1. [Configuring SSH Known Hosts on page 1852](#)
2. [Configuring Support for SCP File Transfer on page 1852](#)
3. [Updating SSH Host Key Information on page 1853](#)

---

### Configuring SSH Known Hosts

To configure SSH known hosts, include the **host** statement, and specify hostname and host key options for trusted servers at the **[edit security ssh-known-hosts]** hierarchy level:

```
[edit security ssh-known-hosts]
host corporate-archive-server, ip-address {
    dsa-key key;
}
host archive-server-url {
    rsa-key key;
}
host server-with-ssh-version-1, ip-address {
    rsa1-key key;
}
```

Host keys are one of the following:

- **dsa-key**—Base64 encoded Digital Signature Algorithm (DSA) key.
- **rsa-key**—Base64 encoded RSA public key algorithm, which supports encryption and digital signatures.
- **rsa1-key**—Base64 encoded RSA public key algorithm, which supports encryption and digital signatures for SSH version 1 and SSH version 2.

---

### Configuring Support for SCP File Transfer

To configure a known host to support background SCP file transfers, include the **archive-sites** statement at the **[edit system archival configuration]** hierarchy level.

```
[edit system archival configuration]
archive-sites {
    scp://username<:password>@host<:port>/url-path;
}
```

**NOTE:** When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks (") and enclose the IPv6 host address in brackets ([ ]). For example, "scp://username<:password>@[host]<:port>/url-path";

Setting the **archive-sites** statement to point to an SCP URL triggers automatic host key retrieval. At this point, Junos OS connects to the SCP host to fetch the SSH public key, displays the host key message digest or fingerprint as output to the console, and terminates the connection to the server.

```
user@switch# set system archival configuration archive-sites "<scp-url-path>"
The authenticity of host <my-archive-server (<server-ip-address>)> can't be established.
RSA key fingerprint is <ascii-text key>. Are you sure you want to continue connecting
(yes/no)?
```

To verify that the host key is authentic, compare this fingerprint with a fingerprint that you obtain from the same host using a trusted source. If the fingerprints are identical, accept the host key by entering **yes** at the prompt. The host key information is then stored in the Routing Engine configuration and supports background data transfers using SCP.

### Updating SSH Host Key Information

Typically, SSH host key information is automatically retrieved when you set a URL attribute for SCP using the **archival configuration archive-sites** statement at the **[edit system]** hierarchy level. However, if you need to manually update the host key database, use one of the following methods.

1. [Retrieving Host Key Information Manually on page 1853](#)
2. [Importing Host Key Information from a File on page 1853](#)

#### *Retrieving Host Key Information Manually*

To manually retrieve SSH public host key information, use the **fetch-from-server** option with the **set security ssh-known-hosts** command. You must include a hostname attribute with the **set security ssh-known-hosts fetch-from-server** command to specify the host from which to retrieve the SSH public key.

```
user@switch# set security ssh-known-hosts fetch-from-server <hostname>
```

#### *Importing Host Key Information from a File*

To manually import SSH host key information from the known-hosts file located at **/var/tmp/known-hosts** on the server, include the **load-key-file** option with the **set security ssh-known-hosts** command. You must include the path to the **known-hosts** file with the **set security ssh-known-hosts load-key-file** command to specify the location from which to import host key information.

```
user@switch# set security ssh-known-hosts load-key-file /var/tmp/known-hosts
```

## Configuring SSH Service for Remote Access to the Router or Switch

To configure the router or switch to accept SSH as an access service, include the **ssh** statement at the **[edit system services]** hierarchy level:

```
[edit system services]
ssh {
  ciphers [ cipher-1 cipher-2 cipher-3 ...]
  client-alive-count-max number;
  client-alive-interval seconds;
  connection-limit limit;
  hostkey-algorithm <algorithm | no-algorithm>;
  key-exchange algorithm;
  macs algorithm;
  max-sessions-per-connection number;
  no-passwords;
  no-tcp-forwarding;
  protocol-version [v1 v2];
  rate-limit limit;
  root-login <allow | deny | deny-password>;
}
```

By default, the router or switch supports a limited number of simultaneous SSH sessions and connection attempts per minute. Use the following statements to change the defaults:

- **connection-limit *limit***—Maximum number of simultaneous connections per protocol (IPv4 and IPv6). The range is a value from 1 through 250. The default is 75. When you configure a connection limit, the limit is applicable to the number of SSH sessions per protocol (IPv4 and IPv6). For example, a connection limit of 10 allows 10 IPv6 SSH sessions and 10 IPv4 SSH sessions.
- **max-sessions-per-connection *number***—Include this statement to specify the maximum number of SSH sessions allowed per single SSH connection. This allows you to limit the number of cloned sessions tunneled within a single SSH connection. The default value is 10.
- **rate-limit *limit***—Maximum number of connection attempts accepted per minute (a value from 1 through 250). The default is 150. When you configure a rate limit, the limit is applicable to the number of connection attempts per protocol (IPv4 and IPv6). For example, a rate limit of 10 allows 10 IPv6 SSH session connection attempts per minute and 10 IPv4 SSH session connection attempts per minute.

By default, a user can create an SSH tunnel over a CLI session to a router running Junos OS via SSH. This type of tunnel could be used to forward TCP traffic, bypassing any firewall filters or ACLs, allowing access to resources beyond the router. Use the **no-tcp-forwarding** option to prevent a user from creating an SSH tunnel to a router via SSH.

For information about other configuration settings, see the following topics:

- [Configuring the Root Login Through SSH on page 1855](#)
- [Configuring the SSH Protocol Version on page 1855](#)
- [Configuring the Client Alive Mechanism on page 1855](#)

### Configuring the Root Login Through SSH

By default, users are allowed to log in to the router or switch as **root** through SSH. To control user access through SSH, include the **root-login** statement at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
root-login (allow | deny | deny-password);
```

**allow**—Allows users to log in to the router or switch as root through SSH. The default is **allow**.

**deny**—Disables users from logging in to the router or switch as root through SSH.

**deny-password**—Allows users to log in to the router or switch as root through SSH when the authentication method (for example, RSA) does not require a password.

### Configuring the SSH Protocol Version

By default, both version 1 and version 2 of the SSH protocol are enabled. To configure the router or switch to use only version 1 of the SSH protocol, include the **protocol-version** statement and specify **v1** at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
protocol-version [ v1 ];
```

To configure the router or switch to use only version 2 of the SSH protocol, include the **protocol-version** statement and specify **v2** at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
protocol-version [ v2 ];
```

To explicitly configure the router or switch to use version 1 and 2 of the SSH protocol, include the **protocol-version** statement and specify **v1** and **v2** at the **[edit system services ssh]** hierarchy level:

```
[edit system services ssh]
protocol-version [ v1 v2 ];
```

For J Series Services Routers, the export license software supports SSH version 1 only.

### Configuring the Client Alive Mechanism

The client alive mechanism is valuable when the client or server depends on knowing when a connection has become inactive. It differs from the standard keepalive mechanism because the client alive messages are sent through the encrypted channel. The client alive mechanism is not enabled at default. To enable it, configure the **client-alive-count-max** and the **client-alive-interval**. This option applies to SSH protocol version 2 only.

In the following example, unresponsive SSH clients will be disconnected after approximately 100 seconds (20 x 5).

```
[edit system services ssh]
```

```
client-alive-count-max 5;  
client-alive-interval 20;
```

## Configuring TACACS+ Authentication (QFX Series)

TACACS+ authentication is a method of authenticating users who attempt to access the router or switch. Tasks to configure TACACS+ configuration are:

- [Configuring TACACS+ Server Details on page 1856](#)
- [Specifying a Source Address for the Junos OS to Access External TACACS+ Servers on page 1857](#)
- [Configuring the Same Authentication Service for Multiple TACACS+ Servers on page 1857](#)
- [Configuring Juniper Networks Vendor-Specific TACACS+ Attributes on page 1858](#)

---

### Configuring TACACS+ Server Details

To use TACACS+ authentication on the router or switch, configure information about one or more TACACS+ servers on the network by including the **tacplus-server** statement at the **[edit system]** hierarchy level:

```
[edit system]  
tacplus-server server-address {  
  port port-number;  
  secret password;  
  single-connection;  
  timeout seconds;  
}
```

**server-address** is the address of the TACACS+ server.

**port-number** is the TACACS+ server port number.

You must specify a secret (password) by using the **secret** statement. The local router or switch passes the **secret** to the TACACS+ client. If the password included spaces, enclose the password in quotation marks. The secret used by the local router or switch must match that used by the server.

Optionally, you can specify the length of time that the local router or switch waits to receive a response from a TACACS+ server by including the **timeout** statement. By default, the router or switch waits 3 seconds. You can configure this to be a value in the range from 1 through 90 seconds.

Optionally, you can use the **single-connection** statement to have the software maintain one open Transmission Control Protocol (TCP) connection to the server for multiple requests, rather than opening a connection for each connection attempt.

**NOTE:** Early versions of the TACACS+ server do not support the **single-connection** option. If you specify this option and the server does not support it, Junos OS will be unable to communicate with that TACACS+ server.

---

To configure multiple TACACS+ servers, include multiple **tacplus-server** statements.

On a TX Matrix router, TACACS+ accounting should be configured only under the groups **re0** and **re1**.

**NOTE:** Accounting should not be configured at the **[edit system]** hierarchy level; on a TX Matrix router, control is done under the switch-card chassis only.

To configure a set of users that share a single account for authorization purposes, you create a template user. To do this, include the **user** statement at the **[edit system login]** hierarchy level.

### Specifying a Source Address for the Junos OS to Access External TACACS+ Servers

You can specify which source address Junos OS uses when accessing your network to contact an external TACACS+ server for authentication. You can also specify which source address Junos OS uses when contacting a TACACS+ server for sending accounting information.

To specify a source address for a TACACS+ server for authentication, include the **source-address** statement at the **[edit system tacplus-server server-address]** hierarchy level:

```
[edit system tacplus-server server-address]
source-address source-address;
```

**source-address** is a valid IP address configured on one of the router or switch interfaces.

To specify a source address for a TACACS+ server for system accounting, include the **source-address** statement at the **[edit system accounting destination tacplus server server-address]** hierarchy level:

```
[edit system accounting destination tacplus server server-address]
source-address source-address;
```

**source-address** is a valid IP address configured on one of the router or switch interfaces.

### Configuring the Same Authentication Service for Multiple TACACS+ Servers

To configure the same authentication service for multiple TACACS+ servers, include statements at the **[edit system tacplus-server]** and **[edit system tacplus-options]** hierarchy levels. For information about how to configure a TACACS+ server at the **[edit system tacplus-server]** hierarchy level.

To assign the same authentication service to multiple TACACS+ servers, include the **service-name** statement at the **[edit system tacplus-options]** hierarchy level:

```
[edit system tacplus-options]
service-name service-name;
```

**service-name** is the name of the authentication service. By default, the service name is set to **junos-exec**.

The following example shows how to configure the same authentication service for multiple TACACS+ servers:

```
[edit system]
tacplus-server {
  10.2.2.2 secret "$9$2dgoJGDiqP5ZG9A"; ## SECRET-DATA
  10.3.3.3 secret "$9$2dgoJGDiqP5ZG9A"; ## SECRET-DATA
}
tacplus-options {
  service-name bob;
}
```

### Configuring Juniper Networks Vendor-Specific TACACS+ Attributes

---

The Juniper Networks vendor-specific TACACS+ attributes enable you to configure access privileges for users on a TACACS+ server. They are specified in the TACACS+ server configuration file on a per-user basis. Junos OS retrieves these attributes through an authorization request of the TACACS+ server after authenticating a user. You do not need to configure these attributes to run Junos OS with TACACS+.

To specify these attributes, include a **service** statement of the following form in the TACACS+ server configuration file:

```
service = junos-exec {
  local-user-name = <username-local-to-router>
  allow-commands = "<allow-commands-regex>"
  allow-configuration = "<allow-configuration-regex>"
  deny-commands = "<deny-commands-regex>"
  deny-configuration = "<deny-configuration-regex>"
}
```

This **service** statement can appear in a **user** or **group** statement.

#### Related Documentation

- [Using Regular Expressions on a RADIUS or TACACS+ Server to Allow or Deny Access to Commands on page 1867](#)
- [Example: Configuring System Authentication for RADIUS, TACACS+, and Password Authentication on page 1880](#)
- [Juniper Networks Vendor-Specific TACACS+ Attributes on page 1815](#)
- [Overview of Template Accounts for RADIUS and TACACS+ Authentication on page 1809](#)
- [Junos OS User Authentication Methods on page 1825](#)

### Configuring TACACS+ System Accounting

You can use TACACS+ to track and log software logins, configuration changes, and interactive commands. To audit these events, include the following statements at the **[edit system accounting]** hierarchy level:

```
[edit system accounting]
events [ events ];
destination {
  tacplus {
    server {
```

```

server-address {
  port port-number;
  secret password;
  single-connection;
  timeout seconds;
}
}
}

```

Tasks for configuring TACACS+ system accounting are:

1. [Specifying TACACS+ Auditing and Accounting Events on page 1859](#)
2. [Configuring TACACS+ Server Accounting on page 1859](#)

### Specifying TACACS+ Auditing and Accounting Events

To specify the events you want to audit when using a TACACS+ server for authentication, include the **events** statement at the **[edit system accounting]** hierarchy level:

```

[edit system accounting]
events [ events ];

```

**events** is one or more of the following:

- **login**—Audit logins
- **change-log**—Audit configuration changes
- **interactive-commands**—Audit interactive commands (any command-line input)

### Configuring TACACS+ Server Accounting

To configure TACACS+ server accounting, include the **server** statement at the **[edit system accounting destination tacplus]** hierarchy level:

```

[edit system accounting destination tacplus]
server {
  server-address {
    port port-number;
    secret password;
    single-connection;
    timeout seconds;
  }
}

```

**server-address** specifies the address of the TACACS+ server. To configure multiple TACACS+ servers, include multiple **server** statements.

**NOTE:** If no TACACS+ servers are configured at the **[edit system accounting destination tacplus]** statement hierarchy level, Junos OS uses the TACACS+ servers configured at the **[edit system tacplus-server]** hierarchy level.

**port-number** specifies the TACACS+ server port number.

You must specify a secret (password) by using the **secret** statement. The local router or switch passes the **secret** to the TACACS+ client. If the password contains spaces, enclose the entire password in quotation marks (" "). The password used by the local router or switch must match that used by the server.

Optionally, you can specify the length of time that the local router or switch waits to receive a response from a TACACS+ server by including the **timeout** statement. By default, the router or switch waits 3 seconds. You can configure this to be a value in the range from 1 through 90 seconds.

Optionally, you can maintain one open TCP connection to the server for multiple requests, rather than opening a connection for each connection attempt, by including the **single-connection** statement.

To ensure that start and stop requests for accounting of login events are correctly logged in the Accounting file instead of the Administration log file on a TACACS+ server, include either the **no-cmd-attribute-value** statement or the **exclude-cmd-attribute** at the **[edit system tacplus-options]** hierarchy level.

If you use the **no-cmd-attribute-value** statement, the value of the **cmd** attribute is set to a null string in the start and stop requests. If you use the **exclude-cmd-attribute** statement, the **cmd** attribute is totally excluded from the start and stop requests. Both statements support the correct logging of accounting requests in the Accounting file, instead of the Administration file.

```
[edit system tacplus-options]
(no-cmd-attribute-value | exclude-cmd-attribute);
```

**Related  
Documentation**

- [Configuring TACACS+ Authentication \(QFX Series\) on page 1856](#)

## Defining Junos OS Login Classes

To define a login class and its access privileges, include the **class** statement at the **[edit system login]** hierarchy level:

```
[edit system login]
class class-name {
  allow-commands "regular-expression";
  allow-configuration "regular-expression";
  deny-commands "regular-expression";
  deny-configuration "regular-expression";
  idle-timeout minutes;
  permissions [ permissions ];
}
```

**Related  
Documentation**

- [Junos OS Login Classes Overview on page 1828](#)

- [Example: Creating Login Classes with Specific Privileges on page 1882](#)
- [Configuring the Junos OS to Display a System Login Announcement on page 165](#)

## Limiting the Number of User Login Attempts for SSH and Telnet Sessions

You can limit the number of times a user can attempt to enter a password while logging in through SSH or Telnet. The connection is terminated if a user fails to log in after the number of attempts specified. You can also specify a delay, in seconds, before a user can try to enter a password after a failed attempt. In addition, you can specify the threshold for the number of failed attempts before the user experiences a delay in being able to enter a password again.

To specify the number of times a user can attempt to enter a password while logging in, include the **retry-options** statement at the **[edit system login]** hierarchy level:

```
[edit system login]
retry-options {
  tries-before-disconnect number;
  backoff-threshold number;
  backoff-factor seconds;
  maximum-time seconds
  minimum-time seconds;
}
```

You can configure the following options:

- **tries-before-disconnect**—Number of times a user can attempt to enter a password when logging in. The connection closes if a user fails to log in after the number specified. The range is from 1 through 10, and the default is 10.
- **backoff-threshold**—Threshold for the number of failed login attempts before the user experiences a delay in being able to enter a password again. Use the **backoff-factor** option to specify the length of the delay in seconds. The range is from 1 through 3, and the default is 2.
- **backoff-factor**—Length of time, in seconds, before a user can attempt to log in after a failed attempt. The delay increases by the value specified for each subsequent attempt after the threshold. The range is from 5 through 10, and the default is 5 seconds.
- **maximum-time *seconds***—Maximum length of time, in seconds, that the connection remains open for the user to enter a username and password to log in. If the user remains idle and does not enter a username and password within the **maximum-time** value, the connection is closed. The range is from 20 through 300 seconds, and the default is 120 seconds.
- **minimum-time**—Minimum length of time, in seconds, that a connection remains open while a user is attempting to enter a correct password. The range is from 20 through 60, and the default is 40.

### Related Documentation

## Recovering the Root Password

If you forget the root password, you can use the password recovery procedure to reset the root password.

**NOTE:** The root password cannot be recovered on a QFabric system.

**NOTE:** You need console access to the switch to recover the root password.

To recover the root password:

1. Power off the switch by switching off the AC power outlet of the device or, if necessary, by pulling the power cords out of the device's power supplies.
2. Turn off the power to the management device, such as a PC or laptop computer, that you want to use to access the CLI.
3. Plug one end of the Ethernet rollover cable supplied with the device into the RJ-45-to-DB-9 serial port adapter supplied with the device.
4. Plug the RJ-45-to-DB-9 serial port adapter into the serial port on the management device.
5. Connect the other end of the Ethernet rollover cable to the console port on the device.
6. Turn on the power to the management device.
7. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate **COM** port to use (for example, **COM1**).
8. Configure the port settings as follows:
  - Bits per second: 9600
  - Data bits: 8
  - Parity: None
  - Stop bits: 1
  - Flow control: None
9. Power on the device by (if necessary) plugging the power cords into the device's power supply, or turning on the power to the device by switching on the AC power outlet the device is plugged into.

The terminal emulation screen on your management device displays the device's boot sequence.

10. When the following prompt appears, press the Spacebar to access the device's bootstrap loader command prompt:

Hit [Enter] to boot immediately, or space bar for command prompt.  
Booting [kernel] in 9 seconds...

11. At the following prompt, enter **boot -s** to start up the system in single-user mode.

```
ok boot -s
```

12. At the following prompt, enter **recovery** to start the root password recovery procedure.

```
Enter full pathname of shell or 'recovery' for root password recovery or RETURN
for /bin/sh: recovery
```

13. Enter configuration mode in the CLI.

14. Set the root password. For example:

```
user@switch# set system root-authentication plain-text-password
```

15. At the following prompt, enter the new root password. For example:

```
New password: juniper1
Retype new password:
```

16. At the second prompt, reenter the new root password.

17. After you have finished configuring the password, commit the configuration.

```
root@host# commit
commit complete
```

18. Exit configuration mode in the CLI.

19. Exit operational mode in the CLI.

20. At the prompt, enter **y** to reboot the device.

```
Reboot the system? [y/n] y
```

**Related Documentation**

- [Configuring the Root Password on page 1846](#)

## Specifying Access Privileges for Junos OS Configuration Mode Hierarchies

You can specify extended regular expressions with the **allow-configuration** and **deny-configuration** statements to define user access privileges to parts of the configuration hierarchy. Doing so overrides login class permission bits set for a user. You can also use wildcards to restrict access. When you define access privileges to parts of the configuration hierarchy, do the following tasks:

- Specify the full paths in the extended regular expressions with the **allow-configuration** and **deny-configuration** statements.
- Put parentheses around an extended regular expression that connects two or more expressions with the pipe | symbol. For example:

```
[edit system login class class-name]
user@switch# set deny-configuration "(system login class) | (system services)"
```

**NOTE:** Each expression separated by a pipe (|) symbol must be a complete standalone expression, and must be enclosed in parentheses ( ). Do not use spaces between regular expressions separated with parentheses and connected with the pipe (|) symbol. You cannot define access to keywords such as **set**, **edit**, or **activate**.

When you explicitly provide access to configuration mode hierarchies or regular expressions using the **allow-configuration** statement, you add to the regular permissions set with the **permissions** statement. If you explicitly deny access to configuration mode hierarchies or regular expressions using the **deny-configuration** statement, you remove permissions for the specified configuration mode hierarchy from the default permissions provided by the **permissions** statement.

To explicitly provide access to an individual configuration mode hierarchy that would otherwise be denied, include the **allow-configuration** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]  
  allow-configuration "regular-expression";
```

To explicitly deny access to an individual configuration hierarchy that would otherwise be supported, include the **deny-configuration** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]  
  deny-configuration "regular-expression";
```

You can include one **deny-configuration** and one **allow-configuration** statement in each login class.

If you allow and deny the same set of configuration hierarchy levels, regular expressions, or commands, the **allow-configuration** statement permissions take precedence over the permissions specified by the **deny-configuration** statement. For example, if you include **allow-configuration "system services"** and **deny-configuration "system services"**, the login class user can continue to edit the configuration or issue commands at the **edit system services** hierarchy level.

#### Related Documentation

- [Defining Access Privileges Using allow/deny-configuration Statements on page 1891](#)
- [Configuring Access Privilege Levels on page 1836](#)

## Specifying Access Privileges for Junos OS Operational Mode Commands

You can specify extended regular expressions by using the **allow-commands** and **deny-commands** statements to define a user's access privileges to individual operational mode commands. Doing so takes precedence over a login class permissions bit set for a user. You can include one **deny-commands** and one **allow-commands** statement in each login class.

To explicitly provide use of an individual operational mode command that would otherwise be denied, include the **allow-commands** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]  
  allow-commands "regular-expression";
```

To explicitly deny access to an individual operational mode command that would otherwise be supported, include the **deny-commands** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]
deny-commands "regular-expression";
```

If the regular expression contains any spaces, operators, or wildcard characters, enclose the expression in quotation marks. Regular expressions are not case-sensitive.

```
allow-commands "show interfaces";
```

**NOTE:** Modifiers are not supported within the regular expression string to be matched. If a modifier is used, then nothing is matched.

For example, the deny command `set protocols` does not match anything, whereas `protocols` matches `protocols`.

Explicitly providing access to operational mode commands using the **allow-commands** statement adds to the regular permissions set using the **permissions** statement. Likewise, explicitly denying access to operational mode commands using the **deny-commands** statement removes permissions for the specified commands from the default permissions provided by the **permissions** statement.

For example, if a login class has the permission **view** and the **allow-commands** statement includes the **request system software add** command, the specified login class user can install software, in addition to the permissions specified by the **view** permissions flag. Likewise, if a login class has the permission **all** and the **deny-commands** statement includes the **request system software add** command, the specified login class user can perform all operations allowed by the **all** permissions flag, except installing software using the **request system software add** command.

If you allow and deny the same commands, the **allow-commands** permissions take precedence over the permissions specified by **deny-commands**. For example, if you include **allow-commands "request system software add"** and **deny-commands "request system software add"**, the login class user is allowed to install software using the **request system software add** command.

If you specify a regular expression for **allow-commands** and **deny-commands** with two different variants of a command, the longest match is always executed.

For example, if you specify a regular expression for **allow-commands** with the **commit-synchronize** command and a regular expression for **deny-commands** with the **commit** command, users assigned to such a login class would be able to issue the **commit synchronize** command, but not the **commit** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize**, and it is specified for **allow-commands**.

Likewise, if you specify a regular expression for **allow-commands** with the **commit** command and a regular expression for **deny-commands** with the **commit-synchronize** command, users assigned to such a login class would be able to issue the **commit** command, but not the **commit-synchronize** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize**, and it is specified for **deny-commands**.

Anchors are required when specifying complex regular expressions with **allow-commands** or **deny-commands** statements. For example, when specifying multiple commands using the pipe (|) symbol for **allow-commands**, the following syntax is incorrect:

**allow-commands = "(monitor.\*)"|(ping.\*)"|(show.\*)"|(exit)"**. Instead, you must specify the expression using the following syntax: **allow-commands = "(^monitor) | (^ping) | (^show) | (^exit)"** OR **allow-commands = "^ (monitor | ping | show | exit)"**

**Related  
Documentation**

- [Example: Configuring Access Privileges for Operational Mode Commands on page 1873](#)
- [Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands on page 1831](#)
- *allow-commands*
- *deny-commands*

## Using Junos OS to Configure Logical System Administrators

Using Junos OS, you can partition a single router or switch into multiple logical devices that perform independent routing or switching tasks. When creating logical systems, you must configure logical system administrators and interfaces, assign logical interfaces to logical systems, and configure various other logical system statements.

The master administrator can assign one or more logical system administrators to each logical system. Once assigned to a logical system, administrators are restricted to viewing only configurations of the logical system to which they are assigned and accessing only the operational commands that apply to that particular logical system. This restriction means that these administrators cannot access global configuration statements, and all command output is restricted to the logical system to which the administrators are assigned.

To configure logical system administrators, include the **logical-system *logical-system-name*** statement at the **[edit system login class *class-name*]** hierarchy level and apply the class to the user. For example:

```
[edit]
system {
  login {
    class admin1 {
      permissions all;
      logical-system logical-system-LS1;
    }
    class admin2 {
      permissions view; # Gives users assigned to class admin2 the ability to view
                        # but not to change the configuration.
      logical-system logical-system-LS2;
    }
    user user1 {
      class admin1;
    }
    user user2 {
      class admin2;
    }
  }
}
```

```
}
}
```

Fully implementing logical systems requires that you also configure any protocols, routing statements, switching statements, and policy statements for the logical system.

## Using Regular Expressions on a RADIUS or TACACS+ Server to Allow or Deny Access to Commands

Use regular expressions to specify which operational or configuration mode commands are allowed or denied when you use a RADIUS or TACACS+ server for user authentication. You can specify the regular expressions using the appropriate Juniper Networks vendor-specific RADIUS or TACACS+ attributes in your authentication server configuration.

You can specify **allow-configuration**, **deny-configuration**, **allow-commands**, or **deny-commands** in a single extended regular expression, enclosing multiple commands in parentheses and separating them using the pipe symbol. For example, you can specify multiple **allow-commands** parameters using: **allow-commands= (cmd1 | cmd2 | cmdn)**. You can specify **user-permissions** as a list of comma-separated values, and not as a regular expression.

On a RADIUS or TACACS+ server, you can also use a simplified version for regular expressions where you specify each individual expression on a separate line. The simplified version is valid for **allow-commands**, **deny-commands**, **allow-configuration**, **deny-configuration**, and **permissions** vendor-specific attributes.

For a RADIUS server, specify the individual regular expressions using the following syntax:

```
Juniper-Allow-Commands+= "cmd1"
Juniper-Allow-Commands+= "cmd2"
Juniper-Allow-Commands+= "cmdn"
Juniper-Deny-Commands+= "cmd1"
Juniper-Deny-Commands+= "cmd2"
Juniper-Deny-Commands+= "cmdn"
Juniper-Allow-Configuration+= "regex1"
Juniper-Allow-Configuration+= "regex2"
Juniper-Allow-Configuration+= "regext"
Juniper-Deny-Configuration+= "regex1"
Juniper-Deny-Configuration+= "regex2"
Juniper-Deny-Configuration+= "regext"
Juniper-User-Permissions+= "permission-flag1"
Juniper-User-Permissions+= "permission-flag2"
Juniper-User-Permissions+= "permission-flagn"
```

For TACACS+ server, specify the individual regular expressions using the following syntax:

```
allow-commands1= "cmd1"
allow-commands2= "cmd2"
allow-commandsn= "cmdn"
deny-commands1= "cmd1"
```

```
deny-commands2="cmd2"  
deny-commandsn="cmdn"  
allow-configuration1="regex1"  
allow-configuration2="regex2"  
allow-configurationn="regexn"  
deny-configuration1="regex1"  
deny-configuration2="regex2"  
deny-configurationn="regexn"  
user-permissions1="permission-flag1"  
user-permissions2="permission-flag2"  
user-permissionsn="permission-flagn "
```

**NOTE:**

- Numeric values 1 to *n* in the syntax (for TACACS+ server) must be unique but need not be sequential. For example, the following syntax is valid:

```
allow-commands1="cmd1"  
allow-commands3="cmd3"  
allow-commands2="cmd2"  
deny-commands3="cmd3"  
deny-commands2="cmd2"  
deny-commands1="cmd1"
```

- The limit on the number of lines of individual regular expressions is imposed by the TACACS+ or RADIUS server.
- When you issue the `show cli authorization` command, the command output displays the regular expression in a single line, even if you specify each individual expression on a separate line.

---

For more information about Juniper Networks vendor-specific RADIUS and TACACS+ attributes, see [“Juniper Networks Vendor-Specific RADIUS Attributes” on page 1812](#) and [“Juniper Networks Vendor-Specific TACACS+ Attributes” on page 1815](#).

**NOTE:** When RADIUS or TACACS+ authentication is configured for a router, regular expressions configured on the RADIUS or TACACS+ server merge with any regular expressions configured on the local router at the `[edit system login class]` hierarchy level using the `allow-commands`, `deny-commands`, `allow-configuration`, `deny-configuration`, or `permissions` statements. If the final expression has a syntax error, the overall result is an invalid regular expression.

## VSA Match Conditions and Actions

Devices support the configuration of RADIUS server attributes specific to Juniper Networks. These attributes are known as vendor-specific attributes (VSAs). They are configured on RADIUS servers and work in combination with 802.1X authentication. Using VSAs, you

can apply port firewall filter attributes as a subset of match conditions and actions sent from the RADIUS server to the switch as a result of successful 802.1X authentication.

Each term in a VSA configured through the RADIUS server consists of *match conditions* and an *action*. Match conditions are the values or fields that the packet must contain. You can define single, multiple, or no match conditions. If no match conditions are specified for the term, the packet is accepted by default. The action is the action that the switch takes if a packet matches the match conditions for the specific term. Allowed actions are to accept a packet or to discard a packet.

The following guidelines apply when you specify match conditions and actions for VSAs:

- Both **match** and **action** statements are mandatory.
- Any or all options (separated by commas) may be included in each **match** and **action** statement.
- Fields separated by commas will be ANDed if they are of a different type. The same types cannot be repeated.
- For OR cases (for example, match 10.1.1.0/24 OR 11.1.1.0/24), apply multiple VSAs to the 802.1X supplicant.
- In order for the **forwarding-class** option to be applied, the forwarding class must be configured on the switch. If it is not configured on the switch, this option is ignored.

Table 135 on page 1869 describes the match conditions you can specify when configuring a VSA using the **match** command on the RADIUS server. The string that defines a match condition is called a *match statement*.

**Table 135: Match Conditions**

| Option                                    | Description                                                                                                                                                                                                                                                                                                                                |
|-------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>destination-mac</b> <i>mac-address</i> | Destination media access control (MAC) address of the packet.                                                                                                                                                                                                                                                                              |
| <b>source-vlan</b> <i>source-vlan</i>     | Name of the source VLAN.                                                                                                                                                                                                                                                                                                                   |
| <b>source-dot1q-tag</b> <i>tag</i>        | Tag value in the 802.1Q header, in the range 0 through 4095.                                                                                                                                                                                                                                                                               |
| <b>destination-ip</b> <i>ip-address</i>   | Address of the final destination node.                                                                                                                                                                                                                                                                                                     |
| <b>ip-protocol</b> <i>protocol-id</i>     | IPv4 protocol value. In place of the numeric value, you can specify one of the following text synonyms:<br><br><b>ah</b> , <b>egp</b> (8), <b>esp</b> (50), <b>gre</b> (47), <b>icmp</b> (1), <b>igmp</b> (2), <b>ipip</b> (4), <b>ipv6</b> (41), <b>ospf</b> (89), <b>pim</b> (103), <b>rsvp</b> (46), <b>tcp</b> (6), or <b>udp</b> (17) |
| <b>source-port</b> <i>port</i>            | TCP or User Datagram Protocol (UDP) source port field. Normally, you specify this match statement in conjunction with the <b>ip-protocol</b> match statement to determine which protocol is being used on the port. In place of the numeric field, you can specify one of the text options listed under <b>destination-port</b> .          |

Table 135: Match Conditions (*continued*)

| Option                              | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|-------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>destination-port</b> <i>port</i> | <p>TCP or UDP destination port field. Normally, you specify this match in conjunction with the <b>ip-protocol</b> match statement to determine which protocol is being used on the port. In place of the numeric value, you can specify one of the following text synonyms (the port numbers are also listed):</p> <p><b>afs</b> (1483), <b>bgp</b> (179), <b>biff</b> (512), <b>bootpc</b> (68), <b>bootps</b> (67), <b>cvspserver</b> (2401), <b>cmd</b> (514), <b>dhcp</b> (67), <b>domain</b> (53), <b>eklogin</b> (2105), <b>ekshell</b> (2106), <b>exec</b> (512), <b>finger</b> (79), <b>ftp</b> (21), <b>ftp-data</b> (20), <b>http</b> (80), <b>https</b> (443), <b>ident</b> (113), <b>imap</b> (143), <b>kerberos-sec</b> (88), <b>klogin</b> (543), <b>kpasswd</b> (761), <b>krb-prop</b> (754), <b>krbupdate</b> (760), <b>kshell</b> (544), <b>ldap</b> (389), <b>login</b> (513), <b>mobileip-agent</b> (434), <b>mobillip-mn</b> (435), <b>msdp</b> (639), <b>netbios-dgm</b> (138), <b>netbios-ns</b> (137), <b>netbios-ssn</b> (139), <b>nfsd</b> (2049), <b>nntp</b> (119), <b>ntalk</b> (518), <b>ntp</b> (123), <b>pop3</b> (110), <b>pptp</b> (1723), <b>printer</b> (515), <b>radacct</b> (1813), <b>radius</b> (1812), <b>rip</b> (520), <b>rkinit</b> (2108), <b>smtp</b> (25), <b>snmp</b> (161), <b>snmptrap</b> (162), <b>snpp</b> (444), <b>socks</b> (1080), <b>ssh</b> (22), <b>sunrpc</b> (111), <b>syslog</b> (514), <b>telnet</b> (23), <b>tacacs-ds</b> (65), <b>talk</b> (517), <b>tftp</b> (69), <b>timed</b> (525), <b>who</b> (513), <b>xmcp</b> (177), <b>zephyr-clt</b> (2103), <b>zephyr-hm</b> (2104)</p> |

When you define one or more terms that specify the filtering criteria, you also define the action to take if the packet matches all criteria. [Table 136 on page 1870](#) shows the actions that you can specify in a term.

Table 136: Actions for VSAs

| Option                                                            | Description                                                                                                                                                                                                                                                            |
|-------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ( <b>allow</b>   <b>deny</b> )                                    | Accept a packet or discard a packet silently without sending an Internet Control Message Protocol (ICMP) message.                                                                                                                                                      |
| <b>forwarding-class</b> <i>class-of-service</i>                   | <p>(Optional) Classify the packet in one of the following forwarding classes:</p> <ul style="list-style-type: none"> <li>• <b>assured-forwarding</b></li> <li>• <b>best-effort</b></li> <li>• <b>expedited-forwarding</b></li> <li>• <b>network-control</b></li> </ul> |
| <b>loss-priority</b> ( <b>low</b>   <b>medium</b>   <b>high</b> ) | (Optional) Set the packet loss priority (PLP) to <b>low</b> , <b>medium</b> , or <b>high</b> . Specify both the forwarding class and loss priority.                                                                                                                    |

## Example: Changing the Requirements for Junos OS Plain-Text Passwords

This example shows how to set various maximum and minimum requirements for plain-text passwords to increase password strength.

- [Requirements on page 1871](#)
- [Overview on page 1871](#)
- [Configuration on page 1871](#)

### Requirements

This example requires a device running Junos 12.2 or greater. The **minimum-length** and **maximum-length** password requirements statements are available in earlier releases, however, you must have Junos OS Release 12.2 or greater to configure **minimum-lower-cases**, **minimum-numeric**, **minimum-punctuations**, or **minimum-upper-cases**.

### Overview

You can use a variety of requirements to strengthen plain-text passwords for greater security. Junos OS provides a number of possible configurations at the **[edit system login password]** hierarchy level that allow you to require users to create plain-text passwords that conform to a particular set of requirements that may include such things as length, number of changes, type of characters, numbers, or letter case.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network

configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**set system login password minimum-length 12**

**set system login password maximum-length 22**

**set system login password minimum-numeric 1**

**set system login password minimum-upper-cases 1**

**set system login password minimum-lower-cases 1**

**set system login password minimum-punctuations 1**

### *Configuring Requirements for Plain-Text Passwords*

#### **Step-by-Step Procedure**

This example configures password requirements that require the user to create a password that has a minimum length of 12 characters, a maximum length of 22 characters, and that includes at least one lower-case letter, at least one upper-case letter, at least one punctuation character, and at least one numeric character.

1. Navigate to configuration mode in the [system login password] hierarchy level.  

```
user@host> edit
[edit]
user@host# edit system login password
```
2. Set a minimum length requirement of 12 characters and a maximum length requirement of 22 characters for user passwords.  

```
[edit system login password]
user@host# set minimum-length 12
[edit system login password]
user@host# set maximum-length 22
```
3. Require users to set a password that has at least one lower-case letter and at least one upper-case letter.  

```
[edit system login password]
user@host# set minimum-lower-cases 1
[edit system login password]
user@host# set minimum-upper-cases 1
```
4. Require users to set a password that has at least one punctuation-class character and at least one number.  

```
[edit system login password]
user@host# set minimum-punctuations 1
[edit system login password]
user@host# set minimum-numeric 1
```

### *Results*

From configuration mode, confirm your configuration by entering the show command at the edit system login password hierarchy level. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit system login password]
user@host# show
minimum-length 12;
maximum-length 22;
minimum-numeric 1;
minimum-upper-cases 1;
minimum-lower-cases 1;
```

- Related Documentation**
- [Special Requirements for Junos OS Plain-Text Passwords on page 1832](#)
  - [password \(Login\) on page 299](#)

### Example: Configuring Access Privilege Levels

Create two access privilege classes on the router or switch, one for configuring and viewing user accounts only and the second for configuring and viewing SNMP parameters only:

```
[edit]
system {
  login {
    class user-accounts {
      permissions [ configure admin admin-control ];
    }
    class network-mgmt {
      permissions [ configure snmp snmp-control ];
    }
  }
}
```

- Related Documentation**
- [Configuring Access Privilege Levels on page 1836](#)

### Example: Configuring Access Privileges for Operational Mode Commands

The following example shows how to configure access privileges for different login classes for individual operational mode commands:

```
[edit]
system {
  # This login class has operator privileges and the additional ability
  # to reboot the router.
  login {
    # This login class has operator privileges and the additional ability to reboot the
    # router or switch.
    class operator-and-boot {
      permissions [ clear network reset trace view ];
      allow-commands "request system reboot";
    }
    # This login class has operator privileges but can't use any commands beginning
    # with "set" .
    # This login class has operator privileges
    # but cannot use any commands beginning with "set"
    class operator-no-set {
      permissions [ clear network reset trace view ];
      deny-commands "^set";
    }
  }
}
```

```
}
# This login class has operator privileges and can install software but not view
# BGP information, and can issue the show route command, without specifying
# commands or arguments under it.
class operator-and-install-but-no-bgp {
  permissions [ clear network reset trace view ];
  allow-commands "(request system software add)|(show route$)";
  deny-commands "show bgp";
}
}
```

**Related Documentation** • [Specifying Access Privileges for Junos OS Operational Mode Commands on page 194](#)

## Example: Configuring a Plain-Text Password for Root Logins

This example shows how to configure the authentication methods for the root-level user, whose username is “root”.

- [Requirements on page 1874](#)
- [Overview on page 1874](#)
- [Configuration on page 1874](#)
- [Verification on page 1875](#)

### Requirements

---

No special configuration beyond device initialization is required before configuring this example.

Make sure you understand the requirements for a valid plain-text password. For Junos OS, the The default requirements for plain-text passwords are as follow:

- The password must be between 6 and 128 characters long.
- You can include most character classes in a password (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended.
- Valid passwords must contain at least one change of case or character class.

### Overview

---

Junos OS is preinstalled on the router. When the router is powered on, it is ready to be configured. Initially, you log in as the user “root” with no password. To set the root password, you have several options. This example shows you how to enter a plain-text password that Junos OS then encrypts for you.

### Configuration

---

#### CLI Quick Configuration

```
[edit system]
set root-authentication plain-text-password
New password: new-password
Retype new password: new-password
```

**Configuring [item]**

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the Junos OS CLI User Guide.

To configure a plain-text password:

1. Type the set command for plain-text password and press Enter.  

```
[edit]
user@host# set system root-authentication plain-text-password
New password:
```
2. Type the new password next to the **New password:** prompt and press Enter.  

```
user@host# new-password
Retype new password:
```
3. Retype the same password next to the next prompt and press Enter.

**Results**

From configuration mode, confirm your configuration by entering the **show** command. It should look something like this:

```
root-authentication {
  encrypted-password "$1$ASwBkGYd$YUcEwgd0IO4QkRzzlQdmT/"; ## SECRET-DATA
}
```

If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

After you have confirmed that the interfaces are configured, enter the **commit** command in configuration mode.

**Verification**

- [Verifying the Configuration of a Plain-Text Password for Root Logins on page 1875](#)

**Verifying the Configuration of a Plain-Text Password for Root Logins**

**Purpose** Verify the configuration of a plain-text password.

**Action** From operational mode, confirm your configuration by entering the **show configuration system** command.

```
user@host> show configuration system
root-authentication {
  encrypted-password "$1$ASwBkGYd$YUcEwgd0IO4QkRzzlQdmT/"; ## SECRET-DATA
}
```

**Meaning** If you use a clear-text password, Junos OS displays the password as an encrypted string so that users viewing the configuration cannot see it. As you enter the password in plain text, Junos OS encrypts it immediately. You do not have to configure Junos OS to encrypt

the password as in some other systems. Plain-text passwords are hidden and marked as ## SECRET-DATA in the configuration.

## Example: Configuring RADIUS Authentication

The Junos OS supports two protocols for central authentication of users on multiple routers: RADIUS and TACACS+. We recommend RADIUS because it is a multivendor IETF standard, and its features are more widely accepted than those of TACACS+ or other proprietary systems. In addition, we recommend using a one-time-password system for increased security, and all vendors of these systems support RADIUS.

The Junos OS uses one or more template accounts to perform user authentication. You create the template account or accounts, and then configure the user access to use that account. If the RADIUS server is unavailable, the fallback is for the login process to use the local account that set up on the router or switch.

The following example shows how to configure RADIUS authentication:

```
[edit]
system {
  authentication-order [ radius password ];
  root-authentication {
    encrypted-password "$9$aH1j8gqQ1gjyjjhgjgiiii"; # SECRET-DATA
  }
  name-server {
    10.1.1.1;
    10.1.1.2;
  }
}
```

The following example shows how to enable RADIUS authentication and define the shared secret between the client and the server. The secret enables the client and server to determine that they are talking to the trusted peer.

Define a timeout value for each server, so that if there is no response within the specified number of seconds, the router can try either the next server or the next authentication mechanism.

```
[edit]
system {
  radius-server {
    10.1.2.1 {
      secret "$9$aH1j8gqQ1sdjerrhser"; # SECRET-DATA
      timeout 5;
    }
    10.1.2.2 {
```

```

        secret "$9$aHlj8gqQlcsdoiuardwefoiud"; # SECRET-DATA
        timeout 5;
    }
}
}

```

**Related Documentation**

- *Configuring RADIUS Authentication*

## Example: Configuring RADIUS Authentication on a QFabric System

RADIUS authentication is a method of authenticating users who are attempting to access a network device. On a QFabric system, users are load balanced on each of the Director devices. Each Director device needs to be able to communicate with the RADIUS server. Packets sent to the RADIUS server originate from the Director device IP addresses.

The following example shows how to configure RADIUS authentication on the QFabric system:

Perform the following steps to configure RADIUS authentication on the QFabric system:

1. Configure the order in which the authentication methods are used.

For example:

```
user@switch # set system authentication-order [radius password]
```

In this example, RADIUS authentication is the first authentication method that Junos OS will use when a user logs into the system.

2. Configure the IP address of the RADIUS server and the secret password. The secret password on the switch must match the secret password on the RADIUS server.

For example:

```
user@switch # set system radius-server 172.28.36.108 secret testing123
```

3. Assign the login class and the template account for the user.

For example:

```
user@switch # set system login user remote class super-user
```

Here are the results of your configuration:

```

[edit]
system {
  authentication-order [ radius password ];
  login {
    user remote {
      class super-ruser;
    }
  }
}
radius-server {
  172.28.36.108 {
    secret test123
  }
}
}

```

### Example: Configuring RADIUS System Accounting

The following example shows three servers (10.5.5.5, 10.6.6.6, and 10.7.7.7) configured for RADIUS accounting.

```
system {
  accounting {
    events [ login change-log interactive-commands ];
    destination {
      radius {
        server {
          10.5.5.5 {
            accounting-port 3333;
            secret $9$dkafeqwrew;
            source-address 10.1.1.1;
            retry 3;
            timeout 3;
          }
          10.6.6.6 secret $9$fe3erqwrez;
          10.7.7.7 secret $9$f34929ftby;
        }
      }
    }
  }
}
```

- [Configuring RADIUS System Accounting on page 1841](#)

### Example: Configuring the Root Password

The following example shows how to configure the root password:

```
[edit]
user@switch# set system root-authentication encrypted-password
"$1$14c5.$sBopasddsdfs0"
[edit]
user@switch# show
system {
  root-authentication {
    encrypted-password "$1$14c5.$sBopasddsdfs0";
  }
}
```

- Related Documentation**
- [Configuring the Root Password on page 173](#)
  - [Example: Configuring a Plain-Text Password for Root Logins on page 206](#)
  - [Configuring the Root Password on page 1846](#)

## Example: Configuring SSH Authentication for Root Logins

The following example shows how to configure two public DSA keys for SSH authentication of root logins:

```
[edit system]
root-authentication {
  encrypted-password "$1$1wp5tqMX$uy/u5H7OdXTwfWTmeJWXe/";
  ## SECRET-DATA;
  ssh-dsa "2354 95 9304@boojum.per";
  ssh-dsa "0483 02 8362@ecbatana.per";
}
```

- Related Documentation**
- [Configuring the Root Password on page 173](#)
  - [Special Requirements for Junos OS Plain-Text Passwords on page 1832](#)

## Example: Configuring User Accounts

The following example shows how to create accounts for four router or switch users, and create an account for the template user **remote**. All users use one of the default system login classes. User **alexander** also has two digital signal algorithm (DSA) public keys configured for SSH authentication.

```
[edit]
system {
  login {
    user philip {
      full-name "Philip of Macedonia";
      uid 1001;
      class super-user;
      authentication {
        encrypted-password "$1$poPPeY";
      }
    }
    user alexander {
      full-name "Alexander the Great";
      uid 1002;
      class view;
      authentication {
        encrypted-password "$1$14c5.$sBopasdFFdssdfFFdsdfs0";
        ssh-dsa "8924 37 5678 5678@gaugamela.per";
        ssh-dsa "6273 94 9283@boojum.per";
      }
    }
    user darius {
      full-name "Darius King of Persia";
      uid 1003;
      class operator;
      authentication {
        ssh-rsa "1024 37 12341234@ecbatana.per";
      }
    }
    user anonymous {
      class unauthorized;
    }
  }
}
```

```
    }  
    user remote {  
        full-name "All remote users";  
        uid 9999;  
        class read-only;  
    }  
}  
}
```

**Related  
Documentation**

- *Junos OS User Accounts Overview*
- *Limiting the Number of User Login Attempts for SSH and Telnet Sessions*

## Example: Configuring System Authentication for RADIUS, TACACS+, and Password Authentication

The following example shows how to configure system authentication for RADIUS, TACACS+, and password authentication.

In this example, only the user Philip and users authenticated by a remote RADIUS server can log in. If a user logs in and is not authenticated by the RADIUS server, the user is denied access to the router or switch. If the RADIUS server is not available, the user is authenticated using the **password** authentication method and allowed access to the router or switch. For more information about the password authentication method, see [“Using Local Password Authentication” on page 1822](#).

When Philip tries to log in to the system, if the RADIUS server authenticates him, he is given access and privileges for the **super-user** class. Local accounts are not configured for other users. When they log in to the system and the RADIUS server authenticates them, they are given access using the same user ID (UID) 9999 and the privileges associated with the **operator** class.

```
[edit]  
system {  
    authentication-order radius;  
    login {  
        user philip {  
            full-name "Philip";  
            uid 1001;  
            class super-user;  
        }  
        user remote {  
            full-name "All remote users";  
            uid 9999;  
            class operator;  
        }  
    }  
}
```

**NOTE:** For authorization purposes, you can use a template account to create a single account that can be shared by a set of users at the same time. For example, when you create a remote template account, a set of remote users can concurrently share a single UID. For more information about template accounts, see [“Overview of Template Accounts for RADIUS and TACACS+ Authentication”](#) on page 1809.

When a user logs in to a device, the user’s login name is used by the RADIUS or TACACS+ server for authentication. If the user is authenticated successfully by the authentication server and the user is not configured at the `[edit system login user]` hierarchy level, the device uses the default remote template user account for the user, provided a remote template account is configured at the `edit system login user remote` hierarchy level. The remote template account serves as a default template user account for all users that are authenticated by the authentication server but not having a locally configured user account on the device. Such users share the same login class and UID.

To configure an alternate template user, specify the **user-name** parameter returned in the RADIUS authentication response packet. Not all RADIUS servers allow you to change this parameter. The following shows a sample Junos OS configuration:

```
[edit]
system {
  authentication-order radius;
  login {
    user philip {
      full-name "Philip";
      uid 1001;
      class super-user;
    }
    user operator {
      full-name "All operators";
      uid 9990;
      class operator;
    }
    user remote {
      full-name "All remote users";
      uid 9999;
      class read-only;
    }
  }
}
```

Assume your RADIUS server is configured with the following information:

- User Philip with password “olympia”
- User Alexander with password “bucephalus” and username “operator”
- User Darius with password “redhead” and username “operator”
- User Roxane with password “athena”

Philip would be given access as a superuser (**super-user**) because he has his own local user account. Alexander and Darius share UID 9990 and have access as operators. Roxane has no template-user override, so she shares access with all the other remote users, getting read-only access.

- Related Documentation**
- [Configuring the Junos OS Authentication Order for RADIUS, TACACS+, and Local Password Authentication on page 1838](#)

## Example: Creating Login Classes with Specific Privileges

The following example shows how to create several user classes, each with specific privileges. In this example, you configure timeouts to disconnect the class members after a period of inactivity. Users' privilege levels, and therefore the classes of which they are members, should be dependent on their responsibilities within the organization, and the permissions shown here are only examples.

The first class of users (called "observation") can only view statistics and configuration. They are not allowed to modify any configuration. The second class of users (called "operation") can view and modify the configuration. The third class of users (called "engineering") has unlimited access and control.

```
[edit]
system {
  login {
    class observation {
      idle-timeout 5;
      permissions [ view ];
    }
    class operation {
      idle-timeout 5;
      permissions [ admin clear configure interface interface-control network
        reset routing routing-control snmp snmp-control trace-control
        firewall-control rollback ];
    }
    class engineering {
      idle-timeout 5;
      permissions all;
    }
  }
}
```

- Related Documentation**
- [Defining Junos OS Login Classes](#)

## Example: Configuring QFabric System Login Classes

This example shows you how to assign the correct login class to users so they can access components within a QFabric system.

- [Requirements on page 1883](#)
- [Overview on page 1883](#)

- [Configuration on page 1884](#)
- [Verification on page 1886](#)

## Requirements

This example uses the following hardware and software components:

- One QFX3000-G QFabric system containing:
  - Two QFX3100 Director devices
  - Two QFX3008-I Interconnect devices
  - Eight QFX3500 Node devices
  - Junos OS Release 12.2 for these QFX Series components
- Eight EX4200 switches, used to make two redundant Virtual Chassis with four members apiece
- Junos OS Release 12.1R1.9 for the EX Series switches used in the Virtual Chassis

Before you begin:

- Perform the initial setup of the QFabric system on the Director group, which includes the creation of a username and password for the QFabric system components. See [“Performing the QFabric System Initial Setup on a QFX3100 Director Group” on page 1471](#).

## Overview

The QFabric system offers three special preset login classes that provide different levels of access to individual components within a QFabric system (such as Node devices and Interconnect devices). The *qfabric-admin* class provides the ability to log in to individual QFabric system components and manage them. The *qfabric-operator* class enables the user to log in to individual components and view component-level operations and configurations. The *qfabric-user* class prevents access to individual QFabric system components.

You include these classes in your configuration at the **[edit system login user *username* authentication remote-debug-permission]** hierarchy level. The key task is to decide which class you should apply to users based on their need to access QFabric system components.

**NOTE:** To set QFabric system login classes for a root user, include the **remote-debug-permission** statement at the **[edit system root-authentication]** hierarchy level and specify the *qfabric-admin* class.

If you assign the *qfabric-admin* or the *qfabric-operator* class to a user, the QFabric system maps the user to a list of authorized users who are permitted to access components. To facilitate ease of use, the QFabric system uses the component password you specified during the initial setup of the Director group. When users assigned the *qfabric-admin* or the *qfabric-operator* class log in to a component by issuing the **request component login**

operational mode command, the QFabric system verifies the class and sends the username and password to the component. The component accepts these credentials and permits access.

NOTE:

- The three QFabric system login classes give access to the components only. To provide access to the QFabric system as a whole through the default partition command-line interface (CLI), you must configure the usual Junos OS login classes or permissions (such as the *super-user* class). For more information about login classes, see [“Junos OS Login Classes Overview” on page 1828](#).
- If you have completed the QFabric system initial setup and the system is operational, you can change the component password by issuing the *device-authentication* statement at the `[edit system]` hierarchy level in the QFabric default partition CLI.

---

### Topology

This example defines three users: Adam, Oscar, and Ulf. Adam needs to manage QFabric system components, Oscar needs limited access, and Ulf should not have any access to the components. As a result, assign the *qfabric-admin* class to Adam, the *qfabric-operator* class to Oscar, and the *qfabric-user* class to Ulf. However, all three users should have all permissions to access the QFabric system CLI.

### Configuration

---

- [\[xref target has no title\]](#)

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the `[edit]` hierarchy level.

```
set system login class all-qfabric permissions all
set system login user Adam class all-qfabric
set system login user Adam authentication encrypted-password
"$1$aoYSFkve$G/dYqsTV5iSvVW2sND69U."
set system login user Adam authentication remote-debug-permission qfabric-admin
set system login user Oscar class all-qfabric
set system login user Oscar authentication encrypted-password
"$1$3e.3wJQ8$31SrZV0.efdRbk.ZJncKm0"
set system login user Oscar authentication remote-debug-permission qfabric-operator
set system login user Ulf class all-qfabric
set system login user Ulf authentication encrypted-password
"$1$qt9Ncm0o$okNYSN8O4fVITE/SHBdYj0"
set system login user Ulf authentication remote-debug-permission qfabric-user
```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To provide the same access to the QFabric system CLI for all users, but different QFabric system component-level access to different users:

1. Define and provide all-qfabric access and passwords to all three users. This administrator-defined class provides full permissions, enabling the users to log in to the QFabric system default partition and use the CLI. Alternatively, you can assign the super-user class to these users to accomplish the same goal.

```
[edit]
user@qfabric# set system login class all-qfabric permissions all
user@qfabric# set system login user Adam class all-qfabric
user@qfabric# set system login user Adam authentication encrypted-password
"$1$aoYSFkvE$G/dYqsTV5iSvVW2sND69U."
user@qfabric# set system login user Oscar class all-qfabric
user@qfabric# set system login user Oscar authentication encrypted-password
"$1$3e.3wJQ8$31SrV0.efdRbk.ZJncKm0"
user@qfabric# set system login user Ulf class all-qfabric
user@qfabric# set system login user Ulf authentication encrypted-password
"$1$qt9Ncm0o$okNYSN8O4fvITE/SHBdYj0"
```

2. Provide qfabric-admin component access to Adam so he can manage QFabric system components.

```
[edit]
user@qfabric# set system login user Adam authentication remote-debug-permission
qfabric-admin
```

3. Provide qfabric-operator component access to Oscar so he can view the CLI at the QFabric system components.

```
[edit]
user@qfabric# set system login user Oscar authentication remote-debug-permission
qfabric-operator
```

4. Assign qfabric-user component restrictions to Ulf to prevent him from accessing the QFabric system components.

```
[edit]
user@qfabric# set system login user Ulf authentication remote-debug-permission
qfabric-user
```

**Results** From configuration mode, confirm your configuration by entering the **show** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

For brevity, this **show** command output includes only the configuration that is relevant to this example.

```
[edit]
system {
  login {
    class all-qfabric {
```

```

        permissions all;
    }
    user Adam {
        class all-qfabric;
        authentication {
            encrypted-password "$1$aoYSFkvE$G/dYqsTV5iSvVW2sND69U."; ##
            SECRET-DATA
            remote-debug-permission qfabric-admin;
        }
    }
    user Oscar {
        class all-qfabric;
        authentication {
            encrypted-password "$1$3e.3wJQ8$31SrZV0.efdBk.ZJncKm0"; ## SECRET-DATA
            remote-debug-permission qfabric-operator;
        }
    }
    user Ulf {
        class all-qfabric;
        authentication {
            encrypted-password "$1$qt9Ncm0o$okNYSN8O4fVITE/SHBdYj0"; ##
            SECRET-DATA
            remote-debug-permission qfabric-user;
        }
    }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the QFabric system and component-level access configuration is working properly for all three users. Adam, Oscar, and Ulf should have equivalent, full-permission access to the QFabric system CLI. Adam should have management-level access to components. Oscar should have read-only access to components. Ulf should have no component-level access.

- [Verifying qfabric-admin Access on page 1886](#)
- [Verifying qfabric-operator Access on page 1888](#)
- [Verifying qfabric-user Access on page 1889](#)

#### **Verifying qfabric-admin Access**

**Purpose** Verify that Adam can access the QFabric system CLI at the default partition and manage QFabric system components.

**Action** From a management station on your network, issue the **ssh user@qfabric** command and enter the password to open an SSH session for Adam to the QFabric system. Issue the **?** command to view the CLI operational mode commands that Adam has permission to use on the QFabric system default partition.

```
> ssh Adam@qfabric.network.net
Warning: Permanently added 'qfabric.network.net' (RSA) to the list of known hosts.
```

```
Adam@qfabric.network.net's password:
Last login: Sun Nov 20 14:12:29 2011 from 192.168.28.19
Juniper QFabric Director 11.3.5510 2011-10-21 16:31:44 UTC
```

```
RUNNING ON DIRECTOR DEVICE : dg0
Adam@qfabric>
```

```
Adam@qfabric> ?
```

```
Possible completions:
```

|            |                                                        |
|------------|--------------------------------------------------------|
| clear      | Clear information in the system                        |
| configure  | Manipulate software configuration information          |
| file       | Perform file operations                                |
| help       | Provide help information                               |
| load       | Load information from file                             |
| op         | Invoke an operation script                             |
| ping       | Ping remote target                                     |
| quit       | Exit the management session                            |
| request    | Make system-level requests                             |
| restart    | Restart software process                               |
| save       | Save information to file                               |
| set        | Set CLI properties, date/time, craft interface message |
| show       | Show system information                                |
| telnet     | Telnet to another host                                 |
| test       | Perform diagnostic debugging                           |
| traceroute | Trace route to remote host                             |

Issue the **request component login ?** command to view the components that Adam can access. Next, issue the **request component login *component-name*** command to log in to a Node device without being prompted for a username or password.

```
Adam@qfabric> request component login ?
```

```
Possible completions:
```

|             |                                    |
|-------------|------------------------------------|
| <[Enter]>   | Execute this command               |
| <node-name> | Inventory name for the remote node |
| BBAK0372    | Node device                        |
| BBAK0394    | Node device                        |
| DRE-0       | Diagnostic routing engine          |
| EE3093      | Node device                        |
| FC-0        | Fabric control                     |
| FC-1        | Fabric control                     |
| FM-0        | Fabric manager                     |
| NW-NG-0     | Node group                         |
| WS001/RE0   | Interconnect device control board  |
| WS001/RE1   | Interconnect device control board  |
|             | Pipe through a command             |

```
Adam@qfabric> request component login EE3093
```

```
Warning: Permanently added 'qfnod-ee3093,169.254.128.14' (RSA) to the list of
known hosts.
```

```
--- JUNOS 11.3I built 2011-11-04 12:46:16 UTC
{master}
```

Finally, issue the **?** command to view the CLI operational mode commands that Adam has the permission to use on the Node device. Notice that the CLI prompt now indicates Adam's component access level (**qfabric-admin**) as the username and the Node device identifier (**EE3093**) as the host.

```
qfabric-admin@EE3093> ?
```

```
Possible completions:
```

|       |                                 |
|-------|---------------------------------|
| clear | Clear information in the system |
|-------|---------------------------------|

|         |                                                        |
|---------|--------------------------------------------------------|
| file    | Perform file operations                                |
| help    | Provide help information                               |
| load    | Load information from file                             |
| monitor | Show real-time debugging information                   |
| mtrace  | Trace multicast path from source to receiver           |
| op      | Invoke an operation script                             |
| ping    | Ping remote target                                     |
| quit    | Exit the management session                            |
| request | Make system-level requests                             |
| restart | Restart software process                               |
| save    | Save information to file                               |
| set     | Set CLI properties, date/time, craft interface message |
| show    | Show system information                                |
| ssh     | Start secure shell on another host                     |
| start   | Start shell                                            |
| telnet  | Telnet to another host                                 |
| test    | Perform diagnostic debugging                           |
| tracert | Trace route to remote host                             |

**Meaning** The output shows that Adam has received the proper permissions to access the QFabric system CLI and log in to individual components with management-level access.

#### *Verifying qfabric-operator Access*

**Purpose** Verify that Oscar can access the QFabric system CLI at the default partition and view the CLI on the QFabric system components.

**Action** From a management station on your network, issue the **ssh user@qfabric** command and enter the password to open an SSH session for Oscar to the QFabric system. Issue the **?** command to view the CLI operational mode commands that Oscar has permission to use on the QFabric system default partition. Notice that these permissions are the same as those given to Adam.

```
> ssh Oscar@qfabric.network.net
Warning: Permanently added 'qfabric.network.net' (RSA) to the list of known hosts.
Oscar@qfabric.network.net's password:
Last login: Sun Nov 19 19:21:29 2011 from 192.168.28.14
Juniper QFabric Director 11.3.5510 2011-10-22 18:33:41 UTC
```

```
RUNNING ON DIRECTOR DEVICE : dg1
Oscar@qfabric>
```

```
Oscar@qfabric> ?
```

Possible completions:

|           |                                                        |
|-----------|--------------------------------------------------------|
| clear     | Clear information in the system                        |
| configure | Manipulate software configuration information          |
| file      | Perform file operations                                |
| help      | Provide help information                               |
| load      | Load information from file                             |
| op        | Invoke an operation script                             |
| ping      | Ping remote target                                     |
| quit      | Exit the management session                            |
| request   | Make system-level requests                             |
| restart   | Restart software process                               |
| save      | Save information to file                               |
| set       | Set CLI properties, date/time, craft interface message |
| show      | Show system information                                |

|         |                              |
|---------|------------------------------|
| telnet  | Telnet to another host       |
| test    | Perform diagnostic debugging |
| tracert | Trace route to remote host   |

Issue the **request component login *component-name*** command to log in to a Node device without being prompted for a username or password.

```
Oscar@qfabric> request component login EE3093
Warning: Permanently added 'qfnode-ee3093,169.254.128.14' (RSA) to the list of
known hosts.
--- JUNOS 11.3I built 2011-11-04 12:46:16 UTC
{master}
```

Finally, issue the **?** command to view the CLI operational mode commands that Oscar has permission to use on the Node device. Notice that the CLI prompt now indicates Oscar's component access level (**qfabric-operator**) as the username and the Node device identifier (**EE3093**) as the host. Additionally, Oscar has fewer CLI commands available than Adam because of Oscar's read-only qfabric-operator login class.

```
qfabric-operator@EE3093> ?
Possible completions:
  file      Perform file operations
  help      Provide help information
  load      Load information from file
  op        Invoke an operation script
  quit      Exit the management session
  request   Make system-level requests
  save      Save information to file
  set       Set CLI properties, date/time, craft interface message
  show      Show system information
  start     Start shell
  test      Perform diagnostic debugging
```

**Meaning** The output shows that Oscar has full permissions to access the QFabric system CLI, but only read-only access when he logs in to individual components. Oscar's permissions on the QFabric system are the same as Adam's, but Oscar has fewer permissions than Adam on the Node device.

### *Verifying qfabric-user Access*

**Purpose** Verify that Ulf has full access to the QFabric system CLI at the default partition but cannot access the QFabric system components.

**Action** From a management station on your network, issue the **ssh *user*@qfabric** command and enter the password to open an SSH session for Ulf to the QFabric system. Issue the **?** command to view the CLI operational mode commands that Ulf has permission to use on the QFabric system default partition. Notice that these permissions are the same as those given to Adam and Oscar.

```
> ssh Ulf@qfabric.network.net
Warning: Permanently added 'qfabric.network.net' (RSA) to the list of known hosts.
Ulf@qfabric.network.net's password:
Last login: Sun Nov 17 17:12:24 2011 from 192.168.28.22
Juniper QFabric Director 11.3.5510 2011-10-23 19:23:31 UTC
```

RUNNING ON DIRECTOR DEVICE : dg0

```
Ulf@qfabric>
```

```
Ulf@qfabric> ?
```

```
Possible completions:
```

|            |                                                        |
|------------|--------------------------------------------------------|
| clear      | Clear information in the system                        |
| configure  | Manipulate software configuration information          |
| file       | Perform file operations                                |
| help       | Provide help information                               |
| load       | Load information from file                             |
| op         | Invoke an operation script                             |
| ping       | Ping remote target                                     |
| quit       | Exit the management session                            |
| request    | Make system-level requests                             |
| restart    | Restart software process                               |
| save       | Save information to file                               |
| set        | Set CLI properties, date/time, craft interface message |
| show       | Show system information                                |
| telnet     | Telnet to another host                                 |
| test       | Perform diagnostic debugging                           |
| traceroute | Trace route to remote host                             |

When Ulf issues the **request component login *component-name*** command, the Node device denies his access attempt.

```
Ulf@qfabric> request component login EE3093
```

```
error: User Ulf does not have sufficient permissions to login to device EE3093
```

**Meaning** The output shows that Ulf has full permissions to access the QFabric system CLI in the same way as Adam and Oscar. However, unlike Adam and Oscar, Ulf cannot access individual components because of the qfabric-user login class assigned to him.

## Example: Configuring User Login Accounts

The following example shows how to configure the local administrator account (**user admin**). If RADIUS fails or becomes unreachable, the login process reverts to password authentication on the local accounts on the router or switch.

```
[edit]
system {
  login {
    user admin {
      uid 1000;
      class engineering;
      authentication {
        encrypted-password "<PASSWORD>"; # SECRET-DATA
      }
    }
  }
}
```

```
}
}
```

**Related  
Documentation**

- [Configuring Junos OS User Accounts](#)

## Example: Configuring RADIUS Template Accounts

The following example shows how to configure RADIUS template accounts for different users or groups of users:

```
[edit]
system {
  login {
    user observation {
      uid 1001;
      class observation;
    }
    user operation {
      uid 1002;
      class operation;
    }
    user engineering {
      uid 1003;
      class engineering;
    }
  }
}
```

**Related  
Documentation**

- [Overview of Template Accounts for RADIUS and TACACS+ Authentication on page 1809](#)

## Defining Access Privileges Using allow/deny-configuration Statements

The following examples show how to configure access privileges for individual configuration mode hierarchy levels.

If the following statement is included in the configuration and the user's login class permission bit is set to **all**, the user cannot configure telnet parameters:

```
[edit system login class class-name]
user@switch# set deny-configuration "system services telnet"
```

If the following statement is included in the configuration and the user's login class permission bit is set to **all**, the user cannot issue login class commands within any login class whose name begins with "m":

```
[edit system login class class-name]
user@switch# set deny-configuration "system login class m.*"
```

If the following statement is included in the configuration and the user's login class permission bit is set to **all**, the user cannot edit a configuration or issue commands (such as **commit**) at the login class or system services hierarchy levels:

```
[edit system login class class-name]
user@switch# set deny-configuration "(system login class) | (system services)"
```

The following example shows how to configure permissions for individual configuration mode hierarchies:

```
[edit]
system {
  login { # This login class has operator privileges and the additional ability to edit
    # configuration at the system services hierarchy level.
    class only-system-services {
      permissions [ configure ];
      allow-configuration "system services";
    }
    # services commands.
    class all-except-system-services { # This login class has operator privileges but
      # cannot edit any system services configuration.
      permissions [ all ];
      deny-configuration "system services";
    }
  }
}
```

### Example: Limiting the Number of Login Attempts for SSH and Telnet Sessions

The following example shows how to limit the user to four attempts when the user enters a password while logging in through SSH or Telnet. Set the **backoff-threshold** to 2, the **back-off-factor** to 5 seconds, and the **minimum-time** to 40 seconds. The user experiences a delay of 5 seconds after the second attempt to enter a correct password fails. After each subsequent failed attempt, the delay increases by 5 seconds. After the fourth and final failed attempt to enter a correct password, the user experiences an additional 10-second delay, and the connection closes after a total of 40 seconds.

The additional variables **maximum-time** and **lockout-period** are not set in this example.

```
[edit]
system {
  login {
    retry-options {
      backoff-threshold 2;
      backoff-factor 5;
      minimum-time 40;
      tries-before-disconnect 4;
    }
    password {
    }
  }
}
```

**NOTE:** This sample only shows the portion off the [edit system login] hierarchy level being modified.

```

**Hierarchy Level** [edit]

**Release Information** Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure authentication, authorization, and accounting (AAA) services.  
  
The statements are explained separately.

**NOTE:** The [edit access] hierarchy is not available on QFabric systems.

**Default** Not enabled

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

| <b>Description</b>              | <p>For MX Series and T Series routers and EX Series switches, configure an interval for LLDP advertisement.</p> <p>For switches configured for Link Layer Discovery Protocol, configure the frequency at which LLDP advertisements are sent.</p> <p>The <b>advertisement-interval</b> value must be greater than or equal to four times the <b>transmit-delay</b> value, or an error will be returned when you attempt to commit the configuration.</p> <div><b>NOTE:</b> The default value of <b>transmit-delay</b> is 2 seconds. If you configure the <b>advertisement-interval</b> as less than 8 seconds and you do not configure a value for <b>transmit-delay</b>, the default value of <b>transmit-delay</b> is automatically changed to 1 second in order to satisfy the requirement that the <b>advertisement-interval</b> value must be greater than or equal to four times the <b>transmit-delay</b> value.</div> |
| <b>Default</b>                  | Disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                      |
| <b>Description</b>              | Set the agent address of all SNMPv1 traps generated by this router or switch. Currently, the only option is <b>outgoing-interface</b> , which sets the agent address of each SNMPv1 trap to the address of the outgoing interface of that trap.                                                                                        |
| <b>Options</b>                  | <b>outgoing-interface</b> —Value of the agent address of all SNMPv1 traps generated by this router or switch. The <b>outgoing-interface</b> option sets the agent address of each SNMPv1 trap to the address of the outgoing interface of that trap.<br><b>Default:</b> Disabled (the agent address is not specified in SNMPv1 traps). |
| <b>Required Privilege Level</b> | snmp—To view this statement in the configuration.<br>snmp-control—To add this statement to the configuration.                                                                                                                                                                                                                          |

| <b>Description</b>         | <p>Specify where to transfer the current configuration files. When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks (" ") and enclose the IPv6 host address in brackets ([ ]). For example, "scp://username&lt;:password&gt;@[ipv6-host-address]&lt;:port&gt;/url-path"</p> <p>If you specify more than one archive site, the router or switch attempts to transfer the configuration files to the first archive site in the list, moving to the next only if the transfer fails.</p> <p>The destination filename is saved in the following format, where <i>n</i> corresponds to the number of the compressed configuration rollback file that has been archived:</p> <p><b><i>router-name_juniper.conf.n.gz_YYYYMMDD_HHMMSS.</i></b></p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> <b>NOTE:</b> The time included in the destination filename is always in Coordinated Universal Time (UTC) regardless of whether the time on the router or switch is configured as UTC or the local time zone. The default time zone on the router or switch is UTC.</p> </div> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> <b>NOTE:</b> The [edit system archival] hierarchy is not available on QFabric systems.</p> </div> |
| <b>Options</b>             | <p>The prefix used in the configuration statement determines the form of transfer:</p> <p><b>file://</b> —transfer on a path to a named file</p> <p><b>ftp://</b> —transfer using active FTP server</p> <p><b>pasvftp://</b> —transfer to a device that only accepts passive FTP services</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**scp://** —transfer to a known host using background SCP file transfers

**Required Privilege Level**    system—To view this statement in the configuration.  
                                  system-control—To add this statement to the configuration.

## authentication-order

---

**Syntax**    authentication-order [none | password | radius];

**Hierarchy Level**    [edit [access profile](#) *profile-name*],  
                          [edit [system](#)]

**Release Information**    Statement introduced in Junos OS Release 9.0 for EX Series switches.  
                                  Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Configure the order of authentication, authorization, and accounting (AAA) servers to use while sending authentication messages.

**Default**    Not enabled

**Options**    **none**—No authentication for specified subscribers.

**password**—Password authentication.

**radius**—RADIUS authentication.

**NOTE:** The [edit access] hierarchy is not available on QFabric systems.

## community (SNMP)

---

**Syntax**    `community community-name {  
                  authorization authorization;  
                  client-list-name client-list-name;  
                  clients {  
                      address restrict;  
                  }  
                  view view-name;  
                  }`

**Hierarchy Level**    [edit snmp]

**Release Information**    Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Define an SNMP community. An SNMP community authorizes SNMP clients based on the source IP address of incoming SNMP request packets. A community also defines which MIB objects are available and the operations (read-only or read-write) allowed on those objects.

**NOTE:** The **authorization read-write** option is not supported on the QFX3000 QFabric system.

---

The SNMP client application specifies an SNMP community name in **Get**, **GetBulk**, **GetNext**, and **Set** SNMP requests.

**Default**    If you omit the **community** statement, all SNMP requests are denied.

**Options**    **community-name**—Community string. If the name includes spaces, enclose it in quotation marks (" ").

The remaining statements are explained separately.

**Required Privilege Level**    snmp—To view this statement in the configuration.  
                                  snmp-control—To add this statement to the configuration.

**Related Documentation**    • [Configuring the SNMP Community String on page 6682](#)

## configuration

**Syntax**

```
configuration {
  transfer-interval interval;
  transfer-on-commit;
  archive-sites {
    file://<path>/<filename>;
    ftp://username@host:<port>url-path password password;
    http://username@host:<port>url-path password password;
    pasvftp://username@host:<port>url-path password password;
    scp://username@host:<port>url-path password password;
  }
}
```

**Hierarchy Level** [edit system archival]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure the router or switch to periodically transfer its currently active configuration (or after each commit).

**NOTE:** The [edit system archival] hierarchy is not available on QFabric systems.

**Options** The remaining statements are explained separately.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

## lldp

```
Syntax  lldp {
    advertisement-interval seconds;
    disable;
    hold-multiplier number;
    interface (all | [interface-name]) {
        disable;
        power-negotiation {
            disable;
        }
    }
    lldp-configuration-notification-interval seconds;
    management-address ip-management-address;
    netbios-snooping;
    ptopo-configuration-maximum-hold-time seconds;
    ptopo-configuration-trap-interval seconds;
    traceoptions {
        file filename <files number> <size size> <world-readable | no-world-readable>
        <no-stamp> <replace>;
        flag flag <disable>;
    }
    transmit-delay seconds;
}
```

**Hierarchy Level** [edit protocols]

**Release Information** Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for QFX Series.

**Description** Configure Link Layer Discovery Protocol (LLDP). The switch uses LLDP to advertise its identity and capabilities on a LAN, as well as to receive information about other network devices. LLDP is defined in the IEEE standard 802.1AB-2005.

The remaining statements are explained separately.

**NOTE:** The `transmit-delay` and `netbios-snooping` options are not available on QFabric systems.

**NOTE:** On EX4300 switches, LLDP cannot be configured on the `me0` or `vme` interface. Issuing the command `set protocols lldp interface me0` generates the following error message:

```
error: name: 'me0': Invalid interface
error: statement creation failed: interface
```

Issuing the command `set protocols lldp interface vme` generates the following error message:

```
error: name: 'vme': Invalid interface
error: statement creation failed: interface
```

## profile

---

**Syntax**    `profile profile-name {  
              accounting (Access Profile) {  
                  accounting-stop-on-access-deny;  
                  accounting-stop-on-failure;  
                  order ( radius | [ accounting-order-data-list ] );  
              }  
              authentication-order [authentication-method];  
              radius {  
                  accounting-server [server-addresses];  
                  authentication-server [server-addresses];  
              }  
          }`

**Hierarchy Level**    [edit access]

**Release Information**    Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Configure an access profile. The access profile contains the entire authentication, authorization, and accounting (AAA) configuration that aids in handling AAA requests, including the authentication method and order, AAA server addresses, and AAA accounting.

**Default**    Not enabled

**Options**    *profile-name*—Profile name of up to 32 characters.  
  
The remaining statements are explained separately.

**NOTE:** The [edit access] hierarchy is not available on QFabric systems.

---

**Required Privilege Level**    admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

## radius

---

**Syntax**    radius {  
              accounting-server [server-addresses];  
              authentication-server [server-addresses];  
              }

**Hierarchy Level**    [edit access profile *profile-name*]

**Release Information**    Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Configure the RADIUS servers for authentication and for accounting. To configure multiple RADIUS servers, include multiple **radius** statements. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached.

The statements are explained separately.

**NOTE:** The [edit access] hierarchy is not available on QFabric systems.

---

**Required Privilege Level**    admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

## radius-server

```
Syntax radius-server server-address {
    accounting-port port-number;
    port number;
    retry number;
    secret password;
    source-address source-address;
    timeout seconds;
}
```

Hierarchy Level [edit system]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure a RADIUS server for Point-to-Point Protocol (PPP).

To configure multiple RADIUS servers, include multiple **radius-server** statements. The servers are tried in order and in a round-robin fashion until a valid response is received from one of the servers or until all the configured retry limits are reached.

**Options** *server-address*—Address of the RADIUS authentication server.

The remaining statements are explained separately.

**NOTE:** The `accounting-port` and `source-address` options are not available on QFabric systems.

| Required Privilege Level |                                              |
|--------------------------|----------------------------------------------|
| system                   | To view this statement in the configuration. |
| system-control           | To add this statement to the configuration.  |

## services (Switches)

---

**Syntax**

```
services {  
  service-deployment {  
    servers address {  
      port-number port-number;  
    }  
    source-address address;  
  }  
  ssh {  
    connection-limit limit;  
    protocol-version [v1 v2];  
    rate-limit limit;  
    root-login (allow | deny | deny-password);  
  }  
}
```

**Hierarchy Level** [edit system]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure the switch so that users on remote systems can access the local switch through SSH.

The remaining statements are explained separately.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

Hierarchy Level [edit]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure system management properties.

**NOTE:** The `radius-server source-address` and `radius-options` statements are not available on the QFabric system.

**Required Privilege** system—To view this statement in the configuration.

**Level** system-control—To add this statement to the configuration.

## tacplus-options

## traceoptions (LLDP)

|                            |                                                                                                                                                                                                                                    |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <pre> traceoptions {     file <i>filename</i> &lt;files <i>number</i>&gt; &lt;size <i>size</i>&gt; &lt;world-readable   no-world-readable&gt; &lt;no-stamp&gt;     &lt;replace&gt;;     flag <i>flag</i> &lt;disable&gt;; } </pre> |
| <b>Hierarchy Level</b>     | [edit protocols <a href="#">lldp</a> ]                                                                                                                                                                                             |
| <b>Release Information</b> | Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                          |
| <b>Description</b>         | Define tracing operations for the Link Layer Discovery Protocol (LLDP). You can trace messages under LLDP for LLDP and PTOPO MIBs.                                                                                                 |

**NOTE:** The traceoptions statement is not supported on the QFX3000 QFabric system.

|                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Default</b> | Tracing operations are disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Options</b> | <p><b>file <i>filename</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory <code>/var/log</code>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum <b>xk</b> to specify KB, <b>xm</b> to specify MB, or <b>xg</b> to specify GB number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000</p> <p><b>Default:</b> 3 files</p> <p><b>flag <i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—All tracing operations.</li> <li>• <b>configuration</b>—Trace configuration operations.</li> <li>• <b>interface</b>—Trace interface update events.</li> <li>• <b>netbios</b>—Trace NetBIOS events.</li> <li>• <b>packet</b>—Trace packet events.</li> <li>• <b>rtsock</b>—Trace routing socket operations.</li> <li>• <b>snmp</b>—Trace SNMP configuration operations.</li> </ul> |

- **vlan**—Trace VLAN update events.

**no-stamp**—(Optional) Do not timestamp the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Restrict file access to the user who created the file.

**replace**—(Optional) Replace an existing trace file if there is one rather than appending output to it.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes (GB). When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through 1 GB

**Default:** 128 KB

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**world-readable**—(Optional) Enable unrestricted file access.

**NOTE:** The **traceoptions** statement is not supported on the QFX3000 QFabric system.

**Required Privilege Level**

- [Monitoring Commands on page 1980](#)

## Routine Monitoring

---

- [Monitoring SNMP on page 1979](#)

### Monitoring SNMP

There are several commands that you can access in Junos OS operational mode to monitor SNMP information. Some of the commands are:

- **show snmp health-monitor**, which displays the health monitor log and alarm information.
- **show snmp mib**, which displays information from the MIBs, such as device and system information.
- **show snmp statistics**, which displays SNMP statistics such as the number of packets, silent drops, and invalid output values.
- **show snmp rmon**, which displays the RMON alarm, event, history, and log information

The following example provides sample output from the **show snmp health-monitor** command:

```
user@switch> show snmp health-monitor
```

```
Alarm
```

| Index | Variable description                                                         | Value | State  |
|-------|------------------------------------------------------------------------------|-------|--------|
| 32768 | Health Monitor: root file system utilization<br>jnxHrStoragePercentUsed.1    | 58    | active |
| 32769 | Health Monitor: /config file system utilization<br>jnxHrStoragePercentUsed.2 | 0     | active |
| 32770 | Health Monitor: RE 0 CPU utilization<br>jnxOperatingCPU.9.1.0.0              | 0     | active |
| 32773 | Health Monitor: RE 0 Memory utilization<br>jnxOperatingBuffer.9.1.0.0        | 35    | active |
| 32775 | Health Monitor: jkernel daemon CPU utilization<br>Init daemon                | 0     | active |

|                  |           |
|------------------|-----------|
| Chassis daemon   | 50 active |
| Firewall daemon  | 0 active  |
| Interface daemon | 5 active  |
| SNMP daemon      | 11 active |
| MIB2 daemon      | 42 active |
| ...              |           |

The following example provides sample output from the **show snmp mib** command:

```
user@switch> show snmp mib walk system
```

```
sysDescr.0    = Juniper Networks, Inc. qfx3500s internet router, kernel  
JUNOS 11.1-20100926.0 #0: 2010-09-26 06:17:38 UTC builder@abc.juniper.net:  
/volume/build/junos/11.1/production/20100926.0/obj-xlr/bsd/sys/compile/JUNIPER-xxxxx
```

```
Build date: 2010-09-26 06:00:10 U  
sysObjectID.0 = jnxProductQFX3500  
sysUpTime.0   = 24444184  
sysContact.0  = J Smith  
sysName.0     = Lab QFX3500  
sysLocation.0 = Lab  
sysServices.0 = 4
```

The following example provides sample output from the **show snmp statistics** command:

```
user@switch> show snmp statistics
```

SNMP statistics:

Input:

```
Packets: 0, Bad versions: 0, Bad community names: 0,  
Bad community uses: 0, ASN parse errors: 0,  
Too bigs: 0, No such names: 0, Bad values: 0,  
Read onlys: 0, General errors: 0,  
Total request varbinds: 0, Total set varbinds: 0,  
Get requests: 0, Get nexts: 0, Set requests: 0,  
Get responses: 0, Traps: 0,  
Silent drops: 0, Proxy drops: 0, Commit pending drops: 0,  
Throttle drops: 0, Duplicate request drops: 0
```

Output:

```
Packets: 0, Too bigs: 0, No such names: 0,  
Bad values: 0, General errors: 0,  
Get requests: 0, Get nexts: 0, Set requests: 0,  
Get responses: 0, Traps: 0
```

## Sample Output

The three sample output displays show the results of attempts to log in to Node device EE3093. The results differ depending on the privilege level assigned to the user.

### request component login (with qfabric-admin Privileges)

```
admin@qfabric> request component login EE3093
Warning: Permanently added 'qfabric-node-ee3093,169.254.128.41' (RSA) to the list
of known hosts.
--- JUNOS 11.3I built 2011-11-04 12:46:16 UTC
{master}
qfabric-admin@node-ee3093> ?
Possible completions:
clear          Clear information in the system
file           Perform file operations
help           Provide help information
load           Load information from file
monitor        Show real-time debugging information
mtrace         Trace multicast path from source to receiver
op             Invoke an operation script
ping           Ping remote target
quit           Exit the management session
request        Make system-level requests
restart        Restart software process
save           Save information to file
set            Set CLI properties, date/time, craft interface message
show           Show system information
ssh            Start secure shell on another host
start          Start shell
```

```

telnet          Telnet to another host
test           Perform diagnostic debugging
traceroute     Trace route to remote host{master}
qfabric-admin@node-ee3093>

```

#### request component login (with qfabric-operator Privileges)

```

operator@qfabric> request component login EE3093
Warning: Permanently added 'qfabric-node-ee3093,169.254.128.41' (RSA) to the list
of known hosts.

| <b>Index</b>             | VLAN index internal to Junos OS software.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>detail</b>                                       |
| <b>untagged   tagged</b> | Specifies whether the interface forwards IEEE802.1Q-tagged or untagged traffic.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | <b>detail</b>                                       |

## Sample Output

### show ethernet-switching interfaces

```
user@switch> show ethernet-switching interfaces
```

| Interface   | State | VLAN members | Blocking                  |
|-------------|-------|--------------|---------------------------|
| xe-0/0/0.0  | up    | T1122        | unblocked                 |
| xe-0/0/1.0  | down  | default      | – MAC limit exceeded      |
| xe-0/0/2.0  | down  | default      | – MAC move limit exceeded |
| xe-0/0/3.0  | down  | default      | – Storm control in effect |
| xe-0/0/4.0  | down  | default      | unblocked                 |
| xe-0/0/5.0  | down  | default      | unblocked                 |
| xe-0/0/6.0  | down  | default      | unblocked                 |
| xe-0/0/7.0  | down  | default      | unblocked                 |
| xe-0/0/8.0  | down  | default      | unblocked                 |
| xe-0/0/9.0  | up    | T111         | unblocked                 |
| xe-0/0/10.0 | down  | default      | unblocked                 |
| xe-0/0/11.0 | down  | default      | unblocked                 |
| xe-0/0/12.0 | down  | default      | unblocked                 |
| xe-0/0/13.0 | down  | default      | unblocked                 |
| xe-0/0/14.0 | down  | default      | unblocked                 |
| xe-0/0/15.0 | down  | default      | unblocked                 |
| xe-0/0/16.0 | down  | default      | unblocked                 |
| xe-0/0/17.0 | down  | default      | unblocked                 |
| xe-0/0/18.0 | down  | default      | unblocked                 |
| xe-0/0/19.0 | up    | T111         | unblocked                 |
| xe-0/1/0.0  | down  | default      | unblocked                 |
| xe-0/1/1.0  | down  | default      | unblocked                 |
| xe-0/1/2.0  | down  | default      | unblocked                 |
| xe-0/1/3.0  | down  | default      | unblocked                 |

### show ethernet-switching interfaces summary

```
user@switch> show ethernet-switching interfaces summary
xe-0/0/0.0
xe-0/0/1.0
xe-0/0/2.0
xe-0/0/3.0
xe-0/0/8.0
xe-0/0/10.0
xe-0/0/11.0
```

### show ethernet-switching interfaces brief

```
user@switch> show ethernet-switching interfaces brief
Interface  State  VLAN members  Blocking
xe-0/0/0.0  down  default       unblocked
xe-0/0/1.0  down  employee-vlan unblocked
xe-0/0/2.0  down  employee-vlan unblocked
xe-0/0/3.0  down  employee-vlan unblocked
xe-0/0/8.0  down  employee-vlan unblocked
xe-0/0/10.0 down  default       unblocked
xe-0/0/11.0 down  employee-vlan unblocked
```

### show ethernet-switching interfaces detail

```
user@switch> show ethernet-switching interfaces detail
Interface: xe-0/0/0.0 Index: 65
  State: down
  VLANs:
    default                untagged    unblocked

Interface: xe-0/0/1.0 Index: 66
  State: down
  VLANs:
    employee-vlan          untagged    unblocked

Interface: xe-0/0/2.0 Index: 67

  State: down
  VLANs:
    employee-vlan          tagged     unblocked
```

**show ethernet-switching interfaces interface-name**

```
user@switch> show ethernet-switching interfaces xe-0/0/0.0
  Interface  State   VLAN members   Blocking
xe-0/0/0.0  down    default         unblocked
```

## show lldp

**Syntax** `show lldp`  
`<detail>`

**Release Information** Command introduced in Junos OS Release 9.0 for EX Series switches.  
 Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Display information about Link Layer Discovery Protocol (LLDP) and Link Level Discovery Protocol–Media Endpoint Discovery (LLDP-MED) configuration and capabilities on the switch. LLDP and LLDP-MED are used to learn about and to distribute device information on network links.

**NOTE:** LLDP-MED is not available on the QFX Series.

**Options** **none**—Display LLDP information for all interfaces.  
**detail**—(Optional) Display detailed LLDP information for all interfaces.

**Required Privilege Level** view

**Related Documentation**

**List of Sample Output** [show lldp \(EX3200 switches\) on page 1993](#)  
[show lldp \(EX4300 switches\) on page 1993](#)  
[show lldp detail \(EX4300 switches\) on page 1994](#)

**Output Fields** [Table 138 on page 1990](#) lists the output fields for the **show lldp** command. Output fields are listed in the approximate order in which they appear.

**Table 138: show lldp Output Fields**

| Field Name | Field Description                                                                                                                                                                                                                                                                                                 | Level of Output |
|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| LLDP       | LLDP operating state. The state can be <b>enabled</b> or <b>disabled</b> .<br><br><b>NOTE:</b> If a VLAN that has been configured for untagged packets on an interface also has Layer 2 protocol tunneling (L2PT) enabled for LLDP, the LLDP operating state for that interface is displayed as <b>disabled</b> . | All levels      |

Table 138: show lldp Output Fields (*continued*)

| Field Name                    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Level of Output |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Advertisement interval</b> | Frequency, in seconds, at which LLDP advertisements are sent.<br><br>This value is set by the <code>advertisement-interval</code> configuration statement.                                                                                                                                                                                                                                                                                                                   | All levels      |
| <b>Transmit delay</b>         | Seconds of delay before advertisements are sent to neighbors following a change to a TLV (type, length, or value) element in the LLDP protocol or to the state of the local system, such as a change in hostname or management address. You can set this value to reduce the delay in notifying neighbors of a change in the local system.<br><br>This value is set by the <code>transmit-delay</code> configuration statement.                                              | All levels      |
| <b>Hold timer</b>             | On EX4300 switches, the hold timer shows the length of time LLDP information is held before it is discarded. The hold timer value is equal to the advertisement interval multiplied by the hold multiplier.<br><br>On all other switches, the hold timer shows the value of the hold multiplier.<br><br>The hold multiplier value is set by the <code>hold-multiplier</code> configuration statement.                                                                        | All levels      |
| <b>Notification interval</b>  | How often LLDP trap notifications are generated as a result of LLDP database changes. If the interval value is 0, LLDP trap notifications on database changes are disabled.<br><br>This value is set by the <code>lldp-configuration-notification-interval</code> configuration statement.                                                                                                                                                                                   | All levels      |
| <b>Config Trap Interval</b>   | How often LLDP trap notifications are generated as a result of changes in topology—for example, when an endpoint connects or disconnects. If the interval value is 0, LLDP trap notifications on topology changes are disabled.<br><br>This value is set by the <code>ptopo-configuration-trap-interval</code> configuration statement.                                                                                                                                      | All levels      |
| <b>Connection Hold timer</b>  | Amount of time the system maintains dynamic topology entries.<br><br>This value is set by the <code>ptopo-configuration-maximum-hold-time</code> configuration statement.                                                                                                                                                                                                                                                                                                    | All levels      |
| <b>LLDP-MED</b>               | LLDP-MED operating state. The state can be <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                                                                                                                                                                                                                               | All levels      |
| <b>MED fast start count</b>   | Number of advertisements sent from a switch to a device, such as a VoIP telephone, when the device is first detected by the switch. These increased advertisements are temporary. After a device and a switch exchange information and can communicate, advertisements are reduced to one per second.<br><br>This value is set by using the <code>fast-start</code> configuration statement.<br><br><b>NOTE:</b> <code>fast-start</code> is not available on the QFX Series. | All levels      |
| <b>Interface</b>              | Name of the interface for which LLDP configuration information is being reported.                                                                                                                                                                                                                                                                                                                                                                                            | All levels      |
| <b>Parent Interface</b>       | Name of the aggregated Ethernet interface, if any, to which the interface belongs.                                                                                                                                                                                                                                                                                                                                                                                           | All levels      |

Table 138: show lldp Output Fields (*continued*)

| Field Name                       | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Level of Output |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>LLDP</b>                      | LLDP operating state. The state can be <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | All levels      |
| <b>Power Negotiation</b>         | LLDP power negotiation operating state. The state can be <b>Enabled</b> or <b>Disabled</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | All levels      |
| <b>Neighbor count</b>            | Total number of new LLDP neighbors detected since the last switch reboot.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | <b>detail</b>   |
| <b>Interface</b>                 | Name of the interface that is advertising VLAN information.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | All levels      |
| <b>Vlan-id</b>                   | VLAN tag associated with the interface sending LLDP frames. If the interface is not a member of a VLAN, the VLAN ID is advertised as 0.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | <b>detail</b>   |
| <b>Vlan-name</b>                 | VLAN name associated with the VLAN ID.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <b>detail</b>   |
| <b>LLDP basic TLVs supported</b> | <p>Basic TLVs supported on the switch:</p> <ul style="list-style-type: none"> <li>• <b>Chassis identifier</b>—TLV that advertises the MAC address associated with the local system.</li> <li>• <b>Port identifier</b>—TLV that advertises the port identification for the specified port in the local system.</li> <li>• <b>Port description</b>—Interface name for the port.</li> <li>• <b>System name</b>—TLV that advertises the user-configured name of the local system.</li> <li>• <b>System description</b>—TLV that advertises the system description containing information about the software and current image running on the system. This information is taken from the software and is not configurable.</li> <li>• <b>System capabilities</b>—TLV that advertises the primary functions performed by the system—for example, bridge or router.</li> <li>• <b>Management address</b>—TLV that advertises the IP management address of the local system.</li> </ul> | <b>detail</b>   |

**LLDP basic TLVs supported:**

Chassis identifier, Port identifier, Port description, System name, System description, System capabilities, Management address.

**Supported LLDP 802 TLVs:**

MAC/PHY configuration/status, Power via MDI, Link aggregation, Maximum frame size, Port VLAN tag, Port VLAN name.

**Supported LLDP MED TLVs:**

LLDP MED capabilities, Network policy, Endpoint location, Extended power Via MDI.

Table 139: show lldp local-information Output Fields (*continued*)

| Field Name                   | Field Description                                                                        |
|------------------------------|------------------------------------------------------------------------------------------|
| <b>Interface name</b>        | Name of the local interface which is configured for either LLDP or LLDP-MED.             |
| <b>Parent Interface</b>      | Name of the aggregated Ethernet interface, if any, to which the local interface belongs. |
| <b>SNMP Index</b>            | SNMP interface index.                                                                    |
| <b>Interface description</b> | User-configured port description.                                                        |
| <b>Status</b>                | Administrative status of the interface: either <b>up</b> or <b>down</b> .                |
| <b>Tunneling</b>             | Status of tunneling on the interface: either <b>enabled</b> or <b>disabled</b> .         |

## Sample Output

### show lldp local-information (EX Series Switch)

```
user@switch> show lldp local-information
```

#### LLDP Local Information details

```
Chassis ID   : 00:1d:b5:aa:b9:f0
System name  : switch
System descr : Juniper Networks, Inc. ex8208 , version 10.4I0 [builder] Build
               date: 2010-11-17 12:38:30 UTC
```

#### System Capabilities

```
Supported   : Bridge Router
Enabled     : Bridge Router
```

#### Management Information

```
Port Name    : -
Port Address : 10.93.54.6
Address Type  : IPv4
Port ID       : 34
Port ID Subtype : local(7)
Port Subtype  : ifIndex(2)
```

| Interface name | Parent Interface | SNMP Index | Interface description | Status | Tunneling |
|----------------|------------------|------------|-----------------------|--------|-----------|
| me0.0          | -                | 34         | -                     | Down   | Disabled  |
| xe-3/0/0.0     | ae31.0           | 769        | xe-3/0/0.0            | Up     | Disabled  |
| xe-3/0/1.0     | ae31.0           | 770        | xe-3/0/1.0            | Up     | Disabled  |
| xe-3/0/2.0     | ae31.0           | 771        | xe-3/0/2.0            | Up     | Disabled  |
| xe-3/0/3.0     | ae31.0           | 772        | xe-3/0/3.0            | Up     | Disabled  |
| xe-3/0/4.0     | ae31.0           | 577        | xe-3/0/4.0            | Up     | Disabled  |
| xe-3/0/5.0     | ae31.0           | 578        | xe-3/0/5.0            | Up     | Disabled  |
| xe-3/0/6.0     | ae31.0           | 579        | xe-3/0/6.0            | Up     | Disabled  |
| xe-3/0/7.0     | ae31.0           | 581        | xe-3/0/7.0            | Up     | Disabled  |

## show lldp neighbors

**Syntax** <show lldp *neighbors*>  
<interface *interface-ids*>

**Release Information** Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Display learned information about Link Layer Discovery Protocol (LLDP) on all neighboring interfaces or on selected interfaces.

**Options** **none**—Display learned LLDP information on all neighboring interfaces and devices.

**interface *interface-ids***—(Optional) Display learned LLDP information on the selected interfaces or devices.

**NOTE:** When a port with DCBX enabled begins to exchange type, length, and value (TLV) entries, optional LLDP TLVs on that port are not advertised to neighbors in order to interoperate with a wider variety of converged network adapters (CNAs). As a result, information for those ports will not be listed in the output for this command.

**Output Fields** [Table 140 on page 1997](#) lists the output fields for the **show lldp neighbors** command. Output fields are listed in the approximate order in which they appear.

**Table 140: show lldp neighbors Output Fields**

| Field Name       | Field Description                                                                                        |
|------------------|----------------------------------------------------------------------------------------------------------|
| Local Interface  | List of local interfaces for which neighbor information is available.                                    |
| Parent Interface | List of aggregated Ethernet interfaces, if any, to which the local interfaces belong.                    |
| Chassis ID       | List of chassis identifiers for neighbors.                                                               |
| Port info        | List of port information gathered from neighbors. This could be the port identifier or port description. |
| System name      | List of system names gathered from neighbors.                                                            |

Table 140: show lldp neighbors Output Fields (*continued*)

| Field Name                       | Field Description                                                                                                                                                                                                                                                     |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>LLDP Neighbor Information</b> | Information about both the local system (the switch) and a neighbor system on the interface (appears when the <b>interface</b> option is used).                                                                                                                       |
| <b>Local Information</b>         | Information about the local system (appears when the <b>interface</b> option is used).                                                                                                                                                                                |
| <b>Index</b>                     | Local interface index (appears when the <b>interface</b> option is used).                                                                                                                                                                                             |
| <b>Time to live</b>              | Number of seconds for which this information is valid (appears when the <b>interface</b> option is used).                                                                                                                                                             |
| <b>Time mark</b>                 | Date and timestamp of information (appears when the <b>interface</b> option is used).                                                                                                                                                                                 |
| <b>Local Interface</b>           | Name of the local physical interface (appears when the <b>interface</b> option is used).                                                                                                                                                                              |
| <b>Parent Interface</b>          | Name of the aggregated Ethernet interface, if any, to which the interface belongs (appears when the <b>interface</b> option is used).                                                                                                                                 |
| <b>Local Port ID</b>             | Local interface SNMP index (appears when the <b>interface</b> option is used).                                                                                                                                                                                        |
| <b>Ageout Count</b>              | Number of times the complete set of information advertised by the neighbor has been deleted from LLDP neighbor information maintained by the local system because the information timeliness interval has expired (appears when the <b>interface</b> option is used). |
| <b>Neighbor Information</b>      | Information about a neighbor system on the interface (appears when the <b>interface</b> option is used).                                                                                                                                                              |
| <b>Chassis type</b>              | Type of chassis identifier supplied, such as <b>MAC address</b> (appears when the <b>interface</b> option is used).                                                                                                                                                   |
| <b>Chassis ID</b>                | Chassis identifier of the chassis type listed (appears when the <b>interface</b> option is used).                                                                                                                                                                     |
| <b>Port type</b>                 | Type of port identifier supplied, such as <b>locally assigned</b> (appears when the <b>interface</b> option is used).                                                                                                                                                 |
| <b>Port ID</b>                   | Port identifier of the port type listed (appears when the <b>interface</b> option is used).                                                                                                                                                                           |
| <b>Port description</b>          | Port description (appears when the <b>interface</b> option is used).                                                                                                                                                                                                  |
| <b>System name</b>               | Name supplied by the system on the interface (appears when the <b>interface</b> option is used).                                                                                                                                                                      |
| <b>System Description</b>        | Description supplied by the system on the interface (appears when the <b>interface</b> option is used).                                                                                                                                                               |

Table 140: show lldp neighbors Output Fields (*continued*)

| Field Name          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| System capabilities | Capabilities (such as <b>Bridge</b> , <b>Router</b> , and <b>Telephone</b> ) that are supported or enabled by the system on the interface (appears when the <b>interface</b> option is used).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Management Info     | <p>Details of management information: <b>Type</b> (such as <b>ipv4</b> or <b>ipv6</b>), <b>Address</b> (such as <b>10.204.34.35</b>), <b>Port ID</b>, <b>Subtype</b>, <b>Interface Subtype</b>, and organization identifier (<b>OID</b>) (appears when the <b>interface</b> option is used).</p> <p>The <b>Interface Subtype</b> displays:</p> <ul style="list-style-type: none"> <li>• <b>ifindex(2)</b>—IP address of the neighbor's management Ethernet interface (<b>me0</b>) or virtual management Ethernet (<b>VME</b>) interface address (for a virtual chassis) is used to manage the switch.</li> <li>• <b>unknown(1)</b>—Neighbor's IP management address has been configured with set <b>protocols lldp management-address</b>.</li> </ul> |
| Media Info          | Additional details about the endpoint device appear when a device that supports LLDP-MED is attached to the interface. The specific details depend upon the capabilities of the device. Details might include <b>Media endpoint class</b> (such as Class 3 for communication devices such as IP phones), <b>MED Hardware revision</b> , <b>MED Firmware revision</b> , <b>MED Software revision</b> , <b>MED Serial number</b> , <b>MED Manufacturer name</b> , or <b>MED Model name</b> .                                                                                                                                                                                                                                                            |
| Organization Info   | One or more entries listing remote information by organizationally unique identifier ( <b>OUI</b> ), <b>Subtype</b> , <b>Index</b> , and <b>Info</b> (appears when the <b>interface</b> option is used).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Age                 | How long the neighbor has been identified (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Local Interface     | Name of the local physical interface (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Parent Interface    | Name of the aggregated Ethernet interface, if any, to which the interface belongs (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Chassis ID          | Chassis identifier of the chassis type listed (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Port description    | Port description (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| System name         | NetBIOS name of the host (appears when the <b>interface</b> option is used and NetBIOS snooping is enabled on the switch).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

## Sample Output

### show lldp neighbors

```
user@switch> show lldp neighbors
```

| Local Interface | Parent Interface | Chassis Id        | Port info  | System Name |
|-----------------|------------------|-------------------|------------|-------------|
| xe-3/0/4.0      | ae31.0           | b0:c6:9a:63:80:40 | xe-0/0/0.0 | newyork31   |
| xe-3/0/5.0      | ae31.0           | b0:c6:9a:63:80:40 | xe-0/0/1.0 | newyork31   |
| xe-3/0/6.0      | ae31.0           | b0:c6:9a:63:80:40 | xe-0/0/2.0 | newyork31   |
| xe-3/0/7.0      | ae31.0           | b0:c6:9a:63:80:40 | xe-0/0/3.0 | newyork31   |
| xe-3/0/0.0      | ae31.0           | b0:c6:9a:63:80:40 | xe-0/1/0.0 | newyork31   |
| xe-3/0/1.0      | ae31.0           | b0:c6:9a:63:80:40 | xe-0/1/1.0 | newyork31   |

| xe-3/0/3.0      | ae31.0           | b0:c6:9a:63:80:40 | xe-0/1/3.0 | newyork31   |

### show lldp neighbors interface

user@switch> show lldp neighbors interface ge-0/0/2

#### LLDP Neighbor Information:

##### Local Information:

Index: 1 Time to live: 240 Time mark: Wed Dec 1 10:23:24 2010 Age: 29 secs  
 Local Interface : ge-0/0/2.0  
 Parent Interface : -  
 Local Port ID : 507  
 Ageout Count : 0

##### Neighbour Information:

Chassis type : Mac address  
 Chassis ID : 00:1f:12:38:7f:c0  
 Port type : Locally assigned  
 Port ID : 507  
 Port description : ge-0/0/2.0  
 System name : bng-148p5-dev

System Description : Juniper Networks, Inc. ex4200-48p , version 10.4I0 Build  
 date: 2010-11-30 09:32:17 UTC

##### System capabilities

Supported : Bridge Router  
 Enabled : Bridge Router

##### Management Info

Type : IPv4  
 Address : 10.204.96.235  
 Port ID : 34  
 Subtype : 1  
 Interface Subtype : ifIndex(2)  
 OID : 1.3.6.1.2.1.31.1.1.1.1.34

Media endpoint class: Network Connectivity

##### Organization Info

OUI : 0.12.f  
 Subtype : 1  
 Index : 1  
 Info : 22A8360000

##### Organization Info

OUI : 0.12.f  
 Subtype : 2  
 Index : 2  
 Info : 030100

## show lldp statistics

|                                 |                                                                                                                                                                                     |

## ssh

**List of Syntax**   [Syntax on page 2011](#)  
[Syntax \(EX Series Switch and the QFX Series\) on page 2011](#)

**Syntax**   `ssh host`  
                   `<bypass-routing>`  
                   `<inet | inet6>`  
                   `<interface interface-name>`  
                   `<logical-system logical-system-name>`  
                   `<routing-instance routing-instance-name>`  
                   `<source address>`  
                   `<v1 | v2>`

**Syntax (EX Series Switch and the QFX Series)**   `ssh host`  
                                                   `<bypass-routing>`  
                                                   `<inet | inet6>`  
                                                   `<interface interface-name>`  
                                                   `<routing-instance routing-instance-name>`  
                                                   `<source address>`  
                                                   `<v1 | v2>`

**Release Information**   Command introduced before Junos OS Release 7.4.  
                                   Command introduced in Junos OS Release 9.0 for EX Series switches.  
                                   Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**   Use the SSH program to open a connection between a local router or switch and a remote system and execute commands on the remote system. You can issue the **ssh** command from the Junos OS CLI to log in to a remote system or from a remote system to log in to the local router or switch. When executing this command, you include one or more CLI commands by enclosing them in quotation marks and separating the commands with semicolons:

```
ssh address 'cli-command1 ; cli-command2 '
```

**Options**   **host**—Name or address of the remote system.

**bypass-routing**—(Optional) Bypass the normal routing tables and send ping requests directly to a system on an attached network. If the system is not on a directly attached network, an error is returned. Use this option to ping a local system through an interface that has no route through it.

**inet | inet6**—(Optional) Create an IPv4 or IPv6 connection, respectively.

**interface interface-name**—(Optional) Interface name for the SSH session. (This option does not work when **default-address-selection** is configured at the **[edit system]** hierarchy level, because this configuration uses the loopback interface as the source address for all locally generated IP packets.)

**logical-system logical-system-name**—(Optional) Name of a particular logical system for the SSH attempt.

**routing-instance** *routing-instance-name*—(Optional) Name of the routing instance for the SSH attempt.

**source address**—(Optional) Source address of the SSH connection.

**v1 | v2**—(Optional) Use SSH version 1 or 2, respectively, when connecting to a remote host.

**Additional Information** To configure an SSH (version 1) key for your user account, include the **authentication ssh-rsa** statement at the **[edit system login user *user-name*]** hierarchy level. To configure an SSH (version 2) key for your user account, include the **authentication dsa-rsa** statement at the **[edit system login user *user-name*]** hierarchy level.

You can limit the number of times a user can attempt to enter a password while logging in through SSH. To specify the number of times a user can attempt to enter a password to log in through SSH, include the **retry-options** statement at the **[edit system login]** hierarchy level. For details, see the .

**Required Privilege Level** network

### Overview of Layer 2 Networking

Layer 2, also known as the Data Link Layer, is the second level in the seven-layer OSI reference model for network protocol design. Layer 2 is equivalent to the link layer (the lowest layer) in the TCP/IP network model. Layer 2 is the network layer used to transfer data between adjacent network nodes in a wide area network or between nodes on the same local area network.

A *frame* is a protocol data unit, the smallest unit of bits on a Layer 2 network. Frames are transmitted to and received from devices on the same local area network (LAN). Unlike bits, frames have a defined structure and can be used for error detection, control plane activities and so forth. Not all frames carry user data. The network uses some frames to control the data link itself..

At Layer 2, *unicast* refers to sending frames from one node to a single other node, whereas *multicast* denotes sending traffic from one node to multiple nodes, and *broadcasting* refers to the transmission of frames to all nodes in a network. A *broadcast domain* is a logical division of a network in which all nodes of that network can be reached at Layer 2 by a broadcast.

Segments of a LAN can be linked at the frame level using *bridges*. Bridging creates separate broadcast domains on the LAN, creating VLANs, which are independent logical networks that group together related devices into separate network segments. The grouping of devices on a VLAN is independent of where the devices are physically located in the LAN. Without bridging and VLANs, all devices on the Ethernet LAN are in a single broadcast domain, and all the devices detect all the packets on the LAN.

*Forwarding* is the relaying of packets from one network segment to another by nodes in the network. On a VLAN, a frame whose origin and destination are in the same VLAN are forwarded only within the local VLAN. A network segment is a portion of a computer network wherein every device communicates using the same physical layer.

Layer 2 contains two sublayers:

- Logical link control (LLC) sublayer, which is responsible for managing communications links and handling frame traffic.
- Media access control (MAC) sublayer, which governs protocol access to the physical network medium. By using the MAC addresses that are assigned to all ports on a switch, multiple devices on the same physical link can uniquely identify one another.

The ports, or interfaces, on a switch operate in either access mode, tagged-access, or trunk mode:

- *Access mode* ports connect to a network device such as a desktop computer, an IP telephone, a printer, a file server, or a security camera. The port itself belongs to a single VLAN. The frames transmitted over an access interface are normal Ethernet frames. By default, all ports on a switch are in access mode.
- *Tagged-Access mode* ports connect to a network device such as a desktop computer, an IP telephone, a printer, a file server, or a security camera. The port itself belongs to a single VLAN. The frames transmitted over an access interface are normal Ethernet frames. By default, all ports on a switch are in access mode. Tagged-access mode accommodates cloud computing, specifically scenarios including virtual machines or virtual computers. Because several virtual computers can be included on one physical server, the packets generated by one server can contain an aggregation of VLAN packets from different virtual machines on that server. To accommodate this situation, tagged-access mode reflects packets back to the physical server on the same downstream port when the destination address of the packet was learned on that downstream port. Packets are also reflected back to the physical server on the downstream port when the destination has not yet been learned. Therefore, the third interface mode, tagged access, has some characteristics of access mode and some characteristics of trunk mode:
- *Trunk mode* ports handle traffic for multiple VLANs, multiplexing the traffic for all those VLANs over the same physical connection. Trunk interfaces are generally used to interconnect switches to other devices or switches.

With native VLAN configured, frames that do not carry VLAN tags are sent over the trunk interface. If you have a situation where packets pass from a device to a switch in access mode, and you want to then send those packets from the switch over a trunk port, use native VLAN mode. Configure the single VLAN on the switch's port (which is in access mode) as a native VLAN. The switch's trunk port will then treat

those frames differently than the other tagged packets. For example, if a trunk port has three VLANs, 10, 20, and 30, assigned to it with VLAN 10 being the native VLAN, frames on VLAN 10 that leave the trunk port on the other end have no 802.1Q header (tag). There is another native VLAN option. You can have the switch add and remove tags for untagged packets. To do this, you first configure the single VLAN as a native VLAN on a port attached to a device on the edge. Then, assign a VLAN ID tag to the single native VLAN on the port connected to a device. Last, add the VLAN ID to the trunk port. Now, when the switch receives the untagged packet, it adds the ID you specified and sends and receives the tagged packets on the trunk port configured to accept that VLAN.

Including the sublayers, Layer 2 on the QFX Series supports the following functionality:

- Unicast, multicast, and broadcast traffic.
- Bridging.
- VLAN 802.1Q—Also known as *VLAN tagging*, this protocol allows multiple bridged networks to transparently share the same physical network link by adding VLAN tags to an Ethernet frame.
- Extension of Layer 2 VLANs across multiple switches using Spanning Tree Protocol (STP) prevents looping across the network.
- *MAC learning*, including per-VLAN MAC learning and Layer 2 learning suppression—This process obtains the MAC addresses of all the nodes on a network
- Link aggregation—This process groups of Ethernet interfaces at the physical layer to form a single link layer interface, also known as a *link aggregation group (LAG)* or LAG bundle
- Storm control on the physical port for unicast, multicast, and broadcast
- STP support, including 802.1d, RSTP, MSTP, and Root Guard

---

## History of VLANs

Ethernet LANs were originally designed for small, simple networks that primarily carried text. However, over time, the type of data carried by LANs grew to include voice, graphics, and video. This more complex data, when combined with the ever-increasing speed of transmission, eventually became too much of a load for the original Ethernet LAN design. Multiple packet collisions were significantly slowing down the larger LANs.

The IEEE 802.1D-2004 standard helped evolve Ethernet LANs to cope with the higher data and transmission requirements by defining the concept of *transparent bridging* (generally called simply *bridging*). Bridging divides a single physical LAN (now called a single *broadcast domain*) into two or more virtual LANs, or VLANs. Each VLAN is a collection of some of the LAN nodes grouped together to form individual broadcast domains.

When VLANs are grouped logically by function or organization, a significant percentage of data traffic stays within the VLAN. This relieves the load on the LAN because all traffic no longer has to be forwarded to all nodes on the LAN. A VLAN first transmits packets within the VLAN, thereby reducing the number of packets transmitted on the entire LAN. Because packets whose origin and destination are in the same VLAN are forwarded only within the local VLAN, packets that are not destined for the local VLAN are the only ones forwarded to other broadcast domains. This way, bridging and VLANs limit the amount of traffic flowing across the entire LAN by reducing the possible number of collisions and packet retransmissions within VLANs and on the LAN as a whole.

---

## How Bridging of VLAN Traffic Works

Because the objective of the IEEE 802.1D-2004 standard was to reduce traffic and therefore reduce potential transmission collisions for Ethernet, a system was implemented to reuse information. Instead of having a switch go through a location process every time a frame is sent to a node, the transparent bridging protocol allows a switch to record the location of known nodes. When packets are sent to nodes, those destination node locations are stored in address-lookup tables called *Ethernet switching tables*. Before sending a packet, a switch using bridging first consults the switching tables to see if that node has already been located. If the location of a node is known, the frame is sent directly to that node.

Transparent bridging uses five mechanisms to create and maintain Ethernet switching tables on the switch:

- Learning
- Forwarding
- Flooding

- Filtering
- Aging

The key bridging mechanism used by LANs and VLANs is *learning*. When a switch is first connected to an Ethernet LAN or VLAN, it has no information about other nodes on the network. As packets are sent, the switch learns the embedded MAC addresses of the sending nodes and stores them in the Ethernet switching table, along with two other pieces of information—the interface (or port) on which the traffic was received on the destination node and the time the address was learned.

Learning allows switches to then do *forwarding*. By consulting the Ethernet switching table to see whether the table already contains the frame's destination MAC address, switches save time and resources when forwarding packets to the known MAC addresses. If the Ethernet switching table does not contain an entry for an address, the switch uses flooding to learn that address.

*Flooding* finds a particular destination MAC address without using the Ethernet switching table. When traffic originates on the switch and the Ethernet switching table does not yet contain the destination MAC address, the switch first floods the traffic to all other interfaces within the VLAN. When the destination node receives the flooded traffic, it can send an acknowledgment packet back to the switch, allowing it to learn the MAC address of the node and add the address to its Ethernet switching table.

*Filtering*, the fourth bridging mechanism, is how broadcast traffic is limited to the local VLAN whenever possible. As the number of entries in the Ethernet switching table grows, the switch pieces together an increasingly complete picture of the VLAN and the larger LAN—it learns which nodes are in the local VLAN and which are on other network segments. The switch uses this information to filter traffic. Specifically, for traffic whose source and destination MAC addresses are in the local VLAN, filtering prevents the switch from forwarding this traffic to other network segments.

To keep entries in the Ethernet switching table current, the switch uses a fifth bridging mechanism, *aging*. Aging is the reason that the Ethernet switching table entries include timestamps. Each time the switch detects traffic from a MAC address, it updates the timestamp. A timer on the switch periodically checks the timestamp, and if it is older than a user-configured value, the switch removes the node's MAC address from the Ethernet switching table. This aging process eventually flushes unavailable network nodes out of the Ethernet switching table.

### Packets Are Either Tagged or Untagged

When an Ethernet LAN is divided into VLANs, each VLAN is identified by a unique 802.1Q ID. The number of available VLANs and VLAN IDs are listed below:

- On a switch running ELS software, you can configure 4093 VLANs.
- On a switch running non-ELS software, you can configure 4091 VLANs.

Ethernet packets include a tag protocol identifier (TPID) EtherType field, which identifies the protocol being transported. When a device within a VLAN generates a packet, this field includes a value of 0x8100, which indicates that the packet is a VLAN-tagged packet.

The packet also has a VLAN ID field that includes the unique 802.1Q ID, which identifies the VLAN to which the packet belongs.

In addition to the TPID EtherType value of 0x8100, switches that run Junos OS that does not support the Enhanced Layer 2 Software (ELS) configuration style also support values of 0x88a8 (Provider Bridging and Shortest Path Bridging) and 0x9100 (Q-in-Q).

For a simple network that has only a single VLAN, all packets include a default 802.1Q tag, which is the only VLAN membership that does not mark the packet as tagged. These packets are untagged packets.

### Switch Interface Modes—Access, Trunk, or Tagged Access

---

Ports, or interfaces, on a switch operate in one of three modes:

- Access mode
- Trunk mode
- Tagged-access mode

#### **Access Mode**

An interface in access mode connects a switch to a single network device, such as a desktop computer, an IP telephone, a printer, a file server, or a security camera. Access interfaces accept only untagged packets.

By default, when you boot a switch that runs Junos OS that does not support ELS and use the factory default configuration, or when you boot such a switch and do not explicitly configure a port mode, all interfaces on the switch are in access mode and accept only untagged packets from the VLAN named **default**. You can optionally configure another VLAN and use that VLAN instead of **default**.

On a switch that runs Junos OS that supports ELS, the VLAN named **default** is not supported. Therefore, on such switches, you must explicitly configure at least one VLAN, even if your network is simple and you want only one broadcast domain to exist. After you assign an interface to a VLAN, the interface functions in access mode.

For switches that run either type of software, you can also configure a trunk port or interface to accept untagged packets from a user-configured VLAN. For details about this concept (native VLAN), see [“Trunk Mode and Native VLAN” on page 2021](#).

#### **Trunk Mode**

Trunk mode interfaces are generally used to connect switches to one another. Traffic sent between switches can then consist of packets from multiple VLANs, with those packets multiplexed so that they can be sent over the same physical connection. Trunk interfaces usually accept only tagged packets and use the VLAN ID tag to determine both the packets' VLAN origin and VLAN destination.

On a switch that runs software that does not support ELS, an untagged packet is not recognized on a trunk port unless you configure additional settings on that port.

On a switch that runs Junos OS that supports ELS, a trunk port recognizes untagged control packets for protocols such as the Link Aggregation Control Protocol (LACP) and the Link Layer Discovery Protocol (LLDP). However, the trunk port does not recognize untagged data packets unless you configure additional settings on that port.

In the rare case where you want untagged packets to be recognized by a trunk port on switches that run either type of software, you must configure the single VLAN on a trunk port as a *native VLAN*. For more information about native VLANs, see [“Trunk Mode and Native VLAN” on page 2021](#).

### **Trunk Mode and Native VLAN**

On a switch that runs Junos OS that does not support ELS, a trunk port does not recognize packets that do not include VLAN tags, which are also known as untagged packets. On a switch that runs Junos OS that supports ELS, a trunk port recognizes untagged control packets, but it does not recognize untagged data packets. With native VLAN configured, untagged packets that a trunk port normally does not recognize are sent over the trunk interface. In a situation where packets pass from a device, such as an IP phone or printer, to a switch in access mode, and you want those packets sent from the switch over a trunk port, use native VLAN mode. Create a native VLAN by configuring a VLAN ID for it, and specify that the trunk port is a member of the native VLAN.

The switch's trunk port will then treat those packets differently than the other tagged packets. For example, if a trunk port has three VLANs, 10, 20, and 30, assigned to it with VLAN 10 being the native VLAN, packets on VLAN 10 that leave the trunk port on the other end have no 802.1Q header (tag).

There is another native VLAN option for switches that do not support ELS. You can have the switch add and remove tags for untagged packets. To do this, you first configure the single VLAN as a native VLAN on a port attached to a device on the edge. Then, assign a VLAN ID tag to the single native VLAN on the port connected to a device. Last, add the VLAN ID to the trunk port. Now, when the switch receives the untagged packet, it adds the ID you specified and sends and receives the tagged packets on the trunk port configured to accept that VLAN.

### **Tagged-Access Mode**

Only switches that run Junos OS that does not use the ELS configuration style support tagged-access mode. Tagged-access mode accommodates cloud computing, specifically scenarios including virtual machines or virtual computers. Because several virtual computers can be included on one physical server, the packets generated by one server can contain an aggregation of VLAN packets from different virtual machines on that server. To accommodate this situation, tagged-access mode reflects packets back to the physical server on the same downstream port when the destination address of the packet was learned on that downstream port. Packets are also reflected back to the physical server on the downstream port when the destination has not yet been learned. Therefore, the third interface mode, tagged access, has some characteristics of access mode and some characteristics of trunk mode:

- Like access mode, tagged-access mode connects the switch to an access layer device. Unlike access mode, tagged-access mode is capable of accepting VLAN tagged packets.

- Like trunk mode, tagged-access mode accepts VLAN tagged packets from multiple VLANs. Unlike trunk port interfaces, which are connected at the core/distribution layer, tagged-access port interfaces connect devices at the access layer.

Like trunk mode, tagged-access mode also supports native VLAN.

**NOTE:** Control packets are never reflected back on the downstream port.

---

### Additional Advantages of Using VLANs

In addition to reducing traffic and thereby speeding up the network, VLANs have the following advantages:

- VLANs provide segmentation services traditionally provided by routers in LAN configurations, thereby reducing hardware equipment costs.
- Packets coupled to a VLAN can be reliably identified and sorted into different domains. You can contain broadcasts within parts of the network, thereby freeing up network resources. For example, when a DHCP server is plugged into a switch and starts broadcasting its presence, you can prevent some hosts from accessing it by using VLANs to split up the network.
- For security issues, VLANs provide granular control of the network because each VLAN is identified by a single IP subnetwork. All packets passing in and out of a VLAN are consistently tagged with the VLAN ID of that VLAN, thereby providing easy identification, because a VLAN ID on a packet cannot be altered. (For a switch that runs Junos OS that does not support ELS, we recommend that you avoid using 1 as a VLAN ID, because that ID is a default value.)
- VLANs react quickly to host relocation—this is also due to the persistent VLAN tag on packets.
- On an Ethernet LAN, all network nodes must be physically connected to the same network. In VLANs, the physical location of nodes is not important—you can group network devices in any way that makes sense for your organization, such as by department or business function, types of network nodes, or physical location.

---

### Maximum VLANs and VLAN Members Per Switch

The number of VLANs supported per switch varies for each switch. Use the configuration-mode command **set vlans *vlan-name* *vlan-id* ?** to determine the maximum number of VLANs allowed on a switch. You cannot exceed this VLAN limit because you have to assign a specific ID number when you create a VLAN—you could overwrite one of the numbers, but you cannot exceed the limit.

You can, however, exceed the recommended VLAN member maximum for a switch.

On a switch that runs Junos OS that does not support the ELS configuration style, the maximum number of VLAN members allowed on the switch is eight times the maximum number of VLANs that the switch supports ( $\text{vmember limit} = \text{vlan max} * 8$ ). If the configuration of the switch exceeds the recommended VLAN member maximum, a

warning message appears when you commit the configuration. If you commit the configuration despite the warning, the commit succeeds, but there is a risk of the Ethernet switching process (eswd) failing as a result of memory allocation failure.

On a switch that runs Junos OS that supports ELS, the maximum number of VLAN members allowed on the switch is 24 times the maximum number of VLANs that the switch supports ( $\text{vmember limit} = \text{vlan max} * 24$ ). If the configuration of the switch exceeds the recommended VLAN member maximum, a warning message appears in the system log (syslog).

A QFabric system supports up to 131,008 VLAN members (vmembers) on a single network node group, server node group, or redundant server node group. The number of vmembers is calculated by multiplying the maximum number of VLANs by 32.

For example, to calculate how many interfaces are required to support 4,000 VLANs, divide the maximum number of vmembers (128,000) by the number of configured VLANs (4,000). In this case, 32 interfaces are required.

On network Node groups and server Node groups, you can configure link aggregation groups (LAGs) across multiple interfaces. Each LAG and VLAN combination is considered a vmember.

A Virtual Chassis Fabric supports up to 512,000 vmembers. The number of vmembers is based on the number of VLANs, and the number of interfaces configured in each VLAN.

### A Default VLAN Is Configured on Most Switches

Some switches that run Junos OS that do not support the ELS configuration style are preconfigured with a VLAN named **default** that does not tag packets and operates only with untagged packets. On these switches, each interface already belongs to the VLAN named **default** and all traffic uses this VLAN until you configure more VLANs and assign traffic to those VLANs.

**NOTE:** When a Juniper Networks QFX3500 or QFX3600 switch is interconnected with other switches in a Virtual Chassis configuration, each individual switch that is included as a member of the configuration is identified with a member ID. The member ID functions as an FPC slot number. When you are configuring interfaces for a Virtual Chassis configuration, you specify the appropriate member ID (0 through 9) as the slot element of the interface name. The default factory settings for a Virtual Chassis configuration include FPC 0 as a member of the default VLAN because FPC 0 is configured as part of the ethernet-switching family. In order to include FPC 1 through FPC 9 in the default VLAN, add the ethernet-switching family to the configurations for those interfaces.

### Assigning Traffic to VLANs

You can assign traffic on any switch to a particular VLAN by referencing either the interface port of the traffic or the MAC addresses of devices sending traffic.

### ***Assign VLAN Traffic According to the Interface Port Source***

This method is most commonly used to assign traffic to VLANs. In this case, you specify that all traffic received on a particular switch interface is assigned to a specific VLAN. You configure this VLAN assignment when you configure the switch, by using either the VLAN number (called a VLAN ID) or by using the VLAN name, which the switch then translates into a numeric VLAN ID. This method is referred to simply as creating a VLAN because it is the most commonly used method.

### ***Assign VLAN Traffic According to the Source MAC Address***

In this case, all traffic received from a specific MAC address is forwarded to a specific egress interface (next hop) on the switch. MAC-based VLANs are either static (named MAC addresses configured one at a time) or dynamic (configured using a RADIUS server).

To configure a static MAC-based VLAN on a switch that supports ELS, see *Adding a Static MAC Address Entry to the Ethernet Switching Table (CLI Procedure)*. To configure a static MAC-based VLAN on a switch that does not support ELS, see *Adding a Static MAC Address Entry to the Ethernet Switching Table (CLI Procedure)*.

## **Forwarding VLAN Traffic**

---

To pass traffic within a VLAN, the switch uses Layer 2 forwarding protocols, including IEEE 802.1Q spanning-tree protocols.

To pass traffic between two VLANs, the switch uses standard Layer 3 routing protocols, such as static routing, OSPF, and RIP. The same interfaces that support Layer 2 bridging protocols also support Layer 3 routing protocols, providing multilayer switching.

To pass traffic from a single device on an access port to a switch and then pass those packets on a trunk port, use the native mode configuration previously discussed under [“Trunk Mode” on page 2020](#).

## **VLANs Communicate with Integrated Routing and Bridging Interfaces or Routed VLAN Interfaces**

---

Traditionally, switches sent traffic to hosts that were part of the same broadcast domain (VLAN) but routers were needed to route traffic from one broadcast domain to another. Also, only routers performed other Layer 3 functions such as traffic engineering.

Switches that run Junos OS that supports the ELS configuration style perform inter-VLAN routing functions using an integrated routing and bridging (IRB) interface named `irb`, while switches that run Junos OS that does not support ELS perform these functions using a routed VLAN interface (RVI) named `vlan`. These interfaces detect both MAC addresses and IP addresses and route data to Layer 3 interfaces, thereby frequently eliminating the need to have both a switch and a router.

## Understanding Unicast

*Unicasting* is the act of sending data from one node of the network to another. In contrast, multicast transmissions send traffic from one data node to multiple other data nodes.

*Unknown unicast* traffic consists of unicast frames with unknown destination MAC addresses. By default, the switch floods these unicast frames that are traveling in a VLAN to all interfaces that are members of the VLAN. Forwarding this type of traffic to interfaces on the switch can trigger a security issue. The LAN is suddenly flooded with packets, creating unnecessary traffic that leads to poor network performance or even a complete loss of network service. This is known as a traffic storm.

To prevent a storm, you can disable the flooding of unknown unicast packets to all interfaces by configuring one VLAN or all VLANs to forward any unknown unicast traffic to a specific trunk interface. (This channels the unknown unicast traffic to a single interface.)

## Introduction to the Media Access Control (MAC) Layer 2 Sublayer

This topic provides an introduction to the MAC sublayer of the data link layer (Layer 2).

In Layer 2 of a network, the Media Access Control (MAC) sublayer provides addressing and channel access control mechanisms that enable several terminals or network nodes to communicate in a network.

The MAC sublayer acts as an interface between the logical link control (LLC) Ethernet sublayer and Layer 1 (the physical layer). The MAC sublayer emulates a full-duplex logical communication channel in a multipoint network. This channel may provide unicast, multicast, or broadcast communication service. The MAC sublayer uses MAC protocols to prevent collisions.

In Layer 2, multiple devices on the same physical link can uniquely identify one another at the data link layer, by using the MAC addresses that are assigned to all ports on a switch. A MAC algorithm accepts as input a secret key and an arbitrary-length message to be authenticated, and outputs a MAC address.

A MAC address is a 12-digit hexadecimal number (48 bits in long). MAC addresses are usually written in one of these formats:

- MM:MM:MM:SS:SS:SS
- MM-MM-MM-SS-SS-SS

The first half of a MAC address contains the ID number of the adapter manufacturer. These IDs are regulated by an Internet standards body. The second half of a MAC address represents the serial number assigned to the adapter by the manufacturer.

Contrast MAC addressing, which works at Layer 2, with IP addressing, which runs at Layer 3 (networking and routing). One way to remember the difference is that the MAC addresses apply to a physical or virtual node, whereas IP addresses apply to the software implementation of that node. MAC addresses are typically fixed on a per-node basis, whereas IP addresses change when the node moves from one part of the network to another.

IP networks maintain a mapping between the IP and MAC addresses of a node using the Address Resolution Protocol (ARP) table. DHCP also typically uses MAC addresses when assigning IP addresses to nodes.

## Understanding Layer 2 Broadcasting

In a Layer 2 network, *broadcasting* refers to sending traffic to all nodes on a network.

Layer 2 broadcast traffic stays within a local area network (LAN) boundary; known as the *broadcast domain*. Layer 2 broadcast traffic is sent to the broadcast domain using a MAC address of FF:FF:FF:FF:FF:FF. Every device in the broadcast domain recognizes this MAC address and passes the broadcast traffic on to other devices in the broadcast domain, if applicable. Broadcasting can be compared to unicasting (sending traffic to a single node) or multicasting (delivering traffic to a group of nodes simultaneously).

Layer 3 broadcast traffic, however, is sent to all devices in a network using a broadcast network address. For example, if your network address is 192.0.0.0, the broadcast network address is 192.255.255.255. In this case, only devices that belong to the 192.0.0.0 network receive the Layer 3 broadcast traffic. Devices that do not belong to this network drop the traffic.

Broadcasting is used in the following situations:

- Address Resolution Protocol (ARP) uses broadcasting to map MAC addresses to IP addresses. ARP dynamically binds the IP address (the logical address) to the correct MAC address. Before IP unicast packets can be sent, ARP discovers the MAC address used by the Ethernet interface where the IP address is configured.
- Dynamic Host Configuration Protocol (DHCP) uses broadcasting to dynamically assign IP addresses to hosts on a network segment or subnet.
- Routing protocols use broadcasting to advertise routes.

Excessive broadcast traffic can sometimes create a broadcast storm. A broadcast storm occurs when messages are broadcast on a network and each message prompts a receiving node to respond by broadcasting its own messages on the network. This, in turn, prompts further responses that create a snowball effect. The LAN is suddenly flooded with packets,

creating unnecessary traffic that leads to poor network performance or even a complete loss of network service.

### History of VLANs

---

Ethernet LANs were originally designed for small, simple networks that primarily carried text. However, over time, the type of data carried by LANs grew to include voice, graphics,

and video. This more complex data, when combined with the ever-increasing speed of transmission, eventually became too much of a load for the original Ethernet LAN design. Multiple packet collisions were significantly slowing down the larger LANs.

The IEEE 802.1D-2004 standard helped evolve Ethernet LANs to cope with the higher data and transmission requirements by defining the concept of *transparent bridging* (generally called simply *bridging*). Bridging divides a single physical LAN (now called a single *broadcast domain*) into two or more virtual LANs, or VLANs. Each VLAN is a collection of some of the LAN nodes grouped together to form individual broadcast domains.

When VLANs are grouped logically by function or organization, a significant percentage of data traffic stays within the VLAN. This relieves the load on the LAN because all traffic no longer has to be forwarded to all nodes on the LAN. A VLAN first transmits packets within the VLAN, thereby reducing the number of packets transmitted on the entire LAN. Because packets whose origin and destination are in the same VLAN are forwarded only within the local VLAN, packets that are not destined for the local VLAN are the only ones forwarded to other broadcast domains. This way, bridging and VLANs limit the amount of traffic flowing across the entire LAN by reducing the possible number of collisions and packet retransmissions within VLANs and on the LAN as a whole.

### How Bridging of VLAN Traffic Works

---

Because the objective of the IEEE 802.1D-2004 standard was to reduce traffic and therefore reduce potential transmission collisions for Ethernet, a system was implemented to reuse information. Instead of having a switch go through a location process every time a frame is sent to a node, the transparent bridging protocol allows a switch to record the location of known nodes. When packets are sent to nodes, those destination node locations are stored in address-lookup tables called *Ethernet switching tables*. Before sending a packet, a switch using bridging first consults the switching tables to see if that node has already been located. If the location of a node is known, the frame is sent directly to that node.

Transparent bridging uses five mechanisms to create and maintain Ethernet switching tables on the switch:

- Learning
- Forwarding
- Flooding
- Filtering
- Aging

The key bridging mechanism used by LANs and VLANs is *learning*. When a switch is first connected to an Ethernet LAN or VLAN, it has no information about other nodes on the network. As packets are sent, the switch learns the embedded MAC addresses of the sending nodes and stores them in the Ethernet switching table, along with two other pieces of information—the interface (or port) on which the traffic was received on the destination node and the time the address was learned.

Learning allows switches to then do *forwarding*. By consulting the Ethernet switching table to see whether the table already contains the frame's destination MAC address, switches save time and resources when forwarding packets to the known MAC addresses. If the Ethernet switching table does not contain an entry for an address, the switch uses flooding to learn that address.

*Flooding* finds a particular destination MAC address without using the Ethernet switching table. When traffic originates on the switch and the Ethernet switching table does not yet contain the destination MAC address, the switch first floods the traffic to all other interfaces within the VLAN. When the destination node receives the flooded traffic, it can send an acknowledgment packet back to the switch, allowing it to learn the MAC address of the node and add the address to its Ethernet switching table.

*Filtering*, the fourth bridging mechanism, is how broadcast traffic is limited to the local VLAN whenever possible. As the number of entries in the Ethernet switching table grows, the switch pieces together an increasingly complete picture of the VLAN and the larger LAN—it learns which nodes are in the local VLAN and which are on other network segments. The switch uses this information to filter traffic. Specifically, for traffic whose source and destination MAC addresses are in the local VLAN, filtering prevents the switch from forwarding this traffic to other network segments.

To keep entries in the Ethernet switching table current, the switch uses a fifth bridging mechanism, *aging*. Aging is the reason that the Ethernet switching table entries include timestamps. Each time the switch detects traffic from a MAC address, it updates the timestamp. A timer on the switch periodically checks the timestamp, and if it is older than a user-configured value, the switch removes the node's MAC address from the Ethernet switching table. This aging process eventually flushes unavailable network nodes out of the Ethernet switching table.

### Packets Are Either Tagged or Untagged

When an Ethernet LAN is divided into VLANs, each VLAN is identified by a unique 802.1Q ID. The number of available VLANs and VLAN IDs are listed below:

- On a switch running ELS software, you can configure 4093 VLANs.
- On a switch running non-ELS software, you can configure 4091 VLANs.

Ethernet packets include a tag protocol identifier (TPID) EtherType field, which identifies the protocol being transported. When a device within a VLAN generates a packet, this field includes a value of 0x8100, which indicates that the packet is a VLAN-tagged packet. The packet also has a VLAN ID field that includes the unique 802.1Q ID, which identifies the VLAN to which the packet belongs.

In addition to the TPID EtherType value of 0x8100, switches that run Junos OS that does not support the Enhanced Layer 2 Software (ELS) configuration style also support values of 0x88a8 (Provider Bridging and Shortest Path Bridging) and 0x9100 (Q-inQ).

For a simple network that has only a single VLAN, all packets include a default 802.1Q tag, which is the only VLAN membership that does not mark the packet as tagged. These packets are untagged packets.

## Switch Interface Modes—Access, Trunk, or Tagged Access

---

Ports, or interfaces, on a switch operate in one of three modes:

- Access mode
- Trunk mode
- Tagged-access mode

### **Access Mode**

An interface in access mode connects a switch to a single network device, such as a desktop computer, an IP telephone, a printer, a file server, or a security camera. Access interfaces accept only untagged packets.

By default, when you boot a switch that runs Junos OS that does not support ELS and use the factory default configuration, or when you boot such a switch and do not explicitly configure a port mode, all interfaces on the switch are in access mode and accept only untagged packets from the VLAN named **default**. You can optionally configure another VLAN and use that VLAN instead of **default**.

On a switch that runs Junos OS that supports ELS, the VLAN named **default** is not supported. Therefore, on such switches, you must explicitly configure at least one VLAN, even if your network is simple and you want only one broadcast domain to exist. After you assign an interface to a VLAN, the interface functions in access mode.

For switches that run either type of software, you can also configure a trunk port or interface to accept untagged packets from a user-configured VLAN. For details about this concept (native VLAN), see [“Trunk Mode and Native VLAN” on page 2021](#).

### **Trunk Mode**

Trunk mode interfaces are generally used to connect switches to one another. Traffic sent between switches can then consist of packets from multiple VLANs, with those packets multiplexed so that they can be sent over the same physical connection. Trunk interfaces usually accept only tagged packets and use the VLAN ID tag to determine both the packets' VLAN origin and VLAN destination.

On a switch that runs software that does not support ELS, an untagged packet is not recognized on a trunk port unless you configure additional settings on that port.

On a switch that runs Junos OS that supports ELS, a trunk port recognizes untagged control packets for protocols such as the Link Aggregation Control Protocol (LACP) and the Link Layer Discovery Protocol (LLDP). However, the trunk port does not recognize untagged data packets unless you configure additional settings on that port.

In the rare case where you want untagged packets to be recognized by a trunk port on switches that run either type of software, you must configure the single VLAN on a trunk port as a *native VLAN*. For more information about native VLANs, see [“Trunk Mode and Native VLAN” on page 2021](#).

### **Trunk Mode and Native VLAN**

On a switch that runs Junos OS that does not support ELS, a trunk port does not recognize packets that do not include VLAN tags, which are also known as untagged packets. On a switch that runs Junos OS that supports ELS, a trunk port recognizes untagged control packets, but it does not recognize untagged data packets. With native VLAN configured, untagged packets that a trunk port normally does not recognize are sent over the trunk interface. In a situation where packets pass from a device, such as an IP phone or printer, to a switch in access mode, and you want those packets sent from the switch over a trunk port, use native VLAN mode. Create a native VLAN by configuring a VLAN ID for it, and specify that the trunk port is a member of the native VLAN.

The switch's trunk port will then treat those packets differently than the other tagged packets. For example, if a trunk port has three VLANs, 10, 20, and 30, assigned to it with VLAN 10 being the native VLAN, packets on VLAN 10 that leave the trunk port on the other end have no 802.1Q header (tag).

There is another native VLAN option for switches that do not support ELS. You can have the switch add and remove tags for untagged packets. To do this, you first configure the single VLAN as a native VLAN on a port attached to a device on the edge. Then, assign a VLAN ID tag to the single native VLAN on the port connected to a device. Last, add the VLAN ID to the trunk port. Now, when the switch receives the untagged packet, it adds the ID you specified and sends and receives the tagged packets on the trunk port configured to accept that VLAN.

### **Tagged-Access Mode**

Only switches that run Junos OS that does not use the ELS configuration style support tagged-access mode. Tagged-access mode accommodates cloud computing, specifically scenarios including virtual machines or virtual computers. Because several virtual computers can be included on one physical server, the packets generated by one server can contain an aggregation of VLAN packets from different virtual machines on that server. To accommodate this situation, tagged-access mode reflects packets back to the physical server on the same downstream port when the destination address of the packet was learned on that downstream port. Packets are also reflected back to the physical server on the downstream port when the destination has not yet been learned. Therefore, the third interface mode, tagged access, has some characteristics of access mode and some characteristics of trunk mode:

- Like access mode, tagged-access mode connects the switch to an access layer device. Unlike access mode, tagged-access mode is capable of accepting VLAN tagged packets.
- Like trunk mode, tagged-access mode accepts VLAN tagged packets from multiple VLANs. Unlike trunk port interfaces, which are connected at the core/distribution layer, tagged-access port interfaces connect devices at the access layer.

Like trunk mode, tagged-access mode also supports native VLAN.

**NOTE:** Control packets are never reflected back on the downstream port.

### Additional Advantages of Using VLANs

---

In addition to reducing traffic and thereby speeding up the network, VLANs have the following advantages:

- VLANs provide segmentation services traditionally provided by routers in LAN configurations, thereby reducing hardware equipment costs.
- Packets coupled to a VLAN can be reliably identified and sorted into different domains. You can contain broadcasts within parts of the network, thereby freeing up network resources. For example, when a DHCP server is plugged into a switch and starts broadcasting its presence, you can prevent some hosts from accessing it by using VLANs to split up the network.
- For security issues, VLANs provide granular control of the network because each VLAN is identified by a single IP subnetwork. All packets passing in and out of a VLAN are consistently tagged with the VLAN ID of that VLAN, thereby providing easy identification, because a VLAN ID on a packet cannot be altered. (For a switch that runs Junos OS that does not support ELS, we recommend that you avoid using 1 as a VLAN ID, because that ID is a default value.)
- VLANs react quickly to host relocation—this is also due to the persistent VLAN tag on packets.
- On an Ethernet LAN, all network nodes must be physically connected to the same network. In VLANs, the physical location of nodes is not important—you can group network devices in any way that makes sense for your organization, such as by department or business function, types of network nodes, or physical location.

### Maximum VLANs and VLAN Members Per Switch

---

The number of VLANs supported per switch varies for each switch. Use the configuration-mode command **set vlans *vlan-name* *vlan-id* ?** to determine the maximum number of VLANs allowed on a switch. You cannot exceed this VLAN limit because you have to assign a specific ID number when you create a VLAN—you could overwrite one of the numbers, but you cannot exceed the limit.

You can, however, exceed the recommended VLAN member maximum for a switch.

On a switch that runs Junos OS that does not support the ELS configuration style, the maximum number of VLAN members allowed on the switch is eight times the maximum number of VLANs that the switch supports (vmember limit = vlan max \* 8). If the configuration of the switch exceeds the recommended VLAN member maximum, a warning message appears when you commit the configuration. If you commit the configuration despite the warning, the commit succeeds, but there is a risk of the Ethernet switching process (eswd) failing as a result of memory allocation failure.

On a switch that runs Junos OS that supports ELS, the maximum number of VLAN members allowed on the switch is 24 times the maximum number of VLANs that the switch supports (vmember limit = vlan max \* 24). If the configuration of the switch exceeds the recommended VLAN member maximum, a warning message appears in the system log (syslog).

A QFabric system supports up to 131,008 VLAN members (vmembers) on a single network node group, server node group, or redundant server node group. The number of vmembers is calculated by multiplying the maximum number of VLANs by 32.

For example, to calculate how many interfaces are required to support 4,000 VLANs, divide the maximum number of vmembers (128,000) by the number of configured VLANs (4,000). In this case, 32 interfaces are required.

On network Node groups and server Node groups, you can configure link aggregation groups (LAGs) across multiple interfaces. Each LAG and VLAN combination is considered a vmember.

A Virtual Chassis Fabric supports up to 512,000 vmembers. The number of vmembers is based on the number of VLANs, and the number of interfaces configured in each VLAN.

### A Default VLAN Is Configured on Most Switches

Some switches that run Junos OS that do not support the ELS configuration style are preconfigured with a VLAN named **default** that does not tag packets and operates only with untagged packets. On these switches, each interface already belongs to the VLAN named **default** and all traffic uses this VLAN until you configure more VLANs and assign traffic to those VLANs.

**NOTE:** When a Juniper Networks QFX3500 or QFX3600 switch is interconnected with other switches in a Virtual Chassis configuration, each individual switch that is included as a member of the configuration is identified with a member ID. The member ID functions as an FPC slot number. When you are configuring interfaces for a Virtual Chassis configuration, you specify the appropriate member ID (0 through 9) as the slot element of the interface name. The default factory settings for a Virtual Chassis configuration include FPC 0 as a member of the default VLAN because FPC 0 is configured as part of the ethernet-switching family. In order to include FPC 1 through FPC 9 in the default VLAN, add the ethernet-switching family to the configurations for those interfaces.

### Assigning Traffic to VLANs

You can assign traffic on any switch to a particular VLAN by referencing either the interface port of the traffic or the MAC addresses of devices sending traffic.

#### *Assign VLAN Traffic According to the Interface Port Source*

This method is most commonly used to assign traffic to VLANs. In this case, you specify that all traffic received on a particular switch interface is assigned to a specific VLAN. You configure this VLAN assignment when you configure the switch, by using either the VLAN number (called a VLAN ID) or by using the VLAN name, which the switch then translates into a numeric VLAN ID. This method is referred to simply as creating a VLAN because it is the most commonly used method.

### ***Assign VLAN Traffic According to the Source MAC Address***

In this case, all traffic received from a specific MAC address is forwarded to a specific egress interface (next hop) on the switch. MAC-based VLANs are either static (named MAC addresses configured one at a time) or dynamic (configured using a RADIUS server).

To configure a static MAC-based VLAN on a switch that supports ELS, see *Adding a Static MAC Address Entry to the Ethernet Switching Table (CLI Procedure)*. To configure a static MAC-based VLAN on a switch that does not support ELS, see *Adding a Static MAC Address Entry to the Ethernet Switching Table (CLI Procedure)*.

---

### **Forwarding VLAN Traffic**

To pass traffic within a VLAN, the switch uses Layer 2 forwarding protocols, including IEEE 802.1Q spanning-tree protocols.

To pass traffic between two VLANs, the switch uses standard Layer 3 routing protocols, such as static routing, OSPF, and RIP. The same interfaces that support Layer 2 bridging protocols also support Layer 3 routing protocols, providing multilayer switching.

To pass traffic from a single device on an access port to a switch and then pass those packets on a trunk port, use the native mode configuration previously discussed under [“Trunk Mode” on page 2020](#).

---

### **VLANs Communicate with Integrated Routing and Bridging Interfaces or Routed VLAN Interfaces**

Traditionally, switches sent traffic to hosts that were part of the same broadcast domain (VLAN) but routers were needed to route traffic from one broadcast domain to another. Also, only routers performed other Layer 3 functions such as traffic engineering.

Switches that run Junos OS that supports the ELS configuration style perform inter-VLAN routing functions using an integrated routing and bridging (IRB) interface named `irb`, while switches that run Junos OS that does not support ELS perform these functions using a routed VLAN interface (RVI) named `vlan`. These interfaces detect both MAC addresses and IP addresses and route data to Layer 3 interfaces, thereby frequently eliminating the need to have both a switch and a router.

## Understanding Integrated Routing and Bridging

To segment traffic on a LAN into separate broadcast domains, you create separate virtual LANs (VLANs). VLANs limit the amount of traffic flowing across the entire LAN, reducing the possible number of collisions and packet retransmissions within the LAN. For example, you might want to create a VLAN that includes the employees in a department and the resources that they use often, such as printers, servers, and so on.

Of course, you also want to allow these employees to communicate with people and resources in other VLANs. To forward packets between VLANs, you normally you need a router that connects the VLANs. However, you can accomplish this forwarding on a switch without using a router by configuring an integrated routing and bridging (IRB) interface. (These interfaces are also called routed VLAN interfaces, or RVIs). Using this approach reduces complexity and avoids the costs associated with purchasing, installing, managing, powering, and cooling another device.

An IRB is a special type of Layer 3 virtual interface named **vlan**. Like normal Layer 3 interfaces, the **vlan** interface needs a logical unit number with an IP address. In fact, to be useful an IRB needs at least two logical units and two IP addresses—you must create units with addresses in each of the subnets associated with the VLANs between which you want traffic to be routed. That is, if you have two VLANs (for example, VLAN **red** and VLAN **blue**) with corresponding subnets, your IRB must have a logical unit with an address in the subnet for **red** and a logical unit with an address in the subnet for **blue**. The switch automatically creates direct routes to these subnets and uses these routes to forward traffic between VLANs.

**NOTE:** If you are using a version of Junos OS that supports Enhanced Layer 2 Software (ELS), you can also create a Layer 3 virtual interface named **irb** instead of **vlan**—that is, both statements are supported by ELS

Table 144 on page 2035 shows values you might use when configuring an IRB:

**Table 144: Sample IRB Values**

| Property                      | Settings                                                                                                                                        |
|-------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| VLAN names and tags (IDs)     | <b>blue</b> , ID 100<br><b>red</b> , ID 200                                                                                                     |
| Subnets associated with VLANs | <b>blue</b> : 192.0.2.0/25 (addresses 192.0.2.1 through 192.0.2.126)<br><b>red</b> : 192.0.2.128/25 (addresses 192.0.2.129 through 192.0.2.254) |
| IRB name                      | interface <b>irb</b>                                                                                                                            |
| IRB units and addresses       | logical unit 100: 192.0.2.1/25<br>logical unit 200: 192.0.2.129/25                                                                              |

For the sake of consistency and to avoid confusion, Table 144 on page 2035 shows IRB logical unit numbers that match the IDs of the corresponding VLANs. However, you do

not have to assign logical unit numbers that match the VLAN IDs—you can use any values for the units. To bind the logical units of the IRB to the appropriate VLANs, you use the [l3-interface](#) statement.

Because IRBs operate at Layer 3, you can use Layer 3 services such as firewall filters or CoS rewriting with them.

[Table 145 on page 2036](#) shows the number of IRBs/RVIs that each QFX platform supports.

**Table 145: Number of Supported IRBs/RVIs by Platform**

| Platform  | Number of Supported IRBs/RVIs |
|-----------|-------------------------------|
| QFX3500   | 1200                          |
| QFX3000-G | 1024                          |
| QFX3000-M | 1024                          |

## Understanding MAC Learning

*MAC learning* is the process of obtaining the MAC addresses of all the nodes on a network.

When a node is first connected to an Ethernet LAN or VLAN, it has no information about the other nodes on the network. As data is sent through the network, data packets include a data frame listing their source and destination MAC addresses. The data frame is forwarded to a target port, which is connected to the second device. The MAC address is learned locally at the target port, which facilitates communications for frames that later enter the target port and contain addresses previously learned from a received frame.

MAC learning can also be enabled on a per-VLAN basis. See [“Example: Disabling MAC Learning in a VLAN” on page 2117](#) for further information.

By default, MAC learning is enabled on the QFX Series.

## Understanding Reflective Relay for Use with VEPA Technology

Virtual Ethernet Port Aggregator (VEPA) technology aggregates packets generated by virtual machines located on the same server and relays them to a physical switch. The physical switch then provides connectivity between the virtual machines located on the server, so the virtual machines do not communicate with one another. Offloading switching activities from a virtual switch to a physical switch reduces the computing overhead on the virtual servers and takes advantage of the security, filtering, and management features of the physical switch. Reflective relay, also known as “hairpin turn,” enables the physical switch to receive aggregated packets from the virtual machines hosted on the server through the VEPA on the downstream port and send those packets out the same downstream port from which the physical switch received them.

- [VEPA on page 2037](#)
- [Reflective Relay on page 2037](#)

### VEPA

Even though virtual machines are capable of sending packets directly to one another, it is more efficient to pass these aggregated packets from the VEPA to a physical switch. The switch can then send any packets destined for a virtual machine located on the same server to the VEPA.

### Reflective Relay

Reflective relay, also known as a “hairpin turn” or “hairpin mode,” returns aggregated packets to the VEPA by using the same downstream port that initially delivered the aggregated packets from the VEPA to the switch. Reflective relay must be configured on the interface located on the physical switch that receives aggregated packets, such as VEPA packets, because some of these packets might need to be sent back to the server if they are destined for another virtual machine on the same server.

Reflective relay only occurs in two situations:

- When the destination address of the packet was learned on that downstream port
- When the destination has not yet been learned

Reflective relay does not otherwise change the operation of the switch. If the interface to which the virtual machine is connected and the MAC address of the virtual machine packet are not yet included in the Ethernet switching table for the virtual machine's associated VLAN, an entry is added. If the source MAC address of an incoming packet under the respective VLAN is not yet present in the Ethernet switching table, the switch floods the packet on all the other ports that are members of the same VLAN, including the port on which the packet arrived.

## Understanding Private VLANs

VLANs limit broadcasts to specified users. Private VLANs (PVLANS) take this concept a step further by splitting the broadcast domain into multiple isolated broadcast subdomains and essentially putting secondary VLANs inside a primary VLAN. PVLANS restrict traffic flows through their member switch ports (called “private ports”) so that these ports communicate only with a specified uplink trunk port or with specified ports within the same VLAN. The uplink trunk port is usually connected to a router, firewall, server, or provider network. Each PVLAN typically contains many private ports that communicate only with a single uplink, thereby preventing the ports from communicating with each other.

Just like regular VLANs, PVLANS are isolated on Layer 2 and require that a Layer 3 device be used to route traffic among them. PVLANS are useful for restricting the flow of broadcast and unknown unicast traffic and for limiting the communication between known hosts. Service providers use PVLANS to keep their customers isolated from one another.

This topic explains the following concepts regarding PVLANS on the QFX Series:

- [Typical Structure and Primary Application of PVLANS on page 2038](#)
- [Using 802.1Q Tags to Identify Packets on page 2040](#)
- [Efficient Use of IP Addresses on page 2041](#)
- [PVLAN Port Types on page 2041](#)
- [Limitations of Private VLANs on page 2043](#)

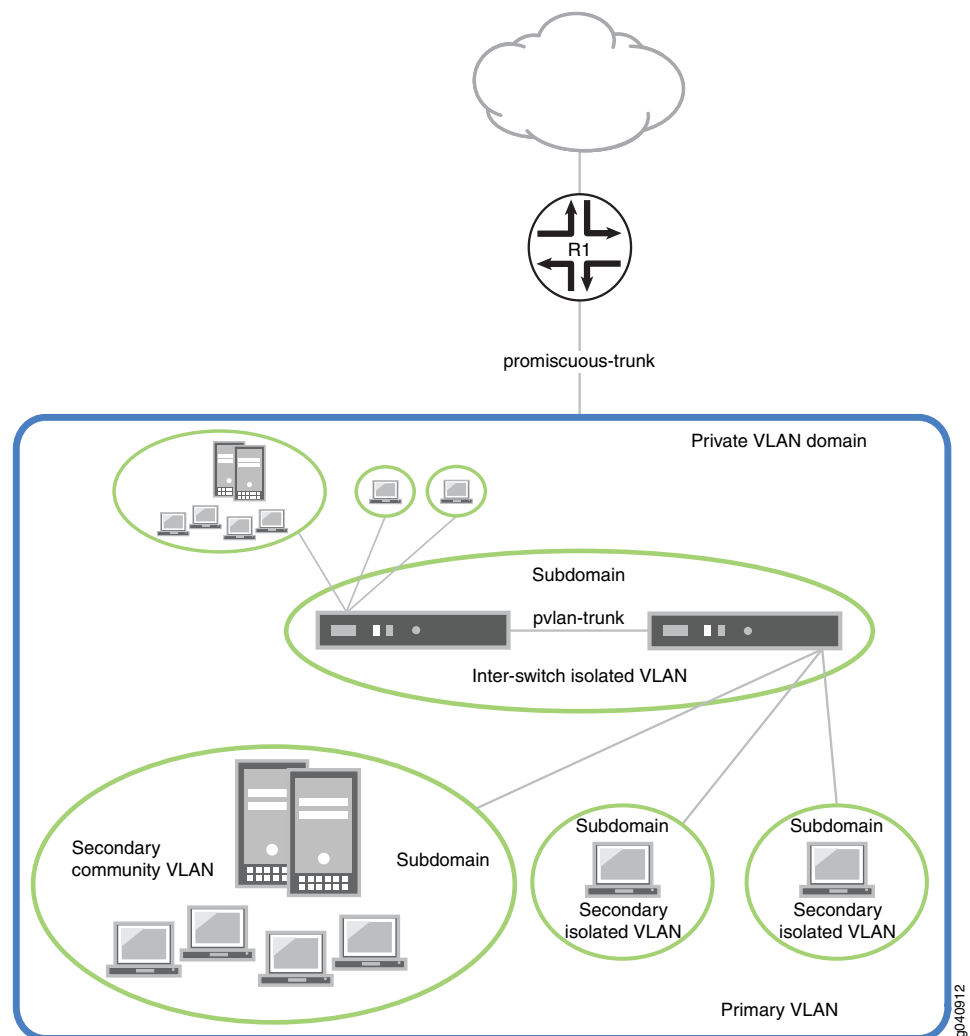

---

### Typical Structure and Primary Application of PVLANS

A PVLAN can be created on a single switch or can be configured to span multiple switches. The PVLAN shown in [Figure 56 on page 2039](#) includes two switches, with a primary PVLAN domain and various subdomains.

Figure 56: Subdomains in a PVLAN

As shown in [Figure 56 on page 2039](#), a PVLAN has only one primary domain and multiple secondary domains. The types of domains are:

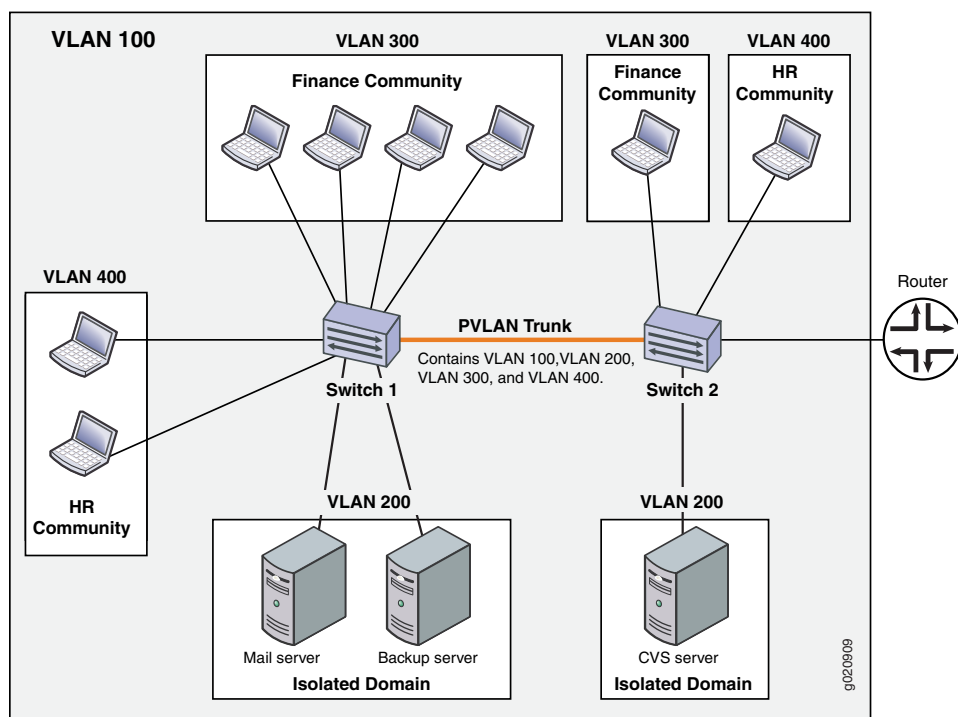

- Primary VLAN—VLAN used to forward frames downstream to isolated and community VLANs.
- Secondary isolated VLAN—VLAN that receives packets only from the primary VLAN and forwards frames upstream to the primary VLAN.
- Secondary interswitch isolated VLAN—VLAN used to forward isolated VLAN traffic from one switch to another through PVLAN trunk ports. 802.1Q tags are required for interswitch isolated VLANs because IEEE 802.1Q uses an internal tagging mechanism

by which a trunking device inserts a 4-byte VLAN frame identification tab into the packet header.

- Secondary community VLAN—VLAN used to transport frames among members of a community (a subset of users within the VLAN) and to forward frames upstream to the primary VLAN.

Figure 57 on page 2040 shows a PVLAN spanning multiple switches, where the primary VLAN (100) contains two community domains (300 and 400) and one interswitch isolated domain.

Figure 57: PVLAN Spanning Multiple Switches

**NOTE:** Primary and secondary VLANs count against the limit of 4089 VLANs supported on the QFX Series. For example, each VLAN in Figure 57 on page 2040 counts against this limit.

### Using 802.1Q Tags to Identify Packets

When packets are marked with a customer-specific 802.1Q tag, that tag identifies ownership of the packets for any switch or router in the network. Sometimes, 802.1Q tags are needed within PVLANS to keep track of packets from different subdomains. Table 146 on page 2041 indicates when a VLAN 802.1Q tag is needed on the primary VLAN or on secondary VLANs.

Table 146: PVLAN Requirements for 802.1Q Tags

|                | On a Single Switch                          | On Multiple Switches                                                                                                                                                                                                               |
|----------------|---------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Primary VLAN   | Specify an 802.1Q tag by setting a VLAN ID. | Specify an 802.1Q tag by setting a VLAN ID.                                                                                                                                                                                        |
| Secondary VLAN | No tag needed on VLANs.                     | VLANs need 802.1Q tags: <ul style="list-style-type: none"> <li>Specify an 802.1Q tag for each community VLAN by setting a VLAN ID.</li> <li>Specify the 802.1Q tag for an isolation VLAN ID by setting an isolation ID.</li> </ul> |

### Efficient Use of IP Addresses

PVLANS provide IP address conservation and efficient allocation of IP addresses. In a typical network, VLANs usually correspond to a single IP subnet. In PVLANS, the hosts in all secondary VLANs belong to the same IP subnet because the subnet is allocated to the primary VLAN. Hosts within the secondary VLAN are assigned IP addresses based on IP subnets associated with the primary VLAN, and their IP subnet masking information reflects that of the primary VLAN subnet. However, each secondary VLAN is a separate broadcast domain.

### PVLAN Port Types

PVLANS can use six different port types. The network depicted in [Figure 57 on page 2040](#) uses a promiscuous port to transport information to the router, community ports to connect the finance and HR communities to their respective switches, isolated ports to connect the servers, and a PVLAN trunk port to connect the two switches. PVLAN ports have different restrictions:

- Promiscuous trunk port—A promiscuous port is an upstream trunk port connected to a router, firewall, server, or provider network. A promiscuous trunk port can communicate with all interfaces, including the isolated and community ports within a PVLAN.
- PVLAN trunk port—A PVLAN trunk port is required in multiswitch PVLAN configurations to span the switches. The PVLAN trunk port is a member of all VLANs within the PVLAN (that is, the primary VLAN, the community VLANs, and the interswitch isolated VLAN), and it carries traffic from the primary VLAN and all secondary VLANs. It can communicate with all ports.

Communication between a PVLAN trunk port and an isolated port is usually unidirectional. A PVLAN trunk port's membership in the interswitch isolated VLAN is egress-only, meaning that an isolated port can forward packets to a PVLAN trunk port, but a PVLAN trunk port does not forward packets to an isolated port (unless the packets ingress on a promiscuous access port and are therefore being forwarded to all the secondary VLANs in the same primary VLAN as the promiscuous port).

- Secondary VLAN trunk port (not shown)—Secondary trunk ports carry secondary VLAN traffic. For a given private VLAN, a secondary VLAN trunk port can carry traffic for only one secondary VLAN. However, a secondary VLAN trunk port can carry traffic for multiple secondary VLANs as long as each secondary VLAN is a member of a different

primary VLAN. For example, a secondary VLAN trunk port can carry traffic for a community VLAN that is part of primary VLAN pvlan100 and also carry traffic for an isolated VLAN that is part of primary VLAN pvlan400.

- **Community port**—Community ports communicate among themselves and with their promiscuous ports. Community ports serve only a select group of users. These interfaces are separated at Layer 2 from all other interfaces in other communities or isolated ports within their PVLAN.
- **Isolated access port**—Isolated ports have Layer 2 connectivity only with promiscuous ports and PVLAN trunk ports—an isolated port cannot communicate with another isolated port even if these two ports are members of the same isolated VLAN (or interswitch isolated VLAN) domain. Typically, a server, such as a mail server or a backup server, is connected on an isolated port. In a hotel, each room would typically be connected on an isolated port, meaning that room-to-room communication is not possible, but each room can access the Internet on the promiscuous port.
- **Promiscuous access port (not shown)**—These ports carry untagged traffic. Traffic that ingresses on a promiscuous access port is forwarded to all secondary VLAN ports on the device. If traffic ingresses into the device on a VLAN-enabled port and egresses on a promiscuous access port, the traffic is untagged on egress. If tagged traffic ingresses on a promiscuous access port, the traffic is discarded.

Table 147 on page 2042 summarizes whether Layer 2 connectivity exists between the different types of ports.

**Table 147: PVLAN Ports and Layer 2 Connectivity**

| Port Type          | Promiscuous Trunk | PVLAN Trunk             | Secondary Trunk | Community               | Isolated Access | Promiscuous access |
|--------------------|-------------------|-------------------------|-----------------|-------------------------|-----------------|--------------------|
| Promiscuous trunk  | Yes               | Yes                     | Yes             | Yes                     | Yes             | Yes                |
| PVLAN trunk        | Yes               | Yes                     | Yes             | Yes—same community only | Yes             | Yes                |
| Secondary Trunk    | Yes               | Yes                     | No              | Yes                     | No              | Yes                |
| Community          | Yes               | Yes                     | Yes             | Yes—same community only | No              | Yes                |
| Isolated access    | Yes               | Yes—unidirectional only | No              | No                      | No              | Yes                |
| Promiscuous access | Yes               | Yes                     | Yes             | Yes                     | Yes             | No                 |

**NOTE:** If you enable the `no-mac-learning` statement on a primary VLAN, all isolated VLANs in the PVLAN inherit that setting. However, if you want to disable MAC address learning on any community VLANs, you must configure the `no-mac-learning` statement on each of those VLANs.

### Limitations of Private VLANs

---

The following constraints apply to private VLAN configurations:

- IGMP snooping is not supported with private VLANs.
- Routed VLAN interfaces are not supported on private VLANs
- Routing between secondary VLANs in the same primary VLAN is not supported.

#### Related Documentation

- [Creating a Private VLAN on a Single Switch on page 2233](#)
- [Creating a Private VLAN Spanning Multiple Switches on page 2234](#)

### Understanding PVLAN Traffic Flows Across Multiple Switches

This topic illustrates and explains three different traffic flows on a sample multiswitch network configured with a private VLAN (PVLAN). PVLANS restrict traffic flows through their member switch ports (which are called “private ports”) so that they communicate only with a specific uplink trunk port or with specified ports within the same VLAN.

This topic describes:

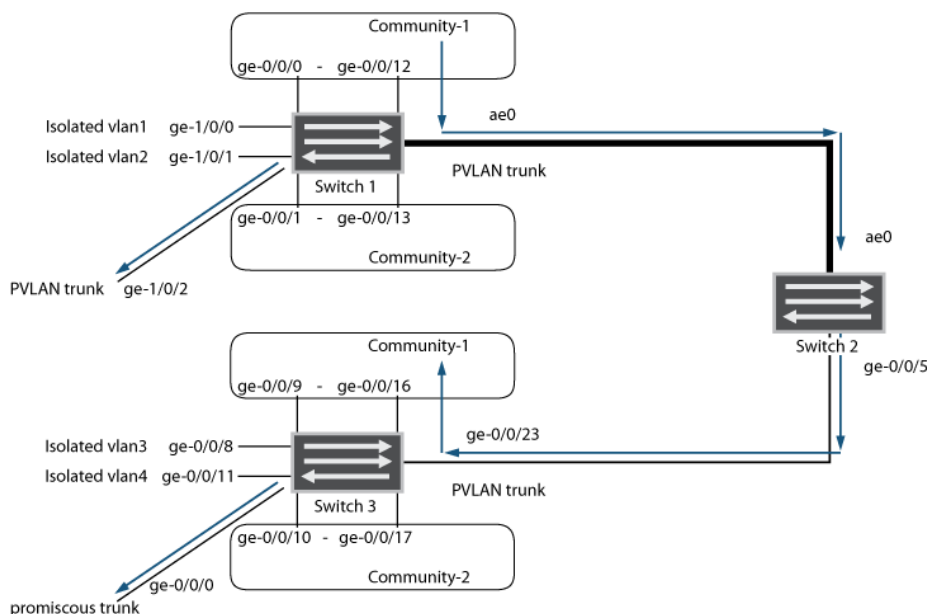

- [Community VLAN Sending Untagged Traffic on page 2043](#)
- [Isolated VLAN Sending Untagged Traffic on page 2044](#)
- [PVLAN Tagged Traffic Sent on a Promiscuous Port on page 2045](#)

#### Community VLAN Sending Untagged Traffic

---

In this scenario, a VLAN in Community-1 of Switch 1 at interface ge-0/0/0 sends untagged traffic. The arrows in [Figure 58 on page 2044](#) represent this traffic flow.

Figure 58: Community VLAN Sends Untagged Traffic

In this scenario, the following activity takes place on Switch 1:

- Community-1 VLAN on interface ge-0/0/0: Learning
- pvlan100 on interface ge-0/0/0: Replication
- Community-1 VLAN on interface ge-0/0/12: Receives traffic
- PVLAN trunk port: Traffic exits from ge-1/0/2 and from ae0 with tag 10
- Community-2: Interface receives no traffic
- Isolated VLANs: Interfaces receive no traffic

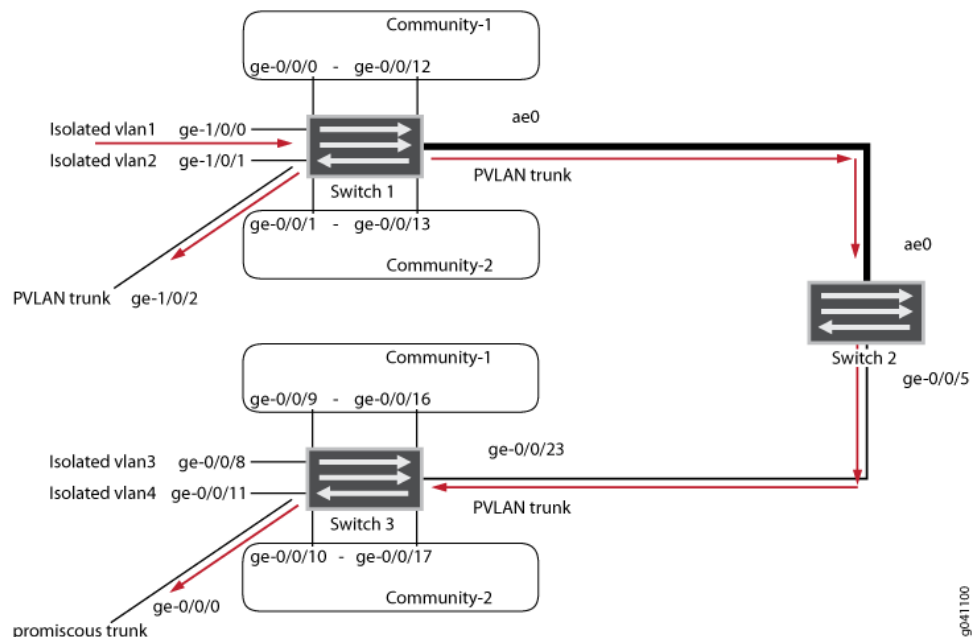

In this scenario, this activity takes place on Switch 3:

- Community-1 VLAN on interface ge-0/0/23 (PVLAN trunk): Learning
- pvlan100 on interface ge-0/0/23: Replication
- Community-1 VLAN on interface ge-0/0/9 and ge-0/0/16: Receives traffic
- Promiscuous trunk port: Traffic exits from ge-0/0/0 with tag 100
- Community-2: Interface receives no traffic
- Isolated VLANs: Interfaces receive no traffic

### Isolated VLAN Sending Untagged Traffic

In this scenario, isolated VLAN1 on Switch 1 at interface ge-1/0/0 sends untagged traffic. The arrows in Figure 59 on page 2045 represent this traffic flow.

Figure 59: Isolated VLAN Sends Untagged Traffic

In this scenario, the following activity takes place on Switch 1:

- Isolated VLAN1 on interface ge-1/0/0: Learning
- pvlan100 on interface ge-1/0/0: Replication
- Traffic exits from pvlan-trunk ge-1/0/2 and ae0 with tag 50
- Community-1 and Community-2: Interfaces receive no traffic
- Isolated VLANs: Interfaces receive no traffic

In this scenario, this activity takes place on Switch 3:

- VLAN on interface ge-0/0/23 (PVLAN trunk port): Learning
- pvlan100 on interface ge0/0/23: Replication
- Promiscuous trunk port: Traffic exits from ge-0/0/0 with tag 100
- Community-1 and Community-2: Interfaces receive no traffic
- Isolated VLANs: Receive no traffic

### PVLAN Tagged Traffic Sent on a Promiscuous Port

In this scenario, PVLAN tagged traffic is sent on a promiscuous port. The arrows in [Figure 60 on page 2046](#) represent this traffic flow.

Figure 60: PVLAN Tagged Traffic Sent on a Promiscuous Port

In this scenario, the following activity takes place on Switch 1:

- pvlan100 VLAN on interface ae0 (PVLAN trunk): Learning
- Community-1, Community-2, and all isolated VLANs on interface ae0: Replication
- VLAN on interface ae0: Replication
- Traffic exits from pvlan-trunk ge-1/0/2 with tag 100
- Community-1 and Community-2: Interfaces receive traffic
- Isolated VLANs: Receive traffic

In this scenario, this activity takes place on Switch 3:

- pvlan100 on interface ge-0/0/0: Learning
- Community-1, Community-2 and all isolated VLANs on interface ge-0/0/0: Replication
- VLAN on interface ge-0/0/0: Replication
- Community-1 and Community-2: Interfaces receive traffic
- Isolated VLANs: Receive traffic

## Understanding Secondary VLAN Trunk Ports and Promiscuous Access Ports on PVLANS

VLANs limit broadcasts to specified users. Private VLANs (PVLANS) take this concept a step further by splitting a VLAN into multiple broadcast subdomains and essentially putting secondary VLANs inside a primary VLAN. PVLANS restrict traffic flows through their member ports so that these ports communicate only with a specified uplink trunk port or with specified ports within the same VLAN. The uplink trunk port is usually connected to a router, firewall, server, or provider network. A PVLAN typically contains many private ports that communicate only with a single uplink, thereby preventing the ports from communicating with each other.

Secondary trunk ports and promiscuous access ports extend the functionality of PVLANS for use in complex deployments, such as:

- Enterprise VMWare Infrastructure environments
- Multitenant cloud services with VM management
- Web hosting services for multiple customers

For example, you can use secondary VLAN trunk ports to connect QFX devices to VMware servers that are configured with private VLANs. You can use promiscuous access ports to connect QFX devices to systems that do not support trunk ports but do need to participate in private VLANs.

This topic explains the following concepts regarding PVLANS on the QFX Series:

- [PVLAN Port Types on page 2047](#)
- [Secondary VLAN Trunk Port Details on page 2048](#)
- [Use Cases on page 2049](#)

---

### PVLAN Port Types

PVLANS can use the following different port types:

- Promiscuous trunk port—A promiscuous port is an upstream trunk port connected to a router, firewall, server, or provider network. A promiscuous trunk port can communicate with all interfaces, including the isolated and community ports within a PVLAN.
- PVLAN trunk port—A PVLAN trunk port is required in multiswitch PVLAN configurations to span the switches. The PVLAN trunk port is a member of all VLANs within the PVLAN (that is, the primary VLAN, the community VLANs, and the interswitch isolated VLAN), and it carries traffic from the primary VLAN and all secondary VLANs. It can communicate with all ports.

Communication between a PVLAN trunk port and an isolated port is usually unidirectional. A PVLAN trunk port's membership in the interswitch isolated VLAN is egress-only, meaning that an isolated port can forward packets to a PVLAN trunk port, but a PVLAN trunk port does not forward packets to an isolated port (unless the packets ingressed on a promiscuous access port and are therefore being forwarded to all the secondary VLANs in the same primary VLAN as the promiscuous port).

- Secondary VLAN trunk port—Secondary VLAN trunk ports carry secondary VLAN traffic. For a given private (primary) VLAN, a secondary VLAN trunk port can carry traffic for only one secondary VLAN. However, a secondary VLAN trunk port can carry traffic for multiple secondary VLANs as long as each secondary VLAN is a member of a different primary VLAN. For example, a secondary VLAN trunk port can carry traffic for a community VLAN that is part of primary VLAN pvlan100 and also carry traffic for an isolated VLAN that is part of primary VLAN pvlan400.

**NOTE:** When traffic egresses from a secondary VLAN trunk port, it normally carries the tag of the primary VLAN that the secondary port is a member of. If you want traffic that egresses from a secondary VLAN trunk port to retain its secondary VLAN tag, use the [extend-secondary-vlan-id](#) statement.

- Community port—Community ports communicate among themselves and with their promiscuous ports. Community ports serve only a select group of users. These interfaces are separated at Layer 2 from all other interfaces in other communities or isolated ports within their PVLAN.
- Isolated access port—Isolated ports have Layer 2 connectivity only with promiscuous ports and PVLAN trunk ports. An isolated access port cannot communicate with another isolated port even if these two ports are members of the same isolated VLAN.
- Promiscuous access port—These ports carry untagged traffic and can be a member of only one primary VLAN. Traffic that ingresses on a promiscuous access port is forwarded to the ports of the secondary VLANs that are members of the primary VLAN that the promiscuous access port is a member of. In this case, the traffic carries the appropriate secondary VLAN tag when it egresses from the secondary VLAN port if the secondary VLAN port is a trunk port. If traffic ingresses on a secondary VLAN port and egresses on a promiscuous access port, the traffic is untagged on egress. If tagged traffic ingresses on a promiscuous access port, the traffic is discarded.

---

### Secondary VLAN Trunk Port Details

---

When using a secondary VLAN trunk port, be aware of the following:

- You must configure an isolation VLAN ID for each primary VLAN that the secondary VLAN trunk port will participate in. This is true even if the secondary VLANs that the secondary VLAN trunk port will carry are confined to a single device.
- If you configure a port to be a secondary VLAN trunk port for a given primary VLAN, you can also configure the same physical port to be any of the following:

- Secondary VLAN trunk port for another primary VLAN
- PVLAN trunk for another primary VLAN
- Promiscuous trunk port
- Access port for a non-private VLAN
- Traffic that ingresses on a secondary VLAN trunk port (with a secondary VLAN tag) and egresses on a PVLAN trunk port retains the secondary VLAN tag on egress.
- Traffic that ingresses on a secondary VLAN trunk port and egresses on a promiscuous trunk port has the appropriate primary VLAN tag on egress.
- Traffic that ingresses on a secondary VLAN trunk port and egresses on a promiscuous access port is untagged on egress.
- Traffic that ingresses on a promiscuous trunk port with a primary VLAN tag and egresses on a secondary VLAN trunk port carries the appropriate secondary VLAN tag on egress. For example, assume that you have configured the following on a switch:
  - Primary VLAN 100
  - Community VLAN 200 as part of the primary VLAN
  - Promiscuous trunk port
  - Secondary trunk port that carries community VLAN 200

If a packet ingresses on the promiscuous trunk port with primary VLAN tag 100 and egresses on the secondary VLAN trunk port, it carries tag 200 on egress.

### Use Cases

On the same physical interface, you can configure multiple secondary VLAN trunk ports (in different primary VLANs) or combine a secondary VLAN trunk port with other types of VLAN ports. The following use cases provide examples of doing this and show how traffic would flow in each case:

- [Secondary VLAN Trunks In Two Primary VLANs on page 2049](#)
- [Secondary VLAN Trunk and Promiscuous Trunk on page 2051](#)
- [Secondary VLAN Trunk and PVLAN Trunk on page 2052](#)
- [Secondary VLAN Trunk and Non-Private VLAN Interface on page 2054](#)
- [Traffic Ingressing on Promiscuous Access Port on page 2055](#)

#### **Secondary VLAN Trunks In Two Primary VLANs**

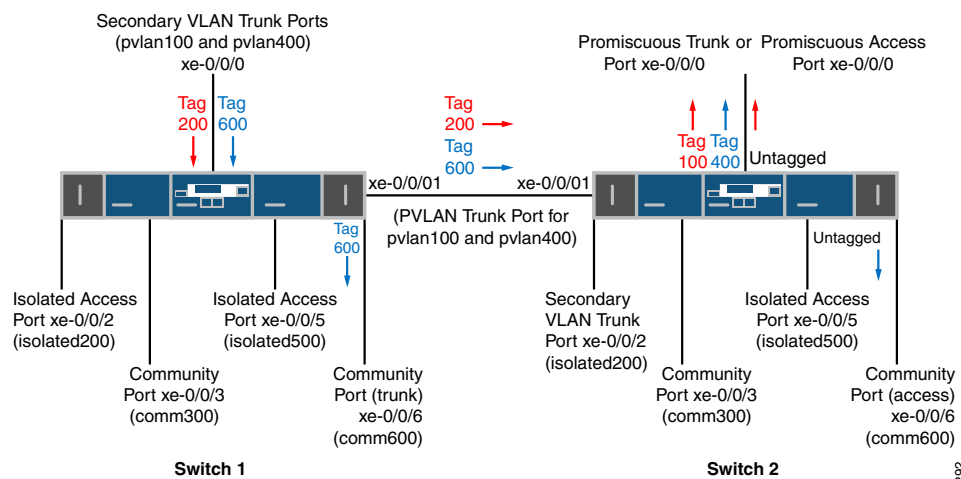

For this use case, assume you have two switches with the following configuration:

- Primary VLAN pvlan100 with tag 100.
  - Isolated VLAN isolated200 with tag 200 is a member of pvlan100.
  - Community VLAN comm300 with tag 300 is a member of pvlan100.
- Primary VLAN pvlan400 with tag 400.

- Isolated VLAN isolated500 with tag 500 is a member of pvlan400.
- Community VLAN comm600 with tag 600 is a member of pvlan400.
- Interface xe-0/0/0 on Switch 1 connects to a VMware server (not shown) that is configured with the private VLANs used in this example. This interface is configured with secondary VLAN trunk ports to carry traffic for secondary VLAN comm600 and the isolated VLAN (tag 200) that is a member of pvlan100.
- Interface xe-0/0/0 on Switch 2 is shown configured as a promiscuous trunk port or promiscuous access port. In the latter case, you can assume that it connects to a system (not shown) that does not support trunk ports but is configured with the private VLANs used in this example.
- On Switch 1, xe-0/0/6 is a member of comm600 and is configured as a trunk port.
- On Switch 2, xe-0/0/6 is a member of comm600 and is configured as an access port.

Figure 61 on page 2050 shows this topology and how traffic for isolated200 and comm600 would flow after ingressing on xe-0/0/0 on Switch 1. Note that traffic would flow only where the arrows indicate. For example, there are no arrows for interfaces xe-0/0/2, xe-0/0/3, and xe-0/0/5 on Switch 1 because no packets would egress on those interfaces.

**Figure 61: Two Secondary VLAN Trunk Ports on One Interface**

g041292

Here is the traffic flow for VLAN isolated200:

1. After traffic for isolated200 ingresses on the secondary VLAN trunk port on Switch 1, it egresses on the PVLAN trunk port because the PVLAN trunk port is a member of all the VLANs. The packets keep the secondary VLAN tag (200) when egressing.
2. After traffic for isolated200 ingresses on the secondary VLAN trunk port on Switch 2, it egresses on xe-0/0/0, which is configured as a promiscuous trunk port or promiscuous access port.
  - If xe-0/0/0 on Switch 2 is configured as a promiscuous trunk port, the packets egress on this port with the primary VLAN tag (100).

- If xe-0/0/0 on Switch 2 is configured as a promiscuous access port, the packets egress on this port untagged.

Note that traffic for VLAN isolated200 does not egress on isolated access port xe-0/0/2 on Switch 1 or secondary VLAN trunk port xe-0/0/2 on Switch 2 even though these two ports are members of the same isolated VLAN.

Here is the traffic flow for VLAN comm600:

1. After traffic for comm600 ingresses on the secondary VLAN trunk port on Switch 1, it egresses on the PVLAN trunk port because the PVLAN trunk port is a member of all the VLANs. The packets keep the secondary VLAN tag (600) when egressing.
2. Traffic for comm600 also egresses on community port xe-0/0/6 on Switch 1. The traffic is tagged because the port is configured as a trunk.
3. After traffic for comm600 ingresses on the PVLAN trunk port on Switch 2, it egresses on xe-0/0/0, if this interface is configured as a promiscuous trunk port.

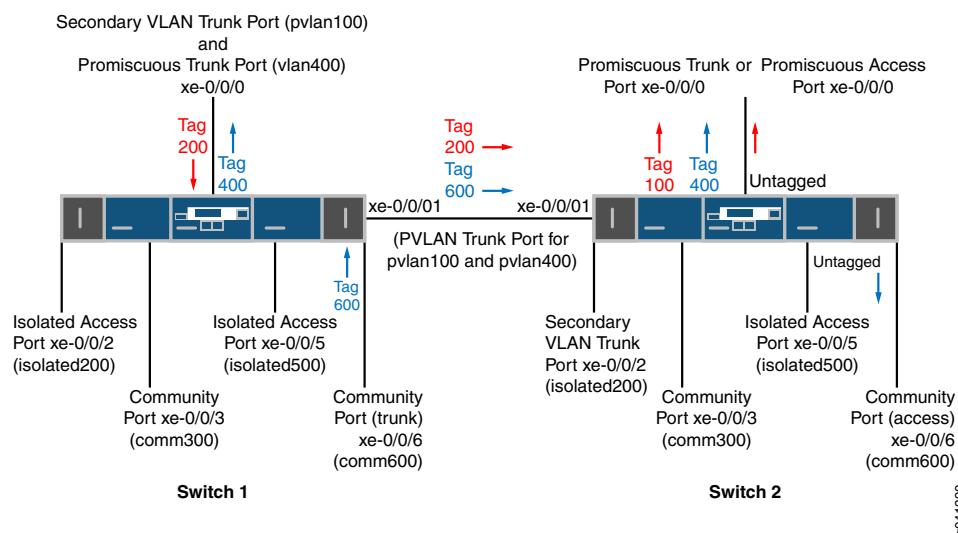

**NOTE:** If xe-0/0/0 on Switch 2 is configured as a promiscuous access port, the port can participate in only one primary VLAN. In this case, the promiscuous access port is part of pvlan100, so traffic for comm600 does not egress from it

4. Traffic for comm600 also egresses on community port xe-0/0/6 on Switch 2. In this case, the traffic is untagged because the port mode is access.

### ***Secondary VLAN Trunk and Promiscuous Trunk***

For this use case, assume you have two switches configured with the same ports and VLANs as in the previous use case, with one exception: In this case, xe-0/0/0 on Switch 1 is configured as a secondary VLAN trunk port for VLAN pvlan100 and is also configured as a promiscuous trunk port for pvlan400.

Figure 62 on page 2052 shows this topology and how traffic for isolated200 (member of pvlan100) and comm600 (member of pvlan400) would flow after ingressing on Switch 1.

**Figure 62: Secondary VLAN Trunk and Promiscuous Trunk on One Interface**

The traffic flow for VLAN isolated200 is the same as in the previous use case, but the flow for comm600 is different. Here is the traffic flow for VLAN comm600:

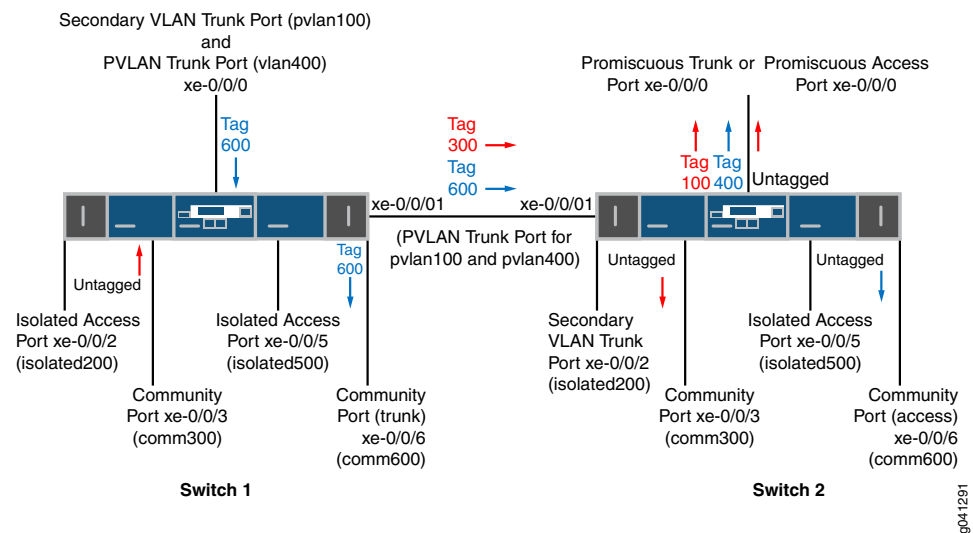

1. After traffic for comm600 ingresses on community VLAN port xe-0/0/6 on Switch 1, it egresses on promiscuous trunk port xe-0/0/0 on Switch 1. In this case it carries the primary VLAN tag (400).
2. Traffic for comm600 also egresses on the PVLAN trunk port because the PVLAN trunk port is a member of all the VLANs. The packets keep the secondary VLAN tag (600) when egressing.
3. After traffic for comm600 ingresses on the PVLAN trunk port on Switch 2, it egresses on xe-0/0/0, if this interface is configured as a promiscuous trunk port. It does not egress on xe-0/0/0 if this interface is configured as a promiscuous access port because the port can participate only in pvlan100.
4. Traffic for comm600 also egresses on community port xe-0/0/6 on Switch 2.

### **Secondary VLAN Trunk and PVLAN Trunk**

For this use case, assume you have two switches configured with the same ports and VLANs as in the previous use cases except that xe-0/0/0 on Switch 1 is configured as a secondary VLAN trunk port for VLAN pvlan100 and is also configured as a PVLAN trunk port for pvlan400.

Figure 63 on page 2053 shows this topology and how traffic for comm300 (member of pvlan100) and comm600 (member of pvlan400) would flow after ingressing on Switch 1.

Figure 63: Secondary VLAN Trunk and PVLAN Trunk on One Interface

Here is the traffic flow for VLAN comm300:

1. After traffic for comm300 ingresses on community port xe-0/0/3 on Switch 1, it egresses on PVLAN trunk port xe-0/0/1 because that PVLAN trunk port is a member of all the VLANs. The packets keep the secondary VLAN tag (300) when egressing.

**NOTE:** Traffic for comm300 does not egress on xe-0/0/0 because the secondary VLAN trunk port on this interface carries isolated200, not comm300.

2. After traffic for comm300 ingresses on the PVLAN trunk port on Switch 2, it egresses on xe-0/0/0, which is configured as a promiscuous trunk port or promiscuous access port.
  - If xe-0/0/0 on Switch 2 is configured as a promiscuous trunk port, the packets egress on this port with the primary VLAN tag (100).
  - If xe-0/0/0 on Switch 2 is configured as a promiscuous access port, the packets egress on this port untagged.
3. Traffic for comm300 also egresses on community port xe-0/0/3 on Switch 2.

Here is the traffic flow for VLAN comm600:

1. After traffic for comm600 ingresses on the PVLAN port xe-0/0/0 on Switch 1, it egresses on the community port xe-0/0/6 on Switch 1. The packets keep the secondary VLAN tag (600) when egressing because xe-0/0/6 is a trunk port.
2. Traffic for comm600 also egresses on PVLAN trunk port xe-0/0/1 because that PVLAN trunk port is a member of all the VLANs. The packets keep the secondary VLAN tag (600) when egressing.

- After traffic for comm600 ingresses on the PVLAN trunk port on Switch 2, it egresses on xe-0/0/0, if this interface is configured as a promiscuous trunk port.

It does not egress on xe-0/0/0 if this interface is configured as a promiscuous access port because the port can participate only in pvlan100.

- Traffic for comm600 also egresses on community port xe-0/0/6 on Switch 2. This traffic is untagged on egress because xe-0/0/6 is an access port.

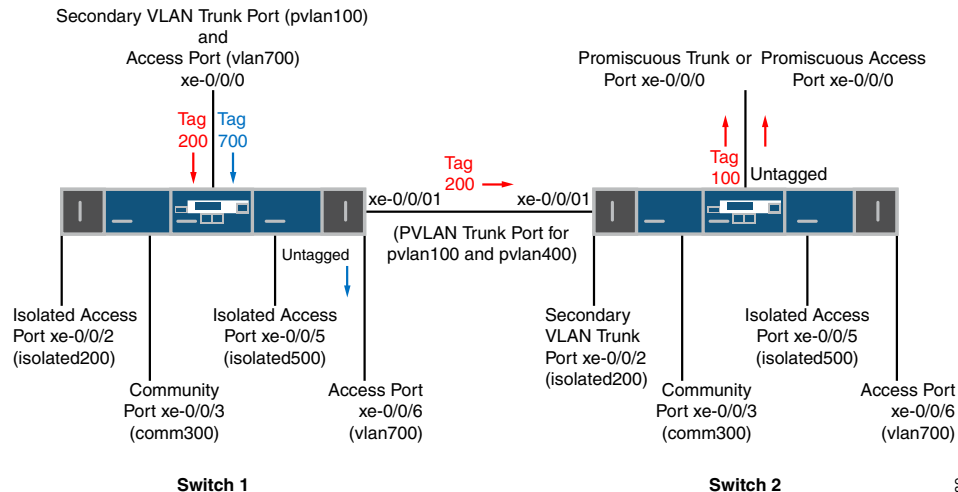

### Secondary VLAN Trunk and Non-Private VLAN Interface

For this use case, assume you have two switches configured with the same ports and VLANs as in the previous use cases except for these differences:

- Configuration for xe-0/0/0 on Switch 1:
  - Secondary VLAN trunk port for VLAN pvlan100
  - Access port for vlan700
- Port xe-0/0/6 on both switches is an access port for vlan700.

Figure 64 on page 2054 shows this topology and how traffic for isolated200 (member of pvlan100) and vlan700 would flow after ingressing on Switch 1.

**Figure 64: Secondary VLAN Trunk and Non-Private VLAN Port on One Interface**

Here is the traffic flow for VLAN isolated200:

- After traffic for isolated200 ingresses on the secondary VLAN trunk port on Switch 1, it egresses on the PVLAN trunk port. The packets keep the secondary VLAN tag (200) when egressing.
- After traffic for isolated200 ingresses on the PVLAN trunk port on Switch 2, it egresses on xe-0/0/0, which is configured as a promiscuous trunk port or promiscuous access port.

- If xe-0/0/0 on Switch 2 is configured as a promiscuous trunk port, the packets egress on this port with the primary VLAN tag (100).
- If xe-0/0/0 on Switch 2 is configured as a promiscuous access port, the packets egress on this port untagged.

Note that traffic for VLAN isolated200 does not egress on isolated access port xe-0/0/2 on Switch 1 or secondary VLAN trunk port xe-0/0/2 on Switch 2 even though these two ports are members of the same isolated VLAN.

After traffic for vlan700 ingresses on the access port configured on xe-0/0/0 on Switch 1, it egresses on access port xe-0/0/6 because that port is a member of the same VLAN. Traffic for vlan700 is not forwarded to Switch 2 (even though xe-0/0/6 on Switch 2 is a member of vlan700) because the PVLAN trunk on xe-0/0/1 does not carry this VLAN.

### ***Traffic Ingressing on Promiscuous Access Port***

For this use case, assume you have two switches configured with the same ports and VLANs as in the previous use case except that xe-0/0/0 on Switch 1 is configured as a promiscuous access port and is a member of pvlan100. Figure 65 on page 2055 shows this topology and how untagged traffic would flow after ingressing through this interface on Switch 1.

**Figure 65: Traffic Ingressing on Promiscuous Access Port**

g041288

As the figure shows, untagged traffic that ingresses on a promiscuous access port is forwarded to all the secondary VLAN ports that are members of the same primary VLAN that the promiscuous access port is a member of. The traffic is untagged when it egresses from access ports and tagged on egress from a trunk port (xe-0/0/2 on Switch 2).

### **Related Documentation**

## Understanding Egress Firewall Filters with PVLANS

If you apply firewall filters to private VLANs in the output direction, the behavior of the filters might be unexpected. This topic explains how egress filters behave when applied to private VLANs.

If you apply a firewall filter in the output direction to a primary VLAN, the filter also applies to the secondary VLANs that are members of the primary VLAN when the traffic egresses with the primary VLAN tag or isolated VLAN tag, as listed below:

- Traffic forwarded from a secondary VLAN trunk port to a promiscuous port (trunk or access)
- Traffic forwarded from a secondary VLAN trunk port to a PVLAN trunk port.
- Traffic forwarded from a promiscuous port (trunk or access) to a secondary VLAN trunk port
- Traffic forwarded from a PVLAN trunk port. to a secondary VLAN trunk port
- Traffic forwarded from a community port to a promiscuous port (trunk or access)

If you apply a firewall filter in the output direction to a primary VLAN, the filter does *not* apply to traffic that egresses with a community VLAN tag, as listed below:

- Traffic forwarded from a community trunk port to a PVLAN trunk port
- Traffic forwarded from a promiscuous port (trunk or access) to a community trunk port
- Traffic forwarded from a PVLAN trunk port. to a community trunk port

If you apply a firewall filter in the output direction to a community VLAN, the following behaviors apply:

- The filter is applied to traffic forwarded from a promiscuous port (trunk or access) to a community trunk port (because the traffic egresses with the community VLAN tag).
- The filter is applied to traffic forwarded from a community port to a PVLAN trunk port (because the traffic egresses with the community VLAN tag).
- The filter is *not* applied to traffic forwarded from a community port to a promiscuous port (because the traffic egresses with the primary VLAN tag or untagged).

## Understanding Multiple VLAN Registration Protocol (MVRP)

Multiple VLAN Registration Protocol (MVRP) is a Layer 2 messaging protocol that automates the creation and management of virtual LANs, thereby reducing the time you have to spend on these tasks. If your QFabric system connects to servers that host many virtual machines that require their own VLANs, using MVRP can save you the time and effort that would be required to manually create and administer the VLANs on the ports that connect to the servers. For example, if a virtual machine moves between servers—and therefore connects to a different redundant server Node group interface—MVRP can configure the appropriate VLAN membership on the new server Node group interface.

When using MVRP on a QFabric system, you must manually create on the QFabric the VLANs that exist on the attached servers because the QFabric implementation of MVRP does not allow VLANs to be created dynamically. However, you do not need to manually assign VLAN membership to the QFabric ports that connect to the servers. MVRP automatically assigns VLAN membership to server-facing QFabric ports when it learns about a VLAN from an attached server.

MVRP is an application protocol of the Multiple Registration Protocol (MRP) and is defined in the IEEE 802.1ak standard. MRP and MVRP replace Generic Attribute Registration Protocol (GARP) and GARP VLAN Registration Protocol (GVRP) and overcome GARP and GVRP limitations.

**NOTE:** MVRP on QFabric systems does not support private VLANs.

- [QFabric Requirements on page 2057](#)
- [MVRP Operations on page 2058](#)
- [MRP Timers Control MVRP Updates on page 2058](#)
- [MVRP Uses MRP Messages to Transmit Switch and VLAN States on page 2059](#)

### QFabric Requirements

When configuring MVRP on a QFabric system, you can enable it globally or enable it only on the trunk ports that need to carry VLAN traffic from the attached servers. You also must manually create the expected VLANs, but you do not have to assign VLAN membership to the server-facing redundant server Node ports (as mentioned previously). However, you *do* have to manually assign VLAN membership to the uplink ports on the redundant server Node group and network Node group devices that will carry the VLAN traffic. [Table 148 on page 2057](#) summarizes the VLAN requirements for redundant server Node groups and network Node groups:

**Table 148: MVRP VLAN Requirements for Node Devices**

| Node Group Type | Interface | Assign VLAN Membership to Trunk Ports? |
|-----------------|-----------|----------------------------------------|
|-----------------|-----------|----------------------------------------|

Table 148: MVRP VLAN Requirements for Node Devices (*continued*)

|                             |                                       |     |
|-----------------------------|---------------------------------------|-----|
| Redundant server Node group | Server-facing trunk                   | No  |
| Redundant server Node group | Uplink trunk (to interconnect device) | Yes |
| Network Node groups         | Uplink trunk (to interconnect device) | Yes |

### MVRP Operations

MVRP stays synchronized by using MVRP protocol data units (PDUs). These PDUs specify which QFabric systems and switches are members of which VLANs, and which switch interfaces are in each VLAN. The MVRP PDUs are sent to other switches in the QFabric system when an MVRP state change occurs, and the receiving switches update their MVRP states accordingly. MVRP timers dictate when PDUs can be sent and when switches receiving MVRP PDUs can update their MVRP information.

In addition to this behavior, QFX switches include a mode—called passive mode—in which an MVRP-configured interface does not announce its membership in a VLAN or send any VLAN declarations (updates) unless it receives registration for that VLAN from a peer (server) on that interface. By default MVRP-configured interfaces behave in the standard manner and automatically send PDU updates to announce any VLAN changes. (This is called active mode.)

To enable passive mode on an interface, enter and commit this statement:

```
set protocols mvrp interface interface-name passive
```

To keep VLAN membership information current, MVRP removes switches and interfaces when they become unavailable. Pruning VLAN information has these benefits:

- Limits the network VLAN configuration to active participants, thereby reducing network overhead.
- Limits broadcast, unknown unicast, and multicast (BUM) traffic to interested devices.

MVRP is disabled by default and is valid only for trunk interfaces.

### MRP Timers Control MVRP Updates

MVRP registration and updates are controlled by timers that are part of MRP. The timers define when MVRP PDUs can be sent and when MVRP information can be updated. You configure the timers on a per-interface basis.

The following MRP timers are used to control the operation of MVRP:

- Join timer—Controls the interval for the next MVRP PDU transmit opportunity.
- Leave timer—Controls the period of time that an interface on the switch waits in the leave state before changing to the unregistered state.
- LeaveAll timer—Controls the frequency with which the interface generates LeaveAll messages.

**BEST PRACTICE:** Unless there is a compelling reason to change the timer settings, leave the default settings in place. Modifying timers to inappropriate values can cause an imbalance in the operation of MVRP.

### MVRP Uses MRP Messages to Transmit Switch and VLAN States

MVRP uses MRP messages to register and declare MVRP states for a interface or VLAN and to inform the switching network that a interface or VLAN is leaving MVRP. These messages are communicated in the MRP PDUs sent by MVRP-enabled interfaces.

The following MRP messages are communicated for MVRP:

- Empty—MVRP information is not declared and no VLAN is registered.
- In—MVRP information is not declared but a VLAN is registered.
- JoinEmpty—MVRP information is declared but no VLAN is registered.
- JoinIn—MVRP information is declared and a VLAN is registered.
- Leave—MVRP information that was previously declared is withdrawn.
- LeaveAll—Unregister all VLANs on the switch. VLANs must re-register to participate in MVRP.
- New—The MVRP information is new and a VLAN might not be registered yet.

## Overview of Spanning-Tree Protocols

QFX Series switches provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), Multiple Spanning Tree Protocol (MSTP), and VLAN Spanning Tree Protocol (VSTP). The default spanning-tree protocol on the QFX Series is RSTP. RSTP provides faster convergence times than STP. However, some legacy networks require the slower convergence times of basic STP.

The STP support provided for the QFX Series includes:

- IEEE 802.1d
- 802.1w RSTP
- 802.1s MSTP

If your network includes IEEE 802.1D 1998 bridges, you can remove RSTP and explicitly configure STP. See [“Configuring STP” on page 2242](#). When you explicitly configure STP, the QFX Series products use the IEEE 802.1D 2004 specification, force version 0. This configuration runs a version of RSTP that is compatible with the classic, basic STP. If you use virtual LANs (VLANs), you should enable VSTP and use it on your network. See [“Understanding VSTP” on page 2062](#).

You can use the same operational commands (**show spanning-tree bridge** and **show spanning-tree interface**) to check the status of your spanning-tree configuration, regardless of which spanning-tree protocol has been configured.

STP uses bridge protocol data unit (BPDU) packets to exchange information with other switches. BPDUs send hello packets out at regular intervals to exchange information across bridges and detect loops in a network topology. There are two types of BPDUs:

- Configuration BPDUs—These BPDUs contain configuration information about the transmitting switch and its ports, including switch and port MAC addresses, switch priority, port priority, and port cost.
- Topology change notification (TCN) BPDUs—When a bridge needs to signal a topology change, it starts to send TCNs on its root port. The designated bridge receives the TCN, acknowledges it, and generates another one for its own root port. The process continues until the TCN reaches the root bridge.

STP uses the information provided by the BPDUs to elect a root bridge, identify root ports for each switch, identify designated ports for each physical LAN segment, and prune specific redundant links to create a loop-free tree topology. All leaf devices calculate the best path to the root device and place their ports in blocking or forwarding states based on the best path to the root. The resulting tree topology provides a single active Layer 2 data path between any two end stations.

---

### Understanding Spanning Tree Protocols on a QFabric System

Although there is no need to run STP in a QFabric system, you can connect a QFabric system to another Layer 2 device and use STP. STP traffic can only be processed on network Node groups. Other Node groups, such as redundant server Node groups and server Node groups, discard the STP bridge protocol data units (BPDUs) traffic and disable the

interface automatically. Server Node groups only process host-facing protocols, whereas Network Node groups process all supported protocols.

- [Understanding MSTP on page 2061](#)
- [Understanding RSTP on page 2061](#)
- [Understanding VSTP on page 2062](#)

## Understanding MSTP

Although RSTP provides faster convergence time than STP does, it still does not solve a problem inherent in STP: all VLANs within a LAN must share the same spanning tree. To solve this problem, the QFX Series products use Multiple Spanning Tree Protocol (MSTP) to create a loop-free topology in networks with multiple spanning-tree regions.

An MSTP region allows a group of bridges to be modeled as a single bridge. An MSTP region contains multiple spanning-tree instances (MSTIs). MSTIs provide different paths for different VLANs. This functionality facilitates more efficient load sharing across redundant links.

An MSTP region can support up to 64 MSTIs, and each instance can support from 1 through 4094 VLANs.

## Understanding RSTP

Juniper Networks QFX Series products use Rapid Spanning Tree Protocol (RSTP) on the network side of the QFX Series to provide quicker convergence time than the base Spanning Tree Protocol (STP) does. RSTP identifies certain links as point to point. When a point-to-point link fails, the alternate link can transition to the forwarding state, which speeds up convergence.

Although STP provides basic loop prevention functionality, it does not provide fast network convergence when there are topology changes. The STP process to determine network state transitions is slower than the RSTP process because it is timer-based. A device must reinitialize every time a topology change occurs. The device must start in the listening state and transition to the learning state and eventually to a forwarding or blocking state. When default values are used for the maximum age (20 seconds) and forward delay (15 seconds), it takes 50 seconds for the device to converge. RSTP converges faster because it uses a handshake mechanism based on point-to-point links instead of the timer-based process used by STP.

For networks with virtual LANs (VLANs), you can use VLAN Spanning Tree Protocol (VSTP), which takes the paths of each VLAN into account when calculating routes. VSTP uses RSTP by default.

An RSTP domain running from the edge outward on a QFX Series product has the following components:

- A *root port*, which is the “best path” to the root device.
- A *designated port*, which indicates that the switch is the designated bridge for the other switch connecting to this port.
- An *alternate port*, which provides an alternate root port.
- A *backup port*, which provides an alternate designated port.

Port assignments change through messages exchanged throughout the domain. An RSTP device generates configuration messages once per hello time interval. If an RSTP device does not receive a configuration message from its neighbor after an interval of three hello times, it determines that the connection with the neighbor is lost. When a *root port* or a *designated port* fails on a device, the device generates a configuration message with the proposal bit set. Once its neighbor device receives this message, it verifies that this configuration message is valid for that port and starts a *synchronizing* operation to ensure that all of its ports are in sync with the new information.

Similar sets of messages propagate through the network, restoring the connectivity very quickly after a topology change (in a well-designed network that uses RSTP, network convergence can take as little as 0.5 seconds). If a device does not receive an agreement to a proposal message it has sent, it returns to the original IEEE 802.D convention.

RSTP was originally defined in the IEEE 802.1w draft specification and later incorporated into the IEEE 802.1D-2004 specification.

VSTP and RSTP can be configured at the same time. If you configure VSTP and RSTP at the same time and the switch has more than 253 VLANs, VSTP is configured only for the first 253 VLANs. For the remaining VLANs, only RSTP is configured. RSTP and VSTP are the only spanning-tree protocols that can be configured at the same time on the QFX Series.

## Understanding VSTP

VLAN Spanning Tree Protocol (VSTP) enables Juniper Networks switches to run one or more Spanning Tree Protocol (STP) or Rapid Spanning Tree Protocol (RSTP) instances for each VLAN on which VSTP is enabled. For networks with multiple VLANs, VSTP improves intelligent tree spanning by defining best paths within the VLANs instead of within the entire network.

You can configure VSTP for a maximum of 509 VLANs.

VSTP and RSTP can be configured at the same time. If you configure VSTP and RSTP at the same time and the switch has more than 253 VLANs, VSTP is configured only for the first 253 VLANs. For the remaining VLANs, only RSTP is configured. RSTP and VSTP are the only spanning-tree protocols that can be configured at the same time on a switch.

**NOTE:** We recommend that you enable VSTP on all VLANs that could receive VSTP bridge protocol data units (BPDUs).

## Understanding BPDU Protection for STP, RSTP, and MSTP

**NOTE:** Using the original CLI, you can disable BPDU protection on interfaces by issuing the `set ethernet-switching-options bpdu-block interface-name disable` command.

A Juniper Networks device Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), and Multiple Spanning Tree Protocol (MSTP). Bridge protocol data unit (BPDU) protection can help prevent STP misconfigurations that can lead to network outages.

A loop-free network is supported through the exchange of a special type of frame called a BPDU. Receipt of BPDUs on certain interfaces in an STP, RSTP, VSTP, or MSTP topology, however, can lead to network outages. Enable BPDU protection on those interfaces to prevent these outages.

Peer STP applications running on the device interfaces use BPDUs to communicate. Ultimately, the exchange of BPDUs determines which interfaces block traffic and which interfaces become root ports and forward traffic.

However, a user bridge application running on a device connected to the device can also generate BPDUs. If these BPDUs are picked up by STP applications running on the device, they can trigger STP miscalculations, and those miscalculations can lead to network outages.

Enable BPDU protection on device interfaces connected to user devices or on interfaces on which no BPDUs are expected, such as edge ports. If BPDUs are received on a protected interface, the interface is disabled and stops forwarding frames.

Not only can you configure BPDU protection on a device with a spanning tree, but also on a device without a spanning tree. This type of topology typically consists of a non-STP device connected to an STP device through a trunk interface.

To configure BPDU protection on a device with a spanning tree, include the **bpdu-block-on-edge** statement at the `[edit protocols (stp | mstp | rstp )]` hierarchy level. To configure BPDU protection on a device without a spanning tree, include the **bpdu-block** statement at the `[edit ethernet-switching-options interface interface-name]` hierarchy level.

If BPDUs are sent to an interface (indicating that the misconfiguration has been corrected), the interface can be unblocked in one of two ways:

- If the **disable-timeout** statement has been included in the BPDU configuration, the interface automatically returns to service after the timer expires.
- Use the operational mode command **clear ethernet-switching bpdu-error**.

Disabling the BPDU protection configuration does not unblock the interface.

## Understanding Loop Protection for STP, RSTP, VSTP, and MSTP

A Juniper Networks device provides Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), and Multiple Spanning Tree Protocol (MSTP). Loop protection increases the efficiency of STP, RSTP, and MSTP by preventing ports from entering a forwarding state that would cause a loop to open in the network.

A loop-free network in spanning-tree topologies is supported through the exchange of a special type of frame called a bridge protocol data unit (BPDU). Peer STP applications running on the device interfaces use BPDUs to communicate. Ultimately, the exchange of BPDUs determines which interfaces block traffic (preventing loops) and which interfaces become root ports and forward traffic.

However, a blocking interface can mistakenly transition to the forwarding state if the interface stops receiving BPDUs from its designated port on the segment. Such a transition error can occur when there is a hardware error on the device or software configuration error between the device and its neighbor.

When loop protection is enabled, the spanning-tree topology detects root ports and blocked ports and ensures that both keep receiving BPDUs. If a loop-protection-enabled

interface stops receiving BPDUs from its designated port, it reacts as it would react to a problem with the physical connection on this interface. It does not transition the interface to a forwarding state, but instead transitions it to a loop-inconsistent state. The interface recovers and it transitions back to the spanning-tree blocking state as soon as it receives a BPDU.

We recommend that you enable loop protection on all device interfaces that have a chance of becoming root or designated ports. Loop protection is most effective when enabled in the entire switched network. When you enable loop protection, you must configure at least one action (**alarm**, **block**, or both).

An interface can be configured for either loop protection or root protection, but not for both.

## Understanding Root Protection for STP, RSTP, VSTP, and MSTP

A Juniper Networks device provides Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), and Multiple Spanning Tree Protocol (MSTP). A loop-free network is supported through the exchange of a special type of frame called a bridge protocol data unit (BPDU). Peer STP applications running on the device interfaces use BPDUs to communicate. Ultimately, the exchange of BPDUs determines which interfaces block traffic and which interfaces become root ports and forward traffic.

You can also see BPDUs generated when you run a bridge application on a device attached to the device. This can interfere with root port election, which may sometimes lead to the wrong root port being elected through the above process. Root protection allows you to manually enforce the root bridge placement in the network.

Enable root protection on interfaces that should not receive higher-priority BPDUs from the root bridge and should not be elected as the root port. These interfaces become designated ports and are typically located on an administrative boundary. If the bridge receives more STP BPDUs on a port that has root protection enabled, that port transitions to a root-prevented STP state (inconsistency state), and the interface is blocked. This blocking prevents a bridge that should not be the root bridge from being elected the root bridge. After the bridge stops receiving more STP BPDUs on the interface with root protection, the interface returns to a listening state, followed by a learning state, and ultimately back to a forwarding state. Recovery back to the forwarding state is automatic.

When root protection is enabled on an interface, it is enabled for all the STP instances on that interface. The interface is blocked only for instances for which it receives more BPDUs. Otherwise, it participates in the spanning-tree topology.

An interface can be configured for either root protection or loop protection, but not for both.

## Unified Forwarding Table

---

- [Understanding the Unified Forwarding Table on page 2066](#)

### Understanding the Unified Forwarding Table

- [Using the Unified Forwarding Table to Optimize Address Storage on page 2066](#)
- [MAC Address and Host Address Memory Allocation on page 2067](#)
- [LPM Table Memory Allocation on page 2068](#)

#### Using the Unified Forwarding Table to Optimize Address Storage

---

On QFX5100 and EX4600 switches, you can control the allocation of forwarding table memory available to store the following:

- MAC addresses.
- Layer 3 host entries.
- Longest prefix match (LPM) table entries.

**NOTE:** Starting with Junos OS 13.2X51-D15, you can allocate more memory to store prefixes in the range /65 to /127 range.

---

This feature gives you the flexibility to configure your switch to match the needs of your particular network environment.

### MAC Address and Host Address Memory Allocation

There are several profiles that allocate memory differently for MAC addresses and host addresses. You configure the mix that best meets your needs by choosing the appropriate profile. [Table 149 on page 2067](#) lists the profiles you can choose and the associated maximum values for the MAC address and host table entries.

**Table 149: Unified Forwarding Table Profiles**

| Profile Name                         | MAC Table     | Host Table (unicast and multicast addresses) |              |             |             |             |             |
|--------------------------------------|---------------|----------------------------------------------|--------------|-------------|-------------|-------------|-------------|
|                                      | MAC Addresses | IPv4 unicast                                 | IPv6 unicast | IPv4 (*, G) | IPv4 (S, G) | IPv6 (*, G) | IPv6 (S, G) |
| <b>l2-profile-one</b>                | 288K          | 16K                                          | 8K           | 8K          | 8K          | 4K          | 4K          |
| <b>l2-profile-two</b>                | 224K          | 80K                                          | 40K          | 40K         | 40K         | 20K         | 20K         |
| <b>l2-profile-three</b><br>(default) | 160K          | 144K                                         | 72K          | 72K         | 72K         | 36K         | 36K         |
| <b>l3-profile</b>                    | 96K           | 208K                                         | 104K         | 104K        | 104K        | 52K         | 52K         |
| <b>lpm-profile</b>                   | 32K           | 16K                                          | 8K           | 8K          | 8K          | 4K          | 4K          |

Note that all entries in the host table share the same memory space. If the host table stores the maximum number of entries for any given type, the entire shared table is full and is unable to accommodate *any* entries of any other type. As you can see, different entry types occupy different amounts of memory. For example, an IPv6 unicast address occupies twice as much memory as an IPv4 unicast address, and an IPv6 multicast address occupies four times as much memory as an IPv4 unicast address.

[Table 150 on page 2067](#) lists various valid combinations that the host table can store if you use the **l2-profile-one** profile. Each row in the table represents a case in which the host table is full and cannot accommodate any more entries. .

**Table 150: Example Host Table Combinations Using l2-profile-one**

| IPv4 unicast | IPv6 unicast | IPv4 multicast (*, G) | IPv4 multicast (S, G) | IPv6 multicast (*, G) | IPv6 multicast (S, G) |
|--------------|--------------|-----------------------|-----------------------|-----------------------|-----------------------|
| 16K          | 0            | 0                     | 0                     | 0                     | 0                     |
| 12K          | 2K           | 0                     | 0                     | 0                     | 0                     |
| 12K          | 0            | 2K                    | 2K                    | 0                     | 0                     |
| 8K           | 4K           | 0                     | 0                     | 0                     | 0                     |
| 4K           | 2K           | 2K                    | 2K                    | 0                     | 0                     |
| 0            | 4K           | 0                     | 0                     | 1K                    | 1K                    |

### [LPM Table Memory Allocation](#)

---

You configure the memory allocation for LPM table entries differently depending on which version of Junos OS you use. To learn how to configure memory allocation for LPM table entries see [“Configuring the Unified Forwarding Table” on page 2217](#).

#### **Related Documentation**

- [Configuring the Unified Forwarding Table on page 2217](#)

## [Q-in-Q Tunneling](#)

---

- [Understanding Q-in-Q Tunneling and VLAN Translation on page 2068](#)

### [Understanding Q-in-Q Tunneling and VLAN Translation](#)

Q-in-Q tunneling and VLAN translation allow service providers to create a Layer 2 Ethernet connection between two customer sites. Providers can segregate different customers' VLAN traffic on a link (for example, if the customers use overlapping VLAN IDs) or bundle different customer VLANs into a single service VLAN. Data centers can use Q-in-Q tunneling and VLAN translation to isolate customer traffic within a single site or to enable customer traffic flows between cloud data centers in different geographic locations.

Q-in-Q tunneling adds a service VLAN tag before the customer's 802.1Q VLAN tags. The Juniper Networks Junos operating system implementation of Q-in-Q tunneling supports the IEEE 802.1ad standard.

All of the VLANs in an implementation can be service VLANs. That is, if the total number of supported VLANs is 4090, all of them can be service VLANs.

This topic describes:

- [How Q-in-Q Tunneling Works on page 2068](#)
- [How VLAN Translation Works on page 2069](#)
- [Mapping C-VLANs to S-VLANs on page 2070](#)

- [Constraints for Q-in-Q Tunneling and VLAN Translation on page 2071](#)

### [How Q-in-Q Tunneling Works](#)

---

In Q-in-Q tunneling, as a packet travels from a customer VLAN (C-VLAN) to a service provider's or data center VLAN (S-VLAN), another 802.1Q tag for the appropriate S-VLAN is added before the C-VLAN tag. The C-VLAN tag remains and is transmitted through the network. As the packet leaves the S-VLAN in the downstream direction, the S-VLAN 802.1Q tag is removed.

An interface can be a member of multiple S-VLANs. You can map one C-VLAN to one S-VLAN or multiple C-VLANs to one S-VLAN. C-VLAN and S-VLAN tags use separate name spaces, so you can have both a C-VLAN 101 and an S-VLAN 101, for example. You can limit the set of accepted customer tags to a range of tags or to discrete values.

When Q-in-Q tunneling is enabled, trunk interfaces are assumed to be part of the service provider or data center network. Access interfaces are assumed to be customer-facing and accept both tagged and untagged frames. When using many-to-one bundling or mapping a specific interface, you must use the **native** option to specify an S-VLAN for untagged and priority tagged packets if you want to accept these packets. (Priority tagged packets have their VLAN ID set to 0, and their priority code point bits might be configured with a CoS value.) If you do not specify an S-VLAN for them, untagged packets are discarded. The **native** option is not available for all-in-one bundling because there is no need to specify untagged and priority tagged packets when all packets are mapped to an S-VLAN.

On QFabric systems only, you can use the **native** option to apply a specified inner tag to packets that ingress as untagged on access interfaces. This functionality is useful if your QFabric system connects to servers that host customer virtual machines that send untagged traffic and each customer's traffic requires its own VLAN while being transported through the QFabric. Instead of using individual VLANs for each customer (which can quickly lead to VLAN exhaustion), you can apply a unique inner (C-VLAN) tag to each customer's traffic and then apply a single outer tag (S-VLAN) tag for transport through the QFabric. This allows you to segregate your customers's traffic while consuming only one QFabric VLAN. Use the **inner-tag** option of the **mapping** statement to accomplish this.

Q-in-Q tunneling does not affect any class-of-service (CoS) values that are configured on a C-VLAN. These settings are retained in the C-VLAN tag and can be used after a packet leaves an S-VLAN. CoS values are not copied from C-VLAN tags to S-VLAN tags.

Depending on your interface configuration, you might need to adjust the MTU value on your trunk or access ports to accommodate the 4 bytes used for the tag added by Q-in-Q tunneling. For example, if you use the default MTU value of 1514 bytes on your access and trunk ports, you need to make one of the following adjustments:

- Reduce the MTU on the access links by at least 4 bytes so that the frames do not exceed the MTU of the trunk link when S-VLAN tags are added.
- Increase the MTU on the trunk link so that the link can handle the larger frame size.

**NOTE:** You can configure Q-in-Q tunneling only on access ports (not trunk ports).

### How VLAN Translation Works

VLAN translation replaces an incoming C-VLAN tag with an S-VLAN tag instead of adding an additional tag. The C-VLAN tag is therefore lost, so a single-tagged packet is normally untagged when it leaves the S-VLAN (at the other end of the link). If an incoming packet has had Q-in-Q tunneling applied in advance, VLAN translation replaces the outer tag and the inner tag is retained when the packet leaves the S-VLAN at the other end of the link.

To configure VLAN translation, use the **mapping swap** statement at the **[edit vlans interface]** hierarchy level.

**NOTE:** You can configure VLAN translation on access ports only. You cannot configure it on trunk ports, and you cannot configure Q-in-Q tunneling on the same access port.

**NOTE:** VLAN translation is not supported on QFabric systems.

---

### Mapping C-VLANs to S-VLANs

---

The three ways to map C-VLANs to an S-VLAN are:

- All-in-one bundling—Use the **edit vlans s-vlan-name dot1q-tunneling** statement without specifying customer VLANs. All packets received on all access interfaces (including untagged packets) are mapped to the S-VLAN.
- Many-to-one bundling—Use the **edit vlans s-vlan-name dot1q-tunneling customer-vlans** statement to specify which C-VLANs are mapped to the S-VLAN. Use this method when you want a subset of the C-VLANs to be part of the S-VLAN. If you want untagged or priority tagged packets to be mapped to the S-VLAN, use the **native** option with the **customer-vlans** statement. (Priority tagged packets have their VLAN ID set to 0, and their priority code point bits might be configured with a CoS value.)
- Mapping a specific interface—Use the **edit vlans s-vlan-name interface interface-name mapping** statement to specify a C-VLAN for a given S-VLAN. This configuration applies to only one interface—not all access interfaces as with all-in-one and many-to-one bundling. If you want untagged or priority tagged packets to be mapped to the S-VLAN, use the **native** option with the **customer-vlans** statement.

This method has two options: swap and push. With the push option, a packet retains its tag and an additional VLAN tag is added. With the swap option, the incoming tag is replaced with an S-VLAN tag. (This is VLAN translation.)

- You can configure multiple push rules for a given S-VLAN and interface. That is, you can configure an interface so that the same S-VLAN tag is added to packets arriving from multiple C-VLANs.
- You can configure only one swap rule for a given S-VLAN and interface.

This functionality is typically used to keep traffic from different customers separate or to provide individualized treatment for traffic on a certain interface.

If you configure multiple methods, the switch prioritizes the mappings in the following order:

1. Specific interface mapping
2. Many-to-one bundling
3. All-in-one bundling

You cannot configure overlapping rules for the same C-VLAN using the same mapping method. For example, you cannot use many-to one bundling to map C-VLAN 100 to two different S-VLANs.

### Routed VLAN Interfaces on Q-in-Q VLANs

Routed VLAN interfaces (RVIs) are supported on Q-in-Q VLANs. Routing is based on the S-VLAN, and the original C-VLAN tag is dropped when a packet leaves the VLAN that it originated in. Outgoing routed packets retain any S-VLAN tag only when exiting a trunk interface—S-VLAN tags are dropped when traffic exits an access interface.

### Constraints for Q-in-Q Tunneling and VLAN Translation

Be aware of the following constraints when configuring Q-in-Q tunneling and VLAN translation:

- Most access port security features are not supported with Q-in-Q tunneling and VLAN translation.
- Configuring Q-in-Q tunneling and VLAN translation on the same port is not supported.
- You can configure at most one VLAN translation for a given VLAN and interface. For example, you can create no more than one translation for VLAN 100 on interface xe-0/0/0.
- The combined total of VLANs and rules for Q-in-Q tunneling and VLAN translation cannot exceed 6000. For example, you can configure and commit 4000 VLANs and 2000 rules for Q-in-Q tunneling and VLAN translation. However, you cannot configure 4000 VLANs and 2500 rules for Q-in-Q tunneling and VLAN translation. If you try to commit a configuration that exceeds the limit, you see CLI and syslog errors that inform you about the problem.
- MAC addresses are learned from S-VLANs, not C-VLANs.
- Broadcast, unknown unicast, and multicast traffic is forwarded to all members in the S-VLAN.
- The following features are not supported with Q-in-Q tunneling:
  - DHCP relay
  - Fibre Channel over Ethernet
  - IP Source Guard
- The following features are not supported with VLAN translation:
  - Fibre Channel over Ethernet
  - Firewall filter applied to a port or VLAN in the output direction
  - Private VLANs
  - VLAN Spanning Tree Protocol
  - Reflective relay

## Layer 2 Protocol Tunneling

---

- [Understanding Layer 2 Protocol Tunneling on page 2072](#)

### Understanding Layer 2 Protocol Tunneling

Layer 2 protocol tunneling (L2PT) allows service providers or data centers to send customer Layer 2 protocol data units (PDUs) across a cloud. This feature is useful when you want to run Layer 2 protocols on a network that includes switches located at remote sites that are connected across a service provider network.

For example, a customer might want to run STP between remote sites that are connected by a service provider network. In this case, the STP PDUs sent by the customer equipment must be tunneled through the service provider network. Otherwise, the customer STP PDUs would be processed by the STP protocol running on the service provider switches.

**NOTE:** Layer 2 protocol tunneling is not supported on QFabric systems.

This topic includes:

- [Layer 2 Protocols Supported by L2PT on page 2072](#)
- [How L2PT Works on page 2073](#)
- [L2PT Basics on page 2075](#)

---

### Layer 2 Protocols Supported by L2PT

---

L2PT supports the following Layer 2 protocols:

- 802.1X authentication
- 802.3ah Operation, Administration, and Maintenance (OAM) link fault management (LFM)

**NOTE:** If you enable L2PT for untagged OAM LFM (Operation, Administration, and Maintenance of link fault management) packets, do not configure link fault management (LFM) on the corresponding access interface.

- Cisco Discovery Protocol (CDP)

- Ethernet local management interface (E-LMI)
- MVRP VLAN Registration Protocol (MVRP)
- Link Aggregation Control Protocol (LACP)

**NOTE:** If you enable L2PT for untagged LACP packets, do not configure Link Aggregation Control Protocol (LACP) on the corresponding access interface.

- Link Layer Discovery Protocol (LLDP)
- Multiple MAC Registration Protocol (MMRP)
- Multiple VLAN Registration Protocol (MVRP)
- Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), and Multiple Spanning Tree Protocol (MSTP)
- Unidirectional Link Detection (UDLD)
- VLAN Spanning Tree Protocol (VSTP)
- VLAN Trunking Protocol (VTP)

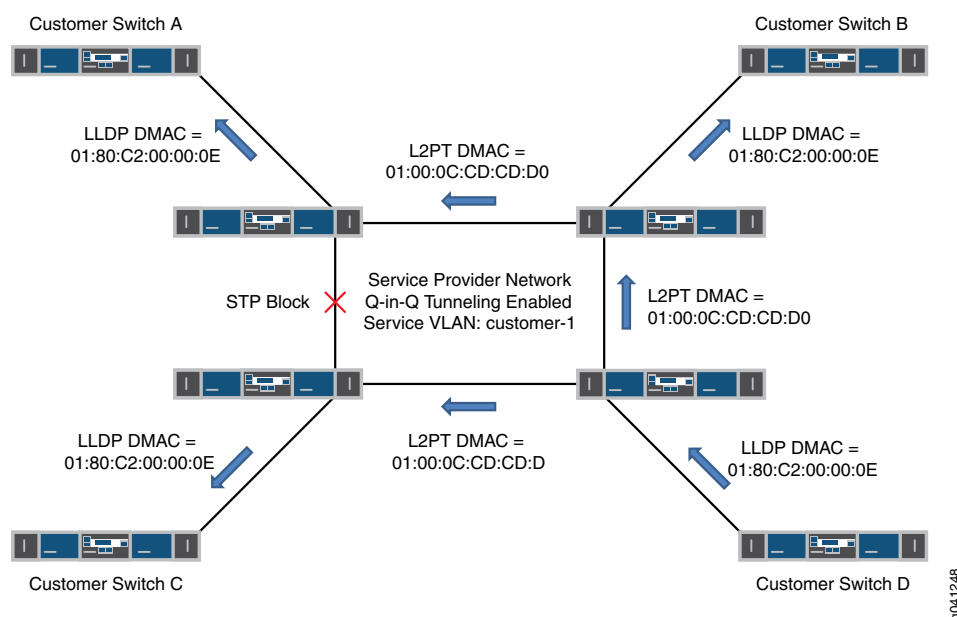

**NOTE:** You cannot configure all of these protocols on QFX Series devices. However, you can tunnel all of them through a QFX Series switch using L2PT.

### How L2PT Works

L2PT works by encapsulating Layer 2 PDUs, tunneling them across a service provider network, and de-encapsulating them for delivery to their destination switches. L2PT encapsulates Layer 2 PDUs by enabling the ingress provider edge (PE) device to rewrite the PDUs' destination media access control (DMAC) addresses before forwarding them onto the service provider network. The devices in the service provider network treat these encapsulated PDUs as multicast Ethernet packets. Upon receipt of these PDUs, the egress PE devices de-encapsulate them by replacing the DMAC addresses with the addresses of the Layer 2 protocol that is being tunneled before forwarding the PDUs to their destination switches.

This process is illustrated in [Figure 66 on page 2074](#):

**Figure 66: L2PT Example**

1. Customer Switch D sends to the service provider network an LLDP PDU that is ultimately intended for the other switches in the customer network.
2. The receiving provider switch adds the L2PT DMAC and sends the frame with the encapsulated LLDP PDU to the other switches in the service provider network.
3. When the other service provider switches receive the frame, they restore the LLDP DMAC and send it to Customer Switches A, B, and C.

[Table 151 on page 2074](#) lists the destination MAC addresses of the supported Layer 2 protocols:

**Table 151: Protocol Destination MAC Addresses**

| Protocol                                    | Ethernet Encapsulation | MAC Address       |
|---------------------------------------------|------------------------|-------------------|
| 802.1X                                      | Ether-II               | 01:80:C2:00:00:03 |
| 802.3ah                                     | Ether-II               | 01:80:C2:00:00:02 |
| Cisco Discovery Protocol (CDP)              | SNAP                   | 01:00:0C:CC:CC:CC |
| Ethernet local management interface (E-LMI) | Ether-II               | 01:80:C2:00:00:07 |
| MVRP VLAN Registration Protocol (MVRP)      | Ether-II               | 01:80C2:00:00:21  |
| Link Aggregation Control Protocol (LACP)    | Ether-II               | 01:80:C2:00:00:02 |

Table 151: Protocol Destination MAC Addresses (*continued*)

| Protocol                                                                                                      | Ethernet Encapsulation | MAC Address       |
|---------------------------------------------------------------------------------------------------------------|------------------------|-------------------|
| Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), and Multiple Spanning Tree Protocol (MSTP) | LLC                    | 01:80:C2:00:00:00 |
| Link Layer Discovery Protocol (LLDP)                                                                          | Ether-II               | 01:80:C2:00:00:0E |
| Multiple MAC Registration Protocol (MMRP)                                                                     | Ether-II               | 01:80:C2:00:00:20 |
| Unidirectional Link Detection (UDLD)                                                                          | SNAP                   | 01:00:0C:CC:CC:CC |
| VLAN Spanning Tree Protocol (VSTP)                                                                            | SNAP                   | 01:00:0C:CC:CC:CD |
| VLAN Trunking Protocol (VTP)                                                                                  | SNAP                   | 01:00:0C:CC:CC:CC |

When a PE device receives a Layer 2 control PDU from any of the customer PE devices, it changes the destination MAC address to 01:00:0C:CD:CD:D0. The modified packet is then sent to the provider network. All devices on the provider network treat these packets as multicast Ethernet packets and deliver them to all PE devices in the VLAN. The egress PE devices receive all the control PDUs with the same MAC address (01:00:0C:CD:CD:D0). Then they identify the packet type by doing deeper packet inspection and replace the destination MAC address 01:00:0C:CD:CD:D0 with the appropriate destination address. The modified PDUs are sent out to the customer PE devices so that the Layer 2 control PDUs are delivered, in their original state, across the provider network. The L2PT protocol is valid for all types of packets (untagged, tagged, and Q-in-Q tagged).

**NOTE:** VLAN translation is not compatible with L2PT. (You configure VLAN translation with the **mapping swap** statement at the [edit vlans interface] hierarchy level.)

### L2PT Basics

L2PT is enabled on a per-VLAN basis. When you enable L2PT on a VLAN, all access interfaces are considered to be customer-facing interfaces, all trunk interfaces are considered to be service provider network-facing interfaces, and the specified Layer 2 protocol is disabled on the access interfaces. L2PT acts only on logical interfaces of the family **ethernet-switching**. L2PT PDUs are flooded to all trunk and access ports within a given service VLAN.

**NOTE:** Access interfaces in an L2PT-enabled VLAN should not receive L2PT-tunneled PDUs. If an access interface does receive L2PT-tunneled PDUs, it might mean that there is a loop in the network. As a result, the interface is shut down.

You configure L2PT at the `[edit vlans vlan-name dot1q-tunneling]` hierarchy level, meaning Q-in-Q tunneling is (and must be) enabled.

**NOTE:** If you want to tunnel untagged or priority-tagged Layer 2 control PDUs, then you must configure the switch to map untagged and priority-tagged packets to an L2PT-enabled VLAN. For more information about assigning untagged and priority-tagged packets to VLANs, see [“Understanding Q-in-Q Tunneling and VLAN Translation” on page 2068](#).

## Proxy ARP

- [Understanding Proxy ARP on page 2076](#)

### Understanding Proxy ARP

You can configure proxy Address Resolution Protocol (ARP) to enable the switch to respond to ARP queries for network addresses by offering its own Ethernet media access control (MAC) address. With proxy ARP enabled, the switch captures and routes traffic to the intended destination.

Proxy ARP is useful in situations where hosts are on different physical networks and you do not want to use subnet masking. Because ARP broadcasts are not propagated between hosts on different physical networks, hosts will not receive a response to their ARP request if the destination is on a different subnet. Enabling the switch to act as an ARP proxy allows the hosts to transparently communicate with each other through the switch. Proxy ARP can help hosts on a subnet reach remote subnets without your having to configure routing or a default gateway.

- [What Is ARP? on page 2076](#)
- [Proxy ARP Overview on page 2077](#)
- [Best Practices for Proxy ARP on page 2077](#)

#### What Is ARP?

---

Ethernet LANs use ARP to map Ethernet MAC addresses to IP addresses. Each device maintains a cache containing a mapping of MAC addresses to IP addresses. The switch maintains this mapping in a cache that it consults when forwarding packets to network devices. If the ARP cache does not contain an entry for the destination device, the host (the DHCP client) broadcasts an ARP request for that device's address and stores the response in the cache.

## Proxy ARP Overview

When proxy ARP is enabled, if the switch receives an ARP request for which it has a route to the target (destination) IP address, the switch responds by sending a proxy ARP reply packet containing its own MAC address. The host that sent the ARP request then sends its packets to the switch, which forwards them to the intended host.

**NOTE:** For security reasons, the source address in an ARP request must be on the same subnet as the interface on which the ARP request is received.

You can configure proxy ARP for each interface. You can also configure proxy ARP for a VLAN by using a routed VLAN interface (RVI).

Two modes of proxy ARP are supported: restricted and unrestricted. Both modes require that the switch have an active route to the destination address of the ARP request.

- **Restricted**—The switch responds to ARP requests in which the physical networks of the source and target are different and does not respond if the source and target IP addresses are on the same subnet. In this mode, hosts on the same subnet communicate without proxy ARP. We recommend that you use this mode on the switch.
- **Unrestricted**—The switch responds to all ARP requests for which it has a route to the destination. This is the default mode (because it is the default mode in Juniper Networks Junos operating system (Junos OS) configurations other than those on the switch). We recommend using restricted mode on the switch.

## Best Practices for Proxy ARP

We recommend these best practices for configuring proxy ARP on the switches:

- Set proxy ARP to restricted mode.
- Use restricted mode when configuring proxy ARP on RVIs.
- If you set proxy ARP to unrestricted, disable gratuitous ARP requests on each interface enabled for proxy ARP.

### Example: Configuring Automatic VLAN Administration Using MVRP

As the numbers of servers and VLANs attached to a QFabric systems increase, VLAN administration becomes complex and the task of efficiently configuring VLANs on multiple redundant server Node group devices becomes increasingly difficult. To partially automate VLAN administration, you can enable Multiple VLAN Registration Protocol (MVRP) on your QFabric system. If your QFabric system connects to servers that host many virtual machines that require their own VLANs, using MVRP can save you the time and effort that would be required to manually configure and administer the VLANs on the interfaces that connect to the servers. For example, if a virtual machine moves between servers—and therefore connects to a different redundant server Node group interface—MVRP can configure the appropriate VLAN membership on the new server Node group interface.

**NOTE:** Only trunk interfaces can be enabled for MVRP.

This example describes how to configure MVRP on a QFabric system.

- [Requirements on page 2080](#)
- [Overview and Topology on page 2080](#)
- [Configuring VLANs and Network Node Group Interfaces on page 2081](#)
- [Configuring the Redundant Server Node Group on page 2083](#)
- [Verification on page 2084](#)

#### Requirements

---

This example uses the following hardware and software components:

- One QFabric system
- Junos OS Release 13.1 for the QFX Series

#### Overview and Topology

---

MVRP ensures that the VLAN membership information on the trunk interface is updated as the switch's access interfaces become active or inactive in the configured VLANs in a static or dynamic VLAN creation setup.

You do not need to explicitly bind a VLAN to the trunk interface. When MVRP is enabled, the trunk interface advertises all the VLANs that are active (bound to access interfaces) on that switch. An MVRP-enabled trunk interface does not advertise VLANs that have been configured on the switch but that are not currently bound to an access interface. Thus, MVRP provides the benefit of reducing network overhead—by limiting the scope of broadcast, unknown unicast, and multicast (BUM) traffic to interested devices only.

When VLAN access interfaces become active or inactive, MVRP ensures that the updated information is advertised on the trunk interface. Thus, in this example, distribution Switch C does not forward traffic to inactive VLANs.

A redundant server Node group device is connected to a server that hosts virtual machines for three customers, each of which requires its own VLAN.

- **customer-1:** VLAN ID 100
- **customer-2:** VLAN ID 200
- **customer-3:** VLAN ID 300

[Table 152 on page 2081](#) explains the components of the example topology.

Table 152: Components of the Example Topology

| Settings           | Settings                                                                                                                                                                                                                                                                                                                                            |

Configuring VLANs and Network Node Group Interfaces

To configure VLANs, bind the VLANs to the server-facing trunk interface, and enable MVRP on the trunk interface of the network Node group device, perform these tasks:

CLI Quick Configuration

To quickly configure VLANs on the QFabric system, assign VLAN membership to the uplink port on the network Node group device, and configure the uplink port to be trunk:

```
[edit]
set vlans customer-1 vlan-id 100
set vlans customer-2 vlan-id 200
set vlans customer-3 vlan-id 300
set interfaces NNG:xe-0/0/1 unit 0 family ethernet-switching port-mode trunk
set interfaces NNG:xe-0/0/1 unit 0 family ethernet-switching vlan members [customer-1
customer-2 customer-3]
```

**NOTE:** As recommended as a best practice, default MVRP timers are used in this example, so they are not configured. The default values associated with each MVRP timer are: 200 ms for the join timer, 1000 ms for the leave timer, and 10000 ms for the leaveall timer. Modifying timers to inappropriate values might cause an imbalance in the operation of MVRP.

### Step-by-Step Procedure

To create the VLANs and configure the network Node group device for MVRP, follow these steps. Note that you are creating VLANs for the entire QFabric system, so you do not need to create them on specific QFabric devices.

1. Configure the VLAN for customer 1:  

```
[edit]
user@qfabric# set vlans customer-1 vlan-id 100
```
2. Configure the VLAN for customer 2:  

```
[edit]
user@qfabric# set vlans customer-2 vlan-id 200
```
3. Configure the VLAN for customer 3:  

```
[edit]
user@qfabric# set vlans customer-3 vlan-id 300
```
4. Configure an uplink interface (one that connects to an interconnect device) to be a trunk:  

```
[edit]
user@qfabric# set interfaces NNG:xe-0/0/1 unit 0 family ethernet-switching port-mode trunk
```
5. Configure the uplink interface to be a member of all three VLANs:  

```
[edit]
user@qfabric# set interfaces NNG:xe-0/0/1 unit 1 family ethernet-switching vlan members
[customer-1 customer-2 customer-3]
```

**NOTE:** If you want the uplink interface to be a member of all the VLANs in the QFabric system, you can enter all instead of specifying the individual VLANs.

**Results** Check the results of the configuration on the network Node group device:

```
[edit]
user@qfabric# show interfaces NNG:xe-0/0/1.0
family ethernet-switching {
  port-mode trunk;
  vlan {
    members customer-1 customer-2 customer-3;
  }
}
```

[edit]

```

user@qfabric# show vlans
customer-1 {
  vlan-id 100;
}
customer-2 {
  vlan-id 200;
}
customer-3 {
  vlan-id 300;
}

```

### Configuring the Redundant Server Node Group

#### CLI Quick Configuration

To quickly configure the redundant server Node group device for MVRP:

```

[edit]
set interfaces RSNG:xe-0/1/1 unit 0 family ethernet-switching port-mode trunk
set interfaces RSNG:xe-0/1/1 unit 0 family ethernet-switching vlan members [customer-1
customer-2 customer-3]
set interfaces RSNG:xe-0/0/1 unit 0 family ethernet-switching port-mode trunk
set protocols mvrp interface RSNG:xe-0/0/1.0 passive

```

#### Step-by-Step Procedure

To configure the redundant server Node group device, follow these steps. Note that you do not need to configure the VLANs on the server-facing interface (RSNG:xe-0/0/1), but you do need to configure the VLANs on the uplink interface. Also notice that in this example you configure the server-facing interface to be passive, which means that it will not announce its membership in a VLAN or send any VLAN declarations (updates) unless it receives registration for that VLAN from the server.

1. Configure an uplink interface (one that connects to the interconnect device) to be a trunk:

```

[edit]
user@qfabric# set interfaces RSNG:xe-0/1/1 unit 0 family ethernet-switching port-mode trunk

```

2. Configure the uplink interface to be a member of all three VLANs:

```

[edit]
user@qfabric# set interfaces NNG:xe-0/1/1 unit 0 family ethernet-switching vlan members [customer-1 customer-2 customer-3]

```

3. Configure an interface that connects to the server that hosts multiple virtual machines to be a trunk:

```

[edit]
user@qfabric# set interfaces RSNG:xe-0/0/1 unit 0 family ethernet-switching port-mode trunk

```

4. Enable MVRP on the server-facing trunk interface and configure it to be passive:

```

[edit]
user@qfabric# set protocols mvrp interface RSNG:xe-0/0/1.0 passive

```

#### Results

Check the results of the configuration for the redundant server Node group:

```

[edit]
user@qfabric# show interfaces RSNG:xe-0/0/1.0
family ethernet-switching {
  port-mode trunk;
}

```

```

[edit]
user@qfabric# show interfaces RSNG:xe-0/1/1.0
family ethernet-switching {
    port-mode trunk;
}
passive
}

[edit]
user@qfabric# show protocols mvrp
interface RSNG:xe-0/0/1.0;

```

### Verification

To confirm that the configuration is updating VLAN membership, perform these tasks:

- [Verifying That MVRP Is Enabled On The QFabric System on page 2084](#)

#### *Verifying That MVRP Is Enabled On The QFabric System*

**Purpose** Verify that MVRP is enabled on the appropriate interfaces

**Action** Show the MVRP configuration:

```
user@qfabric> show mvrp
```

```

MVRP configuration
MVRP status           : Enabled

```

```

MVRP timers (ms):
Interface      Join    Leave    LeaveAll
-----
NNG:xe-0/0/1.0  200    1000    10000
RSNG:xe-0/0/1.0  200    1000    10000
RSNG:xe-0/1/1.0  200    1000    10000

```

```

Interface      Status    Registration Mode
-----
NNG:xe-0/0/1.0  Enabled   Normal
RSNG:xe-0/1/1.0  Enabled   Normal
RSNG:xe-0/0/1.0  Enabled   Passive

```

**Meaning** The results show that MVRP is enabled on the appropriate network Node group and redundant server Node group interfaces and that the default timers are used.

### Example: Connecting an Access Switch to a Distribution Switch

In large local area networks (LANs), you commonly need to aggregate traffic from a number of access switches into a distribution switch.

This example describes how to connect an access switch to a distribution switch:

- [Requirements on page 2085](#)
- [Overview and Topology on page 2085](#)
- [Configuring the Access Switch on page 2086](#)
- [Configuring the Distribution Switch on page 2090](#)
- [Verification on page 2091](#)

### Requirements

This example uses the following hardware and software components:

- For the distribution switch, one EX 4200-24F switch. This model is designed to be used as a distribution switch for aggregation or collapsed core network topologies and in space-constrained data centers. It has twenty-four 1-Gigabit Ethernet fiber SFP ports and an EX-UM-2XFP uplink module with two 10-Gigabit Ethernet XFP ports.
- For the access switch, one EX 3200-24P, which has twenty-four 1-Gigabit Ethernet ports, all of which support Power over Ethernet (PoE), and an uplink module with four 1-Gigabit Ethernet ports.
- Junos OS Release 11.1 or later for the QFX Series

### Overview and Topology

In a large office that is spread across several floors or buildings, or in a data center, you commonly aggregate traffic from a number of access switches into a distribution switch. This configuration example shows a simple topology to illustrate how to connect a single access switch to a distribution switch.

In the topology, the LAN is segmented into two VLANs, one for the sales department and the second for the support team. One 1-Gigabit Ethernet port on the access switch's uplink module connects to the distribution switch, to one 1-Gigabit Ethernet port on the distribution switch.

[Table 153 on page 2085](#) explains the components of the example topology. The example shows how to configure one of the three access switches. The other access switches could be configured in the same manner.

**Table 153: Components of the Topology for Connecting an Access Switch to a Distribution Switch**

| Property                     | Settings                                                                                                                                                         |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Access switch hardware       | EX 3200-24P, 24 1-Gigabit Ethernet ports, all PoE-enabled ( <b>ge-0/0/0</b> through <b>ge-0/0/23</b> ); one 4-port 1-Gigabit Ethernet uplink module (EX-UM-4SFP) |
| Distribution switch hardware | EX 4200-24F, 24 1-Gigabit Ethernet fiber SPF ports ( <b>ge-0/0/0</b> through <b>ge-0/0/23</b> ); one 2-port 10-Gigabit Ethernet XFP uplink module (EX-UM-4SFP)   |
| VLAN names and tag IDs       | <b>sales</b> , tag <b>100</b> <b>support</b> , tag <b>200</b>                                                                                                    |

|                                                                  |                                                                                                                                                                                                                               |
|------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VLAN subnets                                                     | <b>sales:</b> 192.0.2.0/25 (addresses 192.0.2.1 through 192.0.2.126) <b>support:</b> 192.0.2.128/25 (addresses 192.0.2.129 through 192.0.2.254)                                                                               |
| Trunk port interfaces                                            | On the access switch: <b>ge-0/1/0</b> On the distribution switch: <b>ge-0/0/0</b>                                                                                                                                             |
| Access port interfaces in VLAN <b>sales</b> (on access switch)   | Avaya IP telephones: <b>ge-0/0/3</b> through <b>ge-0/0/19</b> Wireless access points: <b>ge-0/0/0</b> and <b>ge-0/0/1</b> Printers: <b>ge-0/0/22</b> and <b>ge-0/0/23</b> File servers: <b>ge-0/0/20</b> and <b>ge-0/0/21</b> |
| Access port interfaces in VLAN <b>support</b> (on access switch) | Avaya IP telephones: <b>ge-0/0/25</b> through <b>ge-0/0/43</b> Wireless access points: <b>ge-0/0/24</b> Printers: <b>ge-0/0/44</b> and <b>ge-0/0/45</b> File servers: <b>ge-0/0/46</b> and <b>ge-0/0/47</b>                   |
| Unused interfaces on access switch                               | <b>ge-0/0/2</b> and <b>ge-0/0/25</b>                                                                                                                                                                                          |

### Configuring the Access Switch

To configure the access switch:

#### CLI Quick Configuration

To quickly configure the access switch, copy the following commands and paste them into the switch terminal window:

```
[edit]
set interfaces ge-0/0/0 unit 0 description "Sales Wireless access point port"
set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/3 unit 0 description "Sales phone port"
set interfaces ge-0/0/3 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/22 unit 0 description "Sales printer port"
set interfaces ge-0/0/22 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/20 unit 0 description "Sales file server port"
set interfaces ge-0/0/20 unit 0 family ethernet-switching vlan members sales
set interfaces ge-0/0/24 unit 0 description "Support wireless access point port"
set interfaces ge-0/0/24 unit 0 family ethernet-switching vlan members support
set interfaces ge-0/0/26 unit 0 description "Support phone port"
set interfaces ge-0/0/26 unit 0 family ethernet-switching vlan members support
set interfaces ge-0/0/44 unit 0 description "Support printer port"
set interfaces ge-0/0/44 unit 0 family ethernet-switching vlan members support
set interfaces ge-0/0/46 unit 0 description "Support file server port"
set interfaces ge-0/0/46 unit 0 family ethernet-switching vlan members support
set interfaces ge-0/1/0 unit 0 description "Uplink module port connection to distribution switch"
set interfaces ge-0/1/0 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/1/0 unit 0 family ethernet-switching native-vlan-id 1
set interfaces ge-0/1/0 unit 0 family ethernet-switching vlan members [sales support]
set interfaces vlan unit 0 family inet address 192.0.2.1/25
set interfaces vlan unit 1 family inet address 192.0.2.129/25
set vlans sales interface ge-0/0/0.0
set vlans sales interface ge-0/0/3.0
set vlans sales interface ge-0/0/22.0
set vlans sales interface ge-0/0/20.0
set vlans sales l3-interface vlan.0
set vlans sales vlan-id 100
set vlans sales vlan-description "Sales VLAN"
set vlans support interface ge-0/0/24.0
set vlans support interface ge-0/0/26.0
```

```

set vlans support interface ge-0/0/44.0
set vlans support interface ge-0/0/46.0
set vlans support vlan-id 200
set vlans support l3-interface vlan.1
set vlans support vlan-description "Support VLAN"

```

### Step-by-Step Procedure

To configure the access switch:

1. Configure the 1-Gigabit Ethernet interface on the uplink module to be the trunk port that connects to the distribution switch:

```

[edit interfaces ge-0/1/0 unit 0]user@access-switch# set description "Uplink
module port connection to distribution switch"user@access-switch# set ethernet-switching
port-mode trunk

```

2. Specify the VLANs to be aggregated on the trunk port:

```

[edit interfaces ge-0/1/0 unit 0]user@access-switch# set ethernet-switching
vlan-members [ sales support ]

```

3. Configure the VLAN ID to use for packets that are received with no dot1q tag (untagged packets):

```

[edit interfaces ge-0/1/0 unit 0]user@access-switch# set ethernet-switching
native-vlan-id 1

```

4. Configure the sales VLAN:

```

[edit vlans sales]user@access-switch# set vlan-description "Sales
VLAN"user@access-switch# set vlan-id (VLANs) 100user@access-switch# set l3-interface
(VLAN) vlan.0

```

5. Configure the support VLAN:

```

[edit vlans support]user@access-switch# set vlan-description "Support
VLAN"user@access-switch# set vlan-id (VLANs) 200user@access-switch# set
l3-interface (VLAN) vlan.1

```

6. Create the subnet for the sales broadcast domain:

```

[edit interfaces]user@access-switch# set vlan unit 0 family inet address 192.0.2.1/25

```

7. Create the subnet for the support broadcast domain:

```

[edit interfaces]user@access-switch# set vlan unit 1 family inet address 192.0.2.129/25

```

8. Configure the interfaces in the sales VLAN:

```

[edit interfaces]user@access-switch# set ge-0/0/0 unit 0 description "Sales wireless
access point port"user@access-switch# set ge-0/0/0 unit 0 family ethernet-switching
vlan members salesuser@access-switch# set ge-0/0/3 unit 0 description "Sales phone
port"user@access-switch# set ge-0/0/3 unit 0 family ethernet-switching vlan members
salesuser@access-switch# set ge-0/0/20 unit 0 description "Sales file server
port"user@access-switch# set ge-0/0/20 unit 0 family ethernet-switching vlan members
salesuser@access-switch# set ge-0/0/22 unit 0 description "Sales printer
port"user@access-switch# set ge-0/0/22 unit 0 family ethernet-switching vlan members
sales

```

9. Configure the interfaces in the support VLAN:

```

[edit interfaces]user@access-switch# set ge-0/0/24 unit 0 description "Support
wireless access point port"user@access-switch# set ge-0/0/24 unit 0 family
ethernet-switching vlan members supportuser@access-switch# set ge-0/0/26 unit 0
description "Support phone port"user@access-switch# set ge-0/0/26 unit 0 family
ethernet-switching vlan members supportuser@access-switch# set ge-0/0/44 unit 0
description "Support printer port"user@access-switch# set ge-0/0/44 unit 0 family
ethernet-switching vlan members supportuser@access-switch# set ge-0/0/46 unit 0
description "Support file server port"user@access-switch# set ge-0/0/46 unit 0 family
ethernet-switching vlan members support

```

10. Configure descriptions and VLAN tag IDs for the sales and support VLANs:

```
[edit vlans]user@access-switch# set sales vlan-description "Sales
VLAN"user@access-switch# set sales vlan-id 100user@access-switch# set support
vlan-description "Support VLAN"user@access-switch# set support vlan-id 200
```

11. To route traffic between the sales and support VLANs and associate a Layer 3 interface with each VLAN:

```
[edit vlans]user@access-switch# set sales l3-interface vlan.0user@access-switch#
set support l3-interface vlan.1
```

**Results** Display the results of the configuration:

```
user@access-switch> show
interfaces {
  ge-0/0/0 {
    unit 0 {
      description "Sales wireless access point port";
      family ethernet-switching {
        vlan members sales;
      }
    }
  }
  ge-0/0/3 {
    unit 0 {
      description "Sales phone port";
      family ethernet-switching {
        vlan members sales;
      }
    }
  }
  ge-0/0/20 {
    unit 0 {
      description "Sales file server port";
      family ethernet-switching {
        vlan members sales;
      }
    }
  }
  ge-0/0/22 {
    unit 0 {
      description "Sales printer port";
      family ethernet-switching {
        vlan members sales;
      }
    }
  }
  ge-0/0/24 {
    unit 0 {
      description "Support wireless access point port";
      family ethernet-switching {
        vlan members support;
      }
    }
  }
  ge-0/0/26 {
    unit 0 {
```

```

        description "Support phone port";
        family ethernet-switching {
            vlan members support;
        }
    }
}
ge-0/0/44 {
    unit 0 {
        description "Support printer port";
        family ethernet-switching {
            vlan members sales;
        }
    }
}
ge-0/0/46 {
    unit 0 {
        description "Support file server port";
        family ethernet-switching {
            vlan members support;
        }
    }
}
ge-0/1/0 {
    unit 0 {
        description "Uplink module port connection to distribution switch";
        family ethernet-switching {
            port-mode trunk;
            vlan members [ sales support ];
            native-vlan-id 1;
        }
    }
}
vlan {
    unit 0 {
        family inet address 192.0.2.1/25;
    }
    unit 1 {
        family inet address 192.0.2.129/25;
    }
}
vlangs {
    sales {
        vlan-id 100;
        vlan-description "Sales VLAN";
        l3-interface vlan.0;
    }
    support {
        vlan-id 200;
        vlan-description "Support VLAN";
        l3-interface vlan.1;
    }
}
}

```

**TIP:** To quickly configure the distribution switch, issue the load merge terminal command, then copy the hierarchy and paste it into the switch terminal window.

## Configuring the Distribution Switch

To configure the distribution switch:

### CLI Quick Configuration

To quickly configure the distribution switch, copy the following commands and paste them into the switch terminal window:

```
set interfaces ge-0/0/0 description "Connection to access switch"
set interfaces ge-0/0/0 ethernet-switching port-mode trunk
set interfaces ge-0/0/0 ethernet-switching vlan members [ sales support ]
set interfaces ge-0/0/0 ethernet-switching native-vlan-id 1
set interfaces vlan unit 0 family inet address 192.0.2.2/25
set interfaces vlan unit 1 family inet address 192.0.2.130/25
set vlans sales vlan-description "Sales VLAN"
set vlans sales vlan-id 100
set vlans sales l3-interface vlan.0
set vlans support vlan-description "Support VLAN"
set vlans support vlan-id 200
set vlans support l3-interface vlan.1
```

### Step-by-Step Procedure

To configure the distribution switch:

1. Configure the interface on the switch to be the trunk port that connects to the access switch:  

```
[edit interfaces ge-0/0/0 unit 0]user@distribution-switch# set description "Connection to access switch"
user@distribution-switch# set ethernet-switching port-mode trunk
```
2. Specify the VLANs to be aggregated on the trunk port:  

```
[edit interfaces ge-0/0/0 unit 0]user@distribution-switch# set ethernet-switching vlanmembers [ sales support ]
```
3. Configure the VLAN ID to use for packets that are received with no dot1q tag (untagged packets):  

```
[edit interfaces]user@distribution-switch# set ge-0/0/0 ethernet-switching native-vlan-id 1
```
4. Configure the sales VLAN:  

```
[edit vlans sales]user@distribution-switch# set vlan-description "Sales VLAN"
user@distribution-switch# set vlan-id (VLANs) 100
user@distribution-switch# set l3-interface (VLAN) vlan.0
```
5. Configure the support VLAN:  

```
[edit vlans support]user@distribution-switch# set vlan-description "Support VLAN"
user@distribution-switch# set vlan-id (VLANs) 200
user@distribution-switch# set l3-interface (VLAN) vlan.1
```
6. Create the subnet for the sales broadcast domain:  

```
[edit interfaces]user@distribution-switch# set vlan unit 0 family inet address 192.0.2.2/25
```
7. Create the subnet for the support broadcast domain:

```
[edit interfaces] user@distribution-switch# set vlan unit 1 family inet address
192.0.2.130/25
```

**Results** Display the results of the configuration:

```
user@distribution-switch> show
interfaces {
  ge-0/0/0 {
    description "Connection to access switch";
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan members [ sales support ];
        native-vlan-id 1;
      }
    }
  }
  vlan {
    unit 0 {
      family inet address 192.0.2.2/25;
    }
    unit 1 {
      family inet address 192.0.2.130/25;
    }
  }
}
vlangs {
  sales {
    vlan-id 100;
    vlan-description "Sales VLAN";
    l3-interface vlan.0;
  }
  support {
    vlan-id 200;
    vlan-description "Support VLAN";
    l3-interface vlan.1;
  }
}
```

**TIP:** To quickly configure the distribution switch, issue the **load merge terminal** command, then copy the hierarchy and paste it into the switch terminal window.

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying the VLAN Members and Interfaces on the Access Switch on page 2092](#)
- [Verifying the VLAN Members and Interfaces on the Distribution Switch on page 2092](#)

**Verifying the VLAN Members and Interfaces on the Access Switch**

**Purpose** Verify that the **sales** and **support** have been created on the switch.

**Action** List all VLANs configured on the switch:

user@switch> **show vlans**

| Name    | Tag | Interfaces                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------|-----|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Bridging Configuration Examples

- [Example: Setting Up Basic Bridging and a VLAN on the QFX Series on page 2093](#)
- [Example: Setting Up Bridging with Multiple VLANs on page 2110](#)

### Example: Setting Up Basic Bridging and a VLAN on the QFX Series

The QFX Series products use bridging and virtual LANs (VLANs) to connect network devices—storage devices, file servers, and other LAN components—in a LAN and to segment the LAN into smaller bridging domains.

To segment traffic on a LAN into separate broadcast domains, you create separate virtual LANs (VLANs) on a switch. Each VLAN is a collection of network nodes. When you use VLANs, frames whose origin and destination are in the same VLAN are forwarded only within the local VLAN, and only frames not destined for the local VLAN are forwarded to other broadcast domains. VLANs thus limit the amount of traffic flowing across the entire LAN, reducing the possible number of collisions and packet retransmissions within the LAN.

This example describes how to configure basic bridging and VLANs for the QFX Series:

- [Requirements on page 2094](#)
- [Overview and Topology on page 2094](#)
- [Configuration on page 2095](#)
- [Verification on page 2103](#)

### Requirements

This example uses the following software and hardware components:

- Junos OS Release 11.1 or later for the QFX Series
- A configured and provisioned QFX Series product

### Overview and Topology

To use a switch to connect network devices on a LAN, you must at a minimum configure bridging and VLANs. By default, bridging is enabled on all switch interfaces, all interfaces are in access mode, and all interfaces belong to a VLAN called **employee-vlan**, which is automatically configured. When you plug in access devices—such as desktop computers, file servers, and printers—they are joined immediately into the **employee-vlan** VLAN, and the LAN is up and running.

The topology used in this example consists of a single QFX3500 switch, with a total of 48 10-Gbps Ethernet ports. (For the purposes of this example, the QSFP+ ports Q0-Q3, which are ports xe-0/1/0 through xe-0/1/15, are excluded.) You use the ports to connect devices that have their own power sources. Table 1 details the topology used in this configuration example.

**Table 154: Components of the Basic Bridging Configuration Topology**

| Property                                              | Settings                                       |
|-------------------------------------------------------|------------------------------------------------|
| Switch hardware                                       | QFX3500 switch, with 48 10-Gbps Ethernet ports |
| VLAN name                                             | <b>employee-vlan</b>                           |
| VLAN ID                                               | 10                                             |
| Connections to file servers                           | <b>xe-0/0/17 and xe-0/0/18</b>                 |
| Direct connections to desktop PCs and laptops         | <b>xe-0/0/0 through xe-0/0/16</b>              |
| Connections to integrated printer/fax/copier machines | <b>xe-0/0/19 through xe-0/0/40</b>             |
| Unused ports                                          | <b>xe-0/0/41 through xe-0/0/47</b>             |

## Configuration

### CLI Quick Configuration

To quickly configure a VLAN, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans employee-vlan vlan-id 10
set interfaces xe-0/0/0 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/1 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/2 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/3 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/4 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/5 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/6 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/7 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/8 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/9 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/10 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/11 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/12 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/13 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/14 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/15 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/16 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/17 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/18 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/19 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/20 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/21 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/22 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/23 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/24 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/25 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/26 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/27 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/28 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/29 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/30 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/31 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/32 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/33 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/34 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/35 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/36 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/37 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/38 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/39 unit 0 family ethernet-switching vlan members employee-vlan
set interfaces xe-0/0/40 unit 0 family ethernet-switching vlan members employee-vlan
```

### Step-by-Step Procedure

To set up basic bridging and a VLAN:

1. Create a VLAN named employee-vlan and specify the VLAN ID of 10 for it:  

```
[edit vlans]
user@switch# set employee-vlan vlan-id 10
```
2. Assign interfaces xe-0/0/0 through xe-0/0/40 to the employee-vlan VLAN:  

```
[edit interface]
user@switch# set xe-0/0/0 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/1 unit 0 family ethernet-switching vlan members employee-vlan
```

```
user@switch# set xe-0/0/2 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/3 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/4 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/5 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/6 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/7 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/8 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/9 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/10 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/11 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/12 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/13 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/14 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/15 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/16 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/17 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/18 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/19 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/20 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/21 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/22 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/23 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/24 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/25 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/26 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/27 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/28 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/29 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/30 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/31 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/32 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/33 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/34 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/35 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/36 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/37 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/38 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/39 unit 0 family ethernet-switching vlan members employee-vlan
user@switch# set xe-0/0/40 unit 0 family ethernet-switching vlan members employee-vlan
```

3. Connect the two file servers to ports xe-0/0/17 and xe-0/0/18.
4. Connect the desktop PCs and laptops to ports xe-0/0/0 through xe-0/0/16.
5. Connect the integrated printer/fax/copier machines to ports xe-0/0/19 through xe-0/0/40.

**Results** Check the results of the configuration:

```

user@switch> show configuration
xe-0/0/0 {
  unit 0 {

```

---

### Verification

To verify that switching is operational and that **employee-vlan** has been created, perform these tasks:

- [Verifying That the VLAN Has Been Created on page 2103](#)
- [Verifying That Interfaces Are Associated with the Proper VLANs on page 2104](#)

#### *Verifying That the VLAN Has Been Created*

**Purpose** Verify that the VLAN named **employee-vlan** has been created on the switch.

**Action** List all VLANs configured on the switch:

```
user@switch> show vlans
Routing instance      VLAN name      Tag      Interfaces
default-switch       employee-vlan   10
                     xe-0/0/0.0
                     xe-0/0/1.0
                     xe-0/0/2.0
                     xe-0/0/3.0
                     xe-0/0/4.0
                     xe-0/0/5.0
                     xe-0/0/6.0
                     xe-0/0/7.0
                     xe-0/0/8.0
                     xe-0/0/9.0
                     xe-0/0/10.0
                     xe-0/0/11.0
                     xe-0/0/12.0
                     xe-0/0/13.0
                     xe-0/0/14.0
                     xe-0/0/15.0
                     xe-0/0/16.0
                     xe-0/0/17.0
                     xe-0/0/18.0
                     xe-0/0/19.0
                     xe-0/0/20.0
                     xe-0/0/21.0
                     xe-0/0/22.0
                     xe-0/0/23.0
                     xe-0/0/24.0
                     xe-0/0/25.0
                     xe-0/0/26.0
                     xe-0/0/27.0
                     xe-0/0/28.0
                     xe-0/0/29.0
                     xe-0/0/30.0
                     xe-0/0/31.0
                     xe-0/0/32.0
                     xe-0/0/33.0
                     xe-0/0/34.0
                     xe-0/0/35.0
                     xe-0/0/36.0
                     xe-0/0/37.0
                     xe-0/0/38.0
                     xe-0/0/39.0
                     xe-0/0/40.0
...

```

**Meaning** The `show vlans` command lists the VLANs configured on the switch. This output shows that the VLAN `employee-vlan` has been created.

#### *Verifying That Interfaces Are Associated with the Proper VLANs*

**Purpose** Verify that Ethernet switching is enabled on switch interfaces and that all interfaces are included in the VLAN.

**Action** List all interfaces on which switching is enabled:

```

user@switch> show ethernet-switching interfaces
Routing Instance Name : default-switch
Logical Interface flags (DL - disable learning, AD - packet action drop,
                        LH - MAC limit hit, DN - interface down )

**Meaning** The `show ethernet-switching interfaces` command lists all interfaces on which switching is enabled (in the **Logical interface** column), along with the VLANs that are active on the interfaces (in the **VLAN members** column). The output in this example shows all the connected interfaces, xe-0/0/0 through xe-0/0/40, are all part of VLAN **employee-vlan**. Notice that the interfaces listed are the logical interfaces, not the physical interfaces. For example, the output shows xe-0/0/0.0 instead of xe-0/0/0. This is because Junos OS creates VLANs on logical interfaces, not directly on physical interfaces.

## Example: Setting Up Bridging with Multiple VLANs

The QFX Series products use bridging and virtual LANs (VLANs) to connect network devices in a LAN—storage devices, file servers, and other network components—and to segment the LAN into smaller bridging domains.

To segment traffic on a LAN into separate broadcast domains, you create separate virtual LANs (VLANs) on a switch. Each VLAN is a collection of network nodes. When you use VLANs, frames whose origin and destination are in the same VLAN are forwarded only within the local VLAN, and only frames not destined for the local VLAN are forwarded to other broadcast domains. VLANs thus limit the amount of traffic flowing across the entire LAN, reducing the possible number of collisions and packet retransmissions within the LAN.

**NOTE:** This task uses Junos OS for QFX3500 and QFX3600 switches does not support the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that supports ELS, see *Example: Setting Up Bridging with Multiple VLANs*.

This example describes how to configure bridging for the QFX Series and how to create two VLANs to segment the LAN:

- [Requirements on page 2111](#)
- [Overview and Topology on page 2111](#)
- [Configuration on page 2112](#)
- [Verification on page 2114](#)

Requirements

This example uses the following hardware and software components:

- A configured and provisioned QFX3500 switch
- Junos OS Release 11.1 or later for the QFX Series

Overview and Topology

Switches connect all devices in an office or data center into a single LAN to provide sharing of common resources such as file servers. The default configuration creates a single VLAN, and all traffic on the switch is part of that broadcast domain. Creating separate network segments reduces the span of the broadcast domain and enables you to group related users and network resources without being limited by physical cabling or by the location of a network device in the building or on the LAN.

This example shows a simple configuration to illustrate the basic steps for creating two VLANs on a single switch. One VLAN, called **sales**, is for the sales and marketing group, and a second, called **support**, is for the customer support team. The sales and support groups each have their own dedicated file servers and other resources. For the switch ports to be segmented across the two VLANs, each VLAN must have its own broadcast domain, identified by a unique name and tag (VLAN ID). In addition, each VLAN must be on its own distinct IP subnet.

The topology used in this example consists of a single QFX3500 switch, with a total of 48 10-Gbps Ethernet ports. (For the purposes of this example, the QSFP+ ports Q0-Q3, which are ports xe-0/1/0 through xe-0/1/15, are excluded.)

Table 155: Components of the Multiple VLAN Topology

| Property        | Settings                                                                              |
|-----------------|---------------------------------------------------------------------------------------|
| Switch hardware | QFX3500 switch configured with 48 10-Gbps Ethernet ports (xe-0/0/0 through xe-0/0/47) |

| Property                          | Settings                                                                                                                                             |
|-----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------|
| VLAN names and tag IDs            | <b>sales</b> , tag 100<br><b>support</b> , tag 200                                                                                                   |
| VLAN subnets                      | <b>sales</b> : 192.0.2.0/25 (addresses 192.0.2.1 through 192.0.2.126)<br><b>support</b> : 192.0.2.128/25 (addresses 192.0.2.129 through 192.0.2.254) |
| Interfaces in VLAN <b>sales</b>   | File servers: <b>xe-0/0/20</b> and <b>xe-0/0/21</b>                                                                                                  |
| Interfaces in VLAN <b>support</b> | File servers: <b>xe-0/0/46</b> and <b>xe-0/0/47</b>                                                                                                  |
| Unused interfaces                 | <b>xe-0/0/2</b> and <b>xe-0/0/25</b>                                                                                                                 |

This configuration example creates two IP subnets, one for the sales VLAN and the second for the support VLAN. The switch bridges traffic within a VLAN. For traffic passing between two VLANs, the switch routes the traffic using a Layer 3 routing interface on which you have configured the address of the IP subnet.

To keep the example simple, the configuration steps show only a few devices in each of the VLANs. Use the same configuration procedure to add more LAN devices.

### Configuration

#### CLI Quick Configuration

To quickly configure Layer 2 switching for the two VLANs (**sales** and **support**) and to quickly configure Layer 3 routing of traffic between the two VLANs, copy the following commands and paste them into the switch terminal window:

```
[edit]
set interfaces xe-0/0/0 unit 0 family ethernet-switching vlan members sales
set interfaces xe-0/0/3 unit 0 family ethernet-switching vlan members sales
set interfaces xe-0/0/22 unit 0 family ethernet-switching vlan members sales
set interfaces xe-0/0/20 unit 0 description "Sales file server port"
set interfaces xe-0/0/20 unit 0 family ethernet-switching vlan members sales
set interfaces xe-0/0/24 unit 0 family ethernet-switching vlan members support
set interfaces xe-0/0/26 unit 0 family ethernet-switching vlan members support
set interfaces xe-0/0/44 unit 0 family ethernet-switching vlan members support
set interfaces xe-0/0/46 unit 0 description "Support file server port"
set interfaces xe-0/0/46 unit 0 family ethernet-switching vlan members support
set interfaces vlan unit 0 family inet address 192.0.2.0/25
set interfaces vlan unit 1 family inet address 192.0.2.128/25
set vlans sales l3-interface vlan.0
set vlans sales vlan-id 100
set vlans support vlan-id 200
set vlans support l3-interface vlan.1
```

**Step-by-Step Procedure** Configure the switch interfaces and the VLANs to which they belong. By default, all interfaces are in access mode, so you do not have to configure the port mode.

1. Configure the interface for the file server in the **sales** VLAN:  

```
[edit interfaces xe-0/0/20 unit 0]
user@switch# set description "Sales file server port"
user@switch# set family ethernet-switching vlan members sales
```
2. Configure the interface for the file server in the **support** VLAN:  

```
[edit interfaces xe-0/0/46 unit 0]
user@switch# set description "Support file server port"
user@switch# set family ethernet-switching vlan members support
```
3. Create the subnet for the **sales** broadcast domain:  

```
[edit interfaces]
user@switch# set vlan unit 0 family inet address 192.0.2.1/25
```
4. Create the subnet for the **support** broadcast domain:  

```
[edit interfaces]
user@switch# set vlan unit 1 family inet address 192.0.2.129/25
```
5. Configure the VLAN tag IDs for the **sales** and **support** VLANs:  

```
[edit vlans]
user@switch# set sales vlan-id 100
user@switch# set support vlan-id 200
```
6. To route traffic between the **sales** and **support** VLANs, define the interfaces that are members of each VLAN and associate a Layer 3 interface:  

```
[edit vlans]
user@switch# set sales l3-interface vlan.0
user@switch# set support l3-interface vlan.1
```

Display the results of the configuration:

```
user@switch> show configuration
interfaces {
  xe-0/0/20 {
    unit 0 {
      description "Sales file server port";
      family ethernet-switching {
        vlan members sales;
      }
    }
  }
  xe-0/0/46 {
    unit 0 {
      description "Support file server port";
      family ethernet-switching {
        vlan members support;
      }
    }
  }
  vlans {
    unit 0 {
      family inet address 192.0.2.1/25;
    }
    unit 1 {
      family inet address 192.0.2.129/25;
    }
  }
}
```

```

    }
  }
}
vlands {
  sales {
    vlan-id 100;
    interface xe-0/0/0.0;
    interface xe-0/0/3.0;
    interface xe-0/0/20.0;
    interface xe-0/0/22.0;
    l3-interface vlan 0;
  }
  support {
    vlan-id 200;
    interface xe-0/0/24.0;
    interface xe-0/0/26.0;
    interface xe-0/0/44.0;
    interface xe-0/0/46.0;
    l3-interface vlan 1;
  }
}
}

```

**TIP:** To quickly configure the sales and support VLAN interfaces, issue the **load merge terminal** command. Then copy the hierarchy and paste it into the switch terminal window.

## Verification

Verify that the **sales** and **support** VLANs have been created and are operating properly, perform these tasks:

- [Verifying That the VLANs Have Been Created and Associated with the Correct Interfaces on page 2114](#)
- [Verifying That Traffic Is Being Routed Between the Two VLANs on page 2115](#)
- [Verifying That Traffic Is Being Switched Between the Two VLANs on page 2115](#)

### *Verifying That the VLANs Have Been Created and Associated with the Correct Interfaces*

**Purpose** Verify that the **sales** and **support** VLANs have been created on the switch and that all connected interfaces on the switch are members of the correct VLAN.

**Action** To list all VLANs configured on the switch, use the **show vlans** command:

```

user@switch> show vlans
Name      Tag      Interfaces
default
          xe-0/0/1.0, xe-0/0/2.0, xe-0/0/4.0, xe-0/0/5.0,
          xe-0/0/6.0, xe-0/0/7.0, xe-0/0/8.0, xe-0/0/9.0,
          xe-0/0/10.0*, xe-0/0/11.0, xe-0/0/12.0, xe-0/0/13.0*,
          xe-0/0/14.0, xe-0/0/15.0, xe-0/0/16.0, xe-0/0/17.0,
          xe-0/0/18.0, xe-0/0/19.0, xe-0/0/21.0, xe-0/0/23.0*,
          xe-0/0/25.0, xe-0/0/27.0, xe-0/0/28.0, xe-0/0/29.0,

```

```

xe-0/0/30.0, xe-0/0/31.0, xe-0/0/32.0, xe-0/0/33.0,
xe-0/0/34.0, xe-0/0/35.0, xe-0/0/36.0, xe-0/0/37.0,
xe-0/0/38.0, xe-0/0/39.0, xe-0/0/40.0, xe-0/0/41.0,
xe-0/0/42.0, xe-0/0/43.0, xe-0/0/45.0, xe-0/0/47.0,
xe-0/1/0.0*, xe-0/1/1.0*, xe-0/1/2.0*, xe-0/1/3.0*

sales      100
           xe-0/0/0.0*, xe-0/0/3.0, xe-0/0/20.0, xe-0/0/22.0

support    200
           xe-0/0/0.24, xe-0/0/26.0, xe-0/0/44.0, xe-0/0/46.0*

mgmt
           me0.0*

```

**Meaning** The **show vlans** command lists all VLANs configured on the switch and which interfaces are members of each VLAN. This command output shows that the **sales** and **support** VLANs have been created. The **sales** VLAN has a tag ID of 100 and is associated with interfaces **xe-0/0/0.0**, **xe-0/0/3.0**, **xe-0/0/20.0**, and **xe-0/0/22.0**. VLAN **support** has a tag ID of 200 and is associated with interfaces **xe-0/0/24.0**, **xe-0/0/26.0**, **xe-0/0/44.0**, and **xe-0/0/46.0**.

#### *Verifying That Traffic Is Being Routed Between the Two VLANs*

**Purpose** Verify routing between the two VLANs.

**Action** List the Layer 3 routes in the switch Address Resolution Protocol (ARP) table:

```

user@switch> show arp
MAC Address      Address      Name          Flags
00:00:0c:06:2c:0d 192.0.2.3    vlan.0        None
00:13:e2:50:62:e0 192.0.2.11   vlan.1        None

```

**Meaning** Sending IP packets on a multiaccess network requires mapping from an IP address to a MAC address (the physical or hardware address). The ARP table displays the mapping between the IP address and MAC address for both **vlan.0** (associated with **sales**) and **vlan.1** (associated with **support**). These VLANs can route traffic to each other.

#### *Verifying That Traffic Is Being Switched Between the Two VLANs*

**Purpose** Verify that learned entries are being added to the Ethernet switching table.

**Action** List the contents of the Ethernet switching table:

```

user@switch> show ethernet-switching table

Ethernet-switching table: 8 entries, 5 learned
VLAN      MAC address      Type      Age Interfaces
default   *                Flood     - All-members
default   00:00:05:00:00:01 Learn     - xe-0/0/10.0
default   00:00:5e:00:01:09 Learn     - xe-0/0/13.0
default   00:19:e2:50:63:e0 Learn     - xe-0/0/23.0
sales     *                Flood     - All-members
sales     00:00:5e:00:07:09 Learn     - xe-0/0/0.0

```

|         |                   |       |               |
|---------|-------------------|-------|---------------|
| support | *                 | Flood | - All-members |
| support | 00:00:5e:00:01:01 | Learn | - xe-0/0/46.0 |

**Meaning** The output shows that learned entries for the **sales** and **support** VLANs have been added to the Ethernet switching table, and are associated with interfaces **xe-0/0/0.0** and **xe-0/0/46.0**. Even though the VLANs were associated with more than one interface in the configuration, these interfaces are the only ones that are currently operating.

## MAC Learning Configuration Examples

- [Example: Disabling MAC Learning on page 2116](#)
- [Example: Disabling MAC Learning in a VLAN on page 2117](#)

### Example: Disabling MAC Learning

By default, MAC learning is enabled on the QFX Series. This topic provides examples for disabling, enabling, and verifying the operation of MAC learning on the QFX Series. These examples require that you be logged in as the root user to the switch on which you wish to modify MAC learning.

**NOTE:** This task uses Junos OS for QFX3500 and QFX3600 switches does not support the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that supports ELS, see *Example: Disabling MAC Learning*.

- To disable MAC learning in a VLAN:

```
[edit]
user@switch# edit ethernet-switching-options interfaces xe-0/0/0.0
[edit ethernet-switching-options interfaces xe-0/0/0.0]
user@switch# set no-mac-learning
```

- To reenab MAC learning:

```
[edit]
user@switch# edit ethernet-switching-options interfaces xe-0/0/0.0
[edit ethernet-switching-options interfaces xe-0/0/0.0]
user@switch# delete no-mac-learning
```

- To verify the status of MAC learning on the QFX Series:

```
user@switch> show ethernet-switching table
Learning stats: 10 learn msg rcvd, 2 error, 0 forced update
Interface                Local pkts    Transit pkts    Error
xe-0/0/0.0                0             6               1
xe-0/0/22.0              0             0               0
xe-0/0/1.0                0             4               1
xe-0/0/2.0                0             0               0
xe-0/0/3.0                0             0               0
xe-0/0/4.0                0             0               0
```

|             |   |   |   |
|-------------|---|---|---|
| xe-0/0/19.0 | 0 | 0 | 0 |
| xe-0/0/18.0 | 0 | 0 | 0 |
| xe-0/0/9.0  | 0 | 0 | 0 |

- Related Documentation**

  - [Disabling MAC Learning on page 2229](#)
  - [no-mac-learning \(Per VLAN\) on page 2261](#)

## Example: Disabling MAC Learning in a VLAN

When MAC learning is enabled, a MAC address is learned dynamically from a packet's source MAC address. By default, MAC learning is enabled on a VLAN. This topic provides examples for disabling, enabling, and verifying the operation of MAC learning in a VLAN. Disabling dynamic MAC learning in a VLAN on a QFX Series product prevents a node from learning source and destination MAC addresses. These examples require that you be logged in as the root user to the switch on which you wish to modify MAC learning. This example uses a VLAN named *blue*.

- To disable MAC learning in a VLAN:

```
[edit vlans vlan-name]
user@switch# set no-mac-learning
```

For example:

```
[edit vlans blue]
user@switch# set no-mac-learning
```

- To verify that you have disabled MAC learning, issue the **show ethernet-switching table** command:

```
user@switch> show ethernet-switching table
Ethernet-switching table: 5 entries, 2 learned
  VLAN      MAC address      Type      Age Interfaces
  blue      *                 Flood     - All-members
  blue      00:1f:12:39:90:80 Static      - Router
  default   *                 Flood     - All-members
  default   00:1f:12:39:90:89 Learn      3:15 ge-0/0/1.0
  default   00:1f:12:39:a3:81 Learn      0 ge-0/0/1.0
```

The CLI output shows that the VLAN named *blue* is not configured for MAC learning. The **Type** column includes only **static** (MAC address that are manually created) and **flood** (MAC addresses that are unknown and flooded to all members of the VLAN) entries.

- To reenabling MAC learning in a VLAN, issue either of the following two commands::

```
[edit vlans vlan-name]
user@switch delete no-mac-learning
user@switch# deactivate no-mac-learning
```

For example:

```
[edit vlans blue]
user@switch delete no-mac-learning
user@switch# deactivate no-mac-learning
```

- To verify that you have enabled MAC learning, issue the **show ethernet-switching table** command:

```
user@switch> show ethernet-switching table
Ethernet-switching table: 6 entries, 3 learned
  VLAN      MAC address      Type      Age  Interfaces
  ---      -
blue       *                  Flood     -    All-members
blue       00:1f:12:39:90:80 Static     -    Router
blue       00:1f:12:39:a3:80 Learn     0    ge-0/0/9.0
default    *                  Flood     -    All-members
default    00:1f:12:39:90:89 Learn     0    ge-0/0/1.0
default    00:1f:12:39:a3:81 Learn     0    ge-0/0/1.0
```

The CLI output shows that the VLAN named *blue* is configured for MAC learning. The **Type** column includes **static** (MAC address that are manually created), **flood** (MAC addresses that are unknown and flooded to all members of the VLAN), and **.Learn** (MAC addresses that are earned dynamically from a packet's source MAC address) entries.

## Private VLAN Configuration Examples

- [Example: Configuring a Private VLAN on a Single Switch on page 2118](#)
- [Example: Configuring a Private VLAN Spanning Multiple Switches on page 2123](#)
- [Example: Configuring PVLANS with Secondary VLAN Trunk Ports and Promiscuous Access Ports on page 2137](#)

### Example: Configuring a Private VLAN on a Single Switch

For security reasons, it is often useful to restrict the flow of broadcast and unknown unicast traffic and even to limit the communication between known hosts. The private VLAN (PVLAN) feature allows an administrator to split a broadcast domain into multiple isolated broadcast subdomains, essentially putting a VLAN inside a VLAN.

This example describes how to create a PVLAN on a single switch:

- [Requirements on page 2118](#)
- [Overview and Topology on page 2119](#)
- [Configuration on page 2119](#)
- [Verification on page 2122](#)

---

#### Requirements

This example uses the following hardware and software components:

- One QFX3500 device

- Junos OS Release 12.1 or later for the QFX Series

Before you begin configuring a PVLAN, make sure you have created and configured the necessary VLANs. See [“Configuring VLANs” on page 2214](#).

### Overview and Topology

In a large office with multiple buildings and VLANs, you might need to isolate some workgroups or other endpoints for security reasons or to partition the broadcast domain. This configuration example shows a simple topology to illustrate how to create a PVLAN with one primary VLAN and two community VLANs, one for HR and one for finance, as well as two isolated ports—one for the mail server and the other for the backup server.

[Table 156 on page 2119](#) lists the settings for the sample topology.

**Table 156: Components of the Topology for Configuring a PVLAN**

| Interface   | Description                              |
|-------------|------------------------------------------|
| ge-0/0/0.0  | Primary VLAN (pvlan100) trunk interface  |
| ge-0/0/11.0 | User 1, HR Community (hr-comm)           |
| ge-0/0/12.0 | User 2, HR Community (hr-comm)           |
| ge-0/0/13.0 | User 3, Finance Community (finance-comm) |
| ge-0/0/14.0 | User 4, Finance Community (finance-comm) |
| ge-0/0/15.0 | Mail server, Isolated (isolated)         |
| ge-0/0/16.0 | Backup server, Isolated (isolated)       |
| ge-1/0/0.0  | Primary VLAN (pvlan100) trunk interface  |

### Configuration

#### CLI Quick Configuration

To quickly create and configure a PVLAN, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans pvlan100 vlan-id 100
set interfaces ge-0/0/0 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-0/0/0 unit 0 family ethernet-switching vlan members pvlan
set interfaces ge-1/0/0 unit 0 family ethernet-switching port-mode trunk
set interfaces ge-1/0/0 unit 0 family ethernet-switching vlan members pvlan
set interfaces ge-0/0/11 unit 0 family ethernet-switching port-mode access
set interfaces ge-0/0/12 unit 0 family ethernet-switching port-mode access
set interfaces ge-0/0/13 unit 0 family ethernet-switching port-mode access
set interfaces ge-0/0/14 unit 0 family ethernet-switching port-mode access
set interfaces ge-0/0/15 unit 0 family ethernet-switching port-mode access
set interfaces ge-0/0/16 unit 0 family ethernet-switching port-mode access
set vlans pvlan100 pvlan
set vlans pvlan100 interface ge-0/0/0.0
set vlans pvlan100 interface ge-1/0/0.0
```

```

set vlans hr-comm interface ge-0/0/11.0
set vlans hr-comm interface ge-0/0/12.0
set vlans finance-comm interface ge-0/0/13.0
set vlans finance-comm interface ge-0/0/14.0
set vlans hr-comm primary-vlan pvlan100
set vlans finance-comm primary-vlan pvlan100
set pvlan100 interface ge-0/0/15.0 isolated
set pvlan100 interface ge-0/0/16.0 isolated

```

### Step-by-Step Procedure

To configure the PVLAN:

1. Set the VLAN ID for the primary VLAN:

```
[edit vlans]
```

```
user@switch# set pvlan vlan-id 100
```

2. Set the interfaces and port modes:

```
[edit interfaces]
```

```

user@switch# set ge-0/0/0 unit 0 family ethernet-switching port-mode trunk
user@switch# set ge-0/0/0 unit 0 family ethernet-switching vlan members pvlan
user@switch# set ge-1/0/0 unit 0 family ethernet-switching port-mode trunk
user@switch# set ge-1/0/0 unit 0 family ethernet-switching vlan members pvlan
user@switch# set ge-0/0/11 unit 0 family ethernet-switching port-mode access
user@switch# set ge-0/0/12 unit 0 family ethernet-switching port-mode access
user@switch# set ge-0/0/13 unit 0 family ethernet-switching port-mode access
user@switch# set ge-0/0/14 unit 0 family ethernet-switching port-mode access
user@switch# set ge-0/0/15 unit 0 family ethernet-switching port-mode access
user@switch# set ge-0/0/16 unit 0 family ethernet-switching port-mode access

```

3. Set the primary VLAN to have no local switching:

**NOTE:** The primary VLAN must be a tagged VLAN.

```
[edit vlans]
```

```
user@switch# set pvlan100 pvlan
```

4. Add the trunk interfaces to the primary VLAN:

```
[edit vlans]
```

```
user@switch# set pvlan100 interface ge-0/0/0.0
```

```
user@switch# set pvlan100 interface ge-1/0/0.0
```

5. For each secondary VLAN, configure access interfaces:

**NOTE:** We recommend that the secondary VLANs be untagged VLANs. It does not impair functioning if you tag the secondary VLANs. However, the tags are not used when a secondary VLAN is configured on a single switch.

```
[edit vlans]
```

```

user@switch# set hr-comm interface ge-0/0/11.0
user@switch# set hr-comm interface ge-0/0/12.0
user@switch# set finance-comm interface ge-0/0/13.0
user@switch# set finance-comm interface ge-0/0/14.0

```

6. For each community VLAN, set the primary VLAN:

```
[edit vlans]
```

```

user@switch# set hr-comm primary-vlan pvlan100
user@switch# set finance-comm primary-vlan pvlan100
7. Configure the isolated interfaces in the primary VLAN:

[edit vlans]
user@switch# set pvlan100 interface ge-0/0/15.0 isolated
user@switch# set pvlan100 interface ge-0/0/16.0 isolated

```

### Results

Check the results of the configuration:

```

[edit]
user@switch# show
interfaces {
  ge-0/0/0 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members pvlan100;
        }
      }
    }
  }
  ge-1/0/0 {
    unit 0 {
      family ethernet-switching;
    }
  }
  ge-0/0/11 {
    unit 0 {
      family ethernet-switching {
        port-mode access;
      }
    }
  }
  ge-0/0/12 {
    unit 0 {
      family ethernet-switching {
        port-mode access;
      }
    }
  }
  ge-0/0/13 {
    unit 0 {
      family ethernet-switching {
        port-mode access;
      }
    }
  }
  ge-0/0/14 {
    unit 0 {
      family ethernet-switching {
        port-mode access;
      }
    }
  }
}

```

```
}
vlands {
  finance-comm {
    interface {
      ge-0/0/13.0;
      ge-0/0/14.0;
    }
    primary-vlan pvlan100;
  }
  hr-comm {
    interface {
      ge-0/0/11.0;
      ge-0/0/12.0;
    }
    primary-vlan pvlan100;
  }
  pvlan100 {
    vlan-id 100;
    interface {
      ge-0/0/15.0;
      ge-0/0/16.0;
      ge-0/0/0.0;
      ge-1/0/0.0;
    }
    pvlan;
  }
}
```

---

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying That the Private VLAN and Secondary VLANs Were Created on page 2122](#)

### *Verifying That the Private VLAN and Secondary VLANs Were Created*

**Purpose** Verify that the primary VLAN and secondary VLANs were properly created on the switch.

**Action** Use the `show vlans` command:

```
user@switch> show vlans pvlan100 extensive
VLAN: pvlan100, Created at: Tue Sep 16 17:59:47 2008
802.1Q Tag: 100, Internal index: 18, Admin State: Enabled, Origin: Static
Private VLAN Mode: Primary
Protocol: Port Mode
Number of interfaces: Tagged 2 (Active = 0), Untagged 6 (Active = 0)
    ge-0/0/0.0, tagged, trunk
    ge-0/0/11.0, untagged, access
    ge-0/0/12.0, untagged, access
    ge-0/0/13.0, untagged, access
    ge-0/0/14.0, untagged, access
    ge-0/0/15.0, untagged, access
    ge-0/0/16.0, untagged, access
    ge-1/0/0.0, tagged, trunk
Secondary VLANs: Isolated 2, Community 2
Isolated VLANs :
    __pvlan_pvlan_ge-0/0/15.0__
    __pvlan_pvlan_ge-0/0/16.0__
```

```

Community VLANs :
  finance-comm
  hr-comm

user@switch> show vlans hr-comm extensive
VLAN: hr-comm, Created at: Tue Sep 16 17:59:47 2008
Internal index: 22, Admin State: Enabled, Origin: Static
Private VLAN Mode: Community, Primary VLAN: pvlan100
Protocol: Port Mode
Number of interfaces: Tagged 2 (Active = 0), Untagged 2 (Active = 0)
  ge-0/0/0.0, tagged, trunk
  ge-0/0/11.0, untagged, access
  ge-0/0/12.0, untagged, access
  ge-1/0/0.0, tagged, trunk

user@switch> show vlans finance-comm extensive
VLAN: finance-comm, Created at: Tue Sep 16 17:59:47 2008
Internal index: 21, Admin State: Enabled, Origin: Static
Private VLAN Mode: Community, Primary VLAN: pvlan100
Protocol: Port Mode
Number of interfaces: Tagged 2 (Active = 0), Untagged 2 (Active = 0)
  ge-0/0/0.0, tagged, trunk
  ge-0/0/13.0, untagged, access
  ge-0/0/14.0, untagged, access
  ge-1/0/0.0, tagged, trunk

user@switch> show vlans __pvlan_pvlan_ge-0/0/15.0__ extensive
VLAN: __pvlan_pvlan_ge-0/0/15.0__, Created at: Tue Sep 16 17:59:47 2008
Internal index: 19, Admin State: Enabled, Origin: Static
Private VLAN Mode: Isolated, Primary VLAN: pvlan100
Protocol: Port Mode
Number of interfaces: Tagged 2 (Active = 0), Untagged 1 (Active = 0)
  ge-0/0/0.0, tagged, trunk
  ge-0/0/15.0, untagged, access
  ge-1/0/0.0, tagged, trunk

user@switch> show vlans __pvlan_pvlan_ge-0/0/16.0__ extensive
VLAN: __pvlan_pvlan_ge-0/0/16.0__, Created at: Tue Sep 16 17:59:47 2008
Internal index: 20, Admin State: Enabled, Origin: Static
Private VLAN Mode: Isolated, Primary VLAN: pvlan100
Protocol: Port Mode
Number of interfaces: Tagged 2 (Active = 0), Untagged 1 (Active = 0)
  ge-0/0/0.0, tagged, trunk
  ge-0/0/16.0, untagged, access
  ge-1/0/0.0, tagged, trunk

```

**Meaning** The output shows that the primary VLAN was created and identifies the interfaces and secondary VLANs associated with it.

## Example: Configuring a Private VLAN Spanning Multiple Switches

For security reasons, it is often useful to restrict the flow of broadcast and unknown unicast traffic and even to limit the communication between known hosts. The private

VLAN (PVLAN) feature allows an administrator to split a broadcast domain into multiple isolated broadcast subdomains, essentially putting a VLAN inside a VLAN. A PVLAN can span multiple switches.

This example describes how to create a PVLAN spanning multiple switches. The example creates one primary PVLAN, containing multiple secondary VLANs:

- [Requirements on page 2124](#)
- [Overview and Topology on page 2124](#)
- [Configuring a PVLAN on Switch 1 on page 2127](#)
- [Configuring a PVLAN on Switch 2 on page 2129](#)
- [Configuring a PVLAN on Switch 3 on page 2132](#)
- [Verification on page 2133](#)

---

### Requirements

This example uses the following hardware and software components:

- Three QFX3500 devices
- Junos OS Release 12.1 or later for the QFX Series

Before you begin configuring a PVLAN, make sure you have created and configured the necessary VLANs. See [“Configuring VLANs” on page 2214](#).

---

### Overview and Topology

In a large office with multiple buildings and VLANs, you might need to isolate some workgroups or other endpoints for security reasons or to partition the broadcast domain. This configuration example shows how to create a PVLAN spanning multiple QFX devices, with one primary VLAN containing two community VLANs (one for HR and one for Finance), and an interswitch isolated VLAN (for the mail server, the backup server, and the CVS server). The PVLAN comprises three switches, two access switches and one distribution switch. The PVLAN is connected to a router through a promiscuous port, which is configured on the distribution switch.

**NOTE:** The isolated ports on Switch 1 and on Switch 2 do not have Layer 2 connectivity with one another even though they are included within the same domain. See [“Understanding Private VLANs” on page 2038](#).

---

[Figure 67 on page 2125](#) shows the topology for this example—two access switches connecting to a distribution switch, which has a connection (through a promiscuous port) to the router.

Figure 67: PVLAN Topology Spanning Multiple Switches

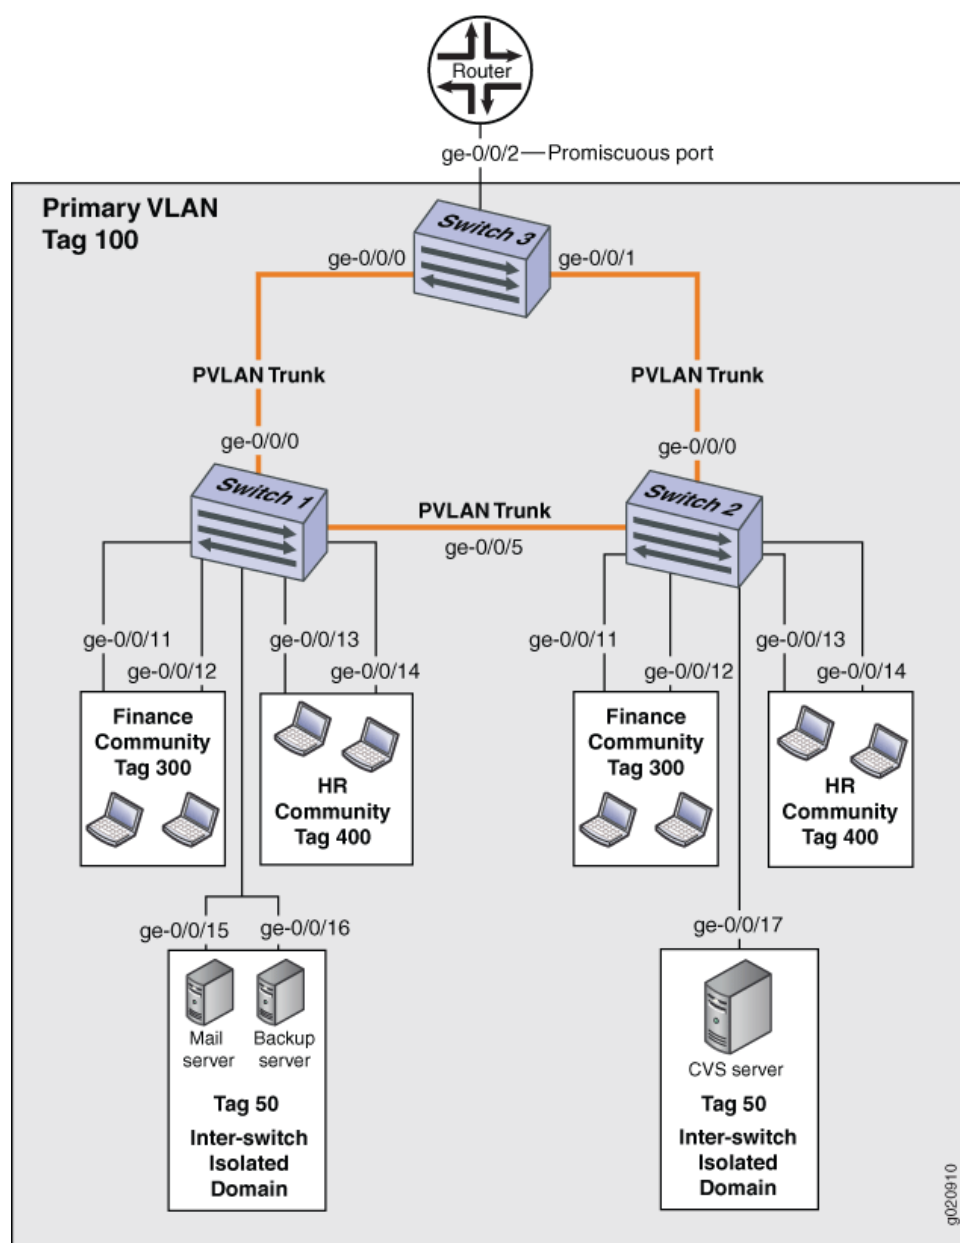

Table 157 on page 2126, Table 158 on page 2126, and Table 159 on page 2127 list the settings for the example topology.

Table 157: Components of Switch 1 in the Topology for Configuring a PVLAN Spanning Multiple Devices

| PVLAN trunk interfaces | <b>ge-0/0/0.0</b> , connects Switch 3 to Switch 1<br><br><b>ge-0/0/1.0</b> , connects Switch 3 to Switch 2                                                                                                                                                     |
| Promiscuous port       | <b>ge-0/0/2</b> , connects the PVLAN to the router<br><br><b>NOTE:</b> You must configure the trunk port that connects the PVLAN to another switch or router outside the PVLAN as a member of the PVLAN, which implicitly configures it as a promiscuous port. |

### Configuring a PVLAN on Switch 1

When configuring a PVLAN on multiple switches, these rules apply:

- The primary VLAN must be a tagged VLAN. We recommend that you configure the primary VLAN first.
- If you are going to configure a community VLAN ID, you must first configure the primary VLAN and the PVLAN trunk port. You must also configure the primary VLAN to be private using the **pvlan** statement.
- If you are going to configure an isolation VLAN ID, you must first configure the primary VLAN and the PVLAN trunk port.

#### CLI Quick Configuration

To quickly create and configure a PVLAN spanning multiple switches, copy the following commands and paste them into the terminal window of Switch 1:

```
[edit]
set vlans finance-comm vlan-id 300
set vlans finance-comm interface ge-0/0/11.0
set vlans finance-comm interface ge-0/0/12.0
set vlans finance-comm primary-vlan pvlan100
set vlans hr-comm vlan-id 400
set vlans hr-comm interface ge-0/0/13.0
set vlans hr-comm interface ge-0/0/14.0
set vlans hr-comm primary-vlan pvlan100
set vlans pvlan100 vlan-id 100
set vlans pvlan100 interface ge-0/0/15.0
set vlans pvlan100 interface ge-0/0/16.0
set vlans pvlan100 interface ge-0/0/0.0 pvlan-trunk
set vlans pvlan100 interface ge-0/0/5.0 pvlan-trunk
set vlans pvlan100 pvlan
set vlans pvlan100 pvlan isolation-vlan-id 50
set pvlan100 interface ge-0/0/15.0 isolated
set pvlan100 interface ge-0/0/16.0 isolated
```

**Step-by-Step  
Procedure**

1. Set the VLAN ID for the primary VLAN:  

```
[edit vlans]
user@switch# set pvlan100 vlan-id 100
```
2. Set the PVLAN trunk interfaces to connect this VLAN across neighboring switches:  

```
[edit vlans]
user@switch# set pvlan100 interface ge-0/0/0.0 pvlan-trunk
user@switch# set pvlan100 interface ge-0/0/5.0 pvlan-trunk
```
3. Set the primary VLAN to be private and have no local switching:  

```
[edit vlans]
user@switch# set pvlan100 pvlan
```
4. Set the VLAN ID for the **finance-comm** community VLAN that spans the switches:  

```
[edit vlans]
user@switch# set finance-comm vlan-id 300
```
5. Configure access interfaces for the **finance-comm** VLAN:  

```
[edit vlans]
user@switch# set finance-comm interface ge-0/0/11.0
user@switch# set finance-comm interface ge-0/0/12.0
```
6. Set the primary VLAN of this secondary community VLAN, **finance-comm** :  

```
[edit vlans]
user@switch# set vlans finance-comm primary-vlan pvlan100
```
7. Set the VLAN ID for the HR community VLAN that spans the switches.  

```
[edit vlans]
user@switch# set hr-comm vlan-id 400
```
8. Configure access interfaces for the **hr-comm** VLAN:  

```
[edit vlans]
user@switch# set hr-comm interface ge-0/0/13.0
user@switch# set hr-comm interface ge-0/0/14.0
```
9. Set the primary VLAN of this secondary community VLAN, **hr-comm**:  

```
[edit vlans]
user@switch# set vlans hr-comm primary-vlan pvlan100
```
10. Set the interswitch isolated ID to create an interswitch isolated domain that spans the switches:  

```
[edit vlans]
user@switch# set pvlan100 pvlan isolation-vlan-id 50
```
11. Configure the isolated interfaces in the primary VLAN:  

```
[edit vlans]
user@switch# set pvlan100 interface ge-0/0/15.0 isolated
user@switch# set pvlan100 interface ge-0/0/16.0 isolated
```

**NOTE:** When you configure an isolated port, include it as a member of the primary VLAN, but do not configure it as a member of any community VLAN.

**Results**

Check the results of the configuration:

```
[edit]
user@switch# show
vlangs {
  finance-comm {
    vlan-id 300;
    interface {
      ge-0/0/11.0;
      ge-0/0/12.0;
    }
    primary-vlan pvlan100;
  }
  hr-comm {
    vlan-id 400;
    interface {
      ge-0/0/13.0;
      ge-0/0/14.0;
    }
    primary-vlan pvlan100;
  }
  pvlan100 {
    vlan-id 100;
    interface {
      ge-0/0/15.0;
      ge-0/0/16.0;
      ge-0/0/0.0 {
        pvlan-trunk;
      }
      ge-0/0/5.0 {
        pvlan-trunk;
      }
    }
    pvlan;
    isolation-vlan-id 50;
  }
}
```

### Configuring a PVLAN on Switch 2

**CLI Quick Configuration** To quickly create and configure a private VLAN spanning multiple switches, copy the following commands and paste them into the terminal window of Switch 2:

**NOTE:** The configuration of Switch 2 is the same as the configuration of Switch 1 except for the interface in the interswitch isolated domain. For Switch 2, the interface is ge-0/0/17.0.

```
[edit]
set vlans finance-comm vlan-id 300
set vlans finance-comm interface ge-0/0/11.0
set vlans finance-comm interface ge-0/0/12.0
set vlans finance-comm primary-vlan pvlan100
set vlans hr-comm vlan-id 400
set vlans hr-comm interface ge-0/0/13.0
```

```
set vlans hr-comm interface ge-0/0/14.0
set vlans hr-comm primary-vlan pvlan100
set vlans pvlan100 vlan-id 100
set vlans pvlan100 interface ge-0/0/17.0
set vlans pvlan100 interface ge-0/0/0.0 pvlan-trunk
set vlans pvlan100 interface ge-0/0/5.0 pvlan-trunk
set vlans pvlan100 pvlan
set vlans pvlan100 pvlan isolation-vlan-id 50
set pvlan100 interface ge-0/0/17.0 isolated
```

### Step-by-Step Procedure

To configure a PVLAN on Switch 2 that will span multiple switches:

1. Set the VLAN ID for the **finance-comm** community VLAN that spans the switches:  

```
[edit vlans]
user@switch# set finance-comm vlan-id 300
```
2. Configure access interfaces for the **finance-comm** VLAN:  

```
[edit vlans]
user@switch# set finance-comm interface ge-0/0/11.0
user@switch# set finance-comm interface ge-0/0/12.0
```
3. Set the primary VLAN of this secondary community VLAN, **finance-comm**:  

```
[edit vlans]
user@switch# set vlans finance-comm primary-vlan pvlan100
```
4. Set the VLAN ID for the HR community VLAN that spans the switches.  

```
[edit vlans]
user@switch# set hr-comm vlan-id 400
```
5. Configure access interfaces for the **hr-comm** VLAN:  

```
[edit vlans]
user@switch# set hr-comm interface ge-0/0/13.0
user@switch# set hr-comm interface ge-0/0/14.0
```
6. Set the primary VLAN of this secondary community VLAN, **hr-comm**:  

```
[edit vlans]
user@switch# set vlans hr-comm primary-vlan pvlan100
```
7. Set the VLAN ID for the primary VLAN:  

```
[edit vlans]
user@switch# set pvlan100 vlan-id 100
```
8. Set the PVLAN trunk interfaces that will connect this VLAN across neighboring switches:  

```
[edit vlans]
user@switch# set pvlan100 interface ge-0/0/0.0 pvlan-trunk
user@switch# set pvlan100 interface ge-0/0/5.0 pvlan-trunk
```
9. Set the primary VLAN to be private and have no local switching:  

```
[edit vlans]
user@switch# set pvlan100 pvlan
```
10. Set the interswitch isolated ID to create an interswitch isolated domain that spans the switches:  

```
[edit vlans]
user@switch# set pvlan100 pvlan isolation-vlan-id 50
```

**NOTE:** To configure an isolated port, include it as one of the members of the primary VLAN, but do not configure it as belonging to one of the community VLANs.

11. Configure the isolated interface in the primary VLAN:

```
[edit vlans]
user@switch# set pvlan100 interface ge-0/0/17.0 isolated
```

### Results

Check the results of the configuration:

```
[edit]
user@switch# show
vlans {
  finance-comm {
    vlan-id 300;
    interface {
      ge-0/0/11.0;
      ge-0/0/12.0;
    }
    primary-vlan pvlan100;
  }
  hr-comm {
    vlan-id 400;
    interface {
      ge-0/0/13.0;
      ge-0/0/14.0;
    }
    primary-vlan pvlan100;
  }
  pvlan100 {
    vlan-id 100;
    interface {
      ge-0/0/15.0;
      ge-0/0/16.0;
      ge-0/0/0.0 {
        pvlan-trunk;
      }
      ge-0/0/5.0 {
        pvlan-trunk;
      }
      ge-0/0/17.0;
    }
    pvlan;
    isolation-vlan-id 50;
  }
}
```

### Configuring a PVLAN on Switch 3

**CLI Quick Configuration** To quickly configure Switch 3 to function as the distribution switch of this PVLAN, copy the following commands and paste them into the terminal window of Switch 3:

**NOTE:** Interface ge-0/0/2.0 is a trunk port connecting the PVLAN to a router.

```
[edit]
set vlans finance-comm vlan-id 300
set vlans finance-comm primary-vlan pvlan100
set vlans hr-comm vlan-id 400
set vlans hr-comm primary-vlan pvlan100
set vlans pvlan100 vlan-id 100
set vlans pvlan100 interface ge-0/0/0.0 pvlan-trunk
set vlans pvlan100 interface ge-0/0/1.0 pvlan-trunk
set vlans pvlan100 pvlan
set vlans pvlan100 pvlan isolation-vlan-id 50
```

**Step-by-Step Procedure** To configure Switch 3 to function as the distribution switch for this PVLAN, use the following procedure:

- Set the VLAN ID for the **finance-comm** community VLAN that spans the switches:  

```
[edit vlans]
user@switch# set vlans finance-comm vlan-id 300
```
- Set the primary VLAN of this secondary community VLAN, **finance-comm**:  

```
[edit vlans]
user@switch# set vlans finance-comm primary-vlan pvlan100
```
- Set the VLAN ID for the HR community VLAN that spans the switches:  

```
[edit vlans]
user@switch# set vlans hr-comm vlan-id 400
```
- Set the primary VLAN of this secondary community VLAN, **hr-comm**:  

```
[edit vlans]
user@switch# set vlans hr-comm primary-vlan pvlan100
```
- Set the VLAN ID for the primary VLAN:  

```
[edit vlans]
user@switch# set pvlan100 vlan-id 100
```
- Set the PVLAN trunk interfaces that will connect this VLAN across neighboring switches:  

```
[edit vlans]
user@switch# set pvlan100 interface ge-0/0/0.0 pvlan-trunk
user@switch# set pvlan100 interface ge-0/0/5.0 pvlan-trunk
```
- Set the primary VLAN to be private and have no local switching:  

```
[edit vlans]
user@switch# set pvlan100 pvlan
```
- Set the interswitch isolated ID to create an interswitch isolated domain that spans the switches:  

```
[edit vlans]
user@switch# set pvlan100 pvlan isolation-vlan-id 50
```

**NOTE:** To configure an isolated port, include it as one of the members of the primary VLAN, but do not configure it as belonging to one of the community VLANs.

## Results

Check the results of the configuration:

```
[edit]
user@switch# show
vpls {
  finance-comm {
    vlan-id 300;
    primary-vlan pvlan100;
  }
  hr-comm {
    vlan-id 400;
    primary-vlan pvlan100;
  }
  pvlan100 {
    vlan-id 100;
    interface {
      ge-0/0/0.0 {
        pvlan-trunk;
      }
      ge-0/0/1.0 {
        pvlan-trunk;
      }
      ge-0/0/2.0;
    }
    pvlan;
    isolation-vlan-id 50;
  }
}
```

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying That the Primary VLAN and Secondary VLANs Were Created on Switch 1 on page 2133](#)
- [Verifying That the Primary VLAN and Secondary VLANs Were Created on Switch 2 on page 2135](#)
- [Verifying That the Primary VLAN and Secondary VLANs Were Created on Switch 3 on page 2136](#)

### *Verifying That the Primary VLAN and Secondary VLANs Were Created on Switch 1*

**Purpose** Verify that the PVLAN configuration spanning multiple switches is working properly on Switch 1:

**Action** Use the **show vlans extensive** command:

```

user@switch> show vlans extensive
VLAN: __pvlan_pvlan100_ge-0/0/15.0__, Created at: Thu Sep 16 23:15:27 2010
Internal index: 5, Admin State: Enabled, Origin: Static
Private VLAN Mode: Isolated, Primary VLAN: pvlan100
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 2 (Active = 2), Untagged 1 (Active = 1)
    ge-0/0/0.0*, tagged, trunk, pvlan-trunk
    ge-0/0/5.0*, tagged, trunk, pvlan-trunk
    ge-0/0/15.0*, untagged, access

VLAN: __pvlan_pvlan100_ge-0/0/16.0__, Created at: Thu Sep 16 23:15:27 2010
Internal index: 6, Admin State: Enabled, Origin: Static
Private VLAN Mode: Isolated, Primary VLAN: pvlan100
Protocol: Port Mode, Mac aging time: 300 seconds

    ge-0/0/11.0*, untagged, access
    ge-0/0/12.0*, untagged, access

VLAN: hr-comm, Created at: Thu Sep 16 23:15:27 2010
802.1Q Tag: 400, Internal index: 9, Admin State: Enabled, Origin: Static
Private VLAN Mode: Community, Primary VLAN: pvlan100
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 2 (Active = 2), Untagged 2 (Active = 2)
    ge-0/0/0.0*, tagged, trunk, pvlan-trunk
    ge-0/0/5.0*, tagged, trunk, pvlan-trunk
    ge-0/0/13.0*, untagged, access
    ge-0/0/14.0*, untagged, access

VLAN: pvlan100, Created at: Thu Sep 16 23:15:27 2010
802.1Q Tag: 100, Internal index: 4, Admin State: Enabled, Origin: Static
Private VLAN Mode: Primary
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 2 (Active = 2), Untagged 6 (Active = 6)
    ge-0/0/0.0*, tagged, trunk, pvlan-trunk
    ge-0/0/5.0*, tagged, trunk, pvlan-trunk

```

```

ge-0/0/11.0*, untagged, access
ge-0/0/12.0*, untagged, access
ge-0/0/13.0*, untagged, access
ge-0/0/14.0*, untagged, access
ge-0/0/15.0*, untagged, access
ge-0/0/16.0*, untagged, access
Secondary VLANs: Isolated 2, Community 2, Inter-switch-isolated 1
Isolated VLANs :
__pvlan_pvlan100_ge-0/0/15.0__
__pvlan_pvlan100_ge-0/0/16.0__
Community VLANs :
  finance-comm
  hr-comm
Inter-switch-isolated VLAN :
__pvlan_pvlan100_isiv__

```

**Meaning** The output shows that a PVLAN was created on Switch 1 and shows that it includes two isolated VLANs, two community VLANs, and an interswitch isolated VLAN. The presence of the pvlan-trunk and Inter-switch-isolated fields indicates that this PVLAN is spanning more than one switch.

#### *Verifying That the Primary VLAN and Secondary VLANs Were Created on Switch 2*

**Purpose** Verify that the PVLAN configuration spanning multiple switches is working properly on Switch 2:

**Action** Use the `show vlans extensive` command:

```

user@switch> show vlans extensive
VLAN: __pvlan_pvlan100_ge-0/0/17.0__, Created at: Thu Sep 16 23:19:22 2010
Internal index: 5, Admin State: Enabled, Origin: Static
Private VLAN Mode: Isolated, Primary VLAN: pvlan100
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 2 (Active = 2), Untagged 1 (Active = 1)
  ge-0/0/0.0*, tagged, trunk, pvlan-trunk
  ge-0/0/5.0*, tagged, trunk, pvlan-trunk
  ge-0/0/17.0*, untagged, access

VLAN: __pvlan_pvlan100_isiv__, Created at: Thu Sep 16 23:19:22 2010
802.1Q Tag: 50, Internal index: 6, Admin State: Enabled, Origin: Static
Private VLAN Mode: Inter-switch-isolated, Primary VLAN: pvlan100
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 2 (Active = 2), Untagged 0 (Active = 0)
  ge-0/0/0.0*, tagged, trunk, pvlan-trunk
  ge-0/0/5.0*, tagged, trunk, pvlan-trunk

VLAN: default, Created at: Thu Sep 16 03:03:18 2010
Internal index: 2, Admin State: Enabled, Origin: Static
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 0 (Active = 0), Untagged 0 (Active = 0)

VLAN: finance-comm, Created at: Thu Sep 16 23:19:22 2010
802.1Q Tag: 300, Internal index: 7, Admin State: Enabled, Origin: Static

Private VLAN Mode: Community, Primary VLAN: pvlan100
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 2 (Active = 2), Untagged 2 (Active = 2)
    ge-0/0/0.0*, tagged, trunk, pvlan-trunk
    ge-0/0/5.0*, tagged, trunk, pvlan-trunk
    ge-0/0/13.0*, untagged, access
    ge-0/0/14.0*, untagged, access
```

```
VLAN: pvlan100, Created at: Thu Sep 16 23:19:22 2010
802.1Q Tag: 100, Internal index: 4, Admin State: Enabled, Origin: Static
Private VLAN Mode: Primary
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 2 (Active = 2), Untagged 5 (Active = 5)
    ge-0/0/0.0*, tagged, trunk, pvlan-trunk
    ge-0/0/5.0*, tagged, trunk, pvlan-trunk
    ge-0/0/11.0*, untagged, access
    ge-0/0/12.0*, untagged, access
    ge-0/0/13.0*, untagged, access
    ge-0/0/14.0*, untagged, access
    ge-0/0/17.0*, untagged, access
Secondary VLANs: Isolated 1, Community 2, Inter-switch-isolated 1
Isolated VLANs :
    __pvlan_pvlan100_ge-0/0/17.0__
Community VLANs :
    finance-comm
    hr-comm
Inter-switch-isolated VLAN :
    __pvlan_pvlan100_isiv__
```

**Meaning** The output shows that a PVLAN was created on Switch 2 and shows that it includes one isolated VLAN, two community VLANs, and an interswitch isolated VLAN. The presence of the pvlan-trunk and Inter-switch-isolated fields indicates that this PVLAN is spanning more than one switch. When you compare this output to the output of Switch 1, you can see that both switches belong to the same PVLAN (**pvlan100**).

### *Verifying That the Primary VLAN and Secondary VLANs Were Created on Switch 3*

**Purpose** Verify that the PVLAN configuration spanning multiple switches is working properly on Switch 3:

**Action** Use the **show vlans extensive** command:

```
user@switch> show vlans extensive
VLAN: __pvlan_pvlan100_isiv__, Created at: Thu Sep 16 23:22:40 2010
802.1Q Tag: 50, Internal index: 5, Admin State: Enabled, Origin: Static
Private VLAN Mode: Inter-switch-isolated, Primary VLAN: pvlan100
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 2 (Active = 2), Untagged 0 (Active = 0)
    ge-0/0/0.0*, tagged, trunk, pvlan-trunk
    ge-0/0/1.0*, tagged, trunk, pvlan-trunk

VLAN: default, Created at: Thu Sep 16 03:03:18 2010
Internal index: 2, Admin State: Enabled, Origin: Static
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 0 (Active = 0), Untagged 0 (Active = 0)
```

```

VLAN: finance-comm, Created at: Thu Sep 16 23:22:40 2010
802.1Q Tag: 300, Internal index: 6, Admin State: Enabled, Origin: Static
Private VLAN Mode: Community, Primary VLAN: pvlan100
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 2 (Active = 2), Untagged 0 (Active = 0)
    ge-0/0/0.0*, tagged, trunk, pvlan-trunk
    ge-0/0/1.0*, tagged, trunk, pvlan-trunk

Private VLAN Mode: Community, Primary VLAN: pvlan100
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 2 (Active = 2), Untagged 0 (Active = 0)
    ge-0/0/0.0*, tagged, trunk, pvlan-trunk
    ge-0/0/1.0*, tagged, trunk, pvlan-trunk

VLAN: pvlan100, Created at: Thu Sep 16 23:22:40 2010
802.1Q Tag: 100, Internal index: 4, Admin State: Enabled, Origin: Static
Private VLAN Mode: Primary
Protocol: Port Mode, Mac aging time: 300 seconds
Number of interfaces: Tagged 2 (Active = 2), Untagged 0 (Active = 0)
    ge-0/0/0.0*, tagged, trunk, pvlan-trunk
    ge-0/0/1.0*, tagged, trunk, pvlan-trunk
Secondary VLANs: Isolated 0, Community 2, Inter-switch-isolated 1
Community VLANs :
    finance-comm
    hr-comm
Inter-switch-isolated VLAN :
    __pvlan_pvlan100_isiv__

```

**Meaning** The output shows that the PVLAN (**pvlan100**) is configured on Switch 3 and that it includes no isolated VLANs, two community VLANs, and an interswitch isolated VLAN. But Switch 3 is functioning as a distribution switch, so the output does not include access interfaces within the PVLAN. It shows only the **pvlan-trunk** interfaces that connect **pvlan100** from Switch 3 to the other switches (Switch 1 and Switch 2) in the same PVLAN.

- [Example: Configuring a Private VLAN on a Single Switch on page 2118](#)

## Example: Configuring PVLANS with Secondary VLAN Trunk Ports and Promiscuous Access Ports

This example shows how to configure secondary VLAN trunk ports and promiscuous access ports as part of a private VLAN configuration. Secondary VLAN trunk ports carry secondary VLAN traffic.

For a given private VLAN, a secondary VLAN trunk port can carry traffic for only one secondary VLAN. However, a secondary VLAN trunk port can carry traffic for multiple secondary VLANs as long as each secondary VLAN is a member of a different private (primary) VLAN. For example, a secondary VLAN trunk port can carry traffic for a community VLAN that is part of primary VLAN pvlan100 and also carry traffic for an isolated VLAN that is part of primary VLAN pvlan400.

To configure a trunk port to carry secondary VLAN traffic, use the **isolated** and **interface** statements, as shown in steps 12 and 13 of the example configuration for Switch 1.

**NOTE:** When traffic egresses from a secondary VLAN trunk port, it normally carries the tag of the primary VLAN that the secondary port is a member of. If you want traffic that egresses from a secondary VLAN trunk port to retain its secondary VLAN tag, use the **extend-secondary-vlan-id** statement.

A promiscuous access port carries untagged traffic and can be a member of only one primary VLAN. Traffic that ingresses on a promiscuous access port is forwarded to the ports of the secondary VLANs that are members of the primary VLAN that the promiscuous access port is a member of. This traffic carries the appropriate secondary VLAN tags when it egresses from the secondary VLAN ports if the secondary VLAN port is a trunk port.

To configure an access port to be promiscuous, use the **promiscuous** statement, as shown in step Figure 65 on page 2055 of the example configuration for Switch 2.

If traffic ingresses on a secondary VLAN port and egresses on a promiscuous access port, the traffic is untagged on egress. If tagged traffic ingresses on a promiscuous access port, the traffic is discarded.

---

## Requirements

This example uses the following hardware and software components:

- Two QFX devices
- Junos OS Release 12.2 or later for the QFX Series

---

## Overview and Topology

Figure 68 on page 2139 shows the topology used in this example. Switch 1 includes several primary and secondary private VLANs and also includes two secondary VLAN trunk ports configured to carry secondary VLANs that are members of primary VLANs pvlan100 and pvlan400.

Switch 2 includes the same private VLANs. The figure shows xe-0/0/0 on Switch 2 as configured with promiscuous access ports or promiscuous trunk ports. The example configuration included here configures this port as a promiscuous access port.

The figure also shows how traffic would flow after ingressing on the secondary VLAN trunk ports on Switch 1.

**Figure 68: PVLAN Topology with Secondary VLAN Trunk Ports and Promiscuous Access Port**

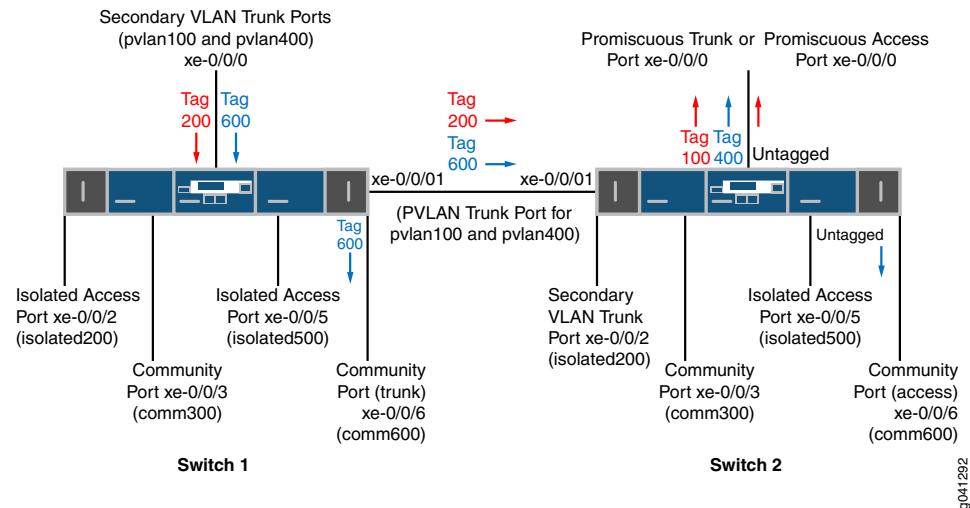

Table 160 on page 2139 and Table 161 on page 2140 list the settings for the example topology on both switches.

**Table 160: Components of the Topology for Configuring a Secondary VLAN Trunk on Switch 1**

| Component             | Description                                                       |
|-----------------------|-------------------------------------------------------------------|
| pvlan100, ID 100      | Primary VLAN                                                      |
| pvlan400, ID 400      | Primary VLAN                                                      |
| comm300, ID 300       | Community VLAN, member of pvlan100                                |

| xe-0/0/6.0            | Community access port for comm600                          |

### Configuring the PVLANS on Switch 1

#### CLI Quick Configuration

To quickly create and configure the PVLANS on Switch 1, copy the following commands and paste them into a switch terminal window:

```
[edit]
set interfaces xe-0/0/0 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/1 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/1 unit 0 family ethernet-switching vlan members pvlan100
set interfaces xe-0/0/1 unit 0 family ethernet-switching vlan members pvlan400
set interfaces xe-0/0/2 unit 0 family ethernet-switching port-mode access
set interfaces xe-0/0/3 unit 0 family ethernet-switching port-mode access
set interfaces xe-0/0/5 unit 0 family ethernet-switching port-mode access
set interfaces xe-0/0/6 unit 0 family ethernet-switching port-mode trunk
set vlans pvlan100 vlan-id 100
set vlans pvlan400 vlan-id 400
set vlans pvlan100 pvlan
set vlans pvlan400 pvlan
set vlans pvlan100 interface xe-0/0/1.0 pvlan-trunk
set vlans pvlan400 interface xe-0/0/1.0 pvlan-trunk
set vlans comm300 vlan-id 300
set vlans comm300 primary-vlan pvlan100
set vlans comm300 interface xe-0/0/3.0
set vlans comm600 vlan-id 600
set vlans comm600 primary-vlan pvlan400
set vlans comm600 interface xe-0/0/6.0
set vlans pvlan100 pvlan isolation-vlan-id 200
```

```

set vlans pvlan400 pvlan isolation-vlan-id 500
set vlans pvlan100 interface xe-0/0/0.0 isolated
set vlans pvlan400 interface xe-0/0/0.0 isolated
set vlans comm600 interface xe-0/0/0.0
set vlans pvlan100 interface xe-0/0/2.0 isolated
set vlans pvlan400 interface xe-0/0/5.0 isolated

```

### Step-by-Step Procedure

To configure the private VLANs and secondary VLAN trunk ports:

1. Configure the interfaces and port modes:

[edit interfaces]

```

user@switch# set xe-0/0/0 unit 0 family ethernet-switching port-mode trunk
user@switch# set xe-0/0/1 unit 0 family ethernet-switching port-mode trunk
user@switch# set xe-0/0/1 unit 0 family ethernet-switching vlan members pvlan100
user@switch# set xe-0/0/1 unit 0 family ethernet-switching vlan members pvlan400
user@switch# set xe-0/0/2 unit 0 family ethernet-switching port-mode access
user@switch# set xe-0/0/3 unit 0 family ethernet-switching port-mode access
user@switch# set xe-0/0/5 unit 0 family ethernet-switching port-mode access
user@switch# set xe-0/0/6 unit 0 family ethernet-switching port-mode access

```

2. Create the primary VLANs:

[edit vlans]

```

user@switch# set pvlan100 vlan-id 100
user@switch# set pvlan400 vlan-id 400

```

**NOTE:** Primary VLANs must always be tagged VLANs, even if they exist on only one device.

3. Configure the primary VLANs to be private:

[edit vlans]

```

user@switch# set pvlan100 pvlan
user@switch# set pvlan400 pvlan

```

4. Configure the PVLAN trunk port to carry the private VLAN traffic between the switches:

[edit vlans]

```

user@switch# set pvlan100 interface xe-0/0/1.0 pvlan-trunk
user@switch# set pvlan400 interface xe-0/0/1.0 pvlan-trunk

```

5. Create secondary VLAN comm300 with VLAN ID 300:

[edit vlans]

```

user@switch# set comm300 vlan-id 300

```

6. Configure the primary VLAN for comm300:

[edit vlans]

```

user@switch# set comm300 primary-vlan pvlan100

```

7. Configure the interface for comm300:

[edit vlans]

```

user@switch# set comm300 interface xe-0/0/3.0

```

8. Create secondary VLAN comm600 with VLAN ID 600:

[edit vlans]

```

user@switch# set comm600 vlan-id 600

```

9. Configure the primary VLAN for comm600:

- ```
[edit vlans]
user@switch# set comm600 primary-vlan pvlan400
```
10. Configure the interface for comm600:
- ```
[edit vlans]
user@switch# set comm600 interface xe-0/0/6.0
```
11. Configure the interswitch isolated VLANs:
- ```
[edit vlans]
user@switch# set pvlan100 pvlan isolation-vlan-id 200
user@switch# set pvlan400 pvlan isolation-vlan-id 500
```

**NOTE:** When you configure a secondary VLAN trunk port to carry an isolated VLAN, you must also configure an **isolation-vlan-id**. This is true even if the isolated VLAN exists only on one switch.

12. Enable trunk port xe-0/0/0 to carry secondary VLANs for the primary VLANs:
- ```
[edit vlans]
user@switch# set pvlan100 interface xe-0/0/0.0 isolated
user@switch# set pvlan400 interface xe-0/0/0.0 isolated
```
13. Configure trunk port xe-0/0/0 to carry comm600 (member of pvlan400):
- ```
[edit vlans]
user@switch# set comm600 interface xe-0/0/0.0
```

**NOTE:** You do not need to explicitly configure xe-0/0/0 to carry the isolated VLAN traffic (tags 200 and 500) because all the isolated ports in pvlan100 and pvlan400—including xe-0/0/0.0—are automatically included in the isolated VLANs created when you configured **isolation-vlan-id 200** and **isolation-vlan-id 500**.

14. Configure xe-0/0/2 and xe-0/0/6 to be isolated:
- ```
[edit vlans]
user@switch# set pvlan100 interface xe-0/0/2.0 isolated
user@switch# set pvlan400 interface xe-0/0/5.0 isolated
```

## Results

Check the results of the configuration on Switch 1:

```
[edit]
user@switch# show
interfaces {
  xe-0/0/0 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members pvlan100;
          members pvlan400;
        }
      }
    }
  }
}
```

```

    }
  }
}
xe-0/0/1 {
  unit 0 {
    family ethernet-switching {
      port-mode trunk;
      vlan {
        members pvlan100;
        members pvlan400;
      }
    }
  }
}
xe-0/0/2 {
  unit 0 {
    family ethernet-switching {
      port-mode access;
    }
  }
}
xe-0/0/3 {
  unit 0 {
    family ethernet-switching {
      port-mode access;
    }
  }
}
xe-0/0/5 {
  unit 0 {
    family ethernet-switching {
      port-mode access;
    }
  }
}
xe-0/0/6 {
  unit 0 {
    family ethernet-switching {
      port-mode trunk;
    }
  }
}
}
vllans {
  comm300 {
    vlan-id 300;
    interface {
      xe-0/0/3.0;
    }
    primary-vlan pvlan100;
  }
  comm600 {
    vlan-id 600;
    interface {
      xe-0/0/6.0;
    }
  }
}

```

```
    primary-vlan pvlan400;
  }
  pvlan100 {
    vlan-id 100;
    interface {
      xe-0/0/0.0;
      xe-0/0/2.0;
      xe-0/0/3.0;
      xe-0/0/1.0 {
        pvlan-trunk;
      }
    }
    no-local-switching;
    isolation-id 200;
  }
  pvlan400 {
    vlan-id 400;
    interface {
      xe-0/0/0.0;
      xe-0/0/5.0;
      xe-0/0/6.0;
      xe-0/0/1.0 {
        pvlan-trunk;
      }
    }
    no-local-switching;
    isolation-id 500;
  }
}
```

---

### Configuring the PVLANS on Switch 2

The configuration for Switch 2 is almost identical to the configuration for Switch 1. The most significant difference is that xe-0/0/0 on Switch 2 is configured as a promiscuous trunk port or a promiscuous access port, as [Figure 68 on page 2139](#) shows. In the following configuration, xe-0/0/0 is configured as a promiscuous access port for primary VLAN pvlan100.

If traffic ingresses on VLAN-enabled port and egresses on a promiscuous access port, the VLAN tags are dropped on egress and the traffic is untagged at that point. For example, traffic for comm600 ingresses on the secondary VLAN trunk port configured on xe-0/0/0.0 on Switch 1 and carries tag 600 as it is forwarded through the secondary VLAN. When it egresses from xe-0/0/0.0 on Switch 2, it will be untagged if you configure xe-0/0/0.0 as a promiscuous access port as shown in this example. If you instead configure xe-0/0/0.0 as a promiscuous trunk port (port-mode trunk), the traffic for comm600 carries its primary VLAN tag (400) when it egresses.

#### CLI Quick Configuration

To quickly create and configure the PVLANS on Switch 2, copy the following commands and paste them into a switch terminal window:

```
[edit]
set interfaces xe-0/0/0 unit 0 family ethernet-switching port-mode access
set interfaces xe-0/0/1 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/1 unit 0 family ethernet-switching vlan members pvlan100
set interfaces xe-0/0/1 unit 0 family ethernet-switching vlan members pvlan400
```

```

set interfaces xe-0/0/2 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/3 unit 0 family ethernet-switching port-mode access
set interfaces xe-0/0/5 unit 0 family ethernet-switching port-mode access
set interfaces xe-0/0/6 unit 0 family ethernet-switching port-mode access
set vlans pvlan100 vlan-id 100
set vlans pvlan400 vlan-id 400
set vlans pvlan100 pvlan
set vlans pvlan400 pvlan
set vlans pvlan100 interface xe-0/0/1.0 pvlan-trunk
set vlans pvlan400 interface xe-0/0/1.0 pvlan-trunk
set vlans comm300 vlan-id 300
set vlans comm300 primary-vlan pvlan100
set vlans comm300 interface xe-0/0/3.0
set vlans comm600 vlan-id 600
set vlans comm600 primary-vlan pvlan400
set vlans comm600 interface xe-0/0/6.0
set vlans pvlan100 pvlan isolation-vlan-id 200
set vlans pvlan400 pvlan isolation-vlan-id 500
set vlans pvlan100 interface xe-0/0/0.0 promiscuous
set vlans pvlan100 interface xe-0/0/2.0 isolated
set vlans pvlan400 interface xe-0/0/5.0 isolated

```

#### Step-by-Step Procedure

To configure the private VLANs and secondary VLAN trunk ports:

1. Configure the interfaces and port modes:  

```

[edit interfaces]
user@switch# set xe-0/0/0 unit 0 family ethernet-switching port-mode access
user@switch# set xe-0/0/1 unit 0 family ethernet-switching port-mode trunk
user@switch# set xe-0/0/1 unit 0 family ethernet-switching vlan members pvlan100
user@switch# set xe-0/0/1 unit 0 family ethernet-switching vlan members pvlan400
user@switch# set xe-0/0/2 unit 0 family ethernet-switching port-mode trunk
user@switch# set xe-0/0/3 unit 0 family ethernet-switching port-mode access
user@switch# set xe-0/0/5 unit 0 family ethernet-switching port-mode access
user@switch# set xe-0/0/6 unit 0 family ethernet-switching port-mode access

```
2. Create the primary VLANs:  

```

[edit vlans]
user@switch# set pvlan100 vlan-id 100
user@switch# set pvlan400 vlan-id 400

```
3. Configure the primary VLANs to be private:  

```

[edit vlans]
user@switch# set pvlan100 pvlan
user@switch# set pvlan400 pvlan

```
4. Configure the PVLAN trunk port to carry the private VLAN traffic between the switches:  

```

[edit vlans]
user@switch# set pvlan100 interface xe-0/0/1.0 pvlan-trunk
user@switch# set pvlan400 interface xe-0/0/1.0 pvlan-trunk

```
5. Create secondary VLAN comm300 with VLAN ID 300:  

```

[edit vlans]
user@switch# set comm300 vlan-id 300

```
6. Configure the primary VLAN for comm300:  

```

[edit vlans]
user@switch# set comm300 primary-vlan pvlan100

```
7. Configure the interface for comm300:

- ```
[edit vlans]
user@switch# set comm300 interface xe-0/0/3.0
```
8. Create secondary VLAN comm600 with VLAN ID 600:
 

```
[edit vlans]
user@switch# set comm600 vlan-id 600
```
  9. Configure the primary VLAN for comm600:
 

```
[edit vlans]
user@switch# set comm600 primary-vlan pvlan400
```
  10. Configure the interface for comm600:
 

```
[edit vlans]
user@switch# set comm600 interface xe-0/0/6.0
```
  11. Configure the interswitch isolated VLANs:
 

```
[edit vlans]
user@switch# set pvlan100 pvlan isolation-vlan-id 200
user@switch# set pvlan400 pvlan isolation-vlan-id 500
```
  12. Configure access port xe-0/0/0 to be promiscuous for pvlan100:
 

```
[edit vlans]
user@switch# set pvlan100 interface xe-0/0/0.0 promiscuous
```

**NOTE:** A promiscuous access port can be a member of only one primary VLAN.

13. Configure xe-0/0/2 and xe-0/0/6 to be isolated:

```
[edit vlans]
user@switch# set pvlan100 interface xe-0/0/2.0 isolated
user@switch# set pvlan400 interface xe-0/0/5.0 isolated
```

### Results

Check the results of the configuration on Switch 2:

```
[edit]
user@switch# show
interfaces {
  xe-0/0/0 {
    unit 0 {
      family ethernet-switching {
        port-mode access;
        vlan {
          members pvlan100;
        }
      }
    }
  }
  xe-0/0/1 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members pvlan100;
        }
      }
    }
  }
}
```

```

        members pvlan400;
    }
}
}
xe-0/0/2 {
    unit 0 {
        family ethernet-switching {
            port-mode trunk;
        }
    }
}
xe-0/0/3 {
    unit 0 {
        family ethernet-switching {
            port-mode access;
        }
    }
}
xe-0/0/5 {
    unit 0 {
        family ethernet-switching {
            port-mode access;
        }
    }
}
xe-0/0/6 {
    unit 0 {
        family ethernet-switching {
            port-mode access;
        }
    }
}
vlands {
    comm300 {
        vlan-id 300;
        interface {
            xe-0/0/3.0;
        }
        primary-vlan pvlan100;
    }
    comm600 {
        vlan-id 600;
        interface {
            xe-0/0/6.0;
        }
        primary-vlan pvlan400;
    }
    pvlan100 {
        vlan-id 100;
        interface {
            xe-0/0/0.0;
            xe-0/0/2.0;
            xe-0/0/3.0;
            xe-0/0/1.0 {
                pvlan-trunk;
            }
        }
    }
}

```

```

    }
  }
  no-local-switching;
  isolation-id 200;
}
pvlan400 {
  vlan-id 400;
  interface {
    xe-0/0/5.0;
    xe-0/0/6.0;
    xe-0/0/1.0 {
      pvlan-trunk;
    }
  }
  no-local-switching;
  isolation-id 500;
}
}

```

## Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying That the Private VLAN and Secondary VLANs Were Created on page 2148](#)
- [Verifying The Ethernet Switching Table Entries on page 2148](#)

### *Verifying That the Private VLAN and Secondary VLANs Were Created*

**Purpose** Verify that the primary VLAN and secondary VLANs were properly created on Switch 1.

**Action** Use the `show vlans` command:

```
user@switch> show vlans private-vlan
```

Name	Role	Tag	Interfaces
pvlan100	Primary	100	xe-0/0/0.0, xe-0/0/1.0, xe-0/0/2.0,
xe-0/0/3.0			
__iso_pvlan100__	Isolated	200	xe-0/0/2.0
comm300	Community	300	xe-0/0/3.0
pvlan400	Primary	400	xe-0/0/0.0, xe-0/0/1.0, xe-0/0/5.0,
xe-0/0/6.0			
__iso_pvlan400__	Isolated	500	xe-0/0/5.0
comm600	Community	600	xe-0/0/6.0

**Meaning** The output shows that the private VLANs were created and identifies the interfaces and secondary VLANs associated with them.

### *Verifying The Ethernet Switching Table Entries*

**Purpose** Verify that the Ethernet switching table entries were created for primary VLAN pvlan100.

**Action** Show the Ethernet switching table entries for pvlan100.

```
user@switch> show ethernet-switching table vlan pvlan100 private-vlan
```

```

Ethernet-switching table: 0 unicast entries
pvlan100          *          Flood          - All-members
pvlan100          00:10:94:00:00:02 Learn      xe-0/0/2.0
__iso_pvlan100__  *          Flood          - All-members
__iso_pvlan100__  00:10:94:00:00:02 Replicated - xe-0/0/2.0

```

## Q-in-Q Tunneling Configuration Example

- [Example: Setting Up Q-in-Q Tunneling on page 2149](#)

### Example: Setting Up Q-in-Q Tunneling

Service providers can use Q-in-Q tunneling to transparently pass Layer 2 VLAN traffic between customer sites without removing or changing the customer VLAN tags or class-of-service (CoS) settings. Data centers can use Q-in-Q tunneling to isolate customer traffic within a single site or when customer traffic flows between cloud data centers in different geographic locations.

This example describes how to set up Q-in-Q tunneling:

- [Requirements on page 2149](#)
- [Overview and Topology on page 2149](#)
- [Configuration on page 2150](#)
- [Verification on page 2151](#)

#### Requirements

This example requires one QFX Series device with Junos OS Release 12.1 or later.

Before you begin setting up Q-in-Q tunneling, make sure you have created and configured the necessary customer VLANs on the neighboring switches. See [“Configuring VLANs” on page 2214](#).

#### Overview and Topology

In this service provider network, there are multiple customer VLANs mapped to one service VLAN.

[Table 162 on page 2150](#) lists the settings for the sample topology.

Table 162: Components of the Topology for Setting Up Q-in-Q Tunneling

Interface	Description
xe-0/0/11.0	Tagged S-VLAN trunk port
xe-0/0/12.0	Untagged customer-facing access port
xe-0/0/13.0	Untagged customer-facing access port
xe-0/0/14.0	Tagged S-VLAN trunk port

### Configuration

#### CLI Quick Configuration

To quickly create and configure Q-in-Q tunneling, copy the following commands and paste them into the switch terminal window:

```
[edit]
set vlans service-vlan vlan-id 1000
set vlans service-vlan dot1q-tunneling customer-vlans 1-100
set vlans service-vlan dot1q-tunneling customer-vlans 201-300
set interfaces xe-0/0/11 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/11 unit 0 family ethernet-switching vlan members 1000
set interfaces xe-0/0/12 unit 0 family ethernet-switching port-mode access
set interfaces xe-0/0/12 unit 0 family ethernet-switching vlan members 1000
set interfaces xe-0/0/13 unit 0 family ethernet-switching port-mode access
set interfaces xe-0/0/13 unit 0 family ethernet-switching vlan members 1000
set interfaces xe-0/0/14 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/14 unit 0 family ethernet-switching vlan members 1000
set ethernet-switching-options dot1q-tunneling ether-type 0x9100
```

#### Step-by-Step Procedure

To configure Q-in-Q tunneling:

1. Set the VLAN ID for the S-VLAN:

```
[edit vlans]
user@switch# set service-vlan vlan-id 1000
```

2. Enable Q-in-Q tunneling and specify the customer VLAN ranges:

```
[edit vlans]
user@switch# set service-vlan dot1q-tunneling customer-vlans 1-100
user@switch# set service-vlan dot1q-tunneling customer-vlans 201-300
```

3. Set the port mode and VLAN information for the interfaces:

```
[edit interfaces]
user@switch# set xe-0/0/11 unit 0 family ethernet-switching port-mode trunk
user@switch# set xe-0/0/11 unit 0 family ethernet-switching vlan members 1000
user@switch# set xe-0/0/12 unit 0 family ethernet-switching port-mode access
user@switch# set xe-0/0/12 unit 0 family ethernet-switching vlan members 1000
user@switch# set xe-0/0/13 unit 0 family ethernet-switching port-mode access
user@switch# set xe-0/0/13 unit 0 family ethernet-switching vlan members 1000
user@switch# set xe-0/0/14 unit 0 family ethernet-switching port-mode trunk
user@switch# set xe-0/0/14 unit 0 family ethernet-switching vlan members 1000
```

4. Set the Q-in-Q Ethertype value (optional):

```
[edit]
user@switch# set ethernet-switching-options dot1q-tunneling ether-type 0x9100
```

## Results

Check the results of the configuration:

```

user@switch> show configuration vlans service-vlan
vlan-id 1000 {
  dot1q-tunneling {
    customer-vlans [ 1-100 201-300 ];
  }
}
user@switch> show configuration interfaces
xe-0/0/11 {
  unit 0 {
    family ethernet-switching {
      port-mode trunk;
      vlan members 1000;
    }
  }
}
xe-0/0/12 {
  unit 0 {
    family ethernet-switching {
      port-mode access;
      vlan members 1000;
    }
  }
}
xe-0/0/13 {
  unit 0 {
    family ethernet-switching {
      port-mode access;
      vlan members 1000;
    }
  }
}
xe-0/0/14 {
  unit 0 {
    family ethernet-switching {
      port-mode trunk;
      vlan members 1000;
    }
  }
}
user@switch> show ethernet-switching-options
dot1q-tunneling {
  ether-type 0x9100;
}

```

## Verification

Confirm that the configuration is working properly.

### Verifying That Q-in-Q Tunneling Was Enabled

**Purpose** Verify that Q-in-Q tunneling was properly enabled.

**Action** Use the **show vlans** command:

```
user@switch> show vlans service-vlan extensive
VLAN: service-vlan, Created at: Wed Mar 14 07:17:53 2012
802.1Q Tag: 1000, Internal index: 18, Admin State: Enabled, Origin: Static
Dot1q Tunneling Status: Enabled
Customer VLAN ranges:
    1-100
    201-300
Protocol: Port Mode
Number of interfaces: Tagged 2 (Active = 0), Untagged 2 (Active = 0)
    xe-0/0/11.0, tagged, trunk
    xe-0/0/14.0, tagged, trunk
    xe-0/0/12.0, untagged, access
    xe-0/0/13.0, untagged, access
```

**Meaning** The output indicates that Q-in-Q tunneling is enabled and that the VLAN is tagged and shows the associated customer VLANs.

## Reflective Relay Configuration Example

- [Example: Configuring Reflective Relay for Use with VEPA Technology on page 2152](#)

### Example: Configuring Reflective Relay for Use with VEPA Technology

Reflective relay must be configured on a switch that receives virtual machine aggregated packets, such as Virtual Ethernet Port Aggregator (VEPA) packets, because some of these packets might be sent back to the server destined for another virtual machine on the same server. Reflective relay returns those packets to the original device using the same downstream port that delivered the packets to the switch.

**NOTE:** This example uses Junos OS for QFX3500 and QFX3600 switches that do not support the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does support ELS, see *Example: Configuring Reflective Relay for Use with VEPA Technology*.

This example shows how to configure a switch port interface to return packets sent by VEPA on the downstream interface back to the server using the same downstream interface:

- [Requirements on page 2153](#)
- [Overview and Topology on page 2153](#)
- [Configuration on page 2155](#)
- [Verification on page 2156](#)

## Requirements

---

This example uses the following hardware and software components:

- One QFX3500 switch
- One server
- Junos OS Release 12.1 or later for the QFX Series

Before you configure reflective relay on a switch port, be sure you have:

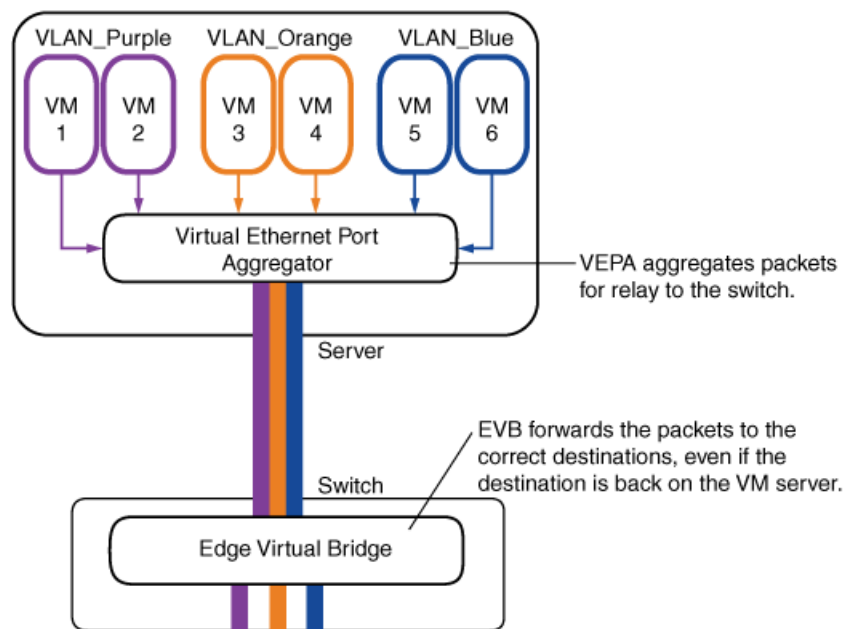

- Configured a server with six virtual machines, VM 1 through VM 6.
- Configured the server with three VLANs named VLAN\_Purple, VLAN\_Orange, and VLAN\_Blue and added two virtual machines to each VLAN.
- Configured the same three VLANs named VLAN\_Purple, VLAN\_Orange, and VLAN\_Blue on one interface.
- Installed and configured VEPA to aggregate the virtual machine packets.

## Overview and Topology

---

In this example, illustrated in [Figure 69 on page 2154](#), a switch is connected to one server that is hosting six virtual machines and is configured with a VEPA for aggregating packets. The server's six virtual machines are VM1 through VM 6, and each virtual machine belongs to one of the three server VLANs, VLAN\_Purple, VLAN\_Orange, or VLAN\_Blue. Instead of the server directly passing packets between virtual machines, packets from any of the three VLANs that are destined for another one of the three VLANs are aggregated using VEPA technology and passed to the switch for processing. You must configure the switch port to accept these aggregated packets on the downstream interface and to return appropriate packets to the server on the same downstream interface after they are processed. [Figure 69 on page 2154](#) shows the topology for this example.

Figure 69: Reflective Relay Topology

g020996

In this example, you configure the physical Ethernet switch port interface for tagged-access port mode and reflective relay. Configuring tagged-access port mode allows the interface to accept VLAN tagged packets. Configuring reflective relay allows the downstream port to return those packets on the same interface. [Table 163 on page 2154](#) shows the components used in this example.

Table 163: Components of the Topology for Configuring Reflective Relay

Component	Description
QFX3500 switch	Switch that supports reflective relay. For a list of switches that support this feature, see <i>QFX Series Software Features Overview</i> .
xe-0/0/2	Switch interface to the server.
Server	Server with virtual machines and VEPA technology.
Virtual machines	Six virtual machines located on the server: V1, V2, V3, V4, V5, and V6.
VLANs	Three VLANs: VLAN_Purple, VLAN_Orange, and VLAN_Blue. Each VLAN has two virtual machine members.
VEPA	Virtual Ethernet port aggregator that aggregates virtual machine packets on the server before the resulting single stream is transmitted to the switch.

## Configuration

To configure reflective relay, perform these tasks:

- [Configuring Reflective Relay on the Port on page 2155](#)

### Configuring Reflective Relay on the Port

#### CLI Quick Configuration

To quickly configure reflective relay, copy the following commands and paste them into the switch window:

```
[edit]
set interfaces xe-0/0/2 unit 0 family ethernet-switching port-mode tagged-access
set interfaces xe-0/0/2 unit 0 family ethernet-switching reflective-relay
set interfaces xe-0/0/2 unit 0 family ethernet-switching vlan members [VLAN_Blue VLAN_Orange
VLAN_Purple]
```

#### Step-by-Step Procedure

To configure reflective relay:

1. Configure the tagged-access port mode on the interface:

**NOTE:** Configure the port mode as tagged-access otherwise you will receive an error when you commit the configuration.

```
[edit]
user@switch# set interfaces xe-0/0/2 unit 0 family ethernet-switching port-mode
tagged-access
```

2. Configure reflective relay on the interface to allow it to both accept and send packets:

```
[edit]
user@switch# set interfaces xe-0/0/2 unit 0 family ethernet-switching reflective-relay
```

3. Configure the interface for the three VLANs on the server:

```
[edit]
user@switch# set interfaces xe-0/0/2 unit 0 family ethernet-switching vlan members
[VLAN_Purple VLAN_Orange VLAN_Blue]
```

#### Results

Check the results of the configuration:

```
[edit interfaces xe-0/0/2]
user@switch# show
unit 0 {
  family ethernet-switching {
    port-mode tagged-access;
    reflective-relay;
    vlan {
      members [ VLAN_Purple VLAN_Orange VLAN_Blue ];
    }
  }
}
```

## Verification

---

To confirm that reflective relay is enabled and working correctly, perform these tasks:

- [Verifying That Reflective Relay Is Enabled and Working Correctly on page 2156](#)

### *Verifying That Reflective Relay Is Enabled and Working Correctly*

**Purpose** Verify that reflective relay is enabled and working correctly.

**Action** Use the **show ethernet-switching interfaces detail** command to display the reflective relay status:

```
user@switch> show ethernet-switching interfaces xe-0/0/2 detail
Interface: xe-0/0/2, Index: 66, State: down, Port mode: Tagged-access
Reflective Relay Status: Enabled
Ether type for the interface: 0x8100
VLAN membership:
  VLAN_Purple, 802.1Q Tag: 450, tagged, unblocked
  VLAN_Orange, 802.1Q Tag: 460, tagged, unblocked
  VLAN_Blue, 802.1Q Tag: 470, tagged, unblocked
Number of MACs learned on IFL: 0
```

Confirm that reflective relay is working by sending a Layer 2 broadcast message from one virtual machine to another virtual machine located on the same VLAN. Check the switch to verify that the switch sends the packets back on the same interface on which they were received. One way to check this is to set up port mirroring on the switch interface, connect a traffic generator to the mirrored interface, and use the traffic generator to examine packets.

Alternatively, if you do not have a traffic generator available, you can send traffic between two virtual machines with FTP, Telnet, or SSH, while running the **tcpdump** utility on the receiver virtual machine port to capture reflected packets.

**Meaning** The reflective relay status is **Enabled**, meaning that interface **xe-0/0/2** is configured for the tagged-access port mode, which accepts VLAN-tagged packets, and for reflective relay, which accepts and returns packets on the same interface.

When the traffic generator shows packets arriving at the switch and returning to the server on the same interface, reflective relay is working.

## VLAN Configuration Examples

- [Example: Configuring BPDU Protection on STP Interfaces to Prevent STP Miscalculations on page 2157](#)
- [Example: Configuring Faster Convergence and Improving Network Stability with RSTP on page 2161](#)
- [Example: Configuring Loop Protection to Prevent Interfaces from Transitioning from Blocking to Forwarding in a Spanning Tree on page 2175](#)
- [Example: Configuring Network Regions for VLANs with MSTP on page 2179](#)
- [Example: Configuring Root Protection to Enforce Root Bridge Placement in Spanning Trees on page 2202](#)
- [Example: Configuring Routing Between VLANs on One Switch on page 2207](#)

### Example: Configuring BPDU Protection on STP Interfaces to Prevent STP Miscalculations

The QFX Series products provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), and Multiple Spanning Tree Protocol (MSTP). Configure BPDU protection on interfaces to prevent them from receiving BPDUs that could result in STP misconfigurations, which could lead to network outages.

This example describes how to configure BPDU protection on access interfaces in QFX Series products in an RSTP topology:

- [Requirements on page 2157](#)
- [Overview and Topology on page 2157](#)
- [Configuration on page 2159](#)
- [Verification on page 2159](#)

#### Requirements

This example uses the following hardware and software components:

- Junos OS Release 11.1 or later for the QFX Series
- Two edged-linked switches in an RSTP topology

**NOTE:** By default, RSTP is enabled on the QFX Series.

#### Overview and Topology

A loop-free network is supported through the exchange of a special type of frame called a bridge protocol data unit (BPDU). However, receipt of BPDUs on certain interfaces in an STP, RSTP, or MSTP topology. It can lead to network outages by triggering an STP misconfiguration. To prevent such outages, enable BPDU protection on those interfaces that should not receive BPDUs.

Enable BPDU protection on switch interfaces connected to user devices or on interfaces on which no BPDUs are expected, such as edge ports. If a BPDU is received on a BPDU-protected interface, the interface is disabled and stops forwarding frames.

Two switches are displayed in [Figure 70 on page 2158](#). In this example, Switch 1 and Switch 2 are configured for RSTP and create a loop-free topology. The interfaces on Switch 2 are access ports.

This example shows you how to configure interface **xe-0/0/5** and interface **xe-0/0/6** as edge ports and how to configure BPDU protection. When BPDU protection is enabled, the interfaces transition to a blocking state when they receive BPDUs.

**Figure 70: BPDU Protection Topology**

[Table 164 on page 2158](#) shows the components that will be configured for BPDU protection.

**Table 164: Components of the Topology for Configuring BPDU Protection on the QFX Series**

Component	Settings
Switch 1 (Distribution Layer)	Switch 1 is connected to Switch 2 on a trunk interface.
Switch 2 (Access Layer)	Switch 2 has these access ports that require BPDU protection: <ul style="list-style-type: none"> <li>• xe-0/0/5</li> <li>• xe-0/0/6</li> </ul>

This configuration example uses an RSTP topology. You also can configure BPDU protection for STP or MSTP topologies at the `[edit protocols (mstp | stp)]` hierarchy level.

### Configuration

**CLI Quick Configuration** To quickly configure BPDU protection on Switch 2, copy the following commands and paste them into the switch terminal window:

```
[edit]
set protocols rstp interface xe-0/0/5 edge
set protocols rstp interface xe-0/0/6 edge
set protocols rstp bpdu-block-on-edge
```

**Step-by-Step Procedure** To configure BPDU protection:

1. Configure interface `xe-0/0/5` and interface `xe-0/0/6` on Switch 2 as edge ports:

```
[edit protocols rstp]
user@switch# set interface xe-0/0/5 edge
user@switch# set interface xe-0/0/6 edge
```

2. Configure BPDU protection on all edge ports:

```
[edit protocols rstp]
user@switch# set bpdu-block-on-edge
```

**Results** Check the results of the configuration:

```
user@switch> show configuration protocols rstp
interface xe-0/0/5.0 {
  edge;
}
interface xe-0/0/6.0 {
  edge;
}
bpdu-block-on-edge;
```

### Verification

To confirm that the configuration is working properly, perform these tasks:

- [Displaying the Interface State Before BPDU Protection Is Triggered on page 2159](#)
- [Verifying That BPDU Protection Is Working Correctly on page 2160](#)

#### *Displaying the Interface State Before BPDU Protection Is Triggered*

**Purpose** Before BPDUs are being received from the devices connected to interface `xe-0/0/5` and interface `xe-0/0/6`, confirm the interface state.

**Action** You can verify the interface state using the **show spanning-tree interface** command:

```
user@switch> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

Interface	Port ID	Designated port ID	Designated bridge ID	Port Cost	State	Role
xe-0/0/0.0	128:513	128:513	32768.0019e2503f00	20000	BLK	DIS
xe-0/0/1.0	128:514	128:514	32768.0019e2503f00	20000	BLK	DIS
xe-0/0/2.0	128:515	128:515	32768.0019e2503f00	20000	BLK	DIS
xe-0/0/3.0	128:516	128:516	32768.0019e2503f00	20000	FWD	DESG
xe-0/0/4.0	128:517	128:517	32768.0019e2503f00	20000	FWD	DESG
xe-0/0/5.0	128:518	128:518	32768.0019e2503f00	20000	FWD	DESG
xe-0/0/6.0	128:519	128:519	32768.0019e2503f00	20000	FWD	DESG

[output truncated]

**Meaning** The output shows that interface **xe-0/0/5.0** and interface **xe-0/0/6.0** are designated ports in a forwarding state.

#### *Verifying That BPDU Protection Is Working Correctly*

**Purpose** In this example, the devices connected to Switch 2 start sending BPDUs to interface **xe-0/0/5.0** and interface **xe-0/0/6.0**. Verify that BPDU protection is configured on the interfaces.

**Action** You can verify that BPDU protection is configured on the interfaces by using the **show spanning-tree interface** command:

```
user@switch> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

Interface	Port ID	Designated port ID	Designated bridge ID	Port Cost	State	Role
xe-0/0/0.0	128:513	128:513	32768.0019e2503f00	20000	BLK	DIS
xe-0/0/1.0	128:514	128:514	32768.0019e2503f00	20000	BLK	DIS
xe-0/0/2.0	128:515	128:515	32768.0019e2503f00	20000	BLK	DIS
xe-0/0/3.0	128:516	128:516	32768.0019e2503f00	20000	FWD	DESG
xe-0/0/4.0	128:517	128:517	32768.0019e2503f00	20000	FWD	DESG
xe-0/0/5.0 (Bpdu-Incon)	128:518	128:518	32768.0019e2503f00	20000	BLK	DIS
xe-0/0/6.0 (Bpdu-Incon)	128:519	128:519	32768.0019e2503f00	20000	BLK	DIS
xe-0/0/7.0	128:520	128:1	16384.00aabbcc0348	20000	FWD	ROOT
xe-0/0/8.0	128:521	128:521	32768.0019e2503f00	20000	FWD	DESG

[output truncated]

**Meaning** When BPDUs are sent from the devices to interface **xe-0/0/5.0** and interface **xe-0/0/6.0** on Switch 2, the output from the operational mode command **show spanning-tree interface** shows that the interfaces have transitioned to a BPDU inconsistent state. The BPDU inconsistent state blocks the interfaces and prevents them from forwarding traffic.

Disabling the BPDU protection configuration on an interface does not unblock the interface. If the **disable-timeout** statement has been included in the BPDU configuration,

the interface automatically returns to service after the timer expires. Otherwise, use the operational mode command `clear ethernet-switching bpd-error` to unblock the interface.

If the devices connected to Switch 2 send BPDUs to the interfaces again, BPDU protection is triggered once more and the interfaces transition back to the BPDU inconsistent state. In such cases, you need to find and repair the misconfiguration on the devices that is triggering the sending of BPDUs to Switch 2.

#### Related Documentation

- [Example: Configuring Loop Protection to Prevent Interfaces from Transitioning from Blocking to Forwarding in a Spanning Tree on page 2175](#)
- [Example: Configuring Root Protection to Enforce Root Bridge Placement in Spanning Trees on page 2202](#)
- [Understanding BPDU Protection for STP, RSTP, and MSTP on page 2063](#)

### Example: Configuring Faster Convergence and Improving Network Stability with RSTP

The QFX Series products use Rapid Spanning Tree Protocol (RSTP) to provide a loop-free topology. RSTP identifies certain links as point to point. When a point-to-point link fails, the alternate link can transition to the forwarding state. RSTP provides quicker reconvergence time than original STP because it uses protocol handshake messages rather than fixed timeouts. Eliminating the need to wait for timers to expire makes RSTP more efficient than STP.

This example describes how to configure RSTP on four QFX3500 switches:

- [Requirements on page 2161](#)
- [Overview and Topology on page 2161](#)
- [Configuring RSTP on Switch 1 on page 2163](#)
- [Configuring RSTP on Switch 2 on page 2166](#)
- [Configuring RSTP on Switch 3 on page 2168](#)
- [Configuring RSTP on Switch 4 on page 2171](#)
- [Verification on page 2173](#)

#### Requirements

This example uses the following hardware and software components:

- Junos OS Release 11.1 for the QFX3500 switches
- Four QFX3500 switches

#### Overview and Topology

In this example, QFX3500 switches are connected in the topology displayed in [Figure 71 on page 2162](#) to create a loop-free topology.

Figure 71: Network Topology for RSTP

g040714

The interfaces shown in [Table 165 on page 2162](#) will be configured for RSTP.

**NOTE:** You can configure RSTP on logical or physical interfaces. This example shows RSTP configured on logical interfaces.

Table 165: Topology for Configuring RSTP on the QFX Series

Components	Settings
Switch 1	<p>The following ports on Switch 1 are connected in this way:</p> <ul style="list-style-type: none"> <li>• xe-0/0/9 is connected to Switch 2</li> <li>• xe-0/0/13 is connected to Switch 4</li> <li>• xe-0/0/11 is connected to Switch 3</li> </ul>
Switch 2	<p>The following ports on Switch 2 are connected in this way:</p> <ul style="list-style-type: none"> <li>• xe-0/0/14 is connected to Switch 1</li> <li>• xe-0/0/18 is connected to Switch 3</li> </ul>
Switch 3	<p>The following ports on Switch 3 are connected in this way:</p> <ul style="list-style-type: none"> <li>• xe-0/0/26 is connected to Switch 1</li> <li>• xe-0/0/28 is connected to Switch 2</li> <li>• xe-0/0/24 is connected to Switch 4</li> </ul>

Table 165: Topology for Configuring RSTP on the QFX Series (*continued*)

Components	Settings
Switch 4	<p>The following ports on Switch 4 are connected in this way:</p> <ul style="list-style-type: none"> <li>• <code>xe-0/0/19</code> is connected to Switch 1</li> <li>• <code>xe-0/0/23</code> is connected to Switch 3</li> </ul>
VLAN names and tag IDs	<p> <code>sales-vlan</code>, tag 10  <code>engineering-vlan</code>, tag 20  <code>publications-vlan</code>, tag 30  <code>support-vlan</code>, tag 40         </p>

This configuration example creates a loop-free topology between four switches using RSTP.

An RSTP topology contains ports that have specific roles:

- The *root port* is responsible for forwarding data to the root bridge.
- The *alternate port* is a standby port for the root port. When a root port goes down, the alternate port becomes the active root port.
- The *designated port* forwards data to the downstream network segment or device.
- The *backup port* is a backup port for the designated port. When a designated port goes down, the backup port becomes the active designated port and starts forwarding data.

### Configuring RSTP on Switch 1

**CLI Quick Configuration** To quickly configure interfaces and RSTP on Switch 1, copy the following commands and paste them into the switch terminal window:

**NOTE:** If you are configuring RSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the `interface-mode` statement instead of the `port-mode` statement. The `port-mode` statement has been replaced with the `interface-mode` statement.

```
[edit]
set vlans sales-vlan description "Sales VLAN"
set vlans sales-vlan vlan-id 10
set vlans engineering-vlan description "Engineering VLAN"
set vlans engineering-vlan vlan-id 20
set vlans publications-vlan description "Publications VLAN"
set vlans publications-vlan vlan-id 30
set vlans support-vlan description "Support VLAN"
set vlans support-vlan vlan-id 40
set interfaces xe-0/0/13 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/9 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/11 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/13 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/9 unit 0 family ethernet-switching port-mode trunk
```

```

set interfaces xe-0/0/11 unit 0 family ethernet-switching port-mode trunk
set protocols rstp bridge-priority 16k
set protocols rstp interface xe-0/0/13.0 cost 1000
set protocols rstp interface xe-0/0/13.0 mode point-to-point
set protocols rstp interface xe-0/0/9.0 cost 1000
set protocols rstp interface xe-0/0/9.0 mode point-to-point
set protocols rstp interface xe-0/0/11.0 cost 1000
set protocols rstp interface xe-0/0/11.0 mode point-to-point

```

### Step-by-Step Procedure

To configure interfaces and RSTP on Switch 1:

1. Configure the VLANs **sales-vlan**, **engineering-vlan** and **publications-vlan**, and **support-vlan**:  
  

```

[edit vlans]
user@switch1# set sales-vlan description "Sales VLAN"
user@switch1# set sales-vlan vlan-id 10
user@switch1# set engineering-vlan description "Engineering VLAN"
user@switch1# set engineering-vlan vlan-id 20
user@switch1# set publications-vlan description "Publications VLAN"
user@switch1# set publications-vlan vlan-id 30

```
2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:  
  

```

[edit interfaces]
user@switch1# set xe-0/0/13 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch1# set xe-0/0/9 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch1# set xe-0/0/11 unit 0 family ethernet-switching vlan members [10 20 30 40]

```
3. Configure the port mode for the interfaces:

**NOTE:** If you are configuring RSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the interface-mode statement instead of the port-mode statement. The port-mode statement has been replaced with the interface-mode statement.

- ```

[edit interfaces]
user@switch1# set xe-0/0/13 unit 0 family ethernet-switching port-mode trunk
user@switch1# set xe-0/0/9 unit 0 family ethernet-switching port-mode trunk
user@switch1# set xe-0/0/11 unit 0 family ethernet-switching port-mode trunk

```
4. Configure RSTP on the switch:  
  

```

[edit protocols]
user@switch1# rstp bridge-priority 16k
user@switch1# rstp interface xe-0/0/13.0 cost 1000
user@switch1# rstp interface xe-0/0/13.0 mode point-to-point
user@switch1# rstp interface xe-0/0/9.0 cost 1000
user@switch1# rstp interface xe-0/0/9.0 mode point-to-point
user@switch1# rstp interface xe-0/0/11.0 cost 1000
user@switch1# rstp interface xe-0/0/11.0 mode point-to-point

```

**Results** Check the results of the configuration:

```
user@switch1> show configuration
```

```
interfaces {
  xe-0/0/13 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members [10 20 30 40];
        }
      }
    }
  }

### Configuring RSTP on Switch 2

#### CLI Quick Configuration

To quickly configure interfaces and RSTP on Switch 2, copy the following commands and paste them into the switch terminal window:

**NOTE:** If you are configuring RSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the `interface-mode` statement instead of the `port-mode` statement. The `port-mode` statement has been replaced with the `interface-mode` statement.

```

[edit]
set vlans sales-vlan description "Sales VLAN"
set vlans sales-vlan vlan-id 10
set vlans engineering-vlan description "Engineering VLAN"
set vlans engineering-vlan vlan-id 20
set vlans publications-vlan description "Publications VLAN"
set vlans publications-vlan vlan-id 30
set vlans support-vlan description "Support VLAN"
set vlans support-vlan vlan-id 40
set interfaces xe-0/0/14 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/18 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/14 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/18 unit 0 family ethernet-switching port-mode trunk
set protocols rstp bridge-priority 32k
set protocols rstp interface xe-0/0/14.0 cost 1000
set protocols rstp interface xe-0/0/14.0 mode point-to-point
set protocols rstp interface xe-0/0/18.0 cost 1000
set protocols rstp interface xe-0/0/18.0 mode point-to-point

```

#### Step-by-Step Procedure

To configure interfaces and RSTP on Switch 2:

1. Configure the VLANs `sales-vlan`, `engineering-vlan` and `publications-vlan`, and `support-vlan`:
 

```

[edit vlans]
user@switch2# set sales-vlan description "Sales VLAN"
user@switch2# set sales-vlan vlan-id 10
user@switch2# set engineering-vlan description "Engineering VLAN"
user@switch2# set engineering-vlan vlan-id 20
user@switch2# set publications-vlan description "Publications VLAN"
user@switch2# set publications-vlan vlan-id 30
user@switch2# set support-vlan vlan-description "Support VLAN"
user@switch2# set publications-vlan vlan-id 40

```
2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:

```
[edit interfaces]
user@switch2# set xe-0/0/14 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch2# set xe-0/0/18 unit 0 family ethernet-switching vlan members [10 20 30 40]
```

3. Configure the port mode for the interfaces:

**NOTE:** If you are configuring RSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the interface-mode statement instead of the port-mode statement. The port-mode statement has been replaced with the interface-mode statement.

```
[edit interfaces]
user@switch2# set xe-0/0/14 unit 0 family ethernet-switching port-mode trunk
user@switch2# set xe-0/0/18 unit 0 family ethernet-switching port-mode trunk
```

4. Configure RSTP on the switch:

```
[edit protocols]
user@switch2# rstp bridge-priority 32k
user@switch2# rstp interface xe-0/0/14.0 cost 1000
user@switch2# rstp interface xe-0/0/14.0 mode point-to-point
user@switch2# rstp interface xe-0/0/18.0 cost 1000
user@switch2# rstp interface xe-0/0/18.0 mode point-to-point
```

**Results** Check the results of the configuration:

```
user@switch2> show configuration
interfaces {
  xe-0/0/14 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members [10 20 30 40];
        }
      }
    }
  }
  xe-0/0/18 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members [10 20 30 40];
        }
      }
    }
  }
}
protocols {
  rstp {
    bridge-priority 32k;
    interface xe-0/0/14.0 {
      cost 1000;
    }
  }
}
```

```

        mode point-to-point;
    }
    interface xe-0/0/18.0 {
        cost 1000;
        mode point-to-point;
    }
}
}
vlands {
    sales-vlan {
        vlan-id 10;
    }
    engineering-vlan {
        vlan-id 20;
    }
    publications-vlan {
        vlan-id 30;
    }
    support-vlan {
        vlan-id 40;
    }
}
}

```

### Configuring RSTP on Switch 3

#### CLI Quick Configuration

To quickly configure interfaces and RSTP on Switch 3, copy the following commands and paste them into the switch terminal window:

**NOTE:** If you are configuring RSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the `interface-mode` statement instead of the `port-mode` statement. The `port-mode` statement has been replaced with the `interface-mode` statement.

```

[edit]
set vlans sales-vlan description "Sales VLAN"
set vlans sales-vlan vlan-id 10
set vlans engineering-vlan description "Engineering VLAN"
set vlans engineering-vlan vlan-id 20
set vlans publications-vlan description "Publications VLAN"
set vlans publications-vlan vlan-id 30
set vlans support-vlan description "Support VLAN"
set vlans support-vlan vlan-id 40
set interfaces xe-0/0/26 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/28 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/24 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/26 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/28 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/24 unit 0 family ethernet-switching port-mode trunk
set protocols rstp bridge-priority 8k
set protocols rstp interface xe-0/0/26.0 cost 1000
set protocols rstp interface xe-0/0/26.0 mode point-to-point
set protocols rstp interface xe-0/0/28.0 cost 1000

```

```

set protocols rstp interface xe-0/0/28.0 mode point-to-point
set protocols rstp interface xe-0/0/24.0 cost 1000
set protocols rstp interface xe-0/0/24.0 mode point-to-point

```

### Step-by-Step Procedure

To configure interfaces and RSTP on Switch 3:

1. Configure the VLANs `sales-vlan`, `engineering-vlan`, `publications-vlan`, and `support-vlan`:

```

[edit vlans]
user@switch3# set sales-vlan description "Sales VLAN"
user@switch3# set sales-vlan vlan-id 10
user@switch3# set engineering-vlan description "Engineering VLAN"
user@switch3# set engineering-vlan vlan-id 20
user@switch3# set publications-vlan description "Publications VLAN"
user@switch3# set publications-vlan vlan-id 30
user@switch3# set support-vlan description "Support VLAN"
user@switch3# set publications-vlan vlan-id 40

```

2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:

```

[edit interfaces]
user@switch3# set xe-0/0/26 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch3# set xe-0/0/28 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch3# set xe-0/0/24 unit 0 family ethernet-switching vlan members [10 20 30 40]

```

3. Configure the port mode for the interfaces:

**NOTE:** If you are configuring RSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the `interface-mode` statement instead of the `port-mode` statement. The `port-mode` statement has been replaced with the `interface-mode` statement.

```

[edit interfaces]
user@switch3# set xe-0/0/26 unit 0 family ethernet-switching port-mode trunk
user@switch3# set xe-0/0/28 unit 0 family ethernet-switching port-mode trunk
user@switch3# set xe-0/0/24 unit 0 family ethernet-switching port-mode trunk

```

4. Configure RSTP on the switch:

```

[edit protocols]
user@switch3# rstp bridge-priority 8k
user@switch3# rstp interface xe-0/0/26.0 cost 1000
user@switch3# rstp interface xe-0/0/26.0 mode point-to-point
user@switch3# rstp interface xe-0/0/28.0 cost 1000
user@switch3# rstp interface xe-0/0/28.0 mode point-to-point
user@switch3# rstp interface xe-0/0/24.0 cost 1000
user@switch3# rstp interface xe-0/0/24.0 mode point-to-point

```

**Results** Check the results of the configuration:

```

user@switch3> show configuration
interfaces {
  xe-0/0/26 {
    unit 0 {
      family ethernet-switching {

```

```
        port-mode trunk;
        vlan {
            members [10 20 30 40];
        }
    }
}
xe-0/0/28 {
    unit 0 {
        family ethernet-switching {
            port-mode trunk;
            vlan {
                members [10 20 30 40];
            }
        }
    }
}
xe-0/0/24 {
    unit 0 {
        family ethernet-switching {
            port-mode trunk;
            vlan {
                members [10 20 30 40];
            }
        }
    }
}
}
}
protocols {
    rstp {
        bridge-priority 8k;
        interface xe-0/0/26.0 {
            cost 1000;
            mode point-to-point;
        }
        interface xe-0/0/28.0 {
            cost 1000;
            mode point-to-point;
        }
        interface xe-0/0/24.0 {
            cost 1000;
            mode point-to-point;
        }
    }
    bridge-priority 8k;
}
}
vllans {
    sales-vlan {
        vlan-id 10;
    }
    engineering-vlan {
        vlan-id 20;
    }
}
```

```

    }
    publications-vlan {
        vlan-id 30;
    }
    support-vlan {
        vlan-id 40;
    }
}

```

### Configuring RSTP on Switch 4

#### CLI Quick Configuration

To quickly configure interfaces and RSTP on Switch 4, copy the following commands and paste them into the switch terminal window:

**NOTE:** If you are configuring RSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the interface-mode statement instead of the port-mode statement. The port-mode statement has been replaced with the interface-mode statement.

```

[edit]
set vlans sales-vlan description "Sales VLAN"
set vlans sales-vlan vlan-id 10
set vlans engineering-vlan description "Engineering VLAN"
set vlans engineering-vlan vlan-id 20
set vlans publications-vlan description "Publications VLAN"
set vlans publications-vlan vlan-id 30
set vlans support-vlan description "Support VLAN"
set vlans support-vlan vlan-id 40
set interfaces xe-0/0/23 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/19 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/23 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/19 unit 0 family ethernet-switching port-mode trunk
set protocols rstp bridge-priority 16k
set protocols rstp interface xe-0/0/23.0 cost 1000
set protocols rstp interface xe-0/0/23.0 mode point-to-point
set protocols rstp interface xe-0/0/19.0 cost 1000
set protocols rstp interface xe-0/0/19.0 mode point-to-point

```

#### Step-by-Step Procedure

To configure interfaces and RSTP on Switch 4:

1. Configure the VLANs `sales-vlan`, `engineering-vlan`, `publications-vlan`, and `support-vlan`:

```

[edit vlans]
user@switch4# set sales-vlan description "Sales VLAN"
user@switch4# set sales-vlan vlan-id 10
user@switch4# set engineering-vlan description "Engineering VLAN"
user@switch4# set engineering-vlan vlan-id 20
user@switch4# set publications-vlan description "Publications VLAN"
user@switch4# set publications-vlan vlan-id 30
user@switch4# set support-vlan description "Support VLAN"
user@switch4# set support-vlan vlan-id 40

```

2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:

```

[edit interfaces]

```

```

user@switch4# set xe-0/0/23 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch4# set xe-0/0/19 unit 0 family ethernet-switching vlan members [10 20 30 40]

```

3. Configure the port mode for the interfaces:

**NOTE:** If you are configuring RSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the `interface-mode` statement instead of the `port-mode` statement. The `port-mode` statement has been replaced with the `interface-mode` statement.

```

[edit interfaces]
user@switch4# set xe-0/0/23 unit 0 family ethernet-switching port-mode trunk
user@switch4# set xe-0/0/19 unit 0 family ethernet-switching port-mode trunk

```

4. Configure RSTP on the switch:

```

[edit protocols]
user@switch4# rstp bridge-priority 16k
user@switch4# rstp interface all cost 1000
user@switch4# rstp interface xe-0/0/23.0 cost 1000
user@switch4# rstp interface xe-0/0/23.0 mode point-to-point
user@switch4# rstp interface xe-0/0/19.0 cost 1000
user@switch4# rstp interface xe-0/0/19.0 mode point-to-point

```

**Results** Check the results of the configuration:

```

user@switch4> show configuration
interfaces {
  xe-0/0/23 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members [10 20 30 40];
        }
      }
    }
  }
  xe-0/0/19 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members [10 20 30 40];
        }
      }
    }
  }
}
protocols {
  rstp {
    bridge-priority 16k;
    interface xe-0/0/23.0 {
      cost 1000;
    }
  }
}

```

```

        mode point-to-point;
    }
    interface xe-0/0/19.0 {
        cost 1000;
        mode point-to-point;
    }
}
}
vllans {
    sales-vlan {
        vlan-id 10;
    }
    engineering-vlan {
        vlan-id 20;
    }
    publications-vlan {
        vlan-id 30;
    }
    support-vlan {
        vlan-id 40;
    }
}
}

```

### Verification

To confirm that the configuration is working properly, perform these tasks:

- [Verifying RSTP Configuration on Switch 1 on page 2173](#)
- [Verifying RSTP Configuration on Switch 2 on page 2174](#)
- [Verifying RSTP Configuration on Switch 3 on page 2174](#)
- [Verifying RSTP Configuration on Switch 4 on page 2174](#)

#### *Verifying RSTP Configuration on Switch 1*

**Purpose** Verify that the RSTP configuration on Switch 1 is correct.

**Action** In operational mode, issue the **show spanning-tree interface** command:

```
user@switch1> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

| Interface   | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|-------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/13.0 | 128:527 | 128:525               | 16384.0019e25040e0      | 1000         | BLK   | ALT  |
| xe-0/0/9.0  | 128:529 | 128:513               | 32768.0019e2503d20      | 1000         | BLK   | ALT  |
| xe-0/0/11.0 | 128:531 | 128:513               | 8192.0019e25051e0       | 1000         | FWD   | ROOT |

**Meaning** See the topology in [Figure 71 on page 2162](#). The operational mode command **show spanning-tree interface** shows that **xe-0/0/13.0** is in a forwarding state. The other interfaces on Switch 1 are blocked.

**Verifying RSTP Configuration on Switch 2**

**Purpose** Verify that the RSTP configuration on Switch 2 is correct.

**Action** In operational mode issue the **show spanning-tree interface** command:

```
user@switch2> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

| Interface   | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|-------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/14.0 | 128:513 | 128:513               | 32768.0019e2503d20      | 1000         | BLK   | DESC |
| xe-0/0/18.0 | 128:519 | 128:515               | 8192.0019e25051e0       | 1000         | FWD   | ROOT |

**Meaning** See the topology in [Figure 71 on page 2162](#). The operational mode command **show spanning-tree interface** shows that interface **xe-0/0/18.0** is in a forwarding state and the root port. The other interface on Switch 2 is blocked.

**Verifying RSTP Configuration on Switch 3**

**Purpose** Verify that the RSTP configuration on Switch 3 is correct.

**Action** In operational mode, issue the **show spanning-tree interface** command:

```
user@switch3> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

| Interface   | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|-------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/26.0 | 128:513 | 128:513               | 8192.0019e25051e0       | 1000         | FWD   | DESC |
| xe-0/0/28.0 | 128:515 | 128:515               | 8192.0019e25051e0       | 1000         | FWD   | DESC |
| xe-0/0/24.0 | 128:517 | 128:517               | 8192.0019e25051e0       | 1000         | FWD   | DESC |

**Meaning** See the topology in [Figure 71 on page 2162](#). The operational mode command **show spanning-tree interface** shows that no interface is the root interface.

**Verifying RSTP Configuration on Switch 4**

**Purpose** Verify the RSTP configuration on Switch 4.

**Action** In operational mode, issue the **show spanning-tree interface** command:

```
user@switch4> show spanning-tree interface
Spanning tree interface parameters for instance 0
```

| Interface   | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|-------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/23.0 | 128:523 | 128:517               | 8192.0019e25051e0       | 1000         | FWD   | ROOT |
| xe-0/0/19.0 | 128:525 | 128:525               | 16384.0019e25040e0      | 1000         | FWD   | DESG |

**Meaning** See the topology in [Figure 71 on page 2162](#). The operational mode command **show spanning-tree interface** shows that interface **xe-0/0/23.0** is the root interface and is in the forwarding state.

- [Understanding RSTP on page 2061](#)

## Example: Configuring Loop Protection to Prevent Interfaces from Transitioning from Blocking to Forwarding in a Spanning Tree

The QFX Series products provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), and Multiple Spanning Tree Protocol (MSTP). Loop protection increases the efficiency of STP, RSTP, and MSTP by preventing interfaces from moving into a forwarding state that would create a loop in the network.

This example describes how to configure loop protection for an interface for the QFX Series in an RSTP topology:

- [Requirements on page 2175](#)
- [Overview and Topology on page 2175](#)
- [Configuration on page 2177](#)
- [Verification on page 2177](#)

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 11.1 or later for the QFX Series
- Three switches in an RSTP topology

**NOTE:** By default, RSTP is enabled for the QFX Series.

### Overview and Topology

A loop-free network in spanning-tree topologies is supported through the exchange of a special type of frame called a bridge protocol data unit (BPDU). Peer STP applications

running on the switch interfaces use BPDUs to communicate. Ultimately, the exchange of BPDUs determines which interfaces block traffic (preventing loops) and which interfaces become root ports and forward traffic.

A blocking interface can transition to the forwarding state in error if the interface stops receiving BPDUs from its designated port on the segment. Such a transition error can occur when there is a hardware error on the switch or software configuration error between the switch and its neighbor. When this happens, a loop appears in the spanning tree. Loops in a Layer 2 topology cause broadcast, unicast, and multicast frames to continuously circle the looped network. As a switch processes a flood of frames in a looped network, its resources become depleted, and the ultimate result is a network outage.

**NOTE:** An interface can be configured for either loop protection or root protection, but not for both.

Three switches are displayed in [Figure 72 on page 2176](#). In this example, they are configured for RSTP and create a loop-free topology. Interface **xe-0/0/6** is blocking traffic between Switch 3 and Switch 1; thus, traffic is forwarded through interface **xe-0/0/7** on Switch 2. BPDUs are being sent from the root bridge on Switch 1 to both of these interfaces.

This example shows how to configure loop protection on interface **xe-0/0/6** to prevent it from transitioning from a blocking state to a forwarding state and creating a loop in the spanning-tree topology.

**Figure 72: Network Topology for Loop Protection**

[Table 166 on page 2177](#) shows the components that will be configured for loop protection.

Table 166: Topology for Configuring Loop Protection on the QFX Series

| Components | Settings                                                              |
|------------|-----------------------------------------------------------------------|
| Switch 1   | Switch 1 is the root bridge.                                          |
| Switch 2   | Switch 2 has the root port <b>xe-0/0/7</b> .                          |
| Switch 3   | Switch 3 is connected to Switch 1 through interface <b>xe-0/0/6</b> . |

A spanning-tree topology contains ports that have specific roles:

- The *root port* is responsible for forwarding data to the root bridge.
- The *alternate port* is a standby port for the root port. When a root port goes down, the alternate port becomes the active root port.
- The *designated port* forwards data to the downstream network segment or device.

This configuration example uses an RSTP topology. However, you can also configure loop protection for STP or MSTP topologies at the `[edit protocols (mstp | stp)]` hierarchy level.

### Configuration

#### CLI Quick Configuration

To quickly configure loop protection on interface **xe-0/0/6**:

```
[edit]
```

```
set protocols rstp interface xe-0/0/6 bpdu-timeout-action block
```

#### Step-by-Step Procedure

To configure loop protection:

1. Configure interface **xe-0/0/6** on Switch 3:

```
[edit protocols rstp]
```

```
user@switch# set interface xe-0/0/6 bpdu-timeout-action block
```

#### Results

Check the results of the configuration:

```
user@switch> show configuration protocols rstp
interface xe-0/0/6.0 {
  bpdu-timeout-action {
    block;
  }
}
```

### Verification

To confirm that the configuration is working properly, perform these tasks:

- [Displaying the Interface State Before Loop Protection Is Triggered on page 2178](#)
- [Verifying That Loop Protection Is Working on an Interface on page 2178](#)

***Displaying the Interface State Before Loop Protection Is Triggered***

**Purpose** Before loop protection is triggered on interface **xe-0/0/6**, confirm that the interface is blocked.

**Action** Display the interface state and role before applying root protection:

```
user@switch> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

| Interface  | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/0.0 | 128:513 | 128:513               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| xe-0/0/1.0 | 128:514 | 128:514               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| xe-0/0/2.0 | 128:515 | 128:515               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| xe-0/0/3.0 | 128:516 | 128:516               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| xe-0/0/4.0 | 128:517 | 128:517               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| xe-0/0/5.0 | 128:518 | 128:518               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| xe-0/0/6.0 | 128:519 | 128:2                 | 16384.00aabbcc0348      | 20000        | BLK   | ALT  |

[output truncated]

**Meaning** The output from the operational mode command **show spanning-tree interface** shows that **xe-0/0/6.0** is the alternate port and is blocked.

***Verifying That Loop Protection Is Working on an Interface***

**Purpose** Verify that the loop protection configuration on interface **xe-0/0/6**. RSTP has been disabled on interface **xe-0/0/4** on Switch 1. This stops BPDUs from being sent to interface **xe-0/0/6** and triggering loop protection on that interface.

**Action** Display the interface state and role after applying root protection:

```
user@switch> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

| Interface  | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/0.0 | 128:513 | 128:513               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| xe-0/0/1.0 | 128:514 | 128:514               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| xe-0/0/2.0 | 128:515 | 128:515               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| xe-0/0/3.0 | 128:516 | 128:516               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| xe-0/0/4.0 | 128:517 | 128:517               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| xe-0/0/5.0 | 128:518 | 128:518               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| xe-0/0/6.0 | 128:519 | 128:519               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |

(Loop-Incon)  
[output truncated]

**Meaning** The operational mode command **show spanning-tree interface** shows that interface **xe-0/0/6.0** has detected that BPDUs are no longer being forwarded to it and has moved into a loop-inconsistent state. The loop-inconsistent state prevents the interface from transitioning to a forwarding state. The interface recovers and transitions back to its original state as soon as it receives BPDUs.

## Example: Configuring Network Regions for VLANs with MSTP

Multiple Spanning Tree Protocol (MSTP) is used to create a loop-free topology in networks using multiple spanning-tree regions, each region containing multiple spanning-tree instances (MSTIs). MSTIs provide different paths for different VLANs. This functionality facilitates more efficient load sharing across redundant links.

You can create up to 64 MSTI instances for QFX Series products, and each MSTI supports up to 4094 VLANs.

This example describes how to configure MSTP on four QFX3500 switches:

- [Requirements on page 2179](#)
- [Overview and Topology on page 2179](#)
- [Configuring MSTP on Switch 1 on page 2182](#)
- [Configuring MSTP on Switch 2 on page 2185](#)
- [Configuring MSTP on Switch 3 on page 2188](#)
- [Configuring MSTP on Switch 4 on page 2191](#)
- [Verification on page 2194](#)

### Requirements

---

This example uses the following hardware and software components:

- Junos OS Release 11.1 for the QFX3500 switches
- Four QFX3500 switches

### Overview and Topology

---

When the number of VLANs grows in a network, MSTP provides a more faster way of creating a loop-free topology using MSTIs. Each MSTI in the spanning-tree domain maintains its own tree. Each tree can be mapped to different links, utilizing bandwidth that would be unavailable to a single tree. MSTIs reduce demand on system resources.

Figure 73: Network Topology for MSTP

The interfaces shown in [Table 167 on page 2180](#) will be configured for MSTP.

**NOTE:** You can configure MSTP on logical or physical interfaces. This example shows MSTP configured on logical interfaces.

Table 167: Topology for Configuring MSTP on the QFX Series

| Components | Settings                                                                                                                                                                                                                                      |

The topology in [Figure 73 on page 2180](#) shows a Common Internal Spanning Tree (CIST). The CIST is a single spanning tree connecting all devices in the network. The switch with the highest priority is elected as the root bridge of the CIST.

Also in an MSTP topology are ports that have specific roles:

- The *root port* is responsible for forwarding data to the root bridge.
- The *alternate port* is a standby port for the root port. When a root port goes down, the alternate port becomes the active root port.
- The *designated port* forwards data to the downstream network segment or device.
- The *backup port* is a backup port for the designated port. When a designated port goes down, the backup port becomes the active designated port and starts forwarding data.

In this example, one MSTP region, **region1**, contains Switch 1, Switch 2, Switch 3, and Switch 4. Within the region, four VLANs are created:

- The **sales-vlan** supports sales traffic and has a VLAN tag identifier of 10.
- The **engineering-vlan** supports data traffic and has a VLAN tag identifier of 20.
- The **publications-vlan** supports publications VLAN traffic (for supplicants that fail 802.1X authentication) and has a VLAN tag identifier of 30.
- The **support-vlan** supports video traffic and has a VLAN tag identifier of 40.

The VLANs are associated with specific interfaces on each of the four switches. Two MSTIs, 1 and 2, are then associated with the VLAN tag identifiers, and some MSTP parameters, such as cost, are configured on each switch.

## Configuring MSTP on Switch 1

**CLI Quick Configuration** To quickly configure interfaces and MSTP on Switch 1, copy the following commands and paste them into the switch terminal window:

**NOTE:** If you are configuring MSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the interface-mode statement instead of the port-mode statement. The port-mode statement has been replaced with the interface-mode statement.

```
[edit]
set vlans sales-vlan description "Sales VLAN"
set vlans sales-vlan vlan-id 10
set vlans engineering-vlan description "Engineering VLAN"
set vlans engineering-vlan vlan-id 20
set vlans publications-vlan description "Publications VLAN"
set vlans publications-vlan vlan-id 30
set vlans support-vlan description "Support VLAN"
set vlans support-vlan vlan-id 40
set interfaces xe-0/0/13 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/9 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/11 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/13 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/9 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/11 unit 0 family ethernet-switching port-mode trunk
set protocols mstp configuration-name region1
set protocols mstp bridge-priority 16k
set protocols mstp interface xe-0/0/13.0 cost 1000
set protocols mstp interface xe-0/0/13.0 mode point-to-point
set protocols mstp interface xe-0/0/9.0 cost 1000
set protocols mstp interface xe-0/0/9.0 mode point-to-point
set protocols mstp interface xe-0/0/11.0 cost 1000
set protocols mstp interface xe-0/0/11.0 mode point-to-point
set protocols mstp msti 1 bridge-priority 16k
set protocols mstp msti 1 vlan [10 20]
set protocols mstp msti 1 interface xe-0/0/11.0 cost 4000
set protocols mstp msti 2 bridge-priority 8k
set protocols mstp msti 2 vlan [30 40]
```

**Step-by-Step Procedure** To configure interfaces and MSTP on Switch 1:

1. Configure the VLANs `sales-vlan`, `engineering-vlan`, `publications-vlan`, and `support-vlan`:

```
[edit vlans]
user@switch1# set sales-vlan description "Sales VLAN"
user@switch1# set sales-vlan vlan-id 10
user@switch1# set engineering-vlan description "Engineering VLAN"
user@switch1# set engineering-vlan vlan-id 20
user@switch1# set publications-vlan description "Publications VLAN"
user@switch1# set publications-vlan vlan-id 30
user@switch1# set support-vlan description "Support VLAN"
user@switch1# set publications-vlan vlan-id 40
```

2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:

```
[edit interfaces]
user@switch1# set xe-0/0/13 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch1# set xe-0/0/9 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch1# set xe-0/0/11 unit 0 family ethernet-switching vlan members [10 20 30 40]
```

3. Configure the port mode for the interfaces:

**NOTE:** If you are configuring MSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the interface-mode statement instead of the port-mode statement. The port-mode statement has been replaced with the interface-mode statement.

```
[edit interfaces]
user@switch1# set xe-0/0/13 unit 0 family ethernet-switching port-mode trunk
user@switch1# set xe-0/0/9 unit 0 family ethernet-switching port-mode trunk
user@switch1# set xe-0/0/11 unit 0 family ethernet-switching port-mode trunk
```

4. Configure MSTP on the switch, including the two MSTIs:

```
[edit protocols]
user@switch1# mstp configuration-name region1
user@switch1# mstp bridge-priority 16k
user@switch1# mstp interface xe-0/0/13.0 cost 1000
user@switch1# mstp interface xe-0/0/13.0 mode point-to-point
user@switch1# mstp interface xe-0/0/9.0 cost 1000
user@switch1# mstp interface xe-0/0/9.0 mode point-to-point
user@switch1# mstp interface xe-0/0/11.0 cost 4000
user@switch1# mstp interface xe-0/0/11.0 mode point-to-point
user@switch1# mstp msti 1 bridge-priority 16k
user@switch1# mstp msti 1 vlan [10 20]
user@switch1# mstp msti 1 interface xe-0/0/11.0 cost 4000
user@switch1# mstp msti 2 bridge-priority 8k
user@switch1# mstp msti 2 vlan [30 40]
```

**Results** Check the results of the configuration:

```
user@switch1> show configuration
interfaces {
  xe-0/0/13 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;

  vlan-id 30;
}
support-vlan {
  vlan-id 40;
}
}

```

### Configuring MSTP on Switch 2

#### CLI Quick Configuration

To quickly configure interfaces and MSTP on Switch 2, copy the following commands and paste them into the switch terminal window:

**NOTE:** If you are configuring MSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the `interface-mode` statement instead of the `port-mode` statement. The `port-mode` statement has been replaced with the `interface-mode` statement.

```

[edit]
set vlans sales-vlan description "Sales VLAN"
set vlans sales-vlan vlan-id 10
set vlans engineering-vlan description "Engineering VLAN"
set vlans engineering-vlan vlan-id 20
set vlans publications-vlan description "Publications VLAN"
set vlans publications-vlan vlan-id 30
set vlans support-vlan description "Support VLAN"
set vlans support-vlan vlan-id 40
set interfaces xe-0/0/14 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/18 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/14 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/18 unit 0 family ethernet-switching port-mode trunk
set protocols mstp configuration-name region1
set protocols mstp bridge-priority 32k
set protocols mstp interface xe-0/0/14.0 cost 1000
set protocols mstp interface xe-0/0/14.0 mode point-to-point
set protocols mstp interface xe-0/0/18.0 cost 1000
set protocols mstp interface xe-0/0/18.0 mode point-to-point
set protocols mstp msti 1 bridge-priority 32k
set protocols mstp msti 1 vlan [10 20]
set protocols mstp msti 2 bridge-priority 4k
set protocols mstp msti 2 vlan [30 40]

```

### Step-by-Step Procedure

To configure interfaces and MSTP on Switch 2:

1. Configure the VLANs `sales-vlan`, `engineering-vlan`, `publications-vlan`, and `support-vlan`:

```
[edit vlans]
user@switch2# set sales-vlan description "Sales VLAN"
user@switch2# set sales-vlan vlan-id 10
user@switch2# set engineering-vlan description "Engineering VLAN"
user@switch2# set engineering-vlan vlan-id 20
user@switch2# set publications-vlan description "Publications VLAN"
user@switch2# set publications-vlan vlan-id 30
user@switch2# set support-vlan vlan-description "Support VLAN"
user@switch2# set publications-vlan vlan-id 40
```

2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:

```
[edit interfaces]
user@switch2# set xe-0/0/14 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch2# set xe-0/0/18 unit 0 family ethernet-switching vlan members [10 20 30 40]
```

3. Configure the port mode for the interfaces:

**NOTE:** If you are configuring MSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the `interface-mode` statement instead of the `port-mode` statement. The `port-mode` statement has been replaced with the `interface-mode` statement.

```
[edit interfaces]
user@switch2# set xe-0/0/14 unit 0 family ethernet-switching port-mode trunk
user@switch2# set xe-0/0/18 unit 0 family ethernet-switching port-mode trunk
```

4. Configure MSTP on the switch, including the two MSTIs:

```
[edit protocols]
user@switch2# mstp configuration-name region1
user@switch2# mstp bridge-priority 32k
user@switch2# mstp interface xe-0/0/14.0 cost 1000
user@switch2# mstp interface xe-0/0/14.0 mode point-to-point
user@switch2# mstp interface xe-0/0/18.0 cost 1000
user@switch2# mstp interface xe-0/0/18.0 mode point-to-point
user@switch2# mstp interface all cost 1000
user@switch2# mstp msti 1 bridge-priority 32k
user@switch2# mstp msti 1 vlan [10 20]
user@switch2# mstp msti 2 bridge-priority 4k
user@switch2# mstp msti 2 vlan [30 40]
```

**Results** Check the results of the configuration:

```
user@switch2> show configuration
interfaces {
  xe-0/0/14 {
    unit 0 {
      family ethernet-switching {

### Configuring MSTP on Switch 3

#### CLI Quick Configuration

To quickly configure interfaces and MSTP on Switch 3, copy the following commands and paste them into the switch terminal window:

**NOTE:** If you are configuring MSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the `interface-mode` statement instead of the `port-mode` statement. The `port-mode` statement has been replaced with the `interface-mode` statement.

```
[edit]
set vlans sales-vlan description "Sales VLAN"
set vlans sales-vlan vlan-id 10
set vlans engineering-vlan description "Engineering VLAN"
set vlans engineering-vlan vlan-id 20
set vlans publications-vlan description "Publications VLAN"
set vlans publications-vlan vlan-id 30
set vlans support-vlan description "Support VLAN"
set vlans support-vlan vlan-id 40
set interfaces xe-0/0/26 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/28 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/24 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/26 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/28 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/24 unit 0 family ethernet-switching port-mode trunk
set protocols mstp configuration-name region1
set protocols mstp bridge-priority 8k
set protocols mstp interface xe-0/0/26.0 cost 1000
set protocols mstp interface xe-0/0/26.0 mode point-to-point
set protocols mstp interface xe-0/0/28.0 cost 1000
set protocols mstp interface xe-0/0/28.0 mode point-to-point
set protocols mstp interface xe-0/0/24.0 cost 1000
set protocols mstp interface xe-0/0/24.0 mode point-to-point
set protocols mstp msti 1 bridge-priority 4k
set protocols mstp msti 1 vlan [10 20]
set protocols mstp msti 2 bridge-priority 16k
set protocols mstp msti 2 vlan [30 40]
```

#### Step-by-Step Procedure

To configure interfaces and MSTP on Switch 3:

1. Configure the VLANs `sales-vlan`, `engineering-vlan`, `publications-vlan`, and `support-vlan`:

```
[edit vlans]
user@switch3# set sales-vlan description "Sales VLAN"
user@switch3# set sales-vlan vlan-id 10
user@switch3# set engineering-vlan description "Engineering VLAN"
user@switch3# set engineering-vlan vlan-id 20
user@switch3# set publications-vlan description "Publications VLAN"
user@switch3# set publications-vlan vlan-id 30
user@switch3# set support-vlan description "Support VLAN"
user@switch3# set publications-vlan vlan-id 40
```

2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:

```
[edit interfaces]
user@switch3# set xe-0/0/26 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch3# set xe-0/0/28 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch3# set xe-0/0/24 unit 0 family ethernet-switching vlan members [10 20 30 40]
```

3. Configure the port mode for the interfaces:

**NOTE:** If you are configuring MSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the interface-mode statement instead of the port-mode statement. The port-mode statement has been replaced with the interface-mode statement.

```
[edit interfaces]
user@switch3# set xe-0/0/26 unit 0 family ethernet-switching port-mode trunk
user@switch3# set xe-0/0/28 unit 0 family ethernet-switching port-mode trunk
user@switch3# set xe-0/0/24 unit 0 family ethernet-switching port-mode trunk
```

4. Configure MSTP on the switch, including the two MSTIs:

```
[edit protocols]
user@switch3# mstp configuration-name region1
user@switch3# mstp bridge-priority 8k
user@switch3# mstp interface xe-0/0/26.0 cost 1000
user@switch3# mstp interface xe-0/0/26.0 mode point-to-point
user@switch3# mstp interface xe-0/0/28.0 cost 1000
user@switch3# mstp interface xe-0/0/28.0 mode point-to-point
user@switch3# mstp interface xe-0/0/24.0 cost 1000
user@switch3# mstp interface xe-0/0/24.0 mode point-to-point
user@switch3# mstp interface all cost 1000
user@switch3# mstp msti 1 bridge-priority 4k
user@switch3# mstp msti 1 vlan [10 20]
user@switch3# mstp msti 2 bridge-priority 16k
user@switch3# mstp msti 2 vlan [30 40]
```

**Results** Check the results of the configuration:

```
user@switch3> show configuration
interfaces {
  xe-0/0/26 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
          members 10;
          members 20;
          members 30;
          members 40;
        }
      }
    }
  }
}
```

```
xe-0/0/28 {
  unit 0 {
    family ethernet-switching {
      port-mode trunk;
      vlan {
        members 10;
        members 20;
        members 30;
        members 40;
      }
    }
  }
}
xe-0/0/24 {
  unit 0 {
    family ethernet-switching {

```

```

        vlan-id 10;
    }
    engineering-vlan {
        vlan-id 20;
    }
    publications-vlan {
        vlan-id 30;
    }
    support-vlan {
        vlan-id 40;
    }
}

```

### Configuring MSTP on Switch 4

**CLI Quick Configuration** To quickly configure interfaces and MSTP on Switch 4, copy the following commands and paste them into the switch terminal window:

**NOTE:** If you are configuring MSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the interface-mode statement instead of the port-mode statement. The port-mode statement has been replaced with the interface-mode statement.

```

[edit]
set vlans sales-vlan description "Sales VLAN"
set vlans sales-vlan vlan-id 10
set vlans engineering-vlan description "Engineering VLAN"
set vlans engineering-vlan vlan-id 20
set vlans publications-vlan description "Publications VLAN"
set vlans publications-vlan vlan-id 30
set vlans support-vlan description "Support VLAN"
set vlans support-vlan vlan-id 40
set interfaces xe-0/0/23 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/19 unit 0 family ethernet-switching vlan members [10 20 30 40]
set interfaces xe-0/0/23 unit 0 family ethernet-switching port-mode trunk
set interfaces xe-0/0/19 unit 0 family ethernet-switching port-mode trunk
set protocols mstp configuration-name region1
set protocols mstp bridge-priority 16k
set protocols mstp interface xe-0/0/23.0 cost 1000
set protocols mstp interface xe-0/0/23.0 mode point-to-point
set protocols mstp interface xe-0/0/19.0 cost 1000
set protocols mstp interface xe-0/0/19.0 mode point-to-point
set protocols mstp msti 1 bridge-priority 16k
set protocols mstp msti 1 vlan [10 20]
set protocols mstp msti 2 bridge-priority 32k
set protocols mstp msti 2 vlan [30 40]

```

### Step-by-Step Procedure

To configure interfaces and MSTP on Switch 4:

1. Configure the VLANs `sales-vlan`, `engineering-vlan`, `publications-vlan`, and `support-vlan`:

```
[edit vlans]
user@switch4# set sales-vlan description "Sales VLAN"
user@switch4# set sales-vlan vlan-id 10
user@switch4# set engineering-vlan description "Engineering VLAN"
user@switch4# set engineering-vlan vlan-id 20
user@switch4# set publications-vlan description "Publications VLAN"
user@switch4# set publications-vlan vlan-id 30
user@switch4# set support-vlan description "Support VLAN"
user@switch4# set publications-vlan vlan-id 40
```

2. Configure the VLANs on the interfaces, including support for the Ethernet switching protocol:

```
[edit interfaces]
user@switch4# set xe-0/0/23 unit 0 family ethernet-switching vlan members [10 20 30 40]
user@switch4# set xe-0/0/19 unit 0 family ethernet-switching vlan members [10 20 30 40]
```

3. Configure the port mode for the interfaces:

**NOTE:** If you are configuring MSTP on devices that support the Enhanced Layer 2 Switching (ELS) CLI, use the `interface-mode` statement instead of the `port-mode` statement. The `port-mode` statement has been replaced with the `interface-mode` statement.

```
[edit interfaces]
user@switch4# set ge-0/0/23 unit 0 family ethernet-switching port-mode trunk
user@switch4# set ge-0/0/19 unit 0 family ethernet-switching port-mode trunk
```

4. Configure MSTP on the switch, including the two MSTIs:

```
[edit protocols]
user@switch4# mstp configuration-name region1
user@switch4# mstp bridge-priority 16k
user@switch4# mstp interface all cost 1000
user@switch4# mstp interface xe-0/0/23.0 cost 1000
user@switch4# mstp interface xe-0/0/23.0 mode point-to-point
user@switch4# mstp interface xe-0/0/19.0 cost 1000
user@switch4# mstp interface xe-0/0/19.0 mode point-to-point
user@switch4# mstp msti 1 bridge-priority 16k
user@switch4# mstp msti 1 vlan [10 20]
user@switch4# mstp msti 2 bridge-priority 32k
user@switch4# mstp msti 2 vlan [30 40]
```

### Results

Check the results of the configuration:

```
user@switch4> show configuration
interfaces {
  xe-0/0/23 {
    unit 0 {
      family ethernet-switching {
        port-mode trunk;
        vlan {
```

```

        members 10;
        members 20;
        members 30;
        members 40;
    }
}
}
xe-0/0/19 {
    unit 0 {
        family ethernet-switching {
            port-mode trunk;
            vlan {
                members 10;
                members 20;
                members 30;
                members 40;
            }
        }
    }
}
}
protocols {
    mstp {
        configuration-name region1;
        bridge-priority 16k;
        interface xe-0/0/23.0 {
            cost 1000;
            mode point-to-point;
        }
        interface xe-0/0/19.0 {
            cost 1000;
            mode point-to-point;
        }
        msti 1 {
            bridge-priority 16k;
            vlan [ 10 20 ];
        }
        msti 2 {
            bridge-priority 32k;
            vlan [ 30 40 ];
        }
    }
}
vlands {
    sales-vlan {
        vlan-id 10;
    }
    engineering-vlan {
        vlan-id 20;
    }
    publications-vlan {
        vlan-id 30;
    }
    support-vlan {
        vlan-id 40;
    }
}

```

```
}  
}
```

## Verification

---

To confirm that the configuration is working properly, perform these tasks:

- [Verifying MSTP Configuration on Switch 1 on page 2194](#)
- [Verifying MSTP Configuration on Switch 2 on page 2196](#)
- [Verifying MSTP Configuration on Switch 3 on page 2198](#)
- [Verifying MSTP Configuration on Switch 4 on page 2200](#)

### ***Verifying MSTP Configuration on Switch 1***

**Purpose** Verify the MSTP configuration on Switch 1.

**Action** Use the operational mode commands:

```
user@switch1> show spanning-tree interface
```

```
Spanning tree interface parameters for instance 0
```

| Interface   | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|-------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/13.0 | 128:527 | 128:525               | 16384.0019e25040e0      | 1000         | FWD   | ROOT |
| xe-0/0/9.0  | 128:529 | 128:513               | 32768.0019e2503d20      | 1000         | BLK   | ALT  |
| xe-0/0/11.0 | 128:531 | 128:513               | 8192.0019e25051e0       | 4000         | BLK   | ALT  |

```
Spanning tree interface parameters for instance 1
```

| Interface   | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|-------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/13.0 | 128:527 | 128:525               | 16385.0019e25040e0      | 1000         | FWD   | ROOT |
| xe-0/0/9.0  | 128:529 | 128:513               | 32769.0019e2503d20      | 1000         | BLK   | ALT  |
| xe-0/0/11.0 | 128:531 | 128:513               | 4097.0019e25051e0       | 4000         | BLK   | ALT  |

```
Spanning tree interface parameters for instance 2

```

**Meaning** The operational mode command **show spanning-tree interface** displays spanning-tree domain information such as the designated port and the port roles.

The operational mode command **show spanning-tree bridge** displays the spanning-tree domain information at either the bridge level or the interface level. If the optional interface name is omitted, all interfaces in the spanning-tree domain are displayed.

#### *Verifying MSTP Configuration on Switch 2*

**Purpose** Verify the MSTP configuration on Switch 2.

**Action** Use the operational mode commands:

```
user@switch2> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

| Interface   | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |

## Example: Configuring Root Protection to Enforce Root Bridge Placement in Spanning Trees

QFX Series products provide Layer 2 loop prevention through Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), and Multiple Spanning Tree Protocol (MSTP). Root protection increases the efficiency of STP, RSTP, and MSTP by allowing network administrators to enforce the root bridge placement in the network manually.

This example describes how to configure root protection on an interface for the QFX Series.

- [Requirements on page 2202](#)
- [Overview and Topology on page 2203](#)
- [Configuration on page 2205](#)
- [Verification on page 2205](#)

### Requirements

---

This example uses the following hardware and software components:

- Junos OS Release 11.1 or later for the QFX Series
- Four switches in an RSTP topology

Before you configure the interface for root protection, be sure you have:

- RSTP operating on the switches.

**NOTE:** By default, RSTP is enabled on the QFX Series.

## Overview and Topology

Peer STP applications running on switch interfaces exchange a special type of frame called a bridge protocol data unit (BPDU). Switches communicate interface information using BPDUs to create a loop-free topology that ultimately determines the root bridge and which interfaces block or forward traffic in the spanning tree.

You can also see BPDUs generated when you run a bridge application on a device attached to the switch. This can interfere with root port election, which may sometimes lead to the wrong root port being elected through the above process. Root protection allows you to manually enforce the root bridge placement in the network.

To prevent this from happening, enable root protection on interfaces that should not receive more BPDUs from the root bridge and should not be elected as the root port. These interfaces are typically located on an administrative boundary and are designated ports.

When root protection is enabled on an interface:

- The interface is blocked from becoming the root port.
- Root protection is enabled for all STP instances on that interface.
- The interface is blocked only for instances for which it receives more BPDUs. Otherwise, it participates in the spanning-tree topology.

**NOTE:** An interface can be configured for either root protection or loop protection, but not for both.

Four switches are displayed in [Figure 74 on page 2204](#). In this example, they are configured for RSTP and create a loop-free topology. Interface **xe-0/0/7** on Switch 1 is a designated port on an administrative boundary. It connects to Switch 4. Switch 3 is the root bridge. Interface **xe-0/0/6** on Switch 1 is the root port.

This example shows how to configure root protection on interface **xe-0/0/7** to prevent it from transitioning to become the root port.

Figure 74: Network Topology for Root Protection

Table 168 on page 2204 shows the components that will be configured for root protection.

Table 168: Topology for Configuring Root Protection on the QFX Series

| Component | Settings                                                                                                                                                                                    |
|-----------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Switch 1  | Switch 1 is connected to Switch 4 through interface <b>xe-0/0/7</b> .                                                                                                                       |
| Switch 2  | Switch 2 is connected to Switch 1 and Switch 3. Interface <b>xe-0/0/4</b> is the alternate port in the RSTP topology.                                                                       |
| Switch 3  | Switch 3 is the root bridge and is connected to Switch 1 and Switch 2.                                                                                                                      |
| Switch 4  | Switch 4 is connected to Switch 1. After loop protection is configured on interface <b>xe-0/0/7</b> , Switch 4 sends more BPDUs that trigger loop protection on interface <b>xe-0/0/7</b> . |

A spanning-tree topology contains ports that have specific roles:

- The *root port* is responsible for forwarding data to the root bridge.

- The *alternate port* is a standby port for the root port. When a root port goes down, the alternate port becomes the active root port.
- The *designated port* forwards data to the downstream network segment or device.

This configuration example uses an RSTP topology. However, you can also configure root protection for STP or MSTP topologies at the `[edit protocols (mstp | stp)]` hierarchy level.

### Configuration

**CLI Quick Configuration** To quickly configure root protection on interface `xe-0/0/7`, copy the following command and paste it into the switch terminal window:

```
[edit]
set protocols rstp interface xe-0/0/7 no-root-port
```

**Step-by-Step Procedure** To configure root protection:

1. Configure interface `xe-0/0/7`:  

```
[edit protocols rstp]
user@switch#
set interface xe-0/0/7 no-root-port
```

**Results** Check the results of the configuration:

```
user@switch> show configuration protocols rstp
interface xe-0/0/7.0 {
  no-root-port;
}
```

### Verification

To confirm that the configuration is working properly, perform these tasks:

- [Displaying the Interface State Before Root Protection Is Triggered on page 2205](#)
- [Verifying That Root Protection Is Working on the Interface on page 2206](#)

#### *Displaying the Interface State Before Root Protection Is Triggered*

**Purpose** Before root protection is triggered on interface `xe-0/0/7`, confirm the interface state.

**Action** Confirm the state of the interfaces before root protection is configured:

```
user@switch> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

| Interface  | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/0.0 | 128:513 | 128:513               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| xe-0/0/1.0 | 128:514 | 128:514               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| xe-0/0/2.0 | 128:515 | 128:515               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| xe-0/0/3.0 | 128:516 | 128:516               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| xe-0/0/4.0 | 128:517 | 128:517               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| xe-0/0/5.0 | 128:518 | 128:2                 | 16384.00aabbcc0348      | 20000        | BLK   | ALT  |
| xe-0/0/6.0 | 128:519 | 128:1                 | 16384.00aabbcc0348      | 20000        | FWD   | ROOT |
| xe-0/0/7.0 | 128:520 | 128:520               | 32768.0019e2503f00      | 20000        | FWD   | DESG |

[output truncated]

**Meaning** The output from the operational mode command **show spanning-tree interface** shows that **xe-0/0/7.0** is a designated port in a forwarding state.

#### *Verifying That Root Protection Is Working on the Interface*

**Purpose** A configuration change takes place on Switch 4. A lower bridge priority on Switch 4 causes it to send more BPDUs to interface **xe-0/0/7**. Receipt of more BPDUs on interface **xe-0/0/7** triggers root protection. Verify that root protection is operating on interface **xe-0/0/7**.

**Action** Verify that root protection has been configured and is operating correctly:

```
user@switch> show spanning-tree interface
```

Spanning tree interface parameters for instance 0

| Interface  | Port ID | Designated<br>port ID | Designated<br>bridge ID | Port<br>Cost | State | Role |
|------------|---------|-----------------------|-------------------------|--------------|-------|------|
| xe-0/0/0.0 | 128:513 | 128:513               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| xe-0/0/1.0 | 128:514 | 128:514               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| xe-0/0/2.0 | 128:515 | 128:515               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |
| xe-0/0/3.0 | 128:516 | 128:516               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| xe-0/0/4.0 | 128:517 | 128:517               | 32768.0019e2503f00      | 20000        | FWD   | DESG |
| xe-0/0/5.0 | 128:518 | 128:2                 | 16384.00aabbcc0348      | 20000        | BLK   | ALT  |
| xe-0/0/6.0 | 128:519 | 128:1                 | 16384.00aabbcc0348      | 20000        | FWD   | ROOT |
| xe-0/0/7.0 | 128:520 | 128:520               | 32768.0019e2503f00      | 20000        | BLK   | DIS  |

(Root-Incon)  
[output truncated]

**Meaning** The operational mode command **show spanning-tree interface** shows that interface **xe-0/0/7.0** has transitioned to a loop inconsistent state. The loop inconsistent state blocks the interface and prevents it from becoming a candidate for the root port. When the root bridge no longer receives more STP BPDUs from the interface, the interface recovers and transitions back to a forwarding state. Recovery is automatic.

**Example: Configuring Routing Between VLANs on One Switch**

To segment traffic on a LAN into separate broadcast domains, you create separate virtual LANs (VLANs). For example, you might want to create a VLAN that includes the employees in a department and the resources that they use often, such as printers, servers, and so on.

Of course, you also want to allow these employees to communicate with people and resources in other VLANs. To forward packets between VLANs you normally you need a router that connects the VLANs. However, you can accomplish this on a Juniper Networks switch without using a router by configuring an integrated routing and bridging (IRB) interface (also known as a routed VLAN interface—or RVI—in versions of Junos OS that do not support Enhanced Layer 2 Software). Using this approach reduces complexity and avoids the costs associated with purchasing, installing, managing, powering, and cooling another device.

**Requirements**

This example uses the following hardware and software components:

- One switch
- Junos OS Release 11.1 or later

**Overview and Topology**

This example uses an IRB to route traffic between two VLANs on the same switch. The topology is shown in [Figure 75 on page 2207](#).

**Figure 75: IRB with One Switch**

This example shows a simple configuration to illustrate the basic steps for creating two VLANs on a single switch and configuring an IRB to enable routing between the VLANs. One VLAN, called **blue**, is for the sales and marketing group, and a second, called **red**, is for the customer support team. The sales and support groups each have their own file servers and wireless access points. Each VLAN must have a unique name, tag (VLAN ID), and distinct IP subnet. [Table 169 on page 2208](#) lists the components of the sample topology.

**Table 169: Components of the Multiple VLAN Topology**

| Property                       | Settings                                                                                                                                        |
|--------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| VLAN names and tag IDs         | <b>blue</b> , ID 100<br><b>red</b> , ID 200                                                                                                     |
| Subnets associated with VLANs  | <b>blue</b> : 192.0.2.0/25 (addresses 192.0.2.1 through 192.0.2.126)<br><b>red</b> : 192.0.2.128/25 (addresses 192.0.2.129 through 192.0.2.254) |
| Interfaces in VLAN <b>blue</b> | Sales server port: <b>xe-0/0/4</b><br>Sales wireless access points: <b>xe-0/0/6</b>                                                             |
| Interfaces in VLAN <b>red</b>  | Support server port: <b>xe-0/0/0</b><br>Support wireless access points: <b>xe-0/0/2</b>                                                         |
| IRB name                       | interface <b>irb</b>                                                                                                                            |
| IRB units and addresses        | logical unit 100: 192.0.2.1/25<br>logical unit 200: 192.0.2.129/25                                                                              |

This configuration example creates two IP subnets, one for the blue VLAN and the second for the red VLAN. The switch bridges traffic within the VLANs. For traffic passing between two VLANs, the switch routes the traffic using an IRB on which you have configured addresses in each IP subnet.

To keep the example simple, the configuration steps show only a few interfaces and VLANs. Use the same configuration procedure to add more interfaces and VLANs. By default, all interfaces are in access mode, so you do not have to configure the port mode.

### Configure Layer 2 switching for two VLANs

#### CLI Quick Configuration

To quickly configure Layer 2 switching for the two VLANs (**blue** and **red**) and to quickly configure Layer 3 routing of traffic between the two VLANs, copy the following commands and paste them into the switch terminal window:

**NOTE:** The following example uses a version of Junos OS that supports Enhanced Layer 2 Software (ELS). When you use ELS, you create a Layer 3 virtual interface named *irb*. If you are using a version of Junos OS that does not support ELS, you create a Layer 3 virtual interface named *vlan*.

[edit]

```

set interfaces xe-0/0/4 unit 0 description "Sales server port"
set interfaces xe-0/0/4 unit 0 family ethernet-switching vlan members blue
set interfaces xe-0/0/6 unit 0 description "Sales wireless access point port"
set interfaces xe-0/0/6 unit 0 family ethernet-switching vlan members blue
set interfaces xe-0/0/0 unit 0 description "Support servers"
set interfaces xe-0/0/0 unit 0 family ethernet-switching vlan members red
set interfaces xe-0/0/2 unit 0 description "Support wireless access point port"
set interfaces xe-0/0/2 unit 0 family ethernet-switching vlan members red
set interfaces irb unit 100 family inet address 192.0.2.1/25
set interfaces irb unit 200 family inet address 192.0.2.129/25
set vlans blue l3-interface irb.100
set vlans blue vlan-id 100
set vlans red vlan-id 200
set vlans red l3-interface irb.200

```

### Step-by-Step Procedure

To configure the switch interfaces and the VLANs to which they belong:

1. Configure the interface for the sales server in the blue VLAN:  

```

[edit interfaces xe-0/0/4 unit 0]
user@switch# set description "Sales server port"
user@switch# set family ethernet-switching vlan members blue

```
2. Configure the interface for the wireless access point in the blue VLAN:  

```

[edit interfaces xe-0/0/6 unit 0]
user@switch# set description "Sales wireless access point port"
user@switch# set family ethernet-switching vlan members blue

```
3. Configure the interface for the support server in the red VLAN:  

```

[edit interfaces xe-0/0/0 unit 0]
user@switch# set description "Support server port"
user@switch# set family ethernet-switching vlan members red

```
4. Configure the interface for the wireless access point in the red VLAN:  

```

[edit interfaces xe-0/0/2 unit 0]
user@switch# set description "Support wireless access point port"
user@switch# set family ethernet-switching vlan members red

```

### Step-by-Step Procedure

Now create the VLANs and the IRB. The IRB will have logical units in the broadcast domains of both VLANs.

1. Create the red and blue VLANs by configuring the VLAN IDs for them:  

```

[edit vlans]
user@switch# set blue vlan-id 100
user@switch# set red vlan-id 200

```
2. Create the interface named **irb** with a logical unit in the sales broadcast domain (blue VLAN):  

```

[edit interfaces]
user@switch# set irb unit 100 family inet address 192.0.2.1/25

```

The unit number is arbitrary and does not have to match the VLAN tag ID. However, configuring the unit number to match the VLAN ID can help avoid confusion.
3. Add a logical unit in the support broadcast domain (red VLAN) to the **irb** interface:  

```

[edit interfaces]
user@switch# set irb unit 200 family inet address 192.0.2.129/25

```
4. Complete the IRB configuration by binding the red and blue VLANs (Layer 2) with the appropriate logical units of the **irb** interface (Layer 3):

```
[edit vlans]
user@switch# set blue l3-interface irb.100
user@switch# set red l3-interface irb.200
```

Display the results of the configuration:

```
user@switch> show configuration
interfaces {
  xe-0/0/4 {
    unit 0 {
      description "Sales server port";
      family ethernet-switching {
        vlan members blue;
      }
    }
  }
  xe-0/0/6 {
    unit 0 {
      description "Sales wireless access point port";
      family ethernet-switching {
        vlan members blue;
      }
    }
  }
  xe-0/0/0 {
    unit 0 {
      description "Support server port";
      family ethernet-switching {
        vlan members red;
      }
    }
  }
  xe-0/0/2 {
    unit 0 {
      description "Support wireless access point port";
      family ethernet-switching {
        vlan members red;
      }
    }
  }
  irb {
    unit 100 {
      family inet address 192.0.2.1/25;
    }
    unit 200 {
      family inet address 192.0.2.129/25;
    }
  }
}
vlans {
  blue {
    vlan-id 100;
    interface xe-0/0/4.0;
    interface xe-0/0/6.0;
    l3-interface irb 100;
  }
}
```

```

}
red {
  vlan-id 200;
  interface xe-0/0/0.0;
  interface xe-0/0/2.0;
  l3-interface irb 200;
}
}

```

**TIP:** To quickly configure the blue and red VLAN interfaces, issue the `load merge terminal` command, copy the hierarchy, and paste it into the switch terminal window.

## Verification

To verify that the **blue** and **red** VLANs have been created and are operating properly, perform these tasks:

- [Verifying That the VLANs Have Been Created and Associated with the Correct Interfaces on page 2211](#)
- [Verifying That Traffic Can Be Routed Between the Two VLANs on page 2211](#)

### *Verifying That the VLANs Have Been Created and Associated with the Correct Interfaces*

**Purpose** Verify that the VLANs **blue** and **red** have been created on the switch and that all connected interfaces on the switch are members of the correct VLAN.

**Action** List all VLANs configured on the switch:

```

user@switch> show vlans
Name      Tag      Interfaces
default   100      xe-0/0/0.0, xe-0/0/2.0, xe-0/0/4.0, xe-0/0/6.0,
blue      100      xe-0/0/4.0, xe-0/0/6.0,
red       200      xe-0/0/0.0, xe-0/0/2.0, *
mgmt      me0.0*

```

**Meaning** The `show vlans` command lists all VLANs configured on the switch and which interfaces are members of each VLAN. This command output shows that the **blue** and **red** VLANs have been created. The **blue** VLAN has a tag ID of 100 and is associated with interfaces **xe-0/0/4.0** and **xe-0/0/6.0**. VLAN **red** has a tag ID of 200 and is associated with interfaces **xe-0/0/0.0** and **xe-0/0/2.0**.

### *Verifying That Traffic Can Be Routed Between the Two VLANs*

**Purpose** Verify routing between the two VLANs.

**Action** Verify that the IRB logical units are up:

```

user@switch> show interfaces terse
irb.100          up    up    inet    192.0.2.1/25

```

```

irb.200                up    up    inet    192.0.2.129/25

```

**NOTE:** At least one port (access or trunk) with an appropriate VLAN assigned to it must be up for the irb interface to be up.

Verify that switch has created routes that use the IRB logical units:

```

user@switch> show route
192.0.2.0/25          *[Direct/0] 1d 03:26:45
                    > via irb.100
192.0.2.1/32         *[Local/0] 1d 03:26:45
                    Local via irb.100
192.0.2.128/25       *[Direct/0] 1d 03:26:45
                    > via irb.200
192.0.2.129/32       *[Local/0] 1d 03:26:45
                    Local via irb.200

```

List the Layer 3 routes in the switch's Address Resolution Protocol (ARP) table:

```

user@switch> show arp
MAC Address          Address          Name            Flags
00:00:0c:06:2c:0d    192.0.2.7       irb.100         None
00:13:e2:50:62:e0    192.0.2.132     irb.200         None

```

**Meaning** The output of the **show interfaces** and **show route** commands show that the Layer 3 IRB logical units are working and the switch has used them to create direct routes that it will use to forward traffic between the VLAN subnets. The **show arp** command displays the mappings between the IP addresses and MAC addresses for devices on both **irb.100** (associated with VLAN **blue**) and **irb.200** (associated with VLAN **red**). These two devices can communicate.

## VLAN Configuration Tasks

- [Configuring the Native VLAN Identifier on page 2213](#)
- [Configuring VLANs on page 2214](#)
- [Creating a Series of Tagged VLANs on page 2216](#)

## Configuring the Native VLAN Identifier

Switches support receiving and forwarding routed or bridged Ethernet frames with 802.1Q VLAN tags. The logical interface on which untagged packets are received must have the same native VLAN ID as that on the physical interface.

**NOTE:** This task uses Junos OS for QFX3500 and QFX3600 switches that does not support the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that supports ELS, see *Configuring the Native VLAN Identifier (CLI Procedure)*.

To configure the native VLAN ID using the CLI:

1. Configure the port mode as **trunk** so that the interface is on multiple VLANs and can multiplex traffic between different VLANs. Trunk interfaces typically connect to other switches and to routers on the LAN.

```
[edit interfaces xe-0/0/3 unit 0 family ethernet-switching]
user@switch# set port-mode trunk
```

2. Configure the native VLAN ID:

```
[edit interfaces xe-0/0/3 unit 0 family ethernet-switching]
user@switch# set native-vlan-id 3
```

On a QFabric system, you can prevent packets with the native VLAN ID from being tagged by using the **except** configuration statement. Use this statement to specify that any egressing packet for the native VLAN of the configured interface will be untagged on egress.

This example shows how to configure a QFabric system to prevent tagging for native VLAN ID packets on egress:

```
set interfaces tor1:xe-0/0/0 unit 0 family ethernet-switching port-mode trunk
set interfaces tor1:xe-0/0/0 unit 0 family ethernet-switching vlan members all
set interfaces tor1:xe-0/0/0 unit 0 family ethernet-switching vlan except v1
set interfaces tor1:xe-0/0/0 unit 0 family ethernet-switching native-vlan-id v1
set vlans v1 vlan-id 1
set vlans v2 vlan-id 2
set vlans v3 vlan-id 3
```

This configuration defines VLAN **v1** as the native VLAN on interface **tor1:xe-0/0/0** and prevents egress traffic for that VLAN from being tagged. Without the **except v1** statement, packets would egress as tagged with VLAN ID 1.

### Related Documentation

- [Understanding Bridging and VLANs on page 2017](#)
- [Example: Setting Up Bridging with Multiple VLANs on page 2110](#)
- [Example: Setting Up Basic Bridging and a VLAN on the QFX Series on page 2093](#)

## Configuring VLANs

Switches use VLANs to make logical groupings of network nodes with their own broadcast domains. You can use VLANs to limit the traffic flowing across the entire LAN and reduce collisions and packet retransmissions.

**NOTE:** This task uses Junos OS for the QFX Series that does not support the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that supports ELS, see *Configuring VLANs*.

For each endpoint on the VLAN, configure the following VLAN parameters on the corresponding interface:

1. Specify the description of the VLAN:

```
[edit interfaces interface-name unit 0]
user@switch# set description vlan-description
```

2. Specify the unique name of the VLAN:

**NOTE:** In a QFabric system, do not configure “default” as the name of a VLAN. Though the QFabric system will allow you to configure and commit a VLAN with the name “default” in the current software with no commit errors, it will not work. Junos OS 12.2 and onwards will not allow you to commit a VLAN with the name “default.”

```
[edit interfaces interface-name unit 0]
user@switch# set family ethernet-switching vlan members vlan-name
```

3. Create the subnet for the VLAN:

```
[edit interfaces]
user@switch# set vlan unit 0 family inet address ip-address
```

4. Configure the VLAN tag ID or VLAN ID range for the VLAN:

```
[edit vlans]
user@switch# set vlan-name vlan-id vlan-id-number
```

or

```
[edit vlans]
user@switch# set vlan-name vlan-range vlan-id-low-vlan-id-high
```

5. Specify the maximum time that an entry can remain in the forwarding table before it ages out:

```
[edit vlans]
user@switch# set vlan-name mac-table-aging-time time
```

6. Specify a VLAN firewall filter to be applied to incoming or outgoing packets:

```
[edit vlans]
user@switch# set vlan-name filter (input | output) filter-name
```

### Related Documentation

- [Example: Setting Up Basic Bridging and a VLAN on the QFX Series on page 2093](#)
- [Configuring IRB Interfaces on page 2240](#)

- [Creating a Series of Tagged VLANs on page 2216](#)
- [Understanding Bridging and VLANs on page 2017](#)

## Creating a Series of Tagged VLANs

When you divide an Ethernet LAN into multiple VLANs, each VLAN is assigned a unique IEEE 802.1Q tag. This tag is associated with each frame in the VLAN, and the network nodes receiving the traffic can use the tag to identify which VLAN a frame is associated with.

Instead of configuring VLANs and 802.1Q tags one at a time for a trunk interface, you can configure a VLAN range to create a series of tagged VLANs.

When an Ethernet LAN is divided into VLANs, each VLAN is identified by a unique 802.1Q tag. The tag is applied to all frames so that the network nodes receiving the frames can detect which VLAN the frames belong to. Trunk ports, which multiplex traffic among a number of VLANs, use the tag to determine the origin of frames and where to forward them.

For example, you could configure the VLAN **employee** and specify a tag range of **10 through 12**. This creates the following VLANs and tags:

- VLAN **employee-10**, tag 10
- VLAN **employee-11**, tag 11
- VLAN **employee-12**, tag 12

Creating tagged VLANs in a series has the following limitations:

- Layer 3 interfaces do not support this feature.
- Because an access interface can only support one VLAN member, access interfaces also do not support this feature.

**NOTE:** This task uses Junos OS for QFX3500 and QFX3600 switches that does not support the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that does support ELS, see *Creating a Series of Tagged VLANs*.

---

To configure a series of tagged VLANs using the CLI (here, the VLAN is **employee**):

1. Configure the series (here, a VLAN series from 120 through 130):

```
[edit]
user@switch# set vlans employee vlan-range 120-130
```

2. Associate a series of tagged VLANs when you configure an interface in one of two ways:

- Include the name of the series:

```
[edit interfaces]
user@switch# set interfaces xe-0/0/22.0 family ethernet-switching vlanmembers employee
```

- Include the VLAN range:

```
[edit interfaces]
user@switch# set interfaces xe-0/0/22.0 family ethernet-switching vlan members 120-130
```

Associating a series of tagged VLANs to an interface by name or by VLAN range has the same result: VLANs **\_\_employee\_120\_\_** through **\_\_employee\_130\_\_** are created.

**NOTE:** When a series of VLANs is created using the `vlan-range` command, the VLAN names are preceded and followed by a double underscore.

## Unified Forwarding Table Configuration Task

- [Configuring the Unified Forwarding Table on page 2217](#)

### Configuring the Unified Forwarding Table

To optimize the way your switch allocates memory for different types of addresses, you can choose a unified forwarding table profile. In addition to choosing this profile, you can also decide how you want memory allocated for longest prefix match (LPM) entries.

- [Configuring an Address-Storage Profile on page 2218](#)
- [Configuring the LPM Allocation on page 2219](#)

### Configuring an Address-Storage Profile

On QFX5100 and EX4600 switches, you can control the allocation of memory available to store the following:

- MAC addresses
- Layer 3 host entries
- Longest prefix match (LPM) table entries

You configure the mix that best meets your needs by choosing the appropriate profile. [Table 170 on page 2218](#) lists the profiles you can choose and the maximum values for the MAC address and host table entries.

Table 170: Unified Forwarding Table Profiles

| Profile Name                      | MAC Table     | Host Table (unicast and multicast addresses) |              |             |             |             |             |
|-----------------------------------|---------------|----------------------------------------------|--------------|-------------|-------------|-------------|-------------|
|                                   | MAC Addresses | IPv4 unicast                                 | IPv6 unicast | IPv4 (*, G) | IPv4 (S, G) | IPv6 (*, G) | IPv6 (S, G) |
| <b>l2-profile-one</b>             | 288K          | 16K                                          | 8K           | 8K          | 8K          | 4K          | 4K          |
| <b>l2-profile-two</b>             | 224K          | 80K                                          | 40K          | 40K         | 40K         | 20K         | 20K         |
| <b>l2-profile-three (default)</b> | 160K          | 144K                                         | 72K          | 72K         | 72K         | 36K         | 36K         |
| <b>l3-profile</b>                 | 96K           | 208K                                         | 104K         | 104K        | 104K        | 52K         | 52K         |
| <b>lpm-profile*</b>               | 32K           | 16K                                          | 8K           | 8K          | 8K          | 4K          | 4K          |

Note that if the host table stores the maximum number of entries for any given type, the entire table is full and is unable to accommodate *any* entries of any other type. For example, an IPv6 unicast address occupies twice as much memory as an IPv4 unicast address, and an IPv6 multicast address occupies four times as much memory as an IPv4 unicast address. For more information about valid combinations of table entries see *Understanding the Unified Forwarding Table*.

To configure the profile that you want, enter and commit the following statement:

```
[edit]
user@switch# set chassis forwarding-options profile-name
```

**NOTE:** When you configure and commit a profile, the PFE process restarts and all the data interfaces on the switch go down and come back up.

The settings for **l2-profile-three** are configured by default. That is, if you do not enter a **set forwarding-options chassis profile-name** statement, these settings are configured.

## Configuring the LPM Allocation

In addition to choosing a profile, you can further optimize memory allocation for LPM table entries by configuring how many IPv6 prefixes in the range /65 through /127 you want the switch to store. The switch uses LPM entries during address lookup to match addresses to the most-specific (longest) applicable prefix. The procedures for configuring the LPM table are different depending on which version of Junos OS you are using.

- [Configuring the LPM Table With Junos OS 13.2X51-D10 and 13.2X52-D10 on page 2219](#)
- [Configuring the LPM Table With Junos OS 13.2x51-D15 on page 2220](#)

### Configuring the LPM Table With Junos OS 13.2X51-D10 and 13.2X52-D10

With Junos OS 13.2x51-D10 and 13.2X52-D10, the switch allocates memory for 16 IPv6 prefixes in the range /65 through /127 by default. If you want to use more than 16 IPv6 prefixes in this range, you must enter and commit the following statement:

```
user@switch# set chassis forwarding-options profile-name num-65-127-prefix [1-128]
```

Each increment adds support for 16 IPv6 prefixes between /65 and /127, for a maximum of 2048 such prefixes (16 x 128 = 2048). The system supports 16 of these prefixes by default, so to increase the number of supported prefixes, you must enter a value of 2 or greater. For example, if you enter 2, the system will support 32 IPv6 prefixes in the range /65 through /127.

**NOTE:** When you configure and commit the `num-65-127-prefix` value, all the data interfaces on the switch restart. The management interfaces are unaffected.

The LPM table is shared, and each increment that you add for IPv6 prefixes in the range /65 through /127 reduces the number of table entries that are available for IPv4 prefixes and IPv6 prefixes shorter than /65. Note that IPv6 prefixes /65 and longer consume twice as much memory as shorter IPv6 prefixes and four times as much memory as IPv4 prefixes. So, for example, entering the following statement

```
user@switch# set chassis forwarding-options l2-profile-one num-65-127-prefix 2
```

provides for 16 additional IPv6 prefixes /65 or longer (for a total of 32 such prefixes) and reduces the numbers of other prefixes that can be stored, as indicated:

- 32 fewer IPv6 prefixes shorter than /65 (16 IPv6 prefixes /65 or longer consume the same amount of memory as 32 IPv6 prefixes shorter than /65), or
- 64 fewer IPv4 prefixes (16 IPv6 prefixes /65 or longer consume the same amount of memory as 64 IPv4 prefixes)

[Table 171 on page 2220](#) provides examples of valid combinations that the LPM table can store using the **l2** and **l3** profiles. Once again, each row in the table represents a case in which the table is full and cannot accommodate any more entries.

Table 171: Example LPM Table Combinations Using l2-and l3 Profiles With Junos OS 13.2X51-D10 and 13.2X52-D10

| num-65-127-prefix Value | IPv4 Entries | IPv6 Entries (Prefix <= 64) | IPv6 Entries (Prefix >= 65) |
|-------------------------|--------------|-----------------------------|-----------------------------|
| 1 (default)             | 16K-16       | 0K                          | 16                          |
| 1 (default)             | 0K           | 8K-16                       | 16                          |
| 1 (default)             | 8K-16        | 4K                          | 16                          |
| 64                      | 4K           | 4K                          | 1K                          |
| 64                      | 2K           | 5K                          | 1K                          |
| 64                      | 0K           | 6K                          | 1K                          |
| 128                     | 4K           | 2K                          | 2K                          |
| 128                     | 2K           | 3K                          | 2K                          |
| 128                     | 0K           | 4K                          | 2K                          |

**NOTE:** With Junos OS 13.2X51-D10 and 13.2X52-D10, the `lpm-profile` does not support IPv6 prefixes. If you use this version of Junos OS and also use the `lpm-profile`, do not configure the `num-65-127-prefix` statement. That is, leave it at its default value of 1, which allows for as many as 128K IPv4 prefixes (the maximum possible).

#### Configuring the LPM Table With Junos OS 13.2x51-D15

With Junos OS 13.2X51-D15, you can configure the memory allocation for the LPM table for the `lpm-profile` profile independently of the other profiles. In addition, Junos OS 13.2x51-D15 offers twice as much storage for IPv6 prefixes /65 through /127 (4K instead of 2K) for the `l2` and `l3` profiles.

- [Configuring the l2 and l3 profiles With Junos OS 13.2x51-D15 on page 2220](#)
- [Configuring The lpm-profile With Junos OS 13.2x51-D15 on page 2221](#)

#### Configuring the l2 and l3 profiles With Junos OS 13.2x51-D15

With Junos OS 13.2x51-D15, you can configure the switch to support as many as 4K IPv6 prefixes /65 through /127 if you are using any profile other than the `lpm-profile` profile. To do so, enter and commit the following statement:

```
user@switch# set chassis forwarding-options profile-name num-65-127-prefix [0-4]
```

Each increment adds support for 1K IPv6 prefixes between /65 and /127, for a maximum of 4K such prefixes. The default value is 1, which allocates memory for 1K of IPv6 prefixes in this range. Each increment that you add for IPv6 prefixes in the range /65 through /127 reduces the number of table entries that are available for IPv6 prefixes shorter than /65

and IPv4 prefixes. [Table 172 on page 2221](#) shows the numbers of entries that you can allocate by using the **num-65-127-prefix** statement with Junos OS 13.2X51-D15. Once again, each row represents a case in which the table is full and cannot accommodate any more entries.

**Table 172: LPM Table Combinations for l2 and l3 profiles With Junos OS 13.2X51-D15**

| num-65-127-prefix Value | IPv4 Entries | IPv6 Entries (Prefix <= 64) | IPv6 Entries (Prefix >= 65) |
|-------------------------|--------------|-----------------------------|-----------------------------|
| 0                       | 16K          | 8K                          | 0K                          |
| 1 (default)             | 12K          | 6K                          | 1K                          |
| 2                       | 8K           | 4K                          | 2K                          |
| 3                       | 4K           | 2K                          | 3K                          |
| 4                       | 0K           | 0K                          | 4K                          |

**NOTE:** When you configure the **num-65-127-prefix** value, the PFE process restarts and all the data interfaces on the switch go down and come back up. The management interfaces are unaffected.

### **Configuring The *lpm-profile* With Junos OS 13.2x51-D15**

If you use the **lpm-profile** profile with Junos OS 13.2x51-D15, you can control whether the switch allocates any memory for IPv6 prefixes /65 through /127. By default, the switch supports the following with this profile:

- 128K IPv4 prefixes
- 16K IPv6 prefixes (all lengths)

You can disable support for IPv6 prefixes /65 through /127 with the **lpm-profile** profile so that there is more memory for IPv6 prefixes shorter than /65. To do so, enter and commit the following statement:

```
user@switch# set chassis forwarding-options profile-name prefix-65-127-disable
```

If you enter this statement, the switch allocates memory for the following:

- 128K IPv4 and IPv6 prefixes shorter than /65
- 0K IPv6 prefixes /65 through /127

For example, if you use the **prefix-65-127-disable** statement, each of the following combinations are valid:

- 100K IPv4 and 28K IPv6 /64 prefixes
- 64K IPv4 and 64K IPv6 /64 prefixes

- 128K IPv4 and 0K IPv6 /64 prefixes
- 0K IPv4 and 128K IPv6 /64 prefixes

## Forwarding Mode Configuration Task

- [Configuring the Forwarding Mode on page 2222](#)

### Configuring the Forwarding Mode

By default, packets are forwarded using store-and-forward mode. You can configure all the interfaces to use cut-through mode instead.

To enable cut-through switching mode, enter the following statement:

```
[edit forwarding-options]  
user@switch# set cut-through
```

**Related  
Documentation**

- [cut-through on page 2257](#)

---

## Interface Address Configuration Task

- [Configuring the Interface Address on page 2222](#)

### Configuring the Interface Address

You assign an address to an interface by specifying the address when configuring the protocol family. For the **inet** or **inet6** family, configure the interface IP address. For the **iso** family, configure one or more addresses for the loopback interface. For the **ccc**, **ethernet-switching**, **tcc**, **mpls**, **tnp**, and **vpls** families, you never configure an address.

**NOTE:** The point-to-point (PPP) address is taken from the loopback interface address that has the primary attribute. When the loopback interface is configured as an unnumbered interface, it takes the primary address from the donor interface.

To assign an address to an interface, include the **address** statement:

```
address address {  
  broadcast address;  
  destination address;  
  destination-profile name;  
  eui-64;  
  preferred;  
  primary;  
}
```

You can include these statements at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* family *family*]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family *family*]

In the **address** statement, specify the network address of the interface.

For each address, you can optionally configure one or more of the following:

- Broadcast address for the interface subnet—Specify this in the **broadcast** statement; this applies only to Ethernet interfaces, such as the management interface **fxp0**, **em0**, or **me0** the Fast Ethernet interface, and the Gigabit Ethernet interface.
- Address of the remote side of the connection (for point-to-point interfaces only)—Specify this in the **destination** statement.
- PPP properties to the remote end—Specify this in the **destination-profile** statement. You define the profile at the [edit access group-profile *name* **ppp**] hierarchy level (for point-to-point interfaces only).
- Whether the router or switch automatically generates the host number portion of interface addresses—The **eui-64** statement applies only to interfaces that carry IPv6 traffic, in which the prefix length of the address is 64 bits or less, and the low-order 64 bits of the address are zero. This option does not apply to the loopback interface (**lo0**) because IPv6 addresses configured on the loopback interface must have a 128-bit prefix length.
- Whether this address is the preferred address—Each subnet on an interface has a preferred local address. If you configure more than one address on the same subnet, the preferred local address is chosen by default as the source address when you originate packets to destinations on the subnet.

By default, the preferred address is the lowest-numbered address on the subnet. To override the default and explicitly configure the preferred address, include the **preferred** statement when configuring the address.

- Whether this address is the primary address—Each interface has a primary local address. If an interface has more than one address, the primary local address is used by default as the source address when you send packets from an interface where the destination provides no information about the subnet (for example, some **ping** commands).

By default, the primary address on an interface is the lowest-numbered non-127 (in other words, non-loopback) preferred address on the interface. To override the default and explicitly configure the preferred address, include the **primary** statement when configuring the address.

**NOTE:** If you configure a duplicate IP address on an interface, even when the earlier interface with that IP address is disabled, a **Warning** message is added to the syslog and not displayed on the screen. Do not configure the same IP address of a disabled interface on another interface.

- [Configuring Interface IPv4 Addresses on page 2224](#)
- [Configuring Interface IPv6 Addresses on page 2226](#)

---

### Configuring Interface IPv4 Addresses

---

You can configure router or switch interfaces with a 32-bit IP version 4 (IPv4) address and optionally with a destination prefix, sometimes called a *subnet mask*. An IPv4 address utilizes a 4-octet dotted decimal address syntax (for example, **192.16.1.1**). An IPv4 address with destination prefix utilizes a 4-octet dotted decimal address syntax with a destination prefix appended (for example, **192.16.1.1/30**).

To configure an IPv4 address on routers and switches running Junos OS, use the **edit interface *interface-name* unit *number* family inet address *a.b.c.d/nn*** statement at the **[edit interfaces]** hierarchy level.

**NOTE:** Juniper Networks routers and switches support /31 destination prefixes when used in point-to-point Ethernet configurations; however, they are not supported by many other devices, such as hosts, hubs, routers, or switches. You must determine if the peer system also supports /31 destination prefixes before configuration.

---

### *Operational Behavior of Interfaces when the Same IPv4 Address is Assigned to Them*

You can configure the same IPv4 address on multiple physical interfaces. When you assign the same IPv4 address to multiple physical interfaces, the operational behavior of those interfaces differs, depending on whether they are implicitly or explicitly point-to-point.

**NOTE:** By default, all interfaces are assumed to be point-to-point (PPP) interfaces. For all interfaces except aggregated Ethernet, Fast Ethernet, and Gigabit Ethernet, you can explicitly configure an interface to be a point-to-point connection.

**NOTE:** If you configure the same address on multiple interfaces in the same routing instance, Junos OS uses only the first configuration, the remaining address configurations are ignored and can leave interfaces without an address. Interfaces that do not have an assigned address cannot be used as a donor interface for an unnumbered Ethernet interface.

For example, in the following configuration the address configuration of interface xe-0/0/1.0 is ignored:

```
interfaces {
  xe-0/0/0 {
    unit 0 {
      family inet {
        address 192.168.1.1/24;
      }
    }
  }
  xe-0/0/1 {
    unit 0 {
      family inet {
        address 192.168.1.1/24;
      }
    }
  }
}
```

The following examples show the sample configuration of assigning the same IPv4 address to implicitly and explicitly point-to-point interfaces, and their corresponding **show interfaces terse** command outputs to see their operational status.

#### Configuring same IPv4 address on implicitly PPP interfaces:

```
[edit]
user@host# show
ge-0/1/0 {
  unit 0 {
    family inet {
      address 200.1.1.1/24;
    }
  }
}
ge-3/0/1 {
  unit 0 {
    family inet {
      address 200.1.1.1/24;
    }
  }
}
```

The sample output shown below for the above configuration reveals that only **ge-0/1/0.0** was assigned the same IPv4 address **200.1.1.1/24** and its **link** state was **up**, while **ge-3/0/1.0** was not assigned the IPv4 address, though its **link** state was up, which means that it will be operational only when it gets a unique IPv4 address other than **200.1.1.1/24**.

```
user@host> show interfaces terse ge*
```

| Interface  | Admin | Link | Proto | Local             | Remote |
|------------|-------|------|-------|-------------------|--------|
| ge-0/1/0   |       | up   | up    |                   |        |
| ge-0/1/0.0 |       | up   | up    | inet 200.1.1.1/24 |        |
|            |       |      |       | multiservice      |        |
| ge-0/1/1   |       | up   | down  |                   |        |
| ge-3/0/0   |       | up   | down  |                   |        |
| ge-3/0/1   |       | up   | up    |                   |        |
| ge-3/0/1.0 |       | up   | up    | inet              |        |
|            |       |      |       | multiservice      |        |

#### Configuring same IPv4 address on explicitly PPP interfaces:

```
[edit]
user@host# show
so-0/0/0 {
  unit 0 {
    family inet {
      address 200.1.1.1/24;
    }
  }
}
so-0/0/3 {
  unit 0 {
    family inet {
      address 200.1.1.1/24;
    }
  }
}
```

The sample output shown below for the above configuration reveals that both **so-0/0/0.0** and **so-0/0/3.0** were assigned the same IPv4 address **200.1.1.1/24** and that their link states were down, which means that to make them operational at least one of them will have to be configured with a unique IPv4 address other than **200.1.1.1/24**.

```
user@host> show interfaces terse so*
Interface      Admin Link Proto  Local      Remote
so-0/0/0        up   up
so-0/0/0.0      up   down inet    200.1.1.1/24
so-0/0/1        up   up
so-0/0/2        up   down
so-0/0/3        up   up
so-0/0/3.0      up   down inet    200.1.1.1/24
so-1/1/0        up   down
so-1/1/1        up   down
so-1/1/2        up   up
so-1/1/3        up   up
so-2/0/0        up   up
so-2/0/1        up   up
so-2/0/2        up   up
so-2/0/3        up   down
```

#### Configuring Interface IPv6 Addresses

**NOTE:** IPv6 is not currently supported for the QFX Series.

You represent IP version 6 (IPv6) addresses in hexadecimal notation using a colon-separated list of 16-bit values.

You assign a 128-bit IPv6 address to an interface by including the **address** statement:

```
address aaa:bbb:::zzzz/nn;
```

**NOTE:** You cannot configure a subnet zero IPv6 address because RFC 2461 reserves the subnet-zero address for anycast addresses, and Junos OS complies with the RFC.

You can include this statement at the following hierarchy levels:

- [edit interfaces *interface-name* unit *logical-unit-number* family inet6]
- [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number* family inet6]

The double colon (::) represents all bits set to 0, as shown in the following example:

```
interfaces fe-0/0/1 {
  unit 0 {
    family inet6 {
      address fec0:1:1::2/64;
    }
  }
}
```

**NOTE:** You must manually configure the router or switch advertisement and advertise the default prefix for autoconfiguration to work on a specific interface.

## MAC Learning Configuration Tasks

- [Configuring MAC Notification on page 2227](#)
- [Configuring MAC Table Aging on page 2229](#)
- [Disabling MAC Learning on page 2229](#)
- [Disabling MAC Learning in a VLAN on page 2230](#)

### Configuring MAC Notification

**NOTE:** This task uses Junos OS for QFX Series devices that do not support Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that supports ELS, see *Configuring MAC Notification (CLI Procedure)*. For ELS details, see *Getting Started with Enhanced Layer 2 Software*.

When a MAC address is learned or unlearned, SNMP notifications can be sent to the network management system at regular intervals to record the addition or removal of the MAC address. This process is known as *MAC notification*.

The MAC notification interval defines how often Simple Network Management Protocol (SNMP) notifications logging the addition or removal of MAC addresses on the switch are sent to the network management system.

MAC notification is disabled by default. When MAC notification is enabled, the default MAC notification interval is 30 seconds.

To enable or disable MAC notification, or to set the MAC notification interval, perform these tasks:

- [Enabling MAC Notification on page 2228](#)
- [Disabling MAC Notification on page 2228](#)
- [Setting the MAC Notification Interval on page 2228](#)

---

### Enabling MAC Notification

MAC notification is disabled by default. You need to perform this procedure to enable MAC notification.

To enable MAC notification on the switch with the default MAC notification interval of 30 seconds:

```
[edit ethernet-switching-options]  
user@switch# set mac-notification
```

To enable MAC notification on the switch with any other MAC notification interval (here, 60 seconds):

```
[edit ethernet-switching-options]  
user@switch# set mac-notification notification-interval 60
```

---

### Disabling MAC Notification

MAC notification is disabled by default. Perform this procedure only if MAC notification was previously enabled on your switch.

To disable MAC notification on the switch:

```
[edit ethernet-switching-options]  
user@switch# delete mac-notification
```

---

### Setting the MAC Notification Interval

The default MAC notification interval is 30 seconds. The procedure to change the MAC notification interval to a different interval is identical to the procedure to enable MAC notification on the switch with a nondefault value for the MAC notification interval.

To set the MAC notification interval on the switch (here, the MAC notification interval is set to 5 seconds):

```
[edit ethernet-switching-options]
```

```
user@switch# set mac-notification notification-interval 5
```

**Related  
Documentation**

- [Verifying That MAC Notification Is Working Properly on page 2339](#)

## Configuring MAC Table Aging

MAC table aging ensures that a switch tracks only active nodes on the network and that it is able to flush out network nodes that are no longer available.

To manage MAC entries more efficiently, you can configure an entry's aging time, which is the maximum time that an entry can remain in the MAC address table before it is deleted because it has reached its maximum age.

**NOTE:** This task uses Junos OS for Junos OS for QFX3500 and QFX3600 switches that does not support the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that supports ELS, see *Configuring MAC Table Aging*.

You can use the **set-mac-table-aging-time** command to configure how long entries remain in the Ethernet switching table before expiring. Here the VLAN is **employee-vlan**:

```
[edit vlans employee-vlan]
user@switch# set mac-table-aging-time 200
```

**Related  
Documentation**

- [Understanding Bridging and VLANs on page 2017](#)
- [Example: Setting Up Bridging with Multiple VLANs on page 2110](#)
- [Example: Connecting an Access Switch to a Distribution Switch on page 2084](#)

## Disabling MAC Learning

By default, MAC learning is globally enabled on all nodes in a device. This topic describes how to disable MAC learning, as well as how to reenabling and verify that MAC learning has been enabled or disabled.

Disabling dynamic MAC learning on the device prevents a node from learning source and destination MAC addresses.

**NOTE:** This task uses Junos OS for QFX3500 and QFX3600 switches and does not support the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that supports ELS, see *Disabling MAC Learning*.

- To disable MAC learning on the QFX Series:

```
[edit ethernet-switching-options interfaces interface]
user@switch# set no-mac-learning
```

- To enable MAC learning on the QFX Series:

```
[edit ethernet-switching-options interfaces interface]
```

```
user@switch# delete no-mac-learning
user@switch# deactivate no-mac-learning
```

- To verify the status of MAC learning on the QFX Series, view the Ethernet MAC learning statistics in operational mode.

```
user@switch> show ethernet-switching table
Ethernet-switching table: 2 entries, 1 learned
  VLAN      MAC address      Type      Age      Interfaces
  default   *                Flood     -        - All-members
  default   00:1f:12:39:90:80 Learn     29       xe-/0/0.0
```

#### Related Documentation

- [Understanding MAC Learning on page 2036](#)
- [Example: Disabling MAC Learning on page 2116](#)
- [no-mac-learning on page 2261](#)

## Disabling MAC Learning in a VLAN

By default, MAC learning is enabled on a VLAN. This topic describes how to disable MAC learning in a VLAN, as well as how to reenable and verify that MAC learning has been enabled or disabled.

Disabling dynamic MAC learning in a VLAN on a QFX Series product prevents a node from learning source and destination MAC addresses.

- To disable MAC learning in a VLAN:

```
[edit vlans vlan-name]
user@switch# set no-mac-learning
```

- To reenable MAC learning in a VLAN, use either of the following two commands:

```
[edit vlans vlan-name]
user@switch# delete no-mac-learning
user@switch# deactivate no-mac-learning
```

- To verify the status of MAC learning on the QFX series:

```
user@switch> show ethernet-switching table
```

## Multiple VLAN Registration Protocol Configuration Task

---

- [Configuring Multiple VLAN Registration Protocol on page 2230](#)

### Configuring Multiple VLAN Registration Protocol

Multiple VLAN Registration Protocol (MVRP) automates the creation and management of VLANs. When using MVRP on a QFabric system, you must manually create on the QFabric the VLANs that exist on the attached servers because the QFabric implementation of MVRP does not allow VLANs to be created dynamically. However, you do not need to

manually assign VLAN membership to the QFabric ports that connect to the servers. MVRP automatically assigns VLAN membership to server-facing QFabric ports when it learns about a VLAN from an attached server. .

MVRP is disabled by default. To enable MVRP or set MVRP options, follow these instructions:

- [Enabling MVRP on page 2231](#)
- [Disabling MVRP on page 2231](#)
- [Configuring Timer Values on page 2231](#)
- [Configuring Passive Mode on page 2232](#)

### Enabling MVRP

MVRP can be enabled only on trunk interfaces. To enable MVRP on a trunk interface:

```
[edit protocols mvrp]
user@qfabric# set interface interface-name
```

**NOTE:** On QFX Series switches, you must configure specific interfaces—you cannot specify `interface all`. You can enable MVRP on an interface range.

### Disabling MVRP

MVRP is disabled by default. You only need to perform this procedure if you have previously enabled MVRP.

To disable MVRP on the entire QFabric system:

```
[edit protocols mvrp]
user@qfabric# set disable
```

To disable MVRP on a specific trunk interface:

```
[edit protocols mvrp]
user@qfabric# set disable interface interface-name
```

### Configuring Timer Values

The timers in MVRP define the amount of time an interface waits to join or leave MVRP or to send or process the MVRP information for the switch after receiving an MVRP PDU. The join timer controls the amount of time the switch waits to accept a registration request, the leave timer controls the period of time that the switch waits in the Leave state before changing to the unregistered state, and the leaveall timer controls the frequency with which the LeaveAll messages are communicated.

The default MVRP timer values are 200 ms for the join timer, 1000 ms for the leave timer, and 10000 ms for the leaveall timer.

**BEST PRACTICE:** Maintain default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values might cause an imbalance in the operation of MVRP.

To set the join timer for an interface:

```
[edit protocols mvrp]
user@qfabric# set interface interface-name 300
```

To set the leave timer for an interface:

```
[edit protocols mvrp]
user@qfabric# set interface interface-name leave-timer 1200
```

To set the leaveall timer for an interface:

```
[edit protocols mvrp]
user@qfabric# set interface interface-name leaveall-timer 12000
```

### Configuring Passive Mode

---

QFX switches include a mode—called passive mode—in which an MVRP-configured interface does not announce its membership in a VLAN or send any VLAN declarations (updates) unless it receives registration for that VLAN from a peer (server).

To configure an interface to operate in passive mode:

```
[edit protocols mvrp]
user@qfabric# set interface interface-name passive
```

#### Related Documentation

## Private VLAN Configuration Tasks

---

- [Creating a Private VLAN on a Single Switch on page 2233](#)
- [Creating a Private VLAN Spanning Multiple Switches on page 2234](#)

## Creating a Private VLAN on a Single Switch

For security reasons, it is often useful to restrict the flow of broadcast and unknown unicast traffic and to even limit the communication between known hosts. The private VLAN (PVLAN) feature allows you to split a broadcast domain into multiple isolated broadcast subdomains, essentially putting a secondary VLAN inside a primary VLAN. This topic describes how to configure a PVLAN on a single switch.

Before you begin, configure names for all secondary VLANs that will be part of the primary VLAN. (You do not need to preconfigure the primary VLAN—it is configured as part of this procedure.) You do not need to create VLAN IDs (tags) for the secondary VLANs. It does not impair functioning if you tag the secondary VLANs, but tags are not used when secondary VLANs are configured on a single switch.

Keep these rules in mind when configuring a PVLAN:

- The primary VLAN must be a tagged VLAN.
- If you are going to configure a community VLAN, you must first configure the primary VLAN and the PVLAN trunk port. You must also configure the primary VLAN to be private using the **pvlan** statement.
- If you are going to configure an isolated VLAN, you must first configure the primary VLAN and the PVLAN trunk port.

If you complete your configuration steps in the order shown, you will not violate these PVLAN rules. To configure a private VLAN on a single switch:

1. Set the name and VLAN ID (802.1Q tag) for the primary VLAN:

```
[edit vlans]
user@switch# set primary-vlan-name vlan-id vlan-id-number
```

2. Configure the VLAN to be private:

```
[edit vlans]
user@switch# set primary-vlan-name pvlan
```

3. Configure the trunk interfaces for the primary VLAN:

```
[edit interfaces]
user@switch# set interface-name unit 0 family ethernet-switching port-mode trunk
user@switch# set interface-name unit 0 family ethernet-switching vlan members
primary-vlan-name
```

4. Add the trunk interfaces to the primary VLAN:

```
[edit vlans]
user@switch# set primary-vlan-name interface interface-name
```

5. Configure the access interfaces for the community (secondary) VLANs:

```
[edit interfaces]
user@switch# set interface-name unit 0 family ethernet-switching port-mode access
```

6. Add the access interfaces to the community VLANs:

```
[edit vlans]
user@switch# set community-vlan-name interface interface-name
```

7. For each community VLAN, set the primary VLAN:

```
[edit vlans]
```

```
user@switch# set community-vlan-name primary-vlan primary-vlan-name
```

8. Configure isolated ports:

```
[edit vlans]  
user@switch# set primary-vlan-name interface interface-name isolated
```

**Related  
Documentation**

## Creating a Private VLAN Spanning Multiple Switches

For security reasons, it is often useful to restrict the flow of broadcast and unknown unicast traffic and to even limit the communication between known hosts. The private VLAN (PVLAN) feature allows you to split a broadcast domain into multiple isolated broadcast subdomains, essentially putting a secondary VLAN inside a primary VLAN. This topic describes how to configure a PVLAN to span multiple switches.

Before you begin, configure names for all secondary VLANs that will be part of the primary VLAN. (You do not need to preconfigure the primary VLAN—it is configured as part of this procedure.) You do not need to create VLAN IDs (tags) for the secondary VLANs. It does not impair functioning if you tag the secondary VLANs, but tags are not used when secondary VLANs are configured on a single switch.

The following rules apply to creating PVLANS:

- The primary VLAN must be a tagged VLAN.
- If you are going to configure a community VLAN, you must first configure the primary VLAN and the PVLAN trunk port. You must also configure the primary VLAN to be private using the **pvlan** statement.
- If you are going to configure an isolated VLAN, you must first configure the primary VLAN and the PVLAN trunk port.

If you complete your configuration steps in the order shown, you will not violate these PVLAN rules. To configure a private VLAN to span multiple switches:

1. Set the name and VLAN ID (802.1Q tag) for the primary VLAN:

```
[edit vlans]  
user@switch# set primary-vlan-name vlan-id vlan-id-number
```

2. Configure the VLAN to be private:

```
[edit vlans]  
user@switch# set primary-vlan-name pvlan
```

3. Configure the trunk interfaces for the primary VLAN:

```
[edit interfaces]  
user@switch# set interface-name unit 0 family ethernet-switching port-mode trunk  
user@switch# set interface-name unit 0 family ethernet-switching vlan members  
primary-vlan-name
```

4. Add the trunk interfaces to the primary VLAN:

```
[edit vlans]
user@switch# set primary-vlan-name interface interface-name
```

5. Configure the access interfaces for the community (secondary) VLANs:

```
[edit interfaces]
user@switch# set interface-name unit 0 family ethernet-switching port-mode access
```

6. Add the access interfaces to the community VLANs:

```
[edit vlans]
user@switch# set community-vlan-name interface interface-name
```

7. For each community VLAN, set the primary VLAN:

```
[edit vlans]
user@switch# set community-vlan-name primary-vlan primary-vlan-name
```

8. Configure an isolated VLAN ID to create an interswitch isolated domain that spans the switches:

```
[edit vlans]
user@switch# set primary-vlan-name isolation-vlan-id number
```

9. Configure isolated ports:

```
[edit vlans]
user@switch# set primary-vlan-name interface interface-name isolated
```

## Proxy ARP Configuration Task

- [Configuring Proxy ARP on page 2235](#)

### Configuring Proxy ARP

You can configure proxy Address Resolution Protocol (ARP) to enable the switch to respond to ARP queries for network addresses by offering its own media access control (MAC) address. With proxy ARP enabled, the switch captures and routes traffic to the intended destination.

To configure proxy ARP on a single interface:

```
[edit interfaces]
user@switch# set xe-0/0/3 unit 0 proxy-arp restricted
```

**BEST PRACTICE:** We recommend that you configure proxy ARP in restricted mode. In restricted mode, the switch is not a proxy if the source and target IP addresses are on the same subnet. If you use unrestricted mode, disable gratuitous ARP requests on the interface to avoid the situation of the switch's response to a gratuitous ARP request appearing to the host to be an indication of an IP conflict:

To configure proxy ARP on a routed VLAN interface (RVI):

```
[edit interfaces]
user@switch# set vlan unit 100 proxy-arp restricted
```

## Q-in-Q Tunneling Configuration Tasks

- [Configuring Q-in-Q Tunneling on page 2236](#)
- [Configuring Layer 2 Protocol Tunneling on page 2237](#)

### Configuring Q-in-Q Tunneling

Q-in-Q tunneling and VLAN translation allow service providers to create a Layer 2 Ethernet connection between two customer sites. Providers can segregate different customers' VLAN traffic on a link (for example, if the customers use overlapping VLAN IDs) or bundle different customer VLANs into a single service VLAN. Data centers can use Q-in-Q tunneling to isolate customer traffic within a single site or when customer traffic flows between cloud data centers in different geographic locations.

Before you begin setting up Q-in-Q tunneling, make sure you have created and configured the necessary customer VLANs on the neighboring switches. See [“Configuring VLANs” on page 2214](#).

To configure Q-in-Q tunneling:

1. Create the service VLAN (S-VLAN) and configure an ID for it:

```
[edit vlans]
user@switch# set s-vlan-name vlan-id s-vlan-ID
```

2. Enable Q-in-Q tunneling on the S-VLAN:

```
[edit vlans]
user@switch# set s-vlan-name dot1q-tunneling
```

3. Set the allowed customer VLANs (C-VLANs) on the S-VLAN (optional). Here, the C-VLANs are identified by a range:

```
[edit vlans]
user@switch# set s-vlan-name dot1q-tunneling customer-vlans range
```

4. Configure a global value for the tag protocol identifier (EtherType) of the service VLAN tags (optional):

```
[edit]
user@switch# set ethernet-switching-options dot1q-tunneling ether-type ether-type-value
```

Depending on your interface configuration, you might need to adjust the MTU value on your trunk or access ports to accommodate the 4 bytes used for the tag added by Q-in-Q tunneling. For example, if you use the default MTU value of 1514 bytes on your access and trunk ports, you need to make one of the following adjustments:

- Reduce the MTU on the access links by at least 4 bytes so that the frames do not exceed the MTU of the trunk link when S-VLAN tags are added.
- Increase the MTU on the trunk link so that the link can handle the larger frame size.

**Related  
Documentation**

- [mtu on page 2852](#)

## Configuring Layer 2 Protocol Tunneling

Layer 2 protocol tunneling (L2PT) allows you to send Layer 2 protocol data units (PDUs) across a service provider network and deliver them to switches at a remote location. This feature is useful when you have a network that includes remote sites that are connected across a service provider network and you want to run Layer 2 protocols on switches connected across the service provider network.

Tunneled Layer 2 PDUs do not normally arrive at high rate. If the tunneled Layer 2 PDUs do arrive at high rate, there might be a problem in the network. Typically, you would want to shut down the interface that is receiving a high rate of tunneled Layer 2 PDUs so that the problem can be isolated. You do so using the **shutdown-threshold** statement. However, if you do not want to completely shut down the interface, you can configure the switch to drop tunneled Layer 2 PDUs that exceed a certain threshold using the **drop-threshold** statement.

L2PT processing is done by the CPU, and L2PT traffic to the CPU is rate-limited to a maximum of 1000 pps. If traffic is received at a rate faster than this limit, the rate limit causes the traffic to be dropped before it hits the threshold and the dropped packets are not reported in L2PT statistics. This can also occur if you configure a drop threshold that is less than 1000 pps but traffic is received at a faster rate. For example, if you configure a drop threshold of 900 pps and the VLAN receives traffic at rate of 1100 pps, L2PT statistics will show that 100 packets were dropped. The 100 packets dropped because of the rate limit will not be reported. Similarly, if you do not configure a drop threshold and the VLAN receives traffic at rate of 1100 pps, the 100 packets dropped because of the rate limit are not reported.

There are no default settings for **drop-threshold** and **shutdown-threshold**. If you do not specify these thresholds, then no thresholds are enforced. As a result, the switch tunnels all Layer 2 PDUs regardless of the speed at which they are received, although the number of packets tunneled per second might be limited by other factors.

You can specify a drop threshold value without specifying a shutdown threshold value, and you can specify a shutdown threshold value without specifying a drop threshold value. If you specify both threshold values, then the drop threshold value must be less than or equal to the shutdown threshold value. If the drop threshold value is greater than the shutdown threshold value and you try to commit the configuration, the commit operation fails.

**NOTE:** L2PT and VLAN translation configured with the [mapping](#) statement cannot both be configured on the same switch.

**NOTE:** If the switch receives untagged Layer 2 control PDUs to be tunneled, then you must configure the switch to map untagged (native) packets to an L2PT-enabled VLAN. Otherwise, the untagged Layer 2 control PDU packets are discarded. For more information, see [“Understanding Q-in-Q Tunneling and VLAN Translation” on page 2068](#).

To configure L2PT:

1. Because L2PT operates under the Q-in-Q tunneling configuration, you must enable Q-in-Q tunneling before you can configure L2PT. Enable Q-in-Q tunneling on VLAN **customer-1**:

[edit]

user@switch# **set vlans customer-1 dot1q-tunneling**

2. Enable L2PT for the Layer 2 protocol you want to tunnel, on the VLAN:

- To enable L2PT for a specific protocol (here, STP):

[edit]

user@switch# **set vlans customer-1 dot1q-tunneling layer2-protocol-tunneling stp**

- To enable L2PT for all supported protocols:

[edit]

user@switch# **set vlans customer-1 dot1q-tunneling layer2-protocol-tunneling all**

3. (Optional) Configure the drop threshold:

**NOTE:** If you also configure the shutdown threshold, ensure that you configure the drop threshold value to be less than or equal to the shutdown threshold value. If the drop threshold value is greater than the shutdown threshold value and you try to commit the configuration changes, the commit operation fails.

[edit]

user@switch# **set vlans customer-1 dot1q-tunneling layer2-protocol-tunneling stp drop-threshold 50**

4. (Optional) Configure the shutdown threshold:

**NOTE:** If you also configure the drop threshold, ensure that you configure the shutdown threshold value to be greater than or equal to the drop threshold value. If the shutdown threshold value is less than the drop threshold value and you try to commit the configuration changes, the commit operation fails.

[edit]

```
user@switch# set vlans customer-1 dot1q-tunneling layer2-protocol-tunneling stp
shutdown-threshold 100
```

**NOTE:** Once an interface is disabled, you must explicitly reenable it using the `clear ethernet-switching layer2-protocol-tunneling error` command. Otherwise, the interface remains disabled.

#### Related Documentation

## Reflective Relay Configuration Task

- [Configuring Reflective Relay on page 2239](#)

### Configuring Reflective Relay

Configure reflective relay when a switch port must return packets on a downstream port. For example, configure reflective relay when a switch port receives aggregated virtual machine packets from a technology such as virtual Ethernet port aggregator (VEPA). When these packets are passed through the switch, reflective relay allows the switch to send those packets back on the same interface that was used for delivery.

**NOTE:** This task uses Junos OS for QFX3500 and QFX3600 switches that do not support the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that supports ELS, see *Configuring Reflective Relay*.

Before you begin configuring reflective relay, ensure that you have:

- Configured packet aggregation on the server connected to the port. See your server documentation.
- Configured the port for all VLANs that could be included in aggregated packets..

To configure reflective relay:

1. Configure an Ethernet interface with a port mode of **tagged-access**:

```
[edit]
user@switch# set interfaces interface-name unit number family family-type port-mode
tagged-access
```

For example:

```
[edit]
user@switch# set interfaces xe-0/0/2 unit 0 family ethernet-switching port-mode
tagged-access
```

2. Configure the interface for reflective relay:

```
[edit]
```

```
user@switch# set interfaces interface-name unit number family family-type reflective-relay
```

For example:

```
[edit]
```

```
user@switch# set interfaces xe-0/0/2 unit 0 family ethernet-switching reflective-relay
```

3. Configure the interface for the VLANs that exist on the VM server:

```
[edit]
```

```
user@switch# set interfaces interface-name unit number family family-type vlan members  
vlan-names
```

For example:

```
[edit]
```

```
user@switch# set interfaces xe-0/0/2 unit 0 family ethernet-switching vlan members  
[VLAN_Purple VLAN_Orange VLAN_Blue]
```

#### Related Documentation

---

## Routed VLAN Interface Configuration Task

- [Configuring IRB Interfaces on page 2240](#)

### Configuring IRB Interfaces

Integrated routing and bridging (IRB) interfaces enable a switch to recognize which packets are being sent to local addresses so that they are bridged whenever possible and are routed only when needed. Whenever packets can be switched instead of routed, several layers of processing are eliminated. Switching also reduces the number of address look-ups.

**NOTE:** In versions of Junos OS that do not support Enhanced Layer 2 Software (ELS), this type of interface is called a routed VLAN interface (RVI).

To configure the routed VLAN interface:

1. Create the VLAN by assigning it a name and a VLAN ID:

```
[edit]
```

```
user@switch# set vlans support vlan-id 111
```

2. Assign an interface to the VLAN by specifying the logical interface (with the **unit** statement) and specifying the VLAN name as the member:

```
[edit]
```

```
user@switch# set interfaces ge-0/0/18 unit 0 family ethernet-switching vlan members  
support
```

3. Create the subnet for the VLAN's broadcast domain:

```
[edit]
```

```
user@switch# set interfaces irb unit 111 family inet address 111.111.111.1/24
```

4. Bind a Layer 3 interface with the VLAN:

```
[edit]
```

```
user@switch# set vlans support l3-interface irb.111
```

**NOTE:** If you are using a version of Junos OS that does not support ELS, you create a Layer 3 virtual interface named `vlan`

**NOTE:** Layer 3 interfaces on trunk ports allow the interface to transfer traffic between multiple VLANs. Within a VLAN, traffic is bridged, while across VLANs, traffic is routed.

You can display the configuration settings:

```
user@switch> show interfaces irb terse
Interface      Admin Link Proto      Local      Remote
vlan           up    up
irb.111        up    up    inet      111.111.111.1/24
```

```
user@switch> show vlans
Name      Tag      Interfaces
default
employee-vlan 20      ge-1/0/0.0, ge-1/0/1.0, ge-1/0/2.0
marketing   40      ge-1/0/10.0, ge-1/0/20.0, ge-1/0/30.0
support     111     ge-0/0/18.0
mgmt        bme0.32769, bme0.32771*
```

```
user@switch> show ethernet-switching table
Ethernet-switching table: 1 entries, 0 learned
VLAN      MAC address      Type      Age      Interfaces
support    00:19:e2:50:95:a0 Static      - Router
```

**Related Documentation**

- [Understanding Integrated Routing and Bridging on page 2035](#)

## Spanning Tree Protocol Configuration Tasks

- [Configuring STP on page 2242](#)
- [Unblocking an Interface That Receives BPDUs in Error on page 2242](#)
- [Configuring VLAN Spanning Tree Protocol on page 2243](#)

## Configuring STP

The default spanning-tree protocol on the device is Rapid Spanning Tree Protocol (RSTP). RSTP provides faster convergence times than Spanning Tree Protocol (STP) does. However, some legacy networks require the slower convergence times of basic STP.

If your network includes 802.1D 1998 bridges, you can remove RSTP and explicitly configure STP. When you explicitly configure STP, the device uses the IEEE 802.1D 2004 specification, force version 0. This configuration runs a version of RSTP that is compatible with the classic, basic STP.

To configure STP using the CLI:

1. Delete the RSTP configuration on the interface (here, the interface is **xe-0/0/5**):

```
[edit]
user@switch# delete protocols rstp interface xe-0/0/5
```

2. Configure STP on the interface:

```
[edit]
user@switch# set protocols stp interface xe-0/0/5
```

3. Commit the configuration:

```
[edit]
user@switch# commit
```

### Related Documentation

- [show spanning-tree bridge on page 2402](#)
- [show spanning-tree interface on page 2407](#)
- [Overview of Spanning-Tree Protocols on page 2060](#)

## Unblocking an Interface That Receives BPDUs in Error

**NOTE:** BPDUs block protection is disabled on Node devices.

Devices use bridge protocol data unit (BPDU) protection on interfaces to prevent them from receiving BPDUs that could trigger a spanning-tree misconfiguration. If BPDUs are received on a BPDU-protected interface, the interface transitions to a blocking state and stops forwarding frames.

After you fix the misconfiguration that triggered the sending of BPDUs to an interface, you can unblock the interface and return it to service.

**NOTE:** This task describes how to use both the original CLI and the Enhanced Layer 2 Software (ELS) CLI. For ELS details, see *Getting Started with Enhanced Layer 2 Software*.

To unblock an interface after fixing the misconfiguration that triggered the BPDUs and return it to service:

- (Original CLI) Automatically unblock an interface by configuring a timer that expires (here, the interface is **xe-0/0/6**):

```
[edit ethernet-switching-options]
user@switch# set bpd-blockdisable-timeout 30 interface xe-0/0/6
```

- (ELS CLI) Automatically unblock an interface by configuring a timer that expires (here, the interface is **xe-0/0/6**):

```
[edit protocols layer2-control]
user@switch# set bpd-blockdisable-timeout 30 interface xe-0/0/6
```

- Manually unblock an interface using the operational mode command:

```
user@switch> clear ethernet-switching bpd-error interface xe-0/0/6
```

#### Related Documentation

- [Understanding BPDU Protection for STP, RSTP, and MSTP on page 2063](#)

## Configuring VLAN Spanning Tree Protocol

VLAN Spanning Tree Protocol (VSTP) enables the device to run one or more Spanning Tree Protocol (STP) or Rapid Spanning Tree Protocol (RSTP) instances for each VLAN on which VSTP is enabled. For networks with multiple VLANs, VSTP improves intelligent tree spanning by defining the best paths within the VLANs instead of within the entire network.

**NOTE:** This task uses Junos OS software that does not support the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that supports ELS, see *Configuring VLAN Spanning-Tree Protocol*.

To configure VSTP:

1. (Optional) Enable Rapid Spanning Tree Protocol (RSTP):

```
[edit protocols]
user@switch# set rstp
```

VSTP can run on a maximum of 253 VLANs; RSTP runs on the remaining VLANs if configured. Enabling RSTP ensures that a spanning-tree protocol runs on all VLANs.

2. Enable VSTP.

- To enable VSTP on multiple VLANs using a VLAN group:

```
[edit protocols]
user@switch# set vstp vlan-group group group-name vlan vlan-id-range
```

- To enable VSTP on all VLANs:

```
[edit protocols]
user@switch# set vstp vlan all
```

**NOTE:** You must enable RSTP if you used the `set vstp vlan all` statement to enable VSTP and if the switch has more than 253 VLANs. If you use the `set vstp vlan all` statement to enable VSTP on a switch with more than 253 VLANs, the configuration cannot be committed.

- To enable VSTP on a VLAN using a single VLAN ID:

```
[edit protocols]
user@switch# set vstp vlan vlan-id
```

- To enable VSTP on a VLAN using a single VLAN name:

```
[edit protocols]
user@switch# set vstp vlan vlan-name
```

**Related  
Documentation**

- [Understanding VSTP on page 2062](#)

---

## Static ARP Entries Configuration Task

- [Configuring Static ARP Entries on page 2244](#)

### Configuring Static ARP Entries

You can create static ARP table entries, which are explicit mappings between IP addresses and MAC addresses.

- To configure a static ARP entry:

```
[edit interfaces interface-name unit logical-unit-number family inet address
address]
user@switch# set arp ip-address (mac | multicast-mac) mac-address
```

The IP address that you specify must be part of the subnet defined in the enclosing **address** statement.

To associate a multicast MAC address with a unicast IP address, use the **multicast-mac** statement.

Specify the MAC address as 6 hexadecimal bytes in one of the following formats: *nnnn.nnnn.nnnn* or *nn:nn:nn:nn:nn:nn*; for example, 0011.2233.4455 or 00:11:22:33:44:55.

## interfaces

---

**Syntax** `interfaces interface-name {  
    no-mac-learning;  
}`

**Hierarchy Level** [edit [ethernet-switching-options](#)]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure settings for interfaces that have been assigned to family **ethernet-switching**.

**Options** *interface-name* —Name of an interface that is configured for family **ethernet-switching**.

The remaining statement is explained separately.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## traceoptions (Ethernet Switching Options)

---

**Syntax**    `traceoptions {  
              file filename <files number> <no-stamp> <replace> <size size> <world-readable |  
              no-world-readable>;  
              flag flag <disable>;  
          }`

**Hierarchy Level**    [edit [ethernet-switching-options](#)]

**Release Information**    Statement introduced in Junos OS Release 11.1 for the QFX Series.

**NOTE:** The `traceoptions` statement is not supported on the QFX3000 QFabric system.

**Description**    Define global tracing operations for access security features on Ethernet switches.

**Default**    The `traceoptions` feature is disabled by default.

**Options**    **disable**—(Optional) Disable the tracing operation. You can use this option to disable a single operation when you have defined a broad group of tracing operations, such as **all**.

**file *filename*** —Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory `/var/log`.

**files *number*** —(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached ( **xk** to specify KB, **xm** to specify MB, or **xg** to specify gigabytes), at which point the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

**Range:** 2 through 1000

**Default:** 3 files

**flag *flag*** —Tracing operation to perform. To specify more than one tracing operation, include multiple flag statements. You can include the following flags:

- **access-security**—Trace access security events.
- **all**—All tracing operations.
- **analyzer**—Trace analyzer events.
- **config-internal**—Trace internal configuration operations.
- **filter**—Trace filter transaction events.
- **forwarding-database**—Trace forwarding database events.

- **general**—Trace general events.
- **interface**—Trace interface events.
- **krt**—Trace communications over routing sockets.
- **lib**—Trace library calls.
- **nexthop**—Trace next-hop events.
- **normal**—Trace normal events.
- **parse**—Trace reading of the configuration.
- **regex-parse**—Trace regular-expression parsing operations.
- **rtg**—Trace redundant trunk group events.
- **state**—Trace state transitions.
- **stp**—Trace spanning-tree events.
- **task**—Trace Ethernet-switching task processing.
- **timer**—Trace Ethernet-switching timer processing.
- **unknown-unicast-forwarding**—Trace unknown unicast forwarding events.
- **vlan**—Trace VLAN events.

**no-stamp**—(Optional) Do not timestamp the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Restrict file access to the user who created the file.

**replace**—(Optional) Replace an existing trace file if there is one rather than appending to it.

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**size size** —(Optional) Maximum size of each trace file, in kilobytes (KB), megabytes (MB), or gigabytes. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. Then the oldest trace file is overwritten. If you specify a maximum number of files, you also must specify a maximum file size with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify gigabytes

**Range:** 10 KB through 1 gigabyte

**Default:** 128 KB

**world-readable**—(Optional) Enable unrestricted file access.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.2X52-D10 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>              | <p>Configure the duration of the graceful restart period for the fabric control Routing Engine.</p> <p>The graceful restart resynchronization process takes longer when the QFabric system contains node groups that have a large number of VLANs. The graceful-restart duration should, therefore, be set higher when the QFabric system contains at least one node group with a large number of VLANs.</p> <p>Configure a restart time of 600 seconds if the number of VLAN members (vmembers) exceeds 32k.</p> |
|                                 | <div>  <p><b>CAUTION:</b> Configuring the restart time restarts the session between the fabric control Routing Engine and the Node groups. Traffic is dropped as a result of this restart. Normal QFabric system operations should resume once the session has restarted without any further user actions.</p> </div>                                                                                                            |
| <b>Options</b>                  | <p><b>seconds</b>—Duration of the graceful restart period.</p> <p><b>Default:</b> 300 seconds</p> <p><b>Range:</b> 300 to 900 seconds</p>                                                                                                                                                                                                                                                                                                                                                                         |

## Unified Forwarding Table Configuration Statements

---

- [forwarding-options \(chassis\) on page 2255](#)
- [num-65-127-prefix on page 2256](#)
- [prefix-65-127-disable on page 2256](#)

## forwarding-options (chassis)

**Syntax** forwarding options *profile-name* {  
     num-65-127-prefix *value*  
     lpm-profile prefix-65-127-disable  
 }

**Hierarchy Level** [edit *chassis*]

**Release Information** Statement introduced in Junos 13.2 for the QFX Series.

**Description** Configure a unified forwarding table profile to allocate the amount a memory available for the following:

- MAC addresses
- Layer 3 host entries
- Longest prefix match table entries

**Options** *profile-name*—name of the profile to use for memory allocation in the unified forwarding table. [Table 173 on page 2255](#) lists the profiles you can choose and the associated values for each type of entry.

**Table 173: Unified Forwarding Table Profiles**

| Profile Name               | MAC Table     | Host Table (unicast and multicast addresses) |              |             |             |             |             |
|----------------------------|---------------|----------------------------------------------|--------------|-------------|-------------|-------------|-------------|
|                            | MAC Addresses | IPv4 unicast                                 | IPv6 unicast | IPv4 (*, G) | IPv4 (S, G) | IPv6 (*, G) | IPv6 (S, G) |
| l2-profile-one             | 288K          | 16K                                          | 8K           | 8K          | 8K          | 4K          | 4K          |
| l2-profile-two             | 224K          | 80K                                          | 40K          | 40K         | 40K         | 20K         | 20K         |
| l2-profile-three (default) | 160K          | 144K                                         | 72K          | 72K         | 72K         | 36K         | 36K         |
| l3-profile                 | 96K           | 208K                                         | 104K         | 104K        | 104K        | 52K         | 52K         |
| lpm-profile*               | 32K           | 16K                                          | 8K           | 8K          | 8K          | 4K          | 4K          |

\* This profile supports only IPv4 in Junos OS 13.2X51-D10. With Junos OS 13.2X51-D15 it supports IPv4 and IPv6.

Note that if the host stores the maximum number of entries for any given type, the entire table is full and is unable to accommodate *any* entries of any other type. For information about valid combinations of table entries see [“Understanding the Unified Forwarding Table” on page 2066](#).

You configure the memory allocation for LPM table entries differently depending on whether you use Junos OS 13.2X51-D10 or Junos OS 13.2X51-D15 and later. To learn

how to configure memory allocation for LPM table entries see [“Configuring the Unified Forwarding Table” on page 2217](#).

| <b>Release Information</b>      | <p>Statement introduced in Junos OS Release 10.0 for EX Series switches.</p> <p>Hierarchy level <b>[edit protocols mvrp]</b> introduced in Junos OS Release 13.2X50-D10 (ELS). (See <i>Getting Started with Enhanced Layer 2 Software</i> for information about ELS.)</p> <p>Statement introduced in Junos OS Release 13.1 for the QFX Series.</p>                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | <p>For Multiple VLAN Registration Protocol (MVRP), configure the interval at which the LeaveAll state operates on the interface.</p> <p>Maintain default timer settings unless there is a compelling reason to change the settings. Modifying timers to inappropriate values might cause an imbalance in the operation of MVRP. However, if you choose to change the default values, keep in mind that on an EX Series switch that uses Junos OS with support for ELS, if the timer value set on an interface level is different from the value set on a switch level, then the value on the interface level takes precedence.</p> |
| <b>Options</b>                  | <p><b>interval</b>—Number of seconds or milliseconds between the sending of Leave All messages.</p> <p><b>Default:</b> 10 seconds, or 10,000 milliseconds</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

| <b>Description</b>         | Enable Q-in-Q tunneling on the specified VLAN.                                                                                                                                                                                                                                                                                                                                                                |

### NOTE:

- The VLAN on which you enable Q-in-Q tunneling must be a tagged VLAN.
- You cannot configure 802.1X user authentication on interfaces that have been enabled for Q-in-Q tunneling.

The remaining statements are explained separately.

| <b>Description</b>              | Map a specific C-VLAN to an S-VLAN. By default, the received incoming or outgoing tag is replaced with the new tag.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>                  | <p><b>inner-tag</b> (QFabric systems only)—apply the specified tag as an inner tag to packets that are received as untagged on an access interface.</p> <p><b>native</b>—Map untagged and priority-tagged packets to an S-VLAN.</p> <p><b>push</b>—Retain the incoming tag (as an inner tag) and adds an additional VLAN tag. When you use this option, the TPID of the outer tag is set as follows:</p> <ul style="list-style-type: none"> <li>• If Q-in-Q tunneling is not enabled in the VLAN, then the Ethertype for outer tag is set to 0x8100.</li> <li>• If Q-in-Q tunneling is enabled in the VLAN and a packet is egressing from a trunk port, then the Ethertype is set to 0x88a8 (or as configured by an <b>ether-type</b> statement).</li> </ul> <p><b>swap</b>—Replaces the incoming VLAN tag with the VLAN ID tag of the S-VLAN. Using this option is also referred to as VLAN ID translation. When you use this option on a trunk port for which Q-in-Q tunneling is enabled, use the <b>ether-type</b> statement to set the Ethertype.</p> <p><b>tag</b>—Original VLAN tag that will be replaced (with <b>swap</b>) or that will become an inner tag (with <b>push</b>).</p> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | Configure an access interface to map a range of C-VLANs to a range of S-VLANs. Use this statement instead of using multiple <b>set vlans <i>VLAN-name</i> interface <i>interface-name</i> mapping (push   swap)</b> statements to configure Q-in-Q tunneling or VLAN translation on a per-VLAN basis. This statement is particularly useful if you have used the <b>vlan-range</b> statement to create multiple VLANs.                                                                               |
| <b>Options</b>                  | <p><b>push</b>—Retain the incoming tag and adds an additional VLAN tag (Q-in-Q tunneling).</p> <p><b>swap</b>—Swap the incoming VLAN tag with the VLAN ID tag of the S-VLAN (VLAN translation).</p> <p><b>vlan-ID-start <i>S-VLAN-ID</i></b>—(Optional) Set the start of the S-VLAN range that the C-VLANs will be mapped to. If you omit this option, mapping begins with the first ID in the range of S-VLAN IDs (which you configure using the <b>set vlans <i>vlan-range</i></b> statement).</p> |
| <b>Required Privilege Level</b> | <p>system—To view this statement in the configuration.</p> <p>system-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                         |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 10.0 for EX Series switches.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Description</b>              | <p>Specify the maximum number of Layer 2 PDUs of the specified protocol that can be received per second on the interfaces in a specified VLAN before the interface is disabled. Once an interface is disabled, you must explicitly reenable it using the <b>clear ethernet-switching layer2-protocol-tunneling error</b> command. Otherwise, the interface remains disabled.</p> <p>The shutdown threshold value must be greater than or equal to the drop threshold value. If the shutdown threshold value is less than the drop threshold value, the drop threshold value has no effect.</p> <p>You can specify a shutdown threshold value without specifying a drop threshold value.</p> |
| <b>Default</b>                  | No shutdown threshold is specified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>                  | <p><b><i>number</i></b>—Maximum number of Layer 2 PDUs of the specified protocol that can be received per second on the interfaces in a specified VLAN before the interface is disabled.</p> <p><b>Range:</b> 1 through 1000</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>              | Configure an access interface to map a range of C-VLANs to a range of S-VLANs. Use this statement instead of using multiple <b>set vlans <i>VLAN-name</i> interface <i>interface-name</i> mapping (push   swap)</b> statements to configure Q-in-Q tunneling or VLAN translation on a per-VLAN basis. This statement sets the start of the S-VLAN range that the C-VLANs are mapped to. If you omit this option, mapping begins with the first ID in the range of S-VLAN IDs (which you configure using the <b>set vlans <a href="#">vlan-range</a></b> statement). |
| <b>Options</b>                  | None                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

## bpdu-block

---

**Syntax**    `bpdu-block {  
              interface (all | [interface-name]);  
              disable-timeout timeout;  
          }`

- Hierarchy Level**
- For platforms with ELS CLI:  
    [edit protocols layer2-control]
  - For platforms with Original CLI:  
    [edit [ethernet-switching-options](#)]

**Release Information**    Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Configure BPDU protection on an interface. If the interface receives BPDUs, it is disabled.

**NOTE:** BPDU block protection is disabled on Node devices.

---

The statements are explained separately.

**Required Privilege Level**    routing—To view this statement in the configuration.  
                                  routing-control—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>              | For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), configure the link mode to identify point-to-point links.                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Default</b>                  | For a full-duplex link, the default link mode is <b>point-to-point</b> . For a half-duplex link, the default link mode is <b>shared</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>                  | <i>mode</i> —Link mode: <ul style="list-style-type: none"> <li>• <b>point-to-point</b>—Link is point to point.</li> <li>• <b>shared</b>—Link is shared media.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## mstp

```

Syntax  mstp {
        disable;
        bpdu-timeout-action;
        bridge-priority priority;
        configuration-name (MSTP) name;
        forward-delay seconds;
        hello-time seconds;
        interface (all | interface-name) {
            bpdu-timeout-action {
                block;
                alarm;
            }
            disable;
            cost cost;
            edge;
            mode mode;
            no-root-port;
            priority priority;
        }
        max-age seconds;
        max-hops hops;
        msti msti-id {
            vlan (vlan-id | vlan-name);
            interface interface-name {
                disable;
                cost cost;
                edge;
                mode mode;
                priority priority;
            }
        }
        traceoptions {
            file name <replace> <size size> <files number> <no-stamp>
              <(world-readable | no-world-readable)>;
            flag flag <flag-modifier> <disable>;
        }
        revision-level revision-level;
    }

```

**Hierarchy Level** [edit protocols]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure Multiple Spanning Tree Protocol (MSTP). MSTP is defined in the IEEE 802.1Q-2003 specification and is used to create a loop-free topology in networks with multiple spanning-tree regions.

The statements are explained separately.

**Default** MSTP is disabled.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## priority (STP)

---

**Syntax** `priority priority;`

**Hierarchy Level** [edit protocols [mstp interface](#) (all | *interface-name*)],  
[edit protocols [mstp msti msti-id interface interface-name](#)],  
[edit protocols [rstp interface](#) (all | *interface-name*)],  
[edit protocols [stp interface](#) (all | *interface-name*)],  
[edit protocols [vstp vlan vlan-id interface](#) (all | *interface-name*)]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** For Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP), VLAN Spanning Tree Protocol (VSTP), or Multiple Spanning Tree Protocol (MSTP), specify the interface priority to control which interface is elected as the root port.

**Options** *priority*—Interface priority. The interface priority must be set in increments of 16.  
**Range:** 0 through 240  
**Default:** 128

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

| <b>Description</b>              | Configure an interface to be a spanning tree designated port. If the bridge receives more STP bridge protocol data units (BPDUs) on a root-protected interface, that interface transitions to a root-prevented STP state (inconsistency state) and the interface is blocked. This blocking prevents a bridge that should not be the root bridge from being elected the root bridge. When the bridge stops receiving more STP BPDUs on the root-protected interface, interface traffic is no longer blocked.                                                                                           |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Description</b>              | <p>Configure Rapid Spanning Tree Protocol (RSTP). RSTP is defined in the IEEE 802.1D-2004 specification and is used to prevent loops in Layer 2 networks, providing shorter convergence times than those provided with basic STP.</p> <p>The statements are explained separately.</p>                                                                                                                                                                                                                                                                                                                                                                                |
| <b>Default</b>                  | RSTP is enabled on all Ethernet switching interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| <b>Release Information</b> | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                               |

**NOTE:** traceoptions is not supported on QFabric systems.

|                    |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|--------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Description</b> | Set STP protocol-level tracing options.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Default</b>     | Traceoptions is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>     | <p><b>disable</b>—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>name</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. We recommend that you place STP tracing output in the file <code>/var/log/stp-log</code>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b>trace-file</b> reaches its maximum size, it is renamed <b>trace-file.0</b>, then <b>trace-file.1</b>, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you must also specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 1 trace file only</p> <p><b>flag</b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b>flag</b> statements. These are the STP-specific tracing options:</p> <ul style="list-style-type: none"> <li>• <b>all</b>—Trace all operations.</li> <li>• <b>all-failures</b>—Trace all failure conditions.</li> <li>• <b>bpdu</b>—Trace BPDU reception and transmission.</li> </ul> |

- **bridge-detection-state-machine**—Trace the bridge detection state machine.
- **events**—Trace events of the protocol state machine.
- **port-information-state-machine**—Trace the port information state machine.
- **port-migration-state-machine**—Trace the port migration state machine.
- **port-receive-state-machine**—Trace the port receive state machine.
- **port-role-select-state-machine**—Trace the port role selection state machine.
- **port-role-transit-state-machine**—Trace the port role transit state machine.
- **port-transmit-state-machine**—Trace the port transmit state machine.
- **port-state-transit-state-machine**—Trace the port state transit state machine.
- **ppmd**—Trace the state and events for the ppm process.
- **state-machine-variables**—Trace when the state machine variables change.
- **timers**—Trace protocol timers.
- **topology-change-state-machine**—Trace the topology change state machine.

The following are the global tracing options:

- **all**—All tracing operations.
- **config-internal**—Trace configuration internals.
- **general**—Trace general events.
- **normal**—All normal events.

**Default:** If you do not specify this option, only unusual or abnormal operations are traced.

- **parse**—Trace configuration parsing.
- **policy**—Trace policy operations and actions.
- **regex-parse**—Trace regular-expression parsing.
- **route**—Trace routing table changes.
- **state**—Trace state transitions.
- **task**—Trace protocol task processing.
- **timer**—Trace protocol task timer processing.

**no-stamp**—(Optional) Do not place timestamp information at the beginning of each line in the trace file.

**Default:** If you omit this option, timestamp information is placed at the beginning of each line of the tracing output.

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**replace**—(Optional) Replace an existing trace file if there is one.

**Default:** If you do not include this option, tracing output is appended to an existing trace file.

**size** *size*—(Optional) Maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.O**. When the **trace-file** again reaches its maximum size, **trace-file.O** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.O**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

|                           |                                                             |
|---------------------------|-------------------------------------------------------------|
| <b>Required Privilege</b> | routing—To view this statement in the configuration.        |
| <b>Level</b>              | routing-control—To add this statement to the configuration. |

## vlan (STP)

```
Syntax  vlan (vlan-id | vlan-name) {
        bridge-priority priority;
        forward-delay seconds;
        hello-time seconds;
        interface (all | interface-name) {
            bpdu-timeout-action {
                block;
                alarm;
            }
            cost cost;
            disable;
            edge;
            mode mode;
            no-root-port;
            priority priority;
        }
        max-age seconds;
        traceoptions {
            file filename <files number > <size size> <no-stamp | world-readable |
            no-world-readable>;
            flag flag;
        }
    }
```

**Hierarchy Level** [edit protocols **mstp** **msti** *msti-id*],  
[edit protocols **vstp**]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure the VLANs for a Multiple Spanning Tree Instance (MSTI).

The remaining statements are explained separately.

**TIP:** To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type ? after vlan or vlans in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range.

**Default** Not enabled.

**Options** *vlan-id*—Numeric VLAN identifier.

*vlan-name*—Name of the VLAN.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## vstp

---

**Syntax**

```
vstp {  
  disable;  
  bpdu-block-on-edge;  
  force-version stp;  
  vlan (vlan-id | vlan-name) {  
    bridge-priority priority;  
    forward-delay seconds;  
    hello-time seconds;  
    interface (all | interface-name) {  
      disable;  
      bpdu-timeout-action {  
        alarm;  
        block;  
      }  
      cost cost;  
      edge;  
      mode mode;  
      no-root-port;  
      priority priority;  
    }  
    max-age seconds;  
    traceoptions {  
      file name <replace> <size size> <files number> <no-stamp>  
        <world-readable | no-world-readable>;  
      flag flag <flag-modifier> <disable>;  
    }  
  }  
}
```

| <b>Description</b>         | For Ethernet, Fast Ethernet, and Gigabit Ethernet interfaces only, configure Address Resolution Protocol (ARP) table entries, mapping IP addresses to MAC addresses.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Options</b>             | <p><b><i>ip-address</i></b>—IP address to map to the MAC address. The IP address specified must be part of the subnet defined in the enclosing <b>address</b> statement.</p> <p><b>mac <i>mac-address</i></b>—MAC address to map to the IP address. Specify the MAC address as six hexadecimal bytes in one of the following formats: <i>nnnn.nnnn.nnnn</i> or <i>nn:nn:nn:nn:nn:nn</i>. For example, 0011.2233.4455 or 00:11:22:33:44:55.</p> <p><b>multicast-mac <i>mac-address</i></b>—Multicast MAC address to map to the IP address. Specify the multicast MAC address as six hexadecimal bytes in one of the following formats: <i>nnnn.nnnn.nnnn</i> or <i>nn:nn:nn:nn:nn:nn</i>. For example, 0011.2233.4455 or 00:11:22:33:44:55.</p> <p><b>publish</b>—(Optional) Have the router or switch reply to ARP requests for the specified IP address. If you omit this option, the router or switch uses the entry to reach the destination but does not reply to ARP requests.</p> |

**NOTE:** The `edit logical-systems` hierarchy is not available on QFabric systems.

| <b>Description</b>              | <p>Specify the maximum number of Layer 2 PDUs of the specified protocol that can be received per second on the interfaces in a specified VLAN before the switch begins dropping the Layer 2 PDUs. The drop threshold value must be less than or equal to the shutdown threshold value.</p> <p>L2PT processing is done by the CPU, and L2PT traffic to the CPU is rate-limited to a maximum of 1000 pps. If traffic is received at a rate faster than this limit, the rate limit causes the traffic to be dropped before it hits the threshold and the dropped packets are not reported in L2PT statistics. This can also occur if you configure a drop threshold that is less than 1000 pps but traffic is received at a faster rate. For example, if you configure a drop threshold of 900 pps and the VLAN receives traffic at rate of 1100 pps, L2PT statistics will show that 100 packets were dropped. The 100 packets dropped because of the rate limit will not be reported. Similarly, if you do not configure a drop threshold and the VLAN receives traffic at rate of 1100 pps, the 100 packets dropped because of the rate limit are not reported.</p> |
|                                 | <p> <b>NOTE:</b> If the drop threshold value is greater than the shutdown threshold value and you try to commit the configuration, the commit operation fails.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|                                 | You can specify a drop threshold value without specifying a shutdown threshold value.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Default</b>                  | No drop threshold is specified.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## l3-interface (VLAN)

---

|                            |                                                                                                                                                                                                                                     |
|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <code>l3-interface (vlan.logical-interface-number   irb.logical-interface-number);</code>                                                                                                                                           |
| <b>Hierarchy Level</b>     | [edit <b>vlan</b> <i>vlan-name</i> ]                                                                                                                                                                                                |
| <b>Release Information</b> | Statement introduced in Junos OS Release 11.1 for the QFX Series.<br><b>irb</b> option introduced in Junos OS Release 13.2 for the QFX Series.                                                                                      |
| <b>Description</b>         | Associate a Layer 3 interface with the VLAN. Configure Layer 3 interfaces on trunk ports to allow the interface to transfer traffic between VLANs. Traffic between VLANs must be routed, which requires a common Layer 3 interface. |
| <b>Default</b>             | No Layer 3 (routing) interface is associated with the VLAN.                                                                                                                                                                         |
| <b>Options</b>             | <code>vlan.logical-interface-number</code> —Number of the logical interface. Use the <b>unit</b> number that you used when you created the <b>vlan</b> interface with a <b>set interfaces vlan unit</b> statement.                  |

**NOTE:** Use this statement with versions of Junos OS that do not support Enhanced Layer 2 Software (ELS).

---

`irb.logical-interface-number`—Logical interface defined with a **set interfaces irb** statement.

---

**NOTE:** Use this statement with versions of Junos OS that support Enhanced Layer 2 Software (ELS).

---

## members

|                            |                                                                                                                       |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <code>members [(all   <i>names</i>   <i>vlan-ids</i>)];</code>                                                        |
| <b>Hierarchy Level</b>     | [edit <a href="#">interfaces</a> <i>interface-name</i> unit 0 family <a href="#">ethernet-switching</a> <i>vlan</i> ] |
| <b>Release Information</b> | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                     |
| <b>Description</b>         | For trunk interfaces, configure the VLANs for which the interface can carry traffic.                                  |

**TIP:** To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type `?` after `vlan` or `vlands` in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range.

**Options** `all`—Specify that this trunk interface be a member of all the VLANs that are configured on this switch. When a new VLAN is configured on the switch, this trunk interface automatically becomes a member of the VLAN.

**NOTE:** Each VLAN that is configured must have a specified VLAN ID when you attempt to commit the configuration; otherwise, the configuration commit fails. Also, `all` cannot be the name of a VLAN on the switch.

*names*—Names of one or more VLANs.

*vlan-ids*—Numeric identifiers of one or more VLANs.

**Required Privilege Level**  
`routing`—To view this statement in the configuration.  
`routing-control`—To add this statement to the configuration.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | <p>Configure the VLAN identifier to associate with untagged packets received on the interface. The logical interface on which untagged packets are received must be configured with the same VLAN ID as the native VLAN ID configured on the physical interface. To configure the logical interface, include the <b>vlan-id</b> statement (matching the <b>native-vlan-id</b> statement on the physical interface) at the <code>[edit <a href="#">interfaces</a> <i>interface-name</i> unit <i>logical-unit-number</i>]</code> hierarchy level.</p> <p>When the <b>native-vlan-id</b> statement is combined with the <i>interface-mode</i> statement, untagged packets are accepted and forwarded within the bridge domain or VLAN that is configured with the matching VLAN ID.</p> <p>When the <b>native-vlan-id</b> statement is combined with the <i>flexible-vlan-tagging</i> statement, untagged packets are accepted on the interfaces that are configured for Q-in-Q tunneling.</p> <p>.</p> |
| <b>Options</b>                  | <p><b>vlan-id</b>—Numeric identifier of the VLAN.</p> <p><b>Range:</b> 1 through 4094</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

| <b>Description</b>              | <div>  <p><b>NOTE:</b> This statement does not support the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that supports ELS, see <i>interface-mode</i>. For ELS details, see <i>Getting Started with Enhanced Layer 2 Software</i>.</p> </div> <p>Configure whether an interface on the switch operates in access, tagged access, or trunk mode.</p>                                                                                                                                                                                                                                                                               |
| <b>Default</b>                  | All switch interfaces are in access mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Options</b>                  | <p><b>access</b>—Have the interface operate in access mode. In this mode, the interface can be in a single VLAN only. Access interfaces typically connect to network devices, such as PCs, printers, IP telephones, and IP cameras.</p> <p><b>tagged-access</b>—Have the interface operate in tagged-access mode. In this mode, the interface can be in multiple VLANs. Tagged access interfaces typically connect to network devices, such as PCs, printers, IP telephones, and IP cameras.</p> <p><b>trunk</b>—Have the interface operate in trunk mode. In this mode, the interface can be in multiple VLANs and can multiplex traffic between different VLANs. Trunk interfaces typically connect to other switches and to routers on the LAN.</p> |

## vlan (Unknown Unicast)

**Syntax**    `vlan (all | vlan-name) {  
                  interface interface-name;  
                  }`

**Hierarchy Level**    [edit [ethernet-switching-options unknown-unicast-forwarding](#)]

**Release Information**    Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Specify a VLAN from which unknown unicast packets will be forwarded, or specify that the packets should be forwarded from *all* VLANs. Unknown unicast packets are forwarded from a VLAN to a specific trunk interface.

The remaining statement is explained separately.

**TIP:** To display a list of all configured VLANs on the system, including VLANs that are configured but not committed, type ? after `vlan` or `vlangs` in your configuration mode command line. Note that only one VLAN is displayed for a VLAN range.

**Options**    `all`—All VLANs.

`vlan-name`—Name of a VLAN.

**Required Privilege Level**    `routing`—To view this statement in the configuration.  
                                  `routing-control`—To add this statement to the configuration.

## vlan-tagging

---

|                                 |                                                                                                                                                                          |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | vlan-tagging;                                                                                                                                                            |
| <b>Hierarchy Level</b>          | [edit <a href="#">interfaces interface-name</a> ]<br>[edit <a href="#">interfaces interface-range interface-range-name</a> ]                                             |
| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.3 for the QFX Series.                                                                                                        |
| <b>Description</b>              | Enable VLAN tagging. The platform receives and forwards single-tag frames with 802.1Q VLAN tags.                                                                         |
| <b>Default</b>                  | VLAN tagging is disabled by default.                                                                                                                                     |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                  |
| <b>Related Documentation</b>    | <ul style="list-style-type: none"> <li>• <a href="#">vlan-id on page 2873</a></li> <li>• <a href="#">Configuring a Layer 3 Logical Interface on page 2777</a></li> </ul> |

## CHAPTER 22

# Administration

- [Routine Monitoring on page 2339](#)
- [Monitoring Commands on page 2349](#)

### Routine Monitoring

---

- [Verifying That MAC Notification Is Working Properly on page 2339](#)
- [Verifying That a Series of Tagged VLANs Has Been Created on page 2340](#)
- [Verifying That Q-in-Q Tunneling Is Working on page 2341](#)
- [Verifying That a Private VLAN Is Working on page 2342](#)
- [Verifying That Proxy ARP Is Working Correctly on page 2347](#)
- [Verifying That MVRP Is Working Correctly on page 2348](#)

### Verifying That MAC Notification Is Working Properly

**Purpose** Verify that MAC notification is enabled or disabled, and that the MAC notification interval is set to the specified value.

**Action** To verify that MAC notification is enabled or disabled and also to verify the MAC notification interval setting.

```
user@switch> show ethernet-switching mac-notification
Notification Status: Enabled
Notification Interval: 60
Notifications Sent      : 0
Notifications Table Maxsize : 256
```

**Meaning** The output in the **Notification Status** field shows that MAC notification is enabled. The output in the **Notification Status** field would display **Disabled** if MAC notification was disabled.

The **Notification Interval** field output shows that the MAC notification interval is set to 60 seconds.

**Related Documentation**

- [Configuring MAC Notification \(CLI Procedure\)](#)

## Verifying That a Series of Tagged VLANs Has Been Created

**Purpose** Verify that a series of tagged VLANs has been created on the switch.

**Action** 1. Display the VLANs in the ascending order of their VLAN ID:

```
user@switch> show vlans sort-by tag
```

| Name             | Tag | Interfaces   |
|------------------|-----|--------------|
| __employee_120__ | 120 | xe-0/0/22.0* |
| __employee_121__ | 121 | xe-0/0/22.0* |
| __employee_122__ | 122 | xe-0/0/22.0* |
| __employee_123__ | 123 | xe-0/0/22.0* |
| __employee_124__ | 124 | xe-0/0/22.0* |
| __employee_125__ | 125 | xe-0/0/22.0* |
| __employee_126__ | 126 | xe-0/0/22.0* |
| __employee_127__ | 127 | xe-0/0/22.0* |
| __employee_128__ | 128 | xe-0/0/22.0* |
| __employee_129__ | 129 | xe-0/0/22.0* |
| __employee_130__ | 130 | xe-0/0/22.0* |

2. Display the VLANs by the alphabetical order of the VLAN name:

```
user@switch> show vlans sort-by name
```

| Name             | Tag | Interfaces   |
|------------------|-----|--------------|
| __employee_120__ | 120 | xe-0/0/22.0* |
| __employee_121__ | 121 | xe-0/0/22.0* |
| __employee_122__ | 122 | xe-0/0/22.0* |
| __employee_123__ | 123 | xe-0/0/22.0* |
| __employee_124__ | 124 | xe-0/0/22.0* |
| __employee_125__ | 125 | xe-0/0/22.0* |
| __employee_126__ | 126 | xe-0/0/22.0* |
| __employee_127__ | 127 | xe-0/0/22.0* |
| __employee_128__ | 128 | xe-0/0/22.0* |
| __employee_129__ | 129 | xe-0/0/22.0* |
| __employee_130__ | 130 | xe-0/0/22.0* |

3. Display the VLANs by specifying the VLAN range name (here, the VLAN range name is **employee**):

```
user@switch> show vlans employee
```

| Name             | Tag | Interfaces   |
|------------------|-----|--------------|
| __employee_120__ | 120 | xe-0/0/22.0* |
| __employee_121__ | 121 | xe-0/0/22.0* |
| __employee_122__ | 122 | xe-0/0/22.0* |
| __employee_123__ | 123 | xe-0/0/22.0* |
| __employee_124__ | 124 | xe-0/0/22.0* |
| __employee_125__ | 125 | xe-0/0/22.0* |
| __employee_126__ | 126 | xe-0/0/22.0* |
| __employee_127__ | 127 | xe-0/0/22.0* |
| __employee_128__ | 128 | xe-0/0/22.0* |
| __employee_129__ | 129 | xe-0/0/22.0* |
| __employee_130__ | 130 | xe-0/0/22.0* |

**Meaning** The sample output shows the VLANs configured on the switch. The series of tagged VLANs is displayed: **\_\_employee\_120\_\_** through **\_\_employee\_130\_\_**. Each of the tagged VLANs is configured on the trunk interface **xe-0/0/22.0**. The asterisk (\*) next to the interface name indicates that the interface is **UP**.

When a series of VLANs is created using the **vlan-range** statement, the VLAN names are preceded and followed by a double underscore.

  - [Creating a Series of Tagged VLANs](#)

## Verifying That Q-in-Q Tunneling Is Working

**Purpose** After creating a Q-in-Q VLAN, verify that it is set up properly.

- Action**
1. Use the **show configuration vlans** command to determine if you successfully created the primary and secondary VLAN configurations:

```
user@switch> show configuration vlans
svlan {
  vlan-id 300;
  dot1q-tunneling {
    customer-vlans [ 101-200 ];
  }
}
```

2. Use the **show vlans** command to view VLAN information and link status:

```
user@switch> show vlans s-vlan-name extensive
VLAN: svlan, Created at: Thu Oct 23 16:53:20 2008
802.1Q Tag: 300, Internal index: 2, Admin State: Enabled, Origin: Static
Dot1q Tunneling Status: Enabled
Customer VLAN ranges:
                        101-200
Protocol: Port Mode
Number of interfaces: Tagged 1 (Active = 0), Untagged 1 (Active = 0)
                      xe-0/0/1, tagged, trunk
                      xe-0/0/2, untagged, access
```

**Meaning** The output confirms that Q-in-Q tunneling is enabled and that the VLAN is tagged, and lists the customer VLANs that are associated with the tagged VLAN.

- Related Documentation**
- *Configuring Q-in-Q Tunneling (CLI Procedure)*
  - *Example: Setting Up Q-in-Q Tunneling on EX Series Switches*

## Verifying That a Private VLAN Is Working

**Purpose** After creating and configuring private VLANs (PVLANS), verify that they are set up properly.

- Action**
1. To determine whether you successfully created the primary and secondary VLAN configurations:

- For a PVLAN on a single switch, use the **show configuration vlans** command:

```
user@switch> show configuration vlans
community1 {
    interface {
        interface a;
        interface b;
    }
    primary-vlan pvlan;
}
community2 {
    interface {
        interface d;
        interface e;
    }
    primary-vlan pvlan;
}
pvlan {
    vlan-id 1000;
    interface {
        isolated1;
        isolated2;
        trunk1;
        trunk2;
    }
    no-local-switching;
}
```

- For a PVLAN spanning multiple switches, use the **show vlans extensive** command:

```
user@switch> show vlans extensive
```

VLAN: COM1, Created at: Tue May 11 18:16:05 2010  
 802.1Q Tag: 100, Internal index: 3, Admin State: Enabled, Origin: Static

__pvlan_primary_isiv__
```

2. Use the **show vlans extensive** command to view VLAN information and link status for a PVLAN on a single switch or for a PVLAN spanning multiple switches.

- For a PVLAN on a single switch:

```
user@switch> show vlans pvlan extensive
VLAN: pvlan, Created at: time
802.1Q Tag: vlan-id, Internal index: index-number, Admin State: Enabled,
Origin: Static
Private VLAN Mode: Primary
Protocol: Port Mode
Number of interfaces: Tagged 2 (Active = 0), Untagged 6 (Active = 0)
trunk1, tagged, trunk
interface a, untagged, access
interface b, untagged, access
interface c, untagged, access
interface d, untagged, access
interface e, untagged, access
interface f, untagged, access
trunk2, tagged, trunk
Secondary VLANs: Isolated 2, Community 2
Isolated VLANs :
__pvlan_pvlan_isolated1__
__pvlan_pvlan_isolated2__
Community VLANs :
community1
community2
```

- For a PVLAN spanning multiple switches:

```
user@switch> show vlans extensive
VLAN: COM1, Created at: Tue May 11 18:16:05 2010
802.1Q Tag: 100, Internal index: 3, Admin State: Enabled, Origin: Static

 Number of interfaces: Tagged 3 (Active = 3), Untagged 0 (Active = 0)  
     ge-0/0/20.0\*, tagged, trunk  
     ge-0/0/22.0\*, tagged, trunk, pvlan-trunk  
     ge-0/0/23.0\*, tagged, trunk, pvlan-trunk

VLAN: community2, Created at: Tue May 11 18:16:05 2010  
 802.1Q Tag: 20, Internal index: 8, Admin State: Enabled, Origin: Static  
 Private VLAN Mode: Community, Primary VLAN: primary  
 Protocol: Port Mode, Mac aging time: 300 seconds  
 Number of interfaces: Tagged 3 (Active = 3), Untagged 2 (Active = 2)  
     ge-0/0/20.0\*, tagged, trunk  
     ge-0/0/22.0\*, tagged, trunk, pvlan-trunk  
     ge-0/0/23.0\*, tagged, trunk, pvlan-trunk  
     ge-0/0/1.0\*, untagged, access  
     ge-1/0/6.0\*, untagged, access

VLAN: primary, Created at: Tue May 11 18:16:05 2010  
 802.1Q Tag: 10, Internal index: 2, Admin State: Enabled, Origin: Static  
 Private VLAN Mode: Primary  
 Protocol: Port Mode, Mac aging time: 300 seconds  
 Number of interfaces: Tagged 3 (Active = 3), Untagged 5 (Active = 4)  
     ge-0/0/20.0\*, tagged, trunk  
     ge-0/0/22.0\*, tagged, trunk, pvlan-trunk  
     ge-0/0/23.0\*, tagged, trunk, pvlan-trunk  
     ge-0/0/0.0\*, untagged, access  
     ge-0/0/1.0\*, untagged, access  
     ge-0/0/2.0, untagged, access  
     ge-0/0/7.0\*, untagged, access  
     ge-1/0/6.0\*, untagged, access

Secondary VLANs: Isolated 2, Community 2, Inter-switch-isolated 1  
 Isolated VLANs :  
     \_\_pvlan\_primary\_ge-0/0/0.0\_\_  
     \_\_pvlan\_primary\_ge-0/0/2.0\_\_  
 Community VLANs :  
     COM1

```
community2
Inter-switch-isolated VLAN :
__pvlan_primary_isiv__
```

3. Use the **show ethernet-switching table** command to view logs for MAC learning on the VLANs:

```
user@switch> show ethernet-switching table
Ethernet-switching table: 8 entries, 1 learned
```

| VLAN                      | MAC address | Type       | Age | Interfaces  |
|---------------------------|-------------|------------|-----|-------------|
| default                   | *           | Flood      | -   | All-members |
| pvlan                     | *           | Flood      | -   | All-members |
| pvlan                     | MAC1        | Replicated | -   | interface a |
| pvlan                     | MAC2        | Replicated | -   | interface c |
| pvlan                     | MAC3        | Replicated | -   | isolated2   |
| pvlan                     | MAC4        | Learn      | 0   | trunk1      |
| __pvlan_pvlan_isolated1__ | *           | Flood      | -   | All-members |
| __pvlan_pvlan_isolated1__ | MAC4        | Replicated | -   | trunk1      |
| __pvlan_pvlan_isolated2__ | *           | Flood      | -   | All-members |
| __pvlan_pvlan_isolated2__ | MAC3        | Learn      | 0   | isolated2   |
| __pvlan_pvlan_isolated2__ | MAC4        | Replicated | -   | trunk1      |
| community1                | *           | Flood      | -   | All-members |
| community1                | MAC1        | Learn      | 0   | interface a |
| community1                | MAC4        | Replicated | -   | trunk1      |
| community2                | *           | Flood      | -   | All-members |
| community2                | MAC2        | Learn      | 0   | interface c |
| community2                | MAC4        | Replicated | -   | trunk1      |

**NOTE:** If you have configured a PVLAN spanning multiple switches, you can use the same command on all the switches to check the logs for MAC learning on those switches.

**Meaning** In the output displays for a PVLAN on a single switch, you can see that the primary VLAN contains two community domains (**community1** and **community2**), two isolated ports,

and two trunk ports. The PVLAN on a single switch has only one tag (1000), which is for the primary VLAN.

The PVLAN that spans multiple switches contains multiple tags:

- The community domain **COM1** is identified with tag **100**.
- The community domain **community2** is identified with tag **20**.
- The interswitch isolated domain is identified with tag **50**.
- The primary VLAN **primary** is identified with tag **10**.

Also, for the PVLAN that spans multiple switches, the trunk interfaces are identified as **pvlan-trunk**.

  - [Creating a Private VLAN Spanning Multiple Switches on page 2234](#)

## Verifying That Proxy ARP Is Working Correctly

**Purpose** Verify that the switch is sending proxy ARP messages.

**Action** List the system statistics for ARP:

```
user@switch> show system statistics arp
arp:
  90060 datagrams received
  34 ARP requests received
  610 ARP replies received
  2 resolution request received
  0 unrestricted proxy requests
  0 restricted proxy requests
  0 received proxy requests
  0 unrestricted proxy requests not proxied
  0 restricted proxy requests not proxied
  0 datagrams with bogus interface
  0 datagrams with incorrect length
  0 datagrams for non-IP protocol
  0 datagrams with unsupported op code
  0 datagrams with bad protocol address length
  0 datagrams with bad hardware address length
  0 datagrams with multicast source address
  0 datagrams with multicast target address
  0 datagrams with my own hardware address
  0 datagrams for an address not on the interface
  0 datagrams with a broadcast source address
  294 datagrams with source address duplicate to mine
  89113 datagrams which were not for me
  0 packets discarded waiting for resolution
  0 packets sent after waiting for resolution
  309 ARP requests sent
  35 ARP replies sent
```

```

0 requests for memory denied
0 requests dropped on entry
0 requests dropped during retry
0 requests dropped due to interface deletion
0 requests on unnumbered interfaces
0 new requests on unnumbered interfaces
0 replies for from unnumbered interfaces
0 requests on unnumbered interface with non-subnetted donor
0 replies from unnumbered interface with non-subnetted donor

```

**Meaning** The statistics show that two proxy ARP requests were received. The **unrestricted proxy requests not proxied** and **restricted proxy requests not proxied** fields indicate that all the unproxied ARP requests received have been proxied by the switch.

**Related Documentation**

- [Configuring Proxy ARP on page 2235](#)
- [Configuring Proxy ARP \(CLI Procedure\)](#)

## Verifying That MVRP Is Working Correctly

**Purpose** After configuring your switch to participate in MVRP, verify that the configuration is properly set and that MVRP messages are being sent and received on your switch.

**Action** 1. Confirm that MVRP is enabled on your switch.

```
user@switch> show mvrp
```

Global MVRP configuration

```

MVRP status           : Enabled
MVRP dynamic vlan creation: Enabled
MVRP Timers (ms):
Interface      Join   Leave  LeaveAll
-----
all            200   600    10000
xe-0/1/1.0     200   600    10000

```

Interface based configuration:

| Interface  | Status   | Registration | Dynamic VLAN Creation |
|------------|----------|--------------|-----------------------|
| all        | Disabled | Fixed        | Enabled               |
| xe-0/1/1.0 | Enabled  | Normal       | Enabled               |

2. Confirm that MVRP messages are being sent and received on your switch.

```
user@switch> show mvrp statistics interface xe-0/1/1.0
```

```

MVRP statistics
MRPDU received           : 3342
Invalid PDU received     : 0
New received             : 2
Join Empty received      : 1116
Join In received         : 2219
Empty received           : 2
In received              : 2
Leave received            : 1
LeaveAll received         : 1117
MRPDU transmitted       : 3280
MRPDU transmit failures : 0

```

```

New transmitted           : 0
Join Empty transmitted    : 1114
Join In transmitted      : 2163
Empty transmitted        : 1
In transmitted           : 1
Leave transmitted         : 1
LeaveAll transmitted      : 1111

```

**Meaning** The output of **show mvrp** shows that interface **xe-0/1/1.0** is enabled for MVRP participation as shown in the status in the **Interface based configuration** field.

The output for **show mvrp statistics interface xe-0/1/1.0** confirms that MVRP messages are being transmitted and received on the interface.

**NOTE:** You can identify an MVRP compatibility issue on EX Series switches by looking at the output from this command. If *Join Empty received* and *Join In received* incorrectly display zero, even though the value for *MRPDU received* has been increased, you are probably running different versions of Junos OS, including Release 11.3, on the switches in this network. Another indication that MVRP is having a version problem is that unexpected VLAN activity, such as multiple VLAN creation, takes place on the switch running the earlier release version. To remedy these problems, see *Configuring Multiple VLAN Registration Protocol (MVRP) (CLI Procedure)*.

| <b>Release Information</b> | Command introduced in Junos OS Release 9.3 for EX Series switches.<br>Command introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>         | <div>  <p><b>NOTE:</b> On a QFabric system, using this command on an FCoE-enabled VLAN when FCoE sessions are active can cause traffic flooding and FCoE traffic drop. The FCoE sessions are not terminated and the traffic reconverges after a short period of time.</p> </div> <p>Clear learned entries, which are media access control (MAC) addresses, in the Ethernet switching table (also called the forwarding database table).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| <b>Options</b>             | <p><b>none</b>—Clear learned entries in the Ethernet switching table, except for persistent MAC addresses.</p> <p><b>interface <i>interface-name</i></b>—(Optional) Clear all learned MAC addresses for the specified interface from the Ethernet switching table.</p> <p><b>mac <i>mac-address</i></b>—(Optional) Clear the specified learned MAC address from the Ethernet switching table.</p> <p><b>management-vlan</b>—(Optional) Clear all MAC addresses learned for the management VLAN from the Ethernet switching table. Note that you do not specify a VLAN name because only one management VLAN exists.</p> <p><b>persistent-mac &lt;<i>interface</i>   <i>mac-address</i>&gt;</b>—(Optional) Clear all MAC addresses, including persistent MAC addresses. Use the <b>interface</b> option to clear all MAC addresses on an interface, or use the <b>mac-address</b> option to clear all entries for a specific MAC address.</p> <p>Use this command whenever you move a device in your network that has a persistent MAC address on the switch. If you move the device to another port on the switch and do not clear the persistent MAC address from the original port it was learned on, then the new port will not learn the MAC address and the device will not be able to connect. If the original port is down when you move the device, then the new port</p> |

will learn the MAC address and the device can connect—however, unless you cleared the MAC address on the original port, when the port comes back up, the system reinstalls the persistent MAC address in the forwarding table for that port. If this occurs, the address is removed from the new port and the device loses connectivity.

**vlan *vlan-name***—(Optional) Clear all MAC addresses learned for the specified VLAN from the Ethernet switching table.

| <b>Output Fields</b>            | Table 175 on page 2361 lists the output fields for the <b>show ethernet-switching layer2-protocol-tunneling interface</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                              |

Table 175: show ethernet-switching layer2-protocol-tunneling interface Output Fields

| Field Name         | Field Description                                                                                                                                                                                                                                                                                                                                 |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Interface</b>   | Name of an interface on the switch.                                                                                                                                                                                                                                                                                                               |
| <b>Operation</b>   | Type of operation being performed on the interface. Values are <b>Encapsulation</b> and <b>Decapsulation</b> .                                                                                                                                                                                                                                    |
| <b>State</b>       | State of the interface. Values are <b>active</b> and <b>shutdown</b> .                                                                                                                                                                                                                                                                            |
| <b>Description</b> | If the interface state is <b>shutdown</b> , displays why the interface is shut down. If the description says <b>Loop detected</b> , it means that the interface is an access interface that has received L2PT-enabled PDUs. Access interfaces should not receive L2PT-enabled PDUs. This scenario might mean that there is a loop in the network. |

## Sample Output

### show ethernet-switching layer2-protocol-tunneling interface

```
user@switch> show ethernet-switching layer2-protocol-tunneling interface
```

Layer2 Protocol Tunneling information:

| Interface  | Operation     | State    | Description                 |
|------------|---------------|----------|-----------------------------|
| xe-0/0/0.0 | Encapsulation | Shutdown | Shutdown threshold exceeded |
| xe-0/0/1.0 | Decapsulation | Shutdown | Loop detected               |
| xe-0/0/2.0 | Decapsulation | Active   |                             |

### show ethernet-switching layer2-protocol-tunneling interface xe-0/0/0.0

```
user@switch> show ethernet-switching layer2-protocol-tunneling interface xe-0/0/0.0
```

Layer2 Protocol Tunneling information:

| Interface  | Operation     | State    | Description                 |
|------------|---------------|----------|-----------------------------|
| xe-0/0/0.0 | Encapsulation | Shutdown | Shutdown threshold exceeded |

## show ethernet-switching layer2-protocol-tunneling statistics

|                                                                                                                                                                                                                                                                            |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>VLAN</b>      | Name of a VLAN on which L2PT has been configured.                                                                                                                                                                                                                        |
| <b>Interface</b> | Name of an interface on which L2PT has been configured.                                                                                                                                                                                                                  |
| <b>Protocol</b>  | Name of a protocol for which L2PT has been enabled. Values are <b>all</b> , <b>802.1x</b> , <b>802.3ah</b> , <b>cdp</b> , <b>e-lmi</b> , <b>gvrp</b> , <b>lACP</b> , <b>lldp</b> , <b>mmrp</b> , <b>mvrp</b> , <b>stp</b> , <b>udld</b> , <b>vstp</b> , and <b>vtp</b> . |
| <b>Operation</b> | Type of operation being performed on the interface. Values are <b>Encapsulation</b> and <b>Decapsulation</b> .                                                                                                                                                           |
| <b>Packets</b>   | Number of packets that have been encapsulated or de-encapsulated.                                                                                                                                                                                                        |
| <b>Drops</b>     | Number of packets that have exceeded the drop threshold and have been dropped.                                                                                                                                                                                           |
| <b>Shutdowns</b> | Number of times that packets have exceeded the shutdown threshold and the interface has been shut down.                                                                                                                                                                  |

## Sample Output

### show ethernet-switching layer2-protocol-tunneling statistics

```
user@switch> show ethernet-switching layer2-protocol-tunneling statistics
```

```
Layer2 Protocol Tunneling Statistics:
VLAN  Interface  Protocol  Operation  Packets  Drops  Shutdowns
v1    xe-0/0/0.0  mvrp     Encapsulation  0        0        0
v1    xe-0/0/1.0  mvrp     Decapsulation  0        0        0
v1    xe-0/0/2.0  mvrp     Decapsulation  60634    0        0

| <b>Output Fields</b>            | Table 177 on page 2366 lists the output fields for the <b>show ethernet-switching layer2-protocol-tunneling vlan</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                              |

Table 177: show ethernet-switching layer2-protocol-tunneling vlan Output Fields

| Field Name                | Field Description                                                                                                                                                                                                                                          |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>VLAN</b>               | Name of the VLAN on which L2PT has been configured.                                                                                                                                                                                                        |
| <b>Protocol</b>           | Name of a protocol for which L2PT has been enabled. Values are <b>all</b> , <b>802.1x</b> , <b>802.3ah</b> , <b>cdp</b> , <b>e-lmi</b> , <b>gvrp</b> , <b>lacp</b> , <b>lldp</b> , <b>mmrp</b> , <b>mvrp</b> , <b>stp</b> , <b>vstp</b> , and <b>vtp</b> . |
| <b>Drop Threshold</b>     | Maximum number of Layer 2 PDUs of the specified protocol that can be received per second on the VLAN before the switch begins dropping the Layer 2 PDUs.                                                                                                   |
| <b>Shutdown Threshold</b> | Maximum number of Layer 2 PDUs of the specified protocol that can be received per second on the VLAN before the interface is disabled.                                                                                                                     |

## Sample Output

### show ethernet-switching layer2-protocol-tunneling vlan

```
user@switch> show ethernet-switching layer2-protocol-tunneling vlan
```

```
Layer2 Protocol Tunneling VLAN information:
VLAN          Protocol      Drop          Shutdown
                Threshold Threshold
v1             mvrp          100           200
v2             cdp            0             0
v2             cdp            0             0
v2             gvrp           0             0
```

### show ethernet-switching layer2-protocol-tunneling vlan v2

```
user@switch> show ethernet-switching layer2-protocol-tunneling vlan v2
```

```
Layer2 Protocol Tunneling VLAN information:
VLAN          Protocol      Drop          Shutdown
                Threshold Threshold
v2             cdp            0             0
v2             cdp            0             0
v2             gvrp           0             0
```

## show ethernet-switching mac-learning-log

|                                 |                                                                                                                                                                                           |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| <b>Output Fields</b>            | Table 178 on page 2368 lists the output fields for the <b>show ethernet-switching mac-learning-log</b> command. Output fields are listed in the approximate order in which they appear.   |

Table 178: show ethernet-switching mac-learning-log Output Fields

| Field Name            | Field Description                                                                                                                                                                                                                                                                             |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Date and Time</b>  | Timestamp in UTC when the MAC operation occurred.                                                                                                                                                                                                                                             |
| <b>vlan_name</b>      | VLAN name. A value defined by the user for all user-configured VLANs. The name of the VLAN on which the MAC is learned.                                                                                                                                                                       |
| <b>MAC</b>            | Learned MAC address.                                                                                                                                                                                                                                                                          |
| <b>Event op</b>       | MAC address that are added, learned, deleted, changed or moved from one interface to another interface.                                                                                                                                                                                       |
| <b>Interface Name</b> | The name of the interface on which the MAC address is learned. When a MAC address is moved, there is another field with the name of the interface. The log displays the name of the interface from where the MAC address moved, and the name of the interface to where the MAC address moved. |
| <b>Flags</b>          | Displays the MAC address flags in which the MAC event occurred. This option is for debugging purposes.                                                                                                                                                                                        |

## Sample Output

### show ethernet-switching mac-learning-log

```

user@switch> show ethernet-switching mac-learning-log
Mon Jun 30 13:49:49 2014 vlan_name v11+11 mac 00:10:94:00:00:02 was learned on
ge-1/0/22.0 with flags: 0x2001f << MAC address that as dynamically learned
Mon Jun 30 13:50:29 2014 vlan_name v11+11 mac 00:10:94:00:00:02 was deleted from
ge-1/0/22.0 with flags: 0x1080 << MAC address that was deleted
Mon Jun 30 13:51:28 2014 vlan_name v11+11 mac 00:00:00:01:01:01 was added to
ge-1/0/22.0 with flags: 0x2013f << Static MAC address that was added
Mon Jun 30 13:51:46 2014 vlan_name v11+11 mac 00:00:00:01:01:01 was deleted from

```

```
ge-1/0/22.0 with flags: 0x1120 << delete of Static MAC address that was deleted
Mon Jun 30 13:52:03 2014 vlan_name v11+11 mac 00:10:94:00:00:02 was learned on
ge-1/0/22.0 with flags: 0x2001f << MAC address that was dynamically learned
Mon Jun 30 13:52:11 2014 vlan_name v11+11 mac 00:10:94:00:00:02 was moved from
ge-1/0/22.0 to ge-1/0/21.0 with flags: 0x2101f << MAC address that was moved
Mon Jun 30 13:54:24 2014 vlan_name v11+11 mac 00:10:94:00:00:02 was changed on
ge-1/0/21.0 with flags: 0x2113f << MAC address that changed from a dynamic
address to a static address
```

**Table 180: show ethernet-switching statistics aging Output Fields**

| Field Name                         | Field Description                                                                                                                                                                                                                                                                                                                                                                   | Level of Output |
|------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Total age messages received</b> | Total number of aging messages received from the hardware.                                                                                                                                                                                                                                                                                                                          | All levels      |
| <b>Immediate aging</b>             | Aging message indicating that the entry should be removed immediately.                                                                                                                                                                                                                                                                                                              | All levels      |
| <b>MAC address seen</b>            | Aging message indicating that the MAC address has been detected by hardware and that the aging timer should be stopped.                                                                                                                                                                                                                                                             | All levels      |
| <b>MAC address not seen</b>        | Aging message indicating that the MAC address has not been detected by the hardware and that the aging timer should be started.                                                                                                                                                                                                                                                     | All levels      |
| <b>Error age messages</b>          | The received aging message contains the following errors: <ul style="list-style-type: none"> <li>• <b>Invalid VLAN</b>—The VLAN of the packet does not exist.</li> <li>• <b>No such entry</b>—The MAC address and VLAN pair provided by the aging message does not exist.</li> <li>• <b>Static entry</b>—An unsuccessful attempt was made to age out a static MAC entry.</li> </ul> | All levels      |

## Sample Output

### show ethernet-switching statistics aging

```
user@switch> show ethernet-switching statistics aging
```

```
Total age messages received: 0
```

```
Immediate aging: 0, MAC address seen: 0, MAC address not seen: 0
```

```
Error age messages: 0
```

```
Invalid VLAN: 0, No such entry: 0, Static entry: 0
```

## show ethernet-switching statistics mac-learning

| <b>Input errors</b>       | <p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle.</li> <li>• <b>L3 incompletes</b>—Number of incoming packets discarded because they failed Layer 3 sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored if you configure the <b>ignore-l3-incompletes</b> statement.</li> <li>• <b>L2 channel errors</b>—Number of times the software did not find a valid logical interface for an incoming frame.</li> <li>• <b>L2 mismatch timeouts</b>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b>        |

Table 183: show interfaces xe Output Fields (*continued*)

| Field Name                      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Level of Output         |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Output errors</b>            | <p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Collisions</b>—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug.</li> <li>• <b>Aged packets</b>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>HS link CRC errors</b>—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b>        |
| <b>Egress queues</b>            | Total number of egress queues supported on the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>detail extensive</b> |
| <b>Queue counters (Egress)</b>  | <p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>detail extensive</b> |
| <b>Queue Number</b>             | The CoS queue number and the forwarding classes mapped to the queue number. The <b>Mapped forwarding class</b> column lists the forwarding classes mapped to each CoS queue.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>detail extensive</b> |
| <b>Ingress queues</b>           | Total number of ingress queues supported on the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <b>extensive</b>        |

| <b>Active alarms and Active defects</b> | <p>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the switch configuration, an alarm can ring the red or yellow alarm bell on the switch, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value <b>None</b> or <b>Link</b>.</p> <ul style="list-style-type: none"> <li>• <b>None</b>—There are no active defects or alarms.</li> <li>• <b>Link</b>—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive none</b> |
| <b>PCS statistics</b>                   | Physical Coding Sublayer (PCS) fault conditions from the LAN PHY device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>detail extensive</b>      |
| <b>MAC statistics</b>                   | <p>Receive and Transmit statistics reported by the PIC's MAC subsystem.</p> <ul style="list-style-type: none"> <li>• <b>Total octets and total packets</b>—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type.</li> <li>• <b>Unicast packets, Broadcast packets, and Multicast packets</b>—Number of unicast, broadcast, and multicast packets.</li> <li>• <b>CRC/Align errors</b>—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</li> <li>• <b>FIFO error</b>—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>MAC control frames</b>—Number of MAC control frames.</li> <li>• <b>MAC pause frames</b>—Number of MAC control frames with <b>pause</b> operational code.</li> <li>• <b>Oversized frames</b>—Number of packets that exceeds the configured MTU.</li> <li>• <b>Jabber frames</b>—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</li> <li>• <b>Fragment frames</b>—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runs (which are normal occurrences caused by collisions) and noise hits are counted.</li> <li>• <b>VLAN tagged frames</b>—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not. This counter is not supported on EX Series switches and is always displayed as 0.</li> <li>• <b>Code violations</b>—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error."</li> </ul> | <b>extensive</b>             |
| <b>Filter statistics</b>                | Receive and Transmit statistics reported by the PIC's MAC address filter subsystem.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>extensive</b>             |

Table 183: show interfaces xe Output Fields (*continued*)

| Field Name                  | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Level of Output |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Autonegotiation information | <p>Information about link autonegotiation.</p> <ul style="list-style-type: none"> <li>• <b>Negotiation status:</b> <ul style="list-style-type: none"> <li>• <b>Incomplete</b>—Ethernet interface has the speed or link mode configured.</li> <li>• <b>No autonegotiation</b>—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation.</li> <li>• <b>Complete</b>—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.</li> </ul> </li> <li>• <b>Link partner status</b>—OK when the Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.</li> <li>• <b>Link partner:</b> <ul style="list-style-type: none"> <li>• <b>Link mode</b>—Depending on the capability of the attached Ethernet device, either <b>Full-duplex</b> or <b>Half-duplex</b>.</li> <li>• <b>Flow control</b>—Types of flow control supported by the remote Ethernet device. For Fast Ethernet interfaces, the type is <b>None</b>. For Gigabit Ethernet interfaces, types are <b>Symmetric</b> (link partner supports <b>PAUSE</b> on receive and transmit), <b>Asymmetric</b> (link partner supports <b>PAUSE</b> on transmit), and <b>Symmetric/Asymmetric</b> (link partner supports both <b>PAUSE</b> on receive and transmit or only <b>PAUSE</b> receive).</li> <li>• <b>Remote fault</b>—Remote fault information from the link partner—<b>Failure</b> indicates a receive link error. <b>OK</b> indicates that the link partner is receiving. <b>Negotiation error</b> indicates a negotiation error. <b>Offline</b> indicates that the link partner is going offline.</li> </ul> </li> <li>• <b>Local resolution:</b> <ul style="list-style-type: none"> <li>• <b>Flow control</b>—Types of flow control supported by the remote Ethernet device. For Gigabit Ethernet interfaces, types are <b>Symmetric</b> (link partner supports <b>PAUSE</b> on receive and transmit), <b>Asymmetric</b> (link partner supports <b>PAUSE</b> on transmit), and <b>Symmetric/Asymmetric</b> (link partner supports both <b>PAUSE</b> on receive and transmit or only <b>PAUSE</b> receive). For asymmetric <b>PAUSE</b>, shows if the <b>PAUSE</b> transmit and <b>PAUSE</b> receive states on the interface are <b>enable</b> or <b>disable</b>.</li> <li>• <b>Remote fault</b>—Remote fault information. <b>Link OK</b> (no error detected on receive), <b>Offline</b> (local interface is offline), and <b>Link Failure</b> (link error detected on receive).</li> </ul> </li> </ul> | extensive       |

Table 183: show interfaces xe Output Fields (*continued*)

| Field Name                                    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Level of Output              |
|-----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Packet Forwarding Engine configuration</b> | Information about the configuration of the Packet Forwarding Engine: <ul style="list-style-type: none"> <li><b>Destination slot</b>—FPC slot number.</li> <li><b>CoS transmit queue</b>—Queue number and its associated user-configured forwarding class name.</li> <li><b>Bandwidth %</b>—Percentage of bandwidth allocated to the queue.</li> <li><b>Bandwidth bps</b>—Bandwidth allocated to the queue (in bps).</li> <li><b>Buffer %</b>—Percentage of buffer space allocated to the queue.</li> <li><b>Buffer usec</b>—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time.</li> <li><b>Priority</b>—Queue priority: <b>low</b> or <b>high</b>.</li> <li><b>Limit</b>—Displayed if rate limiting is configured for the queue. Possible values are <b>none</b> and <b>exact</b>. If <b>exact</b> is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If <b>none</b> is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.</li> </ul> | <b>extensive</b>             |

## show spanning-tree bridge

**List of Syntax** [Syntax on page 2402](#)  
[Syntax \(QFX Series\) on page 2402](#)

**Syntax** show spanning-tree bridge  
 <brief | detail>  
 <msti *msti-id*>  
 <routing-instance *routing-instance-name*>  
 <vlan-id *vlan-id*>

**Syntax (QFX Series)** show spanning-tree bridge  
 <brief | detail>  
 <msti *msti-id*>  
 <vlan-id *vlan-id*>

**Release Information** Command introduced in Junos OS Release 8.4.  
 Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Display the configured or calculated Spanning Tree Protocol (STP) parameters.

**Options** **none**—(Optional) Display brief STP bridge information for all multiple spanning-tree instances (MSTIs).  
**brief | detail**—(Optional) Display the specified level of output.  
**msti *msti-id***—(Optional) Display STP bridge information for the specified MSTI.  
**routing-instance *routing-instance-name***—(Optional) Display STP bridge information for the specified routing instance.  
**vlan-id *vlan-id***—(Optional) Display STP bridge information for the specified VLAN.

**Required Privilege Level** view

**List of Sample Output** [show spanning-tree bridge routing-instance on page 2403](#)  
[show spanning-tree bridge msti on page 2404](#)  
[show spanning-tree bridge vlan-id \(MSTP\) on page 2405](#)  
[show spanning-tree bridge \(RSTP\) on page 2405](#)  
[show spanning-tree bridge vlan-id \(RSTP\) on page 2406](#)

**Output Fields** [Table 184 on page 2402](#) lists the output fields for the **show spanning-tree bridge** command. Output fields are listed in the approximate order in which they appear.

**Table 184: show spanning-tree bridge Output Fields**

| Field Name            | Field Description                                                  |
|-----------------------|--------------------------------------------------------------------|
| Routing instance name | Name of the routing instance under which the bridge is configured. |
| Enabled protocol      | Spanning Tree Protocol type enabled.                               |

Table 184: show spanning-tree bridge Output Fields (*continued*)

| Field Name                      | Field Description                                                                                                                               |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| Root ID                         | Bridge ID of the elected spanning-tree root bridge. The bridge ID consists of a configurable bridge priority and the MAC address of the bridge. |
| Root cost                       | Calculated cost to reach the root bridge from the bridge where the command is entered.                                                          |
| Root port                       | Interface that is the current elected root port for this bridge.                                                                                |
| CIST regional root              | Bridge ID of the elected MSTP regional root bridge.                                                                                             |
| CIST internal root cost         | Calculated cost to reach the regional root bridge from the bridge where the command is entered.                                                 |
| Hello time                      | Configured number of seconds between transmissions of configuration bridge protocol data units (BPDUs).                                         |
| Maximum age                     | Configured maximum expected arrival time of hello bridge protocol data units (BPDUs).                                                           |
| Forward delay                   | How long an STP bridge port remains in the listening and learning states before transitioning to the forwarding state.                          |
| Hop count                       | Configured maximum number of hops a BPDU can be forwarded in the MSTP region.                                                                   |
| Message age                     | Number of elapsed seconds since the most recent BPDU was received.                                                                              |
| Number of topology changes      | Total number of STP topology changes detected since the routing device last booted.                                                             |
| Time since last topology change | Number of elapsed seconds since the most recent topology change.                                                                                |
| Bridge ID (Local)               | Locally configured bridge ID. The bridge ID consists of a configurable bridge priority and the MAC address of the bridge.                       |
| Extended system ID              | System identifier.                                                                                                                              |
| MSTI regional root              | Bridge ID of the elected MSTP regional root bridge.                                                                                             |

## Sample Output

### show spanning-tree bridge routing-instance

```

user@host> show spanning-tree bridge routing-instance vs1 detail
STP bridge parameters
Routing instance name       : vs1
Enabled protocol           : MSTP

```

```
STP bridge parameters for CIST
  Root ID                : 32768.00:13:c3:9e:c8:80
  Root cost               : 0

**Table 185: show spanning-tree Interface Output Fields**

| Field Name            | Field Description                                                             |
|-----------------------|-------------------------------------------------------------------------------|
| <b>Interface name</b> | Interface configured to participate in the STP, RSTP, VSTP, or MSTP instance. |

Table 185: show spanning-tree Interface Output Fields (*continued*)

| Field Name                  | Field Description                                                                                                                                                     |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Port ID</b>              | Logical interface identifier configured to participate in the MSTP or VSTP instance.                                                                                  |
| <b>Designated port ID</b>   | Port ID of the designated port for the LAN segment to which this interface is attached.                                                                               |
| <b>Designated bridge ID</b> | Bridge ID of the designated bridge for the LAN segment to which this interface is attached.                                                                           |
| <b>Port Cost</b>            | Configured cost for the interface.                                                                                                                                    |
| <b>Port State</b>           | STP port state: forwarding ( <b>FWD</b> ), blocking ( <b>BLK</b> ), listening, learning, or disabled.                                                                 |
| <b>Port Role</b>            | MSTP, VSTP, or RSTP port role: designated ( <b>DESG</b> ), backup ( <b>BKUP</b> ), alternate ( <b>ALT</b> ), ( <b>ROOT</b> ), or Root Prevented ( <b>Root-Prev</b> ). |
| <b>Link type</b>            | MSTP, VSTP, or RSTP link type. Shared or point-to-point (pt-pt) and edge or nonedge.                                                                                  |
| <b>Alternate</b>            | Identifies the interface as an MSTP, VSTP, or RSTP alternate root port ( <b>Yes</b> ) or nonalternate root port ( <b>No</b> ).                                        |
| <b>Boundary Port</b>        | Identifies the interface as an MSTP regional boundary port ( <b>Yes</b> ) or nonboundary port ( <b>No</b> ).                                                          |

## Sample Output

### show spanning-tree interface

```
user@host> show spanning-tree interface routing-instance vs1 detail
Spanning tree interface parameters for instance 0
```

**Table 186: show spanning-tree mstp configuration Output Fields**

| Field Name                  | Field Description                                                |
|-----------------------------|------------------------------------------------------------------|
| <b>Context id</b>           | Internally generated identifier.                                 |
| <b>Region name</b>          | MSTP region name carried in the MSTP BPDUs.                      |
| <b>Revision</b>             | Revision number of the MSTP configuration.                       |
| <b>Configuration digest</b> | Numerical value derived from the VLAN-to-instance mapping table. |
| <b>MSTI</b>                 | MST instance identifier.                                         |
| <b>Member VLANs</b>         | VLAN identifiers associated with the MSTI.                       |

## Sample Output

### show spanning-tree mstp configuration detail

```
user@host> show spanning-tree mstp configuration routing-instance vs1 detail
MSTP configuration information
Context identifier      : 1
Region name            : henry
Revision               : 3
Configuration digest    : 0x6da4b5c4fd587757eef35675365e1

MSTI      Member VLANs
  0 0-99,101-199,201-4094
  1 100
  2 200
```

### show spanning-tree mstp configuration detail (QFX Series)

```
user@1f0> show spanning-tree mstp configuration routing-instance vs1 detail
MSTP configuration information
Context identifier      : 1
Region name            : henry
Revision               : 3
Configuration digest    : 0x6da4b5c4fd587757eef35675365e1

MSTI      Member VLANs
  0 0-99,101-199,201-4094
  1 100
  2 200
```

## show spanning-tree statistics

|                                                     |                                                                                                                                                                                                                                                                                                                                                                             |

Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                |

**Table 187: show spanning-tree statistics Output Fields**

| Field Name                      | Field Description                                     |
|---------------------------------|-------------------------------------------------------|
| Message type                    | Type of message being counted.                        |
| BPDUs sent                      | Total number of BPDUs sent.                           |
| BPDUs received                  | Total number of BPDUs received.                       |
| BPDUs sent in last interval     | Number of BPDUs sent within a specified interval.     |
| BPDUs received in last interval | Number of BPDUs received within a specified interval. |

Table 187: show spanning-tree statistics Output Fields (*continued*)

| Field Name                    | Field Description                                              |
|-------------------------------|----------------------------------------------------------------|
| <b>Interface</b>              | Interface for which the statistics are being displayed.        |
| <b>Next BPDU transmission</b> | Number of seconds until the next BPDU is scheduled to be sent. |

## Sample Output

### show spanning-tree statistics routing-instance

```

user@host> show spanning-tree statistics routing-instance vs1 detail
Routing instance level STP statistics
Message type           : bpdus
BPDUs sent             : 1396
BPDUs received         : 1027
BPDUs sent in last interval : 5      (duration: 4 sec)
BPDUs received in last interval: 4    (duration: 4 sec)

```

### show spanning-tree statistics interface routing-instance detail

```

user@host> show spanning-tree statistics interface ge-11/1/4 routing-instance vs1 detail
Interface  BPDUs sent  BPDUs received  Next BPDU
                                     transmission
ge-11/1/4      7           190           0

```

## show system statistics arp

## show system statistics arp

```

user@switch> show system statistics arp
arp:
    90060 datagrams received
    34 ARP requests received
    610 ARP replies received
    0 resolution request received
    0 unrestricted proxy requests
    0 restricted proxy requests
    0 received proxy requests
    0 unrestricted proxy requests not proxied
    0 restricted proxy requests not proxied
    0 datagrams with bogus interface
    0 datagrams with incorrect length
    0 datagrams for non-IP protocol
    0 datagrams with unsupported op code
    0 datagrams with bad protocol address length
    0 datagrams with bad hardware address length
    0 datagrams with multicast source address
    0 datagrams with multicast target address
    0 datagrams with my own hardware address
    0 datagrams for an address not on the interface
    0 datagrams with a broadcast source address
    294 datagrams with source address duplicate to mine
    89113 datagrams which were not for me
    0 packets discarded waiting for resolution
    0 packets sent after waiting for resolution
    309 ARP requests sent
    35 ARP replies sent
    0 requests for memory denied
    0 requests dropped on entry
    0 requests dropped during retry
    0 requests dropped due to interface deletion
    0 requests on unnumbered interfaces
    0 new requests on unnumbered interfaces
    0 replies for from unnumbered interfaces
    0 requests on unnumbered interface with non-subnetted donor
    0 replies from unnumbered interface with non-subnetted donor

```

## show vlans

---

**Syntax**    `show vlans`  
              `<brief | detail | extensive>`  
              `<dot1q-tunneling>`  
              `<sort-by (tag | name)>`  
              `<vlan-range-name>`

**Release Information**    Command introduced in Junos OS Release 11.1 for the QFX Series.  
                              Option **dot1q-tunneling** added in Junos OS Release 12.1 for the QFX Series.

**Description**    Display information about VLANs configured on bridged Ethernet interfaces. For interfaces configured to support a VoIP VLAN and a data VLAN, the **show vlans** command displays both tagged and untagged membership for those VLANs.

**NOTE:** When a series of VLANs is created using the `vlan-range` statement, such VLAN names are preceded and followed by a double underscore. For example, a series of VLANs using the VLAN range 1 through 3 and the base VLAN name `marketing` would be displayed as `__marketing_1__`, `__marketing_2__`, and `__marketing_3__`.

---

**NOTE:** To display an 802.1X supplicant successfully authenticated in multiple-supplicant mode with dynamic VLAN movement, use the `show vlans vlan-name extensive` operational mode command, where *vlan-name* is the dynamic VLAN.

---

**Options**    **none**—Display information for all VLANs. VLAN information is displayed by VLAN name in ascending order.

**brief | detail | extensive**—(Optional) Display the specified level of output.

**sort-by (tag | name)**—(Optional) Display VLANs in ascending order of VLAN IDs or VLAN names.

**vlan-range-name**—(Optional) Display VLANs in ascending order of VLAN range names.

**Required Privilege Level**    view

## Troubleshooting Procedures

---

- [Troubleshooting Ethernet Switching on page 2427](#)

## Troubleshooting Ethernet Switching

**Problem**    **Description:** Sometimes a MAC address entry in the switch's Ethernet switching table is not updated after the device with that MAC address has been moved from one interface to another on the switch. Typically, the switch does not wait for a MAC address expiration when a MAC move operation occurs. As soon as the switch detects the MAC address on the new interface, it immediately updates the table. Many network devices send a gratuitous ARP packet when switching an IP address from one device to another. The switch updates its ARP cache table after receipt of such gratuitous ARP messages, and then it also updates its Ethernet switching table.

Sometimes silent devices, such as syslog servers or SNMP trap receivers that receive UDP traffic but do not return acknowledgment (ACK) messages to the traffic source, fail to send gratuitous ARP packets when a device moves. If such a move occurs when the system administrator is not available to explicitly clear the affected interfaces by issuing the **clear ethernet-switching table** command, the entry for the moved device in the Ethernet switching table is not updated.

**Solution**    Set up the switch to handle unattended MAC address switchovers.

1. Reduce the system-wide ARP aging timer. (By default, the ARP aging timer is set at 20 minutes. The range of the ARP aging timer is from 1 through 240 minutes.)

```
[edit system arp]
user@switch# set aging-timer 3
```

2. Set the MAC aging timer to the same value as the ARP timer. (By default, the MAC aging timer is set to 300 seconds. The range is 15 to 1,000,000 seconds.)

```
[edit vlans]
user@switch# set vlans sales mac-table-aging-time 180
```

The ARP entry and the MAC address entry for the moved device expire within the times specified by the aging timer values. After the entries expire, the switch sends a new ARP message to the IP address of the device. The device responds to the ARP message,

thereby refreshing the entries in the switch's ARP cache table and Ethernet switching table.

- [Understanding VRRP Between QFabric Systems on page 2448](#)

### Graceful Restart Concepts

With routing protocols, any service interruption requires that an affected router recalculate adjacencies with neighboring routers, restore routing table entries, and update other protocol-specific information. An unprotected restart of a router can result in forwarding delays, route flapping, wait times stemming from protocol reconvergence, and even dropped packets. The main benefits of graceful restart are uninterrupted packet forwarding and temporary suppression of all routing protocol updates. Graceful restart enables a router to pass through intermediate convergence states that are hidden from the rest of the network.

Three main types of graceful restart are available on Juniper Networks routing platforms:

- Graceful restart for aggregate and static routes and for routing protocols—Provides protection for aggregate and static routes and for Border Gateway Protocol (BGP), End System-to-Intermediate System (ES-IS), Intermediate System-to-Intermediate System (IS-IS), Open Shortest Path First (OSPF), Routing Information Protocol (RIP), next-generation RIP (RIPng), and Protocol Independent Multicast (PIM) sparse mode routing protocols.
- Graceful restart for MPLS-related protocols—Provides protection for Label Distribution Protocol (LDP), Resource Reservation Protocol (RSVP), circuit cross-connect (CCC), and translational cross-connect (TCC).
- Graceful restart for virtual private networks (VPNs)—Provides protection for Layer 2 and Layer 3 VPNs.

Graceful restart works similarly for routing protocols and MPLS protocols and combines components of these protocol types to enable graceful restart in VPNs. The main benefits of graceful restart are uninterrupted packet forwarding and temporary suppression of all routing protocol updates. Graceful restart thus enables a router to pass through intermediate convergence states that are hidden from the rest of the network.

Most graceful restart implementations define two types of routers—the restarting router and the helper router. The restarting router requires rapid restoration of forwarding state information so it can resume the forwarding of network traffic. The helper router assists the restarting router in this process. Graceful restart configuration statements typically affect either the restarting router or the helper router.

## Graceful Routing Engine Switchover System Requirements

Graceful Routing Engine switchover is supported on all routing (or switching) platforms that contain dual Routing Engines. All Routing Engines configured for graceful Routing Engine switchover must run the same Junos OS release. Hardware and software support for graceful Routing Engine switchover is described in the following sections:

- [Graceful Routing Engine Switchover Platform Support on page 2432](#)
- [Graceful Routing Engine Switchover Feature Support on page 2433](#)
- [Graceful Routing Engine Switchover DPC Support on page 2435](#)
- [Graceful Routing Engine Switchover and Subscriber Access on page 2435](#)
- [Graceful Routing Engine Switchover PIC Support on page 2435](#)

### Graceful Routing Engine Switchover Platform Support

To enable graceful Routing Engine switchover, your system must meet these minimum requirements:

- M20 and M40e routers—Junos OS Release 5.7 or later
- M10i router—Junos OS Release 6.1 or later
- M320 router—Junos OS Release 6.2 or later
- T320 router, T640 router, and TX Matrix router—Junos OS Release 7.0 or later

- M120 router—Junos OS Release 8.2 or later
- MX960 router—Junos OS Release 8.3 or later
- MX480 router—Junos OS Release 8.4 or later (8.4R2 recommended)
- MX240 router—Junos OS Release 9.0 or later
- PTX5000 router—Junos OS Release 12.1X48 or later
- Standalone T1600 router—Junos OS Release 8.5 or later
- Standalone T4000 router—Junos OS Release 12.1R2 or later
- TX Matrix Plus router—Junos OS Release 9.6 or later
- TX Matrix Plus router with 3D SIBs—Junos Release 13.1 or later
- EX Series switches with dual Routing Engines or in a Virtual Chassis — Junos OS Release 9.2 or later for EX Series switches
- QFX Series switches in a Virtual Chassis —Junos OS Release 13.2 or later for the QFX Series
- EX Series or QFX Series switches in a Virtual Chassis Fabric —Junos OS Release 13.2X51-D20 or later for the EX Series and QFX Series switches

For more information about support for graceful Routing Engine switchover, see the sections that follow.

### Graceful Routing Engine Switchover Feature Support

Graceful Routing Engine switchover supports most Junos OS features in Release 5.7 and later. Particular Junos OS features require specific versions of Junos OS. See [Table 189 on page 2433](#).

**Table 189: Graceful Routing Engine Switchover Feature Support**

| Application                                                                                                  | Junos OS Release               |
|--------------------------------------------------------------------------------------------------------------|--------------------------------|
| Aggregated Ethernet interfaces with Link Aggregation Control Protocol (LACP) and aggregated SONET interfaces | 6.2                            |
| Asynchronous Transfer Mode (ATM) virtual circuits (VCs)                                                      | 6.2                            |
| Logical systems                                                                                              | 6.3                            |
| <b>NOTE:</b> In Junos OS Release 9.3 and later, the logical router feature is renamed to logical system.     |                                |
| Multicast                                                                                                    | 6.4 (7.0 for TX Matrix router) |
| Multilink Point-to-Point Protocol (MLPPP) and Multilink Frame Relay (MLFR)                                   | 7.0                            |

**Table 189: Graceful Routing Engine Switchover Feature Support (*continued*)**

| Application                                                                                                                                                                                            | Junos OS Release |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| Automatic Protection Switching (APS)—The current active interface (either the designated working or the designated protect interface) remains the active interface during a Routing Engine switchover. | 7.4              |
| Point-to-multipoint Multiprotocol Label Switching MPLS LSPs (transit only)                                                                                                                             | 7.4              |
| Compressed Real-Time Transport Protocol (CRTP)                                                                                                                                                         | 7.6              |
| Virtual private LAN service (VPLS)                                                                                                                                                                     | 8.2              |
| Ethernet Operation, Administration, and Management (OAM) as defined by IEEE 802.3ah                                                                                                                    | 8.5              |
| Extended DHCP relay agent                                                                                                                                                                              | 8.5              |
| Ethernet OAM as defined by IEEE 802.1ag                                                                                                                                                                | 9.0              |
| Packet Gateway Control Protocol (PGCP) process (pgcpd) on Multiservices 500 PICs on T640 routers.                                                                                                      | 9.0              |
| Subscriber access                                                                                                                                                                                      | 9.4              |
| Layer 2 Circuit and LDP-based VPLS pseudowire redundant configuration                                                                                                                                  | 9.6              |

The following constraints apply to graceful Routing Engine switchover feature support:

- When graceful Routing Engine switchover and aggregated Ethernet interfaces are configured in the same system, the aggregated Ethernet interfaces must not be configured for fast-polling LACP. When fast polling is configured, the LACP polls time out at the remote end during the Routing Engine mastership switchover. When LACP polling times out, the aggregated link and interface are disabled. The Routing Engine mastership change is fast enough that standard and slow LACP polling do not time out during the procedure. However, note that this restriction does not apply to MX Series Routers that are running Junos OS Release 9.4 or later and have distributed periodic packet management (PPM) enabled—which is the default configuration—on them. In such cases, you can configure graceful Routing Engine switchover and have aggregated Ethernet interfaces configured for fast-polling LACP on the same device.
- When a graceful Routing Engine switchover occurs, the VRRP state does not change. VRRP is supported by graceful Routing Engine switchover only in the case that PPM delegation is enabled (which the default) and that VRRP is not running on logical interfaces like aggregate-interface (ae) or integrated-routing-bridging-interfaces (irb).

### Graceful Routing Engine Switchover DPC Support

Graceful Routing Engine switchover supports all Dense Port Concentrators (DPCs) on the MX Series 3D Universal Edge Routers running the appropriate version of Junos OS as shown in “[Graceful Routing Engine Switchover Platform Support](#)” on page 2432. For more information about DPCs, see the *MX Series DPC Guide*.

### Graceful Routing Engine Switchover and Subscriber Access

Graceful Routing Engine switchover currently supports most of the features directly associated with dynamic DHCP and dynamic PPPoE subscriber access. Graceful Routing Engine switchover also supports the unified in-service software upgrade (ISSU) for the DHCP access model and the PPPoE access model used by subscriber access.

### Graceful Routing Engine Switchover PIC Support

Graceful Routing Engine switchover is supported on most PICs, except for the services PICs listed in this section. The PIC must be on a supported routing platform running the appropriate version of Junos OS. For information about FPC types, FPC/PIC compatibility, and the initial Junos OS Release in which an FPC supported a particular PIC, see the PIC guide for your router platform.

The following constraints apply to graceful Routing Engine switchover support for services PICs:

- You can include the **graceful-switchover** statement at the **[edit chassis redundancy]** hierarchy level on a router with Adaptive Services, Multiservices, and Tunnel Services PICs configured on it and successfully commit the configuration. However, all services on these PICs—except the Layer 2 service packages and extension-provider and SDK applications on Multiservices PICs—are reset during a switchover.
- Graceful Routing Engine switchover is not supported on any Monitoring Services PICs or Multilink Services PICs. If you include the **graceful-switchover** statement at the **[edit chassis redundancy]** hierarchy level on a router with either of these PIC types configured on it and issue the **commit** command, the commit fails.
- Graceful Routing Engine switchover is not supported on Multiservices 400 PICs configured for monitoring services applications. If you include the **graceful-switchover** statement, the commit fails.

**NOTE:** When an unsupported PIC is online, you cannot enable graceful Routing Engine switchover. If graceful Routing Engine switchover is already enabled, an unsupported PIC cannot come online.

## Understanding Graceful Routing Engine Switchover

This topic contains the following sections:

- [Graceful Routing Engine Switchover Concepts on page 2436](#)
- [Effects of a Routing Engine Switchover on page 2440](#)

### Graceful Routing Engine Switchover Concepts

---

The graceful Routing Engine switchover (GRES) feature in Junos OS enables a routing platform with redundant Routing Engines to continue forwarding packets, even if one Routing Engine fails. GRES preserves interface and kernel information. Traffic is not interrupted. However, GRES does not preserve the control plane.

**NOTE:** On T Series routers, TX Matrix routers, and TX Matrix Plus routers, the control plane is preserved in case of GRES with nonstop active routing (NSR), and nearly 75 percent of line rate worth of traffic per Packet Forwarding Engine remains uninterrupted during GRES.

---

Neighboring routers detect that the router has experienced a restart and react to the event in a manner prescribed by individual routing protocol specifications.

To preserve routing during a switchover, GRES must be combined with either:

- Graceful restart protocol extensions
- Nonstop active routing

Any updates to the master Routing Engine are replicated to the backup Routing Engine as soon as they occur.

Mastership switches to the backup Routing Engine if:

- The master Routing Engine kernel stops operating.
- The master Routing Engine experiences a hardware failure.
- The administrator initiates a manual switchover,

**NOTE:** To quickly restore or to preserve routing protocol state information during a switchover, GRES must be combined with either graceful restart or nonstop active routing, respectively. For more information about graceful restart, see [“Graceful Restart Concepts” on page 2431](#). For more information about nonstop active routing, see *Nonstop Active Routing Concepts*.

---

If the backup Routing Engine does not receive a keepalive from the master Routing Engine after 2 seconds (4 seconds on M20 routers), it determines that the master Routing Engine has failed and: takes mastership.

The Packet Forwarding Engine:

- Seamlessly disconnects from the old master Routing Engine
- Reconnects to the new master Routing Engine
- Does not reboot
- Does not interrupt traffic

The new master Routing Engine and the Packet Forwarding Engine then become synchronized. If the new master Routing Engine detects that the Packet Forwarding Engine state is not up to date, it resends state update messages.

**NOTE:** If adjacencies between the restarting router and the neighboring peer 'helper' routers time out, graceful restart protocol extensions are unable to notify the peer 'helper' routers about the impending restart. Graceful restart can then stop and cause interruptions in traffic.

To ensure that these adjacencies are kept, change the **hold-time** for IS-IS protocols from the default of 27 seconds to a value higher than 40 seconds.

**NOTE:** Successive Routing Engine switchover events must be a minimum of 240 seconds (4 minutes) apart after both Routing Engines have come up.

If the router or switch displays a warning message similar to Standby Routing Engine is not ready for graceful switchover. Packet Forwarding Engines that are not ready for graceful switchover might be reset . Do not attempt switchover. If you choose to proceed with switchover, only the Packet Forwarding Engines that were not ready for graceful switchover are reset. None of the FPCs should spontaneously restart. We recommend that you wait until the warning no longer appears and then proceed with the switchover.

**NOTE:** In a routing matrix with TX Matrix Plus router with 3D SIBs, for successive Routing Engine switchover, events must be a minimum of 900 seconds (15 minutes) apart after both Routing Engines have come up.

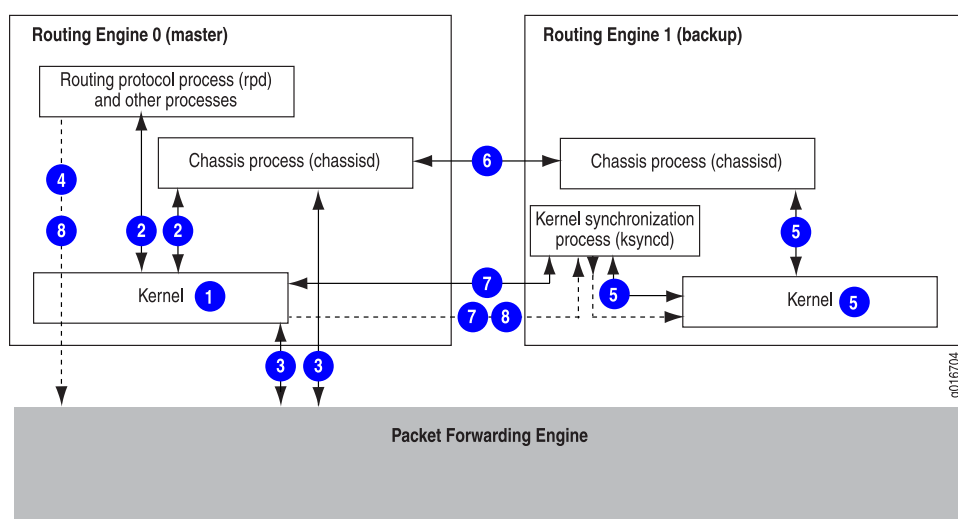

GRES must be performed on one line-card chassis (LCC) (of a TX Matrix router with 3D SIBs) at a time to avoid synchronization issues.

**NOTE:**

- We do *not* recommend performing a commit operation on the backup Routing Engine when GRES is enabled on the router or switch.
- We do *not* recommend enabling GRES on the backup Routing Engine in *any* scenario.

Figure 76 on page 2438 shows the system architecture of graceful Routing Engine switchover and the process a routing platform follows to prepare for a switchover.

**Figure 76: Preparing for a Graceful Routing Engine Switchover**

**NOTE:** Check GRES readiness by executing both:

- The `request chassis routing-engine master switch check` command from the master Routing Engine
- The `show system switchover` command from the Backup Routing Engine

The switchover preparation process for GRES is as follows:

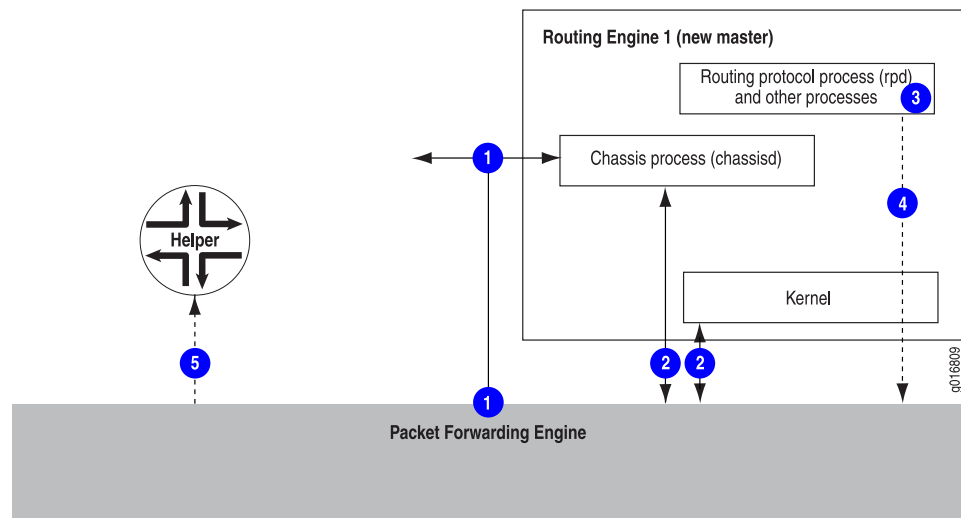

1. The master Routing Engine starts.
2. The routing platform processes (such as the chassis process [chassisd]) start.
3. The Packet Forwarding Engine starts and connects to the master Routing Engine.
4. All state information is updated in the system.
5. The backup Routing Engine starts.
6. The system determines whether GRES has been enabled.

7. The kernel synchronization process (ksyncd) synchronizes the backup Routing Engine with the master Routing Engine.
8. After ksyncd completes the synchronization, all state information and the forwarding table are updated.

Figure 77 on page 2439 shows the effects of a switchover on the routing (or switching) platform.

**Figure 77: Graceful Routing Engine Switchover Process**

When a switchover occurs, the switchover process is as follows:

1. When keepalives from the master Routing Engine are lost, the system switches over gracefully to the backup Routing Engine.
2. The Packet Forwarding Engine connects to the backup Routing Engine, which becomes the new master.
3. Routing platform processes that are not part of GRES (such as the routing protocol process [rpd]) restart.
4. State information learned from the point of the switchover is updated in the system.
5. If configured, graceful restart protocol extensions collect and restore routing information from neighboring peer *helper* routers.

**NOTE:** On T Series and M320 routers during GRES, the Switch Interface Boards (SIBs) are taken offline and restarted one by one. This is done to provide the Switch Processor Mezzanine Board (SPMB) that manages the SIB enough time to populate state information for its associated SIB. However, on a fully populated chassis where all FPCs are sending traffic at full line rate, there might be momentary packet loss during the switchover.

**NOTE:** When GRES is configured and the `restart chassis-control` command is executed on a TX Matrix Plus router with 3D SIBs, we cannot ascertain which Routing Engine becomes the master. This is because the `chassisd` process restarts with the execution of the `restart chassis-control` command. The `chassisd` process is responsible for maintaining and retaining mastership and when it is restarted, the new `chassisd` is processed based on the router or switch load. As a result, any one of the Routing Engines is made the master.

### Effects of a Routing Engine Switchover

Table 190 on page 2440 describes the effects of a Routing Engine switchover when different features are enabled:

- No high availability features
- Graceful Routing Engine switchover
- Graceful restart
- Nonstop active routing

**Table 190: Effects of a Routing Engine Switchover**

| Feature                                         | Benefits                                                                                                                                                                                                               | Considerations                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dual Routing Engines only (no features enabled) | <ul style="list-style-type: none"> <li>• When the switchover to the new master Routing Engine is complete, routing convergence takes place and traffic is resumed.</li> </ul>                                          | <ul style="list-style-type: none"> <li>• All physical interfaces are taken offline.</li> <li>• Packet Forwarding Engines restart.</li> <li>• The standby Routing Engine restarts the routing protocol process (rpd).</li> <li>• All hardware and interfaces are discovered by the new master Routing Engine.</li> <li>• The switchover takes several minutes.</li> <li>• All of the router's adjacencies are aware of the physical (interface alarms) and routing (topology) changes.</li> </ul> |
| GRES enabled                                    | <ul style="list-style-type: none"> <li>• During the switchover, interface and kernel information is preserved.</li> <li>• The switchover is faster because the Packet Forwarding Engines are not restarted.</li> </ul> | <ul style="list-style-type: none"> <li>• The new master Routing Engine restarts the routing protocol process (rpd).</li> <li>• All hardware and interfaces are acquired by a process that is similar to a warm restart.</li> <li>• All adjacencies are aware of the router's change in state.</li> </ul>                                                                                                                                                                                         |
| GRES and nonstop active routing enabled         | <ul style="list-style-type: none"> <li>• Traffic is not interrupted during the switchover.</li> <li>• Interface and kernel information are preserved.</li> </ul>                                                       | <ul style="list-style-type: none"> <li>• Unsupported protocols must be refreshed using the normal recovery mechanisms inherent in each protocol.</li> </ul>                                                                                                                                                                                                                                                                                                                                      |

Table 190: Effects of a Routing Engine Switchover (*continued*)

| Feature                           | Benefits                                                                                                                                                                                                                                                                                 | Considerations                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Understanding Nonstop Software Upgrade for QFabric Systems

The framework that underlies a nonstop software upgrade in a QFabric system enables you to upgrade the system in a step-by-step manner and minimize the impact to the continuous operation of the system. This topic explains how a nonstop software upgrade works in a QFabric system, the steps that are involved, and the procedures that you need to implement to experience the benefits of this style of software upgrade.

Nonstop software upgrade enables some QFabric system components to continue operating while similar components in the system are being upgraded. In general, the QFabric system upgrades redundant components in stages so that some components remain operational and continue forwarding traffic while their equivalent counterparts upgrade to a new version of software.

**TIP:** Use the following guidelines to decide when to implement a nonstop software upgrade:

- If you need to upgrade all components of the system in the shortest amount of time (approximately one hour) and you do not need to retain the forwarding resiliency of the data plane, issue the **request system software**

`add component all` command to perform a standard software upgrade. All components of the QFabric system upgrade simultaneously and expediently, but this type of upgrade does not provide resiliency or switchover capabilities.

- If you need to minimize service impact, preserve the forwarding operations of the data plane during the upgrade, and are willing to take the extra time required for component switchovers (in many cases, several hours), issue the three nonstop software upgrade commands (`request system software nonstop-upgrade (director-group | fabric | node-group)`) described in this topic in the correct order.

NOTE:

- Before you begin a nonstop software upgrade, issue the `request system software download` command to copy the software to the QFabric system.
- Each of the 3 nonstop software upgrade steps must be considered parts of the whole process. You must complete all 3 steps of a nonstop software upgrade in the correct order to ensure the proper operation of the QFabric system.
- Open two SSH sessions to the QFabric CLI. Use one session to monitor the upgrade itself and use a second session to verify that the QFabric system components respond to operational mode commands as expected. For more information on verification of the upgrade, see [“Verifying Nonstop Software Upgrade for QFabric Systems” on page 1554](#).
- Issue the `show fabric administration inventory` command to verify that all upgraded components are operational at the end of a step before beginning the next step.
- Once you start the nonstop software upgrade process, we strongly recommend that you complete all 3 steps within 12 hours.

---

The three steps to a successful nonstop software upgrade must be performed in the following order:

- Director group—The first step upgrades the Director devices, the fabric manager Routing Engine, and the diagnostic Routing Engine. To perform the first step, issue the **`request system software nonstop-upgrade director-group`** command. The key actions that occur during a Director group upgrade are:
  1. Connecting to the QFabric system by way of an SSH connection. This action establishes a load-balanced CLI session on one of the Director devices in the Director group.
  2. The QFabric system downloads and installs the new software in both Director devices.

3. The Director device hosting the CLI session becomes the master for all QFabric system processes running on the Director group, such as the fabric manager and network Node group Routing Engines.
4. The QFabric system installs the new software for the backup fabric manager Routing Engine on the backup Director device.
5. The backup Director device reboots to activate the new software.
6. The master Director device begins a 15 minute sequence that includes a temporary suspension of QFabric services and a QFabric database transfer. You cannot issue operational mode commands in the QFabric CLI during this period.
7. The QFabric system installs the new software for the fabric manager and diagnostic Routing Engines on the Director group master.
8. The QFabric system switches mastership of all QFabric processes from the master Director device to the backup Director device.
9. The master Director device reboots to activate the new software.
10. The CLI session terminates, and logging back in to the QFabric system with a new SSH connection establishes the session on the new master Director device (the original backup).
11. The previous master Director device resumes operation as a backup and the associated processes (such as the fabric manager and network Node group Routing Engines) become backup as well. The fabric control Routing Engine associated with this Director device returns to active status.

**NOTE:** After the Director group nonstop software upgrade completes, any Interconnect device or Node device that reboots will automatically download the new software, install it, and reboot again. As a result, try not to restart any QFabric system devices before you complete the rest of the nonstop software upgrade steps.

**TIP:**

- To enable BGP and OSPF to continue operating on the network Node group during a Director group nonstop service upgrade, we recommend that you configure graceful restart for these routing protocols. For more information on graceful restart, see [“Configuring Graceful Restart for QFabric Systems” on page 1512](#).
- Wait 15 minutes after the second Director device returns to service and hosts Routing Engine processes before proceeding to step 2—the fabric upgrade. You can verify the operational status of both Director devices by issuing the `show fabric administration inventory director-group status` command. Also, issue the `show fabric administration inventory infrastructure` command to verify when the Routing Engine processes become load balanced (typically, there will be three to four Routing Engines running on each Director device).

- Fabric—The second step upgrades the Interconnect devices and the fabric control Routing Engines. To perform the second step, issue the **request system software nonstop-upgrade fabric** command. The key actions that occur during a fabric upgrade are:
  1. The QFabric system downloads, validates, and installs the new software in all Interconnect devices and fabric control Routing Engines (FC-0 and FC-1).
  2. One fabric control Routing Engine reboots and comes back online.
  3. The other fabric control Routing Engine reboots and comes back online.
  4. The first Interconnect device reboots, comes back online, and resumes the forwarding of traffic.
  5. Subsequent Interconnect devices reboot one at a time, come back online, and return to service.

NOTE:

- If the software does not load properly on any one of the fabric components, all components revert back to the original software version.
- If one of the components in a fabric upgrade does not reboot successfully, issue the **request system reboot fabric** command to reattempt the rebooting process for this fabric component and activate the new software.

- Node group—The third and final step upgrades Node groups. You can choose to upgrade a network Node group, a redundant server Node group, or individual server Node groups. You can upgrade the Node groups one at a time or in groups (known as upgrade groups). However, you must upgrade all Node groups in your QFabric system before you can complete the nonstop software upgrade process. To perform the third step, issue the **request system software nonstop-upgrade node-group** command.

The key actions that occur during a network Node group upgrade are:

1. The QFabric system copies the new software to each Node device one at a time.
2. The QFabric system validates and then installs the new software in all Node devices simultaneously.
3. The system copies the software to the network Node group Routing Engines.
4. The QFabric system validates and then installs the software in the network Node group Routing Engines one at a time -- first the backup, then the master.
5. The backup network Node group Routing Engine reboots and comes back online.
6. The supporting Node devices reboot and come back online one at a time.

**NOTE:** To reduce the total upgrade duration, configure an upgrade group. All Node devices within the upgrade group reboot at the same time.

7. The master network Node group Routing Engine relinquishes mastership to the backup, reboots, and comes back online.

The key actions that occur during a redundant server Node group upgrade are:

1. The QFabric system copies the new software to the backup Node device, then the master Node device.
2. The QFabric system validates and then installs the new software on the backup Node device, then the master Node device.
3. The backup Node device reboots, comes back online, and becomes the master Node device.
4. The previous master Node device reboots and comes back online as a backup Node device.

**NOTE:** For redundant server Node groups, both Node devices must be online before the upgrade will proceed. If one of the devices is no longer available, remove the Node device from the Node group configuration before you issue the nonstop software upgrade command.

The key actions that occur during a server Node group upgrade for a Node group that contains one member are:

1. The Node device downloads the software package and validates the software.
2. The Node device installs the software and reboots.

**NOTE:** Because there is no redundancy for Node groups containing a single Node device, traffic loss occurs when the device reboots during the upgrade.

## Understanding VRRP

Juniper Networks QFX Series and EX4600 switches support the Virtual Router Redundancy Protocol (VRRP) and VRRPv3 (for IPv6). This topic covers:

- [Overview of VRRP on page 2446](#)
- [Sample VRRP Topology on page 2447](#)

---

### Overview of VRRP

Configuring end hosts on your network with static default routes minimizes configuration effort and complexity and reduces processing overhead on the end hosts. When hosts are configured with static routes, the failure of the default gateway normally results in a catastrophic event, isolating all hosts that are unable to detect available alternate paths to their gateway. Using Virtual Router Redundancy Protocol (VRRP) enables you to dynamically provide alternative gateways for end hosts if the primary gateway fails.

VRRP (defined in RFC 3768) provides dynamic failover of IP addresses from one router to another in the event of failure. You can implement VRRP to provide a highly available default path to a gateway without needing to configure dynamic routing or router discovery protocols on end hosts.

Switches configured with VRRP share a virtual IP address, which is the address you configure as the default route on the hosts. At any time, one of the switches is the VRRP master, meaning that it owns the virtual IP address and is the active default gateway. The other devices are backups. The switches dynamically assign master and backup roles based on priorities that you configure (**1 through 255**). If the master fails, the backup switch with the highest priority becomes the master within a few seconds. This is done without any interaction with the hosts.

In VRRP operation, the master sends advertisements to the backup switches at regular intervals. The default interval is 1 second. If the backup switches do not receive an advertisement for a set period, the backup with the highest priority takes over as master within a few seconds and begins forwarding packets. This is done without any interaction with the hosts.

**NOTE:** Priority 255 cannot be set for routed VLAN interfaces (RVIs).

---

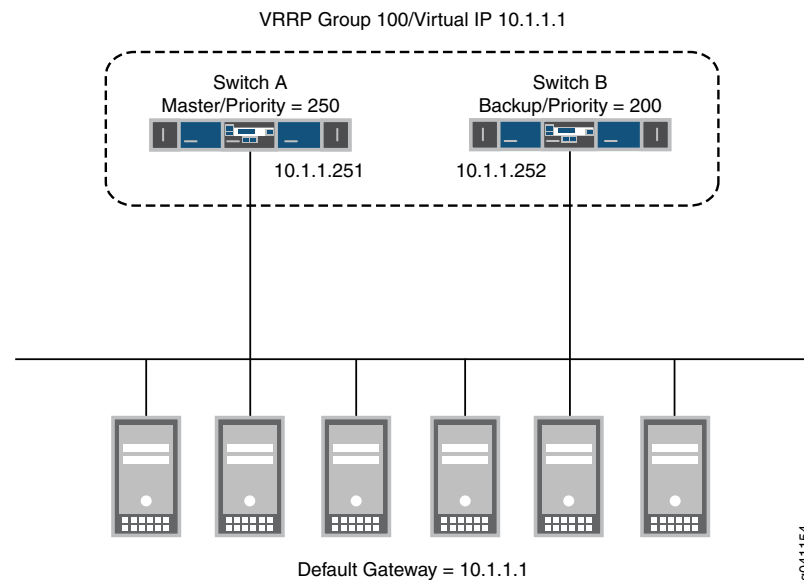

You can configure two QFabric systems to participate in a VRRP configuration as if they were two standalone switches. One benefit of this configuration is if you use VMware's vMotion, virtual machines can transition between hosts connected to the QFabric systems without updating their default gateway information. For example, a virtual machine running on a host connected to a QFabric system in data center A can transition to a host connected to a QFabric system in data center B without needing to resolve a new gateway IP address and MAC address.

### Sample VRRP Topology

Figure 78 on page 2447 illustrates a basic VRRP topology. In this example, switches A and B are running VRRP and share the virtual IP address 10.1.1.1. The default gateway for each of the clients is 10.1.1.1.

**Figure 78: Basic VRRP Topology**

The following illustrates basic VRRP behavior using Figure 78 on page 2447 for reference:

1. When any of the servers wants to send traffic out of the LAN, it sends the traffic to the default gateway address of 10.1.1.1. This is a virtual IP address (VIP) owned by VRRP group 100. Because switch A is the master of the group, the VIP is associated with the "real" address 10.1.1.251 on switch A, and traffic from the servers is actually sent to this address. (Switch A is the master because it has been configured with a higher priority value.)
2. If there is a failure on switch A that prevents it from forwarding traffic to or from the servers—for example, if the interface connected to the LAN fails—switch B becomes the master and assumes ownership of the VIP. The servers continue to send traffic to the VIP, but because the VIP is now associated with the "real" address 10.1.1.252 on switch B (because of change of master), the traffic is sent to switch B instead of switch A.
3. If the problem that caused the failure on switch A is corrected, switch A becomes the master again and reasserts ownership of the VIP. In this case, the servers resume sending traffic to switch A.

Notice that no configuration changes are required on the servers for them to switch between sending traffic to switch A and switch B. When the VIP moves between 10.1.1.251 and 10.1.1.252, the change is detected by normal TCP-IP behavior and no configuration or intervention is required on the servers.

## Understanding VRRP Between QFabric Systems

Juniper Networks QFabric systems support the Virtual Router Redundancy Protocol (VRRP). This topic covers:

- [VRRP Differences on QFabric Systems on page 2448](#)
- [Configuration Details on page 2449](#)

### VRRP Differences on QFabric Systems

---

Configuring servers on your network with static routes to a default gateway minimizes configuration effort and complexity and reduces processing overhead. However, a failure of the default gateway normally results in a catastrophic event, isolating the servers. Using Virtual Router Redundancy Protocol (VRRP) enables you to dynamically provide alternative gateways for servers if the primary gateway fails.

Switches configured with VRRP share a virtual IP (VIP) address, which is the address you configure as the default route on the servers. In normal VRRP operation, one of the switches is the VRRP master, meaning that it owns the VIP and is the active default gateway. The other devices are backups. The switches dynamically assign master and backup roles based on priorities that you configure. If the master fails, the backup switch with the highest priority becomes the master and takes ownership of the VIP within a few seconds. This is done without any interaction with the servers.

You can configure two QFabric systems to participate in a VRRP configuration as if they were two standalone switches. However, in normal VRRP operation, only one system can be the master for a given VRRP group at any one time, which means that only one system can act as a default gateway using the VIP configured for the group. When running VRRP over two QFabric systems, you might want both systems to simultaneously use the VIP to act as a gateway and forward traffic. To achieve this, you can configure a firewall filter to block the VRRP advertisement packets between the QFabric systems on the link between the two network Node groups. When you do this, both QFabric systems act as master and forward traffic received by the VIP (which is the default gateway address that you configure on servers connected to both QFabric systems). If you use VMware's vMotion, this configuration allows virtual machines to transition between servers connected to the QFabric systems without updating their default gateway information. For example, a virtual machine running on a server connected to a QFabric system in data center A can transition to a server connected to a QFabric system in data center B without needing to resolve a new gateway IP address and MAC address because both QFabric systems use the same VIP.

**NOTE:** To use a firewall filter to block VRRP traffic, create a firewall term that matches traffic for protocol vrrp and discards that traffic.

---

### Configuration Details

Configuring a VRRP group across two QFabric systems is similar to configuring VRRP on two switches. The main differences are listed here:

- All the interfaces in both QFabric systems that participate in VRRP must be members of the same VLAN.
- You must create routed VLAN interfaces (RVIs) in that VLAN on both QFabric systems.
- The IP addresses that you assign to both RVIs must be in the same subnet.
- You must configure VRRP on the RVIs.
- Both RVIs must be members of the same VRRP group. This is what allows the two QFabric systems to share a virtual IP address.

The following tables list the elements of an example VRRP configuration running on two QFabric systems—QFabric system A and QFabric system B. This example is configured so that both QFabric systems act as the VRRP master for VIP 10.1.1.50/24 and assumes that a firewall filter blocks the VRRP advertisements between the systems.

[Table 191 on page 2449](#) lists the required characteristics of the RVIs in the example configuration.

**NOTE:** Most of the configuration settings in the following tables would also apply in a traditional VRRP configuration. However, the advertisement interval and priority settings would need to be different (as noted).

**Table 191: RVIs on QFabric systems in example VRRP configuration**

| RVI on QFabric System A                                                       | RVI on QFabric System B         |
|-------------------------------------------------------------------------------|---------------------------------|
| vlan.100                                                                      | vlan.200                        |
| Member of VLAN 100. (Note that the VLAN is the same on both QFabric systems.) | Member of VLAN 100              |
| IP address 10.1.1.100/24                                                      | IP address 10.1.1.200/24        |
| Member of VRRP group 500                                                      | Member of VRRP group 500        |
| Virtual IP address 10.1.1.50/24                                               | Virtual IP address 10.1.1.50/24 |

You must configure VRRP on the RVIs on both QFabric systems. [Table 192 on page 2449](#) lists the elements of a sample VRRP configuration on each RVI. Note that with the exception of the priority, the parameters *must* be the same on both systems.

**Table 192: Sample VRRP configuration each RVI**

| VRRP on RVI on QFabric System A | VRRP on RVI on QFabric System B |
|---------------------------------|---------------------------------|
| VRRP group 500                  | VRRP group 500                  |

**Table 192: Sample VRRP configuration each RVI (*continued*)**

|                                                                                                                                                                                                                                                                                                                         |                                                            |
|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------|
| Virtual IP address 10.1.1.50/24                                                                                                                                                                                                                                                                                         | Virtual IP address 10.1.1.50/24                            |
| Advertisement interval 60 seconds. (In a normal VRRP configuration, you would set this interval to be much smaller, such as 1 second. However, in this configuration these packets are blocked by the firewall filter on the interface that connects to QFabric system B, so there is no need to send them frequently.) | Advertisement interval 60 seconds                          |
| Authentication type md5                                                                                                                                                                                                                                                                                                 | Authentication type md5                                    |
| Authentication key \$9\$1.4ElMVb2aGi4aZjkqzFRhSeWx7-wY2aM8                                                                                                                                                                                                                                                              | Authentication key \$9\$1.4ElMVb2aGi4aZjkqzFRhSeWx7-wY2aM8 |
| Priority 254. (In a normal VRRP configuration, this value would be different on the two systems and the system with the higher value would be the master. However, in this configuration both systems are acting as master, so you do not have to configure different values.)                                          | Priority 254                                               |

**NOTE:** Priority 255 is not supported for RVIs.

[Table 193 on page 2450](#) lists all the interfaces on QFabric system A in the example configuration and identifies what they connect to.

**Table 193: Interfaces on QFabric system A. All interfaces are members of VLAN 100.**

| VLAN 100 Interfaces on QFabric System A                 | Connects To                                                 |
|---------------------------------------------------------|-------------------------------------------------------------|
| vlan.100                                                | vlan.200                                                    |
| Network Node group interface QFA-NNG:xe-0/0/0           | QFB-NNG:xe-0/0/0 on QFabric system B                        |

### Configuration Tasks for Graceful Restart

---

- [Configuring Graceful Restart for QFabric Systems on page 2453](#)
- [Configuring Routing Protocols Graceful Restart on page 2457](#)

### Configuring Graceful Restart for QFabric Systems

When you configure graceful restart in the QFabric CLI, the QFabric system applies the configuration to the network Node group to participate in graceful restart operations with devices external to the QFabric system. Such configuration preserves routing table state and helps neighboring routing devices to resume routing operations more quickly after a system restart. This also enables the network Node group to resume routing operations rapidly if there is a restart in the QFabric system (such as a software upgrade). As a result, we recommend enabling graceful restart for routing protocols in the QFabric CLI.

**NOTE:** The QFabric system also uses graceful restart internally within the fabric to facilitate interfabric resiliency and recovery. This internal feature is enabled by default with no configuration required.

- [Enabling Graceful Restart on page 2454](#)
- [Configuring Graceful Restart Options for BGP on page 2454](#)

- [Configuring Graceful Restart Options for OSPF and OSPFv3 on page 2455](#)
- [Tracking Graceful Restart Events on page 2456](#)

### Enabling Graceful Restart

---

By default, graceful restart is disabled. To enable graceful restart, include the **graceful-restart** statement at the **[edit routing-instance *instance-name* routing-options]** or **[edit routing-options]** hierarchy level.

For example:

```
routing-options {  
  graceful-restart;  
}
```

To configure the duration of the graceful restart period, include the **restart-duration** at the **[edit routing-options graceful-restart]** hierarchy level.

**NOTE:** Helper mode (the ability to assist a neighboring router attempting a graceful restart) is enabled by default when you start the routing platform, even if graceful restart is not enabled. You can disable helper mode on a per-protocol basis.

```
[edit]  
routing-options {  
  graceful-restart {  
    disable;  
    restart-duration seconds;  
  }  
}
```

To disable graceful restart globally, include the **disable** statement at the **[edit routing-options graceful-restart]** hierarchy level.

When graceful restart is enabled for all routing protocols at the **[edit routing-options graceful-restart]** hierarchy level, you can disable graceful restart on a per-protocol basis.

**NOTE:** If you configure graceful restart after a BGP or LDP session has been established, the BGP or LDP session restarts and the peers negotiate graceful restart capabilities. Also, the BGP peer routing statistics are reset to zero.

### Configuring Graceful Restart Options for BGP

---

To configure the duration of the BGP graceful restart period, include the **restart-time** statement at the **[edit protocols bgp graceful-restart]** hierarchy level. To set the length of time the router waits to receive messages from restarting neighbors before declaring them down, include the **stale-routes-time** statement at the **[edit protocols bgp graceful-restart]** hierarchy level.

```
[edit]  
protocols {
```

```

bgp {
  graceful-restart {
    disable;
    restart-time seconds;
    stale-routes-time seconds;
  }
}
routing-options {
  graceful-restart;
}

```

To disable BGP graceful restart capability for all BGP sessions, include the **disable** statement at the **[edit protocols bgp graceful-restart]** hierarchy level.

**NOTE:** To set BGP graceful restart properties or disable them for a group, include the desired statements at the **[edit protocols bgp group group-name graceful-restart]** hierarchy level.

To set BGP graceful restart properties or disable them for a specific neighbor in a group, include the desired statements at the **[edit protocols bgp group group-name neighbor ip-address graceful-restart]** hierarchy level.

**NOTE:** Configuring graceful restart for BGP resets the BGP peer routing statistics to zero. Also, existing BGP sessions restart, and the peers negotiate graceful restart capabilities.

### Configuring Graceful Restart Options for OSPF and OSPFv3

To configure the duration of the OSPF/OSPFv3 graceful restart period, include the **restart-duration** statement at the **[edit protocols (ospf | ospf3) graceful-restart]** hierarchy level. To specify the length of time for which the router notifies helper routers that it has completed graceful restart, include the **notify-duration** at the **[edit protocols (ospf | ospf3) graceful-restart]** hierarchy level. Strict OSPF link-state advertisement (LSA) checking results in the termination of graceful restart by a helping router. To disable strict LSA checking, include the **no-strict-lsa-checking** statement at the **[edit protocols (ospf | ospf3) graceful-restart]** hierarchy level.

```

[edit]
protocols {
  ospf | ospfv3 {
    graceful-restart {
      disable;
      helper-disable
      no-strict-lsa-checking;
      notify-duration seconds;
      restart-duration seconds;
    }
  }
}
routing-options {

```

```
    graceful-restart;
}
```

To disable OSPF/OSPFv3 graceful restart, include the **disable** statement at the **[edit protocols (ospf | ospf3) graceful-restart]** hierarchy level.

Starting with Release 11.3, the Junos OS supports both the standard (based on RFC 3623, *Graceful OSPF Restart*) and the restart signaling-based (as specified in RFC 4811, RFC 4812, and RFC 4813) helper modes for OSPF version 2 graceful restart configurations. Both the standard and restart signaling-based helper modes are enabled by default. To disable the helper mode for OSPF version 2 graceful restart configurations, include the **helper-disable <both | restart-signaling | standard>** statement at the **[edit protocols ospf graceful-restart]** hierarchy level. Note that the last committed statement always takes precedence over the previous one.

```
[edit protocols ospf]
 graceful-restart {
   helper-disable <both | restart-signaling | standard>
 }
```

To reenabling the helper mode, delete the **helper-disable** statement from the configuration by using the **delete protocols ospf graceful-restart helper-disable <restart-signaling | standard | both>** command. In this case also, the last executed command takes precedence over the previous ones.

#### NOTE:

Restart signaling-based helper mode is not supported for OSPFv3 configurations. To disable helper mode for OSPFv3 configurations, include the **helper-disable** statement at the **[edit protocols ospfv3 graceful-restart]** hierarchy level.

**TIP:** You can also track graceful restart events with the **traceoptions** statement at the **[edit protocols (ospf | ospf3)]** hierarchy level. For more information, see [“Tracking Graceful Restart Events” on page 1515](#).

**NOTE:** If you configure BFD and graceful restart for OSPF, graceful restart might not work as expected.

### Tracking Graceful Restart Events

To track the progress of a graceful restart event, you can configure graceful restart trace options flags for IS-IS and OSPF/OSPFv3. To configure graceful restart trace options, include the **graceful-restart** statement at the **[edit protocols protocol traceoptions flag]** hierarchy level:

```
[edit protocols]
 isis {
```

```

    traceoptions {
        flag graceful-restart;
    }
}
(ospf | ospf3) {
    traceoptions {
        flag graceful-restart;
    }
}

```

### Enabling Graceful Restart

By default, graceful restart is disabled. To enable graceful restart, include the **graceful-restart** statement at the **[edit routing-instance *instance-name* routing-options]** or **[edit routing-options]** hierarchy level.

For example:

```

routing-options {
    graceful-restart;
}

```

To configure the duration of the graceful restart period, include the **restart-duration** at the **[edit routing-options graceful-restart]** hierarchy level.

**NOTE:** Helper mode (the ability to assist a neighboring router attempting a graceful restart) is enabled by default when you start the routing platform, even if graceful restart is not enabled. You can disable helper mode on a per-protocol basis.

```

[edit]
routing-options {
    graceful-restart {

```

```
    disable;  
    restart-duration seconds;  
  }  
}
```

To disable graceful restart globally, include the **disable** statement at the **[edit routing-options graceful-restart]** hierarchy level.

When graceful restart is enabled for all routing protocols at the **[edit routing-options graceful-restart]** hierarchy level, you can disable graceful restart on a per-protocol basis.

**NOTE:** If you configure graceful restart after a BGP or LDP session has been established, the BGP or LDP session restarts and the peers negotiate graceful restart capabilities. Also, the BGP peer routing statistics are reset to zero.

---

### Configuring Graceful Restart Options for BGP

---

To configure the duration of the BGP graceful restart period, include the **restart-time** statement at the **[edit protocols bgp graceful-restart]** hierarchy level. To set the length of time the router waits to receive messages from restarting neighbors before declaring them down, include the **stale-routes-time** statement at the **[edit protocols bgp graceful-restart]** hierarchy level.

```
[edit]  
protocols {  
  bgp {  
    graceful-restart {  
      disable;  
      restart-time seconds;  
      stale-routes-time seconds;  
    }  
  }  
}  
routing-options {  
  graceful-restart;  
}
```

To disable BGP graceful restart capability for all BGP sessions, include the **disable** statement at the **[edit protocols bgp graceful-restart]** hierarchy level.

**NOTE:** To set BGP graceful restart properties or disable them for a group, include the desired statements at the **[edit protocols bgp group group-name graceful-restart]** hierarchy level.

To set BGP graceful restart properties or disable them for a specific neighbor in a group, include the desired statements at the **[edit protocols bgp group group-name neighbor ip-address graceful-restart]** hierarchy level.

**NOTE:** Configuring graceful restart for BGP resets the BGP peer routing statistics to zero. Also, existing BGP sessions restart, and the peers negotiate graceful restart capabilities.

### Configuring Graceful Restart Options for ES-IS

On J Series Services Routers, to configure the duration of the ES-IS graceful restart period, include the **restart-duration** statement at the **[edit protocols esis graceful-restart]** hierarchy level.

```
[edit]
protocols {
  esis {
    graceful-restart {
      disable;
      restart-duration seconds;
    }
  }
}
routing-options {
  graceful-restart;
}
```

To disable ES-IS graceful restart capability, include the **disable** statement at the **[edit protocols esis graceful-restart]** hierarchy level.

### Configuring Graceful Restart Options for IS-IS

To configure the duration of the IS-IS graceful restart period, include the **restart-duration** statement at the **[edit protocols isis graceful-restart]** hierarchy level.

```
[edit]
protocols {
  isis {
    graceful-restart {
      disable;
      helper-disable;
      restart-duration seconds;
    }
  }
}
routing-options {
  graceful-restart;
}
```

To disable IS-IS graceful restart helper capability, include the **helper-disable** statement at the **[edit protocols isis graceful-restart]** hierarchy level. To disable IS-IS graceful restart capability, include the **disable** statement at the **[edit protocols isis graceful-restart]** hierarchy level.

**NOTE:** If you configure Bidirectional Forwarding Detection (BFD) and graceful restart for IS-IS, graceful restart might not work as expected.

**NOTE:** If adjacencies between the Routing Engine and the neighboring peer 'helper' routers time out, graceful restart protocol extensions are unable to notify the peer 'helper' routers about the impending restart. Graceful restart can then stop and cause interruptions in traffic.

To ensure that these adjacencies are kept, change the hold-time for IS-IS protocols from the default of 27 seconds to a value higher than 40 seconds. See *Example: Configuring IS-IS for GRES with Graceful Restart* for more information.

**NOTE:** You can also track graceful restart events with the `traceoptions` statement at the `[edit protocols isis]` hierarchy level. For more information, see [“Tracking Graceful Restart Events” on page 1515](#).

### Configuring Graceful Restart Options for OSPF and OSPFv3

To configure the duration of the OSPF/OSPFv3 graceful restart period, include the `restart-duration` statement at the `[edit protocols (ospf | ospf3) graceful-restart]` hierarchy level. To specify the length of time for which the router notifies helper routers that it has completed graceful restart, include the `notify-duration` at the `[edit protocols (ospf | ospf3) graceful-restart]` hierarchy level. Strict OSPF link-state advertisement (LSA) checking results in the termination of graceful restart by a helping router. To disable strict LSA checking, include the `no-strict-lsa-checking` statement at the `[edit protocols (ospf | ospf3) graceful-restart]` hierarchy level.

```
[edit]
protocols {
  ospf | ospfv3 {
    graceful-restart {
      disable;
      helper-disable
      no-strict-lsa-checking;
      notify-duration seconds;
      restart-duration seconds;
    }
  }
}
routing-options {
  graceful-restart;
}
```

To disable OSPF/OSPFv3 graceful restart, include the `disable` statement at the `[edit protocols (ospf | ospf3) graceful-restart]` hierarchy level.

Starting with Release 11.3, the Junos OS supports both the standard (based on RFC 3623, *Graceful OSPF Restart*) and the restart signaling-based (as specified in RFC 4811, RFC 4812, and RFC 4813) helper modes for OSPF version 2 graceful restart configurations. Both the standard and restart signaling-based helper modes are enabled by default. To disable the helper mode for OSPF version 2 graceful restart configurations, include the `helper-disable <both | restart-signaling | standard>` statement at the `[edit protocols ospf`

**graceful-restart**] hierarchy level. Note that the last committed statement always takes precedence over the previous one.

```
[edit protocols ospf]
  graceful-restart {
    helper-disable <both | restart-signaling | standard>
  }
```

To reenable the helper mode, delete the **helper-disable** statement from the configuration by using the **delete protocols ospf graceful-restart helper-disable <restart-signaling | standard | both>** command. In this case also, the last executed command takes precedence over the previous ones.

#### NOTE:

Restart signaling-based helper mode is not supported for OSPFv3 configurations. To disable helper mode for OSPFv3 configurations, include the **helper-disable** statement at the **[edit protocols ospfv3 graceful-restart]** hierarchy level.

**TIP:** You can also track graceful restart events with the **traceoptions** statement at the **[edit protocols (ospf | ospfv3)]** hierarchy level. For more information, see [“Tracking Graceful Restart Events” on page 1515](#).

**NOTE:** You cannot enable OSPFv3 graceful restart between a routing platform running Junos OS Release 7.5 and earlier and a routing platform running Junos OS Release 7.6 or later. As a workaround, make sure both routing platforms use the same Junos OS version.

**NOTE:** If you configure BFD and graceful restart for OSPF, graceful restart might not work as expected.

### Configuring Graceful Restart Options for RIP and RIPng

To configure the duration of the RIP or RIPng graceful restart period, include the **restart-time** statement at the **[edit protocols (rip | ripng) graceful-restart]** hierarchy level.

```
[edit]
  protocols {
    (rip | ripng) {
      graceful-restart {
        disable;
        restart-time seconds;
      }
    }
  }
```

```
routing-options {  
    graceful-restart;  
}
```

To disable RIP or RIPng graceful restart capability, include the **disable** statement at the **[edit protocols (rip | ripng) graceful-restart]** hierarchy level.

### Configuring Graceful Restart Options for PIM Sparse Mode

---

PIM sparse mode continues to forward existing multicast packet streams during a graceful restart, but does not forward new streams until after the restart is complete. After a restart, the routing platform updates the forwarding state with any updates that were received from neighbors and occurred during the restart period. For example, the routing platform relearns the join and prune states of neighbors during the restart, but does not apply the changes to the forwarding table until after the restart.

PIM sparse mode-enabled routing platforms generate a unique 32-bit random number called a generation identifier. Generation identifiers are included by default in PIM hello messages, as specified in the IETF Internet draft *Protocol Independent Multicast - Sparse Mode (PIM-SM): Protocol Specification (Revised)*. When a routing platform receives PIM hellos containing generation identifiers on a point-to-point interface, Junos OS activates an algorithm that optimizes graceful restart.

Before PIM sparse mode graceful restart occurs, each routing platform creates a generation identifier and sends it to its multicast neighbors. If a PIM sparse mode-enabled routing platform restarts, it creates a new generation identifier and sends it to its neighbors. When a neighbor receives the new identifier, it resends multicast updates to the restarting router to allow it to exit graceful restart efficiently. The restart phase completes when either the PIM state becomes stable or when the restart interval timer expires.

If a routing platform does not support generation identifiers or if PIM is enabled on multipoint interfaces, the PIM sparse mode graceful restart algorithm does not activate, and a default restart timer is used as the restart mechanism.

To configure the duration of the PIM graceful restart period, include the **restart-duration** statement at the **[edit protocols pim graceful-restart]** hierarchy level:

```
[edit]  
protocols {  
    pim {  
        graceful-restart {  
            disable;  
            restart-duration seconds;  
        }  
    }  
}  
routing-options {  
    graceful-restart;  
}
```

To disable PIM sparse mode graceful restart capability, include the **disable** statement at the **[edit protocols pim graceful-restart]** hierarchy level.

**NOTE:** Multicast forwarding can be interrupted in two ways. First, if the underlying routing protocol is unstable, multicast reverse-path-forwarding (RPF) checks can fail and cause an interruption. Second, because the forwarding table is not updated during the graceful restart period, new multicast streams are not forwarded until graceful restart is complete.

### Tracking Graceful Restart Events

To track the progress of a graceful restart event, you can configure graceful restart trace options flags for IS-IS and OSPF/OSPFv3. To configure graceful restart trace options, include the **graceful-restart** statement at the **[edit protocols *protocol* traceoptions flag]** hierarchy level:

```
[edit protocols]
isis {
  traceoptions {
    flag graceful-restart;
  }
}
(ospf | ospf3) {
  traceoptions {
    flag graceful-restart;
  }
}
```

### Configuring Graceful Routing Engine Switchover

This section contains the following topics:

- [Enabling Graceful Routing Engine Switchover on page 2464](#)
- [Configuring Graceful Routing Engine Switchover with Graceful Restart on page 2464](#)

- [Synchronizing the Routing Engine Configuration on page 2464](#)
- [Verifying Graceful Routing Engine Switchover Operation on page 2464](#)

---

### Enabling Graceful Routing Engine Switchover

---

By default, graceful Routing Engine switchover (GRES) is disabled. To configure GRES, include the **graceful-switchover** statement at the **[edit chassis redundancy]** hierarchy level.

```
[edit chassis redundancy]
graceful-switchover;
```

When you enable GRES, the command-line interface (CLI) indicates which Routing Engine you are using. For example:

```
{master} [edit]
user@host#
```

To disable GRES, delete the **graceful-switchover** statement from the **[edit chassis redundancy]** hierarchy level.

---

### Configuring Graceful Routing Engine Switchover with Graceful Restart

---

When using GRES with Graceful Restart, if adjacencies between the Routing Engine and the neighboring peer 'helper' routers time out, graceful restart protocol extensions are unable to notify the peer 'helper' routers about the impending restart. Graceful restart can then stop and cause interruptions in traffic.

To ensure that these adjacencies are kept, change the **hold-time** for IS-IS protocols from the default of 27 seconds to a value higher than 40 seconds.

---

### Synchronizing the Routing Engine Configuration

---

**NOTE:** A newly inserted backup Routing Engine automatically synchronizes its configuration with the master Routing Engine configuration.

When you configure GRES, you can bring the backup Routing Engine online after the master Routing Engine is already running. There is no requirement to start the two Routing Engines simultaneously.

---

---

### Verifying Graceful Routing Engine Switchover Operation

---

To verify whether GRES is enabled on the backup Routing Engine, issue the **show system switchover** command. When the output of the command indicates that the **Graceful switchover** field is set to , GRES is operational. The status of the kernel database and configuration database synchronization between Routing Engines is also provided. For example:

```
Graceful switchover: On
Configuration database: Ready
Kernel database: Ready
Peer state: Steady state
```

**NOTE:** You must issue the `show system switchover` command on the backup Routing Engine. This command is not supported on the master Routing Engine.

For more information about the `show system switchover` command, see the [CLI Explorer](#).

#### Related Documentation

- [Understanding Graceful Routing Engine Switchover on page 2436](#)

## Configuring Graceful Routing Engine Switchover in a Virtual Chassis (CLI Procedure)

In a Virtual Chassis, one member switch is assigned the master role and has the master Routing Engine. Another member switch is assigned the backup role and has the backup Routing Engine. Graceful Routing Engine switchover (GRES) enables the master and backup Routing Engines in a Virtual Chassis configuration to switch from the master to backup without interruption to packet forwarding. When you configure graceful Routing Engine switchover, the backup Routing Engine automatically synchronizes with the master Routing Engine to preserve kernel state information and the forwarding state.

To set up the Virtual Chassis configuration to use graceful Routing Engine switchover (GRES):

1. Set up a minimum of two switches in a Virtual Chassis configuration with mastership priority of 255:

```
[edit]
user@switch# set virtual-chassis member 0 mastership-priority 255
[edit]
user@switch# set virtual-chassis member 1 mastership-priority 255
```

2. Set up graceful Routing Engine switchover:

```
[edit]
user@switch# set chassis redundancy graceful-switchover
```

Commit the configuration.

**NOTE:** We recommend that you use the `commit synchronize` command to save any configuration changes that you make to a multimember Virtual Chassis.

  - *High Availability Features for EX Series Switches Overview*
  - *Understanding EX Series Virtual Chassis Configuration*
  - *Understanding QFX Series Virtual Chassis*

## Resetting Local Statistics

When you enable graceful Routing Engine switchover, the master Routing Engine configuration is copied and loaded to the backup Routing Engine. User files, accounting information, and trace options information are not replicated to the backup Routing Engine.

When a graceful Routing Engine switchover occurs, local statistics such as process statistics and networking statistics are displayed as a cumulative value from the time the process first came online. Because processes on the master Routing Engine can start at different times from the processes on the backup Routing Engine, the statistics on the two Routing Engines for the same process might differ. After a graceful Routing Engine switchover, we recommend that you issue the **clear interface statistics (interface-name | all)** command to reset the cumulative values for local statistics. Forwarding statistics are not affected by graceful Routing Engine switchover.

For information about how to use the **clear** command to clear statistics and protocol database information, see the [CLI Explorer](#).

.....

**NOTE:** The **clear firewall** command cannot be used to clear the Routing Engine filter counters on a backup Routing Engine that is enabled for graceful Routing Engine switchover.

## Configuration Task for Nonstop Software Upgrade

- [Performing a Nonstop Software Upgrade on the QFabric System on page 2467](#)

## Performing a Nonstop Software Upgrade on the QFabric System

**NOTE:** Before you can perform a nonstop software upgrade to Junos OS Release 13.1X50-D10, you must have Junos OS Release 12.2X50-D42 or later installed. You cannot perform a nonstop software upgrade with Junos OS Release 12.2X50-D41 or earlier. Contact the Juniper Technical Assistance Center for information on how to download Junos OS Release 12.2X50-D42. Performing a standard software upgrade (that is, issuing the `request system software add component all` command) does not require that you upgrade to an intermediate Junos OS software release.

To perform a nonstop software upgrade to Junos OS Release 13.1X50-D10:

1. First perform a nonstop software upgrade to Junos OS Release 12.2X50-D42.
2. Then perform a nonstop software upgrade to Junos OS Release 13.1X50-D10.

Nonstop software upgrade enables you to upgrade a QFabric system with minimal packet loss and maximum uptime. This feature introduces several high availability improvements to the QFabric system software upgrade process, including:

- Upgrading members of a Director group or Node group one at a time so that one device in the group is always operational
- Switching mastership of Routing Engine processes to the backup Director device before upgrading the master Director device
- Rebooting Interconnect devices and fabric control Routing Engines one at a time, so that one Interconnect device or one fabric control Routing Engine is always operational
- Switching mastership of a Node group to the backup Node device before upgrading the master Node device
- Specifying an upgrade group if you want all Node devices in a Node group to be upgraded in parallel (which shortens the time of the upgrade)
- Rebooting devices automatically as part of the nonstop upgrade process

When performing a nonstop upgrade, start with the Director group upgrade, then issue the fabric upgrade, and end with the Node group upgrades.

**NOTE:** Because there is no redundancy for Node groups containing a single Node device, traffic loss occurs when the device reboots during the upgrade. For node-groups defined with two node-devices, both must be online in order for upgrade to succeed.

**NOTE:** Before you install the software, we recommend that you back up your current configuration files by issuing the `request system software configuration-backup` command.

**NOTE:** Before you can perform a nonstop software upgrade in your QFabric system, you must first upgrade your system to Junos OS Release 12.2 by using a conventional upgrade method such as issuing the `request system software add component all` command.

This topic describes the following tasks:

- [Backing Up the Current Configuration Files on page 2468](#)
- [Downloading Software Files Using a Browser on page 2468](#)
- [Retrieving Software Files for Download on page 2470](#)
- [Performing a Nonstop Software Upgrade for Director Devices in a Director Group on page 2470](#)
- [Performing a Nonstop Software Upgrade for Interconnect Devices and Other Fabric-Related Components on page 2470](#)
- [\(Optional\) Creating Upgrade Groups for Node Groups on page 2471](#)
- [Performing a Nonstop Software Upgrade on a Node Group on page 2471](#)

---

### Backing Up the Current Configuration Files

To back up your current configuration files:

```
user@qfabri> request system software configuration-backup path
```

Back up the configuration files to a local directory, remote server, or removable drive (for example, an external USB flash drive).

For example:

```
user@qfabri> request system software configuration-backup/media/USB/
```

---

### Downloading Software Files Using a Browser

**NOTE:** To access the download site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website <https://www.juniper.net/registration/Register.jsp>.

1. Using a Web browser, navigate to the <http://www.juniper.net/support>.
2. Click **Download Software**.
3. In the **Switching** box, click **Junos OS Platforms**.

4. In the **QFX Series** section, click the name of the platform for which you want to download software.
5. Click the **Software** tab and select the release number from the **Release** drop-down list.
6. Select the complete install package you want to download in the **QFabric System Install Package** section:
  - If you want to upgrade the entire QFabric system, select **QFabric System - Complete Install Package**.
  - If you want to upgrade either a single Node or Interconnect device for recovery purposes, select **Node and Interconnect Device Install Package**. For information on how to perform a recovery installation on either a Node or Interconnect device, see [“Performing a Recovery Installation” on page 120](#).

A login screen appears.

7. Enter your user ID and password and press **Enter**.
8. Read the End User License Agreement, select the **I agree** option button, and then click **Proceed**.
9. Save the **jinstall-qfabric-version.rpm** file on your computer.

### Retrieving Software Files for Download

---

Retrieve the software from the location in which you downloaded it. To do this, issue the **request system software download** command. The software package is copied from where you downloaded it and is placed locally on the QFabric system.

- To retrieve the software:

```
user@qfabric> request system software download /path/package-name
```

For example:

```
user@qfabric> request system software download  
ftp://server/files/jinstall-qfabric-12.2X50-D10.3.rpm
```

### Performing a Nonstop Software Upgrade for Director Devices in a Director Group

---

**NOTE:** If you reboot any Node groups or Interconnect devices after you perform a nonstop upgrade on the Director group, these devices are upgraded to the same version of software that is running on the Director group.

---

To upgrade the software on the Director devices in a Director group:

- Issue the **request system software nonstop-upgrade director-group package-name** command.

For example:

```
user@qfabric> request system software nonstop-upgrade director-group  
jinstall-qfabric-12.2X50-D10.3.rpm
```

### Performing a Nonstop Software Upgrade for Interconnect Devices and Other Fabric-Related Components

---

Before you perform a nonstop upgrade on the Interconnect devices and other fabric-related components, verify that both Director devices in the Director group are online. Both Director devices must be online before you attempt to perform a nonstop upgrade. To verify that both Director devices are online, issue the **show fabric administration inventory director-group status** command.

To install the software on the Interconnect device and other components in the fabric:

- Issue the **request system software nonstop-upgrade fabric package-name** command.

For example:

```
user@qfabric> request system software nonstop-upgrade fabric  
jinstall-qfabric-12.2X50-D10.3.rpm
```

### (Optional) Creating Upgrade Groups for Node Groups

Upgrade groups enable two or more Node devices in a Node group, or an entire Node group, to be rebooted at the same time. If you do not create an upgrade group, the Node devices are upgraded one at a time. Before performing a nonstop upgrade on a Node group, create an upgrade group and include the devices you want to reboot at the same time.

**NOTE:** If you add Node devices that have links to the same link aggregation group (LAG), there might be traffic loss.

- Create the upgrade group by issuing the **set chassis node-group node-group-name nssu upgrade-group upgrade-group-name node-devices** command at the [edit chassis] hierarchy.

For example:

```
user@qfabric# set chassis node-group nodegroup1 nssu upgrade-group upgrade1 node-devices
[ node1 node2 ]
```

### Performing a Nonstop Software Upgrade on a Node Group

When you perform a nonstop software upgrade on a network Node group, the Node devices in the network Node group are upgraded in a serial fashion except when upgrade groups are configured. If you perform a nonstop upgrade on a redundant server Node group, both Node devices must be online for a successful upgrade. If one of the Node devices is no longer available, remove it from the configuration before you perform the nonstop software upgrade. If you perform a nonstop upgrade on a Node group with only one Node device, traffic loss occurs while the Node device is rebooting.

**NOTE:** You can upgrade multiple Node groups with this command. However, if more than one Node group is specified, there may be traffic loss depending on the topology of the network.

To install software on a Node group:

- Issue the **request system software nonstop-upgrade node-group node-group-name package-name** command.

To perform a nonstop upgrade on one Node group:

```
user@qfabric> request system software nonstop-upgrade node-group nodegroup1
jinstall-qfabric-12.2X50-D10.3.rpm
```

To perform a nonstop upgrade on more than one Node group:

```
user@qfabric> request system software nonstop-upgrade node-group [nodegroup1
nodegroup2 nodegroup3] jinstall-qfabric-12.2X50-D10.3.rpm
```

## Configuration Example for VRRP

---

- [Example: Configuring VRRP for Load Sharing on page 2472](#)

### Example: Configuring VRRP for Load Sharing

If you do not want to dedicate a switch to be a VRRP backup (and therefore leave it idle unless the master fails), you can create a load-sharing configuration in which each participating switch simultaneously acts as a master and a backup.

One reason to use a load-sharing (active-active) configuration is that you are more likely to actively monitor and maintain both switches and notice if a problem occurs on either of them. If you use a configuration in which one switch is only a backup (an active-backup configuration), you might be less likely to pay attention to the backup switch while it is idle. In the worst case, this could lead to the backup switch developing an undetected problem and not being able to perform adequately when a failover occurs.

- [Requirements on page 2472](#)
- [Overview and Topology on page 2472](#)
- [Configuring VRRP on Both Switches on page 2473](#)
- [Verification on page 2476](#)

### Requirements

---

This example uses the following hardware and software components:

- Two QFX3500 switches
- Junos OS Release 11.3 or later
- Static routing or a dynamic routing protocol enabled on both switches.

### Overview and Topology

---

This example uses two VRRP groups, each of which has its own virtual IP address. Devices on the LAN use one of these virtual IP addresses as their default gateway. If one of the switches fails, the other switch takes over for it. In the topology shown in [Figure 79 on page 2473](#), for example, Switch A is the master for VRRP group 100. If Switch A fails, Switch B takes over and forwards traffic that the end devices send to the default gateway address 10.1.1.1.

Figure 79: VRRP Load-Sharing Configuration

9041153

This example shows a simple configuration to illustrate the basic steps for configuring two switches running VRRP to back each other up. [Table 195 on page 2473](#) lists VRRP settings for each switch.

Table 195: Settings for VRRP Load-Sharing Example

| Switch A                                                                                                                                      | Switch B                                                                                                                                      |
|-----------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| VRRP Group 100: <ul style="list-style-type: none"> <li>Interface address: 10.1.1.251</li> <li>VIP: 10.1.1.1</li> <li>Priority: 250</li> </ul> | VRRP Group 100: <ul style="list-style-type: none"> <li>Interface address: 10.1.1.252</li> <li>VIP: 10.1.1.1</li> <li>Priority: 200</li> </ul> |
| VRRP Group 200: <ul style="list-style-type: none"> <li>Interface address: 10.1.1.251</li> <li>VIP: 10.1.1.2</li> <li>Priority: 200</li> </ul> | VRRP Group 200: <ul style="list-style-type: none"> <li>Interface address: 10.1.1.252</li> <li>VIP: 10.1.1.2</li> <li>Priority: 250</li> </ul> |

In addition to configuring the two switches as shown, you must configure your end devices so that some of them use one of the virtual IP addresses as their default gateway and the remaining end devices use the other virtual IP address as their default gateway.

Note that if a failover occurs, the remaining switch might be unable to handle all of the traffic, depending on the demand.

### Configuring VRRP on Both Switches

#### CLI Quick Configuration

Enter the following on Switch A:

```
[edit]
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group 100 virtual-address 10.1.1.1
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group 100 priority 250
```

```
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group 200 virtual-address 10.1.1.2
```

```
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group 200 priority 200
```

Enter the following on Switch B:

```
[edit]
```

```
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group 100 virtual-address 10.1.1.1
```

```
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group 100 priority 200
```

```
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group 200 virtual-address 10.1.1.2
```

```
set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group 200 priority 250
```

#### Step-by-Step Procedure

Configure the VRRP groups and priorities on Switch A:

1. Create VRRP group 100 on Switch A and configure the virtual IP address for the group:

```
[edit]
```

```
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group 100 virtual-address 10.1.1.1
```

2. Assign the VRRP priority for this interface in this group:

```
[edit]
```

```
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group 100 priority 250
```

3. Create VRRP group 200 on Switch A and configure the virtual IP address for the group:

```
[edit]
```

```
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group 200 virtual-address 10.1.1.2
```

4. Assign the VRRP priority for this interface in this group:

```
[edit]
```

```
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group 100 priority 200
```

#### Step-by-Step Procedure

Configure the VRRP groups and priorities on Switch B:

1. Create VRRP group 100 on Switch B and configure the virtual IP address for the group:

```
[edit]
```

```
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group 100 virtual-address 10.1.1.1
```

2. Assign the VRRP priority for this interface in this group:

```
[edit]
```

```
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group 100 priority 200
```

Switch A remains the master for group 100 because it has the highest priority for this group.

3. Create VRRP group 200 on Switch A and configure the virtual IP address for the group:

```
[edit]
```

```
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.252/24 vrrp-group 200 virtual-address 10.1.1.2
```

4. Assign the VRRP priority for this interface in this group:

```
[edit]
```

```
user@switch# set interfaces xe-0/0/0 unit 0 family inet address 10.1.1.251/24 vrrp-group 100 priority 250
```

Switch B becomes the master for group 200 because it has the highest priority for this group.

**Results** Display the results of the configuration on Switch A:

```
user@switch> show configuration
interfaces {
  xe-0/0/0 {
    unit 0 {
      family inet {
        address 10.1.1.251 {
          vrrp-group 100 {
            virtual address 10.1.1.1
            priority 250
          }
        }
        vrrp-group 200 {
          virtual address 10.1.1.2
          priority 200
        }
      }
    }
  }
}
```

Display the results of the configuration on Switch B:

```
user@switch> show configuration
interfaces {
  xe-0/0/0 {
    unit 0 {
      family inet {
        address 10.1.1.252 {
          vrrp-group 100 {
            virtual address 10.1.1.1
            priority 200
          }
        }
        vrrp-group 200 {
          virtual address 10.1.1.2
          priority 250
        }
      }
    }
  }
}
```

## Verification

- [Verifying that VRRP is Working on Switch A on page 2476](#)
- [Verifying that VRRP is Working on Switch B on page 2476](#)

### Verifying that VRRP is Working on Switch A

**Purpose** Verify that VRRP is active on Switch A and that the master and backup roles are correct.

**Action** Use the following command to verify that VRRP is active on Switch A and that the switch is master for group 100 and backup for group 200.

```
user@switch> show vrrp
```

| Interface<br>Address | State | Group | VR state | Timer                                  | Type |
|----------------------|-------|-------|----------|----------------------------------------|------|
| xe-0/0/0.0           | up    | 100   | master   | A .0327 1c1 10.1.1.251<br>vip 10.1.1.1 |      |
| xe-0/0/0.0           | up    | 200   | backup   | A .0327 1c1 10.1.1.251<br>vip 10.1.1.2 |      |

**Meaning** The **show vrrp** command displays fundamental information about the VRRP configuration. This output shows that both VRRP groups are active and that this switch has assumed the correct master and backup roles. The **lcl** address is the physical address of the interface and the **vip** address is the virtual address shared by both switches. The **Timer** value (**A .0327**) indicates the remaining time (in seconds) in which this switch expects to receive a VRRP advertisement from the other switch. If an advertisement for group 200 does not arrive before the timer expires, Switch A asserts itself as the master for this group.

### Verifying that VRRP is Working on Switch B

**Purpose** Verify that VRRP is active on Switch B and that the master and backup roles are correct.

**Action** Use the following command to verify that VRRP is active on Switch B and that the switch is backup for group 100 and master for group 200.

```
user@switch> show vrrp
```

| Interface<br>Address | State | Group | VR state | Timer                                  | Type |
|----------------------|-------|-------|----------|----------------------------------------|------|
| xe-0/0/0.0           | up    | 100   | backup   | A .0327 1c1 10.1.1.252<br>vip 10.1.1.1 |      |
| xe-0/0/0.0           | up    | 200   | master   | A .0327 1c1 10.1.1.252<br>vip 10.1.1.2 |      |

**Meaning** The **show vrrp** command displays fundamental information about the VRRP configuration. This output shows that both VRRP groups are active and that this switch has assumed the correct master and backup roles. The **lcl** address is the physical address of the interface and the **vip** address is the virtual address shared by both switches. The **Timer** value (**A .0327**) indicates the remaining time (in seconds) in which this switch expects to receive a VRRP advertisement from the other switch. If an advertisement for group 100 does not arrive before the timer expires, Switch B asserts itself as the master for this group.

- [Configuring Inheritance for a VRRP Group on page 2486](#)

## Configuring Basic VRRP Support

To configure basic VRRP support, configure VRRP groups on interfaces by including the **vrrp-group** statement:

```
vrrp-group group-id {
    priority number;
    virtual-address [ addresses ];
}
```

An interface can be a member of multiple VRRP groups.

You can include this statement at the following hierarchy level:

- **[edit interfaces *interface-name* unit *logical-unit-number* family inet address *address*]**

For each interface, you must configure the following:

- **Group identifier**—Assign a value from 0 through 255. You must use the same identifier for each switch in the VRRP group.
- **Priority**—Assign a value from 1 through 255. The switch with the highest priority becomes the VRRP master. Assign different priorities to each switch in the VRRP group. If there are two or more switches with the same priority, the switch with the VRRP interface that has the highest IP address becomes the master.
- **Virtual IP address**—Normally, you configure only one address per group, but you can configure as many as eight addresses. Do not include a prefix length in a virtual IP address. The following considerations apply to configuring a virtual IP address:
  - You must configure the same address on all the switches in the VRRP group.

- If you configure a virtual IP address to be the same as a physical interface address, the switch with that interface becomes the master for the group. You must configure the priority to be 255, and you must configure preemption by including the **preempt** statement.
- If the virtual IP address is not the same as the physical interface address, you must ensure that the address does not appear anywhere else in the switch configuration. For example, verify that you do not use this address for another interface (including an aggregated Ethernet interface) or for a static ARP entry.

**NOTE:** If you enable MAC source address filtering on an interface, you must include the virtual MAC address in the list of source MAC addresses that you specify in the `source-address-filter` statement at the `[edit interfaces interface-name]` hierarchy. MAC addresses ranging from 00:00:5e:00:01:00 through 00:00:5e:00:01:ff are reserved for VRRP, as defined in RFC 3768. The VRRP group number must be the decimal equivalent of the last hexadecimal byte of the virtual MAC address.

**Related  
Documentation**

- [Understanding VRRP on page 2446](#)
- [Configuring the Startup Period for VRRP Operations on page 2479](#)
- [Configuring VRRP Authentication \(IPv4 Only\) on page 2478](#)

## Configuring VRRP Authentication (IPv4 Only)

VRRP (IPv4 only) protocol exchanges can be authenticated to guarantee that only trusted switches participate in a VRRP group. By default, VRRP authentication is disabled. You can configure one of the following authentication methods for a group, and each switch in the same group must use the same method:

- Simple authentication—Uses a text password included in the transmitted packet. The receiving switch uses an authentication key (password) to verify the packet.
- Message Digest 5 (MD5) algorithm—Adds an authentication header (AH) to the IP packet that encapsulates the VRRP packet. You create an authentication key that is used to create a hash of the packet, and the hash is stored in the AH. A receiving switch recalculates the hash on the incoming packet and compares the hashes. If they are identical, the packet is valid and is accepted. Otherwise the switch drops the incoming packet.

To enable authentication and specify an authentication method, include the **authentication-type** statement.

**authentication-type** *authentication;*

**authentication** can be **simple** or **md5**. The authentication type must be the same for all the switches in the VRRP group.

You can include this statement at the following hierarchy level:

- **[edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*]**

If you include the **authentication-type** statement, you can configure a key (password) on each interface by including the **authentication-key** statement:

**authentication-key** *key*;

**key** (the password) is an ASCII string. For simple authentication, it can be from 1 through 8 characters long. For MD5 authentication, it can be from 1 through 16 characters long. If you include spaces, enclose all characters in quotation marks (" ").

**NOTE:** The key must be the same for all switches in the VRRP group.

You can include this statement at the following hierarchy level:

- **[edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*]**

## Configuring the Startup Period for VRRP Operations

Configure the startup-silent period interval to avoid alarms caused by the delay or interruption of the incoming VRRP advertisement packets while an interface is coming online. The period starts when the state of a VRRP interface is changed from down to up. During this period, Master Down Events are ignored.

To configure the startup period for VRRP operations, include the **startup-silent-period** statement at the **[edit protocols vrrp]** hierarchy level:

**[edit protocols vrrp]**  
**startup-silent-period** *seconds*;

## Configuring the Advertisement Interval for the VRRP Master

By default, the master switch sends VRRP advertisement packets every second to all members of the VRRP group. These packets indicate that the master switch is still operational. If the master switch fails or becomes unreachable, the backup switch with the highest priority value becomes the new master switch.

You can modify the advertisement interval in seconds or in milliseconds; the interval must be the same for all routing platforms in the VRRP group.

This topic contains the following sections:

- [Modifying the Advertisement Interval in Seconds on page 2480](#)
- [Modifying the Advertisement Interval in Milliseconds on page 2480](#)

---

### Modifying the Advertisement Interval in Seconds

To modify the time, in seconds, between the sending of VRRP advertisement packets, include the **advertise-interval** statement:

**advertise-interval** *seconds*;

The interval can be from 1 through 255 seconds.

You can include this statement at the following hierarchy level:

- [edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*]

---

### Modifying the Advertisement Interval in Milliseconds

To modify the time, in milliseconds, between the sending of VRRP advertisement packets, include the **fast-interval** statement:

**fast-interval** *milliseconds*;

The interval can be from 100 through 999 milliseconds.

You can include this statement at the following hierarchy level:

- [edit interfaces *interface-name* unit *logical-unit-number* family (inet | inet6) address *address* (vrrp-group | vrrp-inet6-group) *group-id*]

**NOTE:** Junos OS sets the advertisement interval to 0 in VRRP packets. When you configure VRRP with other vendors' equipment, the **fast-interval** statement works correctly only when the other equipment also has the advertisement interval set to 0 in the VRRP packet. Otherwise, Junos OS interprets other routers' settings as advertisement timer errors.

## Configuring VRRP Preemption and Hold Time

- [Configuring VRRP Preemption on page 2481](#)
- [Configuring the Preemption Hold Time on page 2481](#)
- [Overriding the Hold Time on page 2481](#)

### Configuring VRRP Preemption

By default, a higher-priority VRRP backup switch preempts a lower-priority master switch. To explicitly enable this behavior, include the following statement:

```
preempt;
```

To prohibit a higher-priority VRRP backup switch from preempting a lower-priority master switch, include the following statement on the lower-priority switch:

```
no-preempt;
```

You can include these statements at the following hierarchy level:

- **[edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*]**

### Configuring the Preemption Hold Time

You can also configure a preemption hold time, which is the number of seconds a higher-priority backup router that has just started up waits before preempting the master router. You might want to configure a hold time so that routing protocols or other Junos OS components converge before preemption occurs.

The hold time is applied only on startup. By default, the hold-time value is 0 seconds, meaning that preemption can occur immediately after the backup router starts up.

To modify the preemption hold-time value, configure the following statement:

```
hold-time seconds;
```

The hold time can be from 0 through 3600 seconds.

You can include this statement at the following hierarchy level:

- **[edit interfaces *interface-name* unit *logical-unit-number* family inet address vrrp-group *group-id*] preempt**

### Overriding the Hold Time

You can use the `asymmetric-hold-time` statement to configure a VRRP master to fail over to the backup immediately—without waiting for the preemption hold time to expire—when a tracked route goes down. Otherwise, the master waits for the hold time to expire before it initiates a failover when a tracked route goes down.

When the tracked route comes up again, the new backup (original master) router waits for the preemption hold time to expire before it reasserts mastership.

You can include this statement at the following hierarchy level:

- **[edit protocols vrrp]**

## Configuring a Route to Be Tracked

A VRRP master can track a route and dynamically trigger a new master router election if the route becomes unreachable. To enable this behavior, you must configure a cost that will be subtracted from the priority of the master if the tracked route becomes unreachable. The new priority must be less than the priority of one of the backups so that the backup becomes the new master.

To configure a route to be tracked, include the following statements:

```
track {  
  priority-hold-time seconds;  
  route prefix/prefix-length routing-instance default priority-cost priority;  
}
```

You can include these statements at the following hierarchy level:

- **[edit interfaces interface-name unit logical-unit-number family inet address address vrrp-group group-id]**

The **prefix** and **prefix-length** values specify the route to be tracked. The **priority-hold-time** statement is the minimum length of time that must elapse between priority changes. If the priority of the master changes because of a tracking event, the priority hold timer begins. If another tracking event or manual configuration change occurs while the timer is running, the new priority update is postponed until the timer expires. You might configure the **priority-hold-time** statement to prevent problems that could occur if there were multiple VRRP transitions in a short period of time.

The **priority-cost** option is the value to be subtracted from the VRRP priority when the tracked route goes down. The value can be 1 through 254. The sum of the costs for all tracked interfaces and routes must be less than or equal to the configured priority (so that subtracting all the costs results in a priority equal to or greater than 0).

**Related  
Documentation**

- [Understanding VRRP on page 2446](#)
- [Configuring Basic VRRP Support on page 2477](#)
- [Example: Configuring VRRP for Load Sharing on page 2472](#)
- [Configuring a Logical Interface to Be Tracked on page 2483](#)

## Configuring a Logical Interface to Be Tracked

VRRP can track whether a logical interface is up, down, or not present, and can change the priority of the switch based on the state of the interface, which might trigger a new master election. VRRP can also track the operational speed of a logical interface and update the priority of the switch when the speed crosses a configured threshold. For each VRRP group, you can track as many as 10 logical interfaces.

When interface tracking is enabled on a switch, you cannot assign the switch a priority of 255 to make it the master for the group.

To configure a logical interface to be tracked, include the following statements:

```
track {
  interface interface-name {
    bandwidth-threshold bits-per-second priority-cost priority;
    priority-cost priority;
  }
  priority-hold-time seconds;
}
```

You can include these statements at the following hierarchy level:

- [edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*]

The interface specified is the interface to be tracked for the VRRP group. The **priority-hold-time** statement is the minimum length of time that must elapse between priority changes. If the priority changes because of a tracking event, the priority hold timer begins. If another tracking event or manual configuration change occurs while the timer is running, the new priority update is postponed until the timer expires. You might configure the **priority-hold-time** statement to prevent problems that could occur if there were multiple VRRP transitions in a short period of time.

The **bandwidth-threshold** statement specifies a threshold for the tracked interface. If the bandwidth of the tracked interface drops below the threshold value, the system subtracts the bandwidth threshold **priority-cost** value from the VRRP priority for the switch. You can create as many as five **bandwidth-threshold** statements for each tracked interface.

The interface **priority-cost** statement is the value to be subtracted from the VRRP priority when the tracked route goes down. The value can be 1 through 254. The sum of the costs for all tracked interfaces and routes must be less than or equal to the configured priority (so that subtracting all the costs results in a priority equal to or greater than 0).

**WARNING:** On a QFabric system, do not apply interface tracking to a multichassis link aggregation group (MC-LAG) that includes an interface belonging to a network Node group device and an interface belonging to a server Node group device. If you do apply interface tracking to an MC-LAG configured in this way, a priority update will not occur if the state of the MC-LAG interface changes.

If you configure tracking for more than one interface, Junos OS subtracts the sum of the priority costs for the tracked interfaces from the VRRP priority if all the tracked interfaces fail. However, if you configure the interface **priority-cost** statement and the bandwidth threshold **priority-cost** statement, they are not added together. The switch uses only one priority cost for a tracked interface, as indicated in [Table 196 on page 2484](#):

**Table 196: Interface State and Priority Cost Usage**

| Tracked Interface State                                      | Priority Cost Usage                                        |
|--------------------------------------------------------------|------------------------------------------------------------|
| Down                                                         | <b>priority-cost priority</b>                              |
| Not down; media speed below one or more bandwidth thresholds | Priority-cost of the lowest applicable bandwidth threshold |

You must configure an interface priority cost only if you do not configure any bandwidth thresholds. If you do not configure an interface **priority-cost** value and the interface fails, Junos OS subtracts the bandwidth threshold **priority-cost** value of the lowest bandwidth threshold from the priority of the switch.

## Configuring a Backup to Accept Packets Destined for the Virtual IP Address

By default, a switch configured to be a VRRP backup but acting as the master does not process packets sent to the virtual IP address—that is, packets in which the destination address is the virtual IP address. To configure a backup switch to process packets sent to the virtual IP address while it is acting as the master, include the **accept-data** statement on the backup:

```
accept-data;
```

You can include this statement at the following hierarchy level:

- **[edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group] *group-id***

To explicitly prohibit the backup from accepting packets destined for the virtual IP address while acting as master, include the **no-accept-data** statement:

```
no-accept-data;
```

If you include the **accept-data** statement, configure the connected hosts so that they:

- Process gratuitous ARP requests.
- Do not use packets other than ARP replies to update their ARP cache.

This statement is disabled by default. If you enable it, your configuration does not comply with RFC 3768.

To restrict incoming IP packets to ICMP only, you must configure firewall filters to accept only ICMP packets.

## Configuring Passive ARP Learning for VRRP Backups

By default, VRRP backup switches drop ARP requests for the MAC address of the VRRP IP. This means that backups do not learn the ARP mappings (IP address to MAC address mappings) for the hosts sending the requests. If it becomes the master, the configured backup must learn all the entries that were present in the ARP cache of the original master. In environments with many directly attached hosts, the number of ARP entries to learn can be very large. This can cause a significant delay while the backup transitions to the master state, during which traffic transmitted to some of the hosts might be dropped.

Passive ARP learning enables the ARP cache in the backup to learn approximately the same contents as the ARP cache in the master, thus preventing the problem of needing to learn many ARP entries quickly. To enable passive ARP learning, include the **passive-learning** statement at the **[edit system arp]** hierarchy level:

```
[edit system arp]
passive-learning;
```

We recommend setting passive learning on both the backup and master VRRP switches. Doing so prevents the need to manually configure a master that fails and becomes a backup. While a switch operates as the master, the passive learning configuration has no impact. The configuration takes effect only when a switch operates as a backup.

## Configuring the Silent Period

When the state of a VRRP interface changes from down to up, a silent period begins. During this period, any master down events are ignored. Configure the silent period interval to avoid problems that can be caused if incoming VRRP advertisement packets are delayed or interrupted while an interface starts up.

To configure the silent period, include the **startup-silent-period** statement at the **[edit protocols vrrp]** hierarchy level:

```
[edit protocols vrrp]
startup-silent-period seconds;
```

## Configuring Inheritance for a VRRP Group

Junos OS enables you to configure VRRP groups on the various subnets of a VLAN to inherit the state and configuration of one of the groups, which is known as the *active VRRP group*. By configuring inheritance, you can prevent VRRP groups other than the active group from sending out VRRP advertisements. When the **vrrp-inherit-from** configuration statement is included in the configuration, only the active VRRP group from which the other VRRP groups are inheriting the state sends out VRRP advertisements; the groups inheriting the state do not send any VRRP advertisements, because the state is maintained only on the group from which the state is inherited.

If the **vrrp-inherit-from** statement is not configured, each of the VRRP master groups in the various subnets on the VLAN sends out separate VRRP advertisements and adds to the traffic on the VLAN.

To configure inheritance for a VRRP group, include the **vrrp-inherit-from** statement at the **[edit interfaces *interface-name* unit *logical-unit-number* family inet address *address* vrrp-group *group-id*]**:

```
[edit interfaces interface-name unit logical-unit-number family inet address address
  vrrp-group group-id]
  vrrp-inherit-from vrrp-group;
```

When you configure a group to inherit a state from another group, note the following conditions:

- Both inheriting groups and active groups must be on the same physical interface and logical system. However, the groups need not necessarily be on the same VLAN or logical interface.
- Both inheriting groups and active groups must be on the same routing instances; however, this limitation does not apply for groups on the integrated routing and bridging (IRB) interfaces.

When you include the **vrrp-inherit-from** statement for a VRRP group, the VRRP group inherits the following parameters from the active group:

- **advertise-interval**
- **authentication-key**
- **authentication-type**
- **fast-interval**
- **preempt | no-preempt**
- **priority**

- **track interfaces**
- **track route**

However, you can configure the **accept-data | no-accept-data** statement for the group to specify whether the interface should accept packets destined for the virtual IP address.

| <b>Description</b>         | Disable graceful restart for BGP. Graceful restart allows a routing device undergoing a restart to inform its adjacent neighbors and peers of its condition.                                                                                                                                                                                                                                                                                                                                                                                                                       |

**NOTE:** When you disable graceful restart at one level in the configuration statement hierarchy, it is also disabled at lower levels in the same hierarchy. For example, if you disable graceful restart at the [edit protocols bgp group *group-name*] hierarchy level, it is disabled for all the peers in the group. Therefore, if you want to enable graceful restart for some peers in a group and disable it for others, enable graceful restart at the [edit protocols bgp group *group-name*] hierarchy level and disable graceful restart for each peer at the [edit protocols bgp group *group-name* neighbor *address*] hierarchy level.

## graceful-restart (Enabling Globally)

---

|                            |                                                                                                                                                                                                                                                                                                                                        |
|----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <pre>graceful-restart {<br/>  disable;<br/>  helper-disable;<br/>  maximum-helper-recovery-time <i>seconds</i>;<br/>  maximum-helper-restart-time <i>seconds</i>;<br/>  notify-duration <i>seconds</i>;<br/>  recovery-time <i>seconds</i>;<br/>  restart-duration <i>seconds</i>;<br/>  stale-routes-time <i>seconds</i>;<br/>}</pre> |
| <b>Hierarchy Level</b>     | [edit logical-systems <i>logical-system-name</i> routing-options],<br>[edit logical-systems <i>logical-system-name</i> routing-instances <i>routing-instance-name</i> routing-options],<br>[edit routing-options],<br>[edit routing-instances <i>routing-instance-name</i> routing-options]                                            |
| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.                                                                                                                                         |
| <b>Description</b>         | Configure graceful restart globally to enable the feature. You cannot enable graceful restart for specific protocols unless graceful restart is also enabled globally. You can, optionally, modify the global settings at the individual protocol level.                                                                               |

### NOTE:

- For VPNs, the `graceful-restart` statement allows a router whose VPN control plane is undergoing a restart to continue to forward traffic while recovering its state from neighboring routers.
  - For BGP, if you configure graceful restart after a BGP session has been established, the BGP session restarts and the peers negotiate graceful restart capabilities.
  - LDP sessions flap when `graceful-restart` configurations change.
- 

|                                 |                                                                                                                                                                                   |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Default</b>                  | Graceful restart is disabled by default.                                                                                                                                          |

| Description              | <p>Configure graceful restart for BGP. Graceful restart allows a routing device undergoing a restart to inform its adjacent neighbors and peers of its condition. Graceful restart is disabled by default.</p> <p>To configure the duration of the BGP graceful restart period, include the <b>restart-time</b> statement at the <b>[edit protocols bgp graceful-restart]</b> hierarchy level. To set the length of time the router waits to receive messages from restarting neighbors before declaring them down, include the <b>stale-routes-time</b> statement at the <b>[edit protocols bgp graceful-restart]</b> hierarchy level.</p> <div> <b>NOTE:</b> If you configure graceful restart after a BGP session has been established, the BGP session restarts and the peers negotiate graceful restart capabilities.</div> <p>Configure graceful restart globally at the <b>[edit routing-options]</b> or <b>[edit routing-instances instance-name routing-options]</b> hierarchy level to enable the feature. You cannot enable graceful restart for specific protocols unless graceful restart is also enabled globally. You can, optionally, modify the global settings at the individual protocol level.</p> <p>The remaining statements are explained separately.</p> |

| <b>Description</b>         | <p>Configure graceful restart for OSPF.</p> <p>Graceful restart allows a routing device to restart with minimal effects to the network, and is enabled for all routing protocols at the [edit routing-options] hierarchy level.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>             | <p><b>disable</b>—Disable graceful restart for OSPF.</p> <p><b>helper-disable (standard   restart-signaling   both)</b>—Disable helper mode for graceful restart. When helper mode is disabled, a device cannot help a neighboring device that is attempting to restart. Beginning with Junos OS Release 11.4, you can configure restart signaling-based helper mode for OSPFv2 graceful restart configurations. The <b>standard</b>, <b>restart-signaling</b>, and <b>both</b> options are only supported for OSPFv2. Specify <b>standard</b> to disable helper mode for standard graceful restart (based on RFC 3623). Specify <b>restart-signaling</b> to disable helper mode for restart signaling-based graceful restart (based on RFC 4811, RFC 4812, and RFC 4813). Specify <b>both</b> to disable helper mode for both standard and restart signaling-based graceful restart. The last committed statement takes precedence over the previously configured statement.</p> <p><b>Default:</b> Helper mode is enabled by default. For OSPFv2, both standard and restart-signaling based helper modes are enabled by default.</p> <p><b>no-strict-lsa-checking</b>—Disable strict OSPF link-state advertisement (LSA) checking to prevent the termination of graceful restart by a helping router. LSA checking is enabled by default.</p> |

**NOTE:** The **helper-disable** statement and the **no-strict-lsa-checking** statement cannot be configured at the same time. If you attempt to configure both

statements at the same time, the routing device displays a warning message when you enter the `show protocols (ospf | ospf3)` command.

.....  
**notify-duration seconds**—Estimated time needed to send out purged grace LSAs over all the interfaces.

**Range:** 1 through 3600 seconds

**Default:** 30 seconds

**restart-duration seconds**—Estimated time needed to reacquire a full OSPF neighbor from each area.

**Range:** 1 through 3600 seconds

**Default:** 180 seconds

| <b>Release Information</b>      | Statement introduced in Junos OS 11.3 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>              | <p>Configure a VRRP master to fail over to a backup immediately—without waiting for the preemption hold time to expire—when a tracked route goes down. Otherwise, the master waits for the hold time to expire before it initiates a failover when a tracked route goes down.</p> <p>When the tracked route comes up again, the new backup (original master) router waits for the preemption hold time to expire before it reasserts mastership.</p> |
| <b>Default</b>                  | asymmetric-hold-time is disabled.                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS 11.3 for the QFX Series.                                                                                                                                                                                                                            |
| <b>Description</b>         | Enable Virtual Router Redundancy Protocol (VRRP) IPv4 authentication and specify the authentication scheme for the VRRP group. If you enable authentication, you must specify a password by including the <b>authentication-key</b> statement.<br><br>All routers in the VRRP group must use the same authentication scheme and password. |

**NOTE:** When VRRPv3 is enabled, the **authentication-type** and **authentication-key** statements cannot be configured for any VRRP groups.

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.3 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Description</b>              | <p>If you configure multiple VRRP groups on an interface (using multiple VLANs), traffic for some of the groups might be briefly dropped if a failover occurs. This can happen because the new master must send gratuitous ARP replies for each VRRP group to update the ARP tables in the connected devices, and there is a short delay between each gratuitous ARP reply. Traffic sent by devices that have not yet received the gratuitous ARP reply is dropped (until the device receives the reply and learns the MAC address of the new master).</p> <p>If you configure a failover delay, the new master delays sending gratuitous ARP replies for the period that you set. This allows the new master to send the ARP replies for all of the VRRP groups simultaneously.</p> |
| <b>Options</b>                  | <p><i>milliseconds</i>—Specify the failover delay time, in milliseconds.</p> <p><b>Range:</b> 50 through 2000</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
