

```

**Meaning** The sample output shows the input and output packets for a particular SONET interface (so-0/0/1). The information can include common interface failures, such as SONET/SDH and T3 alarms, loopbacks detected, and increases in framing errors. For more information, see *Checklist for Tracking Error Conditions*.

To control the output of the command while it is running, use the keys shown in [Table 614 on page 6880](#).

**Table 614: Output Control Keys for the monitor interface Command**

| Action                                                                                                                                                                                                                       | Key |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----|
| Display information about the next interface. The <b>monitor interface</b> command scrolls through the physical or logical interfaces in the same order that they are displayed by the <b>show interfaces terse</b> command. | N   |
| Display information about a different interface. The command prompts you for the name of a specific interface.                                                                                                               | I   |
| Freeze the display, halting the display of updated statistics.                                                                                                                                                               | F   |
| Thaw the display, resuming the display of updated statistics.                                                                                                                                                                | T   |
| Clear (zero) the current delta counters since <b>monitor interface</b> was started. It does not clear the accumulative counter.                                                                                              | C   |
| Stop the <b>monitor interface</b> command.                                                                                                                                                                                   | Q   |

See the [CLI Explorer](#) for details on using match conditions with the **monitor traffic** command.

## Monitoring RMON MIB Tables

**Purpose** Monitor remote monitoring (RMON) alarm, event, and log tables.

**Action** To display the RMON tables:

```
user@switch> show snmp rmon
Alarm
Index  Variable description                               Value State

      5 monitor
      jnxOperatingCPU.9.1.0.0                        5 falling threshold

Event
Index  Type                               Last Event
      1 log and trap                     2010-07-10 11:34:17 PDT
Event Index: 1
      Description: Event 1 triggered by Alarm 5, rising threshold (90) crossed,
(variable: jnxOperatingCPU.9.1.0.0, value: 100)
      Time: 2010-07-10 11:34:07 PDT
      Description: Event 1 triggered by Alarm 5, falling threshold (75) crossed,
(variable: jnxOperatingCPU.9.1.0.0, value: 5)
      Time: 2010-07-10 11:34:17 PDT
```

**Meaning** The display shows that an alarm has been defined to monitor jnxRmon MIB object jnxOperatingCPU, which represents the CPU utilization of the Routing Engine. The alarm is configured to generate an event that sends an SNMP trap and adds an entry to the logTable in the RMON MIB. The log table shows that two occurrences of the event have been generated—one for rising above a threshold of 90 percent, and one for falling below a threshold of 75 percent.

## Monitoring SNMP

There are several commands that you can access in Junos OS operational mode to monitor SNMP information. Some of the commands are:

- **show snmp health-monitor**, which displays the health monitor log and alarm information.
- **show snmp mib**, which displays information from the MIBs, such as device and system information.

- **show snmp statistics**, which displays SNMP statistics such as the number of packets, silent drops, and invalid output values.
- **show snmp rmon**, which displays the RMON alarm, event, history, and log information

The following example provides sample output from the **show snmp health-monitor** command:

```
user@switch> show snmp health-monitor
Alarm
Index  Variable description                               Value State

32768 Health Monitor: root file system utilization
      jnxHrStoragePercentUsed.1                      58 active

32769 Health Monitor: /config file system utilization
      jnxHrStoragePercentUsed.2                      0 active

32770 Health Monitor: RE 0 CPU utilization
      jnxOperatingCPU.9.1.0.0                       0 active

32773 Health Monitor: RE 0 Memory utilization
      jnxOperatingBuffer.9.1.0.0                    35 active

32775 Health Monitor: jkernel daemon CPU utilization
      Init daemon                                   0 active
      Chassis daemon                               50 active
      Firewall daemon                              0 active
      Interface daemon                             5 active
      SNMP daemon                                  11 active
      MIB2 daemon                                  42 active
      ...
```

The following example provides sample output from the **show snmp mib** command:

```
user@switch> show snmp mib walk system

sysDescr.0    = Juniper Networks, Inc. qfx3500s internet router, kernel
JUNOS 11.1-20100926.0 #0: 2010-09-26 06:17:38 UTC builder@abc.juniper.net:
/volume/build/junos/11.1/production/20100926.0/obj-xlr/bsd/sys/compile/JUNIPER-xxxxx

Build date: 2010-09-26 06:00:10 U

sysUpTime.0   = 24444184
sysContact.0  = J Smith
sysName.0     = Lab QFX3500
sysLocation.0 = Lab
sysServices.0 = 4
```

The following example provides sample output from the **show snmp statistics** command:

```
user@switch> show snmp statistics

SNMP statistics:
Input:
  Packets: 0, Bad versions: 0, Bad community names: 0,
  Bad community uses: 0, ASN parse errors: 0,

  - [show snmp mib on page 6944](#)
  - [show snmp statistics on page 2007](#)

## Monitoring System Log Messages

**Purpose** Display system log messages about the QFX Series. By looking through a system log file for any entries pertaining to the interface that you are interested in, you can further investigate a problem with an interface on the switch.

**Action** To view system log messages:

```
user@switch1> show log messages
```

## Sample Output

```

Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 1
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 2
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 3
...
Nov  4 11:52:53 switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon
memory usage (Management process): new instance detected (variable:
sysApp1ElmtRunMemory.5.6.2293)
Nov  4 11:52:53 switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon
memory usage (Command-line interface): new instance detected (variable:
sysApp1ElmtRunMemory.5.8.2292)
...
Nov  4 12:10:24 switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
'exit '
Nov  4 12:10:27 switch1 mgd[2293]: UI_DBASE_LOGOUT_EVENT: User 'jsmith' exiting
configuration mode
Nov  4 12:10:31 switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
'show log messages

```

**Meaning** The sample output shows the following entries in the **messages** file:

- A new log file was created when the previous file reached the maximum size of 128 kilobytes (KB).
- The fan speed for Fan 1, 2, and 3 is set at 65 percent.
- Health monitoring activity is detected.
- CLI commands were entered by the user jsmith.

## Pinging Hosts

- Purpose** Use the CLI **ping** command to verify that a host can be reached over the network. This command is useful for diagnosing host and network connectivity problems. The switch sends a series of Internet Control Message Protocol (ICMP) echo (ping) requests to a specified host and receives ICMP echo responses.
- Action** To use the **ping** command to send four requests (ping count) to host3:  
**ping *host count number***

## Sample Output

```
ping host3 count 4
user@switch> ping host3 count 4
PING host3.site.net (176.26.232.111): 56 data bytes
64 bytes from 176.26.232.111: icmp_seq=0 ttl=122 time=0.661 ms
64 bytes from 176.26.232.111: icmp_seq=1 ttl=122 time=0.619 ms
64 bytes from 176.26.232.111: icmp_seq=2 ttl=122 time=0.621 ms
64 bytes from 176.26.232.111: icmp_seq=3 ttl=122 time=0.634 ms

--- host3.site.net ping statistics ---
4 packets transmitted, 4 packets received, 0% packet loss
round-trip min/avg/max/stddev = 0.619/0.634/0.661/0.017 ms
```

- Meaning**
- The **ping** results show the following information:
    - Size of the ping response packet (in bytes).
    - IP address of the host from which the response was sent.
    - Sequence number of the ping response packet. You can use this value to match the ping response to the corresponding ping request.
    - Time-to-live (ttl) hop-count value of the ping response packet.

- Total time between the sending of the ping request packet and the receiving of the ping response packet, in milliseconds. This value is also called round-trip time.
- Number of ping requests (probes) sent to the host.
- Number of ping responses received from the host.
- Packet loss percentage.
- Round-trip time statistics: minimum, average, maximum, and standard deviation of the round-trip time.

## Tracing SNMP Activity on a Device Running Junos OS

SNMP tracing operations track activity for SNMP agents and record the information in log files. The logged error descriptions provide detailed information to help you solve problems faster.

By default, Junos OS does not trace any SNMP activity. If you include the **tracoptions** statement at the **[edit snmp]** hierarchy level, the default tracing behavior is:

- Important activities are logged in files located in the **/var/log** directory. Each log is named after the SNMP agent that generates it. Currently, the following log files are created in the **/var/log** directory when the **tracoptions** statement is used:
  - chassisd
  - craftd
  - ilmid
  - mib2d
  - rmopd
  - serviced
  - snmpd
- When a trace file named **filename** reaches its maximum size, it is renamed **filename.0**, then **filename.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. (For more information about how log files are created, see the *Junos OS System Log Messages Reference*.)
- Log files can be accessed only by the user who configured the tracing operation.

You cannot change the directory (**/var/log**) in which trace files are located. However, you can customize the other trace file settings by including the following statements at the **[edit snmp]** hierarchy level:

```
[edit snmp]
tracoptions {
```

```
file <files number> <match regular-expression> <size size> <world-readable |  
    no-world-readable>;  
flag flag;  
memory-trace;  
no-remote-trace;  
no-default-memory-trace;  
}
```

These statements are described in the following sections:

- [Configuring the Number and Size of SNMP Log Files on page 6886](#)
- [Configuring Access to the Log File on page 6886](#)
- [Configuring a Regular Expression for Lines to Be Logged on page 6886](#)
- [Configuring the Trace Operations on page 6887](#)

---

### Configuring the Number and Size of SNMP Log Files

By default, when the trace file reaches 128 kilobytes (KB) in size, it is renamed *filename.0*, then *filename.1*, and so on, until there are three trace files. Then the oldest trace file (*filename.2*) is overwritten.

You can configure the limits on the number and size of trace files by including the following statements at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]  
file files number size size;
```

For example, set the maximum file size to 2 MB, and the maximum number of files to 20. When the file that receives the output of the tracing operation (*filename*) reaches 2 MB, *filename* is renamed *filename.0*, and a new file called *filename* is created. When the new *filename* reaches 2 MB, *filename.0* is renamed *filename.1* and *filename* is renamed *filename.0*. This process repeats until there are 20 trace files. Then the oldest file (*filename.19*) is overwritten by the newest file (*filename.0*).

The number of files can be from 2 through 1000 files. The file size of each file can be from 10 KB through 1 gigabyte (GB).

---

### Configuring Access to the Log File

By default, log files can be accessed only by the user who configured the tracing operation.

To specify that any user can read all log files, include the **file world-readable** statement at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]  
file world-readable;
```

To explicitly set the default behavior, include the **file no-world-readable** statement at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]  
file no-world-readable;
```

---

### Configuring a Regular Expression for Lines to Be Logged

By default, the trace operation output includes all lines relevant to the logged activities.

You can refine the output by including the **match** statement at the **[edit snmp traceoptions file *filename*]** hierarchy level and specifying a regular expression (regex) to be matched:

```
[edit snmp traceoptions]
file filename match regular-expression;
```

### Configuring the Trace Operations

By default, only important activities are logged. You can specify which trace operations are to be logged by including the following **flag** statement (with one or more tracing flags) at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
flag {
  all;
  configuration;
  database;
  events;
  general;
  interface-stats;
  nonvolatile-sets;
  pdu;
  policy;
  protocol-timeouts;
  routing-socket;
  server;
  subagent;
  timer;
  varbind-error;
}
```

[Table 615 on page 6887](#) describes the meaning of the SNMP tracing flags.

**Table 615: SNMP Tracing Flags**

| Flag                   | Description                                                                 | Default Setting |
|------------------------|-----------------------------------------------------------------------------|-----------------|
| <b>all</b>             | Log all operations.                                                         | Off             |
| <b>configuration</b>   | Log reading of the configuration at the <b>[edit snmp]</b> hierarchy level. | Off             |
| <b>database</b>        | Log events involving storage and retrieval in the events database.          | Off             |
| <b>events</b>          | Log important events.                                                       | Off             |
| <b>general</b>         | Log general events.                                                         | Off             |
| <b>interface-stats</b> | Log physical and logical interface statistics.                              | Off             |
| <b>nonvolatile-set</b> | Log nonvolatile SNMP set request handling.                                  | Off             |
| <b>pdu</b>             | Log SNMP request and response packets.                                      | Off             |

Table 615: SNMP Tracing Flags (*continued*)

| Flag                     | Description                                                  | Default Setting |
|--------------------------|--------------------------------------------------------------|-----------------|
| <b>policy</b>            | Log policy processing.                                       | Off             |
| <b>protocol-timeouts</b> | Log SNMP response timeouts.                                  | Off             |
| <b>routing-socket</b>    | Log routing socket calls.                                    | Off             |
| <b>server</b>            | Log communication with processes that are generating events. | Off             |
| <b>subagent</b>          | Log subagent restarts.                                       | Off             |
| <b>timer</b>             | Log internal timer events.                                   | Off             |
| <b>varbind-error</b>     | Log variable binding errors.                                 | Off             |

To display the end of the log for an agent, issue the **show log agentd | last** operational mode command:

```
[edit]
user@host# run show log agentd | last
```

where **agent** is the name of an SNMP agent.

## Using the Enterprise-Specific Utility MIB to Enhance SNMP Coverage

Even though the Junos OS has built-in performance metrics and monitoring options, you might need to have customized performance metrics. To make it easier for you to monitor such customized data through a standard monitoring system, the Junos OS provides you with an enterprise-specific Utility MIB that can store such data and thus extend SNMP support for managing and monitoring the data of your choice.

The enterprise-specific Utility MIB provides you with container objects of the following types: **32-bit counters**, **64-bit counters**, **signed integers**, **unsigned integers**, and **octet strings**. You can use these container MIB objects to store the data that are otherwise not supported for SNMP operations. You can populate data for these objects either by using CLI commands or with the help of Op scripts and an RPC API that can invoke the CLI commands.

The following CLI commands enable you to set and clear Utility MIB object values:

- `request snmp utility-mib set instance name object-type <counter | counter 64 | integer | string | unsigned integer> object-value value`
- `request snmp utility-mib clear instance name object-type <counter | counter 64 | integer | string | unsigned integer>`

The *instance name* option of the `request snmp utility-mib <set | clear>` command specifies the name of the data instance and is the main identifier of the data. The **object-type** `<counter | counter 64 | integer | string | unsigned integer>` option enables you specify the object type, and the **object-value** *value* option enables you to set the value of the object.

To automate the process of populating Utility MIB data, you can use a combination of an event policy and event script. The following examples show the configuration for an event policy to run **show system buffers** every hour and to store the **show system buffers** data in Utility MIB objects by running an event script (**check-mbufs.slax**).

#### Event Policy Configuration

To configure an event policy that runs the **show system buffers** command every hour and invokes **check-mbufs.slax** to store the **show system buffers** data into Utility MIB objects, include the following statements at the `[edit]` hierarchy level:

```
event-options {
  generate-event {
    1-HOUR time-interval 3600;
  }
  policy MBUFS {
    events 1-HOUR;
    then {
      event-script check-mbufs.slax; # script stored at /var/db/scripts/event/
    }
  }
  event-script {
    file check-mbufs.slax;
  }
}
```

#### check-mbufs.slax Script

The following example shows the **check-mbufs.slax** script that is stored under `/var/db/scripts/event/`:

```
----- script START -----
version 1.0;

ns junos = "http://xml.juniper.net/junos/*/junos";
ns xnm = "http://xml.juniper.net/xnm/1.1/xnm";
ns jcs = "http://xml.juniper.net/junos/commit-scripts/1.0";
ns ext = "http://xmlsoft.org/XSLT/namespace";

match / {
  <op-script-results>{
    var $cmd = <command> "show system buffers";
    var $out = jcs:invoke($cmd);

    var $lines = jcs:break_lines($out);
    for-each ($lines) {
      if (contains(., "current/peak/max")) {
```

```

var $pattern = "([0-9]+)/([0-9]+)/([0-9]+) mbufs";
var $split = jcs:regex($pattern, .);
var $result = $split[2];

var $rpc = <request-snmp-utility-mib-set> {
  <object-type> "integer";
  <instance> "current-mbufs";
  <object-value> $result;
}
var $res = jcs:invoke($rpc);
}
}
}
----- script END -----

```

You can run the following command to check the data stored in the Utility MIB as a result of the event policy and script shown in the preceding examples:

```

user@host> show snmp mib walk jnxUtilData ascii jnxUtilIntegerValue."current-mbufs"
= 0 jnxUtilIntegerTime."current-mbufs" = 07 da 05 0c 03 14 2c 00 2d 07 00
regress@caramels>

```

**NOTE:** The `show snmp mib walk` command is not available on the QFabric system, but you can use external SNMP client applications to perform this operation.

## Displaying Commit Script Output

[Table 616 on page 6890](#) summarizes the Junos OS command-line interface (CLI) commands you can use to monitor and troubleshoot commit scripts. For more information about the `cscript.log` file, see *Tracing Commit Script Processing*.

**NOTE:** Tracing commit script processing, including the `cscript.log` file, is not supported on the QFX3000-G QFabric system.

**Table 616: Commit Script Configuration and Operational Mode Commands**

| Task                                                          | Command                                          |

## Sample Output

### clear sflow collector statistics

The following example shows two output examples for the **show sflow collector** command, one before and one after the **clear sflow collector statistics** command was issued.

```
user@host> show sflow collector
Collector      Udp-port      No. of samples
address
10.1.1.1       6343          3174
10.1.2.1       6343          3562
```

```
user@host> clear sflow collector statistics
```

```
user@host> show sflow collector
Collector      Udp-port      No. of samples
address
10.1.1.1       6343          0
10.1.2.1       6343          0
```

## clear snmp history

---

**Syntax**    clear snmp history (*index* | all)

**Release Information**    Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Delete the samples of Ethernet statistics collected for a history group.

**Options**    all—Clear all the entries in the history index.

*index*—Clear the contents of the specified entry in the history index.

**Required Privilege Level**    clear

## Sample Output

### clear snmp statistics

In the following example, SNMP statistics are displayed before and after the **clear snmp statistics** command is issued:

```
user@host> show snmp statistics
SNMP statistics:
  Input:
    Packets: 8, Bad versions: 0, Bad community names: 0,
    Bad community uses: 0, ASN parse errors: 0,

## monitor traffic

**Syntax** monitor traffic  
 <brief | detail | extensive>  
 <absolute-sequence>  
 <count *count*>  
 <interface *interface-name*>  
 <layer2-headers>  
 <matching *matching*>  
 <no-domain-names>  
 <no-promiscuous>  
 <no-resolve>  
 <no-timestamp>  
 <print-ascii>  
 <print-hex>  
 <resolve-timeout>  
 <size *size*>

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
 Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Display packet headers or packets received and sent from the Routing Engine.

### NOTE:

- Using the **monitor-traffic** command can degrade router or switch performance.
- Delays from DNS resolution can be eliminated by using the **no-resolve** option.

**NOTE:** This command is not supported on the QFabric system.

**Options** **none**—(Optional) Display packet headers transmitted through **fxp0**. On a TX Matrix Plus router, display packet headers transmitted through **em0**.

**brief | detail | extensive**—(Optional) Display the specified level of output.

**absolute-sequence**—(Optional) Display absolute TCP sequence numbers.

**count *count***—(Optional) Specify the number of packet headers to display (0 through 1,000,000). The **monitor traffic** command quits automatically after displaying the number of packets specified.

**interface *interface-name***—(Optional) Specify the interface on which the **monitor traffic** command displays packet data. If no interface is specified, the **monitor traffic** command displays packet data arriving on the lowest-numbered interface.

**layer2-headers**—(Optional) Display the link-level header on each line.

**matching *matching***—(Optional) Display packet headers that match a regular expression. Use matching expressions to define the level of detail with which the **monitor traffic** command filters and displays packet data.

**no-domain-names**—(Optional) Suppress the display of the domain portion of hostnames. With the **no-domain-names** option enabled, the **monitor traffic** command displays only **team** for the hostname **team.company.net**.

**no-promiscuous**—(Optional) Do not put the interface into promiscuous mode.

**no-resolve**—(Optional) Suppress reverse lookup of the IP addresses.

**no-timestamp**—(Optional) Suppress timestamps on displayed packets.

**print-ascii**—(Optional) Display each packet in ASCII format.

**print-hex**—(Optional) Display each packet, except the link-level header, in hexadecimal format.

**resolve-timeout *timeout***—(Optional) Amount of time the router or switch waits for each reverse lookup before timing out. You can set the timeout for 1 through 4,294,967,295 seconds. The default is 4 seconds. To display each packet, use the **print-ascii**, **print-hex**, or **extensive** option.

**size *size***—(Optional) Read but do not display up to the specified number of bytes for each packet. When set to **brief** output, the default packet size is 96 bytes and is adequate for capturing IP, ICMP, UDP, and TCP packet data. When set to **detail** and **extensive** output, the default packet size is 1514. The **monitor traffic** command truncates displayed packets if the matched data exceeds the configured size.

**Additional Information** In the **monitor traffic** command, you can specify an expression to match by using the **matching** option and including the expression in quotation marks:

**monitor traffic matching "*expression*"**

Replace ***expression*** with one or more of the match conditions listed in [Table 617 on page 6899](#).

Table 617: Match Conditions for the monitor traffic Command

| Match Type    | Condition                                             | Description                                                                                                                                                                                                                                                                            |
|---------------|-------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Entity        | <b>host</b> [ <i>address</i>   <i>hostname</i> ]      | Matches packets that contain the specified address or hostname.<br><br>The protocol match conditions <b>arp</b> , <b>ip</b> , or <b>rarp</b> , or any of the directional match conditions can be prepended to the <b>host</b> match condition.                                         |
|               | <b>net</b> <i>address</i>                             | Matches packets with source or destination addresses containing the specified network address.                                                                                                                                                                                         |
|               | <b>net</b> <i>address mask mask</i>                   | Matches packets containing the specified network address and subnet mask.                                                                                                                                                                                                              |
|               | <b>port</b> ( <i>port-number</i>   <i>port-name</i> ) | Matches packets containing the specified source or destination TCP or UDP port number or port name.<br><br>In place of the numeric port address, you can specify a text synonym, such as <b>bgp</b> (179), <b>dhcp</b> (67), or <b>domain</b> (53) (the port numbers are also listed). |
| Directional   | <b>dst</b>                                            | Matches packets going to the specified destination. This match condition can be prepended to any of the entity type match conditions.                                                                                                                                                  |
|               | <b>src</b>                                            | Matches packets from a specified source. This match condition can be prepended to any of the entity type match conditions.                                                                                                                                                             |
|               | <b>src and dst</b>                                    | Matches packets that contain the specified source and destination addresses. This match condition can be prepended to any of the entity type match conditions.                                                                                                                         |
|               | <b>src or dst</b>                                     | Matches packets containing either of the specified addresses. This match condition can be prepended to any of the entity type match conditions.                                                                                                                                        |
| Packet Length | <b>less</b> <i>value</i>                              | Matches packets shorter than or equal to the specified value, in bytes.                                                                                                                                                                                                                |
|               | <b>greater</b> <i>value</i>                           | Matches packets longer than or equal to the specified value, in bytes.                                                                                                                                                                                                                 |

Table 617: Match Conditions for the monitor traffic Command (*continued*)

| Match Type | Condition                                                | Description                                                                                                                                                                                                                                                                                                                     |
|------------|----------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Protocol   | <b>amt</b>                                               | Matches all AMT packets. Use the extensive level of output to decode the inner IGMP packets in addition to the AMT outer packet.                                                                                                                                                                                                |
|            | <b>arp</b>                                               | Matches all ARP packets.                                                                                                                                                                                                                                                                                                        |
|            | <b>ether</b>                                             | Matches all Ethernet packets.                                                                                                                                                                                                                                                                                                   |
|            | <b>ether (broadcast   multicast)</b>                     | Matches broadcast or multicast Ethernet frames. This match condition can be prepended with <b>src</b> and <b>dst</b> .                                                                                                                                                                                                          |
|            | <b>ether protocol (address   (arp   ip   rarp))</b>      | Matches packets with the specified Ethernet address or Ethernet packets of the specified protocol type. The <b>ether protocol</b> arguments <b>arp</b> , <b>ip</b> , and <b>rarp</b> are also independent match conditions, so they must be preceded by a backslash (\) when used in the <b>ether protocol</b> match condition. |
|            | <b>icmp</b>                                              | Matches all ICMP packets.                                                                                                                                                                                                                                                                                                       |
|            | <b>ip</b>                                                | Matches all IP packets.                                                                                                                                                                                                                                                                                                         |
|            | <b>ip (broadcast   multicast)</b>                        | Matches broadcast or multicast IP packets.                                                                                                                                                                                                                                                                                      |
|            | <b>ip protocol (address   (icmp   igmp   tcp   udp))</b> | Matches packets with the specified address or protocol type. The <b>ip protocol</b> arguments <b>icmp</b> , <b>tcp</b> , and <b>udp</b> are also independent match conditions, so they must be preceded by a backslash (\) when used in the <b>ip protocol</b> match condition.                                                 |
|            | <b>isis</b>                                              | Matches all IS-IS routing messages.                                                                                                                                                                                                                                                                                             |
|            | <b>rarp</b>                                              | Matches all RARP packets.                                                                                                                                                                                                                                                                                                       |
|            | <b>tcp</b>                                               | Matches all TCP datagrams.                                                                                                                                                                                                                                                                                                      |
|            | <b>udp</b>                                               | Matches all UDP datagrams.                                                                                                                                                                                                                                                                                                      |

To combine expressions, use the logical operators listed in [Table 618 on page 6900](#).

Table 618: Logical Operators for the monitor traffic Command

| Logical Operator (Highest to Lowest Precedence) | Description                                                                          |
|-------------------------------------------------|--------------------------------------------------------------------------------------|
| <b>!</b>                                        | Logical NOT. If the first condition does not match, the next condition is evaluated. |

Table 618: Logical Operators for the monitor traffic Command (*continued*)

| Logical Operator (Highest to Lowest Precedence) | Description                                                                                                                                         |
|-------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| &&                                              | Logical AND. If the first condition matches, the next condition is evaluated. If the first condition does not match, the next condition is skipped. |
|                                                 | Logical OR. If the first condition matches, the next condition is skipped. If the first condition does not match, the next condition is evaluated.  |
| ( )                                             | Group operators to override default precedence order. Parentheses are special characters, each of which must be preceded by a backslash (\).        |

You can use relational operators to compare arithmetic expressions composed of integer constants, binary operators, a length operator, and special packet data accessors. The arithmetic expression matching condition uses the following syntax:

```
monitor traffic matching "ether[0] & 1 != 0"arithmetic_expression relational_operator arithmetic_expression
```

The packet data accessor uses the following syntax:

```
protocol [byte-offset <size>]
```

The optional *size* field represents the number of bytes examined in the packet header. The available values are 1, 2, or 4 bytes. The following sample command captures all multicast traffic:

```
user@host> monitor traffic matching "ether[0] & 1 != 0"
```

To specify match conditions that have a numeric value, use the arithmetic and relational operators listed in [Table 619 on page 6902](#).

**NOTE:** Because the Packet Forwarding Engine removes Layer 2 header information before sending packets to the Routing Engine:

- The **monitor traffic** command cannot apply match conditions to inbound traffic.
- The **monitor traffic interface** command also cannot apply match conditions for Layer 3 and Layer 4 packet data, resulting in the match pipe option (`| match`) for this command for Layer 3 and Layer 4 packets not working either. Therefore, ensure that you specify match conditions as described in this command summary. For more information about match conditions, see [Table 617 on page 6899](#).
- The 802.1Q VLAN tag information included in the Layer 2 header is removed from all inbound traffic packets. Because the **monitor traffic interface ae[x]** command for aggregated Ethernet interfaces (such as ae0) only shows inbound traffic data, the command does not show VLAN tag information in the output.

**Table 619: Arithmetic and Relational Operators for the monitor traffic Command**

| Arithmetic or Relational Operator                         | Description                                                                         |
|-----------------------------------------------------------|-------------------------------------------------------------------------------------|
| <b>Arithmetic Operator</b>                                |                                                                                     |
| +                                                         | Addition operator.                                                                  |
| -                                                         | Subtraction operator.                                                               |
| /                                                         | Division operator.                                                                  |
| &                                                         | Bitwise AND.                                                                        |
| *                                                         | Bitwise exclusive OR.                                                               |
|                                                           | Bitwise inclusive OR.                                                               |
| <b>Relational Operator (Highest to Lowest Precedence)</b> |                                                                                     |
| <=                                                        | If the first expression is less than or equal to the second, the packet matches.    |
| >=                                                        | If the first expression is greater than or equal to the second, the packet matches. |
| <                                                         | If the first expression is less than the second, the packet matches.                |
| >                                                         | If the first expression is greater than the second, the packet matches.             |
| =                                                         | If the compared expressions are equal, the packet matches.                          |
| !=                                                        | If the compared expressions are unequal, the packet matches.                        |

| <b>Description</b>         | Check host reachability and network connectivity. The <b>ping</b> command sends Internet Control Message Protocol (ICMP) ECHO_REQUEST messages to elicit ICMP ECHO_RESPONSE messages from the specified host. Press Ctrl+c to interrupt a ping command.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>             | <p><b>host</b>—IP address or hostname of the remote system to ping.</p> <p><b>bypass-routing</b>—(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it.</p> <p><b>count requests</b>—(Optional) Number of ping requests to send. The range of values is 1 through 2,000,000,000. The default value is an unlimited number of requests.</p> <p><b>detail</b>—(Optional) Include in the output the interface on which the ping reply was received.</p> <p><b>do-not-fragment</b>—(Optional) Set the do-not-fragment (DF) flag in the IP header of the ping packets. For IPv6 packets, this option disables fragmentation.</p> <div><p><b>NOTE:</b> In Junos OS Release 11.1 and later, when issuing the <b>ping</b> command for an IPv6 route with the <b>do-not-fragment</b> option, the maximum ping packet size is calculated by subtracting 48 bytes (40 bytes for the IPV6 header and 8 bytes for the ICMP header) from the MTU. Therefore, if the ping packet size (including the 48-byte header) is greater than the MTU, the ping operation might fail.</p></div> <p><b>inet</b>—(Optional) Ping Packet Forwarding Engine IPv4 routes.</p> <p><b>inet6</b>—(Optional) Ping Packet Forwarding Engine IPv6 routes.</p> <p><b>interface source-interface</b>—(Optional) Interface to use to send the ping requests.</p> <p><b>interval seconds</b>—(Optional) How often to send ping requests. The range of values, in seconds, is 1 through infinity. The default value is 1.</p> <p><b>logical-system logical-system-name</b>—(Optional) Name of logical system from which to send the ping requests.</p> <p>Alternatively, enter the <b>set cli logical-system logical-system-name</b> command and then run the <b>ping</b> command. To return to the main router or switch, enter the <b>clear cli logical-system</b> command.</p> |

**loose-source *value***—(Optional) Intermediate loose source route entry (IPv4). Open a set of values.

**mac-address *mac-address***—(Optional) Ping the physical or hardware address of the remote system you are trying to reach.

**no-resolve**—(Optional) Do not attempt to determine the hostname that corresponds to the IP address.

**pattern *string***—(Optional) Specify a hexadecimal fill pattern to include in the ping packet.

**rapid**—(Optional) Send ping requests rapidly. The results are reported in a single message, not in individual messages for each ping request. By default, five ping requests are sent before the results are reported. To change the number of requests, include the **count** option.

**record-route**—(Optional) Record and report the packet's path (IPv4).

**routing-instance *routing-instance-name***—(Optional) Name of the routing instance for the ping attempt.

**size *bytes***—(Optional) Size of ping request packets. The range of values, in bytes, is 0 through 65,468. The default value is 56, which is effectively 64 bytes because 8 bytes of ICMP header data are added to the packet.

**source *source-address***—(Optional) IP address of the outgoing interface. This address is sent in the IP source address field of the ping request. If this option is not specified, the default address is usually the loopback interface (lo.0).

**strict**—(Optional) Use the strict source route option (IPv4).

**strict-source *value***—(Optional) Intermediate strict source route entry (IPv4). Open a set of values.

**tos *type-of-service***—(Optional) Set the type-of-service (ToS) field in the IP header of the ping packets. The range of values is 0 through 255.

If the device configuration includes the **dscp-code-point *value*** statement at the **[edit class-of-service host-outbound-traffic]** hierarchy level, the configured DSCP value overrides the value specified in this command option. In this case, the ToS field of ICMP echo request packets sent on behalf of this command carries the DSCP value specified in the **dscp-code-point** configuration statement instead of the value you specify in this command option.

**ttl *value***—(Optional) Time-to-live (TTL) value to include in the ping request (IPv6). The range of values is 0 through 255.

**verbose**—(Optional) Display detailed output.

**vpls *instance-name***—(Optional) Ping the instance to which this VPLS belongs.

**wait *seconds***—(Optional) Maximum wait time, in seconds, after the final packet is sent. If this option is not specified, the default delay is 10 seconds. If this option is used without the count option, a default count of 5 packets is used.

| <b>Output Fields</b>            | When you enter this command, you are provided feedback on the status of your request. An exclamation point (!) indicates that an echo reply was received. A period (.) indicates that an echo reply was not received within the timeout period. An x indicates that an echo reply was received with an error code. These packets are not counted in the received packets count. They are accounted for separately. |

## Sample Output

### ping hostname

```
user@host> ping skye
PING skye.net (192.168.169.254): 56 data bytes
64 bytes from 192.168.169.254: icmp_seq=0 ttl=253 time=1.028 ms
64 bytes from 192.168.169.254: icmp_seq=1 ttl=253 time=1.053 ms

| <b>Output Fields</b>            | <a href="#">Table 621 on page 6914</a> lists the output fields for the <b>ping fabric-unicast-flow</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

Table 621: ping fabric unicast-flow Output Fields

| Field Name                                                                                       | Field Description                                                      |
|--------------------------------------------------------------------------------------------------|------------------------------------------------------------------------|
| Fabric flow ping between source <i>source-fmep-name</i> destination <i>destination-fmep-name</i> | Path of the unicast-flow ping between the source and detination FMEPs. |
| Using fabric flow-specification                                                                  | Name of the flow specification.                                        |
| Ethernet frame-size                                                                              | Ethernet frame size in bytes.                                          |
| Source-MAC                                                                                       | MAC address of the source FMEP interface.                              |
| Destination-MAC                                                                                  | MAC address of the destination FMEP interface.                         |
| Ethertype                                                                                        | EtherType protocol.                                                    |
| received response from fmep-id                                                                   | ID of the FMEP sending the response.                                   |

## Sample Output

### ping fabric unicast-flow

```
user@host> ping fabric unicast-flow fma-name fma1 source-fmep-id 1 dest-fmep-id 2
flow-spec-name fspec1 verbose
```

```
Fabric flow ping between source ED1494 destination ED1497
Using fabric flow-specification: fspec1

| Ether type              | EtherType protocol.                                                                                                                                                              |
| Source-MAC              | MAC address of the source FMEP interface.                                                                                                                                        |

Table 622: show oam fabric flow-specification Output Fields (*continued*)

| Field Name                     | Field Description                                   |
|--------------------------------|-----------------------------------------------------|
| Source-MAC Mask                | MAC address mask of the source FMEP interface.      |
| Destination-MAC                | MAC address of the destination FMEP interface.      |
| Destination-MAC Mask           | MAC address mask of the destination FMEP interface. |
| Source-IP                      | IP address of the source FMEP interface.            |
| Source-IP Mask                 | IP address mask of the source FMEP interface.       |
| Destination-IP                 | IP address of the destination FMEP interface.       |
| Destination-IP mask            | IP address mask of the destination FMEP interface.  |
| IP-Protocol                    | IPv4 protocol configured.                           |
| Source-L4-Port                 | Source TCP or UDP port.                             |
| Destination-L4-Port            | Destination TCP or UDP port.                        |
| Destination multicast group IP | IP address of the destination multicast group.      |

## Sample Output

### show oam fabric flow-specification (All)

```

user@host> show oam fabric flow-specification

Flow specification name : fspec1 Type : Ethernet
  Ethernet frame size : Unspecified
  Ether type : Unspecified
  Source-MAC : Unspecified
  Source-MAC Mask : Unspecified
  Destination-MAC : Unspecified
  Destination-MAC Mask : Unspecified
Flow specification name : fspec2 Type : Ethernet
  Ethernet frame size : Unspecified
  Ether type : 1792
  Source-MAC : 0:0:a0:f0:cc:22
  Source-MAC Mask : Unspecified
  Destination-MAC : 0:11:22:33:a0:e2
  Destination-MAC Mask : Unspecified
Flow specification name : fspec3 Type : Ethernet Unicast IPV4
  Ethernet frame size : Unspecified
  Source-IP : 121.0.0.1
  Source-IP Mask : Unspecified
  Destination-IP : 132.1.0.1
  Destination-IP Mask : Unspecified
  Destination-mac : Unspecified
  IP-protocol : TCP
  Source-L4-port : 270

```

```
Destination-L4-port : Unspecified
Flow specification name : fspec4 Type : Multicast IPV4
Ethernet frame size : Unspecified
Source IP : 100.0.0.23
Destination multicast group IP: 225.0.0.1
Flow specification name : fspec5 Type : Multicast VLAN flood
Ethernet frame size : Unspecified
```

#### show oam fabric flow-specification (Flow Specification Specified)

```
user@host> show oam fabric flow-specification fspec3
```

```
Flow specification name : fspec3 Type : Ethernet Unicast IPV4
Ethernet frame size : Unspecified
Source-IP : 121.0.0.1
Source-IP Mask : Unspecified
Destination-IP : 132.1.0.1
Destination-IP Mask : Unspecified
Destination-mac : Unspecified
IP-protocol : TCP
Source-L4-port : 270
Destination-L4-port : Unspecified
```

| <b>Description</b>                | List log files, display log file contents, or display information about users who have logged in to the router or switch.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>                    | <p><b>none</b>—List all log files.</p> <p><b>&lt;all-lcc   lcc number   scc&gt;</b>—(TX Matrix routers only) (Optional) Display logging information about all T640 routers (or line-card chassis) or a specific T640 router (replace <i>number</i> with a value from 0 through 3) connected to a TX Matrix router. Or, display logging information about the TX Matrix router (or switch-card chassis).</p> <p><b>device-type</b>—(QFabric system only) (Optional) Display log messages for only one of the following device types:</p> <ul style="list-style-type: none"> <li>• <b>director-device</b>—Display logs for Director devices.</li> <li>• <b>infrastructure-device</b>—Display logs for the logical components of the QFabric system infrastructure, including the diagnostic Routing Engine, fabric control Routing Engine, fabric manager Routing Engine, and the default network Node group and its backup (NW-NG-0 and NW-NG-0-backup).</li> <li>• <b>interconnect-device</b>—Display logs for Interconnect devices.</li> <li>• <b>node-device</b>—Display logs for Node devices.</li> </ul> |

**NOTE:** If you specify the *device-type* optional parameter, you must also specify either the *device-id* or *device-alias* optional parameter.

**(device-id | device-alias)**—If a device type is specified, display logs for a device of that type. Specify either the device ID or the device alias (if configured).

**filename**—(Optional) Display the log messages in the specified log file. For the routing matrix, the filename must include the chassis information.

**NOTE:** The *filename* parameter is mandatory for the QFabric system. If you did not configure a syslog filename, specify the default filename of messages.

**user <username>**—(Optional) Display logging information about users who have recently logged in to the router or switch. If you include *username*, display logging information about the specified user.

**Required Privilege Level** trace

**Table 624: show sflow Output Fields**

| Field Name          | Field Description                                                                                                  | Level of Output |
|---------------------|--------------------------------------------------------------------------------------------------------------------|-----------------|
| sFlow               | Status of the feature: <b>Enabled</b> or <b>Disabled</b> .                                                         | All levels      |
| Sample limit        | Number of packets sampled per second. This sample limit cannot be configured and is set to 300 packets per second. | All levels      |
| Polling interval    | Interval at which the sFlow agent polls the interface.                                                             | All levels      |
| Sample rate egress  | Rate at which egress packets are sampled.                                                                          | All levels      |
| Sample rate ingress | Rate at which ingress packets are sampled.                                                                         | All levels      |
| Agent ID            | IP address assigned to the sFlow agent.                                                                            | All levels      |
| Source IP address   | Source IP address for the sFlow packets.                                                                           | All levels      |

## Sample Output

show sflow

```
user@host> show sflow
```

```
sFlow           : Enabled
Sample limit    : 300 packets/second
Polling interval : 20 second
Sample rate egress : 1:2048: Disabled
Sample rate ingress : 1:1000: Enabled
Agent ID        : 10.93.54.7
Source IP address : 10.93.54.7
```

**Table 625: show sflow collector Output Fields**

| Field Name        | Field Description                 | Level of Output |
|-------------------|-----------------------------------|-----------------|
| Collector address | IP address of the collector.      | All levels      |
| UDP-Port          | UDP port number of the collector. | All levels      |
| No. of samples    | Number of samples collected.      | All levels      |

## Sample Output

### show sflow collector

```
user@host> show sflow collector
```

| Collector address | Udp-port | No. of samples |
|-------------------|----------|----------------|
| 10.204.32.46      | 6343     | 1000           |
| 100.204.32.76     | 3400     | 1000           |

## show sflow interface

|                                 |                                                                                                                                                                                                                                                                                                                                  |

| <b>Output Fields</b>            | Table 626 on page 6935 lists the output fields for the <b>show sflow interface</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                              |

**Table 626: show sflow interface Output Fields**

| Field Name                  | Field Description                                      | Level of Output |
|-----------------------------|--------------------------------------------------------|-----------------|
| Interface                   | Interface on which sFlow technology is enabled.        | All levels      |
| Status Egress               | Indicates whether an egress sample rate is enabled.    | All levels      |
| Status Ingress              | Indicates whether an ingress sample rate is enabled.   | All levels      |
| Sample rate Egress          | Rate at which egress packets are sampled.              | All levels      |
| Sample rate Ingress         | Rate at which ingress packets are sampled.             | All levels      |
| Adapted sample rate Egress  | Adapted rate at which egress packets are sampled.      | All levels      |
| Adapted sample rate Ingress | Adapted rate at which ingress packets are sampled.     | All levels      |
| Polling-interval            | Interval at which the sFlow agent polls the interface. | All levels      |

## Sample Output

### show sflow interface (QFX3500 Switch in Standalone Mode)

```
user@host> show sflow interface
```

| Interface  | Status  | Sample rate |         | Adapted sample rate |           | Polling-interval |
|------------|---------|-------------|---------|---------------------|-----------|------------------|
|            |         | Egress      | Ingress | Egress              | Ingress   |                  |
| xe-0/0/0.0 | Enabled | Disabled    | 1000    | 2048                | 1000 2048 | 20               |
| xe-1/0/1.0 | Enabled | Disabled    | 1000    | 2048                | 1000 2048 | 20               |

## Sample Output

### show sflow interface (QFabric System)

```
user@host> show sflow interface

| <b>Output Fields</b>            | <a href="#">Table 628 on page 6942</a> describes the output fields for the <b>show snmp inform-statistics</b> command. Output fields are listed in the approximate order in which they appear. |

**Table 628: show snmp inform-statistics Output Fields**

| Field Name            | Field Description                                                                                                                                  |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Target Name</b>    | Name of the device configured to receive and respond to SNMP informs.                                                                              |
| <b>Address</b>        | IP address of the target device.                                                                                                                   |
| <b>Sent</b>           | Number of informs sent to the target device and acknowledged by the target device.                                                                 |
| <b>Pending</b>        | Number of informs held in memory pending a response from the target device.                                                                        |
| <b>Discarded</b>      | Number of informs discarded after the specified number of retransmissions to the target device were attempted.                                     |
| <b>Timeouts</b>       | Number of informs that did not receive an acknowledgement from the target device within the timeout specified.                                     |
| <b>Probe Failures</b> | Connection failures that occurred (for example, when the target server returned invalid content or you incorrectly configured the target address). |

## Sample Output

### show snmp inform-statistics

```

user@host> show snmp inform-statistics
Inform Request Statistics:
  Target Name: TA1_v3_md5_none Address: 172.17.20.184
    Sent: 176, Pending: 0
    Discarded: 0, Timeouts: 0, Probe Failures: 0
  Target Name: TA2_v3_sha_none Address: 192.168.110.59

```

Sent: 0, Pending: 4  
Discarded: 84, Timeouts: 0, Probe Failures: 258  
Target Name: TA5\_v2\_none Address: 172.17.20.184  
Sent: 0, Pending: 0  
Discarded: 2, Timeouts: 10, Probe Failures: 0

## show snmp mib

---

| <b>Description</b>              | Display local Simple Network Management Protocol (SNMP) Management Information Base (MIB) object values.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Options</b>                  | <p><b>get</b>—Retrieve and display one or more SNMP object values.</p> <p><b>get-next</b>—Retrieve and display the next SNMP object values.</p> <p><b>walk</b>—Retrieve and display the SNMP object values that are associated with the requested object identifier (OID). When you use this option, the Junos OS displays the objects below the subtree that you specify.</p> <p><b>ascii</b>—Display the SNMP object's string indices as an ASCII-key representation.</p> <p><b>decimal</b>—Display the SNMP object values in the decimal (default) format. The <b>decimal</b> option is the default option for this command. Therefore, issuing the <b>show snmp mib (get   get-next   walk) decimal object-id</b> and the <b>show snmp mib (get   get-next   walk) object-id</b> commands display the same output.</p> <p><b>object-id</b>—The object can be represented by a sequence of dotted integers (such as 1.3.6.1.2.1.2) or by its subtree name (such as <b>interfaces</b>). When entering multiple objects, enclose the objects in quotation marks.</p> |
| <b>Required Privilege Level</b> | snmp—To view this statement in the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

Table 629: show snmp mib Output Fields

| Field Name          | Field Description                                                               |
|---------------------|---------------------------------------------------------------------------------|
| <i>name</i>         | Object name and numeric instance value.                                         |
| <i>object value</i> | Object value. The Junos OS translates OIDs into the corresponding object names. |

## Sample Output

### show snmp mib get

```
user@host> show snmp mib get sysObjectID.0
sysObjectID.0 = jnxProductNameM20
```

### show snmp mib get (Multiple Objects)

```
user@host> show snmp mib get ?sysObjectID.0 sysUpTime.0?
sysObjectID.0 = jnxProductNameM20
sysUpTime.0 = 1640992
```

### show snmp mib get (Layer 2 Policer)

```
user@host> show snmp mib get ifInOctets.25970
ifInOctets.25970 = 7545720
```

### show snmp mib get-next

```
user@host> show snmp mib get-next jnxMibs
jnxBoxClass.0 = jnxProductLineM20.0
```

### show snmp mib get-next (Specify an OID)

```
user@host> show snmp mib get-next 1.3.6.1
sysDescr.0 = Juniper Networks, Inc. m20 internet router, kernel
Junos OS Release: 2004-1 Build date: build date UTC Copyright (c) 1996-2004 Juniper
Networks, Inc.
```

### show snmp mib walk

```
user@host> show snmp mib walk system
sysDescr.0 = Juniper Networks, Inc. m20 internet router, kernel
Junos OS Release #0: 2004-1 Build date: build date UTC Copyright (c) 1996-2004
Juniper Networks, Inc.

## traceroute fabric unicast-flow

**Syntax** `traceroute fabric unicast-flow flow-spec-name flow-specification-name fma fma-name  
 <source-fmep fmep-name>  
 <dest-fmep fmep-name>  
 <forced-fte-interface fte-interface>  
 <count count>  
 <verbose>`

**Release Information** Command introduced in Junos OS Release 12.2 for the QFX Series.

**Description** Trace the path taken by a specific unicast flow (ping) operation across a VLAN on the QFabric system from a source maintenance endpoint (FMEP) to a destination FMEP. The source and destination FMEPs may be on the same Node device, different Node devices connected to the same Interconnect device, or different Node devices connected to different Interconnect devices.

The flow path is the sequence of Packet Forwarding Engine forwarding hops along which the protocol data unit (PDU) travels. The hop-by-hop sequence and number of hops are reported in terms of fabric maintenance intermediate points (FMIPs), which are interfaces on the Packet Forwarding Engine of the Interconnect device. An FMIP sends a response to the source FMEP when the traceroute PDU is received.

**NOTE:** This command is not supported on the QFX3000-M QFabric system.

**Options** `dest-fmep-id source-fmep-id`—(Optional) ID of the destination FMEP of the traceroute operation.

`flow-spec-name flow-specification-name`—Name of the flow specification that defines the parameters of the traceroute operation.

`fma-name fma-name`—Name of the FMA that associates a VLAN with the FMEPs.

`forced-fte-interface fte-interface`—(Optional) Option to force the fabric ping operation to use the specified FTE interface to inject the PDU into the fabric instead of using the internal forwarding path lookup table to determine the FTE interface.

`source-fmep-id source-fmep-id`—(Optional) ID of the FMEP that is the source of the traceroute operation.

`verbose`—(Optional) Detailed version of the output display.

**Required Privilege Level** `interface`—To view this statement in the configuration.  
`interface-control`—To add this statement to the configuration.

**Output Fields** [Table 633 on page 6960](#) lists the output fields for the **traceroute fabric-unicast-flow** command. Output fields are listed in the approximate order in which they appear.

**Table 633: traceroute fabric unicast-flow Output Fields**

| Field Name                                                                                             | Field Description                                                                                      |
|--------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| Fabric flow traceroute between source <i>source-fmep-name</i> destination <i>destination-fmep-name</i> | Source and destination FMEP names.                                                                     |
| Using fabric flow-specification                                                                        | Name of the flow specification.                                                                        |
| Ethernet frame-size                                                                                    | Ethernet frame size.                                                                                   |
| Source-MAC                                                                                             | MAC address of the source FMEP interface.                                                              |
| Destination-MAC                                                                                        | MAC address of the destination FMEP interface.                                                         |
| Ethertype                                                                                              | EtherType protocol.                                                                                    |
| Received response from fmip-id, interface                                                              | FMIP identifier and interface name of the FMIP that received the PDU and responded to the source FMEP. |
| Received total <i>number</i> responses                                                                 | Number of responses that are received after the traceroute operation has finished.                     |

## Sample Output

### traceroute fabric unicast-flow

```
user@host> traceroute fabric unicast-flow fma-name fma1 source-fmep-id 1 dest-fmep-id 2
flow-spec-name fspec1
Received response from fmip-id 128.40.0.8, interface A0003:0/1/2
Received response from fmip-id 128.128.0.8, interface A0003:0/0/8
Received response from fmep-id 2
Received total 3 responses
```

## Sample Output

### traceroute fabric unicast-flow (Verbose)

```
user@host> traceroute fabric unicast-flow fma-name fma1 source-fmep-id 1 dest-fmep-id 2
flow-spec-name fspec1 verbose
```

```
Fabric flow traceroute between source ED1494 destination ED1497
Using fabric flow-specification: fspec1
Ethernet frame-size: 256
Source-MAC: 0:EF:7:99:85:10
Destination-MAC: 0:D3:A6:11:39:21
Ethertype: 11564
Received response from fmip-id 128.40.0.8, interface A0003:0/1/2
Received response from fmip-id 128.128.0.8, interface A0003:0/0/8
Received response from fmep-id 2
Received total 3 responses
```

### Understanding Troubleshooting Resources

This topic describes some of the troubleshooting resources available for the QFX Series. These resources include tools such as the Junos OS CLI, Junos Space applications, and the Advanced Insight Scripts (AI-Scripts).

[Table 634 on page 6963](#) provides a list of some of the troubleshooting resources.

**Table 634: Troubleshooting Resources on the QFX Series**

| Troubleshooting Resource              | Description                                                                                                                                               | Documentation                                                             |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------|
| Chassis alarms                        | Chassis alarms indicate a failure on the switch or one of its components. A chassis alarm count is displayed on the LCD panel on the front of the switch. | <a href="#">“Chassis Alarm Messages on a QFX3500 Device” on page 6982</a> |
| Chassis Status LEDs and Fan Tray LEDs | A blinking amber Power, Fan, or Fan Tray LED indicates a hardware component error. A blinking amber Status LED indicates a software error.                | <i>Chassis Status LEDs on a QFX3500 Device</i>                            |
| Interface alarms                      | A predefined alarm (red or yellow) for an interface type is triggered when an interface of that type goes down.                                           | <a href="#">“Interface Alarm Messages” on page 6985</a>                   |
| System alarms                         | A predefined alarm is triggered by a missing rescue configuration or problem with the software license.                                                   | <a href="#">“Understanding Alarms” on page 6981</a>                       |

Table 634: Troubleshooting Resources on the QFX Series (*continued*)

| Troubleshooting Resource                      | Description                                                                                                                                                                                                                                                                                                                                                                                                | Documentation                                                                                                                                                                                                                                |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| System log messages                           | The system log includes details of system and user events, including errors. Specify the severity and type of system log messages you wish to view or save, and configure the output to be sent to local or remote hosts.                                                                                                                                                                                  | <ul style="list-style-type: none"> <li>• <a href="#">Overview of Single-Chassis System Logging Configuration on page 6643</a></li> <li>• <a href="#">Junos OS System Log Configuration Statements on page 6697</a></li> </ul>                |
| Junos OS operational mode commands            | Operational mode commands can be used to monitor switch performance and current activity on the network. For example, use the <b>traceroute monitor</b> command to locate points of failure in a network.                                                                                                                                                                                                  | <ul style="list-style-type: none"> <li>• <a href="#">Monitoring System Process Information on page 337</a></li> <li>• <a href="#">Monitoring System Properties on page 338</a></li> <li>• <a href="#">traceroute monitor</a></li> </ul>      |
| Junos OS automation scripts (event scripts)   | Event scripts can be used to automate network troubleshooting and management tasks.                                                                                                                                                                                                                                                                                                                        | <i>Junos OS Automation Library</i>                                                                                                                                                                                                           |
| Junos OS XML operational tags                 | XML operational tags are equivalent in function to operational mode commands in the CLI, which you can use to retrieve status information for a device.                                                                                                                                                                                                                                                    | <i>Junos XML API Operational Developer Reference</i>                                                                                                                                                                                         |
| NETCONF XML management protocol               | The NETCONF XML management protocol defines basic operations that are equivalent to Junos OS CLI configuration mode commands. Client applications use the protocol operations to display, edit, and commit configuration statements (among other operations), just as administrators use CLI configuration mode commands such as <b>show</b> , <b>set</b> , and <b>commit</b> to perform those operations. | <i>NETCONF XML Management Protocol Developer Guide</i>                                                                                                                                                                                       |
| SNMP MIBs and traps                           | MIBs enable the monitoring of network devices from a central location. For example, use the Traceroute MIB to monitor devices remotely.                                                                                                                                                                                                                                                                    | <ul style="list-style-type: none"> <li>• <a href="#">SNMP MIBs Support on page 6612</a></li> <li>• <a href="#">SNMP Traps Support on page 6628</a></li> <li>• <a href="#">Using the Traceroute MIB for SNMP Remote Operations</a></li> </ul> |
| AI-Scripts and Advanced Insight Manager (AIM) | AI-Scripts installed on the switch can automatically detect and monitor faults on the switch, and depending on the configuration on the AIM application, send notifications of potential problems and submit problem reports to Juniper Support Systems.                                                                                                                                                   | <a href="#">Advanced Insight Scripts (AI-Scripts) Release Notes</a>                                                                                                                                                                          |
| Junos Space Service Now                       | This application enables you to display and manage information about problem events. When problems are detected on the switch by Advanced Insight Scripts (AI-Scripts) that are installed on the switch, the data is collected and sent to Service Now for your review and action.                                                                                                                         | <i>Service Automation</i>                                                                                                                                                                                                                    |

Table 634: Troubleshooting Resources on the QFX Series (*continued*)

| Troubleshooting Resource        | Description                                                                                                                                                                                                                                                                                                                                 | Documentation                                             |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------|
| Junos Space Service Insight     | This application helps in accelerating operational analysis and managing the exposure to known issues. You can identify devices that are nearing their End Of Life (EOL) and also discover and prevent issues that could occur in your network. The functionality of Service Insight is dependent on the information sent from Service Now. | <i>Service Automation</i>                                 |
| Juniper Networks Knowledge Base | You can search in this database for Juniper Networks product information, including alerts and troubleshooting tips.                                                                                                                                                                                                                        | <a href="http://kb.juniper.net">http://kb.juniper.net</a> |

## Troubleshooting Overview

This topic provides a general guide to troubleshooting some typical problems you may encounter on your QFX Series product.

[Table 635 on page 6965](#) provides a list of problem categories, summary of the symptom or problem, and recommended actions with links to the troubleshooting documentation.

Table 635: Troubleshooting on the QFX Series

| Problem Category           | Symptom or Problem                                                          | Recommended Action                                                                                     |
|----------------------------|-----------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| Switch hardware components | LCD panel shows a chassis alarm count.                                      | See <a href="#">“Chassis Alarm Messages on a QFX3500 Device” on page 6982</a> .                        |
|                            | Fan tray LED is blinking amber.                                             | See <i>Fan Tray LED on a QFX3500 Device</i> .                                                          |
|                            | Chassis status LED for the power is blinking amber.                         | See <i>Chassis Status LEDs on a QFX3500 Device</i> .                                                   |
|                            | Chassis status LED for the fan (on the management board) is blinking amber. | Replace the management board as soon as possible. See <i>Chassis Status LEDs on a QFX3500 Device</i> . |

Table 635: Troubleshooting on the QFX Series (*continued*)

| Problem Category               | Symptom or Problem                                                                                          | Recommended Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------|-------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port configuration             | Cannot configure a port as a Gigabit Ethernet port.                                                         | <p>Check whether the port is a valid Gigabit Ethernet port (6 through 41).</p> <p>See <a href="#">“QFX3500 Device Overview” on page 3</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|                                | Cannot configure a port as a Fibre Channel port.                                                            | <p>Check whether the port is a valid Fibre Channel port (0 through 5 and 42 through 47).</p> <p>See <a href="#">“QFX3500 Device Overview” on page 3</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|                                | Cannot configure a port as a 10-Gigabit Ethernet port.                                                      | <p>If the port is not a 40-Gbps QSFP+ interface, check whether the port is in the range of 0 through 5 or 42 through 47. If one of the ports in that block (0 through 5 or 42 through 47) is configured as a Fibre Channel port, then all ports in that block must also be configured as Fibre Channel ports.</p> <p>If the port is a 40-Gbps QSFP+ interface, make sure the configuration does not exceed the interface limit. Each 40-Gbps QSFP+ interface can be split into four 10-Gigabit Ethernet interfaces, but because port 0 is reserved, so you can only configure an additional fifteen 10-Gigabit Ethernet interfaces.</p> <p>See <a href="#">“QFX3500 Device Overview” on page 3</a>.</p> |
|                                | Cannot configure a 40-Gbps QSFP+ interface.                                                                 | <p>The 40-Gbps QSFP+ interfaces can only be used as 10-Gigabit Ethernet interfaces. Each 40-Gbps QSFP+ interface can be split into four 10-Gigabit Ethernet interfaces using a breakout cable. However, port 0 is reserved, so you can only configure an additional fifteen 10-Gigabit Ethernet interfaces.</p> <p>See <a href="#">“QFX3500 Device Overview” on page 3</a>.</p>                                                                                                                                                                                                                                                                                                                         |
| External devices (USB devices) | Upgrading software from a USB device results in an upgrade failure, and the system enters an invalid state. | Unplug the USB device and reboot the switch.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Initial device configuration   | Cannot configure management Ethernet ports.                                                                 | <p>Configure the management ports from the console port. You cannot configure the management ports by directly connecting to them.</p> <p><b>NOTE:</b> The management ports are on the front panel of the QFX3500 switch. They are labeled <b>C0</b> and <b>C1</b> on the front panel. In the CLI they are referred to as <b>me0</b> and <b>me1</b>.</p> <p>See <a href="#">“Configuring a QFX3500 Device as a Standalone Switch” on page 178</a>.</p>                                                                                                                                                                                                                                                  |

Table 635: Troubleshooting on the QFX Series (*continued*)

| Problem Category                   | Symptom or Problem                                                                                                                                                    | Recommended Action                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Software upgrade and configuration | Failed software upgrade.                                                                                                                                              | See <a href="#">“Recovering from a Failed Software Installation” on page 129.</a>                                                                                                                                                                                                                                                                                                             |
|                                    | Active partition becomes inactive after upgrade.                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                               |
|                                    | Problem with the active configuration file.                                                                                                                           | See the following topics: <ul style="list-style-type: none"> <li>• <a href="#">Loading a Previous Configuration File on page 1742</a></li> <li>• <a href="#">Reverting to the Default Factory Configuration on page 190</a></li> <li>• <a href="#">Reverting to the Rescue Configuration on page 191</a></li> <li>• <a href="#">Performing a Recovery Installation on page 120</a></li> </ul> |
|                                    | Root password is lost or forgotten.                                                                                                                                   | Recover the root password. See <a href="#">“Recovering the Root Password” on page 1302.</a>                                                                                                                                                                                                                                                                                                   |
| Network interfaces                 | An aggregated Ethernet interface is down.                                                                                                                             | See <a href="#">“Troubleshooting an Aggregated Ethernet Interface” on page 1303.</a>                                                                                                                                                                                                                                                                                                          |
|                                    | Interface on built-in network port is down.                                                                                                                           | See <a href="#">“Troubleshooting Network Interfaces” on page 1303.</a>                                                                                                                                                                                                                                                                                                                        |
|                                    | Interface on port in which SFP or SFP+ transceiver is installed in an SFP+ uplink module is down.                                                                     |                                                                                                                                                                                                                                                                                                                                                                                               |
| Ethernet switching                 | A MAC address entry in the Ethernet switching table is not updated after the device with that MAC address has been moved from one interface to another on the switch. | See <a href="#">“Troubleshooting Ethernet Switching” on page 2427.</a>                                                                                                                                                                                                                                                                                                                        |
| Firewall filter                    | Firewall configuration exceeded available Ternary Content Addressable Memory (TCAM) space.                                                                            | See <a href="#">“Troubleshooting Firewall Filter Configuration” on page 5181.</a>                                                                                                                                                                                                                                                                                                             |

## QFX5100 Switch with Automation Enhancements Frequently Asked Questions

This FAQ addresses questions regarding using QFX5100 switches with automation enhancements, which were introduced at Junos OS Release 13.2X51-D15.

This FAQ covers the following questions:

- [Who Should You Contact If You Have Problems with Loading, Installing or Updating Libraries? on page 6968](#)
- [Who Should You Contact If You Have Problems with Puppet for Junos OS? on page 6968](#)
- [Who Should You Contact If You Have Problems with Chef for Junos OS? on page 6968](#)
- [What Happens to the User Partition If You Downgrade a QFX5100 Switch That Is Running the jinstall-qfx-5-flex-x.tgz Software Bundle to a QFX Switch That Is Running a Different QFX5100 Software Bundle? on page 6968](#)
- [How Do You Recover Junos OS Binaries That You Have Deleted? on page 6968](#)

- [How Do You Recover from a System Crash?](#) on page 6968
- [How Can You Verify That a QFX5100 Switch Is Running a jinstall-qfx-5-flex-x.tgz Software Bundle?](#) on page 6968

---

### Who Should You Contact If You Have Problems with Loading, Installing or Updating Libraries?

---

Contact Customer Support at <http://www.juniper.net/support>.

---

### Who Should You Contact If You Have Problems with Puppet for Junos OS?

---

You can obtain support for Puppet for Junos OS through the J-Net Forum for Puppet at [http://forums.juniper.net/t5/Puppet-for-JunOS/bd-p/puppet\\_junos](http://forums.juniper.net/t5/Puppet-for-JunOS/bd-p/puppet_junos).

---

### Who Should You Contact If You Have Problems with Chef for Junos OS?

---

You can obtain support for Chef for Junos OS through the J-Net Forum for Chef at [http://forums.juniper.net/t5/Chef-for-JunOS/bd-p/chef\\_junos](http://forums.juniper.net/t5/Chef-for-JunOS/bd-p/chef_junos).

---

### What Happens to the User Partition If You Downgrade a QFX5100 Switch That Is Running the jinstall-qfx-5-flex-x.tgz Software Bundle to a QFX Switch That Is Running a Different QFX5100 Software Bundle?

---

In this case, the user partition remains intact.

**NOTE:** If you make changes to the user partition while performing a unified in-service software upgrade (unified ISSU), the changes might be lost.

---

---

### How Do You Recover Junos OS Binaries That You Have Deleted?

---

You must reinstall the software package.

---

### How Do You Recover from a System Crash?

---

You must reinstall the software package.

---

### How Can You Verify That a QFX5100 Switch Is Running a jinstall-qfx-5-flex-x.tgz Software Bundle?

---

You cannot use the **show version** command to verify that a QFX5100 switch is running the jinstall-qfx-5-flex-x.tgz software bundle. However, there are two other ways to verify this.

- Use the **show configuration** command to check that you are running a Layer 3 configuration. See *Installing Junos OS Software with QFX5100 Switch Automation Enhancements*.
- Go to the shell and confirm that you can invoke Python. See *Invoking the Python Interpreter*.

- [Troubleshooting a Deprecated Network Analytics Configuration on page 6974](#)

### Recovering from a Failed Software Installation

**Problem** **Description:** If the Junos OS appears to have been installed but the CLI does not work, or if the switch has no software installed, you can use this recovery installation procedure to install the Junos OS.

**Solution** If a Junos OS image already exists on the switch, you can either install the new Junos OS package in a separate partition, in which case both Junos OS images remain on the switch, or you can remove the existing Junos OS image before you start the new installation process.

**NOTE:** QFX5100 and EX4600 switches do not have a separate partition to reinstall a Junos OS image.

A recovery image is created automatically on these switches. If a previously-running switch is powered on and unable to boot using a Junos OS image, you can boot the switch using the recovery Junos OS image by selecting an option in the “Select a recovery image” menu.

We suggest creating a system snapshot on your QFX5100 or EX4600 switch onto the external USB flash drive, and using the snapshot for recovery purposes. The system snapshot feature takes a “snapshot” of the files currently used to run the device—the complete contents of the /config directories, which include the running Juniper Networks Junos OS, the active configuration, and the rescue configuration, as well as the host OS—and copies all of these files into an external USB flash drive. See [“Creating a Snapshot and Using It to Boot a QFX Series Switch” on page 181](#).

To perform a recovery installation:

1. Power on the switch. The loader script starts.

2. After the message **Loading /boot/defaults/loader.conf** appears, you are prompted with the following message:

**Hit [Enter] to boot immediately, or space bar for command prompt.**

Press the Spacebar to enter the manual loader. The **loader>** prompt appears.

**NOTE:** The loader prompt does not appear on QFX5100 and EX4600 switches.

On QFX5100 and EX4600 switches only, a recovery image is automatically saved if a previously-running switch is powered on and unable to boot using a Junos OS image.

The “Select a recovery image” menu appears on the console when one of these switches is booted and unable to load a version of Junos OS. Follow the instructions in the “Select a recovery image” menu to load the recovery version of Junos OS for one of these switches.

You can ignore the remainder of this procedure if you are using a QFX5100 or EX4600 switch.

3. Enter the following command:

```
loader> install [- --format] [- --external] source
```

where:

- **format**—Enables you to erase the installation media before installing the installation package. If you do not include this option, the system installs the new Junos OS in a different partition from that of the most recently installed Junos OS.
- **external**—Installs the installation package onto external media (a USB stick, for example).
- **source**—Represents the name and location of the Junos OS package, either on a server on the network or as a file on an external media, as shown in the following two examples:
  - Network address of the server and the path on the server; for example, **tftp://192.171.28/junos/jinstall-qfx-11.1R1.5-domestic-signed.tgz**
  - Junos OS package on a USB device (commonly stored in the root drive as the only file), for example, **file:///jinstall-qfx-11.1R1.5-domestic-signed.tgz**.

The installation now proceeds normally and ends with a login prompt.

## Loading a Previous Configuration File

You can use the **rollback <number>** command to return to a previously committed configuration file. A switch saves the last 50 committed configurations, including the rollback number, date, time, and name of the user who issued the **commit** configuration command.

**Syntax**

**rollback** <*number*>

**Options**

- **none**— Return to the most recently saved configuration.
- **number**—Configuration to return to.
  - **Range:** 0 through 49. The most recently saved configuration is number 0, and the oldest saved configuration is number 49.
  - **Default:** 0

To return to a configuration prior to the most recently committed one:

1. Specify the rollback number (here, 1 is entered and the configuration returns to the previously committed configuration):

```
[edit]
user@switch# rollback 1
load complete
```

2. Activate the configuration you have loaded:

```
[edit]
user@switch# commit
```

**Related Documentation**

- [Configuration File Terms on page 25](#)

## Reverting to the Default Factory Configuration

If for any reason the current active configuration fails, you can revert to the default factory configuration. The default factory configuration contains the basic configuration settings. This is the first configuration of the switch, and it is loaded when the switch is first installed and powered on.

The **load factory default** command is a standard Junos OS configuration command. This configuration command replaces the current active configuration with the default factory configuration.

To revert the switch to the rescue configuration:

1. 

```
[edit]
user@switch# load factory-default
[edit]
user@switch# delete system commit factory-settings
[edit]
user@switch# commit
```

**Related Documentation**

- [Understanding Configuration Files on page 1732](#)
- [Loading a Previous Configuration File on page 1742](#)

- [Reverting to the Rescue Configuration on page 191](#)

## Reverting to the Rescue Configuration

If someone inadvertently commits a configuration that denies management access to a device and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration. The rescue configuration is a previously committed, valid configuration.

To revert the switch to the rescue configuration:

1. Enter the **load override** command.

```
[edit]
user@switch# load override filename
```

2. Commit your changes.

```
[edit]
user@switch# commit filename
```

## Recovering the Root Password

If you forget the root password, you can use the password recovery procedure to reset the root password.

NOTE: The root password cannot be recovered on a QFabric system.

NOTE: You need console access to the switch to recover the root password.

To recover the root password:

1. Power off the switch by switching off the AC power outlet of the device or, if necessary, by pulling the power cords out of the device's power supplies.
2. Turn off the power to the management device, such as a PC or laptop computer, that you want to use to access the CLI.
3. Plug one end of the Ethernet rollover cable supplied with the device into the RJ-45-to-DB-9 serial port adapter supplied with the device.
4. Plug the RJ-45-to-DB-9 serial port adapter into the serial port on the management device.
5. Connect the other end of the Ethernet rollover cable to the console port on the device.

6. Turn on the power to the management device.
7. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate **COM** port to use (for example, **COM1**).
8. Configure the port settings as follows:
  - Bits per second: 9600
  - Data bits: 8
  - Parity: None
  - Stop bits: 1
  - Flow control: None
9. Power on the device by (if necessary) plugging the power cords into the device's power supply, or turning on the power to the device by switching on the AC power outlet the device is plugged into.

The terminal emulation screen on your management device displays the device's boot sequence.

10. When the following prompt appears, press the Spacebar to access the device's bootstrap loader command prompt:  
 Hit [Enter] to boot immediately, or space bar for command prompt.  
 Booting [kernel] in 9 seconds...
11. At the following prompt, enter **boot -s** to start up the system in single-user mode.  
 ok **boot -s**
12. At the following prompt, enter **recovery** to start the root password recovery procedure.  
 Enter full pathname of shell or 'recovery' for root password recovery or RETURN for /bin/sh: **recovery**
13. Enter configuration mode in the CLI.
14. Set the root password. For example:  
 user@switch# **set system root-authentication plain-text-password**
15. At the following prompt, enter the new root password. For example:  
 New password: **juniper1**  
 Retype new password:
16. At the second prompt, reenter the new root password.
17. After you have finished configuring the password, commit the configuration.  
 root@host# **commit**  
 commit complete
18. Exit configuration mode in the CLI.
19. Exit operational mode in the CLI.
20. At the prompt, enter **y** to reboot the device.  
 Reboot the system? [y/n] **y**

## Troubleshooting a Deprecated Network Analytics Configuration

**Problem**    **Description:** After a software upgrade to Junos OS Release 13.2X51-D15 from an earlier release, the network analytics configuration is no longer valid and the feature is disabled.

**Symptoms:** The network analytics configuration used in Junos OS Release 13.2X51-D10 has been deprecated in Release 13.2X51-D15. Issuing the **show services analytics** command results in the following output:

```
root@qfx5100# show services analytics

queue-statistics { ## Warning: 'queue-statistics' is deprecated
    interval 1;
}
```

**Cause**    Junos OS Release 13.2X51-D15 added enhancements to the network analytics feature, resulting in significant changes in the CLI. The updated **[edit services analytics]** hierarchy level contains some statements that have replaced those that were previously released. As a result, the earlier configuration does not work in the new release.

**Solution**    Use the new CLI statements to reconfigure the network analytics feature.

## Understanding Troubleshooting Resources

This topic describes some of the troubleshooting resources available for the QFX Series. These resources include tools such as the Junos OS CLI, Junos Space applications, and the Advanced Insight Scripts (AI-Scripts).

[Table 634 on page 6963](#) provides a list of some of the troubleshooting resources.

**Table 636: Troubleshooting Resources on the QFX Series**

| Troubleshooting Resource              | Description                                                                                                                                               | Documentation                                                             |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------|
| Chassis alarms                        | Chassis alarms indicate a failure on the switch or one of its components. A chassis alarm count is displayed on the LCD panel on the front of the switch. | <a href="#">"Chassis Alarm Messages on a QFX3500 Device" on page 6982</a> |
| Chassis Status LEDs and Fan Tray LEDs | A blinking amber Power, Fan, or Fan Tray LED indicates a hardware component error. A blinking amber Status LED indicates a software error.                | <i>Chassis Status LEDs on a QFX3500 Device</i>                            |
| Interface alarms                      | A predefined alarm (red or yellow) for an interface type is triggered when an interface of that type goes down.                                           | <a href="#">"Interface Alarm Messages" on page 6985</a>                   |
| System alarms                         | A predefined alarm is triggered by a missing rescue configuration or problem with the software license.                                                   | <a href="#">"Understanding Alarms" on page 6981</a>                       |

Table 636: Troubleshooting Resources on the QFX Series (*continued*)

| Troubleshooting Resource                      | Description                                                                                                                                                                                                                                                                                                                                                                                                | Documentation                                                                                                                                                                                                                                |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| System log messages                           | The system log includes details of system and user events, including errors. Specify the severity and type of system log messages you wish to view or save, and configure the output to be sent to local or remote hosts.                                                                                                                                                                                  | <ul style="list-style-type: none"> <li>• <a href="#">Overview of Single-Chassis System Logging Configuration on page 6643</a></li> <li>• <a href="#">Junos OS System Log Configuration Statements on page 6697</a></li> </ul>                |
| Junos OS operational mode commands            | Operational mode commands can be used to monitor switch performance and current activity on the network. For example, use the <b>traceroute monitor</b> command to locate points of failure in a network.                                                                                                                                                                                                  | <ul style="list-style-type: none"> <li>• <a href="#">Monitoring System Process Information on page 337</a></li> <li>• <a href="#">Monitoring System Properties on page 338</a></li> <li>• <a href="#">traceroute monitor</a></li> </ul>      |
| Junos OS automation scripts (event scripts)   | Event scripts can be used to automate network troubleshooting and management tasks.                                                                                                                                                                                                                                                                                                                        | <i>Junos OS Automation Library</i>                                                                                                                                                                                                           |
| Junos OS XML operational tags                 | XML operational tags are equivalent in function to operational mode commands in the CLI, which you can use to retrieve status information for a device.                                                                                                                                                                                                                                                    | <i>Junos XML API Operational Developer Reference</i>                                                                                                                                                                                         |
| NETCONF XML management protocol               | The NETCONF XML management protocol defines basic operations that are equivalent to Junos OS CLI configuration mode commands. Client applications use the protocol operations to display, edit, and commit configuration statements (among other operations), just as administrators use CLI configuration mode commands such as <b>show</b> , <b>set</b> , and <b>commit</b> to perform those operations. | <i>NETCONF XML Management Protocol Developer Guide</i>                                                                                                                                                                                       |
| SNMP MIBs and traps                           | MIBs enable the monitoring of network devices from a central location. For example, use the Traceroute MIB to monitor devices remotely.                                                                                                                                                                                                                                                                    | <ul style="list-style-type: none"> <li>• <a href="#">SNMP MIBs Support on page 6612</a></li> <li>• <a href="#">SNMP Traps Support on page 6628</a></li> <li>• <a href="#">Using the Traceroute MIB for SNMP Remote Operations</a></li> </ul> |
| AI-Scripts and Advanced Insight Manager (AIM) | AI-Scripts installed on the switch can automatically detect and monitor faults on the switch, and depending on the configuration on the AIM application, send notifications of potential problems and submit problem reports to Juniper Support Systems.                                                                                                                                                   | <a href="#">Advanced Insight Scripts (AI-Scripts) Release Notes</a>                                                                                                                                                                          |
| Junos Space Service Now                       | This application enables you to display and manage information about problem events. When problems are detected on the switch by Advanced Insight Scripts (AI-Scripts) that are installed on the switch, the data is collected and sent to Service Now for your review and action.                                                                                                                         | <i>Service Automation</i>                                                                                                                                                                                                                    |

| Junos Space Service Insight     | This application helps in accelerating operational analysis and managing the exposure to known issues. You can identify devices that are nearing their End Of Life (EOL) and also discover and prevent issues that could occur in your network. The functionality of Service Insight is dependent on the information sent from Service Now. | <i>Service Automation</i>                                 |
| Juniper Networks Knowledge Base | You can search in this database for Juniper Networks product information, including alerts and troubleshooting tips.                                                                                                                                                                                                                        | <a href="http://kb.juniper.net">http://kb.juniper.net</a> |

## Troubleshooting Overview

This topic provides a general guide to troubleshooting some typical problems you may encounter on your QFX Series product.

[Table 635 on page 6965](#) provides a list of problem categories, summary of the symptom or problem, and recommended actions with links to the troubleshooting documentation.

Table 637: Troubleshooting on the QFX Series

| Problem Category           | Symptom or Problem                                                          | Recommended Action                                                                                     |
|----------------------------|-----------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|
| Switch hardware components | LCD panel shows a chassis alarm count.                                      | See <a href="#">“Chassis Alarm Messages on a QFX3500 Device” on page 6982</a> .                        |
|                            | Fan tray LED is blinking amber.                                             | See <i>Fan Tray LED on a QFX3500 Device</i> .                                                          |
|                            | Chassis status LED for the power is blinking amber.                         | See <i>Chassis Status LEDs on a QFX3500 Device</i> .                                                   |
|                            | Chassis status LED for the fan (on the management board) is blinking amber. | Replace the management board as soon as possible. See <i>Chassis Status LEDs on a QFX3500 Device</i> . |

Table 637: Troubleshooting on the QFX Series (*continued*)

| Problem Category               | Symptom or Problem                                                                                          | Recommended Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------|-------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Port configuration             | Cannot configure a port as a Gigabit Ethernet port.                                                         | <p>Check whether the port is a valid Gigabit Ethernet port (6 through 41).</p> <p>See <a href="#">“QFX3500 Device Overview” on page 3</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|                                | Cannot configure a port as a Fibre Channel port.                                                            | <p>Check whether the port is a valid Fibre Channel port (0 through 5 and 42 through 47).</p> <p>See <a href="#">“QFX3500 Device Overview” on page 3</a>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|                                | Cannot configure a port as a 10-Gigabit Ethernet port.                                                      | <p>If the port is not a 40-Gbps QSFP+ interface, check whether the port is in the range of 0 through 5 or 42 through 47. If one of the ports in that block (0 through 5 or 42 through 47) is configured as a Fibre Channel port, then all ports in that block must also be configured as Fibre Channel ports.</p> <p>If the port is a 40-Gbps QSFP+ interface, make sure the configuration does not exceed the interface limit. Each 40-Gbps QSFP+ interface can be split into four 10-Gigabit Ethernet interfaces, but because port 0 is reserved, so you can only configure an additional fifteen 10-Gigabit Ethernet interfaces.</p> <p>See <a href="#">“QFX3500 Device Overview” on page 3</a>.</p> |
|                                | Cannot configure a 40-Gbps QSFP+ interface.                                                                 | <p>The 40-Gbps QSFP+ interfaces can only be used as 10-Gigabit Ethernet interfaces. Each 40-Gbps QSFP+ interface can be split into four 10-Gigabit Ethernet interfaces using a breakout cable. However, port 0 is reserved, so you can only configure an additional fifteen 10-Gigabit Ethernet interfaces.</p> <p>See <a href="#">“QFX3500 Device Overview” on page 3</a>.</p>                                                                                                                                                                                                                                                                                                                         |
| External devices (USB devices) | Upgrading software from a USB device results in an upgrade failure, and the system enters an invalid state. | Unplug the USB device and reboot the switch.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Initial device configuration   | Cannot configure management Ethernet ports.                                                                 | <p>Configure the management ports from the console port. You cannot configure the management ports by directly connecting to them.</p> <p><b>NOTE:</b> The management ports are on the front panel of the QFX3500 switch. They are labeled <b>C0</b> and <b>C1</b> on the front panel. In the CLI they are referred to as <b>me0</b> and <b>me1</b>.</p> <p>See <a href="#">“Configuring a QFX3500 Device as a Standalone Switch” on page 178</a>.</p>                                                                                                                                                                                                                                                  |

## Understanding Alarms

The QFX Series support different alarm types and severity levels. [Table 638 on page 6982](#) provides a list of alarm terms and definitions that may help you in monitoring the device.

Table 638: Alarm Terms and Definitions

| Term                  | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Alarm                 | Signal alerting you to conditions that might prevent normal operation. On the device, alarm indicators might include the LCD panel and LEDs on the device. The LCD panel (if present on the device) displays the chassis alarm message count. Blinking amber LEDs indicate yellow alarm conditions for chassis components.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Alarm condition       | Failure event that triggers an alarm.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Alarm severity levels | <p>Seriousness of the alarm. The level of severity can be either major (red) or minor (yellow).</p> <ul style="list-style-type: none"> <li>Major (red)—Indicates a critical situation on the device that has resulted from one of the following conditions. A red alarm condition requires immediate action. <ul style="list-style-type: none"> <li>One or more hardware components have failed.</li> <li>One or more hardware components have exceeded temperature thresholds.</li> <li>An alarm condition configured on an interface has triggered a critical warning.</li> </ul> </li> <li>Minor (yellow or amber)—Indicates a noncritical condition on the device that, if left unchecked, might cause an interruption in service or degradation in performance. A yellow alarm condition requires monitoring or maintenance. For example, a missing rescue configuration generates a yellow system alarm.</li> </ul> |
| Alarm types           | <p>Alarms include the following types:</p> <ul style="list-style-type: none"> <li>Chassis alarm—Predefined alarm triggered by a physical condition on the device such as a power supply failure or excessive component temperature.</li> <li>Interface alarm—Alarm you configure to alert you when an interface link is down. Applies to <b>ethernet</b>, <b>fibre-channel</b>, and <b>management-ethernet</b> interfaces. You can configure a red (major) or yellow (minor) alarm for the link-down condition, or have the condition ignored.</li> <li>System alarm—Predefined alarm that might be triggered by a missing rescue configuration, failure to install a license for a licensed software feature, or high disk usage.</li> </ul>                                                                                                                                                                             |

## Chassis Alarm Messages on a QFX3500 Device

Chassis alarms indicate a failure on the device or one of its components. Chassis alarms are preset and cannot be modified.

The chassis alarm message count is displayed on the LCD panel on the front of the device. To view the chassis alarm message text remotely, use the **show chassis lcd** CLI command.

Chassis alarms on QFX3500 devices have two severity levels:

- Major (red)—Indicates a critical situation on the device that has resulted from one of the conditions described in [Table 639 on page 6983](#). A red alarm condition requires immediate action.

- Minor (yellow or amber)—Indicates a noncritical condition on the device that, if left unchecked, might cause an interruption in service or degradation in performance. A yellow alarm condition requires monitoring or maintenance.

Table 639 on page 6983 describes the chassis alarm messages on QFX3500 devices.

**Table 639: QFX3500 Chassis Alarm Messages**

| Component      | Alarm Type  | CLI Message                                                | Recommended Action                                                                                                                                                                                                                                                                                                                                                         |

|                |             | Fan I2C Failure                                            | Check the system log for one of the following messages and report the error message to customer support: <ul style="list-style-type: none"> <li>• CM ENV Monitor: Get fan speed failed.</li> <li>• CM ENV Monitor: Get fan speed failed <i>Fan-number</i> is NOT spinning @ correct speed, where <i>fan-number</i> may be 1, 2, or 3.</li> </ul>                           |
|                |             | <i>fan-number</i> Not Spinning Fan                         | Remove and check the fan for obstructions, and then reinsert the fan. If the problem persists, replace the fan.                                                                                                                                                                                                                                                            |
| Power Supplies | Major (red) | PEM <i>pem-number</i> Airflow not matching Chassis Airflow | The power supply airflow direction is the opposite of the chassis airflow direction. Replace the power supply with a power supply that supports the same airflow direction as the chassis.                                                                                                                                                                                 |
|                |             | PEM <i>pem-number</i> I2C Failure                          | Check the system log for one of the following messages and report the error message to customer support: <ul style="list-style-type: none"> <li>• I2C Read failed for device <i>number</i>, where <i>number</i> may be from 123 to 125.</li> <li>• PS <i>number</i>: Transitioning from online to offline, where power supply (PS) <i>number</i> may be 1 or 2.</li> </ul> |
|                |             | PEM <i>pem-number</i> is not supported                     | Indicates a power supply problem, or the power supply is not supported on the device. Report the problem to customer support.                                                                                                                                                                                                                                              |
|                |             | PEM <i>pem-number</i> Not OK                               | Indicates a problem with the incoming AC or outgoing DC power. Replace the power supply.                                                                                                                                                                                                                                                                                   |

Table 639: QFX3500 Chassis Alarm Messages (*continued*)

| Component           | Alarm Type     | CLI Message                                             | Recommended Action                                                                                                                                                                                                                                                       |
|---------------------|----------------|---------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                     | Minor (yellow) | <b>PEM <i>pem-number</i> Absent</b>                     | For information only. Indicates the device was powered on with two power supplies installed, but now one is missing. The device can continue to operate with a single power supply. If you wish to remove this alarm message, reboot the device with one power supply.   |
|                     |                | <b>PEM <i>pem-number</i> is not powered</b>             | For information only. Check the power cord connection and reconnect it if necessary.                                                                                                                                                                                     |
|                     |                | <b>PEM <i>pem-number</i> Power Supply Type Mismatch</b> | For information only. Indicates that an AC power supply and DC power supply have been installed in the same chassis. If you wish to remove this alarm message, reboot the device with two AC power supplies or two DC power supplies.                                    |
|                     |                | <b>PEM <i>pem-number</i> Removed</b>                    | For information only. Indicates the device was powered on with two power supplies installed, but one has been removed. The device can continue to operate with a single power supply. If you wish to remove this alarm message, reboot the device with one power supply. |
| Temperature Sensors | Major (red)    | <b><i>sensor-location</i> Temp Sensor Fail</b>          | Check the system log for the following message and report it to customer support:<br><br><b>Temp sensor <i>sensor-number</i> failed</b> , where <i>sensor-number</i> may range from 1 through 10.                                                                        |
|                     |                | <b><i>sensor-location</i> Temp Sensor Too Hot</b>       | Check environmental conditions and alarms on other devices. Ensure that environmental factors (such as hot air blowing around the equipment) are not affecting the temperature sensor. If the condition persists, the device may shut down.                              |
|                     | Minor (yellow) | <b><i>sensor-location</i> Temp Sensor Too Warm</b>      | For information only. Check environmental conditions and alarms on other devices. Ensure that environmental factors (such as hot air blowing around the equipment) are not affecting the temperature sensor.                                                             |

## Interface Alarm Messages

Interface alarms are alarms that you configure to alert you when an interface is down.

To configure an interface link-down condition to trigger a red or yellow alarm, or to configure the link-down condition to be ignored, use the **alarm** statement at the **[edit chassis]** hierarchy level. You can specify the **ethernet**, **fibre-channel**, or **management-ethernet** interface type.

**NOTE:** Fibre Channel alarms are only valid on QFX3500 devices.

**NOTE:** When red alarms or major alarms are issued on QFX5100 and EX4600 switches, the alarm LED glows amber instead of red.

By default, major alarms are configured for interface link-down conditions on the control plane and management network interfaces in a QFabric system. The link-down alarms indicate that connectivity to the control plane network is down. You can configure these alarms to be ignored using the **alarm** statement at the **[edit chassis]** hierarchy level.

**NOTE:** If you configure a yellow alarm on the QFX3008-I Interconnect device, it will be handled as a red alarm.

## System Utilization Alarms

QFX Series devices provide system alarms that alert you when disk usage in the **/var** partition exceeds acceptable levels.

You can display the messages for these alarms by issuing the **show system alarms** operational mode command if the **/var** partition usage exceeds 75 percent. A usage level between 76 and 90 percent indicates high usage and raises a minor alarm condition, whereas a usage level above 90 percent indicates that the partition is full and raises a major alarm condition.

The following sample output from the **show system alarms** command shows system alarm messages that are displayed when disk usage is exceeded on the switch.

```
user@host> show system alarms
4 alarms currently active
Alarm time          Class  Description
```

```
2013-10-08 20:08:20 UTC Minor RE 0 /var partition usage is high
2013-10-08 20:08:20 UTC Major RE 0 /var partition is full
2013-10-08 20:08:08 UTC Minor FPC 1 /var partition usage is high
2013-10-08 20:08:08 UTC Major FPC 1 /var partition is full
```

**BEST PRACTICE:** We recommend that you regularly request a system file storage cleanup to optimize the performance of the switch and prevent generating system alarms.

### Monitoring SNMP

There are several commands that you can access in Junos OS operational mode to monitor SNMP information. Some of the commands are:

- **show snmp health-monitor**, which displays the health monitor log and alarm information.
- **show snmp mib**, which displays information from the MIBs, such as device and system information.
- **show snmp statistics**, which displays SNMP statistics such as the number of packets, silent drops, and invalid output values.
- **show snmp rmon**, which displays the RMON alarm, event, history, and log information

The following example provides sample output from the **show snmp health-monitor** command:

```
user@switch> show snmp health-monitor
```

```
Alarm
```

| Index | Variable description                                                         | Value | State  |
|-------|------------------------------------------------------------------------------|-------|--------|
| 32768 | Health Monitor: root file system utilization<br>jnxHrStoragePercentUsed.1    | 58    | active |
| 32769 | Health Monitor: /config file system utilization<br>jnxHrStoragePercentUsed.2 | 0     | active |

```
32770 Health Monitor: RE 0 CPU utilization
      jnxOperatingCPU.9.1.0.0                0 active

32773 Health Monitor: RE 0 Memory utilization
      jnxOperatingBuffer.9.1.0.0            35 active

32775 Health Monitor: jkernel daemon CPU utilization
      Init daemon                          0 active
      Chassis daemon                       50 active
      Firewall daemon                      0 active
      Interface daemon                     5 active
      SNMP daemon                          11 active
      MIB2 daemon                          42 active
      ...
```

The following example provides sample output from the **show snmp mib** command:

```
user@switch> show snmp mib walk system
```

```
sysDescr.0    = Juniper Networks, Inc. qfx3500s internet router, kernel
JUNOS 11.1-20100926.0 #0: 2010-09-26 06:17:38 UTC builder@abc.juniper.net:

## Tracing SNMP Activity on a Device Running Junos OS

SNMP tracing operations track activity for SNMP agents and record the information in log files. The logged error descriptions provide detailed information to help you solve problems faster.

By default, Junos OS does not trace any SNMP activity. If you include the **traceoptions** statement at the **[edit snmp]** hierarchy level, the default tracing behavior is:

- Important activities are logged in files located in the **/var/log** directory. Each log is named after the SNMP agent that generates it. Currently, the following log files are created in the **/var/log** directory when the **traceoptions** statement is used:
  - chassisd
  - craftd
  - ilmid
  - mib2d
  - rmopd
  - serviced
  - snmpd
- When a trace file named **filename** reaches its maximum size, it is renamed **filename.0**, then **filename.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. (For more information about how log files are created, see the *Junos OS System Log Messages Reference*.)
- Log files can be accessed only by the user who configured the tracing operation.

You cannot change the directory (**/var/log**) in which trace files are located. However, you can customize the other trace file settings by including the following statements at the **[edit snmp]** hierarchy level:

```
[edit snmp]
traceoptions {
  file <files number> <match regular-expression> <size size> <world-readable |
    no-world-readable>;
  flag flag;
  memory-trace;
  no-remote-trace;
  no-default-memory-trace;
}
```

These statements are described in the following sections:

- [Configuring the Number and Size of SNMP Log Files on page 6990](#)
- [Configuring Access to the Log File on page 6990](#)
- [Configuring a Regular Expression for Lines to Be Logged on page 6990](#)
- [Configuring the Trace Operations on page 6990](#)

### Configuring the Number and Size of SNMP Log Files

---

By default, when the trace file reaches 128 kilobytes (KB) in size, it is renamed *filename.0*, then *filename.1*, and so on, until there are three trace files. Then the oldest trace file (*filename.2*) is overwritten.

You can configure the limits on the number and size of trace files by including the following statements at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
file files number size size;
```

For example, set the maximum file size to 2 MB, and the maximum number of files to 20. When the file that receives the output of the tracing operation (*filename*) reaches 2 MB, *filename* is renamed *filename.0*, and a new file called *filename* is created. When the new *filename* reaches 2 MB, *filename.0* is renamed *filename.1* and *filename* is renamed *filename.0*. This process repeats until there are 20 trace files. Then the oldest file (*filename.19*) is overwritten by the newest file (*filename.0*).

The number of files can be from 2 through 1000 files. The file size of each file can be from 10 KB through 1 gigabyte (GB).

### Configuring Access to the Log File

---

By default, log files can be accessed only by the user who configured the tracing operation.

To specify that any user can read all log files, include the **file world-readable** statement at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
file world-readable;
```

To explicitly set the default behavior, include the **file no-world-readable** statement at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
file no-world-readable;
```

### Configuring a Regular Expression for Lines to Be Logged

---

By default, the trace operation output includes all lines relevant to the logged activities.

You can refine the output by including the **match** statement at the **[edit snmp traceoptions file filename]** hierarchy level and specifying a regular expression (regex) to be matched:

```
[edit snmp traceoptions]
file filename match regular-expression;
```

### Configuring the Trace Operations

---

By default, only important activities are logged. You can specify which trace operations are to be logged by including the following **flag** statement (with one or more tracing flags) at the **[edit snmp traceoptions]** hierarchy level:

```
[edit snmp traceoptions]
flag {
  all;
```

```

configuration;
database;
events;
general;
interface-stats;
nonvolatile-sets;
pdu;
policy;
protocol-timeouts;
routing-socket;
server;
subagent;
timer;
varbind-error;
}

```

Table 615 on page 6887 describes the meaning of the SNMP tracing flags.

**Table 640: SNMP Tracing Flags**

| Flag                     | Description                                                                 | Default Setting |
|--------------------------|-----------------------------------------------------------------------------|-----------------|
| <b>all</b>               | Log all operations.                                                         | Off             |
| <b>configuration</b>     | Log reading of the configuration at the <b>[edit snmp]</b> hierarchy level. | Off             |
| <b>database</b>          | Log events involving storage and retrieval in the events database.          | Off             |
| <b>events</b>            | Log important events.                                                       | Off             |
| <b>general</b>           | Log general events.                                                         | Off             |
| <b>interface-stats</b>   | Log physical and logical interface statistics.                              | Off             |
| <b>nonvolatile-set</b>   | Log nonvolatile SNMP set request handling.                                  | Off             |
| <b>pdu</b>               | Log SNMP request and response packets.                                      | Off             |
| <b>policy</b>            | Log policy processing.                                                      | Off             |
| <b>protocol-timeouts</b> | Log SNMP response timeouts.                                                 | Off             |
| <b>routing-socket</b>    | Log routing socket calls.                                                   | Off             |
| <b>server</b>            | Log communication with processes that are generating events.                | Off             |
| <b>subagent</b>          | Log subagent restarts.                                                      | Off             |
| <b>timer</b>             | Log internal timer events.                                                  | Off             |

Table 640: SNMP Tracing Flags (*continued*)

| Flag                 | Description                  | Default Setting |
|----------------------|------------------------------|-----------------|
| <b>varbind-error</b> | Log variable binding errors. | Off             |

To display the end of the log for an agent, issue the **show log agentd | last** operational mode command:

```
[edit]
user@host# run show log agentd | last
```

where **agent** is the name of an SNMP agent.

## Monitoring RMON MIB Tables

**Purpose** Monitor remote monitoring (RMON) alarm, event, and log tables.

**Action** To display the RMON tables:

```
user@switch> show snmp rmon
Alarm
Index  Variable description                               Value State
-----
5 monitor
   jnxOperatingCPU.9.1.0.0                          5 falling threshold

Event
Index  Type                               Last Event
-----
1 log and trap                          2010-07-10 11:34:17 PDT
Event Index: 1
  Description: Event 1 triggered by Alarm 5, rising threshold (90) crossed,
(variable: jnxOperatingCPU.9.1.0.0, value: 100)
  Time: 2010-07-10 11:34:07 PDT
  Description: Event 1 triggered by Alarm 5, falling threshold (75) crossed,
(variable: jnxOperatingCPU.9.1.0.0, value: 5)
  Time: 2010-07-10 11:34:17 PDT
```

**Meaning** The display shows that an alarm has been defined to monitor jnxRmon MIB object jnxOperatingCPU, which represents the CPU utilization of the Routing Engine. The alarm is configured to generate an event that sends an SNMP trap and adds an entry to the logTable in the RMON MIB. The log table shows that two occurrences of the event have been generated—one for rising above a threshold of 90 percent, and one for falling below a threshold of 75 percent.

## Displaying a Log File from a Single-Chassis System

To display a log file stored on a single-chassis system, enter Junos OS CLI operational mode and issue the following commands:

```
user@switch> show log log-filename
user@switch> file show log-file-pathname
```

By default, the commands display the file stored on the local Routing Engine.

The following example shows the output from the **show log messages** command:

```
user@switch1> show log messages
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 1
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 2
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 3
...
Nov  4 11:52:53 switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon memory usage (Management
process): new instance detected (variable: sysAppElmtRunMemory.5.6.2293)
Nov  4 11:52:53 switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon memory usage (Command-line
interface): new instance detected (variable: sysAppElmtRunMemory.5.8.2292)
...
Nov  4 12:08:30 switch1 rpdf[957]: task_connect: task BGP_100.10.10.1.6+179 addr
10.10.1.6+179: Can't assign requested
address
Nov  4 12:08:30 switch1 rpdf[957]: bgp_connect_start: connect 10.10.1.6 (Internal
AS 100): Can't assign requested address
Nov  4 12:10:24 switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
'exit '
Nov  4 12:10:27 switch1 mgd[2293]: UI_DBASE_LOGOUT_EVENT: User 'jsmith' exiting
configuration mode
Nov  4 12:10:31 switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
'show log messages'
```

The following example shows the output from the **file show** command. The file in the pathname **/var/log/processes** has been previously configured to include messages from the daemon facility.

```
user@switch1> file show /var/log/processes
Feb 22 08:58:24 switch1 snmpd[359]: SNMPD_TRAP_WARM_START: trap_generate_warm:
SNMP trap: warm start
Feb 22 20:35:07 switch1 snmpd[359]: SNMPD_THROTTLE_QUEUE_DRAINED:
trap_throttle_timer_handler: cleared all throttled traps
Feb 23 07:34:56 switch1 snmpd[359]: SNMPD_TRAP_WARM_START: trap_generate_warm:
SNMP trap: warm start
Feb 23 07:38:19 switch1 snmpd[359]: SNMPD_TRAP_COLD_START: trap_generate_cold:
```

```
SNMP trap: cold start
...
```

## Monitoring System Log Messages

**Purpose** Display system log messages about the QFX Series. By looking through a system log file for any entries pertaining to the interface that you are interested in, you can further investigate a problem with an interface on the switch.

**Action** To view system log messages:

```
user@switch1> show log messages
```

## Sample Output

```
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:01 switch1 newsyslog[2283]: logfile turned over due to size>128K
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 1
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 2
Nov  4 11:30:06 switch1 chassism[952]: CM ENV Monitor: set fan speed is 65 percent
for Fan 3
...
Nov  4 11:52:53 switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon
memory usage (Management process): new instance detected (variable:
sysApp1ElmtRunMemory.5.6.2293)
Nov  4 11:52:53 switch1 snmpd[944]: SNMPD_HEALTH_MON_INSTANCE: Health Monitor:
jroute daemon
memory usage (Command-line interface): new instance detected (variable:
sysApp1ElmtRunMemory.5.8.2292)
...
Nov  4 12:10:24 switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
'exit '
Nov  4 12:10:27 switch1 mgd[2293]: UI_DBASE_LOGOUT_EVENT: User 'jsmith' exiting
configuration mode
Nov  4 12:10:31 switch1 mgd[2293]: UI_CMDLINE_READ_LINE: User 'jsmith', command
'show log messages'
```

**Meaning** The sample output shows the following entries in the **messages** file:

- A new log file was created when the previous file reached the maximum size of 128 kilobytes (KB).
- The fan speed for Fan 1, 2, and 3 is set at 65 percent.
- Health monitoring activity is detected.
- CLI commands were entered by the user jsmith.

## Monitoring Traffic Through the Router or Switch

To help with the diagnosis of a problem, display real-time statistics about the traffic passing through physical interfaces on the router or switch.

To display real-time statistics about physical interfaces, perform these tasks:

1. [Displaying Real-Time Statistics About All Interfaces on the Router or Switch on page 6995](#)
2. [Displaying Real-Time Statistics About an Interface on the Router or Switch on page 6996](#)

### Displaying Real-Time Statistics About All Interfaces on the Router or Switch

**Purpose** Display real-time statistics about traffic passing through all interfaces on the router or switch.

**Action** To display real-time statistics about traffic passing through all interfaces on the router or switch:

```
user@host> monitor interface traffic
```

## Sample Output

```
user@host> monitor interface traffic
host name          Seconds: 15          Time: 12:31:09
Interface  Link  Input packets  (pps)  Output packets  (pps)
so-1/0/0    Down      0          (0)         0          (0)
so-1/1/0    Down      0          (0)         0          (0)
so-1/1/1    Down      0          (0)         0          (0)
so-1/1/2    Down      0          (0)         0          (0)
so-1/1/3    Down      0          (0)         0          (0)
t3-1/2/0    Down      0          (0)         0          (0)
t3-1/2/1    Down      0          (0)         0          (0)
t3-1/2/2    Down      0          (0)         0          (0)
t3-1/2/3    Down      0          (0)         0          (0)
so-2/0/0     Up    211035        (1)       36778        (0)
so-2/0/1     Up    192753        (1)       36782        (0)
so-2/0/2     Up    211020        (1)       36779        (0)
so-2/0/3     Up    211029        (1)       36776        (0)
so-2/1/0     Up    189378        (1)       36349        (0)
so-2/1/1    Down      0          (0)       18747        (0)
so-2/1/2    Down      0          (0)       16078        (0)
so-2/1/3     Up      0          (0)       80338        (0)
at-2/3/0     Up      0          (0)         0          (0)
```

```

at-2/3/1    Down          0          (0)          0          (0)
Bytes=b, Clear=c, Delta=d, Packets=p, Quit=q or ESC, Rate=r, Up=^U, Down=^D

```

**Meaning** The sample output displays traffic data for active interfaces and the amount that each field has changed since the command started or since the counters were cleared by using the **C** key. In this example, the **monitor interface** command has been running for 15 seconds since the command was issued or since the counters last returned to zero.

### Displaying Real-Time Statistics About an Interface on the Router or Switch

**Purpose** Display real-time statistics about traffic passing through an interface on the router or switch.

**Action** To display traffic passing through an interface on the router or switch, use the following Junos OS CLI operational mode command:

```
user@host> monitor interface interface-name
```

### Sample Output

```

user@host> monitor interface so-0/0/1
Next='n', Quit='q' or ESC, Freeze='f', Thaw='t', Clear='c', Interface='i'
R1
Interface: so-0/0/1, Enabled, Link is Up
Encapsulation: PPP, Keepalives, Speed: 0C3 Traffic statistics:
  Input bytes:          5856541 (88 bps)
  Output bytes:         6271468 (96 bps)
  Input packets:        157629 (0 pps)
  Output packets:       157024 (0 pps)
Encapsulation statistics:
  Input keepalives:      42353
  Output keepalives:     42320
  LCP state: Opened
Error statistics:
  Input errors:          0
  Input drops:           0
  Input framing errors:  0
  Input runs:            0
  Input giants:          0
  Policed discards:      0
  L3 incompletes:        0
  L2 channel errors:     0
  L2 mismatch timeouts:  0
  Carrier transitions:   1
  Output errors:         0
  Output drops:          0
  Aged packets:          0
Active alarms : None
Active defects: None
SONET error counts/seconds:

  ES-S                   77
  SES-S                   77
SONET statistics:
  BIP-B1                 0
  BIP-B2                 0

```

```

REI-L                0
BIP-B3              0
REI-P              0
Received SONET overhead:  F1      : 0x00  J0      : 0xZ

```

**Meaning** The sample output shows the input and output packets for a particular SONET interface (**so-0/0/1**). The information can include common interface failures, such as SONET/SDH and T3 alarms, loopbacks detected, and increases in framing errors. For more information, see *Checklist for Tracking Error Conditions*.

To control the output of the command while it is running, use the keys shown in [Table 641 on page 6880](#).

**Table 641: Output Control Keys for the monitor interface Command**

| Action                                                                                                                                                                                                                       | Key      |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------|
| Display information about the next interface. The <b>monitor interface</b> command scrolls through the physical or logical interfaces in the same order that they are displayed by the <b>show interfaces terse</b> command. | <b>N</b> |
| Display information about a different interface. The command prompts you for the name of a specific interface.                                                                                                               | <b>I</b> |
| Freeze the display, halting the display of updated statistics.                                                                                                                                                               | <b>F</b> |
| Thaw the display, resuming the display of updated statistics.                                                                                                                                                                | <b>T</b> |
| Clear (zero) the current delta counters since <b>monitor interface</b> was started. It does not clear the accumulative counter.                                                                                              | <b>C</b> |
| Stop the <b>monitor interface</b> command.                                                                                                                                                                                   | <b>Q</b> |

See the [CLI Explorer](#) for details on using match conditions with the **monitor traffic** command.

## Pinging Hosts

**Purpose** Use the CLI **ping** command to verify that a host can be reached over the network. This command is useful for diagnosing host and network connectivity problems. The switch sends a series of Internet Control Message Protocol (ICMP) echo (ping) requests to a specified host and receives ICMP echo responses.

**Action** To use the **ping** command to send four requests (ping count) to host3:  
**ping host count number**

## Sample Output

```

ping host3 count 4
user@switch> ping host3 count 4
PING host3.site.net (176.26.232.111): 56 data bytes
64 bytes from 176.26.232.111: icmp_seq=0 ttl=122 time=0.661 ms
64 bytes from 176.26.232.111: icmp_seq=1 ttl=122 time=0.619 ms

```

```
64 bytes from 176.26.232.111: icmp_seq=2 ttl=122 time=0.621 ms
64 bytes from 176.26.232.111: icmp_seq=3 ttl=122 time=0.634 ms

--- host3.site.net ping statistics ---
4 packets transmitted, 4 packets received, 0% packet loss
round-trip min/avg/max/stddev = 0.619/0.634/0.661/0.017 ms
```

**Meaning** • The **ping** results show the following information:

- Size of the ping response packet (in bytes).
- IP address of the host from which the response was sent.
- Sequence number of the ping response packet. You can use this value to match the ping response to the corresponding ping request.
- Time-to-live (ttl) hop-count value of the ping response packet.
- Total time between the sending of the ping request packet and the receiving of the ping response packet, in milliseconds. This value is also called round-trip time.
- Number of ping requests (probes) sent to the host.
- Number of ping responses received from the host.
- Packet loss percentage.
- Round-trip time statistics: minimum, average, maximum, and standard deviation of the round-trip time.

- [Cleaning Up the System File Storage Space on page 7001](#)

### Loading a Previous Configuration File

You can use the **rollback** *<number>* command to return to a previously committed configuration file. A switch saves the last 50 committed configurations, including the rollback number, date, time, and name of the user who issued the **commit** configuration command.

#### Syntax

**rollback** *<number>*

#### Options

- **none**— Return to the most recently saved configuration.
- **number**—Configuration to return to.
  - **Range:** 0 through 49. The most recently saved configuration is number 0, and the oldest saved configuration is number 49.
  - **Default:** 0

To return to a configuration prior to the most recently committed one:

1. Specify the rollback number (here, 1 is entered and the configuration returns to the previously committed configuration):

```
[edit]
user@switch# rollback 1
load complete
```

2. Activate the configuration you have loaded:

```
[edit]
user@switch# commit
```

**Related  
Documentation**

- [Configuration File Terms on page 25](#)

## Reverting to the Default Factory Configuration

If for any reason the current active configuration fails, you can revert to the default factory configuration. The default factory configuration contains the basic configuration settings. This is the first configuration of the switch, and it is loaded when the switch is first installed and powered on.

The **load factory default** command is a standard Junos OS configuration command. This configuration command replaces the current active configuration with the default factory configuration.

To revert the switch to the rescue configuration:

1. 

```
[edit]
user@switch# load factory-default
[edit]
user@switch# delete system commit factory-settings
[edit]
user@switch# commit
```

**Related  
Documentation**

- [Understanding Configuration Files on page 1732](#)
- [Loading a Previous Configuration File on page 1742](#)
- [Reverting to the Rescue Configuration on page 191](#)

## Reverting to the Rescue Configuration

If someone inadvertently commits a configuration that denies management access to a device and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration. The rescue configuration is a previously committed, valid configuration.

To revert the switch to the rescue configuration:

1. Enter the **load override** command.

```
[edit]
user@switch# load override filename
```

2. Commit your changes.

```
[edit]
user@switch# commit filename
```

### Related Documentation

## Cleaning Up the System File Storage Space

**Problem**    **Description:** The system file storage space on the switch is full. Rebooting the switch does not solve the problem.

The following error message is displayed during a typical operation on the switch after the file storage space is full.

```
user@switch% cli
user@switch> configure
/var: write failed, filesystem is full
```

**Solution**    Clean up the file storage on the switch by deleting system files.

1. Request to delete system files on the switch.

```
user@switch> request system storage cleanup
```

The list of files to be deleted is displayed.

List of files to delete:

|  | Size  | Date         | Name                               |
|--|-------|--------------|------------------------------------|
|  | 11B   | Jul 26 20:55 | /var/jail/tmp/alarmd.ts            |
|  | 124B  | Aug 4 18:05  | /var/log/default-log-messages.0.gz |
|  | 1301B | Jul 26 20:42 | /var/log/install.0.gz              |
|  | 387B  | Jun 3 14:37  | /var/log/install.1.gz              |
|  | 4920B | Aug 4 18:05  | /var/log/messages.0.gz             |
|  | 20.0K | Jul 26 21:00 | /var/log/messages.1.gz             |
|  | 16.3K | Jun 25 13:45 | /var/log/messages.2.gz             |
|  | 804B  | Aug 4 18:05  | /var/log/security.0.gz             |
|  | 16.8K | Aug 3 11:15  | /var/log/security.1.gz             |

```
487B Aug  4 18:04 /var/log/wtmp.0.gz
855B Jul 29 22:54 /var/log/wtmp.1.gz
920B Jun 30 16:32 /var/log/wtmp.2.gz
 94B Jun  3 14:36 /var/log/wtmp.3.gz
353.2K Jun  3 14:37 /var/sw/pkg/jloader-qfx-11.2I20110303_1117_dc-builder.tgz

124.0K Jun  3 14:30 /var/tmp/gres-tp/env.dat
  0B Apr 14 16:20 /var/tmp/gres-tp/lock
  0B Apr 14 17:37 /var/tmp/if-rtbdb/env.lock
 12.0K Jul 26 20:55 /var/tmp/if-rtbdb/env.mem
2688.0K Jul 26 20:55 /var/tmp/if-rtbdb/shm_usr1.mem
132.0K Jul 26 20:55 /var/tmp/if-rtbdb/shm_usr2.mem
2048.0K Jul 26 20:55 /var/tmp/if-rtbdb/trace.mem
 155B Jul 26 20:55 /var/tmp/krt_gencfg_filter.txt
  0B Jul 26 20:55 /var/tmp/rtbdb/if-rtbdb
1400.6K Aug  3 10:13 /var/tmp/sfid.core.0.gz
1398.9K Aug  3 17:01 /var/tmp/sfid.core.1.gz
Delete these files ? [yes,no] (no)
```

2. Enter **yes** to delete the files.

3. Reboot the switch.

**BEST PRACTICE:** We recommend that you regularly request a system file storage cleanup to optimize the performance of the switch.

## Ethernet Switching

- [Troubleshooting Ethernet Switching on page 7002](#)
- [Troubleshooting Layer 2 Protocol Tunneling on page 7003](#)
- [Troubleshooting Private VLANs on page 7004](#)
- [Troubleshooting Q-in-Q and VLAN Translation Configuration on page 7007](#)

## Troubleshooting Ethernet Switching

**Problem**    **Description:** Sometimes a MAC address entry in the switch's Ethernet switching table is not updated after the device with that MAC address has been moved from one interface to another on the switch. Typically, the switch does not wait for a MAC address expiration when a MAC move operation occurs. As soon as the switch detects the MAC address on the new interface, it immediately updates the table. Many network devices send a gratuitous ARP packet when switching an IP address from one device to another. The switch updates its ARP cache table after receipt of such gratuitous ARP messages, and then it also updates its Ethernet switching table.

Sometimes silent devices, such as syslog servers or SNMP trap receivers that receive UDP traffic but do not return acknowledgment (ACK) messages to the traffic source, fail to send gratuitous ARP packets when a device moves. If such a move occurs when the system administrator is not available to explicitly clear the affected interfaces by

issuing the **clear ethernet-switching table** command, the entry for the moved device in the Ethernet switching table is not updated.

**Solution** Set up the switch to handle unattended MAC address switchovers.

1. Reduce the system-wide ARP aging timer. (By default, the ARP aging timer is set at 20 minutes. The range of the ARP aging timer is from 1 through 240 minutes.)

```
[edit system arp]
user@switch# set aging-timer 3
```

2. Set the MAC aging timer to the same value as the ARP timer. (By default, the MAC aging timer is set to 300 seconds. The range is 15 to 1,000,000 seconds.)

```
[edit vlans]
user@switch# set vlans sales mac-table-aging-time 180
```

The ARP entry and the MAC address entry for the moved device expire within the times specified by the aging timer values. After the entries expire, the switch sends a new ARP message to the IP address of the device. The device responds to the ARP message, thereby refreshing the entries in the switch's ARP cache table and Ethernet switching table.

## Troubleshooting Layer 2 Protocol Tunneling

- [Drop Threshold Statistics Might Be Incorrect on page 7003](#)
- [Egress Filtering of L2PT Traffic Not Supported on page 7003](#)

### Drop Threshold Statistics Might Be Incorrect

**Problem** **Description:** L2PT processing is done by the CPU, and L2PT traffic to the CPU is rate limited to a maximum of 1000 pps. If traffic is received at a rate faster than this limit, the rate limit causes the traffic to be dropped before it hits the threshold and the dropped packets will not be reported in L2PT statistics. This can also occur if you configure a drop threshold that is less than 1000 pps but traffic is received at a faster rate. For example, if you configure a drop threshold of 900 pps and the VLAN receives traffic at rate of 1100 pps, L2PT statistics will show that 100 packets were dropped. The 100 packets dropped because of the rate limit are not reported. Similarly, if you do not configure a drop threshold and the VLAN receives traffic at rate of 1100 pps, the 100 packets dropped because of the rate limit are not reported.

**Solution** This is expected behavior.

### Egress Filtering of L2PT Traffic Not Supported

**Problem** **Description:** Egress filtering of L2PT traffic is not supported on the QFX3500 switch. That is, if you configure L2PT to tunnel a protocol on an interface, you cannot also use a

firewall filter to filter traffic for that protocol on that interface in the output direction. If you commit a configuration for this purpose, the firewall filter is not applied to the L2PT-tunneled traffic.

**Solution** This is expected behavior.

**Related Documentation**

- [Configuring Layer 2 Protocol Tunneling on page 2237](#)

## Troubleshooting Private VLANs

Use the following information to troubleshoot a private VLAN configuration.

- [Limitations of Private VLANs on page 7004](#)
- [Forwarding with Private VLANs on page 7004](#)
- [Egress Firewall Filters with Private VLANs on page 7005](#)
- [Egress Port Mirroring with Private VLANs on page 7006](#)

### Limitations of Private VLANs

---

The following constraints apply to private VLAN configurations:

- IGMP snooping is not supported with private VLANs.
- Routed VLAN interfaces are not supported on private VLANs
- Routing between secondary VLANs in the same primary VLAN is not supported.

### Forwarding with Private VLANs

---

**Problem Description:**

- When isolated VLAN or community VLAN tagged traffic is received on a PVLAN trunk port, MAC addresses are learned from the primary VLAN. This means that output from the [show ethernet-switching table](#) command shows that MAC addresses are learned from the primary VLAN and replicated to secondary VLANs. This behavior has no effect on forwarding decisions.
- If a packet with a secondary VLAN tag is received on a promiscuous port, it is accepted and forwarded.
- If a packet is received on a PVLAN trunk port and meets both of the conditions listed below, it is dropped.
  - The packet has a community VLAN tag.
  - The packet is destined to a unicast MAC address or multicast group MAC address that was learned on an isolated VLAN.
- If a packet is received on a PVLAN trunk port and meets both of the conditions listed below, it is dropped.

- The packet has an isolated VLAN tag.
- The packet is destined to a unicast MAC address or multicast group MAC address that was learned on a community VLAN.
- If a packet with a primary VLAN tag is received by a secondary (isolated or community) VLAN port, the secondary port forwards the packet.
- If you configure a community VLAN on one device and configure another community VLAN on a second device and both community VLANs use the same VLAN ID, traffic for one of the VLANs can be forwarded to the other VLAN. For example, assume the following configuration:
  - Community VLAN comm1 on switch 1 has VLAN ID 50 and is a member of primary VLAN pvlan100.
  - Community VLAN comm2 on switch 2 also has VLAN ID 50 and is a member of primary VLAN pvlan200.
  - Primary VLAN pvlan100 exists on both switches.

If traffic for comm1 is sent from switch 1 to switch 2, it will be sent to the ports participating in comm2. (The traffic will also be forwarded to the ports in comm1, as you would expect.)

**Solution** These are expected behaviors.

### Egress Firewall Filters with Private VLANs

**Problem Description:** If you apply a firewall filter in the output direction to a primary VLAN, the filter also applies to the secondary VLANs that are members of the primary VLAN when the traffic egresses with the primary VLAN tag or isolated VLAN tag, as listed below:

- Traffic forwarded from a secondary VLAN trunk port to a promiscuous port (trunk or access)
- Traffic forwarded from a secondary VLAN trunk port that carries an isolated VLAN to a PVLAN trunk port.
- Traffic forwarded from a promiscuous port (trunk or access) to a secondary VLAN trunk port
- Traffic forwarded from a PVLAN trunk port. to a secondary VLAN trunk port
- Traffic forwarded from a community port to a promiscuous port (trunk or access)

If you apply a firewall filter in the output direction to a primary VLAN, the filter does *not* apply to traffic that egresses with a community VLAN tag, as listed below:

- Traffic forwarded from a community trunk port to a PVLAN trunk port
- Traffic forwarded from a secondary VLAN trunk port that carries a community VLAN to a PVLAN trunk port

- Traffic forwarded from a promiscuous port (trunk or access) to a community trunk port
- Traffic forwarded from a PVLAN trunk port. to a community trunk port

If you apply a firewall filter in the output direction to a community VLAN, the following behaviors apply:

- The filter is applied to traffic forwarded from a promiscuous port (trunk or access) to a community trunk port (because the traffic egresses with the community VLAN tag).
- The filter is applied to traffic forwarded from a community port to a PVLAN trunk port (because the traffic egresses with the community VLAN tag).
- The filter is *not* applied to traffic forwarded from a community port to a promiscuous port (because the traffic egresses with the primary VLAN tag or untagged).

**Solution** These are expected behaviors. They occur only if you apply a firewall filter to a private VLAN in the output direction and do not occur if you apply a firewall filter to a private VLAN in the input direction.

#### Egress Port Mirroring with Private VLANs

**Problem** **Description:** If you create a port-mirroring configuration that mirrors private VLAN (PVLAN) traffic on egress, the mirrored traffic (the traffic that is sent to the analyzer system) has the VLAN tag of the ingress VLAN instead of the egress VLAN. For example, assume the following PVLAN configuration:

- Promiscuous trunk port that carries primary VLANs pvlan100 and pvlan400.
- Isolated access port that carries secondary VLAN isolated200. This VLAN is a member of primary VLAN pvlan100.
- Community port that carries secondary VLAN comm300. This VLAN is also a member of primary VLAN pvlan100.
- Output interface (monitor interface) that connects to the analyzer system. This interface forwards the mirrored traffic to the analyzer.

If a packet for pvlan100 enters on the promiscuous trunk port and exits on the isolated access port, the original packet is untagged on egress because it is exiting on an access port. However, the mirror copy retains the tag for pvlan100 when it is sent to the analyzer.

Here is another example: If a packet for comm300 ingresses on the community port and egresses on the promiscuous trunk port, the original packet carries the tag for pvlan100 on egress, as expected. However, the mirrored copy retains the tag for comm300 when it is sent to the analyzer.

**Solution** This is expected behavior.

## Troubleshooting Q-in-Q and VLAN Translation Configuration

- [Firewall Filter Match Condition Not Working with Q-in-Q Tunneling on page 7007](#)
- [Egress Port Mirroring with VLAN Translation on page 7007](#)

### Firewall Filter Match Condition Not Working with Q-in-Q Tunneling

**Problem** **Description:** If you create a firewall filter that includes a match condition of **dot1q-tag** or **dot1q-user-priority** and apply the filter on input to a trunk port that participates in a service VLAN, the match condition does not work if the Q-in-Q EtherType is not 0x8100. (When Q-in-Q tunneling is enabled, trunk interfaces are assumed to be part of the service provider or data center network and therefore participate in service VLANs.)

**Solution** This is expected behavior. To set the Q-in-Q EtherType to 0x8100, enter the **set dot1q-tunneling ethertype 0x8100** statement at the **[edit ethernet-switching-options]** hierarchy level. You must also configure the other end of the link to use the same EtherType.

### Egress Port Mirroring with VLAN Translation

**Problem** **Description:** If you create a port-mirroring configuration that mirrors customer VLAN (CVLAN) traffic on egress and the traffic undergoes VLAN translation before being mirrored, the VLAN translation does not apply to the mirrored packets. That is, the mirrored packets retain the service VLAN (SVLAN) tag that should be replaced by the CVLAN tag on egress. The original packets are unaffected—on these packets VLAN translation works properly, and the SVLAN tag is replaced with the CVLAN tag on egress.

**Solution** This is expected behavior.

- Related Documentation**
- [Understanding Q-in-Q Tunneling and VLAN Translation on page 2068](#)
  - [Example: Setting Up Q-in-Q Tunneling on page 2149](#)

## Hardware

- [Troubleshooting QFX3100 Director Device Isolation on page 7008](#)

## Troubleshooting QFX3100 Director Device Isolation

**Problem**    **Description:** Both connections between the QFX3100 Director devices are broken so that one of the Director devices in a Director group becomes isolated from the group.

The redundant patch cables interconnecting the Director devices are critical links required for the operation of the Director group. The two inter-Director device links must remain connected when the Director devices are online. After the Director devices are installed and the Director group is active, if a single inter-Director device link loses and regains its connection, the operation of the Director group remains intact. However, the loss of both inter-Director device links causes one Director device to isolate itself from the Director group.

**WARNING:** Do not reconnect the inter-Director patch cables before properly restarting the isolated Director device. Restarting the active Director device instead of the isolated Director device can result in both Director devices rebooting, with a subsequent data loss.

**Environment:** This problem occurs between the two QFX3100 Director devices found in QFabric systems.

**Symptoms:** Symptoms of this problem include an unscheduled rebooting of one of the Director devices.

---

### Resolution    *Determine Which Director Device Is Isolated*

Before restoring the inter-Director device links, determine which one of the Director devices is in isolation.

To locate an isolated Director device, use one of the following methods:

- Review logs or management tools for standard SNMP traps issued from the Director group before the Director device became isolated.
  - If eth-2/6 links are down, the Director group cannot communicate. Normally, one of the devices reboots.
  - If both eth-2/6 and eth-7/8/9 links are down, the Director device is isolated from the control plane and is not providing fabric services.
  - Issue **show fabric session-host**.
- Use the CLI to determine the serial numbers of the active Director device.
  - Issue the **show fabric session-host** command.

```
root@qfabric>show fabric session-host
Identifier: 0281042010000013
```

- Issue the **show fabric administration inventory director-group status | grep “dg0|dg1”** command.

```
root@qfabrid> show fabric administration inventory director-group status | grep
“dg0|dg1”
```

```
dg0 online master 10.94.214.80 0% 13597976k 4 4 days, 22:36 hrs
dg1 online master 10.94.214.81 0% 18677380k 3 4 days, 22:25 hrs
dg0 0281042010000013 online master
dg1 0281042010000018 online backup
```

When the Director devices cannot communicate, the **show fabric administration inventory director-group** command only displays the Director device that is online.

### *Power Off the Isolated Director Device and Restore the Inter-Director Device Links*

**CAUTION:** Be sure you know which Director device is active and which is isolated. If you power off the active Director device, both Director devices reboot and cause potential data loss on the system.

To restore communication within the Director group:

1. Power off the isolated Director device.
2. Restore the inter-Director device links (port 3 to port 3) by firmly inserting the redundant patch cables.
3. Power on the previously isolated Director device. The Director device reboots.

#### Related Documentation

- [Connecting QFX3100 Director Devices in a Director Group](#)

## High Availability

- [Troubleshooting VRRP on page 7009](#)

## Troubleshooting VRRP

**Problem** **Description:** If you configure multiple VRRP groups on an interface (using multiple VLANs), traffic for some of the groups might be briefly dropped if a failover occurs. This can happen because the new master must send gratuitous ARP replies for each VRRP group to update the ARP tables in the connected devices, and there is a short delay between each gratuitous ARP reply. Traffic sent by devices that have not yet received the gratuitous ARP reply is dropped (until the device receives the reply and learns the MAC address of the new master).

**Solution** Configure a failover delay so that the new master delays sending gratuitous ARP replies for the period that you set. This allows the new master to send the ARP replies for all of the VRRP groups simultaneously.

**Related Documentation**

- [failover-delay on page 2511](#)

## Interfaces

---

- [Troubleshooting an Aggregated Ethernet Interface on page 7010](#)
- [Troubleshooting Network Interfaces on page 7010](#)
- [Troubleshooting Multichassis Link Aggregation on page 7011](#)

### Troubleshooting an Aggregated Ethernet Interface

**Problem**    **Description:** The **show interfaces terse** command shows that the LAG is down.

**Solution**    Check the following:

- Verify that there is no configuration mismatch.
- Verify that all member ports are up.
- Verify that a LAG is part of family ethernet-switching (Layer 2 LAG) or family inet (Layer 3 LAG).
- Verify that the LAG member is connected to the correct LAG at the other end.
- Verify that the LAG members belong to the same switch.

**Related Documentation**

- [Verifying the Status of a LAG Interface on page 2880](#)
- [Example: Configuring Link Aggregation Between a QFX Series Product and an Aggregation Switch on page 2656](#)

### Troubleshooting Network Interfaces

**The interface on the port in which an SFP or SFP+ transceiver is installed in an SFP or SFP+ module is down**

---

**Problem**    **Description:** The QFX Series has an SFP or SFP+ module installed. The interface on the port in which an SFP or SFP+ transceiver is installed is down.

**Symptoms:** When you check the status with the CLI command **show interfaces interface-name**, the disabled port is not listed.

**Cause**    By default, the SFP or SFP+ module operates in the 10-Gigabit Ethernet mode and supports only SFP or SFP+ transceivers. The operating mode for the module is incorrectly set.

**Solution**    Only SFP or SFP+ transceivers can be installed in SFP or SFP+ modules. You must configure the operating mode of the SFP or SFP+ module to match the type of transceiver you want to use. For SFP+ transceivers, configure 10-Gigabit Ethernet operating mode.

- [Layer 3 Traffic Sent to the Standby MC-LAG Peer Is Not Redirected to Active MC-LAG Peer on page 7016](#)
- [AE Interfaces Go Down on page 7016](#)
- [Flooding of Upstream Traffic on page 7016](#)

### MAC Addresses Learned on MC-AE Interfaces Are Not Removed from the MAC Address Table

**Problem Description:** When both of the multichassis aggregated Ethernet (MC-AE) interfaces on both connected multichassis link aggregation group (MC-LAG) peers are down, the MAC addresses learned on the MC-AE interfaces are not removed from the MAC address table. For example, if you disable the MC-AE interface (ae0) on both MC-LAG peers by issuing the **set interfaces ae0 disable** command and commit the configuration, the MAC table still shows the MAC addresses as being learned on the MC-AE interfaces of both MC-LAG peers:

```
user@switchA> show ethernet-switching table
Ethernet-switching table: 6 entries, 2 learned, 0 persistent entries
VLAN          MAC address      Type      Age Interfaces
v10            *                Flood     - All-members
v10            00:10:94:00:00:01 Learn(L)    3:55 ae0.0 (MCAE)
```

|     |                   |          |               |
|-----|-------------------|----------|---------------|
| v10 | 00:10:94:00:00:02 | Learn(R) | 0 xe-0/0/9.0  |
| v20 | *                 | Flood    | - All-members |
| v30 | *                 | Flood    | - All-members |
| v30 | 84:18:88:de:b1:2e | Static   | - Router      |

user@switchB> show ethernet-switching table

Ethernet-switching table: 6 entries, 2 learned, 0 persistent entries

| VLAN | MAC address       | Type     | Age | Interfaces    |
|------|-------------------|----------|-----|---------------|
| v10  | *                 | Flood    |     | - All-members |
| v10  | 00:10:94:00:00:01 | Learn(R) | 0   | ae0.0 (MCAE)  |
| v10  | 00:10:94:00:00:02 | Learn    | 40  | xe-0/0/10.0   |
| v20  | *                 | Flood    |     | - All-members |
| v30  | *                 | Flood    |     | - All-members |
| v30  | 84:18:88:df:83:0a | Static   |     | - Router      |

**Solution** This is expected behavior.

---

#### MC-LAG Peer Does Not Go into Standby Mode

**Problem** **Description:** A multichassis link aggregation group (MC-LAG) peer does not go into standby mode if the MC-LAG peer IP address specified in the Interchassis Control Protocol (ICCP) configuration and the IP address specified in the multichassis protection configuration are different.

**Solution** To prevent failure to enter standby mode, make sure the peer IP address in the ICCP configurations and the IP address in multichassis protection configurations are the same.

---

#### Secondary MC-LAG Peer with Status Control Set to Standby Becomes Inactive

**Problem** **Description:** When the interchassis control link-protection link (ICL-PL) and multichassis aggregated Ethernet (MC-AE) interfaces go down on the primary multichassis link aggregation group (MC-LAG) peer, the secondary MC-LAG peer's MC-AE interfaces with status control set to standby become inactive instead of active.

**Solution** This is expected behavior.

---

#### Redirect Filters Take Priority over User-Defined Filters

**Problem** **Description:** Multichassis link aggregation group (MC-LAG) implicit failover redirection filters take precedence over user-configured explicit filters. This is expected behavior.

**Solution** This is expected behavior.

### Operational Command Output Is Wrong

**Problem Description:** After you deactivate the Interchassis Control Protocol (ICCP), the **show iccp** operational command output still shows registered client daemons, such as mcsnoopd, lacpd, and eswd.

For example:

```
user@switch> show iccp
Client Application: MCSNOOPD
Redundancy Group IDs Joined: None
```

```
Client Application: lacpd
Redundancy Group IDs Joined: 1
```

```
Client Application: eswd
Redundancy Group IDs Joined: 1
```

The **show iccp** command output always shows registered modules regardless of whether or not ICCP peers are configured.

**Solution** This is expected behavior.

### ICCP Connection Might Take Up to 60 Seconds to Become Active

**Problem Description:** When the Interchassis Control Protocol (ICCP) configuration and the routed VLAN interface (RVI) configuration are committed together, the ICCP connection might take up to 60 seconds to become active.

**Solution** This is expected behavior.

### MAC Address Age Learned on an MC-AE Interface Is Reset to Zero

**Problem Description:** When you activate and then deactivate an interchassis control link-protection link (ICL-PL), the MAC address age learned on the multichassis aggregated Ethernet (MC-AE) interface is reset to zero. The next-hop interface changes trigger MAC address updates in the hardware, which then triggers aging updates in the Packet Forwarding Engine (PFE). The result is that the MAC address age is updated to zero.

For example, the ICL-PL has been deactivated, and the **show ethernet-switching table** command output shows that the MAC addresses have an age of 0.

```
user@switch> show ethernet-switching table
Ethernet-switching table: 3 entries, 2 learned, 0 persistent entries
VLAN      MAC address      Type      Age Interfaces
v100      *                Flood     - All-members
v100      00:10:00:00:00:01 Learn(L)    0 ae0.0 (MCAE)
v100      00:10:00:00:00:02 Learn(L)    0 ae0.0 (MCAE)
```

**Solution** This is expected behavior.

#### MAC Address Is Not Learned Remotely in a Default VLAN

---

**Problem**    **Description:** If a multichassis link aggregation group (MC-LAG) peer learns a MAC address in the default VLAN, the Interchassis Control Protocol (ICCP) does not synchronize the MAC address with the MAC address of the other MC-LAG peer.

**Solution**    This is expected behavior.

#### Snooping Entries Learned on MC-AE Interfaces Are Not Removed

---

**Problem**    **Description:** When multichassis aggregated Ethernet (MC-AE) interfaces are configured on a VLAN that is enabled for multicast snooping, the membership entries learned on the MC-AE interfaces on the VLAN are not cleared when the MC-AE interfaces go down. This is done to speed up convergence time when the interfaces come up, or come up and go down.

**Solution**    This is expected behavior.

#### ICCP Does Not Come Up After You Add or Delete an Authentication Key

---

**Problem**    **Description:** The Interchassis Control Protocol (ICCP) connection is not established when you add an authentication key and then delete it only at the global ICCP level. However, authentication works correctly at the ICCP peer level.

**Solution**    Delete the ICCP configuration , and then add the ICCP configuration.

#### Local Status Is Standby When It Should Be Active

---

**Problem**    **Description:** If the multichassis aggregated Ethernet (MC-AE) interface is down when the state machine is in a synchronized state, the multichassis link aggregation group (MC-LAG) peer local status is standby. If the MC-AE interface goes down after the state machine is in an active state, then the local status remains active, and the local state indicates that the interface is down.

**Solution**    This is expected behavior.

#### Packets Loop on the Server When ICCP Fails

---

**Problem**    **Description:** When you enable backup liveness detection for a multichassis link aggregation group (MC-LAG), and the backup liveness detection packets are lost because of a temporary failure on the MC-LAG, then both of the peers in the MC-LAG remain active. If this happens, both of the MC-LAG peers send packets to the connected server.

**Solution**    This is expected behavior.

---

### Both MC-LAG Peers Use the Default System ID After a Reboot or an ICCP Configuration Change

---

**Problem** **Description:** After a reboot or after a new Interchassis Control Protocol (ICCP) configuration has been committed, and the ICCP connection does not become active, the Link Aggregation Control Protocol (LACP) messages transmitted over the multichassis aggregated Ethernet (MC-AE) interfaces use the default system ID. The configured system ID is used instead of the default system ID only after the MC-LAG peers synchronize with each other.

**Solution** This is expected behavior.

---

### No Commit Checks Are Done for ICL-PL Interfaces

---

**Problem** **Description:** There are no commit checks on the interface being configured as an interchassis control link-protection link (ICL-PL), so you must provide a valid interface name for the ICL-PL.

**Solution** This is expected behavior.

---

### Double Failover Scenario

---

**Problem** **Description:** If the following events happen in this exact order—the Interchassis Control Protocol (ICCP) goes down, and the multichassis aggregated Ethernet (MC-AE) interface on the multichassis link aggregation group (MC-LAG) peer in active mode goes down—a double failover occurs. In this scenario, the MC-LAG peer in standby mode does not detect what happens on the active MC-LAG peer. The MC-LAG peer in standby mode operates as if the MC-AE interface on the MC-LAG in active mode were up and blocks the interchassis control protocol-protection link (ICL-PL) traffic. The ICL-PL traffic is not forwarded.

**Solution** This is expected behavior.

---

### Multicast Traffic Floods the VLAN When the ICL-PL Interface Goes Down and Up

---

**Problem** **Description:** When the interchassis control link-protection link (ICL-PL) goes down and up, multicast traffic is flooded to all of the interfaces in the VLAN. The Packet Forwarding Engine (PFE) flag `Ip4McastFloodMode` for the VLAN is changed to `MCAST_FLOOD_ALL`. This problem only occurs when a multichassis link aggregation group (MC-LAG) is configured for Layer 2.

**Solution** This is expected behavior.

### Layer 3 Traffic Sent to the Standby MC-LAG Peer Is Not Redirected to Active MC-LAG Peer

---

**Problem**    **Description:** When the Interchassis Control Protocol (ICCP) is down, the status of a remote MC-LAG peer is unknown. Even if the MC-LAG peer is configured as standby, the traffic is not redirected to this peer because it is assumed that this peer is down.

**Solution**    This is expected behavior.

### AE Interfaces Go Down

---

**Problem**    **Description:** When a multichassis aggregated Ethernet (MC-AE) interface is converted to an aggregated Ethernet (AE) interface, it retains some MC-AE properties. For example, the AE interface might retain the administrative key of the MC-AE. When this happens, the AE interface goes down.

**Solution**    Restart the Link Aggregation Control Protocol (LACP) on the multichassis link aggregation group (MC-LAG) peer hosting the AE interface to bring up the AE interface. Restarting LACP removes the MC-AE properties of the AE interface.

### Flooding of Upstream Traffic

---

**Problem**    **Description:** When MAC synchronization is enabled, the multichassis link aggregation group (MC-LAG) peer can resolve Address Resolution Protocol (ARP) entries for the MC-LAG routed VLAN interface (RVI) with either of the MC-LAG peer MAC addresses. If the downstream traffic is sent with one MAC address (MAC1) but the peer has resolved the MAC address with a different MAC address (MAC2), the MAC2 address might not be learned by any of the access layer switches. Flooding of the upstream traffic for the MAC2 address might then occur.

**Solution**    Make sure that downstream traffic is sent from the MC-LAG peers periodically to prevent the MAC addresses from aging out.

## Rebooting and Halting a Device

To reboot the switch, issue the **request system reboot** command.

```
user@switch> request system reboot ?
Possible completions:
<[Enter]>      Execute this command
all-members    Reboot all virtual chassis members
at             Time at which to perform the operation
both-routing-engines  Reboot both the Routing Engines
fast-boot      Enable fast reboot
in             Number of minutes to delay before operation
local          Reboot local virtual chassis member
member         Reboot specific virtual chassis member (0..9)
message        Message to display to all users
other-routing-engine  Reboot the other Routing Engine
|             Pipe through a command
{master:0}
```

```
user@switch> request system reboot
Reboot the system ? [yes,no] (no) yes
Rebooting switch
```

**NOTE:** Not all options shown in the preceding command output are available on all QFX Series and EX4600 devices. For example, the **fast-boot** option is available only on QFX5100. See the documentation for the [request system reboot](#) command for details about options.

Similarly, to halt the switch, issue the **request system halt** command.

**CAUTION:** Before entering this command, you must have access to the switch's console port in order to bring up the Routing Engine.

```
user@switch> request system halt ?
Possible completions:
<[Enter]>      Execute this command
all-members    Halt all virtual chassis members
at             Time at which to perform the operation
backup-routing-engine  Halt backup Routing Engine
both-routing-engines  Halt both Routing Engines
in             Number of minutes to delay before operation
local          Halt local virtual chassis member
member         Halt specific virtual chassis member (0..9)
message        Message to display to all users
other-routing-engine  Halt other Routing Engine
|             Pipe through a command
```

**NOTE:** When you issue this command on an individual component in a QFabric system, you will receive a warning that says “Hardware-based members will halt, Virtual Junos Routing Engines will reboot.” If you want to halt only one member, use the member option. You cannot issue this command from the QFabric CLI.

Issuing the **request system halt** command on the switch halts the Routing Engine. To reboot a Routing Engine that has been halted, you must connect through the console.

## Recovering from a Failed Software Installation

**Problem**    **Description:** If the Junos OS appears to have been installed but the CLI does not work, or if the switch has no software installed, you can use this recovery installation procedure to install the Junos OS.

**Solution**    If a Junos OS image already exists on the switch, you can either install the new Junos OS package in a separate partition, in which case both Junos OS images remain on the switch, or you can remove the existing Junos OS image before you start the new installation process.

**NOTE:** QFX5100 and EX4600 switches do not have a separate partition to reinstall a Junos OS image.

A recovery image is created automatically on these switches. If a previously-running switch is powered on and unable to boot using a Junos OS image, you can boot the switch using the recovery Junos OS image by selecting an option in the “Select a recovery image” menu.

We suggest creating a system snapshot on your QFX5100 or EX4600 switch onto the external USB flash drive, and using the snapshot for recovery purposes. The system snapshot feature takes a “snapshot” of the files currently used to run the device—the complete contents of the /config directories, which include the running Juniper Networks Junos OS, the active configuration, and the rescue configuration, as well as the host OS—and copies all of these files into an external USB flash drive. See “[Creating a Snapshot and Using It to Boot a QFX Series Switch](#)” on page 181.

To perform a recovery installation:

1. Power on the switch. The loader script starts.
2. After the message **Loading /boot/defaults/loader.conf** appears, you are prompted with the following message:

**Hit [Enter] to boot immediately, or space bar for command prompt.**

Press the Spacebar to enter the manual loader. The **loader>** prompt appears.

**NOTE:** The loader prompt does not appear on QFX5100 and EX4600 switches.

On QFX5100 and EX4600 switches only, a recovery image is automatically saved if a previously-running switch is powered on and unable to boot using a Junos OS image.

The “Select a recovery image” menu appears on the console when one of these switches is booted and unable to load a version of Junos OS. Follow the instructions in the “Select a recovery image” menu to load the recovery version of Junos OS for one of these switches.

You can ignore the remainder of this procedure if you are using a QFX5100 or EX4600 switch.

3. Enter the following command:

```
loader> install [– –format] [– –external] source
```

where:

- **format**—Enables you to erase the installation media before installing the installation package. If you do not include this option, the system installs the new Junos OS in a different partition from that of the most recently installed Junos OS.
- **external**—Installs the installation package onto external media (a USB stick, for example).
- **source**—Represents the name and location of the Junos OS package, either on a server on the network or as a file on an external media, as shown in the following two examples:
  - Network address of the server and the path on the server; for example, **tftp://192.171.28/junos/jinstall-qfx-11.1R1.5-domestic-signed.tgz**
  - Junos OS package on a USB device (commonly stored in the root drive as the only file), for example, **file:///jinstall-qfx-11.1R1.5-domestic-signed.tgz**.

The installation now proceeds normally and ends with a login prompt.

## Recovering the Root Password

If you forget the root password, you can use the password recovery procedure to reset the root password.

**NOTE:** The root password cannot be recovered on a QFabric system.

**NOTE:** You need console access to the switch to recover the root password.

To recover the root password:

1. Power off the switch by switching off the AC power outlet of the device or, if necessary, by pulling the power cords out of the device's power supplies.
2. Turn off the power to the management device, such as a PC or laptop computer, that you want to use to access the CLI.
3. Plug one end of the Ethernet rollover cable supplied with the device into the RJ-45-to-DB-9 serial port adapter supplied with the device.
4. Plug the RJ-45-to-DB-9 serial port adapter into the serial port on the management device.
5. Connect the other end of the Ethernet rollover cable to the console port on the device.
6. Turn on the power to the management device.
7. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate **COM** port to use (for example, **COM1**).
8. Configure the port settings as follows:
  - Bits per second: 9600
  - Data bits: 8
  - Parity: None
  - Stop bits: 1
  - Flow control: None
9. Power on the device by (if necessary) plugging the power cords into the device's power supply, or turning on the power to the device by switching on the AC power outlet the device is plugged into.

The terminal emulation screen on your management device displays the device's boot sequence.

10. When the following prompt appears, press the Spacebar to access the device's bootstrap loader command prompt:

```
Hit [Enter] to boot immediately, or space bar for command prompt.  
Booting [kernel] in 9 seconds...
```

11. At the following prompt, enter **boot -s** to start up the system in single-user mode.

```
ok boot -s
```

12. At the following prompt, enter **recovery** to start the root password recovery procedure.

```
Enter full pathname of shell or 'recovery' for root password recovery or RETURN
for /bin/sh: recovery
```

13. Enter configuration mode in the CLI.

14. Set the root password. For example:

```
user@switch# set system root-authentication plain-text-password
```

15. At the following prompt, enter the new root password. For example:

```
New password: juniper1
Retype new password:
```

16. At the second prompt, reenter the new root password.

17. After you have finished configuring the password, commit the configuration.

```
root@host# commit
commit complete
```

18. Exit configuration mode in the CLI.

19. Exit operational mode in the CLI.

20. At the prompt, enter **y** to reboot the device.

```
Reboot the system? [y/n] y
```

**Related Documentation**

- [Configuring the Root Password on page 1846](#)

## Creating an Emergency Boot Device

If Junos OS on the device is damaged in some way that prevents the software from loading properly, you can use an emergency boot device to repartition the primary disk and load a fresh installation of Junos OS. Use the following procedure to create an emergency boot device.

Before you begin, you need to download the installation media image for your device and Junos OS release from <http://www.juniper.net/customers/support/>.

**NOTE:** In the following procedure, we assume that you are creating the emergency boot device on a QFX device. You can create the emergency boot device on another Juniper Networks switch or router, or any PC or laptop that supports Linux. The steps you take to create the emergency boot device vary, depending on the device.

To create an emergency boot device:

1. Use FTP to copy the installation media image into the **/var/tmp** directory on the device.
2. Insert a USB device into the USB port.
3. From the Junos OS command-line interface (CLI), start the shell:

```
user@device> start shell
%
```

4. Switch to the root account using the **su** command:

```
% su
Password: password
```

**NOTE:** The password is the root password for the device. If you logged in to the device as root, you do not need to perform this step.

5. Enter the following command on the QFX3500, QFX3600, and QFX3600-I devices:

```
root@device% dd if=/var/tmp/filename of=/dev/da1 bs=16k
```

The device writes the installation media image to the USB device:

```
root@device% dd if=/var/tmp/install-media-qfx3500.junos_11.1 of=/dev/da1 bs=16k
11006+1 records in
11006+1 records out
180332544 bytes transferred in 71.764266 secs (2512846 bytes/sec)
```

6. Enter the following command on the QFX5100 and EX4600 devices:

```
root@device% dd if=/var/tmp/filename of=/dev/da0 bs=1048576
```

The device writes the installation media image to the USB device:

```
root@device% dd if=/var/tmp/jinstall-vjunos-usb-13.2.img of=/dev/da0 bs=1048576
11006+1 records in
11006+1 records out
180332544 bytes transferred in 71.764266 secs (2512846 bytes/sec)
```

**NOTE:** QFX5100 and EX4600 devices automatically create a recovery Junos OS image.

The “Select a recovery image” menu appears on the console when one of these switches is booted and unable to load a version of Junos OS. You can follow the instructions in the “Select a recovery image” menu to load the Junos OS image for one of these switches.

7. Log out of the shell:

```
root@device% exit
% exit
user@device>
```

## Performing a Recovery Installation

If Junos OS on your device is damaged in some way that prevents the software from loading correctly, you may need to perform a recovery installation using an emergency boot device (for example, a USB flash drive) to restore the default factory installation. Once you have recovered the software, you need to restore the device configuration. You can either create a new configuration as you did when the device was shipped from the factory, or if you saved the previous configuration, you can simply restore that file to the device.

You can also use a system snapshot as a bootup option when your Junos OS or configuration is damaged. The system snapshot feature takes a “snapshot” of the files currently used to run the device—the complete contents of the `/config` directories, which include the running Juniper Networks Junos OS, the active configuration, and the rescue configuration, as well as the host OS—and copies all of these files into an external USB flash drive. See *Understanding System Snapshot*.

If at all possible, you should try to perform the following steps before you perform the recovery installation:

1. Ensure that you have an emergency boot device to use during the installation. See [“Creating an Emergency Boot Device” on page 180](#) for information on how to create an emergency boot device.
2. Copy the existing configuration in the file `/config/juniper.conf.gz` from the device to a remote system, such as a server, or to an emergency boot device. For extra safety, you can also copy the backup configurations (the files named `/config/juniper.conf.n`, where *n* is a number from 0 through 9) to a remote system or to an emergency boot device.

**WARNING:** The recovery installation process completely overwrites the entire contents of the internal flash storage.

3. Copy any other stored files to a remote system as desired.

To reinstall Junos OS:

1. Insert the emergency boot device into the QFX Series device.
2. Reboot the QFX Series device.

**NOTE:** Do not power off the device if it is already on.

```
[edit system]
user@device> request system reboot
```

If you do not have access to the CLI, power cycle the QFX Series device.

The emergency boot device (external USB install media) is detected. At this time, you can load the Junos OS from the emergency boot device onto the internal flash storage.

3. The software prompts you with the following options:

```
External USB install media detected.  
You can load Junos from this media onto an internal drive.  
Press 'y' to proceed, 'f' to format and install, or 'n' to abort.  
Do you wish to continue ([y]/f/n)? f
```

4. Type **f** to format the internal flash storage and install the Junos OS on the emergency boot device onto the internal flash storage.

If you do not want to format the internal flash storage, type **y**.

The following messages are displayed:

```
Installing packages from external USB drive da1  
Packages will be installed to da0, media size: 8G
```

```
Processing format options  
Fri September 4 01:18:44 UTC 2012
```

```
-- IMPORTANT INFORMATION --  
Installer has detected settings to format system boot media.  
This operation will erase all data from your system.
```

```
Formatting installation disk .. this will take a while, please wait  
Disabling platform watchdog - threshold 12 mins
```

```
Determining installation slice  
Fri September 4 01:27:07 UTC 2012
```

5. The device copies the software from the emergency boot device, occasionally displaying status messages. Copying the software can take up to 12 minutes.

When the device is finished copying the software, you are presented with the following prompt:

```
*** Fri September 4 01:19:00 UTC 2012***  
Installation successful..  
Please select one of the following options:  
Reboot to installed Junos after removing install media (default) ... 1  
Reboot to installed Junos by disabling install media ..... 2  
Exit to installer debug shell ..... 3  
Install Junos to alternate slice ..... 4  
Your choice: 4  
NOTE: System installer will now install Junos to alternate slice  
Do not power off or remove the external installer media or  
interrupt the installation mechanism.
```

6. Select **4** to install Junos OS to the alternate slice of the partition, and then press Enter.
7. Remove the emergency boot device when prompted and then press Enter. The device then reboots from the internal flash storage on which the software was just installed. When the reboot is complete, the device displays the login prompt.
8. Create a new configuration as you did when the device was shipped from the factory, or restore the previously saved configuration file to the device.

**Related Documentation** • [Creating an Emergency Boot Device on page 180](#)

## Performing a QFabric System Recovery Installation on the Director Group

If the software on your QFabric system is damaged in some way that prevents the software from loading correctly, or you need to upgrade the software on your QFabric system, you may need to perform a recovery installation on the Director group.

If possible, perform the following steps before you perform the recovery installation:

1. Ensure that you have an emergency boot device (for example, an external USB flash drive) for each of your Director devices to use during the recovery installation.

You can either use the external USB flash drive containing the software supplied by Juniper Networks, or you can use an external USB flash drive supplied by Juniper Networks on which you install the QFabric system install media.

2. Because the recovery installation process completely overwrites the entire contents of the Director device, make sure you back up any configuration files and initial setup information on a different external USB flash drive before you begin a recovery installation. You will need to restore this information as part of recovery process.

Use the **request system software configuration-backup** command to back up your configuration files and initial setup information:

```
user@switch> request system software configuration-backup path
```

**NOTE:** To recover the Director group, you must upgrade both Director devices in parallel. If you are recovering only one Director device in a Director group, and the software version will remain the same between the two Director devices, make sure that the other Director device is powered on and operational. If the software version of the Director device you are recovering will be different, make sure that the other Director device is powered off and is not operational.

- (Optional) [Creating an Emergency Boot Device Using a Juniper Networks External Blank USB Flash Drive on page 7026](#)
- [Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software on page 7027](#)

### (Optional) Creating an Emergency Boot Device Using a Juniper Networks External Blank USB Flash Drive

---

If you do not have an external USB flash drive preloaded with the software from Juniper Networks to use as an emergency boot device, you can create your own, using a blank external USB flash drive provided by Juniper Networks. Download the install media from the Juniper Networks Support website onto your UNIX workstation, uncompress and untar the software, and then burn the software image onto your Juniper Networks external USB (4-gigabyte) flash drive. Make sure you create two emergency boot devices, one for each Director device, so you can perform a recovery installation in parallel.

1. Using a Web browser, navigate to the <http://www.juniper.net/support>.
2. Click **Download Software**.
3. In the *Switchingbox*, click *Junos OS Platforms*.
4. In the *QFX Series* section, click the name of the platform for which you want to download software.
5. Click the *Software* tab and select the release number from the *Release* drop-down list.
6. Select the complete install media you want to download in the *QFabric System Install Media* section.  
A login screen appears.
7. Enter your name and password and press **Enter**.
8. Read the End User License Agreement, click the **I agree** radio button, and then click **Proceed**.
9. Log in and save the install media file to your UNIX workstation.
10. Use FTP to access the UNIX workstation where the install media resides.  
**ftp ftp://hostname/pathname install-media-qfabric-<version>.img.tgz**
11. When prompted, enter your username and password.
12. Make sure you are in binary mode by entering **binary** at the prompt.  
**binary**
13. Use the **get** command to transfer the installation package from the FTP host to your UNIX workstation.  
**get install-media-qfabric-<version>.img.tgz**
14. Close the FTP session:  
**bye**
15. Untar the *install-media-qfabric-<version>.img.tgz* file on your UNIX workstation.  
**tar -xvzf install-media-qfabric-11.3X30.6.img.tgz**
16. Insert a blank external USB (4-gigabyte) flash drive supplied by Juniper Networks into your UNIX workstation.
17. Burn the software image you just downloaded to your UNIX workstation onto your external USB flash drive using the **dd** command:

```
dd if=install-media-qfabric-11.3X30.6.img of=/dev/sdb bs=16k
250880+0 records in
250880+0 records out
4110417920 bytes (4.1 GB) copied, 5.10768 seconds, 805 MB/s
```

18. Perform the steps in [“Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software”](#) on page 87 to continue with the recovery installation.

### Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software

This procedure describes how to perform a recovery installation using an external USB flash drive that contains Junos OS software.

**NOTE:** Since the recovery installation process completely overwrites the entire contents of the Director device, you will need to restore the required configuration files and initial setup information. The following procedure assumes you previously saved these backup files with the **request system software configuration-backup** command. Ensure that you have these backup files available on an external USB flash drive before you perform the following steps.

1. Insert the external USB flash drive into the Director device.
2. Perform one of the following tasks:
  - If you have access to the default partition, reboot the Director device by issuing the **request system reboot director-group** command.
  - If you do not have access to the default partition, power cycle the Director device.

The following menu appears on the Director device console when the Director device boots up:

```
Juniper Networks QFabric Director Install/Recovery Media
- To boot from the local disk, wait 10 seconds or press the Enter key.
- To reinstall the QFabric software on this Director device, type: install
```

3. Type **install** and then press **Enter** to install the software on the Director device.

Once the installation process is complete, the Director device reboots, and the following menu appears on the Director device console:

```
Juniper Networks QFabric Director Install/Recovery Media
- To boot from the local disk, wait 10 seconds or press the Enter key.
- To reinstall the QFabric software on this Director device, type: install
```

4. Press **Enter**.

The Director device reboots from the local disk on which the software was just installed.

5. Log in as root on the Director device.

The following menu appears on the Director device console:

Before you can access the QFabric system, you must complete the initial setup of the Director group by using the steps that follow.  
If the initial setup procedure does not complete successfully, log out of the Director device and then log back in to restart this setup menu.

Continue?[y/n]

6. Enter **n** to bypass the initial setup script and enter the Director device root directory, where you can mount the external USB flash drive containing the configuration files and initial setup information.

7. Issue the **ls /mnt** command to list the *mount* directory.

```
root@dg0 ~]# ls /mnt
```

8. Issue the **mkdir** command to create a directory within the mount directory.

```
root@dg0 ~]# mkdir /mnt/myusb
```

9. Issue the **mount /dev/sdb2 /mnt/myusb/** command to mount the external USB flash drive to the local drive of the Director device.

```
root@dg0 ~]# mount /dev/sdb2 /mnt/myusb/
```

10. Issue the **ls -la /mnt/myusb/** command to verify the contents of your mounted external USB flashdrive.

```
root@dg0 ~]# ls -la /mnt/myusb/
total 1770884
drwxr-xr-x 2 root root      4096 Sep  7 05:16 .
drwxr-xr-x 3 root root      4096 Sep  7 10:15 ..
-rw-r--r-- 1 root root    4249 Sep  7 03:52 mybackup-20110907
```

11. Exit the Director device and log back in as root on the Director device.

The following menu appears:

Before you can access the QFabric system, you must complete the initial setup of the Director group by using the steps that follow.  
If the initial setup procedure does not complete successfully, log out of the Director device and then log back in to restart this setup menu.

Continue?[y/n] y

Initial Configuration

You may enter the configuration manually or restore from a backup.

Specify a backup file? [y/n] : y

Please specify the full path of the configuration backup file. :  
/mnt/myusb/mybackup-20110907

12. Enter **y** to continue.

13. Enter **y** and specify the path to the backup configuration file located on the external USB flash drive.

```
/mnt/myusb/mybackup-20110907
```

The following messages appear:

```
Saving temporary configuration...
Configuring peer...
connect error for 1.1.1.2:9001
Configuring local interfaces...
```

```

Configuring interface eth0 with [10.49.213.163/24:10.49.213.254]
Configured interface eth0 with [10.49.213.163/24:10.49.213.254]
Configuring QFabric software with initial pool of 4000 MAC addresses
[00:10:00:00:00:00 - 00:10:00:00:0f:3b]
Configuring QFabric address [10.49.213.50]
Reconfiguring QFabric software static configuration
Applying the new Director Device password
Applying the QFabric component password
First install initial configuration, generating and sharing SSH keys.
First install initial configuration, generating SSH keys.
connect error for 1.1.1.2:9001
Shared SSH keys.
Configuration complete. Director Group services will auto start within 30
seconds.

```

The Director device reboots from the local disk on which the software was just installed. Exit the Director device session and log in to the QFabric default partition CLI.

14. Issue the **request system software configuration-restore** command and specify the path to the backup configuration file located on the external USB flash drive to load the previously saved QFabric system configuration.
15. From the default partition, issue the **request system reboot node-group all** command to reboot all of the Node groups in the QFabric system to ensure that all Node devices are running the same version of software as the Director-group.

```
user@switch> request system reboot node-group all
```

16. From the default partition, issue the **request system reboot fabric** command to reboot the Interconnect devices and the other components in the fabric in the QFabric system to ensure that Interconnect devices are running the same version of software as the Director group.

```
user@switch> request system reboot fabric
```

17. Log in to the default partition and issue the **show version component all** command to verify that all components are running the same version of software.

```

user@switch> show version component all

## Troubleshooting Network Interfaces

**The interface on the port in which an SFP or SFP+ transceiver is installed in an SFP or SFP+ module is down**

**Problem**    **Description:** The QFX Series has an SFP or SFP+ module installed. The interface on the port in which an SFP or SFP+ transceiver is installed is down.

**Symptoms:** When you check the status with the CLI command **show interfaces *interface-name***, the disabled port is not listed.

**Cause**    By default, the SFP or SFP+ module operates in the 10-Gigabit Ethernet mode and supports only SFP or SFP+ transceivers. The operating mode for the module is incorrectly set.

**Solution**    Only SFP or SFP+ transceivers can be installed in SFP or SFP+ modules. You must configure the operating mode of the SFP or SFP+ module to match the type of transceiver you want to use. For SFP+ transceivers, configure 10-Gigabit Ethernet operating mode.

## Troubleshooting an Aggregated Ethernet Interface

**Problem**    **Description:** The **show interfaces terse** command shows that the LAG is down.

**Solution**    Check the following:

- Verify that there is no configuration mismatch.
- Verify that all member ports are up.
- Verify that a LAG is part of family ethernet-switching (Layer 2 LAG) or family inet (Layer 3 LAG).
- Verify that the LAG member is connected to the correct LAG at the other end.
- Verify that the LAG members belong to the same switch.

### Troubleshooting Virtual Routing Instances

- [Direct Routes Not Leaked Between Routing Instances on page 7032](#)

---

#### Direct Routes Not Leaked Between Routing Instances

**Problem**     **Description:** Direct routes are not exported (leaked) between virtual routing instances. For example, consider the following scenario:

- Switch with two virtual routing instances:
  - Routing instance 1 connects to downstream device through interface xe-0/0/1.
  - Routing instance 2 connects to upstream device through interface xe-0/0/2.

If you enable route leaking between the routing instances (by using the **rib-group** statement, for example), the downstream device cannot connect to the upstream device because the switch connects to the upstream device over a direct route and these routes are not leaked between instances.

**NOTE:** You can see a route to the upstream device in the routing table of the downstream device, but this route is not functional.

---

Indirect routes *are* leaked between routing instances, so the downstream device can connect to any upstream devices that are connected to the switch over indirect routes.

**Solution**     This is expected behavior.

## MPLS

---

- [Issues and Limitations in Operation of MPLS Features on the QFX Series and on the EX4600 Switch on page 7033](#)

### Issues and Limitations in Operation of MPLS Features on the QFX Series and on the EX4600 Switch

The following issues exist in the operation of MPLS features on QFX Series devices and on the EX4600 switch. In each case, the described behavior is the expected behavior.

- Configuring an MPLS firewall filter on a switch that is deployed as an egress provider edge (PE) switch has no effect.
- Configuring the **revert-timer** statement at the **[edit protocols mpls]** hierarchy level has no effect.
- If you configure the BGP labeled unicast address family (using the **labeled-unicast** statement at the **[edit protocols bgp family inet]** hierarchy level) on a QFX switch or on an EX4600 switch deployed as a route reflector for BGP labeled routes, path selection will occur at the route reflector, and a single best path will be advertised. This will result in loss of BGP multipath information.

## Understanding Troubleshooting Resources

This topic describes some of the troubleshooting resources available for the QFX Series. These resources include tools such as the Junos OS CLI, Junos Space applications, and the Advanced Insight Scripts (AI-Scripts).

Table 634 on page 6963 provides a list of some of the troubleshooting resources.

**Table 642: Troubleshooting Resources on the QFX Series**

| Troubleshooting Resource                    | Description                                                                                                                                                                                                               | Documentation                                                                                                                                                                                                                           |
|---------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Chassis alarms                              | Chassis alarms indicate a failure on the switch or one of its components. A chassis alarm count is displayed on the LCD panel on the front of the switch.                                                                 | <a href="#">“Chassis Alarm Messages on a QFX3500 Device” on page 6982</a>                                                                                                                                                               |
| Chassis Status LEDs and Fan Tray LEDs       | A blinking amber Power, Fan, or Fan Tray LED indicates a hardware component error. A blinking amber Status LED indicates a software error.                                                                                | <i>Chassis Status LEDs on a QFX3500 Device</i>                                                                                                                                                                                          |
| Interface alarms                            | A predefined alarm (red or yellow) for an interface type is triggered when an interface of that type goes down.                                                                                                           | <a href="#">“Interface Alarm Messages” on page 6985</a>                                                                                                                                                                                 |
| System alarms                               | A predefined alarm is triggered by a missing rescue configuration or problem with the software license.                                                                                                                   | <a href="#">“Understanding Alarms” on page 6981</a>                                                                                                                                                                                     |
| System log messages                         | The system log includes details of system and user events, including errors. Specify the severity and type of system log messages you wish to view or save, and configure the output to be sent to local or remote hosts. | <ul style="list-style-type: none"> <li>• <a href="#">Overview of Single-Chassis System Logging Configuration on page 6643</a></li> <li>• <a href="#">Junos OS System Log Configuration Statements on page 6697</a></li> </ul>           |
| Junos OS operational mode commands          | Operational mode commands can be used to monitor switch performance and current activity on the network. For example, use the <b>traceroute monitor</b> command to locate points of failure in a network.                 | <ul style="list-style-type: none"> <li>• <a href="#">Monitoring System Process Information on page 337</a></li> <li>• <a href="#">Monitoring System Properties on page 338</a></li> <li>• <a href="#">traceroute monitor</a></li> </ul> |
| Junos OS automation scripts (event scripts) | Event scripts can be used to automate network troubleshooting and management tasks.                                                                                                                                       | <i>Junos OS Automation Library</i>                                                                                                                                                                                                      |
| Junos OS XML operational tags               | XML operational tags are equivalent in function to operational mode commands in the CLI, which you can use to retrieve status information for a device.                                                                   | <i>Junos XML API Operational Developer Reference</i>                                                                                                                                                                                    |

Table 642: Troubleshooting Resources on the QFX Series (*continued*)

| Troubleshooting Resource                      | Description                                                                                                                                                                                                                                                                                                                                                                                                | Documentation                                                                                                                                                                                                                                |
|-----------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NETCONF XML management protocol               | The NETCONF XML management protocol defines basic operations that are equivalent to Junos OS CLI configuration mode commands. Client applications use the protocol operations to display, edit, and commit configuration statements (among other operations), just as administrators use CLI configuration mode commands such as <b>show</b> , <b>set</b> , and <b>commit</b> to perform those operations. | <i>NETCONF XML Management Protocol Developer Guide</i>                                                                                                                                                                                       |
| SNMP MIBs and traps                           | MIBs enable the monitoring of network devices from a central location. For example, use the Traceroute MIB to monitor devices remotely.                                                                                                                                                                                                                                                                    | <ul style="list-style-type: none"> <li>• <a href="#">SNMP MIBs Support on page 6612</a></li> <li>• <a href="#">SNMP Traps Support on page 6628</a></li> <li>• <a href="#">Using the Traceroute MIB for SNMP Remote Operations</a></li> </ul> |
| AI-Scripts and Advanced Insight Manager (AIM) | AI-Scripts installed on the switch can automatically detect and monitor faults on the switch, and depending on the configuration on the AIM application, send notifications of potential problems and submit problem reports to Juniper Support Systems.                                                                                                                                                   | <a href="#">Advanced Insight Scripts (AI-Scripts) Release Notes</a>                                                                                                                                                                          |
| Junos Space Service Now                       | This application enables you to display and manage information about problem events. When problems are detected on the switch by Advanced Insight Scripts (AI-Scripts) that are installed on the switch, the data is collected and sent to Service Now for your review and action.                                                                                                                         | <i>Service Automation</i>                                                                                                                                                                                                                    |
| Junos Space Service Insight                   | This application helps in accelerating operational analysis and managing the exposure to known issues. You can identify devices that are nearing their End Of Life (EOL) and also discover and prevent issues that could occur in your network. The functionality of Service Insight is dependent on the information sent from Service Now.                                                                | <i>Service Automation</i>                                                                                                                                                                                                                    |
| Juniper Networks Knowledge Base               | You can search in this database for Juniper Networks product information, including alerts and troubleshooting tips.                                                                                                                                                                                                                                                                                       | <a href="http://kb.juniper.net">http://kb.juniper.net</a>                                                                                                                                                                                    |

## Troubleshooting Overview

This topic provides a general guide to troubleshooting some typical problems you may encounter on your QFX Series product.

[Table 635 on page 6965](#) provides a list of problem categories, summary of the symptom or problem, and recommended actions with links to the troubleshooting documentation.

Table 643: Troubleshooting on the QFX Series

| Problem Category               | Symptom or Problem                                                                                          | Recommended Action                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Switch hardware components     | LCD panel shows a chassis alarm count.                                                                      | See <a href="#">"Chassis Alarm Messages on a QFX3500 Device" on page 6982</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|                                | Fan tray LED is blinking amber.                                                                             | See <a href="#">Fan Tray LED on a QFX3500 Device</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|                                | Chassis status LED for the power is blinking amber.                                                         | See <a href="#">Chassis Status LEDs on a QFX3500 Device</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|                                | Chassis status LED for the fan (on the management board) is blinking amber.                                 | Replace the management board as soon as possible. See <a href="#">Chassis Status LEDs on a QFX3500 Device</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Port configuration             | Cannot configure a port as a Gigabit Ethernet port.                                                         | Check whether the port is a valid Gigabit Ethernet port (6 through 41).<br><br>See <a href="#">"QFX3500 Device Overview" on page 3</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|                                | Cannot configure a port as a Fibre Channel port.                                                            | Check whether the port is a valid Fibre Channel port (0 through 5 and 42 through 47).<br><br>See <a href="#">"QFX3500 Device Overview" on page 3</a> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|                                | Cannot configure a port as a 10-Gigabit Ethernet port.                                                      | If the port is not a 40-Gbps QSFP+ interface, check whether the port is in the range of 0 through 5 or 42 through 47. If one of the ports in that block (0 through 5 or 42 through 47) is configured as a Fibre Channel port, then all ports in that block must also be configured as Fibre Channel ports.<br><br>If the port is a 40-Gbps QSFP+ interface, make sure the configuration does not exceed the interface limit. Each 40-Gbps QSFP+ interface can be split into four 10-Gigabit Ethernet interfaces, but because port 0 is reserved, so you can only configure an additional fifteen 10-Gigabit Ethernet interfaces.<br><br>See <a href="#">"QFX3500 Device Overview" on page 3</a> . |
|                                | Cannot configure a 40-Gbps QSFP+ interface.                                                                 | The 40-Gbps QSFP+ interfaces can only be used as 10-Gigabit Ethernet interfaces. Each 40-Gbps QSFP+ interface can be split into four 10-Gigabit Ethernet interfaces using a breakout cable. However, port 0 is reserved, so you can only configure an additional fifteen 10-Gigabit Ethernet interfaces.<br><br>See <a href="#">"QFX3500 Device Overview" on page 3</a> .                                                                                                                                                                                                                                                                                                                         |
| External devices (USB devices) | Upgrading software from a USB device results in an upgrade failure, and the system enters an invalid state. | Unplug the USB device and reboot the switch.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

Table 643: Troubleshooting on the QFX Series (*continued*)

| Problem Category                   | Symptom or Problem                                                                                                                                                    | Recommended Action                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Initial device configuration       | Cannot configure management Ethernet ports.                                                                                                                           | <p>Configure the management ports from the console port. You cannot configure the management ports by directly connecting to them.</p> <p><b>NOTE:</b> The management ports are on the front panel of the QFX3500 switch. They are labeled <b>C0</b> and <b>C1</b> on the front panel. In the CLI they are referred to as <b>me0</b> and <b>me1</b>.</p> <p>See <a href="#">“Configuring a QFX3500 Device as a Standalone Switch”</a> on page 178.</p> |
| Software upgrade and configuration | Failed software upgrade.                                                                                                                                              | See <a href="#">“Recovering from a Failed Software Installation”</a> on page 129.                                                                                                                                                                                                                                                                                                                                                                      |
|                                    | Active partition becomes inactive after upgrade.                                                                                                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

|                                    | Interface on built-in network port is down.                                                                                                                           | See <a href="#">“Troubleshooting Network Interfaces”</a> on page 1303.                                                                                                                                                                                                                                                                                                                                                                                 |
|                                    | Interface on port in which SFP or SFP+ transceiver is installed in an SFP+ uplink module is down.                                                                     |                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Ethernet switching                 | A MAC address entry in the Ethernet switching table is not updated after the device with that MAC address has been moved from one interface to another on the switch. | See <a href="#">“Troubleshooting Ethernet Switching”</a> on page 2427.                                                                                                                                                                                                                                                                                                                                                                                 |
| Firewall filter                    | Firewall configuration exceeded available Ternary Content Addressable Memory (TCAM) space.                                                                            | See <a href="#">“Troubleshooting Firewall Filter Configuration”</a> on page 5181.                                                                                                                                                                                                                                                                                                                                                                      |

## QFX5100 Switch with Automation Enhancements Frequently Asked Questions

This FAQ addresses questions regarding using QFX5100 switches with automation enhancements, which were introduced at Junos OS Release 13.2X51-D15.

This FAQ covers the following questions:

- [Who Should You Contact If You Have Problems with Loading, Installing or Updating Libraries? on page 7038](#)
- [Who Should You Contact If You Have Problems with Puppet for Junos OS? on page 7038](#)
- [Who Should You Contact If You Have Problems with Chef for Junos OS? on page 7038](#)
- [What Happens to the User Partition If You Downgrade a QFX5100 Switch That Is Running the jinstall-qfx-5-flex-x.tgz Software Bundle to a QFX Switch That Is Running a Different QFX5100 Software Bundle? on page 7038](#)
- [How Do You Recover Junos OS Binaries That You Have Deleted? on page 7038](#)
- [How Do You Recover from a System Crash? on page 7038](#)
- [How Can You Verify That a QFX5100 Switch Is Running a jinstall-qfx-5-flex-x.tgz Software Bundle? on page 7039](#)

### [Who Should You Contact If You Have Problems with Loading, Installing or Updating Libraries?](#)

---

Contact Customer Support at <http://www.juniper.net/support>.

### [Who Should You Contact If You Have Problems with Puppet for Junos OS?](#)

---

You can obtain support for Puppet for Junos OS through the J-Net Forum for Puppet at [http://forums.juniper.net/t5/Puppet-for-JunOS/bd-p/puppet\\_junos](http://forums.juniper.net/t5/Puppet-for-JunOS/bd-p/puppet_junos).

### [Who Should You Contact If You Have Problems with Chef for Junos OS?](#)

---

You can obtain support for Chef for Junos OS through the J-Net Forum for Chef at [http://forums.juniper.net/t5/Chef-for-JunOS/bd-p/chef\\_junos](http://forums.juniper.net/t5/Chef-for-JunOS/bd-p/chef_junos).

### [What Happens to the User Partition If You Downgrade a QFX5100 Switch That Is Running the jinstall-qfx-5-flex-x.tgz Software Bundle to a QFX Switch That Is Running a Different QFX5100 Software Bundle?](#)

---

In this case, the user partition remains intact.

**NOTE:** If you make changes to the user partition while performing a unified in-service software upgrade (unified ISSU), the changes might be lost.

### [How Do You Recover Junos OS Binaries That You Have Deleted?](#)

---

You must reinstall the software package.

### [How Do You Recover from a System Crash?](#)

---

You must reinstall the software package.

### How Can You Verify That a QFX5100 Switch Is Running a `jinstall-qfx-5-flex-x.tgz` Software Bundle?

You cannot use the **show version** command to verify that a QFX5100 switch is running the `jinstall-qfx-5-flex-x.tgz` software bundle. However, there are two other ways to verify this.

- Use the **show configuration** command to check that you are running a Layer 3 configuration. See *Installing Junos OS Software with QFX5100 Switch Automation Enhancements*.
- Go to the shell and confirm that you can invoke Python. See *Invoking the Python Interpreter*.

### Recovering from a Failed Software Installation

**Problem**    **Description:** If the Junos OS appears to have been installed but the CLI does not work, or if the switch has no software installed, you can use this recovery installation procedure to install the Junos OS.

**Solution**    If a Junos OS image already exists on the switch, you can either install the new Junos OS package in a separate partition, in which case both Junos OS images remain on the switch, or you can remove the existing Junos OS image before you start the new installation process.

**NOTE:** QFX5100 and EX4600 switches do not have a separate partition to reinstall a Junos OS image.

A recovery image is created automatically on these switches. If a previously-running switch is powered on and unable to boot using a Junos OS image, you can boot the switch using the recovery Junos OS image by selecting an option in the “Select a recovery image” menu.

We suggest creating a system snapshot on your QFX5100 or EX4600 switch onto the external USB flash drive, and using the snapshot for recovery purposes. The system snapshot feature takes a “snapshot” of the files currently used to run the device—the complete contents of the /config directories, which include the running Juniper Networks Junos OS, the active configuration, and the rescue configuration, as well as the host OS—and copies all of these files into an external USB flash drive. See [“Creating a Snapshot and Using It to Boot a QFX Series Switch” on page 181](#).

To perform a recovery installation:

1. Power on the switch. The loader script starts.
2. After the message **Loading /boot/defaults/loader.conf** appears, you are prompted with the following message:

**Hit [Enter] to boot immediately, or space bar for command prompt.**

Press the Spacebar to enter the manual loader. The **loader>** prompt appears.

**NOTE:** The loader prompt does not appear on QFX5100 and EX4600 switches.

On QFX5100 and EX4600 switches only, a recovery image is automatically saved if a previously-running switch is powered on and unable to boot using a Junos OS image.

The “Select a recovery image” menu appears on the console when one of these switches is booted and unable to load a version of Junos OS. Follow the instructions in the “Select a recovery image” menu to load the recovery version of Junos OS for one of these switches.

You can ignore the remainder of this procedure if you are using a QFX5100 or EX4600 switch.

3. Enter the following command:

```
loader> install [- --format] [- --external] source
```

where:

- **format**—Enables you to erase the installation media before installing the installation package. If you do not include this option, the system installs the new Junos OS in a different partition from that of the most recently installed Junos OS.
- **external**—Installs the installation package onto external media (a USB stick, for example).
- **source**—Represents the name and location of the Junos OS package, either on a server on the network or as a file on an external media, as shown in the following two examples:
  - Network address of the server and the path on the server; for example, **tftp://192.171.28/junos/jinstall-qfx-11.1R1.5-domestic-signed.tgz**
  - Junos OS package on a USB device (commonly stored in the root drive as the only file), for example, **file:///jinstall-qfx-11.1R1.5-domestic-signed.tgz**.

The installation now proceeds normally and ends with a login prompt.

## Loading a Previous Configuration File

You can use the **rollback <number>** command to return to a previously committed configuration file. A switch saves the last 50 committed configurations, including the rollback number, date, time, and name of the user who issued the **commit** configuration command.

### Syntax

**rollback <number>**

### Options

- **none**—Return to the most recently saved configuration.
- **number**—Configuration to return to.
  - **Range:** 0 through 49. The most recently saved configuration is number 0, and the oldest saved configuration is number 49.
  - **Default:** 0

To return to a configuration prior to the most recently committed one:

1. Specify the rollback number (here, 1 is entered and the configuration returns to the previously committed configuration):

```
[edit]
user@switch# rollback 1
load complete
```

2. Activate the configuration you have loaded:

```
[edit]
user@switch# commit
```

- Related Documentation**
- [Configuration File Terms on page 25](#)

## Reverting to the Default Factory Configuration

If for any reason the current active configuration fails, you can revert to the default factory configuration. The default factory configuration contains the basic configuration settings. This is the first configuration of the switch, and it is loaded when the switch is first installed and powered on.

The **load factory default** command is a standard Junos OS configuration command. This configuration command replaces the current active configuration with the default factory configuration.

To revert the switch to the rescue configuration:

1. 

```
[edit]
user@switch# load factory-default
[edit]
user@switch# delete system commit factory-settings
[edit]
user@switch# commit
```

- Related Documentation**
- [Understanding Configuration Files on page 1732](#)
  - [Loading a Previous Configuration File on page 1742](#)
  - [Reverting to the Rescue Configuration on page 191](#)

## Reverting to the Rescue Configuration

If someone inadvertently commits a configuration that denies management access to a device and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration. The rescue configuration is a previously committed, valid configuration.

To revert the switch to the rescue configuration:

1. Enter the **load override** command.

```
[edit]
user@switch# load override filename
```
2. Commit your changes.

```
[edit]
user@switch# commit filename
```

- Related Documentation**
- [Setting or Deleting the Rescue Configuration on page 1751](#)
  - [Reverting to the Default Factory Configuration on page 190](#)
  - [Configuration File Terms on page 25](#)

## Recovering the Root Password

If you forget the root password, you can use the password recovery procedure to reset the root password.

**NOTE:** The root password cannot be recovered on a QFabric system.

**NOTE:** You need console access to the switch to recover the root password.

To recover the root password:

1. Power off the switch by switching off the AC power outlet of the device or, if necessary, by pulling the power cords out of the device's power supplies.
2. Turn off the power to the management device, such as a PC or laptop computer, that you want to use to access the CLI.
3. Plug one end of the Ethernet rollover cable supplied with the device into the RJ-45-to-DB-9 serial port adapter supplied with the device.
4. Plug the RJ-45-to-DB-9 serial port adapter into the serial port on the management device.
5. Connect the other end of the Ethernet rollover cable to the console port on the device.
6. Turn on the power to the management device.
7. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate **COM** port to use (for example, **COM1**).
8. Configure the port settings as follows:
  - Bits per second: 9600
  - Data bits: 8
  - Parity: None
  - Stop bits: 1
  - Flow control: None
9. Power on the device by (if necessary) plugging the power cords into the device's power supply, or turning on the power to the device by switching on the AC power outlet the device is plugged into.

The terminal emulation screen on your management device displays the device's boot sequence.

10. When the following prompt appears, press the Spacebar to access the device's bootstrap loader command prompt:

```
Hit [Enter] to boot immediately, or space bar for command prompt.
Booting [kernel] in 9 seconds...
```

11. At the following prompt, enter **boot -s** to start up the system in single-user mode.  

```
ok boot -s
```
12. At the following prompt, enter **recovery** to start the root password recovery procedure.  

```
Enter full pathname of shell or 'recovery' for root password recovery or RETURN for /bin/sh: recovery
```
13. Enter configuration mode in the CLI.
14. Set the root password. For example:  

```
user@switch# set system root-authentication plain-text-password
```
15. At the following prompt, enter the new root password. For example:  

```
New password: juniper1
Retype new password:
```
16. At the second prompt, reenter the new root password.
17. After you have finished configuring the password, commit the configuration.  

```
root@host# commit
commit complete
```
18. Exit configuration mode in the CLI.
19. Exit operational mode in the CLI.
20. At the prompt, enter **y** to reboot the device.  

```
Reboot the system? [y/n] y
```

## Troubleshooting a Deprecated Network Analytics Configuration

**Problem Description:** After a software upgrade to Junos OS Release 13.2X51-D15 from an earlier release, the network analytics configuration is no longer valid and the feature is disabled.

**Symptoms:** The network analytics configuration used in Junos OS Release 13.2X51-D10 has been deprecated in Release 13.2X51-D15. Issuing the **show services analytics** command results in the following output:

```
root@qfx5100# show services analytics

queue-statistics { ## Warning: 'queue-statistics' is deprecated
  interval 1;
}
```

**Cause** Junos OS Release 13.2X51-D15 added enhancements to the network analytics feature, resulting in significant changes in the CLI. The updated **[edit services analytics]** hierarchy level contains some statements that have replaced those that were previously released. As a result, the earlier configuration does not work in the new release.

**Solution** Use the new CLI statements to reconfigure the network analytics feature.

#### Firewall Filter Configuration Returns a No Space Available in TCAM Message

**Problem** **Description:** When a firewall filter configuration exceeds the amount of available Ternary Content Addressable Memory (TCAM) space, the system returns the following **syslogd** message:

```
No space available in tcam.
Rules for filter filter-name will not be installed.
```

A switch returns this message during the commit operation if the firewall filter that has been applied to a port, VLAN, or Layer 3 interface exceeds the amount of space available in the TCAM table. The filter is not applied, but the commit operation for the firewall filter configuration is completed in the CLI module.

**Solution** When a firewall filter configuration exceeds the amount of available TCAM table space, you must configure a new firewall filter with fewer filter terms so that the space requirements for the filter do not exceed the available space in the TCAM table.

You can perform either of the following procedures to correct the problem:

To delete the filter and its binding and apply the new smaller firewall filter to the same binding:

1. Delete the filter and its binding to ports, VLANs, or Layer 3 interfaces. For example:

```
[edit]
user@switch# delete firewall family ethernet-switching filter ingress-vlan-rogue-block
user@switch# delete vlans employee-vlan description "filter to block rogue devices on
employee-vlan"
user@switch# delete vlans employee-vlan filter input ingress-vlan-rogue-block
```

2. Commit the changes:

```
[edit]
user@switch# commit
```

3. Configure a smaller filter with fewer terms that does not exceed the amount of available TCAM space. For example:

```
[edit]
user@switch# set firewall family ethernet-switching filter new-ingress-vlan-rogue-block ...
```

4. Apply (bind) the new firewall filter to a port, VLAN, or Layer 3 interface. For example:

```
[edit]
user@switch# set vlans employee-vlan description "filter to block rogue devices on
employee-vlan"
user@switch# set vlans employee-vlan filter input new-ingress-vlan-rogue-block
```

5. Commit the changes:

```
[edit]
user@switch# commit
```

To apply a new firewall filter and overwrite the existing binding but not delete the original filter:

1. Configure a firewall filter with fewer terms than the original filter:

```
[edit]
user@switch# set firewall family ethernet-switching filter new-ingress-vlan-rogue-block...
```

2. Apply the firewall filter to the port, VLAN, or Layer 3 interfaces to overwrite the binding of the original filter—for example:

```
[edit]
user@switch# set vlans employee-vlan description "smaller filter to block rogue devices on
employee-vlan"
user@switch# set vlans employee-vlan filter input new-ingress-vlan-rogue-block
```

Because you can apply no more than one firewall filter per VLAN per direction, the binding of the original firewall filter to the VLAN is overwritten with the new firewall filter **new-ingress-vlan-rogue-block**.

3. Commit the changes:

```
[edit]
user@switch# commit
```

**NOTE:** The original filter is not deleted and is still available in the configuration.

---

### Filter Counts Previously Dropped Packet

- Problem** **Description:** If you configure two or more filters in the same direction for a physical interface and one of the filters includes a counter, the counter will be incorrect if the following circumstances apply:
- You configure the filter that is applied to packets first to discard certain packets. For example, imagine that you have a VLAN filter that accepts packets sent to 10.10.1.0/24 addresses and implicitly discards packets sent to any other addresses. You apply the filter to the **admin** VLAN in the output direction, and interface xe-0/0/1 is a member of that VLAN.
  - You configure a subsequent filter to accept and count packets that are dropped by the first filter. In this example, you have a port filter that accepts and counts packets sent to 192.168.1.0/24 addresses that is also applied to xe-0/0/1 in the output direction.

The egress VLAN filter is applied first and correctly discards packets sent to 192.168.1.0/24 addresses. The egress port filter is applied next and counts the discarded packets as matched packets. The packets are not forwarded, but the counter displayed by the egress port filter is incorrect.

Remember that the order in which filters are applied depends on the direction in which they are applied, as indicated here:

Ingress filters:

1. Port (Layer 2) filter
2. VLAN filter
3. Router (Layer 3) filter

Egress filters:

1. Router (Layer 3) filter
2. VLAN filter
3. Port (Layer 2) filter

**Solution** This is expected behavior.

### Matching Packets Not Counted

**Problem** **Description:** If you configure two egress filters with counters for a physical interface and a packet matches both of the filters, only one of the counters includes that packet. For example:

- You configure an egress port filter with a counter for interface xe-0/0/1.
- You configure an egress VLAN filter with a counter for the **admin** VLAN, and interface xe-0/0/1 is a member of that VLAN.

- A packet matches both filters.

In this case, the packet is counted by only one of the counters even though it matched both filters.

**Solution** This is expected behavior.

---

#### Counter Reset When Editing Filter

---

**Problem** **Description:** If you edit a firewall filter term, the value of any counter associated with any term in the same filter is set to 0, including the implicit counter for any policer referenced by the filter. Consider the following examples:

- Assume that your filter has **term1**, **term2**, and **term3**, and each term has a counter that has already counted matching packets. If you edit any of the terms in any way, the counters for all the terms are reset to 0.
- Assume that your filter has **term1** and **term2**. Also assume that **term2** has a **policer** action modifier and the implicit counter of the policer has already counted 1000 matching packets. If you edit **term1** or **term2** in any way, the counter for the policer referenced by **term2** is reset to 0.

**Solution** This is expected behavior.

---

#### Cannot Include loss-priority and policer Actions in Same Term

---

**Problem** **Description:** You cannot include both of the following actions in the same firewall filter term in a QFX Series switch:

- **loss-priority**
- **policer**

If you do so, you see the following error message when you attempt to commit the configuration: "cannot support policer action if loss-priority is configured."

**Solution** This is expected behavior.

---

#### Cannot Egress Filter Certain Traffic Originating on QFX Switch

---

**Problem** **Description:** On a QFX Series switch, you cannot filter certain traffic with a firewall filter applied in the output direction if the traffic originates on the QFX switch. This limitation applies to control traffic for protocols such as ICMP (ping), STP, LACP, and so on.

**Solution** This is expected behavior.

### Firewall Filter Match Condition Not Working with Q-in-Q Tunneling

**Problem** **Description:** If you create a firewall filter that includes a match condition of `dot1q-tag` or `dot1q-user-priority` and apply the filter on input to a trunk port that participates in a service VLAN, the match condition does not work if the Q-in-Q EtherType is not 0x8100. (When Q-in-Q tunneling is enabled, trunk interfaces are assumed to be part of the service provider or data center network and therefore participate in service VLANs.)

**Solution** This is expected behavior. To set the Q-in-Q EtherType to 0x8100, enter the `set dot1q-tunneling ethertype 0x8100` statement at the `[edit ethernet-switching-options]` hierarchy level. You must also configure the other end of the link to use the same Ethertype.

### Egress Firewall Filters with Private VLANs

**Problem** **Description:** If you apply a firewall filter in the output direction to a primary VLAN, the filter also applies to the secondary VLANs that are members of the primary VLAN when the traffic egresses with the primary VLAN tag or isolated VLAN tag, as listed below:

- Traffic forwarded from a secondary VLAN trunk port to a promiscuous port (trunk or access)
- Traffic forwarded from a secondary VLAN trunk port that carries an isolated VLAN to a PVLAN trunk port.
- Traffic forwarded from a promiscuous port (trunk or access) to a secondary VLAN trunk port
- Traffic forwarded from a PVLAN trunk port. to a secondary VLAN trunk port
- Traffic forwarded from a community port to a promiscuous port (trunk or access)

If you apply a firewall filter in the output direction to a primary VLAN, the filter does *not* apply to traffic that egresses with a community VLAN tag, as listed below:

- Traffic forwarded from a community trunk port to a PVLAN trunk port
- Traffic forwarded from a secondary VLAN trunk port that carries a community VLAN to a PVLAN trunk port
- Traffic forwarded from a promiscuous port (trunk or access) to a community trunk port
- Traffic forwarded from a PVLAN trunk port. to a community trunk port

If you apply a firewall filter in the output direction to a community VLAN, the following behaviors apply:

- The filter is applied to traffic forwarded from a promiscuous port (trunk or access) to a community trunk port (because the traffic egresses with the community VLAN tag).
- The filter is applied to traffic forwarded from a community port to a PVLAN trunk port (because the traffic egresses with the community VLAN tag).

- The filter is *not* applied to traffic forwarded from a community port to a promiscuous port (because the traffic egresses with the primary VLAN tag or untagged).

**Solution** These are expected behaviors. They occur only if you apply a firewall filter to a private VLAN in the output direction and do not occur if you apply a firewall filter to a private VLAN in the input direction.

---

#### Egress Filtering of L2PT Traffic Not Supported

---

**Problem** **Description:** Egress filtering of L2PT traffic is not supported on the QFX3500 switch. That is, if you configure L2PT to tunnel a protocol on an interface, you cannot also use a firewall filter to filter traffic for that protocol on that interface in the output direction. If you commit a configuration for this purpose, the firewall filter is not applied to the L2PT-tunneled traffic.

**Solution** This is expected behavior.

---

#### Cannot Drop BGP Packets in Certain Circumstances

---

**Problem** **Description:** BGP packets with a time-to-live (TTL) value greater than 1 cannot be discarded using a firewall filter applied to a loopback interface or applied on input to a Layer 3 interface. BGP packets with TTL value of 1 or 0 can be discarded using a firewall filter applied to a loopback interface or applied on input to a Layer 3 interface.

**Solution** This is expected behavior.

---

#### Invalid Statistics for Policer

---

**Problem** **Description:** If you apply a single-rate two-color policer in more than 128 terms in a firewall filter, the output of the **show firewall** command displays incorrect data for the policer.

**Solution** This is expected behavior.

---

#### Policers can Limit Egress Filters

---

**Problem** **Description:** The number of egress policers that you configure can affect the total number of allowed egress firewall filters. Every policer has two implicit counters that consume two entries in a 1024-entry TCAM that is used for counters, including counters that are configured as action modifiers in firewall filter terms. (Policers consume two entries because one is used for green packets and one is used for nongreen packets regardless of policer type.) If the TCAM becomes full, you cannot commit any more egress firewall filters that have terms with counters. For example, if you configure and commit 512 egress policers (two-color, three-color, or a combination of both policer types), all of the memory entries for counters are used up. If later in your configuration file you insert additional

egress firewall filters with terms that also include counters, *none* of the terms in those filters are committed because there is no available memory space for the counters.

Here are some additional examples:

- Assume that you configure egress filters that include a total of 512 policers and no counters. Later in your configuration file you include another egress filter with 10 terms, 1 of which has a counter action modifier. None of the terms in this filter are committed because there is not enough TCAM space for the counter.
- Assume that you configure egress filters that include a total of 500 policers, so 1000 TCAM entries are occupied. Later in your configuration file you include the following two egress filters:
  - Filter A with 20 terms and 20 counters. All the terms in this filter are committed because there is enough TCAM space for all the counters.
  - Filter B comes after Filter A and has five terms and five counters. *None* of the terms in this filter are committed because there is not enough memory space for *all* the counters. (Five TCAM entries are required but only four are available.)

**Solution** You can prevent this problem by ensuring that egress firewall filter terms with counter actions are placed earlier in your configuration file than terms that include policers. In this circumstance, Junos OS commits policers even if there is not enough TCAM space for the implicit counters. For example, assume the following:

- You have 1024 egress firewall filter terms with counter actions.
- Later in your configuration file you have an egress filter with 10 terms. None of the terms have counters but one has a policer action modifier.

You can successfully commit the filter with 10 terms even though there is not enough TCAM space for the implicit counters of the policer. The policer is committed without the counters.

---

### Incomplete Count of Packet Drops

---

**Problem**    **Description:** Under certain circumstances, Junos OS might display a misleading number of packets dropped by an ingress policer.

If packets are dropped because of ingress admission control, policer statistics might not show the number of packet drops you would expect by calculating the difference between ingress and egress packet counts. This might happen if you apply an ingress policer to multiple interfaces, and the aggregate ingress rate of those interfaces exceeds the line rate of a common egress interface. In this case, packets might be dropped from the ingress buffer. These drops are not included in the count of packets dropped by the policer, which causes policer statistics to underreport the total number of drops.

**Solution**    This is expected behavior.

---

### Counter Reset When Editing Filter

---

**Problem**    **Description:** If you edit a firewall filter term, the value of any counter associated with any term in the same filter is set to 0, including the implicit counter for any policer referenced by the filter. Consider the following examples:

- Assume that your filter has **term1**, **term2**, and **term3**, and each term has a counter that has already counted matching packets. If you edit any of the terms in any way, the counters for all the terms are reset to 0.
- Assume that your filter has **term1** and **term2**. Also assume that **term2** has a **policer** action modifier and the implicit counter of the policer has already counted 1000 matching packets. If you edit **term1** or **term2** in any way, the counter for the policer referenced by **term2** is reset to 0.

**Solution**    This is expected behavior.

---

### Invalid Statistics for Policer

---

**Problem**    **Description:** If you apply a single-rate two-color policer in more than 128 terms in a firewall filter, the output of the **show firewall** command displays incorrect data for the policer.

**Solution**    This is expected behavior.

---

### Egress Policers on QFX3500 Devices Might Allow More Throughput Than Is Configured

---

**Problem**    **Description:** If you configure a policer to rate-limit throughput and apply it on egress to multiple interfaces on a QFX3500 switch or Node, the measured aggregate policed rate

might be twice the configured rate, depending on which interfaces you apply the policer to. The doubling of the policed rate occurs if you apply a policer to multiple interfaces and *both* of the following are true:

- There is at least one policed interface in the range xe-0/0/0 to xe-0/0/23 or the range xe-0/1/1 to xe-0/1/7.
- There is at least one policed interface in the range xe-0/0/24 to xe-0/0/47 or the range xe-0/1/8 to xe-0/1/15.

For example, if you configure a policer to rate-limit traffic at 1 Gbps and apply the policer (by using a firewall filter) to xe-0/0/0 and xe-0/0/24 in the output direction, each interface is rate-limited at 1 Gbps, for a total allowed throughput of 2 Gbps. The same behavior occurs if you apply the policer to xe-0/1/1 and xe-0/0/24—each interface is rate-limited at 1 Gbps.

If you apply the same policer on egress to multiple interfaces in these groups, each *group* is rate-limited at 1 Gbps. For example, if you apply the policer to xe-0/0/0 through xe-0/0/4 (five interfaces) and xe-0/0/24 through xe-0/0/33 (ten interfaces), each group is rate-limited at 1 Gbps, for a total allowed throughput of 2 Gbps.

Here is another example: If you apply the policer to xe-0/0/0 through xe-0/0/4 and xe-0/1/1 through xe-0/1/5 (a total of ten interfaces), that group is rate-limited at 1 Gbps in aggregate. If you also apply the policer to xe-0/0/24, that one interface is rate-limited at 1 Gbps while the other ten are still rate-limited at 1 Gbps in aggregate.

Interfaces xe-0/1/1 through xe-0/1/15 are physically located on the QSFP+ uplink ports, according to the following scheme:

- xe-0/1/1 through xe-0/1/3 are on Q0.
- xe-0/1/4 through xe-0/1/7 are on Q1.
- xe-0/1/8 through xe-0/1/11 are on Q2.
- xe-0/1/12 through xe-0/1/15 are on Q3.

The doubling of the policed rate occurs only if the policer is applied in the output direction. If you configure a policer as described above but apply it in the input direction, the total allowed throughput for all interfaces is 1 Gbps.

**Solution** This is expected behavior.

### Filter-Specific Egress Policers on QFX3500 Devices Might Allow More Throughput Than Is Configured

**Problem** **Description:** You can configure policers to be filter-specific, which means that Junos OS creates only one policer instance regardless of how many times the policer is referenced. When you do this, rate limiting is applied in aggregate, so if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms, the total bandwidth allowed by the filter is 1 Gbps. However, the behavior of a filter-specific policer is affected by how the firewall filter terms that reference the policer are stored in ternary content addressable memory (TCAM). If you create a filter-specific policer and

reference it in multiple firewall filter terms, the policer allows more traffic than expected if the terms are stored in different TCAM slices. For example, if you configure a policer to discard traffic that exceeds 1 Gbps and reference that policer in three different terms that are stored in three separate memory slices, the total bandwidth allowed by the filter is 3 Gbps, not 1 Gbps.

**Solution** To prevent this unexpected behavior, use the information about TCAM slices presented in [“Planning the Number of Firewall Filters to Create” on page 4961](#) to organize your configuration file so that all the firewall filter terms that reference a given filter-specific policer are stored in the same TCAM slice.

### **Policers Can Limit Egress Filters**

---

**Problem** **Description:** The number of egress policers that you configure can affect the total number of allowed egress firewall filters. Every policer has two implicit counters that consume two entries in a 1024-entry TCAM that is used for counters, including counters that are configured as action modifiers in firewall filter terms. (Policers consume two entries because one is used for green packets and one is used for nongreen packets regardless of policer type.) If the TCAM becomes full, you cannot commit any more egress firewall filters that have terms with counters. For example, if you configure and commit 512 egress policers (two-color, three-color, or a combination of both policer types), all of the memory entries for counters are used up. If later in your configuration file you insert additional egress firewall filters with terms that also include counters, *none* of the terms in those filters are committed because there is no available memory space for the counters. Here are some additional examples:

- Assume that you configure egress filters that include a total of 512 policers and no counters. Later in your configuration file you include another egress filter with 10 terms, 1 of which has a counter action modifier. None of the terms in this filter are committed because there is not enough TCAM space for the counter.
- Assume that you configure egress filters that include a total of 500 policers, so 1000 TCAM entries are occupied. Later in your configuration file you include the following two egress filters:
  - Filter A with 20 terms and 20 counters. All the terms in this filter are committed because there is enough TCAM space for all the counters.
  - Filter B comes after Filter A and has five terms and five counters. *None* of the terms in this filter are committed because there is not enough memory space for *all* the counters. (Five TCAM entries are required but only four are available.)

**Solution** You can prevent this problem by ensuring that egress firewall filter terms with counter actions are placed earlier in your configuration file than terms that include policers. In this circumstance, Junos OS commits policers even if there is not enough TCAM space for the implicit counters. For example, assume the following:

- You have 1024 egress firewall filter terms with counter actions.

- Later in your configuration file you have an egress filter with 10 terms. None of the terms have counters but one has a policer action modifier.

You can successfully commit the filter with 10 terms even though there is not enough TCAM space for the implicit counters of the policer. The policer is committed without the counters.

#### Port Mirroring Constraints and Limitations

- [Local and Remote Port Mirroring on page 7055](#)
- [Remote Port Mirroring Only on page 7057](#)

#### *Local and Remote Port Mirroring*

The following constraints and limitations apply to local and remote port mirroring:

- You can create a total of four port-mirroring configurations.
- You can create a total of four port-mirroring configurations on each Node group in a QFabric system, subject to the following constraints:
  - As many as four of the configurations can be for local port mirroring.
  - As many as three of the configurations can be for remote port mirroring.
- Regardless of whether you are configuring a standalone switch or a Node group, the following limits apply:
  - There can be no more than two configurations that mirror ingress traffic. (If you configure a firewall filter to send traffic to a port mirror—that is, you use the **analyzer** action modifier in a filter term—this counts as an ingress mirroring configuration for switch or Node group on which the filter is applied.)
  - There can be no more than two configurations that mirror egress traffic.

**NOTE:** On QFabric systems, there is no system-wide limit on the total number of mirror sessions.

- You can configure no more than one type of output in one port-mirroring configuration. That is, you can use no more than one of the following to complete a **set analyzer name output** statement:

- **interface**
- **ip-address**
- **vlan**
- If you configure Junos OS to mirror egress packets, do not configure more than 2000 VLANs on a standalone switch or QFabric system. If you do so, some VLAN packets might contain incorrect VLAN IDs. This applies to any VLAN packets—not only the mirrored copies.
- The **ratio** and **loss-priority** options are not supported.
- Packets with physical layer errors are filtered out and are not sent to the output port or VLAN.
- If you use sFlow monitoring to sample traffic, it does not sample the mirror copies when they exit from the output interface.
- You cannot mirror packets exiting or entering the following ports:
  - Dedicated Virtual Chassis interfaces
  - Management interfaces (me0 or vme0)
  - Fibre Channel interfaces
  - Routed VLAN interfaces
- An aggregated Ethernet interface cannot be an output interface if the input is a VLAN or if traffic is sent to the analyzer by a firewall filter.
- Do not include an 802.1Q subinterface that has a unit number other than 0 in a port mirroring configuration. Port mirroring does not work with subinterfaces if their unit number is not 0. (You configure 802.1Q subinterfaces using the **vlan-tagging** statement.)
- When packet copies are sent out the output interface, they are not modified for any changes that are normally applied on egress, such as CoS rewriting.
- An interface can be the input interface for only one mirroring configuration. Do not use the same interface as the input interface for multiple mirroring configurations.
- CPU-generated packets (such as ARP, ICMP, BPDU, and LACP packets) cannot be mirrored on egress.
- VLAN-based mirroring is not supported for STP traffic.
- (QFabric systems only) If you configure a QFabric analyzer to mirror egress traffic and the input and output interfaces are on different Node devices, the mirrored copies have incorrect VLAN IDs. This limitation does not apply if you configure a QFabric analyzer to mirror egress traffic and the input and output interfaces are on the *same* Node device. In this case the mirrored copies have the correct VLAN IDs (as long as you do not configure more than 2000 VLANs on the QFabric system).

**Remote Port Mirroring Only**

The following constraints and limitations apply to remote port mirroring:

- If you configure an output IP address, the address cannot be in the same subnetwork as any of the switch's management interfaces.
- If you create virtual routing instances and also create an analyzer configuration that includes an output IP address, the output address belongs to the default virtual routing instance (inet.0 routing table).
- An output VLAN cannot be a private VLAN or VLAN range.
- An output VLAN cannot be shared by multiple **analyzer** statements.
- An output VLAN interface cannot be a member of any other VLAN.
- An output VLAN interface cannot be an aggregated Ethernet interface.
- On the source (monitored) switch, only one interface can be a member of the analyzer VLAN.

**Egress Port Mirroring with VLAN Translation**

**Problem** **Description:** If you create a port-mirroring configuration that mirrors customer VLAN (CVLAN) traffic on egress and the traffic undergoes VLAN translation before being mirrored, the VLAN translation does not apply to the mirrored packets. That is, the mirrored packets retain the service VLAN (SVLAN) tag that should be replaced by the CVLAN tag on egress. The original packets are unaffected—on these packets VLAN translation works properly, and the SVLAN tag is replaced with the CVLAN tag on egress.

**Solution** This is expected behavior.

**Egress Port Mirroring with Private VLANs**

**Problem** **Description:** If you create a port-mirroring configuration that mirrors private VLAN (PVLAN) traffic on egress, the mirrored traffic (the traffic that is sent to the analyzer system) has the VLAN tag of the ingress VLAN instead of the egress VLAN. For example, assume the following PVLAN configuration:

- Promiscuous trunk port that carries primary VLANs pvlan100 and pvlan400.
- Isolated access port that carries secondary VLAN isolated200. This VLAN is a member of primary VLAN pvlan100.
- Community port that carries secondary VLAN comm300. This VLAN is also a member of primary VLAN pvlan100.
- Output interface (monitor interface) that connects to the analyzer system. This interface forwards the mirrored traffic to the analyzer.

If a packet for pvlan100 enters on the promiscuous trunk port and exits on the isolated access port, the original packet is untagged on egress because it is exiting on an access port. However, the mirror copy retains the tag for pvlan100 when it is sent to the analyzer.

Here is another example: If a packet for comm300 ingresses on the community port and egresses on the promiscuous trunk port, the original packet carries the tag for pvlan100 on egress, as expected. However, the mirrored copy retains the tag for comm300 when it is sent to the analyzer.

**Solution** This is expected behavior.

## Troubleshooting Dropped FCoE Traffic

**Problem** **Description:** Fibre Channel over Ethernet (FCoE) traffic for which you want guaranteed delivery is dropped.

**Cause** There are several possible causes of dropped FCoE traffic (the list numbers of the possible causes correspond to the list numbers of the solutions in the *Solution* section.):

1. Priority-based flow control (PFC) is not enabled on the FCoE priority (IEEE 802.1p code point) in both the input and output stanzas of the congestion notification profile.
2. The FCoE traffic is not classified correctly at the ingress interface. FCoE traffic should either use the default **fcoe** forwarding class and classifier configuration (maps the **fcoe** forwarding class to IEEE 802.1p code point 011) or be mapped to a lossless forwarding class and to the code point enabled for PFC on the input and output interfaces.
3. The congestion notification profile that enables PFC on the FCoE priority is not attached to the interface.
4. The forwarding class set (priority group) used for guaranteed delivery traffic does not include the forwarding class used for FCoE traffic.

5. Insufficient bandwidth has been allocated for the FCoE queue or for the forwarding class set to which the FCoE queue belongs.
6. If you are using Junos OS Release 12.2, the **fcoe** forwarding class has been explicitly configured instead of using the default **fcoe** forwarding class configuration (forwarding-class-to-queue mapping).

**NOTE:** If you are using Junos OS Release 12.2, use the default forwarding-class-to-queue mapping for the lossless **fcoe** and **no-loss** forwarding classes. If you explicitly configure the lossless forwarding classes, the traffic mapped to those forwarding classes is treated as lossy (best effort) traffic and does *not* receive lossless treatment.

---

7. If you are using Junos OS Release 12.3 or later and you are not using the default **fcoe** forwarding class configuration, the forwarding class used for FCoE is not configured with the **no-loss** packet drop attribute. In Junos OS 12.3 or later, explicit forwarding classes configurations must include the **no-loss** packet drop attribute to be treated as lossless forwarding classes.

**Solution** The list numbers of the possible solutions correspond to the list numbers of the causes in the *Cause* section.

1. Check the congestion notification profile (CNP) to see if PFC is enabled on the FCoE priority (the correct IEEE 802.1p code point) on both input and output interfaces. Use the **show class-of-service congestion-notification** operational command to show the code points that are enabled for PFC in each CNP.

If you are using the default configuration, FCoE traffic is mapped to code point 011 (priority 3). In this case, the input stanza of the CNP should show that PFC is enabled on code point 011, and the output stanza should show that priority 011 is mapped to flow control queue 3.

If you explicitly configured a forwarding class for FCoE traffic, ensure that:

- You specified the **no-loss** packet drop attribute in the forwarding class configuration
- The code point mapped to the FCoE forwarding class in the ingress classifier is the code point enabled for PFC in the CNP input stanza
- The code point and output queue used for FCoE traffic are mapped to each other in the CNP output stanza (if you are not using the default priority and queue, you must explicitly configure each output queue that you want to respond to PFC messages)

For example, if you explicitly configure a forwarding class for FCoE traffic that is mapped to output queue 5 and to code point 101 (priority 5), the output of the **show class-of-service congestion-notification** looks like:

```
Name: fcoe_p5_cnp, Index: 12183
Type: Input
Cable Length: 100 m
  Priority  PFC      MRU
  000      Disabled
  001      Disabled
  010      Disabled
  011      Disabled
  100      Disabled
  101      Enabled   2500
  110      Disabled
  111      Disabled
Type: Output
  Priority  Flow-Control-Queues
  101      5
```

2. Use the **show class-of-service classifier type ieee-802.1p** operational command to check if the classifier maps the forwarding class used for FCoE traffic to the correct IEEE 802.1p code point.
3. Ensure that the congestion notification profile and classifier are attached to the correct ingress interface. Use the operational command **show configuration class-of-service interfaces interface-name**.
4. Check that the forwarding class set includes the forwarding class used for FCoE traffic. Use the operational command **show configuration class-of-service forwarding-class-sets** to show the configured priority groups and their forwarding classes.

5. Verify the amount of bandwidth allocated to the queue mapped to the FCoE forwarding class and to the forwarding class set to which the FCoE traffic queue belongs. Use the **show configuration class-of-service schedulers *scheduler-name*** operational command (specify the scheduler for FCoE traffic as the *scheduler-name*) to see the minimum guaranteed bandwidth (**transmit-rate**) and maximum bandwidth (**shaping-rate**) for the queue.

Use the **show configuration class-of-service traffic-control-profiles *traffic-control-profile*** operational command (specify the traffic control profile used for FCoE traffic as the *traffic-control-profile*) to see the minimum guaranteed bandwidth (**guaranteed-rate**) and maximum bandwidth (**shaping-rate**) for the forwarding class set.

6. Delete the explicit FCoE forwarding-class-to-queue mapping so that the system uses the default FCoE forwarding-class-to-queue mapping. Include the **delete forwarding-classes class fcoe queue-num 3** statement at the **[edit class-of-service]** hierarchy level to remove the explicit configuration. The system then uses the default configuration for the FCoE forwarding class and preserves the lossless treatment of FCoE traffic.
7. Use the **show class-of-service forwarding-class** operational command to display the configured forwarding classes. The *No-Loss* column shows whether lossless transport is enabled or disabled for each forwarding class. If the forwarding class used for FCoE traffic is not enabled for lossless transport, include the **no-loss** packet drop attribute in the forwarding class configuration (**set class-of-service forwarding-classes class *fcoe-forwarding-class-name* queue-num *queue-number* no-loss**).

See “Example: Configuring CoS PFC for FCoE Traffic” on page 5441 for step-by-step instructions on how to configure PFC for FCoE traffic, including classifier, interface, congestion notification profile, PFC, and bandwidth scheduling configuration.

## Troubleshooting Egress Bandwidth That Exceeds the Configured Maximum Bandwidth

**Problem**    **Description:** The maximum bandwidth of a queue when measured at the egress port exceeds the maximum bandwidth (shaping rate) configured for the queue.

**Cause**    When you configure bandwidth for a queue or a priority group, the switch accounts for the configured bandwidth as data only. The switch does not rate-shape the preamble and the interframe gap (IFG) associated with frames, so the switch does not account for the bandwidth consumed by the preamble and the IFG in its maximum bandwidth calculations.

The measured egress bandwidth can exceed the configured maximum bandwidth when small packet sizes (64 or 128 bytes) are transmitted because the preamble and the IFG are a larger percentage of the total traffic. For larger packet sizes, the preamble and IFG overhead are a small portion of the total traffic, and the effect on egress bandwidth is minor.

**Solution** When you calculate the bandwidth requirements for queues on which you expect a significant amount of traffic with small packet sizes, consider the shaping rate as the maximum bandwidth for the data only. Add sufficient bandwidth to your calculations to account for the preamble and IFG so that the port bandwidth is sufficient to handle the combined maximum data rate (shaping rate) and the preamble and IFG.

If the maximum bandwidth measured at the egress port exceeds the amount of bandwidth that you want to allocate to the queue, reduce the shaping rate for that queue.

## Troubleshooting Egress Bandwidth That Exceeds the Configured Minimum Bandwidth

**Problem** **Description:** The minimum bandwidth of a queue or a priority group when measured at the egress port exceeds the minimum bandwidth configured for the queue (transmit-rate) or for the priority group (guaranteed-rate).

**Cause** When you configure bandwidth for a queue or a priority group, the switch accounts for the configured bandwidth as data only. The switch does not include the preamble and the interframe gap (IFG) associated with frames, so the switch does not account for the bandwidth consumed by the preamble and the IFG in its minimum bandwidth calculations.

The measured egress bandwidth can exceed the configured minimum bandwidth when small packet sizes (64 or 128 bytes) are transmitted because the preamble and the IFG are a larger percentage of the total traffic. For larger packet sizes, the preamble and IFG overhead are a small portion of the total traffic, and the effect on egress bandwidth is minor.

**NOTE:** The sum of the queue transmit rates in a priority group should not exceed the guaranteed rate for the priority group. (You cannot guarantee a minimum bandwidth for the queues that is greater than the minimum bandwidth guaranteed for the entire set of queues.)

---

**Solution** When you calculate the bandwidth requirements for queues and priority groups on which you expect a significant amount of traffic with small packet sizes, consider the transmit

rate and the guaranteed rate as the minimum bandwidth for the data only. Add sufficient bandwidth to your calculations to account for the preamble and IFG so that the port bandwidth is sufficient to handle the combined minimum data rate and the preamble and IFG.

If the minimum bandwidth measured at the egress port exceeds the amount of bandwidth that you want to allocate to a queue or to a priority group, reduce the transmit rate for that queue and reduce the guaranteed rate of the priority group that contains the queue.

## Troubleshooting Egress Queue Bandwidth Impacted by Congestion

**Problem** **Description:** Congestion on an egress port causes egress queues to receive less bandwidth than expected. Egress port congestion can impact the amount of bandwidth allocated to queues on the congested port and, in some cases, on ports that are not congested.

**Cause** Egress queue congestion can cause the ingress port buffer to fill above a certain threshold and affect the flow to the queues on the egress port. One queue receives its configured bandwidth, but the other queues on the egress port are affected and do not receive their configured share of bandwidth.

**Solution** The solution is to configure a drop profile to apply weighted random early detection (WRED) to the queue or queues on the congested ports.

Configure a drop profile on the queue that is receiving its configured bandwidth. This queue is preventing the other queues from receiving their expected bandwidth. The drop profile prevents the queue from affecting the other queues on the port.

To configure a WRED profile using the CLI:

- Name the drop profile and set the drop start point, drop end point, minimum drop rate, and maximum drop rate for the drop profile:

```
[edit class-of-service]
user@switch# set drop-profile drop-profile-name interpolate fill-level percentage fill-level
percentage drop-probability 0 drop-probability percentage
```

## Troubleshooting an Unexpected Rewrite Value

**Problem**    **Description:** Traffic from one or more forwarding classes on an egress port is assigned an unexpected rewrite value.

**NOTE:** For packets that carry both an inner VLAN tag and an outer VLAN tag, the rewrite rules rewrite only the outer VLAN tag.

**Cause**    If you configure a rewrite rule for a forwarding class on an egress port but you do not configure a rewrite rule for every forwarding class on that egress port, then the forwarding classes that do not have a configured rewrite rule are assigned random rewrite values.

For example:

1. Configure forwarding classes **fc1**, **fc2**, and **fc3**.
2. Configure rewrite rules for forwarding classes **fc1** and **fc2**, but not for forwarding class **fc3**.
3. Assign forwarding classes **fc1**, **fc2**, and **fc3** to a port.

When traffic for these forwarding classes flows through the port, traffic for forwarding classes **fc1** and **fc2** is rewritten correctly. However, traffic for forwarding class **fc3** is assigned a random rewrite value.

**Solution**    If any forwarding class on an egress port has a configured rewrite rule, then all forwarding classes on that egress port must have a configured rewrite rule. Configuring a rewrite rule for any forwarding class that is assigned a random rewrite value solves the problem.

**TIP:** If you want the forwarding class to use the same code point value assigned to it by the ingress classifier, specify that value as the rewrite rule value. For example, if a forwarding class has the IEEE 802.1 ingress classifier code point value 011, configure a rewrite rule for that forwarding class that uses the IEEE 802.1p code point value 011.

**NOTE:** There are no default rewrite rules. You can bind one rewrite rule for each type (DSCP and IEEE 802.1) to a given interface. A rewrite rule can contain multiple forwarding-class-to-rewrite-value associations.

1. Assign a rewrite value to a forwarding class. Add the new rewrite value to the same rewrite rule as the other forwarding classes on the port:  
  
[edit class-of-service rewrite-rules]

```
user@switch# set (dscp | ieee-802.1) rewrite-name forwarding-class class-name loss-priority
priority code-point (alias | bits)
```

For example, if the other forwarding classes on the port use rewrite values defined in the rewrite rule **custom-rw**, the forwarding class **fcoe** is being randomly rewritten, and you want to use IEEE 802.1 code point **011** for the **fcoe** forwarding class:

```
[edit class-of-service rewrite-rules]
user@switch# set ieee-802.1 custom-rw forwarding-class fcoe loss-priority high code-point
011
```

2. Enable the rewrite rule on an interface if it is not already enabled on the desired interface:

```
[edit]
user@switch# set class-of-service interfaces interface-name unit unit rewrite-rules (dscp |
ieee-802.1) rewrite-rule-name
```

For example, to enable the rewrite rule **custom-rw** on interface **xe-0/0/24.0**:

```
[edit]
user@switch# set class-of-service interfaces xe-0/0/24 unit 0 rewrite-rules ieee-802.1
custom-rw
```

## Troubleshooting a Port Reset on QFabric Systems When a Queue Stops Transmitting Traffic

**Problem**    **Description:** In QFabric systems, if any queue that contains outgoing packets does not transmit packets for 12 consecutive seconds, the port automatically resets.

**Cause**    Failure of a queue to transmit packets for 12 consecutive seconds may be due to:

- A strict-high priority queue consuming all of the port bandwidth
- Several queues consuming all of the port bandwidth
- Any queue or port receiving continuous priority-based flow control (PFC) or 802.3x Ethernet PAUSE messages (received PFC and PAUSE messages prevent a queue or a port, respectively, from transmitting packets because of network congestion)
- Other conditions that prevent a queue from obtaining port bandwidth for 12 consecutive seconds

**Solution**    If the cause is a strict-high priority queue or other queues consuming all of the port bandwidth, you can use rate shaping to configure a maximum rate for the queues that are using all of the port bandwidth and preventing other queues from obtaining bandwidth on the port. You configure a maximum rate by creating a scheduler, using a scheduler map to apply it to a forwarding class (which maps to an output queue), and applying the scheduler map to the port using a forwarding class set and a traffic control profile.

To configure rate shaping using the CLI:

1. Name the existing scheduler or create a scheduler and define the maximum bandwidth as a rate or as a percentage:

```
[edit class-of-service]
user@switch# set schedulers scheduler-name shaping-rate (rate | percent percentage)
```

2. Configure a scheduler map to associate the scheduler with the forwarding class (queue) that is consuming all of the port bandwidth:

```
[edit class-of-service]
user@switch# set scheduler-maps scheduler-map-name forwarding-class
forwarding-class-name scheduler scheduler-name
```

3. Associate the scheduler map with a traffic control profile:

```
[edit class-of-service]
user@switch# set traffic-control-profiles traffic-control-profile-name scheduler-map
scheduler-map-name
```

4. Associate the traffic control profile (and thus the scheduler map that contains the rate shaping queue scheduler) with a forwarding class set and apply them to the interface that is being reset:

```
[edit class-of-service]
user@switch# set interfaces interface-name forwarding-class-set fc-set-name
output-traffic-control-profile traffic-control-profile-name
```

For example, a strict-high priority queue is using all of the bandwidth on interface **shpnode:xe-0/0/10** and preventing other queues from transmitting for 12 consecutive seconds. You decide to set a maximum rate of 7 Gbps on the strict-high priority queue to ensure that at least 3 Gbps of the port bandwidth is available to service other queues.

[Table 584 on page 6561](#) shows the topology for this example:

**Table 644: Components of the Rate Shaping Troubleshooting Example**

| Component                                  | Settings                                                                                                                                                                                                                                                                                                                                          |

## Virtual Chassis Fabric

- [Troubleshooting Virtual Chassis Fabric on page 7067](#)

### Troubleshooting Virtual Chassis Fabric

This topic describes some of the following common troubleshooting issues for a Virtual Chassis Fabric (VCF):

- [Virtual Chassis Port Link Does Not Form on page 7068](#)
- [QFX5100 Leaf Device Assumes Routing Engine Role on page 7068](#)

### Virtual Chassis Port Link Does Not Form

---

**Problem**    **Description:** You connect a 40-Gbps QSFP+ port or a 10-Gbps SFP+ port between a leaf device and a spine device in an autoprovisioned or preprovisioned VCF. You expect the automatic Virtual Chassis port (VCP) conversion feature to convert the link into a VCP link, but the conversion doesn't occur.

The **show virtual-chassis vc-port** output indicates that the status of the interface is **Absent** or one or both of interfaces don't appear in the **show virtual-chassis vc-port** output.

**Cause**    If one end of a link is configured as a VCP and the other is not configured as a VCP, the VCP link does not form.

The automatic VCP conversion feature, therefore, does not work in the following situations:

- a 40-Gbps QSFP+ or 10-Gbps SFP+ interface on one end of the link is already configured as a VCP.

If you have previously removed a device from a VCF but haven't used the **request virtual-chassis vc-port delete** command to convert the interface that was connected to the removed device out of VCP mode, the interface is still configured as a VCP.

If you have removed a device from one Virtual Chassis or VCF and not changed the VCP port setting, the device being added to the VCF might also be configured as a VCP.

- a 40-Gbps QSFP+ port on an EX4300 switch, which is configured as a VCP by default, is interconnecting to a spine device.

**Solution**    Manually configure the interface that is not configured as a VCP into a VCP using the **request virtual-chassis vc-port set** command.

### QFX5100 Leaf Device Assumes Routing Engine Role

---

**Problem**    **Description:** A QFX5100 device configured as a leaf device assumes the Routing Engine role during VCF setup. The **show virtual-chassis** output confirms the role.

**Solution**    The device can assume the Routing Engine role for several minutes during setup before it receives the configuration from the master Routing Engine, but eventually returns to the linecard role with no user intervention.
