| <b>Description</b>         | Enable logical interface tracking for a Virtual Router Redundancy Protocol (VRRP) group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

**WARNING:** On a QFabric system, do not apply interface tracking to a multichassis link aggregation group (MC-LAG) that includes an interface belonging to a network Node group device and an interface belonging to a server Node group device. If you do apply interface tracking to an MC-LAG configured in this way, a priority update will not occur if the state of the MC-LAG interface changes.

| <b>Description</b>              | Configure a Virtual Router Redundancy Protocol (VRRP) router's priority cost for becoming the master default router. The router with the highest priority within the group becomes the master.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>                  | <p><b><i>priority</i></b>—The value subtracted from the configured VRRP priority when the tracked interface or route is down to force a new master router election. The sum of all the costs for all interfaces or routes that are tracked must be less than or equal to the configured priority of the VRRP group.</p> <p><b>Range:</b> 1 through 254</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

## traceoptions

**Syntax** traceoptions {  
     file <filename> <files number> <match regular-expression> <microsecond-stamp>  
         <size size> <world-readable | no-world-readable>;  
     flag flag;  
     no-remote-trace;  
 }

**Hierarchy Level** [edit protocols vrrp]

**Release Information** Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description** Define tracing operations for the Virtual Router Redundancy Protocol (VRRP) process.

To specify more than one tracing operation, include multiple **flag** statements.

By default, VRRP logs the error, dcd configuration, and routing socket events in a file in the directory **/var/log**.

**NOTE:** The traceoptions statement is not supported on a QFabric system.

**Default** If you do not include this statement, no VRRP-specific tracing operations are performed.

**Options** **filename filename**—Name of the file to receive the output of the tracing operation. Enclose the name within quotation marks. All files are placed in the directory **/var/log**. By default, VRRP tracing output is placed in the file **vrrpd**.

**files number**—(Optional) Maximum number of trace files. When a trace file named **trace-file** reaches its maximum size, it is renamed **trace-file.0**, then **trace-file.1**, and so on, until the maximum number of trace files is reached. When the maximum number is reached, the oldest trace file is overwritten.

**Range:** 0 through 4,294,967,296 files

**Default:** 3 files

If you specify a maximum number of files, you also must specify a maximum file size with the **size** option.

**flag flag**—Tracing operation to perform. To specify more than one tracing operation, include multiple **flag** statements. These are the VRRP-specific tracing options:

- **all**—All VRRP tracing operations
- **database**—Database changes
- **general**—General events
- **interfaces**—Interface changes

- **normal**—Normal events
- **packets**—Packets sent and received
- **state**—State transitions
- **timer**—Timer events

**match *regex***—(Optional) Refine the output to include only those lines that match the given regular expression.

**microsecond-stamp**—(Optional) Provide a timestamp with microsecond granularity.

**no-world-readable**—Restrict users from reading the log file.

**size *size***—(Optional) Maximum size of each trace file, in kilobytes, megabytes, or gigabytes. When a trace file named ***trace-file*** reaches this size, it is renamed ***trace-file.0***. When the ***trace-file*** again reaches its maximum size, ***trace-file.0*** is renamed ***trace-file.1*** and ***trace-file*** is renamed ***trace-file.0***. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

**Syntax:** *xk* to specify KB, *xm* to specify MB, or *xg* to specify GB

**Range:** 10 KB through the maximum file size supported on your routing platform

**Default:** 1 MB

If you specify a maximum file size, you also must specify a maximum number of trace files with the **files** option.

**world-readable**—Allow users to read the log file.

| <b>Description</b>              | Configure the addresses of the virtual routers in a Virtual Router Redundancy Protocol (VRRP) IPv4 or IPv6 group. You can configure up to eight addresses.                                                                                                                                                                   |
| <b>Options</b>                  | <b><i>addresses</i></b> —Addresses of one or more virtual routers. Do not include a prefix length. If the address is the same as the interface's physical address, the interface becomes the master virtual router for the group.                                                                                            |
| <b>Required Privilege Level</b> | interface—To view this statement in the configuration.<br>interface-control—To add this statement to the configuration.                                                                                                                                                                                                      |

| <b>Description</b>              | <p>Configure a Virtual Router Redundancy Protocol (VRRP) IPv4 group. As of Junos OS Release 13.2, VRRP nonstop active routing (NSR) is enabled only when you configure the <b>nonstop-routing</b> statement at the [edit routing-options] or [edit logical system logical-system-name routing-options] hierarchy level.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>                  | <p><b><i>group-id</i></b>—VRRP group identifier. If you enable MAC source address filtering on the interface, you must include the virtual MAC address in the list of source MAC addresses that you specify in the <b>source-address-filter</b> statement. MAC addresses ranging from 00:00:5e:00:01:00 through 00:00:5e:00:01:ff are reserved for VRRP, as defined in RFC 2338. The VRRP group number must be the decimal equivalent of the last hexadecimal byte of the virtual MAC address.</p> <p><b>Range:</b> 0 through 255</p> <p>The remaining statements are explained separately.</p>                                                                                                                                                                                        |
| <b>Required Privilege Level</b> | <p>interface—To view this statement in the configuration.</p> <p>interface-control—To add this statement to the configuration.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

### Verifying Nonstop Software Upgrade for QFabric Systems

This topic discusses how you can monitor the progress of each of the three steps in a nonstop software upgrade. By identifying the key actions and events that define this process, you can track the status of the upgrade with confidence.

**TIP:** When performing a nonstop software upgrade, open two SSH sessions to the QFabric CLI. Use one session to monitor the upgrade itself and use a second session to verify that the QFabric system components respond to operational mode commands as expected.

### Verifying a Director Group Nonstop Software Upgrade

---

**Purpose** During the Director group portion of a nonstop software upgrade, you should expect to see the Director device that hosts the CLI session selected as the master device. When mastership of all processes moves to the master, the QFabric system upgrades the backup Director device and this Director device reboots. After the backup Director device comes back online, the master Director device suspends CLI operations for 15 minutes, upgrades itself, and reboots. At this point, the backup becomes the new master Director

device and you can issue CLI operational commands. Finally, the former master comes back online as a backup and both devices are operational once again. In addition to the steps below, you can issue the **show system software upgrade status** command to view the progress of the upgrade.

- Action** 1. In one SSH session to the QFabric CLI, verify the current status of the QFabric system by issuing the **show fabric administration inventory**, **show fabric administration inventory director-group status**, and **show fabric session-host** commands. In this case, Director device DG0 is the master device but DG1 hosts the CLI session.

```
session1@qfabric> show fabric administration inventory
```

| Item                      | Identifier | Connection | Configuration |

CP Link [1/3]                up

```

```

session1@qfabric> show fabric session-host
Identifier: 0281052011000032

```

- In a second SSH session to the QFabric CLI, issue the request for the Director group nonstop software upgrade.

```

root@qfabric> request system software nonstop-upgrade director-group
jinstall-qfabric-12.2X50-D10.3.rpm

```

3. If the CLI session is being hosted by the master Director device, skip to step 4. However, if the CLI session is hosted by the backup Director device, the Director group mastership switches to the backup device after you issue the nonstop software upgrade command. In this example, mastership switches to Director device DG1.

```
session1@qfabric> show fabric administration inventory director-group status
```

```

5. When the system upgrades and reboots the backup Director device DG0, notice how this device is not displayed in the output of the **show fabric administration inventory director-group status** command. Because Director device DG1 appears, this means that the DG1 is operational and acts as the master device.

**NOTE:** If your second SSH session is being hosted by the rebooting Director device, your session terminates and you need to log back in to establish a new session running on the active Director device.

```
session1@qfabric> show fabric administration inventory director-group status
```

```
Director Group Status Tue Jun  5 15:41:14 UTC 2012
```

### Verifying a Fabric Nonstop Software Upgrade

**Purpose** During the fabric portion of a nonstop software upgrade, you should expect to see both fabric control Routing Engines upgrade first, followed by the upgrade of each Interconnect device one at a time. In addition to the steps below, you can issue the **show system software upgrade status** command to view the progress of the upgrade.

**Action** 1. In an SSH session to the QFabric CLI, issue the request for the fabric nonstop software upgrade.

```
root@qfabric> request system software nonstop-upgrade fabric
```

```
jinstall-qfabric-12.2X50-D10.3.rpm
```

```

### Verifying a Redundant Server Node Group Nonstop Software Upgrade

**Purpose** During the redundant server Node group portion of a nonstop software upgrade, you should expect to see the backup Node device upgrade first, followed by the upgrade of the master Node device. Server Node groups with a single device upgrade the device in the same way as a standalone switch. In addition to the steps below, you can issue the **show system software upgrade status** command to view the progress of the upgrade.

**Action** 1. In an SSH session to the QFabric CLI, issue the request for the redundant server Node group nonstop software upgrade.

```
root@qfabric> request system software nonstop-upgrade node-group RSNG
jinstall-qfabric-12.2X50-D10.3.rpm
Upgrading target(s): RSNG
```

```

### Verifying a Network Node Group Nonstop Software Upgrade

**Purpose** During the network Node group portion of a nonstop software upgrade, you should expect to see the backup network Node group Routing Engine upgrade first, followed by the Node devices within the network Node group upgrading one at a time, and ending with the upgrade of the master network Node group Routing Engine. In addition to the steps below, you can issue the **show system software upgrade status** command to view the progress of the upgrade.

**NOTE:** If you configure an upgrade group for Node groups containing 2 or more Node devices, all Node devices within the upgrade group reboot at the same time.

**Action** 1. In an SSH session to the QFabric CLI, issue the request for the network Node group nonstop software upgrade.

```
root@qfabric> request system software nonstop-upgrade node-group NW-NG-0
jinstall-qfabric-12.2X50-D10.3.rpm
Upgrading target(s): NW-NG-0
```

```

[NW-NG-0 2012-06-01 10:18:55]: Switchover Completed
[Status 2012-06-01 10:18:58]: Upgrade completed with 0 errors
Success

```

2. Issue the **show system software upgrade status** command to view the status of the upgrade.

```

root@qfabric> show system software upgrade status
Wed Jan 16 22:06:02 2013 Software nonstop upgrade on:
NW-NG-0 in progress

```

3. Verify the progress of the upgrade by issuing the **show chassis nonstop-upgrade node-group**, **show fabric administration inventory**, **show fabric administration inventory infrastructure**, and **show fabric administration inventory node-groups NW-NG-0** commands. You should see the backup network Node group Routing Engine reboot first, followed by each Node device within the network Node group, and ending with the reboot of master network Node group Routing Engine. Restarting devices appear as **Disconnected** in the output of the **show fabric administration inventory** command and restarting Routing Engines do not appear in output of the **show fabric administration inventory infrastructure** command until they return to service.

## Operational Mode Commands for Graceful Restart

---

- [Verifying Graceful Restart Operation on page 2547](#)
- [show bgp neighbor](#)
- [show log](#)
- [show \(ospf | ospfv3\) overview](#)

### Verifying Graceful Restart Operation

This topic contains the following sections:

- [Graceful Restart Operational Mode Commands on page 2547](#)
- [Verifying BGP Graceful Restart on page 2548](#)
- [Verifying IS-IS and OSPF Graceful Restart on page 2548](#)
- [Verifying CCC and TCC Graceful Restart on page 2549](#)

### Graceful Restart Operational Mode Commands

---

To verify proper operation of graceful restart, use the following commands:

- **show bgp neighbor** (for BGP graceful restart)
- **show log** (for IS-IS and OSPF/OSPFv3 graceful restart)
- **show (ospf | ospfv3) overview** (for OSPF/OSPFv3 graceful restart)
- **show rsvp neighbor detail** (for RSVP graceful restart—helper router)
- **show rsvp version** (for RSVP graceful restart—restarting router)
- **show ldp session detail** (for LDP graceful restart)
- **show connections** (for CCC and TCC graceful restart)
- **show route instance detail** (for Layer 3 VPN graceful restart and for any protocols using graceful restart in a routing instance)
- **show route protocol l2vpn** (for Layer 2 VPN graceful restart)

For more information about these commands and a description of their output fields, see the [CLI Explorer](#).

## Verifying BGP Graceful Restart

---

To view graceful restart information for BGP sessions, use the **show bgp neighbor** command:

```
user@PE1> show bgp neighbor 192.255.10.1
Peer: 192.255.10.1+179 AS 64595 Local: 192.255.5.1+1106 AS 64595
  Type: Internal    State: Established    Flags: <>
  Last State: OpenConfirm    Last Event: RecvKeepAlive
  Last Error: None
  Export: [ static ]
  Options:<Preference LocalAddress HoldTime GracefulRestart Damping PeerAS Refresh>

  Local Address: 192.255.5.1 Holdtime: 90 Preference: 170
  IPsec SA Name: hope
  Number of flaps: 0
  Peer ID: 192.255.10.1    Local ID: 192.255.5.1    Active Holdtime: 90
  Keepalive Interval: 30
  NLRI for restart configured on peer: inet-unicast
  NLRI advertised by peer: inet-unicast
  NLRI for this session: inet-unicast
  Peer supports Refresh capability (2)
  Restart time configured on the peer: 180
  Stale routes from peer are kept for: 180
  Restart time requested by this peer: 300
  NLRI that peer supports restart for: inet-unicast
  NLRI that peer saved forwarding for: inet-unicast
  NLRI that restart is negotiated for: inet-unicast
  NLRI of received end-of-rib markers: inet-unicast
  NLRI of all end-of-rib markers sent: inet-unicast
  Table inet.0 Bit: 10000
  RIB State: restart is complete
  Send state: in sync
  Active prefixes: 0
  Received prefixes: 0
  Suppressed due to damping: 0
  Last traffic (seconds): Received 19    Sent 19    Checked 19
  Input messages: Total 2    Updates 1    Refreshes 0    Octets 42
  Output messages: Total 3    Updates 0    Refreshes 0    Octets 116
  Output Queue[0]: 0
```

## Verifying IS-IS and OSPF Graceful Restart

---

To view graceful restart information for IS-IS and OSPF, configure traceoptions (see [“Tracking Graceful Restart Events” on page 2457](#)).

Here is the output of a traceoptions log from an OSPF restarting router:

```
Oct  8 05:20:12 Restart mode - sending grace lsas
Oct  8 05:20:12 Restart mode - estimated restart duration timer triggered
Oct  8 05:20:13 Restart mode - Sending more grace lsas
```

Here is the output of a traceoptions log from an OSPF helper router:

```
Oct  8 05:20:14 Helper mode for neighbor 192.255.5.1
Oct  8 05:20:14 Received multiple grace lsa from 192.255.5.1
```

## Verifying CCC and TCC Graceful Restart

To view graceful restart information for CCC and TCC connections, use the **show connections** command. The following example assumes four remote interface CCC connections between CE1 and CE2:

```
user@PE1> show connections
CCC and TCC connections [Link Monitoring On]
Legend for status (St)
UN -- uninitialized
NP -- not present
WE -- wrong encapsulation
DS -- disabled
Dn -- down
-> -- only outbound conn is up
<- -- only inbound conn is up
Up -- operational
RmtDn -- remote CCC down
Restart -- restarting

Legend for connection types
if-sw: interface switching
rmt-if: remote interface switching
lsp-sw: LSP switching

Legend for circuit types
intf -- interface
tlsp -- transmit LSP
rlsp -- receive LSP
```

### CCC Graceful restart : Restarting

| Connection/Circuit | Type   | St      | Time last up | # Up trans |
|--------------------|--------|---------|--------------|------------|
| CE1-CE2-0          | rmt-if | Restart | -----        | 0          |
| fe-1/1/0.0         | intf   | Up      |              |            |
| PE1-PE2-0          | tlsp   | Up      |              |            |
| PE2-PE1-0          | rlsp   | Up      |              |            |
| CE1-CE2-1          | rmt-if | Restart | -----        | 0          |
| fe-1/1/0.1         | intf   | Up      |              |            |
| PE1-PE2-1          | tlsp   | Up      |              |            |
| PE2-PE1-1          | rlsp   | Up      |              |            |
| CE1-CE2-2          | rmt-if | Restart | -----        | 0          |
| fe-1/1/0.2         | intf   | Up      |              |            |
| PE1-PE2-2          | tlsp   | Up      |              |            |
| PE2-PE1-2          | rlsp   | Up      |              |            |
| CE1-CE2-3          | rmt-if | Restart | -----        | 0          |
| fe-1/1/0.3         | intf   | Up      |              |            |
| PE1-PE2-3          | tlsp   | Up      |              |            |
| PE2-PE1-3          | rlsp   | Up      |              |            |

| Remove-private options                 | Options associated with the <code>remove-private</code> statement.                                                                                                                                                                                                                                                                                                              |
| Holdtime                               | Hold time configured with the <code>hold-time</code> statement. The hold time is three times the interval at which keepalive messages are sent.                                                                                                                                                                                                                                 |
| Flags for NLRI<br>inet-label-unicast   | Flags related to labeled-unicast: <ul style="list-style-type: none"> <li>• <b>TrafficStatistics</b>—Collection of statistics for labeled-unicast traffic is enabled.</li> </ul>                                                                                                                                                                                                 |
| Traffic statistics                     | Information about labeled-unicast traffic statistics: <ul style="list-style-type: none"> <li>• <b>Options</b>—Options configured for collecting statistics about labeled-unicast traffic.</li> <li>• <b>File</b>—Name and location of statistics log files.</li> <li>• <b>size</b>—Size of all the log files, in bytes.</li> <li>• <b>files</b>—Number of log files.</li> </ul> |
| Traffic Statistics<br>Interval         | Time between sample periods for labeled-unicast traffic statistics, in seconds.                                                                                                                                                                                                                                                                                                 |
| Preference                             | Preference value configured with the <code>preference</code> statement.                                                                                                                                                                                                                                                                                                         |
| Outbound Timer                         | Time for which the route is available in Junos OS routing table before it is exported to BGP. This field is displayed in the output only if the <code>out-delay</code> parameter is configured to a non-zero value.                                                                                                                                                             |
| Number of flaps                        | Number of times the BGP session has gone down and then come back up.                                                                                                                                                                                                                                                                                                            |
| Peer ID                                | Router identifier of the peer.                                                                                                                                                                                                                                                                                                                                                  |
| Group index                            | Index number for the BGP peer group. The index number differentiates between groups when a single BGP group is split because of different configuration options at the group and peer levels.                                                                                                                                                                                   |
| Peer index                             | Index that is unique within the BGP group to which the peer belongs.                                                                                                                                                                                                                                                                                                            |
| Local ID                               | Router identifier of the local routing device.                                                                                                                                                                                                                                                                                                                                  |
| Local Interface                        | Name of the interface on the local routing device.                                                                                                                                                                                                                                                                                                                              |
| Active holdtime                        | Hold time that the local routing device negotiated with the peer.                                                                                                                                                                                                                                                                                                               |
| Keepalive Interval                     | Keepalive interval, in seconds.                                                                                                                                                                                                                                                                                                                                                 |
| BFD                                    | Status of BFD failure detection.                                                                                                                                                                                                                                                                                                                                                |
| Local Address                          | Name of directly connected interface over which direct EBGP peering is established.                                                                                                                                                                                                                                                                                             |
| NLRI for restart<br>configured on peer | Names of address families configured for restart.                                                                                                                                                                                                                                                                                                                               |

Table 197: show bgp neighbor Output Fields (*continued*)

| Field Name                                      | Field Description                                                                                                                                                                                                                         |
|-------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| NLRI advertised by peer                         | Address families supported by the peer: <b>unicast</b> or <b>multicast</b> .                                                                                                                                                              |
| NLRI for this session                           | Address families being used for this session.                                                                                                                                                                                             |
| Peer supports Refresh capability                | Remote peer's ability to send and request full route table readvertisement (route refresh capability). For more information, see RFC 2918, <i>Route Refresh Capability for BGP-4</i> .                                                    |
| Restart time configured on peer                 | Configured time allowed for restart on the neighbor.                                                                                                                                                                                      |
| Stale routes from peer are kept for             | When graceful restart is negotiated, the maximum time allowed to hold routes from neighbors after the BGP session has gone down.                                                                                                          |
| Peer does not support Restarter functionality   | Graceful restart restarter-mode is disabled on the peer.                                                                                                                                                                                  |
| Peer does not support Receiver functionality    | Graceful restart helper-mode is disabled on the peer.                                                                                                                                                                                     |
| Restart time requested by this peer             | Restart time requested by this neighbor during capability negotiation.                                                                                                                                                                    |
| Restart flag received from the peer             | When this field appears, the BGP speaker has restarted (Restarting), and this peer should not wait for the <b>end-of-rib</b> marker from the speaker before advertising routing information to the speaker.                               |
| NLRI that peer supports restart for             | Neighbor supports graceful restart for this address family.                                                                                                                                                                               |
| NLRI peer can save forwarding state             | Neighbor supporting this address family saves all forwarding states.                                                                                                                                                                      |
| NLRI that peer saved forwarding for             | Neighbor saves all forwarding states for this address family.                                                                                                                                                                             |
| NLRI that restart is negotiated for             | Router supports graceful restart for this address family.                                                                                                                                                                                 |
| NLRI of received end-of-rib markers             | Address families for which end-of-routing-table markers are received from the neighbor.                                                                                                                                                   |
| NLRI of all end-of-rib markers sent             | Address families for which end-of-routing-table markers are sent to the neighbor.                                                                                                                                                         |
| Peer supports 4 byte AS extension (peer-as 1)   | Peer understands 4-byte AS numbers in BGP messages. The peer is running Junos OS Release 9.1 or later.                                                                                                                                    |
| NLRIs for which peer can receive multiple paths | Appears in the command output of the local router if the downstream peer is configured to receive multiple BGP routes to a single destination, instead of only receiving the active route.<br><br>Possible value is <b>inet-unicast</b> . |

Table 197: show bgp neighbor Output Fields (*continued*)

| Field Name                                                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Output queue                                               | Number of BGP packets that are queued to be transmitted to a particular neighbor for a particular routing table. Output queue 0 is for unicast NLRIs, and queue 1 is for multicast NLRIs.<br><br>It also specifies the routing table name and the NLRI they represent in the format ( <b>routing table name, NLRI</b> ).<br><br><b>NOTE:</b> The output queues of routing tables that are not advertised, will only show up at <b>extensive</b> output level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Trace options                                              | Configured tracing of BGP protocol packets and operations.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Table 197: show bgp neighbor Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                   |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Trace file              | Name of the file to receive the output of the tracing operation.                                                                                                                                                                                                                                                                                    |
| Filter Updates rcv      | (orf option only) Number of outbound-route filters received for each configured address family.<br><br><b>NOTE:</b> The counter is cumulative. For example, the counter is increased after the remote peer either resends or clears the outbound route filtering prefix list.                                                                       |
| Immediate               | (orf option only) Number of route updates received with the immediate flag set. The immediate flag indicates that the BGP peer should readvertise the updated routes.<br><br><b>NOTE:</b> The counter is cumulative. For example, the counter is increased after the remote peer either resends or clears the outbound route filtering prefix list. |
| Filter                  | (orf option only) Type of prefix filter received: <b>prefix-based</b> or <b>extended-community</b> .                                                                                                                                                                                                                                                |
| Received filter entries | (orf option only) List of received filters displayed.                                                                                                                                                                                                                                                                                               |
| seq                     | (orf option only) Numerical order assigned to this prefix entry among all the received outbound route filter prefix entries.                                                                                                                                                                                                                        |
| prefix                  | (orf option only) Address for the prefix entry that matches the filter.                                                                                                                                                                                                                                                                             |
| minlength               | (orf option only) Minimum prefix length, in bits, required to match this prefix.                                                                                                                                                                                                                                                                    |
| maxlength               | (orf option only) Maximum prefix length, in bits, required to match this prefix.                                                                                                                                                                                                                                                                    |
| match                   | (orf option only) For this prefix match, whether to <b>permit</b> or <b>deny</b> route updates.                                                                                                                                                                                                                                                     |

## Sample Output

### show bgp neighbor

```

user@host > show bgp neighbor
Peer: 10.255.7.250+179 AS 10   Local: 10.255.7.248+63740 AS 10
  Type: Internal   State: Established   Flags: <Sync>

| <b>Description</b>                | List log files, display log file contents, or display information about users who have logged in to the router or switch.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>                    | <b>none</b> —List all log files.<br><br><b>&lt;all-lcc   lcc number   scc&gt;</b> —(TX Matrix routers only) (Optional) Display logging information about all T640 routers (or line-card chassis) or a specific T640 router (replace <i>number</i> with a value from 0 through 3) connected to a TX Matrix router. Or, display logging information about the TX Matrix router (or switch-card chassis).<br><br><b>device-type</b> —(QFabric system only) (Optional) Display log messages for only one of the following device types: <ul style="list-style-type: none"><li>• <b>director-device</b>—Display logs for Director devices.</li><li>• <b>infrastructure-device</b>—Display logs for the logical components of the QFabric system infrastructure, including the diagnostic Routing Engine, fabric control Routing Engine, fabric manager Routing Engine, and the default network Node group and its backup (NW-NG-0 and NW-NG-0-backup).</li><li>• <b>interconnect-device</b>—Display logs for Interconnect devices.</li><li>• <b>node-device</b>—Display logs for Node devices.</li></ul> |

**NOTE:** If you specify the **device-type** optional parameter, you must also specify either the **device-id** or **device-alias** optional parameter.

---

**(device-id | device-alias)**—If a device type is specified, display logs for a device of that type. Specify either the device ID or the device alias (if configured).

**filename**—(Optional) Display the log messages in the specified log file. For the routing matrix, the filename must include the chassis information.

**NOTE:** The *filename* parameter is mandatory for the QFabric system. If you did not configure a syslog filename, specify the default filename of messages.

**user <username>**—(Optional) Display logging information about users who have recently logged in to the router or switch. If you include *username*, display logging information about the specified user.

**Required Privilege Level** trace

|----------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>Instance</b>                  | OSPF routing instance.                                                                                                                                                                   | All levels      |
| <b>Router ID</b>                 | Router ID of the routing device.                                                                                                                                                         | All levels      |
| <b>Route table index</b>         | Route table index.                                                                                                                                                                       | All levels      |
| <b>Configured overload</b>       | Overload capability is enabled. If the overload timer is also configured, display the time that remains before it is set to expire. This field is not displayed after the timer expires. | All levels      |
| <b>Topology</b>                  | Topology identifier.                                                                                                                                                                     | All levels      |
| <b>Prefix export count</b>       | Number of prefixes exported into OSPF.                                                                                                                                                   | All levels      |
| <b>Full SPF runs</b>             | Number of complete Shortest Path First calculations.                                                                                                                                     | All levels      |
| <b>SPF delay</b>                 | Delay before performing consecutive Shortest Path First calculations.                                                                                                                    | All levels      |
| <b>SPF holddown</b>              | Delay before performing additional Shortest Path First (SPF) calculations after the maximum number of consecutive SPF calculations is reached.                                           | All levels      |
| <b>SPF rapid runs</b>            | Maximum number of Shortest Path First calculations that can be performed in succession before the hold-down timer begins.                                                                | All levels      |
| <b>LSA refresh time</b>          | Refresh period for link-state advertisement (in minutes).                                                                                                                                | All levels      |
| <b>Database protection state</b> | Current state of database protection.                                                                                                                                                    | All levels      |
| <b>Warning threshold</b>         | Threshold at which a warning message is logged (percentage of maximum LSA count).                                                                                                        | All levels      |
| <b>Non self-generated LSAs</b>   | Number of LSAs whose router ID is not equal to the local router ID: <b>Current</b> , <b>Warning</b> (threshold), and <b>Allowed</b> .                                                    | All levels      |
| <b>Ignore time</b>               | How long the database has been in the ignore state.                                                                                                                                      | All levels      |
| <b>Reset time</b>                | How long the database must stay out of the ignore or isolated state before it returns to normal operations.                                                                              | All levels      |
| <b>Ignore count</b>              | Number of times the database has been in the ignore state: <b>Current</b> and <b>Allowed</b> .                                                                                           | All levels      |
| <b>Restart</b>                   | Graceful restart capability: <b>enabled</b> or <b>disabled</b> .                                                                                                                         | All levels      |
| <b>Restart duration</b>          | Time period for complete reacquisition of OSPF neighbors.                                                                                                                                | All levels      |
| <b>Restart grace period</b>      | Time period for which the neighbors should consider the restarting routing device as part of the topology.                                                                               | All levels      |

Table 198: show ospf overview Output Fields (*continued*)

| Field name                    | Field Description                                                                                                                                                                                                                                                                                                                           | Level of Output  |
|-------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| Graceful restart helper mode  | (OSPFv2) Standard graceful restart helper capability (based on RFC 3623): <b>enabled</b> or <b>disabled</b> .                                                                                                                                                                                                                               | All levels       |
| Restart-signaling helper mode | (OSPFv2) Restart signaling-based graceful restart helper capability (based on RFC 4811, RFC 4812, and RFC 4813): <b>enabled</b> or <b>disabled</b> .                                                                                                                                                                                        | All levels       |
| Helper mode                   | (OSPFv3) Graceful restart helper capability: <b>enabled</b> or <b>disabled</b> .                                                                                                                                                                                                                                                            | All levels       |
| Trace options                 | OSPF-specific trace options.                                                                                                                                                                                                                                                                                                                | <b>extensive</b> |
| Trace file                    | Name of the file to receive the output of the tracing operation.                                                                                                                                                                                                                                                                            | <b>extensive</b> |
| Area                          | Area number. Area 0.0.0.0 is the backbone area.                                                                                                                                                                                                                                                                                             | All levels       |
| Stub type                     | Stub type of area: <b>Normal Stub</b> , <b>Not Stub</b> , or <b>Not so Stubby Stub</b> .                                                                                                                                                                                                                                                    | All levels       |
| Authentication Type           | Type of authentication: <b>None</b> , <b>Password</b> , or <b>MD5</b> .<br><br><b>NOTE:</b> The <b>Authentication Type</b> field refers to the authentication configured at the <code>[edit protocols ospf area area-id]</code> level. Any authentication configured for an interface in this area will not affect the value of this field. | All levels       |
| Area border routers           | Number of area border routers.                                                                                                                                                                                                                                                                                                              | All levels       |
| Neighbors                     | Number of autonomous system boundary routers.                                                                                                                                                                                                                                                                                               | All levels       |

## Sample Output

### show ospf overview

```

user@host> show ospf overview
Instance: master
  Router ID: 10.255.245.6
  Route table index: 0
  Configured overload, expires in 118 seconds
  LSA refresh time: 50 minutes
  Restart: Enabled
    Restart duration: 20 sec
    Restart grace period: 40 sec
    Helper mode: enabled
  Area: 0.0.0.0
    Stub type: Not Stub
    Authentication Type: None
    Area border routers: 0, AS boundary routers: 0
    Neighbors
      Up (in full state): 0
  Topology: default (ID 0)
  Prefix export count: 0
  Full SPF runs: 1
  SPF delay: 0.200000 sec, SPF holddown: 5 sec, SPF rapid runs: 3

```

### show ospf overview (With Database Protection)

```
user@host> show ospf overview
Instance: master
  Router ID: 10.255.112.218
  Route table index: 0
  LSA refresh time: 50 minutes
  Traffic engineering
  Restart: Enabled
    Restart duration: 180 sec
    Restart grace period: 210 sec
    Graceful restart helper mode: Enabled
    Restart-signaling helper mode: Enabled
  Database protection state: Normal
    Warning threshold: 70 percent
    Non self-generated LSAs: Current 582, Warning 700, Allowed 1000
    Ignore time: 30, Reset time: 60
    Ignore count: Current 0, Allowed 1
  Area: 0.0.0.0
    Stub type: Not Stub
    Authentication Type: None
    Area border routers: 0, AS boundary routers: 0
  Neighbors
    Up (in full state): 160
  Topology: default (ID 0)
    Prefix export count: 0
    Full SPF runs: 70
    SPF delay: 0.200000 sec, SPF holddown: 5 sec, SPF rapid runs: 3
    Backup SPF: Not Needed
```

### show ospf3 overview (With Database Protection)

```
user@host> show ospf3 overview
Instance: master
  Router ID: 10.255.112.128
  Route table index: 0
  LSA refresh time: 50 minutes
  Database protection state: Normal
    Warning threshold: 80 percent
    Non self-generated LSAs: Current 3, Warning 8, Allowed 10
    Ignore time: 30, Reset time: 60
    Ignore count: Current 0, Allowed 2
  Area: 0.0.0.0
    Stub type: Not Stub
    Area border routers: 0, AS boundary routers: 0
  Neighbors
    Up (in full state): 1
  Topology: default (ID 0)
    Prefix export count: 0
    Full SPF runs: 7
    SPF delay: 0.200000 sec, SPF holddown: 5 sec, SPF rapid runs: 3
    Backup SPF: Not Needed
```

### show ospf overview extensive

```
user@host> show ospf overview extensive
Instance: master
  Router ID: 1.1.1.103
  Route table index: 0
  Full SPF runs: 13, SPF delay: 0.200000 sec
  LSA refresh time: 50 minutes
```

```
Restart: Disabled
Trace options: lsa
Trace file: /var/log/ospf size 131072 files 10
Area: 0.0.0.0
  Stub type: Not Stub
  Authentication Type: None
  Area border routers: 0, AS boundary routers: 0
  Neighbors
    Up (in full state): 1
```

| <b>Release Information</b>            | Command introduced before Junos OS Release 7.4.<br>Command introduced in Junos OS Release 9.0 for EX Series switches.<br>sfc option introduced for the TX Matrix Plus router in Junos OS Release 9.6.<br>Command introduced in Junos OS Release 13.2X51-D20 for QFX Series switches. |
| <b>Description</b>                    | Display whether graceful Routing Engine switchover is configured, the state of the kernel replication (ready or synchronizing), any replication errors, and whether the primary and standby Routing Engines are using compatible versions of the kernel database.                    |

**NOTE:** Issue the `show system switchover` command *only* on the backup Routing Engine. This command is *not* supported on the master Routing Engine, because the kernel-replication process daemon does not run on the master Routing Engine. This process runs only on the backup Routing Engine.

Beginning Junos OS Release 9.6, the `show system switchover` command has been deprecated on the master Routing Engine on all routers other than a TX Matrix (switch-card chassis) or a TX Matrix Plus (switch-fabric chassis) router.

However, in a routing matrix, if you issue the `show system switchover` command on the master Routing Engine of the TX Matrix router (or switch-card chassis), the CLI displays graceful switchover information for the master Routing Engine of the T640 routers (or line-card chassis) in the routing matrix. Likewise, if you issue the `show system switchover` command on the master Routing Engine of a TX Matrix Plus router (or switch-fabric chassis), the CLI displays output for the master Routing Engine of T1600 or T4000 routers in the routing matrix.

---

**Options** **all-chassis**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display graceful Routing Engine switchover information for all Routing Engines on the TX Matrix router and the T640 routers configured in the routing matrix. On a TX Matrix Plus router, display graceful Routing Engine switchover information for all Routing Engines on the TX Matrix Plus router and the T1600 or T4000 routers configured in the routing matrix.

**all-lcc**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display graceful Routing Engine switchover information for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display graceful Routing Engine switchover information for all connected T1600 or T4000 LCCs.

Note that in this instance, packets get dropped. The LCCs perform GRES on their own chassis (GRES cannot be handled by one particular chassis for the entire router) and synchronization is not possible as the LCC plane bringup time varies for each LCC. Therefore, when there is traffic on these planes, there may be a traffic drop.

**all-members**—(MX Series routers only) (Optional) Display graceful Routing Engine switchover information for all Routing Engines on all members of the Virtual Chassis configuration.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display graceful Routing Engine switchover information for a specific T640 router connected to the TX Matrix router. On a TX Matrix Plus router, display graceful Routing Engine switchover information for a specific router connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display graceful Routing Engines switchover information for all Routing Engines on the local Virtual Chassis member.

**member *member-id***—(MX Series routers only) (Optional) Display graceful Routing Engine switchover information for all Routing Engines on the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**scc**—(TX Matrix router only) (Optional) Display graceful Routing Engine switchover information for the TX Matrix router (or switch-card chassis).

**sfc**—(TX Matrix Plus routers only) (Optional) Display graceful Routing Engine switchover information for the TX Matrix Plus router.

**Additional Information** If you issue the **show system switchover** command on a TX Matrix backup Routing Engine, the command is broadcast to all the T640 backup Routing Engines that are connected to it.

Likewise, if you issue the **show system switchover** command on a TX Matrix Plus backup Routing Engine, the command is broadcast to all the T1600 or T4000 backup Routing Engines that are connected to it.

If you issue the **show system switchover** command on the active Routing Engine in the master router of an MX Series Virtual Chassis, the router displays an error message that graceful Routing Engine switchover (GRES) is not enabled on this member.

| <b>Release Information</b> | Command introduced in Junos OS Release 12.2 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>         | Nonstop software upgrade enables you to upgrade a QFabric system with minimal packet loss and maximum uptime. You should upgrade the devices in the following order: Director group, fabric controls and Interconnect devices, and network and server Node groups.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>             | <p><b><i>package-name</i></b>—Location from which the software is to be installed. For example:</p> <ul style="list-style-type: none"><li>• <b><i>protocol://hostname/pathname/package-name</i></b>—For a software package or bundle that is to be downloaded and installed from a remote location. Replace <b><i>protocol</i></b> with one of the following:<ul style="list-style-type: none"><li>• <b>ftp</b>—File Transfer Protocol.<br/>Use <b><i>ftp://hostname/pathname/package-name</i></b>. To specify authentication credentials, use <b><i>ftp://&lt;username&gt;:&lt;password&gt;@hostname/pathname/package-name</i></b>. To have the system prompt you for the password, specify <b>prompt</b> in place of the password. If a password is required, and you do not specify the password or <b>prompt</b>, an error message is displayed.</li><li>• <b>http</b>—Hypertext Transfer Protocol.<br/>Use <b><i>http://hostname/pathname/package-name</i></b>. To specify authentication credentials, use <b><i>http://&lt;username&gt;:&lt;password&gt;@hostname/pathname/package-name</i></b>. If a password is required and you omit it, you are prompted for it.</li><li>• <b>scp</b>—Secure copy (available only for Canada and U.S. version).<br/>Use <b><i>scp://hostname/pathname/package-name</i></b>. To specify authentication credentials, use <b><i>scp://&lt;username&gt;:&lt;password&gt;@hostname/pathname/package-name</i></b>.</li></ul></li></ul> |

**NOTE:**

- The ***pathname*** in the protocol is the relative path to the user's home directory on the remote system and not the root directory.
- 

**director-group**—Install software package on the Director group and Fabric managers.

**fabric**—Install software package on the Interconnect devices and Fabric controls.

**node-group *name*** —Install software package on the redundant server Node group, server Node group, or network Node group.

## Sample Output

### request system software nonstop-upgrade director-group

```

user@qfabric> request system software nonstop-upgrade director-group
jinstall-qfabric-12.2X50-D10.3.rpm
Validating update package jinstall-qfabric-12.2X50-D10.3.rpm
Installing update package jinstall-qfabric-12.2X50-D10.3.rpm
Installing fabric images version 12.2X50-D10.3
Performing cleanup
Package install complete
Installing update package jinstall-qfabric-12.2X50-D10.3.rpm on peer
Triggering Initial Stage of Fabric Manager Upgrade
Updating CCIF default image to 12.2X50-D10.3
Updating FM-0 to Junos version 12.2X50-D10.3
[Status 2012-06-05 15:25:29]: Fabric Manager: Upgrade Initial Stage started
[FM-0 2012-06-05 15:25:38]: FM-0 Master already running on LOCAL DG
[NW-NG-0 2012-06-05 15:25:45]: NW-NG-0 Master already running on LOCAL DG
[FM-0 2012-06-05 15:26:12]: Retrieving package
[FM-0 2012-06-05 15:27:11]: Pushing bundle to re0
[Status 2012-06-05 15:29:06]: Load completed with 0 errors...
[Status 2012-06-05 15:29:06]: Reboot is required to complete upgrade ...
[Status 2012-06-05 15:29:07]: Trying to Connect to Node: FM-0
[Status 2012-06-05 15:29:13]: Rebooting FM-0
[FM-0 2012-06-05 15:29:13]: Waiting for FM-0 to terminate ...
Starting Peer upgrade

Initiating rolling upgrade of Director peer: version 12.2X50-D10.3

Inform CCIF regarding rolling upgrade
[Peer Update Status]: Validating install package jinstall-qfabric-12.2X50-D10.3.rpm
[Peer Update Status]: Cleaning up node for rolling phase one upgrade
[Peer Update Status]: Director group upgrade complete
[Peer Update Status]: COMPLETED
[Peer Update Status]: Waiting for peer to reboot and start phase one of rolling
upgrade
[Peer Update Status]: Waiting for peer to reboot and start phase one of rolling
upgrade

Table 202: show vrrp Output Fields (*continued*)

| Field Name                  | Field Description                                                                                                                                                                                                                                                                                              | Level of Output   |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------|
| Master router               | IP address of the interface that is acting as the master. If the VRRP interface is down, the output is <b>N/A</b> .                                                                                                                                                                                            | detail, extensive |
| Virtual router uptime       | Time that the virtual router has been up.                                                                                                                                                                                                                                                                      | detail, extensive |
| Master router uptime        | Time that the master router has been up.                                                                                                                                                                                                                                                                       | detail, extensive |
| Virtual MAC                 | MAC address associated with the virtual IP address.                                                                                                                                                                                                                                                            | detail, extensive |
| Tracking                    | Whether tracking is <b>enabled</b> or <b>disabled</b> .                                                                                                                                                                                                                                                        | detail, extensive |
| Current priority            | Current operational priority for being the VRRP master.                                                                                                                                                                                                                                                        | detail, extensive |
| Configured priority         | Configured base priority for being the VRRP master.                                                                                                                                                                                                                                                            | detail, extensive |
| Priority hold-time          | Minimum time interval, in seconds, between successive changes to the current priority. <b>Disabled</b> indicates no minimum interval.                                                                                                                                                                          | detail, extensive |
| Remaining-time              | (track option only) Displays the time remaining in the priority hold-time interval.                                                                                                                                                                                                                            | detail            |
| Interface tracking          | Whether interface tracking is enabled or disabled. When enabled, the output also displays the number of tracked interfaces.                                                                                                                                                                                    | detail extensive  |
| Interface/Tracked interface | Name of the tracked interface.                                                                                                                                                                                                                                                                                 | detail extensive  |
| Int state/Interface state   | Current operational state of the tracked interface: <b>up</b> or <b>down</b> .                                                                                                                                                                                                                                 | detail, extensive |
| Int speed/Speed             | Current operational speed, in bits per second, of the tracked interface.                                                                                                                                                                                                                                       | detail, extensive |
| Incurred priority cost      | Operational priority cost incurred due to the state and speed of this tracked interface. This cost is applied to the configured priority to obtain the current priority.                                                                                                                                       | detail, extensive |
| Threshold                   | Speed below which the corresponding priority cost is incurred. In other words, when the speed of the interface drops below the threshold speed, the corresponding priority cost is incurred.<br><br>An entry of <b>down</b> means that the corresponding priority cost is incurred when the interface is down. | detail, extensive |
| Route tracking              | Whether route tracking is enabled or disabled. When enabled, the output also displays the number of tracked routes.                                                                                                                                                                                            | detail, extensive |
| Route count                 | The number of routes being tracked.                                                                                                                                                                                                                                                                            | detail, extensive |

Table 202: show vrrp Output Fields (*continued*)

| Field Name                               | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Level of Output          |

## Troubleshooting VRRP

**Problem**    **Description:** If you configure multiple VRRP groups on an interface (using multiple VLANs), traffic for some of the groups might be briefly dropped if a failover occurs. This can happen because the new master must send gratuitous ARP replies for each VRRP group to update the ARP tables in the connected devices, and there is a short delay between each gratuitous ARP reply. Traffic sent by devices that have not yet received the gratuitous ARP reply is dropped (until the device receives the reply and learns the MAC address of the new master).

**Solution**    Configure a failover delay so that the new master delays sending gratuitous ARP replies for the period that you set. This allows the new master to send the ARP replies for all of the VRRP groups simultaneously.

**Related Documentation**    • [failover-delay on page 2511](#)

## Interfaces Overview

Juniper Networks devices have two types of interfaces: network interfaces and special interfaces. This topic provides brief information about these interfaces. For additional information, see the *Junos OS Network Interfaces Library for Routing Devices*.

- [Network Interfaces on page 2599](#)
- [Special Interfaces on page 2600](#)

### Network Interfaces

---

Network interfaces connect to the network and carry network traffic. [Table 203 on page 2599](#) lists the types of network interfaces supported.

**Table 203: Network Interface Types and Purposes**

| Type                           | Purpose                                                                                                                                                                                                                                                               |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Aggregated Ethernet interfaces | You can group Ethernet interfaces at the physical layer to form a single link-layer interface, also known as a <i>link aggregation group (LAG)</i> or <i>bundle</i> . These aggregated Ethernet interfaces help to balance traffic and increase the uplink bandwidth. |

Table 203: Network Interface Types and Purposes (*continued*)

| Type                                                | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|-----------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Channelized Interfaces                              | <p>Depending on the device and software package, 40-Gbps QSFP+ ports can be configured to operate as the following types of interfaces:</p> <ul style="list-style-type: none"> <li>• 10-Gigabit Ethernet interfaces (<i>xe</i>)</li> <li>• 40-Gigabit Ethernet interfaces (<i>et</i> and <i>xle</i>)</li> <li>• 40-Gigabit data plane uplink interfaces (<i>fte</i>)</li> </ul> <p>When an <i>et</i> port is channelized to four <i>xe</i> ports, a colon is used to signify the four separate channels. For example, on a QFX3500 standalone switch with port 2 on PIC 1 configured as four 10-Gigabit Ethernet ports, the interface names are <i>xe-0/1/2:0</i>, <i>xe-0/1/2:1</i>, <i>xe-0/1/2:2</i>, and <i>xe-0/1/2:3</i>.</p> <p><b>NOTE:</b> You cannot configure channelized interfaces to operate as Virtual Chassis ports.</p> |
| Ethernet Interfaces                                 | You can configure Gigabit Ethernet, 10-Gigabit Ethernet, 40-Gigabit Ethernet interfaces to connect to other servers, storage, and switches. You can configure 40-Gigabit data plane uplink ports to connect a Node device to an Interconnect devices as well as for Virtual Chassis ports (VCPs).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Fibre Channel interfaces                            | You can use Fibre Channel interfaces to connect the switch to a Fibre Channel over Ethernet (FCoE) forwarder or a Fibre Channel switch in a storage area network (SAN). You can configure Fibre Channel interfaces only on ports 0 through 5 and 42 through 47 on QFX3500 devices. Fibre Channel interfaces do not forward Ethernet traffic.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| LAN access interfaces                               | You can use these interfaces to connect to other servers, storage, and switches. When you power on a QFX Series product and use the factory-default configuration, the software automatically configures interfaces in access mode for each of the network ports.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Multichassis aggregated Ethernet (MC-AE) interfaces | You can group a LAG on one standalone switch with a LAG on another standalone switch to create a MC-AE. The MC-AE provides load balancing and redundancy across the two standalone switches.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Tagged-access mode interfaces                       | You can use tagged-access interfaces to connect a switch to an access layer device. Tagged-access interfaces can accept VLAN-tagged packets from multiple VLANs.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Trunk interfaces                                    | You can use trunk interfaces to connect to other switches or routers. To use a port for this type of connection, you must explicitly configure the port interface for trunk mode. The interfaces from the switches or routers must also be configured for trunk mode. In this mode, the interface can be in multiple VLANs and accept tagged packets from multiple devices. Trunk interfaces typically connect to other switches and to routers on the LAN.                                                                                                                                                                                                                                                                                                                                                                              |
| Virtual Chassis ports (VCPs)                        | You can use Virtual Chassis ports to send and receive Virtual Chassis Control Protocol (VCCP) traffic, and to create, monitor, and maintain the Virtual Chassis. On QFX3500, QFX3600, QFX5100, and EX4600 standalone switches, you can configure 40-Gigabit Ethernet QSFP+ uplink ports (non-channelized) or fixed SFP+ 10-Gigabit Ethernet ports as VCPs by issuing the <b>request virtual-chassis-vc-port-set</b> CLI command.                                                                                                                                                                                                                                                                                                                                                                                                         |

### Special Interfaces

Table 204 on page 2601 lists the types of special interfaces supported on the QFX Series.

Table 204: Special Interface Types and Purposes

| Type                                            | Purpose                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|-------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Console port                                    | Each QFX Series product has a serial port, labeled <b>CON</b> or <b>CONSOLE</b> , for connecting tty-type terminals to the switch using standard PC-type tty cables. The console port does not have a physical address or IP address associated with it. However, it is an interface in the sense that it provides access to the switch.                                                                                                                                                                                                                                                                                                                       |
| Loopback interface                              | All QFX Series products have this software-only virtual interface that is always up. The loopback interface provides a stable and consistent interface and IP address on the switch.                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Management interface                            | The Juniper Networks Junos OS for the QFX Series includes management Ethernet interfaces. The management Ethernet interface provides an out-of-band method for connecting to a standalone switch and QFabric system.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Routed VLAN interfaces (RVI and IRB interfaces) | <p>QFX Series products use a Layer 3 routed VLAN interface (called RVI in the original CLI, and called IRB in Enhanced Layer 2 Software) <b>vlan</b> to route traffic from one broadcast domain to another and to perform other Layer 3 functions such as traffic engineering. These functions are typically performed by a router interface in a traditional network.</p> <p>The RVI or IRB functions as a logical router, eliminating the need for having both a switch and a router. The RVI or IRB must be configured as part of a broadcast domain or virtual private LAN service (VPLS) routing instance for Layer 3 traffic to be routed out of it.</p> |

## Overview of Uplink Failure Detection

Uplink failure detection allows a switch to detect link failure on uplink interfaces and to propagate this information to the downlink interfaces, so that servers connected to those downlinks can switch over to secondary interfaces.

Uplink failure detection supports network adapter teaming and provides network redundancy. In network adapter teaming, all of the network interface cards (NICs) on a server are configured in a primary or secondary relationship and share the same IP address. When the primary link goes down, the server transparently shifts the connection to the secondary link. With uplink failure detection, the switch monitors uplink interfaces for link failures. When it detects a failure, it disables the downlink interfaces. When the server detects disabled downlink interfaces, it switches over to the secondary link to help ensure that the traffic of the failed link is not dropped.

This topic describes:

- [Uplink Failure Detection Configuration on page 2602](#)
- [Failure Detection Pair on page 2603](#)

### Uplink Failure Detection Configuration

Uplink failure detection allows switches to monitor uplink interfaces to spot link failures. When a switch detects a link failure, it automatically disables the downlink interfaces bound to the uplink interface. A server that is connected to the disabled downlink interface triggers a network adapter failover to a secondary link to avoid any traffic loss.

[Figure 80 on page 2602](#) illustrates a typical setup for uplink failure detection.

**Figure 80: Uplink Failure Detection Configuration on Switches**

g040577

For uplink failure detection, you specify a group of uplink interfaces to be monitored and downlink interfaces to be brought down when an uplink fails. The downlink interfaces are bound to the uplink interfaces within the group. If all uplink interfaces in a group go down, then the switch brings down all downlink interfaces within that group. If any uplink interface returns to service, then the switch brings all downlink interfaces in that group back to service.

The switch can monitor both physical interface links and logical interface links for uplink failures, but you must put the two types of interfaces into separate groups.

**NOTE:** For logical interfaces, the server must send keepalives between the switch and the server to detect failure of logical links.

### Failure Detection Pair

Uplink failure detection requires that you create pairs of uplink and downlink interfaces in a group. Each pair includes one of each of the following:

- A link-to-monitor interface—The link-to-monitor interfaces specify the uplinks the switch monitors. You can configure a maximum of eight uplink interfaces as link-to-monitor interfaces for a group.
- A link-to-disable interface—The link-to-disable interfaces specify the downlinks the switch disables when the switch detects an uplink failure. You can configure a maximum of 48 downlinks to disable in the group.

The link-to-disable interfaces are bound to the link-to-monitor interfaces within the group. When a link-to-monitor interface returns to service, the switch automatically enables all link-to-disable interfaces in the group.

## Understanding Aggregated Ethernet Interfaces and LACP

IEEE 802.3ad link aggregation enables you to group Ethernet interfaces to form a single, aggregated Ethernet interface, also known as a *link aggregation group (LAG)* or *bundle*.

Link aggregation is used to aggregate Ethernet interfaces between two devices. You can create a LAG between a Juniper Networks device and a router, switch, aggregation switch, server, or other devices. The aggregated Ethernet interfaces that participate in a LAG are called member links. Because a LAG is composed of multiple member links, even if one member link fails, the LAG continues to carry traffic over the remaining links.

**NOTE:** On QFX5100 and EX4600 standalone switches and on a QFX5100 Virtual Chassis and EX4600 Virtual Chassis, you can configure a mixed rate of link speeds for the aggregated Ethernet bundle. Only link speeds of 40G and 10G are supported. Load balancing will not work if you configure link speeds that are not supported.

Link Aggregation Control Protocol (LACP) is a subcomponent of the IEEE 802.3ad standard and is used as a discovery protocol.

**NOTE:** To ensure load balancing across the aggregated Ethernet (AE) interfaces on a redundant server Node group, the members of the AE must be equally distributed across the redundant server Node group.

**NOTE:** During a network Node group switchover, traffic might be dropped for a few seconds.

- [Link Aggregation Group on page 2604](#)
- [Link Aggregation Control Protocol \(LACP\) on page 2605](#)

---

## Link Aggregation Group

---

To create a LAG:

1. Create a logical aggregated Ethernet interface.
2. Define the parameters associated with the logical aggregated Ethernet interface, such as a logical unit, interface properties, and Link Aggregation Control Protocol (LACP).
3. Define the member links to be contained within the aggregated Ethernet interface—for example, two 10-Gigabit Ethernet interfaces.
4. Configure LACP for link detection.

Keep in mind these hardware and software guidelines:

- Up to 32 Ethernet interfaces can be grouped to form a LAG on a redundant server Node group, a server Node group, and a network Node group on a QFabric system. Up to 48 LAGs are supported on redundant server Node groups and server Node groups on a QFabric system, and up to 128 LAGs are supported on network Node groups on a QFabric system. You can configure LAGs across Node devices in redundant server Node groups, server Node groups, and network Node groups.

**NOTE:** If you try to commit a configuration containing more than 32 Ethernet interfaces in a LAG, you will receive an error message saying that the group limit of 32 has been exceeded, and the configuration checkout has failed.

- Up to 64 Ethernet interfaces can be grouped to form a LAG, and up to 448 LAGs are supported on QFX3500, QFX3600, QFX5100, and EX4600 switches.

**NOTE:** If you try to commit a configuration containing more than 64 Ethernet interfaces in a LAG, you will receive an error message saying that the group limit of 64 has been exceeded, and the configuration checkout has failed.

- The LAG must be configured on both sides of the link.
- The interfaces on either side of the link must be set to the same speed and be in full-duplex mode.

**NOTE:** On a QFX5100 and EX4600 standalone switch or QFX5100 Virtual Chassis and EX4600 Virtual Chassis, you can configure mixed rate aggregated Ethernet bundles (LAGs with different link speeds).

**NOTE:** Junos OS assigns a unique ID and port priority to each port. The ID and priority are not configurable.

- QFabric systems support a special LAG called an FCoE LAG, which enables you to transport FCoE traffic and regular Ethernet traffic (traffic that is not FCoE traffic) across the same link aggregation bundle. Standard LAGs use a hashing algorithm to determine which physical link in the LAG is used for a transmission, so communication between two devices might use different physical links in the LAG for different transmissions. An FCoE LAG ensures that FCoE traffic uses the same physical link in the LAG for requests and replies in order to preserve the virtual point-to-point link between the FCoE device converged network adapter (CNA) and the FC SAN switch across a QFabric system Node device. An FCoE LAG does not provide load balancing or link redundancy for FCoE traffic. However, regular Ethernet traffic uses the standard hashing algorithm and receives the usual LAG benefits of load balancing and link redundancy in an FCoE LAG. See “[Understanding FCoE LAGs](#)” on [page 5417](#) for more information.

### Link Aggregation Control Protocol (LACP)

LACP is one method of bundling several physical interfaces to form one logical aggregated Ethernet interface. The LACP mode can be active or passive. The transmitting link is known as the *actor*, and the receiving link is known as the *partner*. If the actor and partner are both in passive mode, they do not exchange LACP packets, and the aggregated Ethernet links do not come up. If either the actor or partner is active, they do exchange LACP packets. By default, LACP is in passive mode on aggregated Ethernet interfaces. To initiate transmission of LACP packets and response to LACP packets, you must enable LACP active mode. You can configure Ethernet links to actively transmit protocol data units (PDUs), or you can configure the links to passively transmit them, sending out LACP PDUs only when they receive them from another link. You can configure both VLAN-tagged

and untagged aggregated Ethernet interfaces without LACP enabled. LACP is defined in IEEE 802.3ad, *Aggregation of Multiple Link Segments*.

LACP was designed to achieve the following:

- Automatic addition and deletion of individual links to the LAG without user intervention.
- Link monitoring to check whether both ends of the bundle are connected to the correct group.

When a dual-homed server is deployed with a switch, the network interface cards form a LAG with the switch. During a server upgrade, the server may not be able to exchange LACP PDUs. In such a situation you can configure an interface to be in the **up** state even if no PDUs are exchanged. Use the **force-up** statement to configure an interface when the peer has limited LACP capability. The interface selects the associated LAG by default, whether the switch and peer are both in active or passive mode. When there are no received PDUs, the partner is considered to be working in the passive mode. Therefore, LACP PDU transmissions are controlled by the transmitting link.

If the remote end of the LAG link is a security device, LACP might not be supported because security devices require a deterministic configuration. In this case, do not configure LACP. All links in the LAG are permanently operational unless the switch detects a link failure within the Ethernet physical layer or data link layers.

## Understanding Interface Naming Conventions

The QFX Series and the EX4600 device uses a naming convention for defining the interfaces that is similar to that of other platforms running under Juniper Networks Junos OS. This topic provides brief information about the naming conventions used for interfaces on the QFX Series and on EX4600 switches.

This topic describes:

- [Physical Part of an Interface Name on page 2607](#)
- [Logical Part of an Interface Name on a Switch Running QFabric Software Package on page 2611](#)
- [Logical Part of a Channelized Interface Name on a Switch Running Enhanced Layer 2 Software on page 2611](#)
- [Wildcard Characters in Interface Names on page 2611](#)

## Physical Part of an Interface Name

Interfaces in Junos OS are specified as follows:

*device-name:type-fpc/pic/port*

The convention is as follows:

- *device-name*—(QFabric systems only) The *device-name* is either the serial number or the alias of the QFabric system component, such as a Node device, Interconnect device, or QFabric infrastructure. The name can contain a maximum of 128 characters and cannot contain any colons.
- *type*—The QFX Series and EX4600 device interfaces use the following media types:
  - **fc**—Fibre Channel interface
  - **ge**—Gigabit Ethernet interface
  - **xe**—10-Gigabit Ethernet interface
  - **xle**—40-Gigabit Ethernet interface (QFX3500, QFX3600, and QFX5100 switches running a QFabric software package)
  - **et**—40-Gigabit Ethernet interface (QFX3500, QFX3600, QFX5100, and EX4600 switches running Enhanced Layer 2 Software)
  - **fte**—40-Gigabit data plane uplink interface (QFX3500, QFX3600, and QFX5100 switches running a QFabric software package)
  - **me**—Management interface
  - **em**—Management interface on QFX5100 and EX4600 switches.
- *fpc*—Flexible PIC Concentrator. QFX Series interfaces use the following convention for the FPC number in interface names:
  - On QFX3500, QFX3600, and QFX5100 devices running a QFabric software package, the FPC number is always 0.

The FPC number indicates the slot number of the line card that contains the physical interface.

- On QFX3500, QFX3600, QFX5100, and EX4600 switches running Enhanced Layer 2 Software, the member ID of a member in a Virtual Chassis determines the FPC number.

**NOTE:** Every member in a Virtual Chassis must have a unique member ID, otherwise the Virtual Chassis will not be created.

- On standalone QFX5100 and EX4600 switches, the FPC number is always 0.
- *pic*—QFX Series and EX4600 device interfaces use the following convention for the PIC (Physical Interface Card) number in interface names:

- On a QFX3500 switch running a QFabric software package, PIC 0 can support 48 ports, PIC 1 can support 16 10-Gigabit Ethernet ports, and PIC 2 can support 4 40-Gigabit Ethernet ports.
- On a QFX3500 switch running Enhanced Layer 2 software, PIC 0 can support 48 ports, and PIC 1 can support 16 10-Gigabit Ethernet ports, and 4 40-Gigabit Ethernet ports.
- On a QFX3500 Node device running a QFabric software package, PIC 0 can support 48 ports and PIC 1 can support four 40-Gigabit data plane uplink ports.
- On a QFX3600 switch running a QFabric software package, PIC 0 can support 64 10-Gigabit Ethernet ports, and PIC 1 can support 16 40-Gigabit Ethernet ports.
- On a QFX3600 switch running Enhanced Layer 2 software, PIC 0 can support 64 10-Gigabit Ethernet ports and can also support 16 40-Gigabit Ethernet ports.
- On a QFX3600 Node device running a QFabric software package, PIC 0 can support 56 10-Gigabit Ethernet ports, and PIC 1 can support 8 40-Gigabit data plane uplink ports, and up to 14 40-Gigabit Ethernet ports.
- On a QFX5100-48S switch running Enhanced Layer 2 software, PIC 0 provides six 40-Gbps QSFP+ ports and 48 10-Gigabit Ethernet interfaces.
- On an EX4600 device running Enhanced Layer 2 software, PIC 0 provides 4 40-Gbps QSFP+ ports and 24 10-Gigabit Ethernet interfaces. There are two expansion bays (PIC 1 and PIC 2), and you can insert QFX-EM-4Q expansion modules and EX4600-EM-8F expansion modules. The QFX-EM-4Q expansion module provide 4 40-Gbps QSFP+ ports. The EX4600-EM-8F expansion module provides 8 40-Gbps QSFP+ ports. You can insert any combination of expansion modules. For example, you can insert two EX4600-EM-8F expansion modules, two QFX-EM-4Q expansion modules, or one of each.
- On a QFX5100-48S switch running a QFabric software package, PIC 1 provides six 40-Gbps QSFP+ ports, and PIC 0 provides 48 10-Gigabit Ethernet interfaces.

- On a QFX5100-24Q switch running Enhanced Layer 2 software, PIC 0 provides 24 40-Gbps QSFP+ ports. PIC 1 and PIC 2 can each contain a QFX-EM-4Q expansion module, and each expansion module provides 4 40-Gbps QSFP+ ports
- On a QFX5100-96S switch running Enhanced Layer 2 software, PIC 0 provides 96 10-Gigabit Ethernet interfaces and 8 40-Gbps QSFP+ ports.
- *port*—Interfaces use the following convention for port numbers:

- On a QFX3500 switch running a QFabric software package, there are 48 network access ports (10-Gigabit Ethernet) labeled 0 through 47 on PIC 0 and, 16 network access ports labeled 0 through 15 on PIC 1, and four 40-Gbps QSFP+ ports labeled Q0 through Q3 on PIC 2. You can use the QSFP+ ports to connect the Node device to Interconnect devices.

By default, the 40-Gbps QSFP+ ports are configured to operate as 10-Gigabit Ethernet ports. You can use QSFP+ to four SFP+ copper breakout cables to connect the 10-Gigabit Ethernet ports to other servers, storage, and switches. Optionally, you can choose to configure the QSFP+ ports as 40-Gigabit Ethernet ports (see [“Configuring the QSFP+ Port Type on QFX3500 Standalone Switches” on page 2784](#)).

- On a QFX3500 switch running Enhanced Layer 2 software, there are 48 network access ports labeled 0 through 47 on PIC 0 and 4 40-Gbps QSFP+ ports labeled Q0 through Q3 on PIC 1. See *Channelizing Interfaces* for information on how to configure and channelize the 40-Gbps QSFP+ ports.
- On a QFX3600 switch running a QFabric software package, there are 64 network access ports (10-Gigabit Ethernet) labeled Q0 through Q15 on PIC 0, and there are 16 network access ports (40-Gigabit Ethernet) labeled Q0 through Q15 on PIC 1.

By default, all the QSFP+ ports are configured to operate as 40-Gigabit Ethernet ports. Optionally, you can choose to configure the QSFP+ ports as 10-Gigabit Ethernet ports (see [“Configuring the Port Type on QFX3600 Standalone Switches” on page 2787](#)) and use QSFP+ to four SFP+ copper breakout cables to connect the 10-Gigabit Ethernet ports to other servers, storage, and switches.

- On a QFX3600 Node device running a QFabric software package, PIC 0 can support up to 56 10-Gigabit Ethernet ports labeled Q2 through Q15, and PIC 1 can support up to 8 40-Gigabit data plane uplink ports labeled Q0 through Q7, and up to 14 40-Gigabit Ethernet ports labeled Q2 through Q15. See [“Configuring the Port Type on QFX3600 Node Devices” on page 1503](#) for information on how to configure the 40-Gbps QSFP+ ports.

On a QFX3600 Node device, by default, four 40-Gbps QSFP+ ports (labeled Q0 through Q3) are configured for uplink connections between your Node device and your Interconnect devices, and twelve 40-Gbps QSFP+ ports (labeled Q4 through Q15) use QSFP+ to four SFP+ copper breakout cables to support up to 48 10-Gigabit Ethernet ports for connections to either endpoint systems (such as servers and storage devices) or external networks. Optionally, you can choose to configure the first eight ports (Q0 through Q7) for uplink connections between your Node device and your Interconnect devices, and ports Q2 through Q15 for 10-Gigabit Ethernet or 40-Gigabit Ethernet connections to either endpoint systems or external networks (see [“Configuring the Port Type on QFX3600 Node Devices” on page 1503](#)).

- On a QFX3600 switch running Enhanced Layer 2 software, PIC 0 can support 64 network access ports (10-Gigabit Ethernet ports) labeled Q0 through Q15 and 16 40-Gigabit Ethernet ports labeled Q0 through Q15. See *Channelizing Interfaces* for information on how to configure and channelize the 40-Gbps QSFP+ ports.
- On a QFX5100-48S switch running Enhanced Layer 2 software, PIC 0 can support 48 network access ports (10-Gigabit Ethernet ports) labeled 0 through 47 and 6 40-Gbps QSFP+ ports labeled 48 through 53. See *Channelizing Interfaces* for information on how to configure and channelize the 40-Gbps QSFP+ ports.
- On an EX4600 switch running Enhanced Layer 2 software, PIC 0 can support 24 network access ports (10-Gigabit Ethernet ports) labeled 0 through 23 and 4 40-Gbps QSFP+ ports labeled 24 through 27. There are two expansion bays (PIC 1 and PIC 2), and you can insert QFX-EM-4Q expansion modules and EX4600-EM-8F expansion modules. The QFX-EM-4Q expansion module provide 4 40-Gbps QSFP+ ports. The EX4600-EM-8F expansion module provides 8 40-Gbps QSFP+ ports. You can insert any combination of expansion modules. For example, you can insert two EX4600-EM-8F expansion modules, two QFX-EM-4Q expansion modules, or one of each. See *Channelizing Interfaces* for information on how to configure and channelize the 40-Gbps QSFP+ ports.
- On a QFX5100-48S switch running a QFabric software package, PIC 0 can support 48 network access ports (10-Gigabit Ethernet ports) labeled 0 through 47, and PIC 1 can support 6 40-Gbps QSFP+ ports labeled 0 through 5. See *Configuring the QSFP+ Port Type on QFX5100 Switches* for information on how to configure the port mode of 40-Gbps QSFP+ ports.
- On a QFX5100-24Q switch running Enhanced Layer 2 software, PIC 0 can support 24 40-Gbps QSFP+ ports labeled 0 through 23. PIC 1 and PIC 2 each support 4 40-Gbps QSFP+ port, for a total of eight 40-Gbps QSFP+ ports. See *Channelizing Interfaces* for information on how to configure and channelize the 40-Gbps QSFP+ ports.

**NOTE:** You cannot channelize the 40-Gbps QSFP+ ports provided in the two QFX-EM-4Q expansion modules. Also, even though there is a total of 128 physical ports, only 104 logical ports can be channelized.

You can configure different system modes to achieve varying levels of port density on the QFX5100-24Q and QFX5100-96S switches. Depending on the system mode you configure, there are restrictions on which ports you can channelize. If you channelize ports that are restricted, the configuration is ignored. See *Configuring the System Mode* for information on how to configure the system mode.

- On a QFX5100-96S switch running Enhanced Layer 2 software, PIC 0 can support 96 10-Gigabit Ethernet ports labeled 0 through 95, and 8 40-Gbps QSFP+ ports labeled 96 through 103. See *Channelizing Interfaces* for information on how to configure and channelize the 40-Gbps QSFP+ ports.

**NOTE:** You can only channelize the 40-Gbps QSFP+ ports provided in ports 96 and 100, because only 104 logical ports can be channelized.

You can configure different system modes to achieve varying levels of port density on the QFX5100-24Q and QFX5100-96S switches. Depending on the system mode you configure, there are restrictions on which ports you can channelize. If you channelize ports that are restricted, the configuration is ignored. See *Configuring the System Mode* for information on how to configure the system mode.

### Logical Part of an Interface Name on a Switch Running QFabric Software Package

The logical unit part of the interface name corresponds to the logical unit number, which can be a number from 0 through 16384. In the virtual part of the name, a period (.) separates the port and logical unit numbers: *device-name* (QFabric systems only): *type-fpc/pic/port.logical-unit-number*. For example, if you issue the **show ethernet-switching interfaces** command on a system with a default VLAN, the resulting display shows the logical interfaces associated with the VLAN:

| Interface               | State | VLAN members    | Blocking  |
|-------------------------|-------|-----------------|-----------|
| node-device1:xe-0/0/1.0 | down  | remote-analyzer | unblocked |
| node-device1:xe-0/0/2.0 | down  | default         | unblocked |
| node-device1:xe-0/0/3.0 | down  | default         | unblocked |

When you configure aggregated Ethernet interfaces, you configure a logical interface, which is called a *bundle* or a LAG. Each LAG can include up to eight Ethernet interfaces, depending on the switch model.

### Logical Part of a Channelized Interface Name on a Switch Running Enhanced Layer 2 Software

Channelizing enables you to configure four 10-Gigabit Ethernet interfaces from a 40-Gigabit Ethernet QSFP+ interface. By default, a 40-Gigabit Ethernet QSFP+ interface is named *et-fpc/pic/port*. The resulting 10-Gigabit Ethernet interfaces appear in the following format: *xe-fpc/pic/port:channel*, where channel can be a value of 0 through 3.

For example, if an *et* interface named **et-0/0/3** is channelized to four 10-Gigabit Ethernet interfaces, the resulting 10-Gigabit Ethernet interface names will be **xe-0/0/3:0**, **xe-0/0/3:1**, **xe-0/0/3:2**, and **xe-0/0/3:3**:

| Interface  | Admin | Link | Proto | Local | Remote |
|------------|-------|------|-------|-------|--------|
| xe-0/0/3:0 | up    | down |       |       |        |
| xe-0/0/3:1 | up    | down |       |       |        |
| xe-0/0/3:2 | up    | down |       |       |        |
| xe-0/0/3:3 | up    | down |       |       |        |

### Wildcard Characters in Interface Names

In the **show interfaces** and **clear interfaces** commands, you can use wildcard characters in the *interface-name* option to specify groups of interface names without having to type each name individually. You must enclose all wildcard characters except the asterisk (\*) in quotation marks (" ").

## Understanding Interface Ranges

You can use the interface ranges to group interfaces of the same type that share a common configuration profile. This helps reduce the time and effort in configuring interfaces. The configurations common to all the interfaces can be included in the interface range definition.

The interface range definition contains the name of the interface range defined, the names of the individual member interfaces that do not fall in a series of interfaces, a range of interfaces defined in the member range, and the configuration statements common to all the interfaces. An interface range defined with member ranges and individual members but without any common configurations is also a valid definition.

**NOTE:** The interface range definition is supported only for Gigabit Ethernet, 10-Gigabit Ethernet, and Fibre Channel interfaces.

The common configurations defined in the interface range will be overridden by the local configuration.

The defined interface ranges can be used at places where the **interface** statement is used in the following configuration hierarchies:

- **ethernet-switching-options analyzer *name* input egress interface**
- **ethernet-switching-options analyzer *name* input ingress interface**
- **ethernet-switching-options analyzer output interface**
- **ethernet-switching-options bpd-block interface**
- **ethernet-switching-options interfaces**
- **ethernet-switching-options redundant-trunk-group group-name interface**
- **ethernet-switching-options secure-access-port interface**
- **ethernet-switching-options voip interface**
- **protocols igmp-snooping vlan *vlan-name* interface**

## Understanding Layer 3 Logical Interfaces

A Layer 3 logical interface is a logical division of a physical interface that operates at the network level and therefore can receive and forward 802.1Q VLAN tags. You can use Layer 3 logical interfaces to route traffic among multiple VLANs along a single trunk line that connects a Juniper Networks switch to a Layer 2 switch. Only one physical connection is required between the switches. You can also use Layer 3 logical interfaces to provide alternative gateway addresses for smart DHCP relay.

To create Layer 3 logical interfaces on a switch, enable VLAN tagging, partition the physical interface into logical partitions, and bind the VLAN ID to the logical interface.

We recommend that you use the VLAN ID as the logical interface number when you configure the logical interface. QFX Series and EX4600 switches support a maximum of 4089 VLANs, which includes the default VLAN. You can, however, assign a VLAN ID in the range of 1 to 4094, but five of these VLAN IDs are reserved for internal use.

VLAN tagging places the VLAN ID in the frame header, allowing each physical interface to handle multiple VLANs. When you configure multiple VLANs on an interface, you must also enable tagging on that interface. Junos OS on switches supports a subset of the 802.1Q standard for receiving and forwarding routed or bridged Ethernet frames with single VLAN tags and running Virtual Router Redundancy Protocol (VRRP) over 802.1Q-tagged interfaces.

## Understanding Management Interfaces

You use management interfaces to access devices remotely. Typically, a management interface is not connected to the in-band network, but is connected to a device in the internal network. Through a management interface, you can access the device over the network using utilities such as **ssh** and **telnet** and configure it from anywhere, regardless of its physical location. As a security feature, users cannot log in as **root** through a management interface. To access the device as **root**, you must use the console port. You can also use **root** to log in using SSH.

**NOTE:** Before you can use the management interfaces on the QFX3500, QFX3600, QFX5100, and EX4600 devices, you must configure the logical interfaces with valid IP addresses. Juniper Networks does not support configuring two management interfaces in the same subnet.

Management interface port ranges vary based on device type:

- QFX3500 devices:

The valid port range for a management interface (**me**) on a QFX3500 device is between 0 and 6, with a total of seven available ports. On a QFX3500 standalone switch, however, you can only configure **me0** and **me1** as management interfaces. The management interfaces are labeled **C0** and **C1**, and they correspond to **me0** and **me1**. On a QFX3500 Node device, the RJ-45 management interfaces and SFP management interfaces correspond to **me5** and **me6**.

- QFX3600 devices:

There are two RJ-45 management interfaces (labeled **C0** and **C1**) and two SFP management interfaces (labeled **C0S** and **C1S**). On a QFX3600 standalone switch, the RJ-45 management interfaces and SFP management interfaces correspond to **me0** and **me1**. On a QFX3600 Node device, the RJ-45 management interfaces and SFP management interfaces correspond to **me5** and **me6**. Each pair of management interfaces correspond to one Ethernet interface—for example, both RJ-45 management interfaces (labeled **C0** and **C0s**) can correspond to **me0**, and both SFP management interfaces (labeled **C1** and **C1s**) can correspond to **me1**. By default, both RJ-45 management interfaces are active. If you insert an SFP interface into the SFP management port (**C0S**, for example), the SFP interface would become the active management interface, and the corresponding RJ-45 management interface (**C0**) is disabled.

**NOTE:** On a QFX3600 device, you can use either the RJ-45 or the SFP management interfaces, but not both at the same time.

- On QFX5100 and EX4600 switches, there is one RJ-45 management interface (labeled C0) and one SFP management interface (labeled C1), and they correspond to em0 and em1. You can use both management interfaces simultaneously.

- QFabric system:

On a QFabric system, there are management interfaces on the Node devices, Interconnect devices, and Director devices. However, you cannot access the management interfaces on the Node devices or Interconnect devices directly. You can only manage and configure these devices using the Director device. You can connect to the management interface over the network using utilities such as SSH.

For information on how to use management interfaces on a QFabric system, see [“Performing the QFabric System Initial Setup on a QFX3100 Director Group” on page 1471](#) and [“Gaining Access to the QFabric System Through the Default Partition” on page 1480](#).

## Understanding Multichassis Link Aggregation

Layer 2 networks are increasing in scale mainly because of technologies such as virtualization. Protocol and control mechanisms that limit the disastrous effects of a topology loop in the network are necessary. Spanning Tree Protocol (STP) is the primary solution to this problem because it provides a loop-free Layer 2 environment. STP has gone through a number of enhancements and extensions, and although it scales to very large network environments, it still only provides one active path from one device to another, regardless of how many actual connections might exist in the network. Although STP is a robust and scalable solution to redundancy in a Layer 2 network, the single logical link creates two problems: At least half of the available system bandwidth is off-limits to data traffic, and network topology changes occur. The Rapid Spanning Tree Protocol (RSTP) reduces the overhead of the rediscovery process and allows a Layer 2 network to reconverge faster, but the delay is still high.

Link aggregation (IEEE 802.3ad) solves some of these problems by enabling users to use more than one link connection between switches. All physical connections are considered one logical connection. The problem with standard link aggregation is that the connections are point to point.

Multichassis link aggregation groups (MC-LAGs) enable a client device to form a logical LAG interface between two MC-LAG peers. An MC-LAG provides redundancy and load balancing between the two MC-LAG peers, multihoming support, and a loop-free Layer 2 network without running the Spanning Tree Protocol (STP).

On one end of an MC-LAG, there is an MC-LAG client device, such as a server, that has one or more physical links in a link aggregation group (LAG). This client device does not need to have an MC-LAG configured. On the other side of the MC-LAG, there are two

MC-LAG peers. Each of the MC-LAG peers has one or more physical links connected to a single client device.

The MC-LAG peers use Interchassis Control Protocol (ICCP) to exchange control information and coordinate with each other to ensure that data traffic is forwarded properly.

Link Aggregation Control Protocol (LACP) is a subcomponent of the IEEE 802.3ad standard. LACP is used to discover multiple links from a client device connected to an MC-LAG peer. LACP must be configured on all member links for an MC-LAG to work correctly.

**NOTE:** You must specify a service identifier (service-id) for each multichassis aggregated Ethernet interface that belongs to a link aggregation group (LAG), otherwise multichassis link aggregation will not work.

See [Table 205 on page 2617](#) for information about ICCP failure scenarios.

The following sections provide an overview of the terms and features associated with MC-LAG:

### Active-Active Mode

In active-active mode, all member links are active on the MC-LAG. In this mode, MAC addresses learned on one MC-LAG peer are propagated to the other MC-LAG peer. Active-active mode is the only mode supported at this time.

### ICCP and ICL-PL

ICCP replicates control traffic and forwarding states across the MC-LAG peers and communicates the operational state of the MC-LAG members. Because ICCP uses TCP/IP to communicate between the peers, the two peers must be connected to each other. ICCP messages exchange MC-LAG configuration parameters and ensure that both peers use the correct LACP parameters.

The interchassis link-protection link (ICL-PL) provides redundancy when a link failure (for example, an MC-LAG trunk failure) occurs on one of the active links. The ICL-PL can be either a 10-Gigabit Ethernet interface or an aggregated Ethernet interface. You can configure only one ICL-PL between the two peers, although you can configure multiple MC-LAGs between them.

### Failure Handling

Configuring ICCP adjacency over aggregated links mitigates the possibility of a split-brain state. A split brain state occurs when the ICL-PL configured between the MC-LAG peers goes down. To work around this problem, enable backup liveness detection. With backup liveness enabled, the MC-LAG peers can communicate through the keepalive link.

During a split-brain state, the standby peer brings down local members in the MC-LAG links by changing the LACP system ID. When the ICCP connection is active, both of the MC-LAG peers use the configured LACP system ID. If the LACP system ID is changed during failures, the server that is connected over the MC-LAG removes these links from the aggregated Ethernet bundle.

When the ICL-PL is operationally down and the ICCP connection is active, the LACP state of the links with status control configured as standby is set to the standby state. When the LACP state of the links is changed to standby, the server that is connected over the MC-LAG makes these links inactive and does not use them for sending data.

[Table 205 on page 2617](#) describes the different ICCP failure scenarios. The dash means that the item is not applicable.

**Table 205: ICCP Failure Scenarios**

| ICCP Connection Status | ICL-PL Status | Backup Liveness Peer Status | Action on Multichassis Aggregated Ethernet (MC-AE) Interface with Status Set to Standby |
|------------------------|---------------|-----------------------------|-----------------------------------------------------------------------------------------|
| Down                   | Down or Up    | Not configured              | LACP system ID is changed to default value.                                             |
| Down                   | Down or Up    | Active                      | LACP system ID is changed to default value.                                             |
| Down                   | Down or Up    | Inactive                    | No change in LACP system ID.                                                            |

Table 205: ICCP Failure Scenarios (*continued*)

| ICCP Connection Status | ICL-PL Status | Backup Liveness Peer Status | Action on Multichassis Aggregated Ethernet (MC-AE) Interface with Status Set to Standby |
|------------------------|---------------|-----------------------------|-----------------------------------------------------------------------------------------|
| Up                     | Down          | –                           | LACP state is set to standby. MUX state moves to waiting state.                         |

Split-brain states bring down the MC-LAG link completely if the primary peer members are also down for other reasons. Recovery from the split-brain state occurs automatically when the ICCP adjacency comes up between the MC-LAG peers.

### Multichassis Link Protection

Multichassis link protection provides link protection between the two MC-LAG peers hosting an MC-LAG. If the ICCP connection is up and the ICL-PL comes up, the peer configured as standby brings up the multichassis aggregated Ethernet (MC-AE) interfaces shared with the peer. Multichassis protection must be configured on each MC-LAG peer that is hosting an MC-LAG.

### MC-LAG Packet Forwarding

To prevent the server from receiving multiple copies from both of the MC-LAG peers, a block mask is used to prevent forwarding of traffic received on the ICL-PL toward the MC-AE interface. Preventing forwarding of traffic received on the ICL-PL interface toward the MC-AE interface ensures that traffic received on MC-LAG links is not forwarded back to the same link on the other peer. The forwarding block mask for a given MC-LAG link is cleared if all of the local members of the MC-LAG link go down on the peer. To achieve faster convergence, if all local members of the MC-LAG link are down, outbound traffic on the MC-LAG is redirected to the ICL-PL interface on the data plane.

### Layer 3 Routing

To provide Layer 3 routing functions to downstream clients, configure the same gateway address on both MC-LAG network peers. To upstream routers, the MC-LAG network peers could be viewed as either equal-cost multipath (ECMP) or two routes with different preference values.

Junos OS supports active-active MC-LAGs by using Virtual Router Redundancy Protocol (VRRP) over routed VLAN interfaces (RVIs). Junos OS also supports active-active MC-LAGs by using RVI MAC address synchronization. You must configure the RVI using the same IP address across MC-LAG peers.

### Spanning Tree Protocol (STP) Guidelines

- Enable STP globally.  
STP might detect local miswiring loops within the peer or across MC-LAG peers.  
STP might not detect network loops introduced by MC-LAG peers.
- Disable STP on ICL-PL links; otherwise, it might block ICL-PL ports and disable protection.

- Do not enable bridge protocol data unit (BPDU) block on interfaces connected to aggregation switches.

For more information about BPDU block, see [“Understanding BPDU Protection for STP, RSTP, and MSTP” on page 2063](#).

### MC-LAG Upgrade Guidelines

Upgrade the MC-LAG peers according to the following guidelines. See [“Upgrading Software” on page 143](#) for exact details about how to perform a software upgrade.

**NOTE:** After a reboot, the MC-AE interfaces come up immediately and might start receiving packets from the server. If routing protocols are enabled, and the routing adjacencies have not been formed, packets might be dropped.

To prevent this scenario, issue the `set interfaces interface-name aggregated-ether-options mc-ae init-delay-time time` to set a time by which the routing adjacencies are formed.

1. Make sure that both of the MC-LAG peers (node1 and node2) are in the active-active state using the following command on any one of the MC-LAG peers:

```
user@switch> show interfaces mc-ae id 1
Member Link           : ae0
Current State Machine's State: mcae active state
Local Status          : active<<<<<<<<
Local State           : up
Peer Status           : active<<<<<<<<
Peer State            : up
  Logical Interface    : ae0.0
  Topology Type        : bridge
  Local State          : up
  Peer State           : up
  Peer Ip/MCP/State    : 20.1.1.2 ae2.0 up
```

2. Upgrade node1 of the MC-LAG.

When node1 is upgraded it is rebooted, and all traffic is sent across the available LAG interfaces of node2, which is still up. The amount of traffic lost depends on how quickly the neighbor devices detect the link loss and rehash the flows of the LAG.

3. Verify that node1 is running the software you just installed. Issue the `show version` command.
4. Make sure that both nodes of the MC-LAG (node1 and node2) are in the active-active state after the reboot of node1.
5. Upgrade node2 of the MC-LAG.

Repeat step 1 through step 3 to upgrade node2.

### Layer 2 Unicast Features Supported

The following Layer 2 unicast features are supported:

- L2 unicast: learning and aging
  - Learned MAC addresses are propagated across MC-LAG peers for all of the VLANs that are spawned across the peers.
  - Aging of MAC addresses occurs when the MAC address is not seen on both of the peers.
  - MAC learning is disabled on the ICL-PL automatically.
  - MAC addresses learned on single-homed links are propagated across all of the VLANs that have MC-LAG links as members.

---

### Layer 2 Multicast Features Supported

The following Layer 2 multicast features are supported:

- L2 multicast: unknown unicast and IGMP snooping
  - Flooding happens on all links across peers if both peers have virtual LAN membership. Only one of the peers forwards traffic on a given MC-LAG link.
  - Known and unknown multicast packets are forwarded across the peers by adding the ICL-PL port as a multicast router port.
  - IGMP membership learned on MC-LAG links is propagated across peers.
  - During an MC-LAG peer reboot, known multicast traffic is flooded until the IGMP snooping state is synced with the peer.

---

### IGMP Snooping on an Active-Active MC-LAG

IGMP snooping controls multicast traffic in a switched network. When IGMP snooping is not enabled, the Layer 2 device broadcasts multicast traffic out of all of its ports, even if the hosts on the network do not want the multicast traffic. With IGMP snooping enabled, a Layer 2 device monitors the IGMP join and leave messages sent from each connected host to a multicast router. This enables the Layer 2 device to keep track of the multicast groups and associated member ports. The Layer 2 device uses this information to make intelligent decisions and to forward multicast traffic to only the intended destination hosts. IGMP uses Protocol Independent Multicast (PIM) to route the multicast traffic. PIM uses distribution trees to determine which traffic is forwarded.

In an active-active MC-LAG configuration, IGMP snooping replicates the Layer 2 multicast routes so that each MC-LAG peer has the same routes. If a device is connected to an MC-LAG peer by way of a single-homed interface, IGMP snooping replicates join message to its IGMP snooping peer. If a multicast source is connected to an MC-LAG by way of a Layer 3 device, the Layer 3 device passes this information to the RVI that is configured on the MC-LAG. The first hop DR is responsible for sending the register and register-stop messages for the multicast group. The last hop DR is responsible for sending PIM join and leave messages toward the rendezvous point and source for the multicast group. The routing device with the smallest preference metric forwards traffic on transit LANs.

Configure the ICL-PL interface as a router-facing interface. For the scenario in which traffic arrives by way of a Layer 3 interface, PIM and IGMP must be enabled on the RVI interface configured on the MC-LAG peers.

### Layer 3 Unicast Features Supported

The following Layer 3 unicast features are supported:

- VRRP active-standby support enables Layer 3 routing over MC-AE interfaces.
- Routed VLAN interface (RVI) MAC address synchronization enables MC-LAG peers to forward Layer 3 packets arriving on MC-AE interfaces with either its own RVI MAC address or its peer's RVI MAC address.
- Address Resolution Protocol (ARP) synchronization enables ARP resolution on both of the MC-LAG peers.
- DHCP Relay with option 82 enables option 82 on the MC-LAG peers. Option 82 provides information about the network location of DHCP clients. The DHCP server uses this information to implement IP addresses or other parameters for the client.

### VRRP Active-Standby Support

VRRP in active-standby mode enables Layer 3 routing over the MC-AE interfaces on the MC-LAG peers. In this mode, the MC-LAG peers act as virtual routers. The virtual routers share the virtual IP address that corresponds to the default route configured on the host or server connected to the MC-LAG. This virtual IP address, known as a routed VLAN interface (RVI), maps to either of the VRRP MAC addresses or the logical interfaces of the MC-LAG peers. The host or server uses the VRRP MAC address to send any Layer 3 upstream packets. At any time, one of the VRRP routers is the master (active), and the other is a backup (standby). Both VRRP active and VRRP backup routers forward Layer 3 traffic arriving on the MC-AE interface. If the master router fails, all the traffic shifts to the MC-AE link on the backup router.

**NOTE:** You must configure VRRP on both MC-LAG peers in order for both the active and standby members to accept and route packets. Additionally, configure the VRRP backup router to send and receive ARP requests.

Routing protocols run on the primary IP address of the RVI, and both of the MC-LAG peers run routing protocols independently. The routing protocols use the primary IP address of the RVI and the RVI MAC address to communicate with the MC-LAG peers. The RVI MAC address of each MC-LAG peer is replicated on the other MC-LAG peer and is installed as a MAC address that has been learned on the ICL-PL.

### Routed VLAN Interface (RVI) MAC Address Synchronization

Routed VLAN interface (RVI) MAC address synchronization enables MC-LAG peers to forward Layer 3 packets arriving on MC-AE interfaces with either its own RVI MAC address or its peer's RVI MAC address. Each MC-LAG peer installs its own RVI MAC address as well as the peer's RVI MAC address in the hardware. Each MC-LAG peer treats the packet

as if it were its own packet. If RVI MAC address synchronization is not enabled, the RVI MAC address is installed on the MC-LAG peer as if it was learned on the ICL-PL.

**NOTE:** If you need routing capability, configure both VRRP and routing protocols on each MC-LAG peer.

Control packets destined for a particular MC-LAG peer that arrive on an MC-AE interface of its MC-LAG peer are not forwarded on the ICL-PL interface. Additionally, using the gateway IP address as a source address when you issue either a ping, traceroute, telnet, or FTP request is not supported.

To enable RVI MAC address synchronization, issue the **set vlan *vlan-name* l3\_interface *rvi-name* mcae-mac-synchronize** on each MC-LAG peer. Configure the same IP address on both MC-LAG peers. This IP address is used as the default gateway for the MC-LAG servers or hosts.

### Address Resolution Protocol (ARP)

---

Address Resolution Protocol (ARP) maps IP addresses to MAC addresses. Without synchronization, if one MC-LAG peer sends an ARP request, and the other MC-LAG peer receives the response, ARP resolution is not successful. With synchronization, the MC-LAG peers synchronize the ARP resolutions by sniffing the packet at the MC-LAG peer receiving the ARP response and replicating this to the other MC-LAG peer. This ensures that the entries in ARP tables on the MC-LAG peers are consistent.

When one of the MC-LAG peers restarts, the ARP destinations on its MC-LAG peer are synchronized. Because the ARP destinations are already resolved, its MC-LAG peer can forward Layer 3 packets out of the MC-AE interface.

**NOTE:** For integrated routing and bridging (IRB) interfaces, static ARP configuration is required on the MC-LAG IRB peer for any routing protocol to come up over that IRB interface.

### DHCP Relay with Option 82

---

DHCP relay with option 82 provides information about the network location of DHCP clients. The DHCP server uses this information to implement IP addresses or other parameters for the client. With DHCP relay enabled, DHCP request packets might take the path to the DHCP server through either of the MC-LAG peers. Because the MC-LAG peers have different host names, chassis MAC addresses, and interface names, you need to observe these requirements when you configure DHCP relay with option 82:

- Use the interface description instead of the interface name.
- Do not use the hostname as part of the circuit ID or remote ID strings.
- Do not use the chassis MAC address as part of the remote ID string.
- Do not enable the vendor ID.

- If the ICL-PL interface receives DHCP request packets, the packets are dropped to avoid duplicate packets in the network.

A counter called *Due to received on ICL interface* has been added to the **show helper statistics** command, which tracks the packets that the ICL-PL interface drops.

An example of the CLI output follows:

```
user@switch> show helper statistics
BOOTP:
  Received packets: 6
  Forwarded packets: 0
  Dropped packets: 6
    Due to no interface in DHCP Relay database: 0
    Due to no matching routing instance: 0
    Due to an error during packet read: 0
    Due to an error during packet send: 0
    Due to invalid server address: 0
    Due to no valid local address: 0
    Due to no route to server/client: 0
    Due to received on ICL interface: 6
```

The output shows that six packets received on the ICL-PL interface have been dropped.

### Private VLAN (PVLAN)

Private VLANs allow you to split a broadcast domain into multiple isolated broadcast subdomains, essentially putting a VLAN inside of a VLAN. A PVLAN can span multiple peers on an MC-LAG.

When configuring a PVLAN, you must configure the ICL-PL interface as the PVLAN trunk interface for the PVLAN. This is essential for traffic to be switched to the required primary and secondary ports of the PVLAN across the MC-LAG peers.

### Layer 3 Multicast

- [PIM Operation With Normal Mode DR Election on page 2623](#)
- [PIM Operation with Dual-DR Mode on page 2624](#)
- [Configuration Guidelines and Caveats on page 2624](#)

Protocol Independent Multicast (PIM) and Internet Group Management Protocol (IGMP) provide support for Layer 3 multicast. In addition to the standard mode of PIM operation, there is a special mode called PIM dual DR (designated router). PIM dual DR minimizes traffic loss in case of failures.

#### ***PIM Operation With Normal Mode DR Election***

In normal mode DR election, the RVI interfaces on both of the MC-LAG peers are configured with PIM enabled. In this mode, one of the MC-LAG peers becomes the DR through the PIM DR election mechanism. The elected DR maintains the rendezvous-point tree (RPT) and shortest-path tree (SPT) so it can receive data from the source device. The elected DR participates in periodic PIM join and prune activities toward the rendezvous point (RP) or the source.

The trigger for initiating these join and prune activities is the IGMP membership reports that are received from interested receivers. IGMP reports received over MC-AE interfaces

(potentially hashing on either of the MC-LAG peers) and single-homed links are synchronized to the MC-LAG peer through ICCP.

Both MC-LAG peers receive traffic on their incoming interface (IIF). The non-DR receives traffic by way of the ICL-PL interface, which acts as a multicast router (mrouter) interface.

If the DR fails, the non-DR has to build the entire forwarding tree (RPT and SPT), which can cause multicast traffic loss.

#### ***PIM Operation with Dual-DR Mode***

In this mode, both of MC-LAG peers act as DRs (active and backup) and send periodic join and prune messages upstream towards the RP, or source, and eventually join the RPT or SPT.

The primary MC-LAG peer forwards the multicast traffic to the receiver devices even if the standby MC-LAG peer has a smaller preference metric.

The standby MC-LAG peer also joins the forwarding tree and receives the multicast data. The standby MC-LAG peer drops the data because it has an empty outgoing interface list (OIL). When the standby MC-LAG peer detects the primary MC-LAG peer failure, it adds the receiver VLAN to the OIL, and starts to forward the multicast traffic

To enable a multicast dual DR, issue the **set protocols pim interface interface-name dual-dr** command on the VLAN interfaces of each MC-LAG peer.

#### ***Configuration Guidelines and Caveats***

- Configure the IP address on the active MC-LAG peer with a high IP address or a high DR priority. To ensure that the active MC-LAG peer retains the DR membership designation if PIM neighborship with the peer goes down.
- Using Bidirectional Forwarding Detection (BFD) and RVI MAC synchronization together is not supported because ARP fails.
- When using RVI MAC synchronization, make sure that you configure the primary IP address on both MC-LAG peers. Doing this ensures that both MC-LAG peers cannot become assert winners.
- The number of BFD sessions on RVIs with PIM enabled is restricted to 100. Also, If you have more than 100 RVIs configured, do not configure BFD, and make sure that the hello interval is 2 seconds.

## Understanding Port Ranges and System Modes

QFX Series devices and EX4600 switches can support different port ranges depending on the device, media type of the interface, the software that is running on the device, and the system mode.

This topic describes:

- [Port Ranges for Different Media Types on page 2625](#)
- [Supported System Modes on page 2648](#)

### Port Ranges for Different Media Types

The following media types support the following port ranges:

- On a QFX3500 device:
  - The valid port range for a Fibre Channel (fc) interface is **0** through **5** and **42** through **47** on PIC **0**, with a total of 12 available Fibre Channel ports.

**NOTE:** Fibre Channel ports are not supported on QFX3500, QFX3600, and QFX5100 switches running Enhanced Layer 2 software.

- The valid port range for a Gigabit Ethernet (ge) interface is **6** through **41** on PIC **0** because the ports between **0** and **5** and **42** and **47** are reserved as Fibre Channel ports. The total number of available Gigabit Ethernet ports is 36, because 12 of the remaining 48 ports are reserved for Fibre Channel and 10-Gigabit Ethernet interfaces. Fibre Channel ports cannot be configured as Gigabit Ethernet ports.
- The valid port range for a 10-Gigabit Ethernet (xe) interface is **0** through **47** on PIC **0**. The valid port range for a 10-Gigabit Ethernet (xe) interface is **0** through **15** on PIC **1**. The total number of available 10-Gigabit Ethernet ports is 64.
- The valid port range for a 40-Gigabit data plane uplink interface is **0** through **3** on PIC **1**
- The valid port range for a 40-Gigabit Ethernet interface is **0** through **3** on PIC **2**. There are four available ports.
- On a QFX3600 Node device:
  - The valid port range for a 10-Gigabit Ethernet interface is **8** through **63** on PIC **0**. There are 56 available ports.
  - The valid port range for a 40-Gigabit Ethernet interface is **2** through **15** on PIC **1**. There are 14 available ports.
  - The valid port range for a 40-Gigabit data plane uplink interface is **0** through **7** on PIC **1**. There are eight available ports.

See [Table 208 on page 2634](#) for physical port to logical port mappings.

- On a QFX3600 switch running Enhanced Layer 2 Software:
  - The valid port range for a 10-Gigabit Ethernet interface is **0** through **63** on PIC **0**. There are 64 available ports.
  - The valid port range for a 40-Gigabit Ethernet interface is **0** through **15** on PIC **0**. There are 16 available ports.

See [Table 209 on page 2637](#) for physical port to logical port mappings.

- On QFX5100-48S and QFX5100-48T switches running Enhanced Layer 2 Software:
  - The valid port range for a 10-Gigabit Ethernet interface is **0** through **47** on PIC **0**. There are 48 available ports. When you channelize the 6 40-Gbps QSFP+ ports on **0** through **5** on PIC **1**, there are 72 available ports.

**NOTE:** On PIC 1, ports 0 and 1 are reserved for fte ports. You cannot convert these fte ports to xe or xle ports.

- The valid port range for a 40-Gbps QSFP+ port is **0** through **5** on PIC **1**. There are six available ports.

See [Table 211 on page 2642](#) for physical port to logical port mappings.

- On EX4600 switches running Enhanced Layer 2 Software:
  - The valid port range for a 10-Gigabit Ethernet interface is **0** through **23** on PIC **0**. There are 24 available ports. When you channelize the 4 40-Gbps QSFP+ ports on **24** through **27** on PIC **0**. There are 40 available ports.

See [Table 211 on page 2642](#) for physical port to logical port mappings.

- On QFX5100-48S and QFX5100-48T switches running a QFabric software package:
  - The valid port range for a 10-Gigabit Ethernet interface is **0** through **47** on PIC **0**. There are 48 available ports.
  - The valid port range for a 40-Gbps QSFP+ port is **0** through **5** on PIC **1**. There are six available ports.

**NOTE:** On PIC 1, ports 0 and 1 are reserved for fte ports. You cannot convert these fte ports to xe or xle ports.

See [Table 212 on page 2645](#) for physical port to logical port mappings.

- For QFX5100-24Q and QFX5100-96S switches running Enhanced Layer 2 Software, see [Table 213 on page 2649](#) for physical port to logical port mappings for different system modes.

Table 206: Valid Port Ranges on QFX3500 Switches Running QFabric Software Package

| Port Number | Fibre Channel Interfaces<br>(On PIC 0) | Gigabit Ethernet Interfaces<br>(On PIC 0) | 10-Gigabit Ethernet Interfaces<br>(On PIC 0 and 1) | 40-Gigabit Data Plane Uplink Interfaces (On PIC 1) | 40-Gigabit Ethernet Interfaces<br>(On PIC 2) |
|-------------|----------------------------------------|-------------------------------------------|----------------------------------------------------|----------------------------------------------------|----------------------------------------------|
| 0           | fc-0/0/0                               | Not supported on this port                | xe-0/0/0                                           | Not supported on this port                         | Not supported on this port                   |
| 1           | fc-0/0/1                               | Not supported on this port                | xe-0/0/1                                           | Not supported on this port                         | Not supported on this port                   |
| 2           | fc-0/0/2                               | Not supported on this port                | xe-0/0/2                                           | Not supported on this port                         | Not supported on this port                   |
| 3           | fc-0/0/3                               | Not supported on this port                | xe-0/0/3                                           | Not supported on this port                         | Not supported on this port                   |
| 4           | fc-0/0/4                               | Not supported on this port                | xe-0/0/4                                           | Not supported on this port                         | Not supported on this port                   |
| 5           | fc-0/0/5                               | Not supported on this port                | xe-0/0/5                                           | Not supported on this port                         | Not supported on this port                   |
| 6           | Not supported on this port             | ge-0/0/6                                  | xe-0/0/6                                           | Not supported on this port                         | Not supported on this port                   |
| 7           | Not supported on this port             | ge-0/0/7                                  | xe-0/0/7                                           | Not supported on this port                         | Not supported on this port                   |
| 8           | Not supported on this port             | ge-0/0/8                                  | xe-0/0/8                                           | Not supported on this port                         | Not supported on this port                   |
| 9           | Not supported on this port             | ge-0/0/9                                  | xe-0/0/9                                           | Not supported on this port                         | Not supported on this port                   |
| 10          | Not supported on this port             | ge-0/0/10                                 | xe-0/0/10                                          | Not supported on this port                         | Not supported on this port                   |
| 11          | Not supported on this port             | ge-0/0/11                                 | xe-0/0/11                                          | Not supported on this port                         | Not supported on this port                   |
| 12          | Not supported on this port             | ge-0/0/12                                 | xe-0/0/12                                          | Not supported on this port                         | Not supported on this port                   |
| 13          | Not supported on this port             | ge-0/0/13                                 | xe-0/0/13                                          | Not supported on this port                         | Not supported on this port                   |

### Supported System Modes

*NOTE:* There are restrictions on the ports you can channelize on the QFX5100-24Q and QFX5100-96S switches depending on the system mode you configure. If you try to channelize ports that are restricted, the configuration is ignored.

The following system modes are available on the QFX5100-24Q switch:

- Default mode
- Mode-104-port
- Flexi-PIC mode
- Non-oversubscribed mode

See [Table 213 on page 2649](#) for more information regarding the supported system modes for your switch.

The following system modes are available on the QFX5100-96S switch:

- Default-mode
- Non-oversubscribed mode

See [Table 213 on page 2649](#) for more information regarding the supported system modes for your switch.

**Table 213: System Modes Supported on QFX5100 Switches Running Enhanced Layer 2 Software**

|                             | Default-mode                                                                                                                                                                                                                                                                                                                                                                                     | Mode-104port                                                                                                                                                                                                                                                                                                                                                                                     | Flexi-pic-mode                                                                                                                                                                                            | Non-oversubscribed-mode                                                                                                                                                                                                                                                                       |

### Example: Configuring Interfaces for Uplink Failure Detection

Uplink failure detection allows a switch to detect link failure on uplink interfaces and to propagate the failure information to the downlink interfaces. All of the network interface cards (NICs) on a server are configured as being either the primary link or the secondary link and share the same IP address. When the primary link goes down, the server transparently shifts the connection to the secondary link to ensure that the traffic on the failed link is not dropped.

This example describes:

- [Requirements on page 2652](#)
- [Overview and Topology on page 2652](#)
- [Configuring Uplink Failure Detection on Both Switches on page 2653](#)
- [Verification on page 2654](#)

## Requirements

This example uses the following software and hardware components:

- Junos OS Release 12.1 or later for the QFX Series
- Two QFX3500 switches
- Two aggregation switches
- One dual-homed server

## Overview and Topology

The topology in this example illustrates how to configure uplink failure detection on Switch A and Switch B. Switch A and Switch B are both configured with a link-to-monitor interface (the uplink interface to the aggregation switch) and a link-to-disable interface (the downlink interface to the server). For simplicity, only one group of link-to-monitor interfaces and link-to-disable interfaces is configured for each switch. The server is dual-homed to both Switch A and Switch B. In this scenario, if the link-to-monitor interface to Switch A is disabled, the server uses the link-to-monitor interface to Switch B instead.

**NOTE:** This example does not describe how to configure the dual-homed server or the aggregation switches. Please refer to the documentation for each of these devices for more information.

Figure 80 on page 2602 illustrates a typical setup for uplink failure detection.

**Figure 81: Uplink Failure Detection Configuration on Switches**

Table 214 on page 2653 lists uplink failure settings for each QFX3500 switch.

Table 214: Settings for Uplink Failure Protection Example

| Switch A                                                                                                                                                                     | Switch B                                                                                                                                                                     |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <ul style="list-style-type: none"> <li>Group name: Group1</li> <li>Link-to-monitor interface: <b>xe-0/0/0</b></li> <li>Link-to-disable interface: <b>xe-0/0/1</b></li> </ul> | <ul style="list-style-type: none"> <li>Group name: Group2</li> <li>Link-to-monitor interface: <b>xe-0/0/0</b></li> <li>Link-to-disable interface: <b>xe-0/0/1</b></li> </ul> |

### Configuring Uplink Failure Detection on Both Switches

To configure uplink failure detection on both switches, perform these tasks:

#### CLI Quick Configuration

To quickly configure uplink failure protection on Switch A and Switch B, copy the following commands and paste them into the switch terminal window:

```
[edit protocols]
set uplink-failure-detection group group1
set uplink-failure-detection group group2
set uplink-failure-detection group group1 link-to-monitor xe-0/0/0
set uplink-failure-detection group group2 link-to-monitor xe-0/0/0
set uplink-failure-detection group group1 link-to-disable xe-0/0/1
set uplink-failure-detection group group2 link-to-disable xe-0/0/1
```

#### Step-by-Step Procedure

To configure uplink failure protection on both switches:

- Specify a name for the uplink failure detection group on Switch A:  

```
[edit protocols]
user@switch# set uplink-failure-detection group group1
```
- Add an uplink interface to the group on Switch A:  

```
[edit protocols]
user@switch# set uplink-failure-detection group group1 link-to-monitor xe-0/0/0
```
- Add a downlink interface to the group on Switch A:  

```
[edit protocols]
user@switch# set uplink-failure-detection group group1 link-to-disable xe-0/0/1
```
- Specify a name for the uplink failure detection group on Switch B:  

```
[edit protocols]
user@switch# set uplink-failure-detection group group2
```
- Add an uplink interface to the group on Switch B:  

```
[edit protocols]
user@switch# set uplink-failure-detection group group2 link-to-monitor xe-0/0/0
```
- Add a downlink interface to the group on Switch B:  

```
[edit protocols]
user@switch# set uplink-failure-detection group group2 link-to-disable xe-0/0/1
```

**Results** Display the results of the configuration:

```
uplink-failure-detection {
  group {
    group1 {
      link-to-monitor {
        xe-0/0/0;
      }
      link-to-disable {
        xe-0/0/1;
      }
    }
  }
}
```

```
    }  
  }  
  group2 {  
    link-to-monitor {  
      xe-0/0/0;  
    }  
    link-to-disable {  
      xe-0/0/1;  
    }  
  }  
}
```

---

### Verification

To verify that uplink failure detection is working correctly, perform the following tasks on Switch A and Switch B:

- [Verifying That Uplink Failure Detection is Working Correctly on page 2654](#)

#### *Verifying That Uplink Failure Detection is Working Correctly*

**Purpose** Verify that the switch disables the downlink interface when it detects an uplink failure.

**Action** 1. View the current uplink failure detection status:

```
user@switch> show uplink-failure-detection  
Group           : group1  
Uplink           : xe-0/0/0*  
Downlink         : xe-0/0/1*  
Failure Action   : Inactive
```

**NOTE:** The asterisk (\*) indicates that the link is up.

2. Disable the uplink interface:

```
[edit]  
user@switch# set interface xe-0/0/0 disable
```

3. Save the configuration on the switch.

4. View the current uplink failure detection status:

```
user@switch> show uplink-failure-detection  
Group           : group1  
Uplink           : xe-0/0/0  
Downlink         : xe-0/0/1  
Failure Action   : Active
```

**Meaning** The output in Step 1 shows that the uplink interface is up, and hence that the downlink interface is also up, and that the status of **Failure Action** is **Inactive**.

The output in Step 4 shows that both the uplink and downlink interfaces are down (there are no asterisks after the interface name) and that the status of **Failure Action** is changed to **Active**. This output shows that uplink failure detection is working.

**Related  
Documentation**

- [Verifying That Uplink Failure Detection Is Working Correctly on page 2882](#)

## Example: Configuring Link Aggregation Between a QFX Series Product and an Aggregation Switch

A QFX Series product allows you to combine multiple Ethernet links into one logical interface for higher bandwidth and redundancy. The ports that are combined in this manner are referred to as a link aggregation group (LAG) or bundle. The number of Ethernet links you can combine into a LAG depends on your QFX Series product model. You can configure LAGs to connect a QFX Series product to other switches, like aggregation switches, servers, or routers. This example describes how to configure LAGs to connect a QFX3500, QFX3600, or QFX5100 switch to an aggregation switch.

- [Requirements on page 2656](#)
- [Overview and Topology on page 2656](#)
- [Configuration on page 2657](#)
- [Verification on page 2659](#)
- [Troubleshooting on page 2660](#)

---

### Requirements

This example uses the following software and hardware components:

- Junos OS Release 11.1 or later for the QFX3500 and QFX3600 switches, and Junos OS 13.2 or later for the QFX5100 switch.
- One QFX3500, QFX3600, or QFX5100 switch.

---

### Overview and Topology

In this example, the switch has one LAG comprising two 10-Gigabit Ethernet interfaces. This LAG is configured in port mode trunk so that the switch and the VLAN to which it has been assigned can send and receive traffic.

Configuring the Ethernet interfaces as LAGs has the following advantages:

- If one physical port is lost for any reason (a cable is unplugged or a switch port fails), the logical port transparently continues to function over the remaining physical port.
- Link Aggregation Control Protocol (LACP) can optionally be configured for link monitoring and automatic addition and deletion of individual links without user intervention.

**NOTE:** If the remote end of the LAG link is a security device, LACP might not be supported because security devices require a deterministic configuration. In this case, do not configure LACP. All links in the LAG are permanently operational unless the switch detects a link failure within the Ethernet physical layer or data link layers.

---

The topology used in this example consists of one switch with a LAG configured between two of its 10-Gigabit Ethernet interfaces. The switch is connected to an aggregation switch.

Table 215 on page 2657 details the topology used in this configuration example.

**Table 215: Components of the Topology for Configuring a LAG Between a QFX3500 Switch and Aggregation Switch**

| Hostname | Base Hardware                       | Trunk Port                                                                                               |
|----------|-------------------------------------|----------------------------------------------------------------------------------------------------------|
| switch   | QFX3500, QFX3600, or QFX5100 switch | ae0 is configured as a trunk port and combines the following two interfaces:<br>xe-0/0/2 and<br>xe-0/0/3 |

### Configuration

To configure a LAG between two 10-Gigabit Ethernet interfaces:

#### CLI Quick Configuration

To quickly configure a LAG between two 10-Gigabit Ethernet interfaces on a switch, copy the following commands and paste them into the switch terminal window:

**NOTE:** If you are configuring a LAG on the QFX5100 switch, use the interface-mode statement instead of the port-mode statement. For ELS details, see *Getting Started with Enhanced Layer 2 Software*.

```

[edit]
set chassis aggregated-devices ethernet device-count 1
set interfaces ae0 aggregated-ether-options minimum-links 1
set interfaces ae0 aggregated-ether-options link-speed 10g
set interfaces ae0 unit 0 family ethernet-switching vlan members green
set interfaces xe-0/0/2 ether-options 802.ad ae0
set interfaces xe-0/0/3 ether-options 802.ad ae0
set interfaces ae0 unit 0 family ethernet-switching port-mode trunk
set interfaces ae0 aggregated-ether-options lacp active
set interfaces ae0 aggregated-ether-options lacp periodic fast
  
```

#### Step-by-Step Procedure

To configure a LAG between a QFX Series switch and an aggregation switch:

- Specify the number of LAGs to be created on the switch:
 

```

[edit chassis]
user@switch# set aggregated-devices ethernet device-count 1
      
```
- Specify the number of links that need to be present for the ae0 LAG interface to be up:

- ```
[edit interfaces]
user@switch# set ae0 aggregated-ether-options minimum-links 1
```
3. Specify the media speed of the ae0 link:
 

```
[edit interfaces]
user@switch# set ae0 aggregated-ether-options link-speed 10g
```
  4. Specify the members to be included within the aggregated Ethernet bundle:
 

```
[edit interfaces]
user@switch# set interfaces xe-0/0/2 ether-options 802.ad ae0
[edit interfaces]
user@switch# set interfaces xe-0/0/3 ether-options 802.ad ae0
```
  5. Assign a port mode of trunk to the ae0 link:

**NOTE:** If you are configuring a LAG on the QFX5100 switch, use the **interface-mode** statement instead of the **port-mode** statement. For ELS details, see *Getting Started with Enhanced Layer 2 Software*.

- ```
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching port-mode trunk
or
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching interface-mode trunk
```
6. Assign the LAG to a VLAN:
 

```
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching vlan members green vlan-id 200
```
  7. (Optional): Designate one side of the LAG as active for LACP:
 

```
[edit interfaces]
user@switch# set ae0 aggregated-ether-options lacp active
```
  8. (Optional): Designate the interval and speed at which the interfaces send LACP packets:
 

```
[edit interfaces]
user@switch# set ae0 aggregated-ether-options lacp periodic fast
```

### Results

Display the results of the configuration on a QFX3500 or QFX3600 switch:

```
[edit]
chassis {
  aggregated-devices {
    ethernet {
      device-count 1;
    }
  }
}
green {
  vlan-id 200;
}
}
interfaces {
  ae0 {
```

```

    aggregated-ether-options {
        link-speed 10g;
        minimum-links 1;
    }
    unit 0 {
        family ethernet-switching {
            port-mode trunk;
            vlan {
                members green;
            }
        }
    }
}
xe-0/0/2 {
    ether-options {
        802.ad ae0;
    }
}
xe-0/0/3 {
    ether-options {
        802.ad ae0;
    }
}
}

```

### Verification

To verify that switching is operational and one LAG has been created, perform these tasks:

- [Verifying That LAG ae0.0 Has Been Created on page 2659](#)
- [Verifying That LAG ae0 Has Been Created on page 2659](#)

#### *Verifying That LAG ae0.0 Has Been Created*

**Purpose** Verify that LAG **ae0.0** has been created on the switch.

**Action** `show interfaces ae0 terse`

| Interface | Admin | Link | Proto      | Local | Remote |
|-----------|-------|------|------------|-------|--------|
| ae0       | up    | up   |            |       |        |
| ae0.0     | up    | up   | eth-switch |       |        |

**Meaning** The output confirms that the **ae0.0** link is up and shows the **family** and IP address assigned to this link.

#### *Verifying That LAG ae0 Has Been Created*

**Purpose** Verify that LAG **ae0** has been created on the switch

**Action** `show interfaces ae0 terse`

| Interface | Admin | Link | Proto      | Local | Remote |
|-----------|-------|------|------------|-------|--------|
| ae0       | up    | down |            |       |        |
| ae0.0     | up    | down | eth-switch |       |        |

**Meaning** The output shows that the **ae0.0** link is down.

### [Troubleshooting](#)

---

#### *Troubleshooting a LAG That Is Down*

**Problem** The **show interfaces terse** command shows that the LAG is **down**.

**Solution** Check the following:

- Verify that there is no configuration mismatch.
- Verify that all member ports are up.
- Verify that a LAG is part of family ethernet switching (Layer 2 LAG) or family inet (Layer 3 LAG).
- Verify that the LAG member is connected to the correct LAG at the other end.

**Related  
Documentation**

- [Configuring Link Aggregation on page 2777](#)
- [Verifying the Status of a LAG Interface on page 2880](#)
- [Verifying That LACP Is Configured Correctly and Bundle Members Are Exchanging LACP Protocol Packets on page 2881](#)
- [Example: Configuring Link Aggregation with LACP Between a QFX Series Product and an Aggregation Switch on page 2660](#)
- [Example: Configuring an FCoE LAG on a Redundant Server Node Group on page 5509](#)
- [show lacp statistics interfaces \(View\) on page 3060](#)

### **Example: Configuring Link Aggregation with LACP Between a QFX Series Product and an Aggregation Switch**

QFX Series products allow you to combine multiple Ethernet links into one logical interface for higher bandwidth and redundancy. The ports that are combined in this manner are referred to as a link aggregation group (LAG) or bundle. The number of Ethernet links you can combine into a LAG depends on your QFX Series product model. On a standalone switch, you can group up to 32 Ethernet interfaces to form a LAG. On a QFabric system, you can group up to 8 Ethernet interfaces to form a LAG. QFX Series products allow you to further enhance these links by configuring Link Aggregation Control Protocol (LACP).

This example describes how to overlay LACP on the LAG configurations that were created in [“Example: Configuring Link Aggregation Between a QFX Series Product and an Aggregation Switch” on page 2656](#):

- [Requirements on page 2661](#)
- [Overview and Topology on page 2661](#)
- [Configuring LACP for the LAG on the QFX Series on page 2661](#)

- [Verification on page 2662](#)
- [Troubleshooting on page 2663](#)

## Requirements

This example uses the following software and hardware components:

- Junos OS Release 11.1 or later for the QFX3500 switch, Junos OS Release 12.1 or later for the QFX3600 switch, and Junos OS 13.2 or later for the QFX5100 switch.
- One QFX3500, QFX3600, or QFX5100 switch.

Before you configure LACP, be sure you have:

- Configured the ports on the switches as trunk ports.
- Configured the LAG.

## Overview and Topology

The topology in this example is exactly the same as the topology used in the [Configuring a LAG Between a QFX Switch and an Aggregation Switch](#) example. This example shows how to use LACP to enhance the LAG functionality.

LACP exchanges are made between *actors* (the transmitting link) and *partners* (the receiving link). The LACP mode can be either active or passive.

**NOTE:** If the actor and partner are both in passive mode, they do not exchange LACP packets, which results in the aggregated Ethernet links not coming up. By default, LACP is in passive mode. To initiate transmission of LACP packets and responses to LACP packets, you must enable LACP in active mode.

By default, the actor and partner send LACP packets every second. You can configure the interval at which the interfaces send LACP packets by including the **periodic** statement at the **[edit interfaces *interface-name* aggregated-ether-options lacp]** hierarchy level.

The interval can be fast (every second) or slow (every 30 seconds).

## Configuring LACP for the LAG on the QFX Series

To configure LACP for a QFX Series LAG, perform these tasks:

### CLI Quick Configuration

To quickly configure LACP for the access switch LAGs, copy the following commands and paste them into the switch terminal window:

```
[edit]
set interfaces ae0 aggregated-ether-options lacp active periodic fast
```

**Step-by-Step Procedure**

To configure LACP for LAG ae0 :

1. Specify the aggregated Ethernet options for the LAG:

```
[edit interfaces]
user@switch# set ae0 aggregated-ether-options lacp active periodic fast
```

**Results** Display the results of the configuration:

```
[edit interfaces]
user@switch# show
ae0 {
  aggregated-ether-options {
    lacp {
      active;
      periodic fast;
    }
  }
}
```

**Verification**

To verify that LACP packets are being exchanged, perform the following tasks:

- [Verifying the LACP Settings on page 2662](#)
- [Verifying That the LACP Packets Are Being Exchanged on page 2662](#)

**Verifying the LACP Settings****Purpose** Verify that LACP has been set up correctly.**Action** Use the `show lacp interfaces interface-name` command to check that LACP has been enabled as active on one end.

```
user@switch> show lacp interfaces xe-0/0/2
```

Aggregated interface: ae0

| LACP state:    | Role          | Exp | Def            | Dist | Col       | Syn | Aggr | Timeout | Activity |
|----------------|---------------|-----|----------------|------|-----------|-----|------|---------|----------|
| xe-0/0/2       | Actor         | No  | Yes            | No   | No        | No  | Yes  | Fast    | Active   |
| xe-0/0/2       | Partner       | No  | Yes            | No   | No        | No  | Yes  | Fast    | Passive  |
| LACP protocol: | Receive State |     | Transmit State |      | Mux State |     |      |         |          |
| xe-0/0/2       | Defaulted     |     | Fast periodic  |      | Detached  |     |      |         |          |

**Meaning** The output indicates that LACP has been set up correctly and is active at one end.**Verifying That the LACP Packets Are Being Exchanged****Purpose** Verify that LACP packets are being exchanged.

**Action** Use the **show interfaces aex statistics** command to display LACP information.

```
user@switch> show interfaces ae0 statistics
```

```
Physical interface: ae0, Enabled, Physical link is Down
Interface index: 153, SNMP ifIndex: 30

```

**Meaning** The output here shows that the link is down and that no PDUs are being exchanged.

### Troubleshooting

To troubleshoot a nonworking LACP link, perform these tasks:

- [Troubleshooting a Nonworking LACP Link on page 2663](#)

#### *Troubleshooting a Nonworking LACP Link*

**Problem** The LACP link is not working.

**Solution** Check the following:

- Remove the LACP configuration and verify whether the static LAG is up.
- Verify that LACP is configured at both ends.
- Verify that LACP is not passive at both ends.
- Verify whether LACP protocol data units (PDUs) are being exchanged by running the **monitor traffic-interface lag-member detail** command.

**Related Documentation**

- [Configuring Link Aggregation on page 2777](#)
- [Verifying the Status of a LAG Interface on page 2880](#)

- [Verifying That LACP Is Configured Correctly and Bundle Members Are Exchanging LACP Protocol Packets on page 2881](#)
- [Example: Configuring Link Aggregation Between a QFX Series Product and an Aggregation Switch on page 2656](#)

- [show lacp statistics interfaces \(View\) on page 3060](#)

## Example: Configuring Multichassis Link Aggregation

**NOTE:** Multichassis Link Aggregation (MC-LAG) is supported on QFX3500 and QFX3600 standalone switches running the original CLI and QFX5100 standalone switches and EX4600 switches running Enhanced Layer 2 Software.

Multichassis link aggregation groups (MC-LAGs) enable a client device to form a logical LAG interface between two switches. An MC-LAG provides redundancy and load balancing between the two switches, multihoming support, and a loop-free Layer 2 network without running Spanning Tree Protocol (STP).

The peers in an MC-LAG use an interchassis control link-protection link (ICL-PL) to replicate forwarding information across the peers. The Interchassis Control Protocol (ICCP) exchanges the control information between two MC-LAG switches. Additionally, ICCP propagates the operational state of MC-LAG members through the ICL-PL.

On one end of an MC-LAG is an MC-LAG client device, such as a server, that has one or more physical links in a link aggregation group (LAG). This client device does not need to detect the MC-LAG. On the other side of an MC-LAG are two MC-LAG switches. Each of the switches has one or more physical links connected to a single client device. The switches coordinate with each other to ensure that data traffic is forwarded properly.

- [Requirements on page 2665](#)
- [Overview on page 2666](#)
- [Configuration on page 2667](#)
- [Verification on page 2684](#)
- [Troubleshooting on page 2687](#)

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 12.2 or later for the QFX3500 and QFX3600 standalone switches and Junos OS Release 13.2X51-D10 or later for the QFX5100 standalone switches.
- Two QFX3500 or QFX3600 standalone switches, or two QFX5100 standalone switches.

Before you configure an MC-LAG, be sure that you understand how to:

- Configure aggregated Ethernet interfaces on a switch. See [“Example: Configuring Link Aggregation Between a QFX Series Product and an Aggregation Switch” on page 2656](#).
- Configure the Link Aggregation Control Protocol (LACP) on aggregated Ethernet interfaces on a switch. See [“Example: Configuring Link Aggregation with LACP Between a QFX Series Product and an Aggregation Switch” on page 2660](#).

Overview

In this example, you configure an MC-LAG across two switches, consisting of two aggregated Ethernet interfaces, an interchassis control link-protection link (ICL-PL), multichassis protection link for the ICL-PL, ICCP for the peers hosting the MC-LAG, and Layer 3 connectivity between MC-LAG peers. Layer 3 connectivity is required for ICCP.

Topology

The topology used in this example consists of two switches hosting an MC-LAG. The two switches are connected to a server. [Figure 82 on page 2666](#) shows the topology of this example.

Figure 82: Configuring a Multichassis LAG Between Switch A and Switch B

[Table 215 on page 2657](#) details the topology used in this configuration example.

Table 216: Components of the Topology for Configuring a Multichassis LAG Between Two Switches

| Hostname | Base Hardware                                                      | Multichassis Link Aggregation Group                                                                                                                                                                                                                                                                                                                                                                                         |
|----------|--------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Switch A | QFX3500 or QFX3600 standalone switch, or QFX5100 standalone switch | <b>ae0</b> is configured as an aggregated Ethernet interface, and is used as an ICL-PL. The following interfaces are part of <b>ae0</b> : <b>xe-0/0/12</b> and <b>xe-0/0/13</b> Switch A and <b>xe-0/0/12</b> and <b>xe-0/0/13</b> on Switch B.<br><br><b>ae1</b> is configured as an MC-LAG, and the following two interfaces are part of <b>ae1</b> : <b>xe-0/0/44</b> on Switch A and <b>xe-0/0/46</b> on Switch B.<br>. |
| Switch B | QFX3500 or QFX3600 standalone switch, or QFX5100 standalone switch |                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network configuration, and paste the commands into the CLI at the **[edit]** hierarchy level of Switch A.

**NOTE:** This example shows how to configure MC-LAG using both the original CLI and Enhanced Layer 2 Software (ELS).

In ELS, there are three different statements and one different option from the original CLI:

- The `port-mode` statement in the `[edit interfaces interface-name unit number family ethernet-switching]` hierarchy is not supported. Use the `interface-mode` statement instead.
- The `vlan` statement in the `[edit interfaces interface-name]` hierarchy is not supported. Use the `irb` statement instead.
- The `vlan.logical-interface-number` option in the `[edit vlans vlan-name l3-interface]` option is not supported. Use the `irb.logical-interface-number` option instead.
- The `service-id` statement in the `[edit switch-options]` hierarchy is required in the ELS CLI.

### Original CLI

```
set chassis aggregated-devices ethernet device-count 2
set interfaces xe-0/0/12 ether-options 802.3ad ae0
set interfaces xe-0/0/13 ether-options 802.3ad ae0
set interfaces xe-0/0/44 ether-options 802.3ad ae1
set interfaces ae0 unit 0 family ethernet-switching port-mode trunk
set interfaces ae0 unit 0 family ethernet-switching vlan members v500
set interfaces ae1 aggregated-ether-options lacp active
set interfaces ae1 aggregated-ether-options lacp system-id 00:01:02:03:04:05
set interfaces ae1 aggregated-ether-options lacp admin-key 3
set interfaces ae1 aggregated-ether-options mc-ae mc-ae-id 3
set interfaces ae1 aggregated-ether-options mc-ae chassis-id 0
set interfaces ae1 aggregated-ether-options mc-ae mode active-active
set interfaces ae1 aggregated-ether-options mc-ae status-control active
set ae1 aggregated-ether-options mc-ae init-delay-time 240
set interfaces ae1 unit 0 family ethernet-switching port-mode trunk
set interfaces ae1 unit 0 family ethernet-switching vlan members v100
set interfaces vlan unit 500 family inet address 3.3.3.2/24
set vlans v100 vlan-id 100
set vlans v500 vlan-id 500
set vlans v500 l3-interface vlan.500
set protocols iccp local-ip-addr 3.3.3.2
set protocols iccp peer 3.3.3.1 session-establishment-hold-time 50
set protocols iccp peer 3.3.3.1 backup-liveness-detection backup-peer-ip 10.207.64.233
set protocols iccp peer 3.3.3.1 liveness-detection minimum-receive-interval 1000
```

```
set protocols iccp peer 3.3.3.1 liveness-detection transmit-interval minimum-interval 1000
set protocols rstp interface ae0.0 disable
set protocols rstp interface ae1.0 edge
set protocols rstp interface all mode point-to-point
set protocols rstp bpdu-block-on-edge
set multi-chassis multi-chassis-protection 3.3.3.1 interface ae0
```

## ELS

```
set chassis aggregated-devices ethernet device-count 2
set interfaces xe-0/0/12 ether-options 802.3ad ae0
set interfaces xe-0/0/13 ether-options 802.3ad ae0
set interfaces xe-0/0/44 ether-options 802.3ad ae1
set interfaces ae0 unit 0 family ethernet-switching interface-mode trunk
set interfaces ae0 unit 0 family ethernet-switching vlan members v500
set interfaces ae1 aggregated-ether-options lacp active
set interfaces ae1 aggregated-ether-options lacp system-id 00:01:02:03:04:05
set interfaces ae1 aggregated-ether-options lacp admin-key 3
set interfaces ae1 aggregated-ether-options mc-ae mc-ae-id 3
set interfaces ae1 aggregated-ether-options mc-ae chassis-id 0
set interfaces ae1 aggregated-ether-options mc-ae mode active-active
set interfaces ae1 aggregated-ether-options mc-ae status-control active
set ae1 aggregated-ether-options mc-ae init-delay-time 240
set interfaces ae1 unit 0 family ethernet-switching interface-mode trunk
set interfaces ae1 unit 0 family ethernet-switching vlan members v100
set interfaces irb unit 500 family inet address 3.3.3.2/24
set vlans v100 vlan-id 100
set vlans v500 vlan-id 500
set vlans v500 l3-interface irb.500
set protocols iccp local-ip-addr 3.3.3.2
set protocols iccp peer 3.3.3.1 session-establishment-hold-time 50
set protocols iccp peer 3.3.3.1 backup-liveness-detection backup-peer-ip 10.207.64.233
set protocols iccp peer 3.3.3.1 liveness-detection minimum-receive-interval 1000
set protocols iccp peer 3.3.3.1 liveness-detection transmit-interval minimum-interval 1000
set protocols rstp interface ae0.0 disable
set protocols rstp interface ae1.0 edge
set protocols rstp interface all mode point-to-point
set protocols rstp bpdu-block-on-edge
set multi-chassis multi-chassis-protection 3.3.3.1 interface ae0
set switch-options service-id 10
```

To quickly configure this example, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network configuration, and paste the commands into the CLI at the **[edit]** hierarchy level of Switch B.

**NOTE:** This example shows how to configure MC-LAG using both the original CLI and Enhanced Layer 2 Software (ELS).

In ELS, there are three different statements and one different option from the original CLI:

- The port-mode statement in the [edit interfaces *interface-name* unit *number* family ethernet-switching] hierarchy is not supported. Use the interface-mode statement instead.
- The vlan statement in the [edit interfaces *interface-name*] hierarchy is not supported. Use the irb statement instead.
- The vlan.logical-interface-number option in the [edit vlans *vlan-name* l3-interface] option is not supported. Use the irb.logical-interface-number option instead.
- The service-id statement in the [edit switch-options] hierarchy is required in the ELS CLI.

### Original CLI

```
set chassis aggregated-devices ethernet device-count 2
set interfaces xe-0/0/12 ether-options 802.3ad ae0
set interfaces xe-0/0/13 ether-options 802.3ad ae0
set interfaces xe-0/0/46 ether-options 802.3ad ae1
set interfaces ae0 unit 0 family ethernet-switching port-mode trunk
set interfaces ae0 unit 0 family ethernet-switching vlan members v500
set interfaces ae1 aggregated-ether-options lacp active
set interfaces ae1 aggregated-ether-options lacp system-id 00:01:02:03:04:05
set interfaces ae1 aggregated-ether-options lacp admin-key 3
set interfaces ae1 aggregated-ether-options mc-ae mc-ae-id 3
set interfaces ae1 aggregated-ether-options mc-ae chassis-id 1
set interfaces ae1 aggregated-ether-options mc-ae mode active-active
set interfaces ae1 aggregated-ether-options mc-ae status-control standby
set ae1 aggregated-ether-options mc-ae init-delay-time 240
set interfaces ae1 unit 0 family ethernet-switching port-mode trunk
set interfaces ae1 unit 0 family ethernet-switching vlan members v100
set interfaces vlan unit 500 family inet address 3.3.3.1/24
set vlans v100 vlan-id 100
set vlans v500 vlan-id 500
set vlans v500 l3-interface vlan.500
set protocols iccp local-ip-addr 3.3.3.1
set protocols iccp peer 3.3.3.2 session-establishment-hold-time 50
set protocols iccp peer 3.3.3.2 backup-liveness-detection backup-peer-ip 10.207.64.233
set protocols iccp peer 3.3.3.2 liveness-detection minimum-receive-interval 1000
set protocols iccp peer 3.3.3.2 liveness-detection transmit-interval minimum-interval 1000
set protocols rstp interface ae0.0 disable
set protocols rstp interface ae1.0 edge
set protocols rstp interface all mode point-to-point
set protocols rstp bpdu-block-on-edge
set multi-chassis multi-chassis-protection 3.3.3.2 interface ae0
```

### ELS

```
set chassis aggregated-devices ethernet device-count 2
```

```

set interfaces xe-0/0/12 ether-options 802.3ad ae0
set interfaces xe-0/0/13 ether-options 802.3ad ae0
set interfaces xe-0/0/46 ether-options 802.3ad ae1
set interfaces ae0 unit 0 family ethernet-switching interface-mode trunk
set interfaces ae0 unit 0 family ethernet-switching vlan members v500
set interfaces ae1 aggregated-ether-options lacp active
set interfaces ae1 aggregated-ether-options lacp system-id 00:01:02:03:04:05
set interfaces ae1 aggregated-ether-options lacp admin-key 3
set interfaces ae1 aggregated-ether-options mc-ae mc-ae-id 3
set interfaces ae1 aggregated-ether-options mc-ae chassis-id 1
set interfaces ae1 aggregated-ether-options mc-ae mode active-active
set interfaces ae1 aggregated-ether-options mc-ae status-control standby
set ae1 aggregated-ether-options mc-ae init-delay-time 240
set interfaces ae1 unit 0 family ethernet-switching interface-mode trunk
set interfaces ae1 unit 0 family ethernet-switching vlan members v100
set interfaces irb unit 500 family inet address 3.3.3.1/24
set vlans v100 vlan-id 100
set vlans v500 vlan-id 500
set vlans v500 l3-interface irb.500
set protocols iccp local-ip-addr 3.3.3.1
set protocols iccp peer 3.3.3.2 session-establishment-hold-time 50
set protocols iccp peer 3.3.3.2 backup-liveness-detection backup-peer-ip 10.207.64.233
set protocols iccp peer 3.3.3.2 liveness-detection minimum-receive-interval 1000
set protocols iccp peer 3.3.3.2 liveness-detection transmit-interval minimum-interval 1000
set protocols rstp interface ae0.0 disable
set protocols rstp interface ae1.0 edge
set protocols rstp interface all mode point-to-point
set protocols rstp bpdu-block-on-edge
set multi-chassis multi-chassis-protection 3.3.3.2 interface ae0
set switch-options service-id 10

```

### Configuring MC-LAG on Two Switches

#### Step-by-Step Procedure

To enable multichassis protection link between MC-LAG peers:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Configure the number of LAGs on both Switch A and Switch B.  

```

[edit chassis]
user@switch# set aggregated-devices ethernet device-count 2

```
2. Add member interfaces to the aggregated Ethernet interfaces on both Switch A and Switch B.  

```

[edit interfaces]
user@switch# set xe-0/0/12 ether-options 802.3ad ae0
[edit interfaces]
user@switch# set xe-0/0/13 ether-options 802.3ad ae0
[edit interfaces]
user@switch# set xe-0/0/44 ether-options 802.3ad ae1
[edit interfaces]
user@switch# set xe-0/0/46 ether-options 802.3ad ae1

```
3. Configure a trunk interface between Switch A and Switch B.

**NOTE:** The `port-mode` statement is not supported on Enhanced Layer 2 Software (ELS). If you are running ELS, use the `interface-mode` statement.

Original CLI:

```
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching port-mode trunk
or
```

ELS:

```
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching interface-mode trunk
```

4. Configure a multichassis protection link between Switch A and Switch B.

Switch A:

```
[edit]
user@switch# set multi-chassis multi-chassis-protection 3.3.3.2 interface ae0
```

Switch B:

```
[edit]
user@switch# set multi-chassis multi-chassis-protection 3.3.3.1 interface ae0
```

#### Step-by-Step Procedure

To enable ICCP:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Configure the local IP address to be in the ICCP connection on Switch A and Switch B.

Switch A:

```
[edit protocols]
user@switch# set iccp local-ip-addr 3.3.3.2
```

Switch B:

```
[edit protocols]
user@switch# set iccp local-ip-addr 3.3.3.1
```

2. Configure the peer IP address and minimum receive interval for a (BFD) session for ICCP on Switch A and Switch B.

**NOTE:** Configure at least 1000ms as the minimum receive interval.

Switch A:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 liveness-detection minimum-receive-interval 1000
```

Switch B:

```
[edit protocols]
```

```
user@switch# set iccp peer 3.3.3.2 liveness-detection minimum-receive-interval 1000
```

3. Configure the peer IP address and minimum transmit interval for Bidirectional Forwarding Detection (BFD) session for ICCP on Switch A and Switch B.

**NOTE:** Configure at least 1000ms as the transmit interval minimum interval.

Switch A:

```
[edit protocols]
```

```
user@switch# set iccp peer 3.3.3.1 liveness-detection transmit-interval minimum-interval 1000
```

Switch B:

```
[edit protocols]
```

```
user@switch# set iccp peer 3.3.3.2 liveness-detection transmit-interval minimum-interval 1000
```

4. (Optional) Configure the time during which an ICCP connection must succeed between MC-LAG peers on Switch A and Switch B.

**NOTE:** Configuring session establishment hold time helps in faster ICCP connection establishment. The recommended value is 50 seconds.

Switch A:

```
[edit protocols]
```

```
user@switch# set iccp peer 3.3.3.1 session-establishment-hold-time 50
```

Switch B:

```
[edit protocols]
```

```
user@switch# set iccp peer 3.3.3.2 session-establishment-hold-time 50
```

5. (Optional) Configure the backup IP address to be used for backup liveness detection on both Switch A and Switch B.

**NOTE:** By default, backup liveness detection is not enabled. Configuring a backup IP address helps achieve sub-second traffic loss during a MC-LAG peer reboot.

Switch A:

```
[edit protocols]
```

```
user@switch# set iccp peer 3.3.3.1 backup-liveness-detection backup-peer-ip 10.207.64.233
```

Switch B:

- ```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 backup-liveness-detection backup-peer-ip 10.207.64.232
```
6. Configure Layer 3 connectivity between the MC-LAG peers on both Switch A and Switch B.
- ```
[edit vlans]
user@switch# set v500 vlan-id 500
[edit vlans]
user@switch# set v500 l3-interface vlan.500
[edit vlans]
user@switch# set v500 l3-interface irb.500
```

**NOTE:** The port-mode statement is not supported on Enhanced Layer 2 Software (ELS). If you are running ELS, use the interface-mode statement.

Original CLI:

```
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching port-mode trunk vlan members
v500
```

or

ELS:

```
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching interface-mode trunk vlan members
v500
```

### Step-by-Step Procedure

To enable the MC-LAG interface:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Enable LACP on the MC-LAG interface on Switch A and Switch B.

**NOTE:** At least one end needs to be active. The other end can be either active or passive.

- ```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options lacp active
```
2. Specify the same multichassis aggregated Ethernet identification number on both MC-LAG peers on Switch A and Switch B.
- ```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae mc-ae-id 3
```
3. Specify the same service ID on Switch A and Switch B.
- ELS:
- ```
[edit]
```

- user@switch# **set switch-options service-id 10**
- Specify a unique chassis ID for the MC-LAG on the MC-LAG peers on Switch A and Switch B.

Switch A:

[edit interfaces]

user@switch# **set ae1 aggregated-ether-options mc-ae chassis-id 0**

Switch B:

[edit interfaces]

user@switch# **set ae1 aggregated-ether-options mc-ae chassis-id 1**

- Specify the operating mode of the MC-LAG on both Switch A and Switch B.

**NOTE:** Only active-active mode is supported at this time.

[edit interfaces]

user@switch# **set ae1 aggregated-ether-options mc-ae mode active-active**

- Specify the status control for MC-LAG on Switch A and Switch B.

**NOTE:** You must configure status control on both Switch A and Switch B hosting the MC-LAG. If one peer is in active mode, the other must be in standby mode.

Switch A:

[edit interfaces]

user@switch# **set ae1 aggregated-ether-options mc-ae status-control active**

Switch B:

[edit interfaces]

user@switch# **set ae1 aggregated-ether-options mc-ae status-control standby**

- Specify the number of seconds by which the bring-up of the MC-AE interface should be deferred after you reboot Switch A and Switch B.

**NOTE:** The recommended value for maximum VLAN configuration (for example, 4,000 VLANs) is 240 seconds. If IGMP snooping is enabled on all of the VLANs, the recommended value is 420 seconds.

[edit interfaces]

user@switch# **set ae1 aggregated-ether-options mc-ae init-delay-time 240**

- Specify the same LACP system ID for the MC-LAG on Switch A and Switch B.

[edit interfaces]

user@switch# **set ae1 aggregated-ether-options lacp system-ID 00:01:02:03:04:05**

- Specify the same LACP administration key on both Switch A and Switch B.

[edit interfaces]

user@switch# **set ae1 aggregated-ether-options lacp admin-key 3**

10. Enable a VLAN on the MC-LAG on Switch A and Switch B.

**NOTE:** The `port-mode` statement is not supported on Enhanced Layer 2 Software (ELS). If you are running ELS, use the `interface-mode` statement.

Original CLI:

```
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching port-mode trunk
or
```

ELS:

```
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching interface-mode trunk
[edit]
user@switch# set vlans v100 vlan-id 100
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching vlan members v100
```

11. (Optional) Enable a private VLAN on the MC-LAG on Switch A and Switch B.

```
[edit]
user@switch# set vlans vlan100 pvlan isolation-vlan-id 200
extend-secondary-vlan-id
[edit]
user@switch# set vlans vlan100 interface ae0.0 pvlan-trunk
```

#### Step-by-Step Procedure

To enable RSTP:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Enable RSTP globally on all interfaces on Switch A and Switch B.  

```
[edit]
user@switch# set protocols rstp interface all mode point-to-point
```
2. Disable RSTP on the ICL-PL interfaces on Switch A and Switch B:  

```
[edit]
user@switch# set protocols rstp interface ae0.0 disable
```
3. Configure the MC-LAG interfaces as edge ports on Switch A and Switch B.

**NOTE:** The `ae1` interface is a downstream interface. This is why RSTP and `bpdu-block-on-edge` need to be configured.

```
[edit]
user@switch# set protocols rstp interface ae1.0 edge
```

4. Enable BPDU blocking on all interfaces except for the ICL-PL interfaces on Switch A and Switch B.

**NOTE:** The ae1 interface is a downstream interface. This is why RSTP and bpdu-block-on-edge need to be configured.

```
[edit]
user@switch# set protocols rstp bpdu-block-on-edge
```

### Results

Display the results of the configuration on Switch A using the original CLI.

```
chassis {

### Verification

---

To verify that the MC-LAG group has been created and is working properly, perform these tasks:

- [Verifying That ICCP Is Working on Switch A on page 2684](#)
- [Verifying That ICCP Is Working on Switch B on page 2684](#)
- [Verifying That LACP Is Active on Switch A on page 2685](#)
- [Verifying That LACP Is Active on Switch B on page 2685](#)
- [Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch A on page 2685](#)
- [Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch B on page 2686](#)
- [Verifying that MAC Learning Is Occurring on Switch A on page 2686](#)
- [Verifying that MAC Learning Is Occurring on Switch B on page 2686](#)

#### *Verifying That ICCP Is Working on Switch A*

**Purpose** Verify that ICCP is running on Switch A.

**Action** [edit]  
user@switch# **show iccp**  
Redundancy Group Information for peer 3.3.3.1  
TCP Connection : Established  
Liveliness Detection : Up  
  
Client Application: MCSNOOPD  
  
Client Application: eswd

**Meaning** This output shows that the TCP connection between the peers hosting the MC-LAG is up, liveness detection is up, and MCSNOOPD and ESWD client applications are running.

#### *Verifying That ICCP Is Working on Switch B*

**Purpose** Verify that ICCP is running on Switch B.

**Action** **show iccp**  
  
[edit]  
user@switch# **show iccp**

```

Redundancy Group Information for peer 3.3.3.2
TCP Connection      : Established
Liveliness Detection : Up

```

```
Client Application: MCSNOOPD
```

```
Client Application: eswd
```

**Meaning** This output shows that the TCP connection between the peers hosting the MC-LAG is up, liveness detection is up, and MCSNOOPD and ESWD client applications are running.

### *Verifying That LACP Is Active on Switch A*

**Purpose** Verify that LACP is active on Switch A.

```

Action [edit]
user@switch# show lacp interfaces
Aggregated interface: ae1
  LACP state:      Role  Exp  Def  Dist  Col  Syn  Aggr  Timeout  Activity
  xe-0/0/46       Actor No   No   Yes  Yes  Yes  Yes   Fast   Active
  xe-0/0/46       Partner No   No   Yes  Yes  Yes  Yes   Fast   Active
  LACP protocol:   Receive State Transmit State Mux State
  xe-0/0/46       Current Fast periodic Collecting distributing

```

**Meaning** This output shows that Switch A is participating in LACP negotiation.

### *Verifying That LACP Is Active on Switch B*

**Purpose** Verify that LACP is active on Switch B

```

Action [edit]
user@switch# show lacp interfaces
Aggregated interface: ae1
  LACP state:      Role  Exp  Def  Dist  Col  Syn  Aggr  Timeout  Activity
  xe-0/0/44       Actor No   No   Yes  Yes  Yes  Yes   Fast   Active
  xe-0/0/44       Partner No   No   Yes  Yes  Yes  Yes   Fast   Active
  LACP protocol:   Receive State Transmit State Mux State
  xe-0/0/44       Current Fast periodic Collecting distributing

```

**Meaning** This output shows that Switch B is participating in LACP negotiation.

### *Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch A*

**Purpose** Verify that the MC-AE and ICL-PL interfaces are up on Switch A.

**Action** [edit]  
user@switch# **show interfaces mc-ae**  
Member Link : ae1  
Current State Machine's State: mcae active state  
Local Status : active  
Local State : up  
Peer Status : active  
Peer State : up  
Logical Interface : ae1.0  
Topology Type : bridge  
Local State : up  
Peer State : up  
Peer Ip/MCP/State : 3.3.3.1 ae0.0 up

**Meaning** This output shows that the MC-AE interface on Switch A is up and active.

***Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch B***

**Purpose** Verify that the MC-AE and ICL-PL interfaces are up on Switch B.

**Action** [edit]  
user@switch# **show interfaces mc-ae**  
Member Link : ae1  
Current State Machine's State: mcae active state  
Local Status : active  
Local State : up  
Peer Status : active  
Peer State : up  
Logical Interface : ae1.0  
Topology Type : bridge  
Local State : up  
Peer State : up  
Peer Ip/MCP/State : 3.3.3.2 ae0.0 up

**Meaning** This output shows that the MC-AE interface on Switch B is up and active.

***Verifying that MAC Learning Is Occurring on Switch A***

**Purpose** Verify that MAC learning is working on Switch A.

**Action** [edit]  
user@switch# **show ethernet-switching table**  
Ethernet-switching table: 10 entries, 4 learned, 0 persistent entries  

VLAN	MAC address	Type	Age	Interfaces
V100	*	Flood	-	All-members
V100	00:10:94:00:00:05	Learn(L)	33	ae0.0 (MCAE)

**Meaning** The output shows four learned MAC addresses entries.

***Verifying that MAC Learning Is Occurring on Switch B***

**Purpose** Verify that MAC learning is working on Switch B.

**Action** [edit]  
 user@switch# **show ethernet-switching table**  
 Ethernet-switching table: 10 entries, 4 learned, 0 persistent entries

VLAN	MAC address	Type	Age	Interfaces
V100	*	Flood		- All-members
V100	00:10:94:00:00:05	Learn(L)	33	ae0.0 (MCAE)

**Meaning** The output shows four learned MAC addresses entries.

## Troubleshooting

### Troubleshooting a LAG That Is Down

**Problem** The **show interfaces terse** command shows that the MC-LAG is **down**

**Solution** Check the following:

- Verify that there is no configuration mismatch.
- Verify that all member ports are up.
- Verify that the MC-LAG is part of family Ethernet switching (Layer 2 LAG).
- Verify that the MC-LAG member is connected to the correct MC-LAG member at the other end.

**Related Documentation**

- [Understanding Multichassis Link Aggregation on page 2615](#)
- [Configuring Multichassis Link Aggregation on page 2780](#)

## Example: Configuring Multichassis Link Aggregation for Layer 3 Multicast Using VRRP

**NOTE:** Multichassis Link Aggregation (MC-LAG) is supported on QFX3500 and QFX3600 standalone switches running the original CLI and QFX5100 standalone switches running Enhanced Layer 2 Software (ELS).

There are two methods for enabling Layer 3 multicast functionality across a multichassis link aggregation group (MC-LAG). You can choose either to configure Virtual Router Redundancy Protocol (VRRP) or synchronize the MAC addresses for the Layer 3 interfaces of the switches participating in the MC-LAG. The procedure to configure VRRP for use in a Layer 3 multicast MC-LAG is included in this example.

- [Requirements on page 2688](#)
- [Overview on page 2688](#)
- [Configuration on page 2690](#)
- [Verification on page 2723](#)

## Requirements

---

This example uses the following hardware and software components:

- Junos OS Release 12.3 or later for the QFX3500 and QFX3600 standalone switches and Junos OS Release 13.2X51-D10 or later for the QFX5100 standalone switches.
- Two QFX3500 or QFX3600 standalone switches, or two QFX5100 standalone switches.

Before you configure an MC-LAG for Layer 3 multicast using VRRP, be sure that you understand how to:

- Configure aggregated Ethernet interfaces on a switch. See [“Example: Configuring Link Aggregation Between a QFX Series Product and an Aggregation Switch” on page 2656](#).
- Configure the Link Aggregation Control Protocol (LACP) on aggregated Ethernet interfaces on a switch. See [“Example: Configuring Link Aggregation with LACP Between a QFX Series Product and an Aggregation Switch” on page 2660](#).

## Overview

---

In this example, you configure two MC-LAGs across two switches, consisting of two aggregated Ethernet interfaces (ae1 and ae2). To support the MC-LAG, create a third aggregated Ethernet interface (ae0) for the interchassis control link-protection link (ICL-PL). Configure a multichassis protection link for the ICL-PL, Interchassis Control Protocol (ICCP) for the peers hosting the MC-LAG, and Layer 3 connectivity between MC-LAG peers.

**NOTE:** Layer 3 connectivity is required for ICCP.

---

To complete the configuration, enable VRRP by completing the following steps for each MC-LAG:

- Create a routed VLAN interface (RVI)
- Create a VRRP group and assign a virtual IP address that is shared between each switch in the VRRP group
- Enable a member of a VRRP group to accept all packets destined for the virtual IP address if it is the master in the VRRP group
- Configure Layer 3 connectivity between the VRRP groups

## Topology

The topology used in this example consists of two switches hosting two MC-LAGs—ae1 and ae2. The two switches are connected to a multicast source (Server 1) over the MC-LAG ae1, and a multicast receiver (Server 2) over the MC-LAG ae2. [Figure 83 on page 2689](#) shows the topology of this example.

Figure 83: Configuring a Multichassis LAG for Layer 3 Multicast Using VRRP

g041361

Table 217 on page 2689 details the topology used in this configuration example.

Table 217: Components of the Topology for Configuring a Multichassis LAG for Layer 3 Multicast Using VRRP

Hostname	Base Hardware	Multichassis Link Aggregation Group
Switch A	QFX3500 or QFX3600 standalone switch, or QFX5100 standalone switch	<ul style="list-style-type: none"> <li>ae0 is configured as an aggregated Ethernet interface, and is used as an ICL-PL. The following two interfaces are part of ae0: xe-0/0/12 and xe-0/0/13 on Switch A and xe-0/0/12 and xe-0/0/13 on Switch B.</li> <li>ae1 is configured as an MC-LAG for the multicast source (Server 1), and the following two interfaces are part of ae1: xe-0/0/44 on Switch A and xe-0/0/46 on Switch B.</li> <li>ae2 is configured as an MC-LAG for the multicast receiver (Server 2), and the following two interfaces are part of ae2: xe-0/0/45 on Switch A and xe-0/0/47 on Switch B.</li> </ul>
Switch B	QFX3500 or QFX3600 standalone switch, or QFX5100 standalone switch	

## Configuration

### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network configuration, and paste the commands into the CLI at the **[edit]** hierarchy level of Switch A.

**NOTE:** This example shows how to configure MC-LAG using both the original CLI and Enhanced Layer 2 Software (ELS).

In ELS, there are three different statements and one different option from the original CLI:

- The `port-mode` statement in the `[edit interfaces interface-name unit number family ethernet-switching]` hierarchy is not supported. Use the `interface-mode` statement instead.
- The `vlan` statement in the `[edit interfaces interface-name]` hierarchy is not supported. Use the `irb` statement instead.
- The `vlan.logical-interface-number` option in the `[edit vlans vlan-name l3-interface]` option is not supported. Use the `irb.logical-interface-number` option instead.
- The `service-id` statement in the `[edit switch-options]` hierarchy is required in the ELS CLI.

### Original CLI:

```
set chassis aggregated-devices ethernet device-count 3
set interfaces xe-0/0/12 ether-options 802.3ad ae0
set interfaces xe-0/0/13 ether-options 802.3ad ae0

### *Configuring MC-LAG for Layer 3 Multicast Using VRRP on Two Switches*

#### **Step-by-Step Procedure**

To enable multichassis protection link between MC-LAG peers:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Configure the number of LAGs on both Switch A and Switch B.

```
[edit chassis]
user@switch# set aggregated-devices ethernet device-count 3
```

2. Add member interfaces to the aggregated Ethernet interfaces on both Switch A and Switch B.

#### Switch A and Switch B

```
[edit interfaces]
user@switch# set xe-0/0/12 ether-options 802.3ad ae0
user@switch# set xe-0/0/13 ether-options 802.3ad ae0
```

#### Switch A

```
[edit interfaces]
user@switch# set xe-0/0/44 ether-options 802.3ad ae1
user@switch# set xe-0/0/45 ether-options 802.3ad ae2
```

#### Switch B

```
[edit interfaces]
user@switch# set xe-0/0/46 ether-options 802.3ad ae1
user@switch# set xe-0/0/47 ether-options 802.3ad ae2
```

3. Configure ae0 as the trunk interface between Switch A and Switch B.

#### Switch A and Switch B

```
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching port-mode trunk
```

#### Switch A and Switch B Using ELS

```
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching interface-mode trunk
```

4. Configure ae0 as the multichassis protection link between Switch A and Switch B.

#### Switch A

```
[edit]
user@switch# set multi-chassis multi-chassis-protection 3.3.3.1 interface ae0
```

#### Switch B

```
[edit]
user@switch# set multi-chassis multi-chassis-protection 3.3.3.2 interface ae0
```

#### Step-by-Step Procedure

To enable ICCP:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Configure the local IP address to be in the ICCP connection on Switch A and Switch B.

#### Switch A

```
[edit protocols]
user@switch# set iccp local-ip-addr 3.3.3.2
```

**Switch B**

```
[edit protocols]
user@switch# set iccp local-ip-addr 3.3.3.1
```

2. Configure the peer IP address, minimum receive interval, and minimum transmit interval for a Bidirectional Forwarding Detection (BFD) session for ICCP on Switch A and Switch B.

**Switch A**

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 liveness-detection minimum-receive-interval
1000
user@switch# set iccp peer 3.3.3.1 liveness-detection transmit-interval
minimum-interval 1000
```

**Switch B**

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 liveness-detection minimum-receive-interval
1000
user@switch# set iccp peer 3.3.3.2 liveness-detection transmit-interval
minimum-interval 1000
```

3. (Optional) Configure the time during which an ICCP connection must succeed between MC-LAG peers on Switch A and Switch B.

**NOTE:** Configuring session establishment hold time helps in faster ICCP connection establishment. The recommended value is 50 seconds.

**Switch A**

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 session-establishment-hold-time 50
```

**Switch B**

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 session-establishment-hold-time 50
```

4. (Optional) Configure the backup IP address to be used for backup liveness detection on both Switch A and Switch B.

**NOTE:** By default, backup liveness detection is not enabled. Configuring a backup IP address helps achieve sub-second traffic loss during a MC-LAG peer reboot.

**Switch A**

```
[edit protocols]
```

```
user@switch# set iccp peer 3.3.3.1 backup-liveness-detection backup-peer-ip
10.207.64.233
```

#### Switch B

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 backup-liveness-detection backup-peer-ip
10.207.64.232
```

5. Configure Layer 3 connectivity between the MC-LAG peers on both Switch A and Switch B.

**NOTE:** In ELS, use the *irb.logical-interface-number* instead.

#### Switch A and Switch B

```
[edit vlans]
user@switch# set v500 vlan-id 500
user@switch# set v500 l3-interface vlan.500
```

#### Switch A and Switch B Using ELS

```
[edit vlans]
user@switch# set v500 vlan-id 500
user@switch# set v500 l3-interface irb.500
```

#### Switch A and Switch B

```
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching vlan members v500
```

#### Switch A

```
[edit interfaces]
user@switch# set vlan unit 500 family inet address 3.3.3.2/24
```

#### Switch A Using ELS

```
[edit interfaces]
user@switch# set irbunit 500 family inet address 3.3.3.2/24
```

#### Switch B

```
[edit interfaces]
user@switch# set vlan unit 500 family inet address 3.3.3.1/24
```

#### Switch B Using ELS

```
[edit interfaces]
user@switch# set irb unit 500 family inet address 3.3.3.1/24
```

**Step-by-Step Procedure** To enable the ae1 and ae2 MC-LAG interfaces:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Enable LACP on the MC-LAG interfaces on Switch A and Switch B.

**NOTE:** At least one end needs to be active. The other end can be either active or passive.

[edit interfaces]

```
user@switch# set ae1 aggregated-ether-options lacp active
```

```
user@switch# set ae2 aggregated-ether-options lacp active
```

2. Specify the same multichassis aggregated Ethernet (MC-AE) identification number for each MC-LAG peer on Switch A and Switch B.

[edit interfaces]

```
user@switch# set ae1 aggregated-ether-options mc-ae mc-ae-id 3
```

```
user@switch# set ae2 aggregated-ether-options mc-ae mc-ae-id 4
```

3. Specify the same service ID on Switch A and Switch B.

**ELS:**

[edit]

```
set switch-options service-id 10
```

4. Specify a unique chassis ID for the MC-LAG on the MC-LAG peers on Switch A and Switch B.

**Switch A**

[edit interfaces]

```
user@switch# set ae1 aggregated-ether-options mc-ae chassis-id 0
```

```
user@switch# set ae2 aggregated-ether-options mc-ae chassis-id 0
```

**Switch B**

[edit interfaces]

```
user@switch# set ae1 aggregated-ether-options mc-ae chassis-id 1
```

```
user@switch# set ae2 aggregated-ether-options mc-ae chassis-id 1
```

5. Specify the operating mode of the MC-LAGs on both Switch A and Switch B.

**NOTE:** Only active-active mode is supported at this time.

[edit interfaces]

```
user@switch# set ae1 aggregated-ether-options mc-ae mode active-active
```

```
user@switch# set ae2 aggregated-ether-options mc-ae mode active-active
```

6. Specify the status control for the MC-LAGs on Switch A and Switch B.

**NOTE:** You must configure status control on both Switch A and Switch B hosting the MC-LAGs. If one peer is in active mode, the other must be in standby mode.

#### Switch A

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae status-control active
user@switch# set ae2 aggregated-ether-options mc-ae status-control active
```

#### Switch B

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae status-control standby
user@switch# set ae2 aggregated-ether-options mc-ae status-control standby
```

7. Specify the number of seconds by which the bring-up of the MC-LAG interfaces should be deferred after you reboot Switch A or Switch B.

**NOTE:** The recommended value for maximum VLAN configuration (for example, 4,000 VLANs) is 240 seconds. If IGMP snooping is enabled on all of the VLANs, the recommended value is 420 seconds.

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae init-delay-time 420
user@switch# set ae2 aggregated-ether-options mc-ae init-delay-time 420
```

8. Specify the same LACP system ID for each MC-LAG on Switch A and Switch B.

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options lacp system-ID 00:01:02:03:04:05
user@switch# set ae2 aggregated-ether-options lacp system-ID 00:01:02:03:04:06
```

9. Specify the same LACP administration key on both Switch A and Switch B.

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options lacp admin-key 3
user@switch# set ae2 aggregated-ether-options lacp admin-key 3
```

10. Enable a VLAN for each MC-LAG on Switch A and Switch B.

```
[edit vlans]
user@switch# set v100 vlan-id 100
user@switch# set v200 vlan-id 200
```

```
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching vlan members v100
user@switch# set ae2 unit 0 family ethernet-switching vlan members v200
```

11. Configure ae1 and ae2 as trunk interfaces between Switch A and Switch B.

```
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching port-mode trunk
```

```
user@switch# set ae2 unit 0 family ethernet-switching port-mode trunk
```

ELS:

```
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching interface-mode trunk
user@switch# set ae2 unit 0 family ethernet-switching interface-mode trunk
```

#### Step-by-Step Procedure

To enable VRRP on the MC-LAGs on Switch A and Switch B:

1. Create a routed VLAN interface (RVI) for each MC-LAG, assign a virtual IP address that is shared between each switch in the VRRP groups, and assign an individual IP address for each switch in the VRRP groups.

##### Switch A

```
[edit interfaces]
user@switch# set vlan unit 100 family inet address 10.1.1.11/24 vrrp-group 1
virtual-address 10.1.1.1
user@switch# set vlan unit 200 family inet address 10.1.1.21/24 vrrp-group 2
virtual-address 10.1.1.2
```

##### Switch A Using ELS

```
[edit interfaces]
user@switch# set irb unit 100 family inet address 10.1.1.11/24 vrrp-group 1
virtual-address 10.1.1.1
user@switch# set irb unit 200 family inet address 10.1.1.21/24 vrrp-group 2
virtual-address 10.1.1.2
```

##### Switch B

```
[edit interfaces]
user@switch# set vlan unit 100 family inet address 10.1.1.10/24 vrrp-group 1
virtual-address 10.1.1.1
user@switch# set vlan unit 200 family inet address 10.1.1.20/24 vrrp-group 2
virtual-address 10.1.1.2
```

##### Switch B Using ELS

```
[edit interfaces]
user@switch# set irb unit 100 family inet address 10.1.1.10/24 vrrp-group 1
virtual-address 10.1.1.1
user@switch# set irb unit 200 family inet address 10.1.1.20/24 vrrp-group 2
virtual-address 10.1.1.2
```

2. Assign the priority for each switch in the VRRP groups:

**NOTE:** The switch configured with the highest priority is the master.

##### Switch A

```
[edit interfaces]
```

```

user@switch# set vlan unit 100 family inet address 10.1.1.11/24 vrrp-group 1 priority
200
user@switch# set vlan unit 200 family inet address 10.1.1.21/24 vrrp-group 2 priority
200

```

#### Switch A Using ELS

```

[edit interfaces]
user@switch# set irb unit 100 family inet address 10.1.1.11/24 vrrp-group 1 priority
200
user@switch# set irb unit 200 family inet address 10.1.1.21/24 vrrp-group 2 priority
200

```

#### Switch B

```

[edit interfaces]
user@switch# set vlan unit 100 family inet address 10.1.1.10/24 vrrp-group 1 priority
150
user@switch# set vlan unit 200 family inet address 10.1.1.20/24 vrrp-group 2 priority
150

```

#### Switch B Using ELS

```

[edit interfaces]
user@switch# set irb unit 100 family inet address 10.1.1.10/24 vrrp-group 1 priority
150
user@switch# set irb unit 200 family inet address 10.1.1.20/24 vrrp-group 2 priority
150

```

3. Enable the switch to accept all packets destined for the virtual IP address if it is the master in a VRRP group:

#### Switch A

```

[edit interfaces]
user@switch# set vlan unit 100 family inet address 10.1.1.11/24 vrrp-group 1
accept-data
user@switch# set vlan unit 200 family inet address 10.1.1.21/24 vrrp-group 2
accept-data

```

#### Switch A Using ELS

```

[edit interfaces]
user@switch# set irb unit 100 family inet address 10.1.1.11/24 vrrp-group 1 accept-data
user@switch# set irb unit 200 family inet address 10.1.1.21/24 vrrp-group 2
accept-data

```

#### Switch B

```

[edit interfaces]
user@switch# set vlan unit 100 family inet address 10.1.1.10/24 vrrp-group 1
accept-data
user@switch# set vlan unit 200 family inet address 10.1.1.20/24 vrrp-group 2
accept-data

```

#### Switch B Using ELS

```

[edit interfaces]

```

```
user@switch# set irb unit 100 family inet address 10.1.1.10/24 vrrp-group 1
accept-data
user@switch# set irb unit 200 family inet address 10.1.1.20/24 vrrp-group 2
accept-data
```

4. Configure Layer 3 connectivity between Switch A and Switch B.

```
[edit interfaces]
user@switch# set v100 l3-interface vlan.100
user@switch# set v200 l3-interface vlan.200
```

ELS:

```
[edit interfaces]
user@switch# set v100 l3-interface irb.100
user@switch# set v200 l3-interface irb.200
```

#### Step-by-Step Procedure

To enable IGMP snooping:

1. Enable IGMP snooping for all VLANs on Switch A and Switch B.

```
[edit protocols]
user@switch# set igmp-snooping vlan all
```

#### Step-by-Step Procedure

To configure OSPF as the Layer 3 protocol:

1. Configure an OSPF area on Switch A and Switch B.

```
[edit protocols ospf]
user@switch# set area 0.0.0.0
```

2. Assign the VLAN interfaces for the MC-LAGs as interfaces to the OSPF area on Switch A and Switch B.

```
[edit protocols ospf area 0.0.0.0]
user@switch# set interface vlan.100
user@switch# set interface vlan.200
```

3. Configure the minimum receive interval, minimum transmit interval, and transmit interval threshold for a Bidirectional Forwarding Detection (BFD) session for the OSPF interfaces on Switch A and Switch B.

**NOTE:** On a QFX5100 switch, the minimum transmit interval must be 1000 milliseconds or greater. Sub-second timers are not supported in Junos OS 13.2X51-D10 and later. If you configure the minimum transmit interval timer lower than 1000 milliseconds, the state of the MC-LAG can be affected.

---

```
[edit protocols ospf area 0.0.0.0]
user@switch# set interface vlan.100 bfd-liveness-detection
minimum-receive-interval 700
user@switch# set interface vlan.100 bfd-liveness-detection transmit-interval
minimum-interval 350
```

```

user@switch# set interface vlan.100 bfd-liveness-detection transmit-interval
threshold 500
user@switch# set interface vlan.200 bfd-liveness-detection
minimum-receive-interval 700
user@switch# set interface vlan.200 bfd-liveness-detection transmit-interval
minimum-interval 350
user@switch# set interface vlan.200 bfd-liveness-detection transmit-interval
threshold 500

```

### Step-by-Step Procedure

To configure PIM as the multicast protocol:

1. Configure a static rendezvous point (RP) address on Switch A and Switch B.  

```

[edit protocols pim]
user@switch# set rp static address 1.0.0.3

```
2. Configure the address ranges of the multicast groups for which Switch A and Switch B can be a rendezvous point (RP).  

```

[edit protocols pim rp static address 1.0.0.3]
user@switch# set group-ranges 239.0.0.0/8

```
3. Enable PIM on the VLAN interfaces for the MC-LAGs on Switch A and Switch B.  

```

[edit protocols pim]
user@switch# set interface vlan.100 dual-dr
user@switch# set interface vlan.200 dual-dr

```
4. Configure each PIM interface's priority for being selected as the designated router (DR).

An interface with a higher priority value has a higher probability of being selected as the DR.

#### Switch A

```

[edit protocols pim]
user@switch# set interface vlan.100 priority 200
user@switch# set interface vlan.200 priority 600

```

#### Switch B

```

[edit protocols pim]
user@switch# set interface vlan.100 priority 100
user@switch# set interface vlan.200 priority 500

```

5. Configure the minimum receive interval, minimum transmit interval, and transmit interval threshold for a Bidirectional Forwarding Detection (BFD) session for the PIM interfaces on Switch A and Switch B.

```

[edit protocols pim]
user@switch# set interface vlan.100 bfd-liveness-detection
minimum-receive-interval 700
user@switch# set interface vlan.100 bfd-liveness-detection transmit-interval
minimum-interval 350
user@switch# set interface vlan.100 bfd-liveness-detection transmit-interval
threshold 500
user@switch# set interface vlan.200 bfd-liveness-detection
minimum-receive-interval 700

```

```
user@switch# set interface vlan.200 bfd-liveness-detection transmit-interval
minimum-interval 350
```

```
user@switch# set interface vlan.200 bfd-liveness-detection transmit-interval
threshold 500
```

**Step-by-Step  
Procedure**

To enable RSTP:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Enable RSTP globally on all interfaces on Switch A and Switch B.

```
[edit protocols rstp]
user@switch# set interface all mode point-to-point
```

2. Disable RSTP on the ICL-PL interfaces on Switch A and Switch B.

```
[edit protocols rstp]
user@switch# set interface ae0.0 disable
```

3. Configure the MC-LAG interfaces as edge ports on Switch A and Switch B.

**NOTE:** The ae1 and ae2 interfaces are downstream interfaces. This is why RSTP and bpd-block-on-edge need to be configured.

```
[edit protocols rstp]
user@switch# set interface ae1.0 edge
user@switch# set interface ae2.0 edge
```

4. Enable BPDU blocking on all interfaces except for the ICL-PL interfaces on Switch A and Switch B.

**NOTE:** The ae1 and ae2 interfaces are downstream interfaces. This is why RSTP and bpd-block-on-edge need to be configured.

```
[edit protocols rstp]
user@switch# set bpd-block-on-edge
```

**Results**

From configuration mode on Switch A, confirm your configuration by entering the **show chassis**, **show interfaces**, **show multi-chassis**, **show protocols**, and **show vlans** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

**Original CLI:**

```

From configuration mode on Switch B, confirm your configuration by entering the **show chassis**, **show interfaces**, **show multi-chassis**, **show protocols**, and **show vlans** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

### Verification

To verify that the MC-LAG group has been created and is working properly, perform these tasks:

- [Verifying That Switch A is the Master Designated Router on page 2723](#)
- [Verifying That Switch B is the Backup Designated Router on page 2723](#)

#### *Verifying That Switch A is the Master Designated Router*

**Purpose** Verify that Switch A is the master designated router (DR).

**Action** From operational mode, enter the `show pim interfaces` command.

```
user@switch> show pim interfaces
```

Stat = Status, V = Version, NbrCnt = Neighbor Count,

S = Sparse, D = Dense, B = Bidirectional,

DR = Designated Router, P2P = Point-to-point link,

Active = Bidirectional is active, NotCap = Not Bidirectional Capable

Name	Stat	Mode	IP	V	State	NbrCnt	JoinCnt(sg/*g)	DR	address
pim.32769	Down	S	4	2	P2P,NotCap	0	0/0		
vlan.100	Up	S	4	2	DDR-DR,NotCap	1	0/0		10.1.1.11
vlan.200	Up	S	4	2	DDR-DR,NotCap	2	0/0		10.1.1.21

**Meaning** The DDR-DR state of the VLAN interfaces in the output shows that Switch A is the master designated router.

#### *Verifying That Switch B is the Backup Designated Router*

**Purpose** Verify that Switch B is the backup designated router (BDR).

**Action** From operational mode, enter the `show pim interfaces` command.

```
user@switch> show pim interfaces
```

Stat = Status, V = Version, NbrCnt = Neighbor Count,

S = Sparse, D = Dense, B = Bidirectional,

DR = Designated Router, P2P = Point-to-point link,

Active = Bidirectional is active, NotCap = Not Bidirectional Capable

Name	Stat	Mode	IP	V	State	NbrCnt	JoinCnt(sg/*g)	DR	address
pim.32769	Down	S	4	2	P2P,NotCap	0	0/0		
vlan.100	Up	S	4	2	DDR-BDR,NotCap	1	0/0		10.1.1.11
vlan.200	Up	S	4	2	DDR-BDR,NotCap	2	0/0		10.1.1.21

**Meaning** The DDR-BDR state of the VLAN interfaces in the output shows that Switch B is the backup designated router.

  - [Configuring Multichassis Link Aggregation on page 2780](#)

## Example: Configuring Multichassis Link Aggregation with Layer 3 MAC Address Synchronization

**NOTE:** Multichassis Link Aggregation (MC-LAG) is supported on QFX3500 and QFX3600 standalone switches running the original CLI and QFX5100 standalone switches running Enhanced Layer 2 Software.

**NOTE:** Issuing a PING request on an MC-LAG with MAC synchronization enabled does not work.

There are 2 methods for enabling Layer 3 unicast functionality across a multichassis link aggregation group (MC-LAG). You can choose either to synchronize the MAC addresses between the switches for the participating MC-LAG interfaces, or you can configure Virtual Router Redundancy Protocol (VRRP). The procedure to configure MAC address synchronization is included in this example. For more information on configuring VRRP for use in a Layer 3 unicast MC-LAG, see “[Example: Configuring Multichassis Link Aggregation for Layer 3 Unicast Using Virtual Router Redundancy Protocol \(VRRP\)](#)” on page 2745.

- [Troubleshooting on page 2745](#)

### Requirements

---

This example uses the following hardware and software components:

- Junos OS Release 12.3 or later for the QFX3500 and QFX3600 standalone switches and Junos OS Release 13.2X51-D10 or later for the QFX5100 standalone switches.
- Two QFX3500 or QFX3600 standalone switches, or two QFX5100 standalone switches.

Before you configure an MC-LAG for Layer 3 unicast, be sure that you understand how to:

- Configure aggregated Ethernet interfaces on a switch. See “[Example: Configuring Link Aggregation Between a QFX Series Product and an Aggregation Switch](#)” on page 2656.

- Configure the Link Aggregation Control Protocol (LACP) on aggregated Ethernet interfaces on a switch. See [“Example: Configuring Link Aggregation with LACP Between a QFX Series Product and an Aggregation Switch”](#) on page 2660.

## Overview

In this example, you configure an MC-LAG across two switches, consisting of two aggregated Ethernet interfaces, an interchassis control link-protection link (ICL-PL), multichassis protection link for the ICL-PL, ICCP for the peers hosting the MC-LAG, and Layer 3 connectivity between MC-LAG peers. Layer 3 connectivity is required for ICCP.

## Topology

The topology used in this example consists of two switches hosting an MC-LAG. The two switches are connected to a server. [Figure 82 on page 2666](#) shows the topology of this example.

**Figure 84: Configuring a Multichassis LAG Between Switch A and Switch B**

g041294

[Table 215 on page 2657](#) details the topology used in this configuration example.

Table 218: Components of the Topology for Configuring a Multichassis LAG Between Two Switches

Hostname	Base Hardware	Multichassis Link Aggregation Group
Switch A	QFX3500 or QFX3600 standalone switch, or QFX5100 standalone switch	<b>ae0</b> is configured as an aggregated Ethernet interface, and is used as an ICL-PL. The following interfaces are part of <b>ae0</b> : <b>xe-0/0/12</b> and <b>xe-0/0/13</b> on Switch A and <b>xe-0/0/12</b> and <b>xe-0/0/13</b> on Switch B.  <b>ae1</b> is configured as an MC-LAG, and the following two interfaces are part of <b>ae1</b> : <b>xe-0/0/44</b> on Switch A and <b>xe-0/0/46</b> on Switch B.
Switch B	QFX3500 or QFX3600 standalone switch, or QFX5100 standalone switch	

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network configuration, and paste the commands into the CLI at the **[edit]** hierarchy level of Switch A.

**NOTE:** This example shows how to configure MC-LAG using both the original CLI and Enhanced Layer 2 Software (ELS).

In ELS, there are three different statements and one different option from the original CLI:

- The `port-mode` statement in the `[edit interfaces interface-name unit number family ethernet-switching]` hierarchy is not supported. Use the `interface-mode` statement instead.
- The `vlan` statement in the `[edit interfaces interface-name]` hierarchy is not supported. Use the `irb` statement instead.
- The `vlan.logical-interface-number` option in the `[edit vlans vlan-name l3-interface]` option is not supported. Use the `irb.logical-interface-number` option instead.
- The `service-id` statement in the `[edit switch-options]` hierarchy is required in the ELS CLI.

#### Original CLI on Switch A:

```
set chassis aggregated-devices ethernet device-count 2
set interfaces xe-0/0/12 ether-options 802.3ad ae0
set interfaces xe-0/0/13 ether-options 802.3ad ae0
set interfaces xe-0/0/44 ether-options 802.3ad ae1
set interfaces ae0 unit 0 family ethernet-switching port-mode trunk
set interfaces ae0 unit 0 family ethernet-switching vlan members v500
set interfaces ae1 aggregated-ether-options lacp active
```

```

set interfaces ae1 aggregated-ether-options lacp system-id 00:01:02:03:04:05
set interfaces ae1 aggregated-ether-options lacp admin-key 3
set interfaces ae1 aggregated-ether-options mc-ae mc-ae-id 3
set interfaces ae1 aggregated-ether-options mc-ae chassis-id 0
set interfaces ae1 aggregated-ether-options mc-ae mode active-active
set interfaces ae1 aggregated-ether-options mc-ae status-control active
set ae1 aggregated-ether-options mc-ae init-delay-time 240
set interfaces ae1 unit 0 family ethernet-switching port-mode trunk
set interfaces ae1 unit 0 family ethernet-switching vlan members v100
set interfaces vlan unit 500 family inet address 3.3.3.2/24
set vlans v100 vlan-id 100
set vlans v500 vlan-id 500
set vlans v500 l3-interface vlan.500
set protocols iccp local-ip-addr 3.3.3.2
set protocols iccp peer 3.3.3.1 session-establishment-hold-time 50
set protocols iccp peer 3.3.3.1 backup-liveness-detection backup-peer-ip 10.207.64.233
set protocols iccp peer 3.3.3.1 liveness-detection minimum-receive-interval 1000
set protocols iccp peer 3.3.3.1 liveness-detection transmit-interval minimum-interval 1000
set protocols rstp interface ae0.0 disable
set protocols rstp interface ae1.0 edge
set protocols rstp interface all mode point-to-point
set protocols rstp bpdu-block-on-edge
set multi-chassis multi-chassis-protection 3.3.3.1 interface ae0

```

#### ELS on Switch A:

```

set chassis aggregated-devices ethernet device-count 2
set interfaces xe-0/0/12 ether-options 802.3ad ae0
set interfaces xe-0/0/13 ether-options 802.3ad ae0
set interfaces xe-0/0/44 ether-options 802.3ad ae1
set interfaces ae0 unit 0 family ethernet-switching interface-mode trunk
set interfaces ae0 unit 0 family ethernet-switching vlan members v500
set interfaces ae1 aggregated-ether-options lacp active
set interfaces ae1 aggregated-ether-options lacp system-id 00:01:02:03:04:05
set interfaces ae1 aggregated-ether-options lacp admin-key 3
set interfaces ae1 aggregated-ether-options mc-ae mc-ae-id 3
set interfaces ae1 aggregated-ether-options mc-ae chassis-id 0
set interfaces ae1 aggregated-ether-options mc-ae mode active-active
set interfaces ae1 aggregated-ether-options mc-ae status-control active
set ae1 aggregated-ether-options mc-ae init-delay-time 240
set interfaces ae1 unit 0 family ethernet-switching interface-mode trunk
set interfaces ae1 unit 0 family ethernet-switching vlan members v100
set interfaces irb unit 500 family inet address 3.3.3.2/24
set vlans v100 vlan-id 100
set vlans v500 vlan-id 500
set vlans v500 l3-interface irb.500
set protocols iccp local-ip-addr 3.3.3.2
set protocols iccp peer 3.3.3.1 session-establishment-hold-time 50
set protocols iccp peer 3.3.3.1 backup-liveness-detection backup-peer-ip 10.207.64.233
set protocols iccp peer 3.3.3.1 liveness-detection minimum-receive-interval 1000
set protocols iccp peer 3.3.3.1 liveness-detection transmit-interval minimum-interval 1000
set protocols rstp interface ae0.0 disable
set protocols rstp interface ae1.0 edge
set protocols rstp interface all mode point-to-point
set protocols rstp bpdu-block-on-edge
set multi-chassis multi-chassis-protection 3.3.3.1 interface ae0
set switch-options service-id 10

```

To quickly configure this example, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network

configuration, and paste the commands into the CLI at the **[edit]** hierarchy level of Switch B.

#### Original CLI on Switch B:

```
set chassis aggregated-devices ethernet device-count 2
set interfaces xe-0/0/12 ether-options 802.3ad ae0
set interfaces xe-0/0/13 ether-options 802.3ad ae0
set interfaces xe-0/0/46 ether-options 802.3ad ae1
set interfaces ae0 unit 0 family ethernet-switching port-mode trunk
set interfaces ae0 unit 0 family ethernet-switching vlan members v500
set interfaces ae1 aggregated-ether-options lacp active
set interfaces ae1 aggregated-ether-options lacp system-id 00:01:02:03:04:05
set interfaces ae1 aggregated-ether-options lacp admin-key 3
set interfaces ae1 aggregated-ether-options mc-ae mc-ae-id 3
set interfaces ae1 aggregated-ether-options mc-ae chassis-id 1
set interfaces ae1 aggregated-ether-options mc-ae mode active-active
set interfaces ae1 aggregated-ether-options mc-ae status-control standby
set ae1 aggregated-ether-options mc-ae init-delay-time 240
set interfaces ae1 unit 0 family ethernet-switching port-mode trunk
set interfaces ae1 unit 0 family ethernet-switching vlan members v100
set interfaces vlan unit 500 family inet address 3.3.3.1/24
set vlans v100 vlan-id 100
set vlans v500 vlan-id 500
set vlans v500 l3-interface vlan.500
set protocols iccp local-ip-addr 3.3.3.1
set protocols iccp peer 3.3.3.2 session-establishment-hold-time 50
set protocols iccp peer 3.3.3.2 backup-liveness-detection backup-peer-ip 10.207.64.233
set protocols iccp peer 3.3.3.2 liveness-detection minimum-receive-interval 1000
set protocols iccp peer 3.3.3.2 liveness-detection transmit-interval minimum-interval 1000
set protocols rstp interface ae0.0 disable
set protocols rstp interface ae1.0 edge
set protocols rstp interface all mode point-to-point
set protocols rstp bpdu-block-on-edge
set multi-chassis multi-chassis-protection 3.3.3.2 interface ae0
```

#### ELS on Switch B:

```
set chassis aggregated-devices ethernet device-count 2
set interfaces xe-0/0/12 ether-options 802.3ad ae0
set interfaces xe-0/0/13 ether-options 802.3ad ae0
set interfaces xe-0/0/46 ether-options 802.3ad ae1
set interfaces ae0 unit 0 family ethernet-switching interface-mode trunk
set interfaces ae0 unit 0 family ethernet-switching vlan members v500
set interfaces ae1 aggregated-ether-options lacp active
set interfaces ae1 aggregated-ether-options lacp system-id 00:01:02:03:04:05
set interfaces ae1 aggregated-ether-options lacp admin-key 3
set interfaces ae1 aggregated-ether-options mc-ae mc-ae-id 3
set interfaces ae1 aggregated-ether-options mc-ae chassis-id 1
set interfaces ae1 aggregated-ether-options mc-ae mode active-active
set interfaces ae1 aggregated-ether-options mc-ae status-control standby
set ae1 aggregated-ether-options mc-ae init-delay-time 240
set interfaces ae1 unit 0 family ethernet-switching port-mode trunk
set interfaces ae1 unit 0 family ethernet-switching vlan members v100
set interfaces irb unit 500 family inet address 3.3.3.1/24
set vlans v100 vlan-id 100
set vlans v500 vlan-id 500
set vlans v500 l3-interface irb.500
set protocols iccp local-ip-addr 3.3.3.1
set protocols iccp peer 3.3.3.2 session-establishment-hold-time 50
set protocols iccp peer 3.3.3.2 backup-liveness-detection backup-peer-ip 10.207.64.233
```

```

set protocols iccp peer 3.3.3.2 liveness-detection minimum-receive-interval 1000
set protocols iccp peer 3.3.3.2 liveness-detection transmit-interval minimum-interval 1000
set protocols rstp interface ae0.0 disable
set protocols rstp interface ae1.0 edge
set protocols rstp interface all mode point-to-point
set protocols rstp bpdu-block-on-edge
set multi-chassis multi-chassis-protection 3.3.3.2 interface ae0
set switch-options service-id 10

```

### Configuring MC-LAG on Two Switches

#### Step-by-Step Procedure

To enable multichassis protection link between MC-LAG peers:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Configure the number of LAGs on both Switch A and Switch B.  

```

[edit chassis]
user@switch# set aggregated-devices ethernet device-count 2

```
2. Add member interfaces to the aggregated Ethernet interfaces on both Switch A and Switch B.

```

[edit interfaces]
user@switch# set xe-0/0/12 ether-options 802.3ad ae0
[edit interfaces]
user@switch# set xe-0/0/13 ether-options 802.3ad ae0
[edit interfaces]
user@switch# set xe-0/0/44 ether-options 802.3ad ae1
[edit interfaces]
user@switch# set xe-0/0/46 ether-options 802.3ad ae1

```

3. Configure a trunk interface between Switch A and Switch B.  

```

[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching port-mode trunk
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching interface-mode trunk

```
4. Configure a multichassis protection link between Switch A and Switch B.

Switch A:

```

[edit]
user@switch# set multi-chassis multi-chassis-protection 3.3.3.2 interface ae0

```

Switch B:

```

[edit]
user@switch# set multi-chassis multi-chassis-protection 3.3.3.1 interface ae0

```

**Step-by-Step  
Procedure**

To enable ICCP:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Configure the local IP address to be in the ICCP connection on Switch A and Switch B.

Switch A:

```
[edit protocols]
user@switch# set iccp local-ip-addr 3.3.3.2
```

Switch B:

```
[edit protocols]
user@switch# set iccp local-ip-addr 3.3.3.1
```

2. Configure the peer IP address and minimum receive interval for a (BFD) session for ICCP on Switch A and Switch B.

Switch A:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 liveness-detection minimum-receive-interval 1000
```

Switch B:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 liveness-detection minimum-receive-interval 1000
```

3. Configure the peer IP address and minimum transmit interval for Bidirectional Forwarding Detection (BFD) session for ICCP on Switch A and Switch B.

Switch A:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 liveness-detection transmit-interval minimum-interval 1000
```

Switch B:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 liveness-detection transmit-interval minimum-interval 1000
```

4. (Optional) Configure the time during which an ICCP connection must succeed between MC-LAG peers on Switch A and Switch B.

**NOTE:** Configuring session establishment hold time helps in faster ICCP connection establishment. The recommended value is 50 seconds.

---

Switch A:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 session-establishment-hold-time 50
```

Switch B:

```
[edit protocols]
```

- user@switch# **set iccp peer 3.3.3.2 session-establishment-hold-time 50**
5. (Optional) Configure the backup IP address to be used for backup liveness detection on both Switch A and Switch B.

**NOTE:** By default, backup liveness detection is not enabled. Configuring a backup IP address helps achieve sub-second traffic loss during a MC-LAG peer reboot.

Switch A:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 backup-liveness-detection backup-peer-ip 10.207.64.233
```

Switch B:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 backup-liveness-detection backup-peer-ip 10.207.64.232
```

6. Configure Layer 3 connectivity between the MC-LAG peers on both Switch A and Switch B using the original CLI:

```
[edit vlans]
user@switch# set v500 vlan-id 500
[edit vlans]
user@switch# set v500 l3-interface vlan.500
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching port-mode trunk vlan members v500
```

7. Configure Layer 3 connectivity between the MC-LAG peers on both Switch A and Switch B using ELS:

```
[edit vlans]
user@switch# set v500 vlan-id 500
[edit vlans]
user@switch# set v500 l3-interface irb.500
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching interface-mode trunk vlan members v500
```

### Step-by-Step Procedure

To enable the MC-LAG interface:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Enable LACP on the MC-LAG interface on Switch A and Switch B.

**NOTE:** At least one end needs to be active. The other end can be either active or passive.

```
[edit interfaces]
```

```
user@switch# set ae1 aggregated-ether-options lacp active
```

2. Specify the same multichassis aggregated Ethernet identification number on both MC-LAG peers on Switch A and Switch B.

```
[edit interfaces]
```

```
user@switch# set ae1 aggregated-ether-options mc-ae mc-ae-id 3
```

3. Specify the same service ID on Switch A and Switch B.

ELS:

```
[edit]
```

```
user@switch# set switch-options service-id 10
```

4. Specify a unique chassis ID for the MC-LAG on the MC-LAG peers on Switch A and Switch B.

Switch A:

```
[edit interfaces]
```

```
user@switch# set ae1 aggregated-ether-options mc-ae chassis-id 0
```

Switch B:

```
[edit interfaces]
```

```
user@switch# set ae1 aggregated-ether-options mc-ae chassis-id 1
```

5. Specify the operating mode of the MC-LAG on both Switch A and Switch B.

**NOTE:** Only active-active mode is supported at this time.

```
[edit interfaces]
```

```
user@switch# set ae1 aggregated-ether-options mc-ae mode active-active
```

6. Specify the status control for MC-LAG on Switch A and Switch B.

**NOTE:** You must configure status control on both Switch A and Switch B hosting the MC-LAG. If one peer is in active mode, the other must be in standby mode.

Switch A:

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae status-control active
```

Switch B:

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae status-control standby
```

7. Specify the number of seconds by which the bring-up of the MC-AE interface should be deferred after you reboot Switch A and Switch B.

**NOTE:** The recommended value for maximum VLAN configuration (for example, 4,000 VLANs) is 240 seconds. If IGMP snooping is enabled on all of the VLANs, the recommended value is 420 seconds.

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae init-delay-time 240
```

8. Specify the same LACP system ID for the MC-LAG on Switch A and Switch B.

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options lacp system-ID 00:01:02:03:04:05
```

9. Specify the same LACP administration key on both Switch A and Switch B.

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options lacp admin-key 3
```

10. Enable a VLAN on the MC-LAG on Switch A and Switch B using the original CLI:

```
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching port-mode trunk
[edit]
user@switch# set vlans v100 vlan-id 100
```

```
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching vlan members v100
```

11. Enable a VLAN on the MC-LAG on Switch A and Switch B using ELS:

```
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching interface-mode trunk
[edit]
user@switch# set vlans v100 vlan-id 100
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching vlan members v100
```

### Step-by-Step Procedure

To enable RSTP:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Enable RSTP globally on all interfaces on Switch A and Switch B.

```
[edit]
user@switch# set protocols rstp interface all mode point-to-point
```

2. Disable RSTP on the ICL-PL interfaces on Switch A and Switch B:

```
[edit]
user@switch# set protocols rstp interface ae0.0 disable
```

3. Configure the MC-LAG interfaces as edge ports on Switch A and Switch B.

```
[edit]
```

- ```
user@switch# set protocols rstp interface ae1.0 edge
```
4. Enable BPDU blocking on all interfaces except for the ICL-PL interfaces on Switch A and Switch B.

```
[edit]
```

```
user@switch# set protocols rstp bpdu-block-on-edge
```

### Results

Display the results of the configuration on Switch A using the original CLI.

```

### Verification

---

To verify that the MC-LAG group has been created and is working properly, perform these tasks:

- [Verifying That ICCP Is Working on Switch A on page 2742](#)
- [Verifying That ICCP Is Working on Switch B on page 2742](#)
- [Verifying That LACP Is Active on Switch A on page 2743](#)
- [Verifying That LACP Is Active on Switch B on page 2743](#)
- [Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch A on page 2743](#)
- [Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch B on page 2744](#)
- [Verifying that MAC Learning Is Occurring on Switch A and Switch B on page 2744](#)

#### *Verifying That ICCP Is Working on Switch A*

**Purpose** Verify that ICCP is running on Switch A.

**Action** [edit]  
user@switch# show iccp  
Redundancy Group Information for peer 3.3.3.1  
TCP Connection : Established  
Liveliness Detection : Up  
  
Client Application: MCSNOOPD  
  
Client Application: eswd

**Meaning** This output shows that the TCP connection between the peers hosting the MC-LAG is up, liveness detection is up, and MCSNOOPD and ESWD client applications are running.

#### *Verifying That ICCP Is Working on Switch B*

**Purpose** Verify that ICCP is running on Switch B.

**Action** show iccp  
  
[edit]  
user@switch# show iccp  
Redundancy Group Information for peer 3.3.3.2  
TCP Connection : Established  
Liveliness Detection : Up

Client Application: MCSNOOPD

Client Application: eswd

**Meaning** This output shows that the TCP connection between the peers hosting the MC-LAG is up, liveness detection is up, and MCSNOOPD and ESWD client applications are running.

#### *Verifying That LACP Is Active on Switch A*

**Purpose** Verify that LACP is active on Switch A.

**Action** [edit]  
 user@switch# show lacp interfaces  
 Aggregated interface: ae1

| LACP state: | Role    | Exp | Def | Dist | Col | Syn | Aggr | Timeout | Activity |
|-------------|---------|-----|-----|------|-----|-----|------|---------|----------|
| xe-0/0/46   | Actor   | No  | No  | Yes  | Yes | Yes | Yes  | Fast    | Active   |
| xe-0/0/46   | Partner | No  | No  | Yes  | Yes | Yes | Yes  | Fast    | Active   |

LACP protocol:

| Receive State | Transmit State | Mux State                             |
|---------------|----------------|---------------------------------------|
| xe-0/0/46     | Current        | Fast periodic Collecting distributing |

**Meaning** This output shows that Switch A is participating in LACP negotiation.

#### *Verifying That LACP Is Active on Switch B*

**Purpose** Verify that LACP is active on Switch B

**Action** [edit]  
 user@switch# show lacp interfaces  
 Aggregated interface: ae1

| LACP state: | Role    | Exp | Def | Dist | Col | Syn | Aggr | Timeout | Activity |
|-------------|---------|-----|-----|------|-----|-----|------|---------|----------|
| xe-0/0/44   | Actor   | No  | No  | Yes  | Yes | Yes | Yes  | Fast    | Active   |
| xe-0/0/44   | Partner | No  | No  | Yes  | Yes | Yes | Yes  | Fast    | Active   |

LACP protocol:

| Receive State | Transmit State | Mux State                             |
|---------------|----------------|---------------------------------------|
| xe-0/0/44     | Current        | Fast periodic Collecting distributing |

**Meaning** This output shows that Switch B is participating in LACP negotiation.

#### *Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch A*

**Purpose** Verify that the MC-AE and ICL-PL interfaces are up on Switch A.

**Action** [edit]  
user@switch# **show interfaces mc-ae**  
Member Link : ae1  
Current State Machine's State: mcae active state  
Local Status : active  
Local State : up  
Peer Status : active  
Peer State : up  
Logical Interface : ae1.0  
Topology Type : bridge  
Local State : up  
Peer State : up  
Peer Ip/MCP/State : 3.3.3.1 ae0.0 up

**Meaning** This output shows that the MC-AE interface on Switch A is up and active.

***Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch B***

**Purpose** Verify that the MC-AE and ICL-PL interfaces are up on Switch B.

**Action** [edit]  
user@switch# **show interfaces mc-ae**  
Member Link : ae1  
Current State Machine's State: mcae active state  
Local Status : active  
Local State : up  
Peer Status : active  
Peer State : up  
Logical Interface : ae1.0  
Topology Type : bridge  
Local State : up  
Peer State : up  
Peer Ip/MCP/State : 3.3.3.2 ae0.0 up

**Meaning** This output shows that the MC-AE interface on Switch B is up and active.

***Verifying that MAC Learning Is Occurring on Switch A and Switch B***

**Purpose** Verify that MAC learning is working on Switch A and B.

**Action** [edit]  
user@switch# **show ethernet-switching table**  
Ethernet-switching table: 10 entries, 4 learned, 0 persistent entries

| VLAN | MAC address       | Type     | Age | Interfaces   |
|------|-------------------|----------|-----|--------------|
| v222 | *                 | Flood    | -   | All-members  |
| v222 | 00:00:5e:00:01:01 | Static   | -   | Router       |
| v222 | 00:10:94:00:00:05 | Learn(L) | 33  | ae0.0 (MCAE) |
| v222 | 84:18:88:df:ac:ae | Learn(R) | 0   | ae2.0        |

**Meaning** The output shows four learned MAC addresses entries.

## Troubleshooting

---

### *Troubleshooting a LAG That Is Down*

**Problem** The `show interfaces terse` command shows that the MC-LAG is **down**

**Solution** Check the following:

- Verify that there is no configuration mismatch.
- Verify that all member ports are up.
- Verify that the MC-LAG is part of family Ethernet switching (Layer 2 LAG).
- Verify that the MC-LAG member is connected to the correct MC-LAG member at the other end.

**Related Documentation**

- [Understanding Multichassis Link Aggregation on page 2615](#)
- [Configuring Multichassis Link Aggregation on page 2780](#)
- [Example: Configuring Multichassis Link Aggregation for Layer 3 Multicast Using VRRP on page 2687](#)

### Example: Configuring Multichassis Link Aggregation for Layer 3 Unicast Using Virtual Router Redundancy Protocol (VRRP)

There are two methods for enabling Layer 3 unicast functionality across a multichassis link aggregation group (MC-LAG). You can choose either to configure Virtual Router Redundancy Protocol (VRRP) or synchronize the MAC addresses for the Layer 3 interfaces of the switches participating in the MC-LAG. The procedure to configure VRRP for use in a Layer 3 unicast MC-LAG is included in this example. For more information on configuring MAC address synchronization, see *Example: Configuring Multichassis Link Aggregation for Layer 3 Unicast using MAC Address Synchronization*.

- [Requirements on page 2745](#)
- [Overview on page 2746](#)
- [Configuration on page 2747](#)
- [Verification on page 2766](#)
- [Troubleshooting on page 2771](#)

## Requirements

---

This example uses the following hardware and software components:

- Junos OS Release 12.3 or later for the QFX Series
- Two QFX3500 or QFX3600 or QFX5100 switches

Before you configure an MC-LAG, be sure that you understand how to:

- Configure aggregated Ethernet interfaces on a switch. See [“Example: Configuring Link Aggregation Between a QFX Series Product and an Aggregation Switch”](#) on page 2656.
- Configure the Link Aggregation Control Protocol (LACP) on aggregated Ethernet interfaces on a switch. See [“Example: Configuring Link Aggregation with LACP Between a QFX Series Product and an Aggregation Switch”](#) on page 2660.
- Configure Virtual Router Redundancy Protocol (VRRP) on a switch. See [“Configuring Basic VRRP Support”](#) on page 2477.

---

## Overview

In this example, you configure an MC-LAG across two switches by including interfaces from both switches in an aggregated Ethernet interface (ae1). To support the MC-LAG, create a second aggregated Ethernet interface (ae0) for the interchassis control link-protection link (ICL-PL). Configure a multichassis protection link for the ICL-PL, Interchassis Control Protocol (ICCP) for the peers hosting the MC-LAG, and Layer 3 connectivity between MC-LAG peers.

**NOTE:** Layer 3 connectivity is required for ICCP.

---

To complete the configuration, enable VRRP by completing the following steps:

- Create a routed VLAN interface (RVI)
- Create a VRRP group and assign a virtual IP address that is shared between each switch in the VRRP group
- Enable a member of a VRRP group to accept all packets destined for the virtual IP address if it is the master in the VRRP group
- Configure Layer 3 connectivity between the VRRP groups

## Topology

The topology used in this example consists of two switches hosting an MC-LAGs. The two switches are connected to a server. [Figure 85 on page 2747](#) shows the topology of this example.

Figure 85: Configuring a Multichassis LAG Between Switch A and Switch B

Table 215 on page 2657 details the topology used in this configuration example.

Table 219: Components of the Topology for Configuring a Multichassis LAG Between Two Switches

| Hostname | Base Hardware                       | Multichassis Link Aggregation Group                                                                                                                                                                                                                |
|----------|-------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Switch A | QFX3500, QFX3600, or QFX5100 switch | <b>ae0</b> is configured as an aggregated Ethernet interface, and is used as an ICL-PL. The following interfaces are part of <b>ae0</b> : <b>xe-0/0/12</b> and <b>xe-0/0/13</b> on Switch A and <b>xe-0/0/12</b> and <b>xe-0/0/13</b> on Switch B. |
| Switch B |                                     |                                                                                                                                                                                                                                                    |
|          |                                     | <b>ae1</b> is configured as an MC-LAG, and the following two interfaces are part of <b>ae1</b> : <b>xe-0/0/44</b> on Switch A and <b>xe-0/0/46</b> on Switch B.                                                                                    |

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network configuration, and paste the commands into the CLI at the **[edit]** hierarchy level of Switch A.

**NOTE:** This example shows how to configure MC-LAG using both the original CLI and Enhanced Layer 2 Software (ELS).

In ELS, there are three different statements and one different option from the original CLI:

- The port-mode statement in the [edit interfaces *interface-name* unit *number* family ethernet-switching] hierarchy is not supported. Use the interface-mode statement instead.
- The vlan statement in the [edit interfaces *interface-name*] hierarchy is not supported. Use the irb statement instead.
- The vlan.logical-interface-number option in the [edit vlans *vlan-name* l3-interface] option is not supported. Use the irb.logical-interface-number option instead.
- The service-id statement in the [edit switch-options] hierarchy is required in the ELS CLI.

#### Original CLI:

```
set chassis aggregated-devices ethernet device-count 2
set interfaces xe-0/0/12 ether-options 802.3ad ae0
set interfaces xe-0/0/13 ether-options 802.3ad ae0
set interfaces xe-0/0/44 ether-options 802.3ad ae1
set interfaces ae0 unit 0 family ethernet-switching port-mode trunk
set interfaces ae0 unit 0 family ethernet-switching vlan members v500 v100

### Configuring MC-LAG on Two Switches

#### Step-by-Step Procedure

To enable multichassis protection link between MC-LAG peers:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Configure the number of LAGs on both Switch A and Switch B.  

```
[edit chassis]
user@switch# set aggregated-devices ethernet device-count 2
```
2. Add member interfaces to the aggregated Ethernet interfaces on both Switch A and Switch B.  

```
[edit interfaces]
user@switch# set xe-0/0/12 ether-options 802.3ad ae0
[edit interfaces]
user@switch# set xe-0/0/13 ether-options 802.3ad ae0
[edit interfaces]
user@switch# set xe-0/0/44 ether-options 802.3ad ae1
[edit interfaces]
user@switch# set xe-0/0/46 ether-options 802.3ad ae1
```
3. Configure a trunk interface between Switch A and Switch B using the original CLI.  

```
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching port-mode trunk
```
4. Configure a trunk interface between Switch A and Switch B using ELS.  

```
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching interface-mode trunk
```
5. Configure a multichassis protection link between Switch A and Switch B.  

Switch A:

```
[edit]
user@switch# set multi-chassis multi-chassis-protection 3.3.3.2 interface ae0
```

Switch B:

```
[edit]
user@switch# set multi-chassis multi-chassis-protection 3.3.3.1 interface ae0
```

**Step-by-Step  
Procedure**

To enable ICCP:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Configure the local IP address to be in the ICCP connection on Switch A and Switch B.

Switch A:

```
[edit protocols]
user@switch# set iccp local-ip-addr 3.3.3.2
```

Switch B:

```
[edit protocols]
user@switch# set iccp local-ip-addr 3.3.3.1
```

2. Configure the peer IP address and minimum receive interval for a (BFD) session for ICCP on Switch A and Switch B.

Switch A:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 liveness-detection minimum-receive-interval 1000
```

Switch B:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 liveness-detection minimum-receive-interval 1000
```

3. Configure the peer IP address and minimum transmit interval for Bidirectional Forwarding Detection (BFD) session for ICCP on Switch A and Switch B.

Switch A:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 liveness-detection transmit-interval minimum-interval 1000
```

Switch B:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 liveness-detection transmit-interval minimum-interval 1000
```

4. (Optional) Configure the time during which an ICCP connection must succeed between MC-LAG peers on Switch A and Switch B.

**NOTE:** Configuring session establishment hold time helps in faster ICCP connection establishment. The recommended value is 50 seconds.

---

Switch A:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 session-establishment-hold-time 50
```

Switch B:

```
[edit protocols]
```

- user@switch# **set iccp peer 3.3.3.2 session-establishment-hold-time 50**
5. (Optional) Configure the backup IP address to be used for backup liveness detection on both Switch A and Switch B.

**NOTE:** By default, backup liveness detection is not enabled. Configuring a backup IP address helps achieve sub-second traffic loss during a MC-LAG peer reboot.

Switch A:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.1 backup-liveness-detection backup-peer-ip 10.207.64.233
```

Switch B:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 backup-liveness-detection backup-peer-ip 10.207.64.232
```

6. Configure Layer 3 connectivity between the MC-LAG peers on both Switch A and Switch B using the original CLI.

```
[edit vlans]
user@switch# set v500 vlan-id 500
[edit vlans]
user@switch# set v500 l3-interface vlan.500
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching port-mode trunk vlan members v500 v100
```

7. Configure Layer 3 connectivity between the MC-LAG peers on both Switch A and Switch B using ELS.

```
[edit vlans]
user@switch# set v500 vlan-id 500
[edit vlans]
user@switch# set v500 l3-interface irb.500
[edit interfaces]
user@switch# set ae0 unit 0 family ethernet-switching interface-mode trunk vlan members v500 v100
```

**Step-by-Step Procedure**

To enable the MC-LAG interface:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Enable LACP on the MC-LAG interface on Switch A and Switch B.

**NOTE:** At least one end needs to be active. The other end can be either active or passive.

[edit interfaces]

user@switch# **set ae1 aggregated-ether-options lacp active**

2. Specify the same multichassis aggregated Ethernet identification number on both MC-LAG peers on Switch A and Switch B.

[edit interfaces]

user@switch# **set ae1 aggregated-ether-options mc-ae mc-ae-id 3**

3. Specify the same service ID on Switch A and Switch B.

ELS:

[edit]

user@switch# **set switch-options service-id 10**

4. Specify a unique chassis ID for the MC-LAG on the MC-LAG peers on Switch A and Switch B.

Switch A:

[edit interfaces]

user@switch# **set ae1 aggregated-ether-options mc-ae chassis-id 0**

Switch B:

[edit interfaces]

user@switch# **set ae1 aggregated-ether-options mc-ae chassis-id 1**

5. Specify the operating mode of the MC-LAG on both Switch A and Switch B.

**NOTE:** Only active-active mode is supported at this time.

[edit interfaces]

user@switch# **set ae1 aggregated-ether-options mc-ae mode active-active**

6. Specify the status control for MC-LAG on Switch A and Switch B.

**NOTE:** You must configure status control on both Switch A and Switch B hosting the MC-LAG. If one peer is in active mode, the other must be in standby mode.

Switch A:

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-aether-options status-control active
```

Switch B:

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-aether-options status-control standby
```

7. Specify the number of seconds by which the bring-up of the MC-AE interface should be deferred after you reboot Switch A and Switch B.

**NOTE:** The recommended value for maximum VLAN configuration (for example, 4,000 VLANs) is 240 seconds. If IGMP snooping is enabled on all of the VLANs, the recommended value is 420 seconds.

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-aether-options init-delay-time 240
```

8. Specify the same LACP system ID for the MC-LAG on Switch A and Switch B.

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options lacp system-id 00:01:02:03:04:05
```

9. Specify the same LACP administration key on both Switch A and Switch B.

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options lacp admin-key 3
```

10. Enable a VLAN on the MC-LAG on Switch A and Switch B using the original CLI.

```
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching port-mode trunk
[edit]
```

```
user@switch# set vlans v100 vlan-id 100
```

```
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching vlan members v100
```

11. Enable a VLAN on the MC-LAG on Switch A and Switch B using ELS.

```
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching interface-mode trunk
[edit]
```

```
user@switch# set vlans v100 vlan-id 100
```

```
[edit interfaces]
user@switch# set ae1 unit 0 family ethernet-switching vlan members v100
```

12. Enable VRRP on the MC-LAG on Switch A and Switch B:

- Create a routed VLAN interface (RVI), assign a virtual IP address that is shared between each switch in the VRRP group, and assign an individual IP address for each switch in the VRRP group:

Switch A:

```
[edit interfaces]
user@switch# set vlan unit 100 family inet address 100.1.1.1/24 vrrp-group 1
virtual-address 100.1.1.1
```

Switch B:

```
[edit interfaces]
user@switch# set vlan unit 100 family inet address 100.1.1.10/24 vrrp-group 1
virtual-address 100.1.1.1
```

- Assign the priority for each switch in the VRRP group:

**NOTE:** The switch configured with the highest priority is the master.

Switch A:

```
[edit interfaces]
user@switch# set vlan unit 100 family inet address 100.1.1.11/24 vrrp-group 1 priority 200
```

Switch B:

```
[edit interfaces]
user@switch# set vlan unit 100 family inet address 100.1.1.10/24 vrrp-group 1 priority 150
```

- Enable the switch to accept all packets destined for the virtual IP address if it is the master in the VRRP group:

Switch A:

```
[edit interfaces]
user@switch# set vlan unit 100 family inet address 100.1.1.11/24 vrrp-group 1 accept-data
```

Switch B:

```
[edit interfaces]
user@switch# set vlan unit 100 family inet address 100.1.1.10/24 vrrp-group 1 accept-data
```

- Configure Layer 3 connectivity between Switch A and Switch B.

```
[edit interfaces]
user@switch# set vlans v100 l3-interface vlan.100
```

13. Enable VRRP on the MC-LAG on Switch A and Switch B using ELS:

- Create a routed VLAN interface (RVI), assign a virtual IP address that is shared between each switch in the VRRP group, and assign an individual IP address for each switch in the VRRP group:

Switch A:

```
[edit interfaces]
user@switch# set irb unit 100 family inet address 100.1.1.11/24 vrrp-group 1 virtual-address 100.1.1.1
```

Switch B:

```
[edit interfaces]
user@switch# set irb unit 100 family inet address 100.1.1.10/24 vrrp-group 1 virtual-address 100.1.1.1
```

- Assign the priority for each switch in the VRRP group:

**NOTE:** The switch configured with the highest priority is the master.

Switch A:

```
[edit interfaces]
user@switch# set irb unit 100 family inet address 100.1.1.11/24 vrrp-group 1 priority 200
```

Switch B:

```
[edit interfaces]
user@switch# set irb unit 100 family inet address 100.1.1.10/24 vrrp-group 1 priority 150
```

- Enable the switch to accept all packets destined for the virtual IP address if it is the master in the VRRP group:

Switch A:

```
[edit interfaces]
user@switch# set irb unit 100 family inet address 100.1.1.11/24 vrrp-group 1 accept-data
```

Switch B:

```
[edit interfaces]
user@switch# set irb unit 100 family inet address 100.1.1.10/24 vrrp-group 1 accept-data
```

- Configure Layer 3 connectivity between Switch A and Switch B.

```
[edit interfaces]
user@switch# set irb v100 l3-interface irb.100
```

### Step-by-Step Procedure

To enable RSTP:

The following example requires you to navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

1. Enable RSTP globally on all interfaces on Switch A and Switch B.

```
[edit]
user@switch# set protocols rstp interface all mode point-to-point
```

2. Disable RSTP on the ICL-PL interfaces on Switch A and Switch B:

```
[edit]
user@switch# set protocols rstp interface ae0.0 disable
```

3. Configure the MC-LAG interfaces as edge ports on Switch A and Switch B.

**NOTE:** The ae1 interface is a downstream interface. This is why RSTP and bpdu-block-on-edge need to be configured.

```
[edit]
user@switch# set protocols rstp interface ae1.0 edge
```

4. Enable BPDU blocking on all interfaces except for the ICL-PL interfaces on Switch A and Switch B.

**NOTE:** The ae1 interface is a downstream interface. This is why RSTP and bpdu-block-on-edge need to be configured.

```
[edit]
user@switch# set protocols rstp bpdu-block-on-edge
```

### Results

Display the results of the configuration on Switch A using the original CLI.

## Verification

To verify that the MC-LAG group has been created and is working properly, perform these tasks:

- [Verifying That ICCP Is Working on Switch A on page 2767](#)
- [Verifying That ICCP Is Working on Switch B on page 2767](#)

- [Verifying That LACP Is Active on Switch A on page 2768](#)
- [Verifying That LACP Is Active on Switch B on page 2768](#)
- [Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch A on page 2768](#)
- [Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch B on page 2768](#)
- [Verifying that MAC Learning Is Occurring on Switch A on page 2769](#)
- [Verifying that MAC Learning Is Occurring on Switch B on page 2769](#)
- [Verifying that Switch A is the Master in the VRRP Group on page 2770](#)
- [Verifying that Switch B is the Backup Member in the VRRP Group on page 2770](#)
- [Verifying that the Virtual IP Address is Attached to an Individual Address on Switch A on page 2771](#)
- [Verifying that the Virtual IP Address is Attached to an Individual Address on Switch B on page 2771](#)

### ***Verifying That ICCP Is Working on Switch A***

**Purpose** Verify that ICCP is running on Switch A.

**Action** [edit]  
 user@switch# **show iccp**  
 Redundancy Group Information for peer 3.3.3.1  
     TCP Connection : Established  
     Liveliness Detection : Up  
  
 Client Application: MCSNOOPD  
  
 Client Application: eswd

**Meaning** This output shows that the TCP connection between the peers hosting the MC-LAG is up, liveness detection is up, and MCSNOOPD and ESWD client applications are running.

### ***Verifying That ICCP Is Working on Switch B***

**Purpose** Verify that ICCP is running on Switch B.

**Action** **show iccp**  
  
 [edit]  
 user@switch# **show iccp**  
 Redundancy Group Information for peer 3.3.3.2  
     TCP Connection : Established  
     Liveliness Detection : Up  
  
 Client Application: MCSNOOPD  
  
 Client Application: eswd

**Meaning** This output shows that the TCP connection between the peers hosting the MC-LAG is up, liveness detection is up, and MCSNOOPD and ESWD client applications are running.

**Verifying That LACP Is Active on Switch A**

**Purpose** Verify that LACP is active on Switch A.

**Action** [edit]  
 user@switch# show lacp interfaces  
 Aggregated interface: ae1

| LACP state: | Role    | Exp | Def | Dist | Col | Syn | Aggr | Timeout | Activity |
|-------------|---------|-----|-----|------|-----|-----|------|---------|----------|
| xe-0/0/46   | Actor   | No  | No  | Yes  | Yes | Yes | Yes  | Fast    | Active   |
| xe-0/0/46   | Partner | No  | No  | Yes  | Yes | Yes | Yes  | Fast    | Active   |

LACP protocol:                      Receive State      Transmit State                      Mux State  
 xe-0/0/46                                      Current              Fast periodic      Collecting distributing

**Meaning** This output shows that Switch A is participating in LACP negotiation.

**Verifying That LACP Is Active on Switch B**

**Purpose** Verify that LACP is active on Switch B

**Action** [edit]  
 user@switch# show lacp interfaces  
 Aggregated interface: ae1

| LACP state: | Role    | Exp | Def | Dist | Col | Syn | Aggr | Timeout | Activity |
|-------------|---------|-----|-----|------|-----|-----|------|---------|----------|
| xe-0/0/44   | Actor   | No  | No  | Yes  | Yes | Yes | Yes  | Fast    | Active   |
| xe-0/0/44   | Partner | No  | No  | Yes  | Yes | Yes | Yes  | Fast    | Active   |

LACP protocol:                      Receive State      Transmit State                      Mux State  
 xe-0/0/44                                      Current              Fast periodic      Collecting distributing

**Meaning** This output shows that Switch B is participating in LACP negotiation.

**Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch A**

**Purpose** Verify that the MC-AE and ICL-PL interfaces are up on Switch A.

**Action** [edit]  
 user@switch# show interfaces mc-ae

```
Member Link                : ae1
Current State Machine's State: mcae active state
Local Status                : active
Local State                 : up
Peer Status                 : active
Peer State                  : up
  Logical Interface         : ae1.0
  Topology Type             : bridge
  Local State               : up
  Peer State                : up
  Peer Ip/MCP/State         : 3.3.3.1 ae0.0 up
```

**Meaning** This output shows that the MC-AE interface on Switch A is up and active.

**Verifying That the MC-AE and ICL-PL Interfaces Are Up on Switch B**

**Purpose** Verify that the MC-AE and ICL-PL interfaces are up on Switch B.

**Action** [edit]  
 user@switch# **show interfaces mc-ae**  
 Member Link : ae1  
 Current State Machine's State: mcae active state  
 Local Status : active  
 Local State : up  
 Peer Status : active  
 Peer State : up  
 Logical Interface : ae1.0  
 Topology Type : bridge  
 Local State : up  
 Peer State : up  
 Peer Ip/MCP/State : 3.3.3.2 ae0.0 up

**Meaning** This output shows that the MC-AE interface on Switch B is up and active.

#### *Verifying that MAC Learning Is Occurring on Switch A*

**Purpose** Verify that MAC learning is working on Switch A.

**Action** [edit]  
 user@switch# **show ethernet-switching table**  
 Ethernet-switching table: 6 entries, 1 learned, 0 persistent entriesC

| VLAN | MAC address       | Type     | Age | Interfaces    |
|------|-------------------|----------|-----|---------------|
| v100 | *                 | Flood    |     | - All-members |
| v100 | 00:00:5e:00:01:01 | Static   |     | - Router      |
| v100 | 78:fe:3d:5a:07:42 | Static   |     | - Router      |
| v100 | 78:fe:3d:5b:ad:c2 | Learn(R) | 0   | ae0.0         |
| v500 | *                 | Flood    |     | - All-members |
| v500 | 78:fe:3d:5a:07:42 | Static   |     | - Router      |

**Meaning** The output shows two static MAC address in VLAN v100 and one static MAC address in VLAN v500. These addresses belong to the Layer 3 RVI addresses on both Switch A and Switch B that you configured in the MC-LAG. The ICL-PL interface configured on the VRRP master member learned the VLAN v100 Learn (R) MAC address of the VRRP backup member.

#### *Verifying that MAC Learning Is Occurring on Switch B*

**Purpose** Verify that MAC learning is working on Switch B.

**Action** [edit]user@switch# **show ethernet-switching table**

Ethernet-switching table: 7 entries, 1 learned, 0 persistent entries

| VLAN | MAC address       | Type     | Age | Interfaces    |
|------|-------------------|----------|-----|---------------|
| v100 | *                 | Flood    |     | - All-members |
| v100 | 00:00:5e:00:01:01 | Static   |     | - Router      |
| v100 | 78:fe:3d:5a:07:42 | Learn(R) | 0   | ae0.0         |
| v100 | 78:fe:3d:5b:ad:c2 | Static   |     | - Router      |
| v200 | 78:fe:3d:5b:ad:c2 | Static   |     | - Router      |
| v500 | *                 | Flood    |     | - All-members |
| v500 | 78:fe:3d:5b:ad:c2 | Static   |     | - Router      |

**Meaning** The output shows two static MAC address in VLAN v100 and one static MAC address in VLAN v500. These addresses belong to the Layer 3 RVI addresses on both Switch A and Switch B that you configured in the MC-LAG. The ICL-PL interface configured on the VRRP backup member learned the VLAN v100 Learn (R) MAC address of the VRRP master member.

**Verifying that Switch A is the Master in the VRRP Group**

**Purpose** Verify that Switch A is the master member in the VRRP group.

**Action** [edit]user@switch# **show vrrp**

| Interface | State | Group | VR state | VR Mode | Timer   | Type | Address    |
|-----------|-------|-------|----------|---------|---------|------|------------|
| vlan.100  | up    | 1     | master   | Active  | A 0.605 | lcl  | 100.1.1.11 |
|           |       |       |          |         |         | vip  | 100.1.1.1  |

**Meaning** The output shows that Switch A is the master member in the VRRP group.

**Verifying that Switch B is the Backup Member in the VRRP Group**

**Purpose** Verify that Switch B is the backup member in the VRRP group.

**Action** [edit]user@switch# **show vrrp**

| Interface | State | Group | VR state | VR Mode | Timer   | Type | Address    |
|-----------|-------|-------|----------|---------|---------|------|------------|
| vlan.100  | up    | 1     | backup   | Active  | A 0.605 | lcl  | 100.1.1.10 |
|           |       |       |          |         |         | vip  | 100.1.1.1  |

**Meaning** The output shows that Switch B is the backup member in the VRRP group.

*Verifying that the Virtual IP Address is Attached to an Individual Address on Switch A*

**Action** [edit]  
 user@switch# run show interfaces terse vlan

| Interface | Admin | Link | Proto | Local        | Remote        |
|-----------|-------|------|-------|--------------|---------------|
| vlan      | up    | up   |       |              |               |
| vlan.100  | up    | up   | inet  | 100.1.1.1/24 | 100.1.1.11/24 |
| vlan.500  | up    | up   | inet  | 3.3.3.2/24   |               |

**Meaning** The output shows that the virtual IP address (100.1.1.1/24) is bound to the individual IP address (100.1.1.11/24) on Switch A.

*Verifying that the Virtual IP Address is Attached to an Individual Address on Switch B*

**Action** [edit]  
 user@switch# run show interfaces terse vlan

| Interface | Admin | Link | Proto | Local        | Remote        |
|-----------|-------|------|-------|--------------|---------------|
| vlan      | up    | up   |       |              |               |
| vlan.100  | up    | up   | inet  | 100.1.1.1/24 | 100.1.1.10/24 |
| vlan.500  | up    | up   | inet  | 3.3.3.1/24   |               |

**Meaning** The output shows that the virtual IP address (100.1.1.1/24) is bound to the individual IP address (100.1.1.10/24) on Switch B.

**Troubleshooting***Troubleshooting a LAG That Is Down*

**Problem** The show interfaces terse command shows that the MC-LAG is down

**Solution** Check the following:

- Verify that there is no configuration mismatch.
- Verify that all member ports are up.
- Verify that the MC-LAG is part of family Ethernet switching (Layer 2 LAG).
- Verify that the MC-LAG member is connected to the correct MC-LAG member at the other end.

## Configuring Gigabit and 10-Gigabit Ethernet Interfaces

Devices include a factory default configuration that:

- Enables all 10-Gigabit Ethernet network interfaces on the switch
- Sets a default port mode (access)
- Sets default link settings
- Specifies a logical unit (**unit 0**) and assigns it to **family ethernet-switching**
- Configures Storm Control on all 10-Gigabit Ethernet network interfaces
- Provides basic Rapid Spanning Tree Protocol (RSTP) and Link Layer Discovery Protocol (LLDP) configuration

---

### Configuring Port Mode

If you are connecting a switch to other switches and to routers on the LAN, you need to assign the interface to a logical port and you need to configure the logical port as a trunk port.

To configure a Gigabit Ethernet or 10-Gigabit interface for trunk port mode on the original CLI:

```
[edit]
user@switch# set interfaces interface-name unit logical-unit-number family ethernet-switching
port-mode trunk
```

To configure a Gigabit Ethernet or 10-Gigabit interface for trunk port mode on the Enhanced Layer 2 software (ELS):

```
[edit]
user@switch# set interfaces interface-name unit logical-unit-number family ethernet-switching
interface-mode trunk
```

### Configuring the Link Settings for Gigabit Ethernet and 10-Gigabit Ethernet Interfaces

Devices include a factory default configuration that enables Gigabit Ethernet and 10-Gigabit Ethernet and interfaces with applicable link settings.

The following default configurations are available on Gigabit Ethernet interfaces:

- The speed for Gigabit Ethernet interfaces is set to 1000 Mbps by default. The speed for 1-Gigabit Ethernet Copper SFP interfaces is 1 Gbps by default.
- Gigabit Ethernet interfaces operate in full-duplex mode.
- Autonegotiation is not supported.

To enable autonegotiation, issue the **set interfaces *name* ether-options auto-negotiate** command.

To disable autonegotiation, issue the **delete interfaces *name* ether-options auto-negotiate** command.

**NOTE:** Do not use the **set interface *name* ether-options no-auto-negotiate** command to remove the autonegotiation configuration.

The following default configurations are available on 10-Gigabit Ethernet interfaces:

- The speed for 10-Gigabit Ethernet interfaces is set to 10 Gbps by default. The speed cannot be configured.
- 10-Gigabit Ethernet interfaces operate in full-duplex mode by default.
- Autonegotiation is not supported.

To enable autonegotiation, issue the **set interfaces *name* ether-options auto-negotiate** command.

To disable autonegotiation, issue the **delete interfaces *name* ether-options auto-negotiate** command.

**NOTE:** Do not use the **set interface *name* ether-options no-auto-negotiate** command to remove the autonegotiation configuration.

The **ether-options** statement enables you to modify the following options:

- **802.3ad**—Specify an aggregated Ethernet bundle for both Gigabit Ethernet and 10-Gigabit Ethernet interfaces.
- **autonegotiation**—Enable or disable autonegotiation of flow control, link mode, and speed for Gigabit Ethernet interfaces.
- **link-mode**—Specify **full-duplex**, **half-duplex**, or **automatic** for Gigabit Ethernet interfaces.
- **loopback**—Enable or disable a loopback interface for both Gigabit Ethernet and 10-Gigabit Ethernet interfaces.

To set **ether-options** for both Gigabit Ethernet and 10-Gigabit Ethernet interfaces:

```
[edit]
user@switch# set interfaces interface-name ether-options
```

---

### Configuring the Speed of Gigabit Ethernet Copper SFP Interfaces

You can configure the speed of Gigabit Ethernet copper SFP interfaces on the EX4600 and QFX5100 devices. The default speed is 1Gbps.

**NOTE:** Autonegotiation is not supported on EX4600 and QFX5100 devices.

---

1. Configure the speed of the interface:

```
[edit]
user@switch# set interfaces interface-name speed speed
```

For example, to configure a speed of 100Mbps on the **ge-0/1/0** interface:

```
[edit]
user@switch# set interfaces ge-0/1/0 speed 100m
```

2. To delete the speed of the interface:

```
[edit]
user@switch# delete interfaces interface-name speed speed
```

For example, to delete a speed of 100Mbps on the **ge-0/1/0** interface:

```
[edit]
user@switch# delete interfaces ge-0/1/0 speed 100m
```

---

### Configuring the IP Options

To specify an IP address for the logical unit:

```
[edit]
user@switch# set interfaces interface-name unit logical-unit-number family inet address ip-address
```

## Configuring Aggregated Ethernet LACP

For aggregated Ethernet interfaces, you can configure the Link Aggregation Control Protocol (LACP). LACP is one method of bundling several physical interfaces to form one logical interface. You can configure aggregated Ethernet with or without LACP enabled.

Before you configure LACP, be sure you have configured the aggregated Ethernet bundles—also known as link aggregation groups (LAGs).

When LACP is enabled, the local and remote sides of the aggregated Ethernet links exchange protocol data units (PDUs), containing information about the state of the link. You can configure Ethernet links to actively transmit PDUs, or you can configure the links to passively transmit them, sending out LACP PDUs only when they receive them from another link. One side of the link must be configured as **active** for the link to be up.

**NOTE:** Do not add LACP to a LAG if the remote end of the LAG link is a security device, unless the security device supports LACP. Security devices often do not support LACP because they require a deterministic configuration.

To configure LACP:

1. Enable the LACP mode:

```
[edit interfaces]
user@switch# set aex aggregated-ether-options lacp mode
```

For example, to specify the mode as active, execute the following command:

```
[edit interfaces]
user@switch# set aex aggregated-ether-options lacp active
```

2. Specify the interval and speed at which the interfaces send LACP packets:

```
[edit interfaces]
user@switch# set aex aggregated-ether-options lacp periodic interval
```

For example, to specify the interval as fast, execute the following command:

```
[edit interfaces]
user@switch# set aex aggregated-ether-options lacp periodic fast
```

## Configuring Ethernet Loopback Capability

To place an interface in loopback mode, include the **loopback** statement:

```
loopback;
```

To return to the default—that is, to disable loopback mode—delete the **loopback** statement from the configuration:

```
[edit]
user@switch# delete interfaces interface-name ether-options loopback
```

To explicitly disable loopback mode, include the **no-loopback** statement:

```
no-loopback;
```

You can include the **loopback** and **no-loopback** statements at the following hierarchy levels:

- [edit interfaces *interface-name* aggregated-ether-options]
- [edit interfaces *interface-name* ether-options]

**Related  
Documentation**

- [Configuring Gigabit and 10-Gigabit Ethernet Interfaces on page 2772](#)

## Configuring Interfaces for Uplink Failure Detection

You can configure uplink failure detection to help ensure balanced traffic flow. Using this feature, switches can monitor and detect link failure on uplink interfaces and can propagate the failure information to downlink interfaces, so that servers connected to those downlinks can switch over to secondary interfaces.

Follow these configuration guidelines:

- Configure an interface in only one group.
- Configure a maximum of eight groups for each switch.
- Configure a maximum of eight uplinks to monitor and a maximum of 48 downlinks to disable in each group.
- Configure physical links and logical links in separate groups.

To configure uplink failure detection on a switch:

1. Specify a name for an uplink failure detection group:

```
[edit protocols]
user@switch# set uplink-failure-detection group group-name
```

2. Add an uplink interface to the group:

```
[edit protocols]
user@switch# set uplink-failure-detection group group-name link-to-monitor interface-name
```

3. Repeat Step 2 for each uplink interface you add to the group.

4. Add a downlink interface to the group:

```
[edit protocols]
user@switch# set uplink-failure-detection group group-name link-to-disable interface-name
```

5. Repeat Step 4 for each downlink interface you add to the group.

**NOTE:** After you have configured an uplink failure detection group, use the **show uplink-failure-detection group (*Uplink Failure Detection*) *group-name*** command to verify that all interfaces in the group are up. If the interfaces are down, uplink failure detection does not work.

---

## Configuring a Layer 3 Logical Interface

Devices use Layer 3 logical interfaces to divide a physical interface into multiple logical interfaces, each corresponding to a VLAN. Layer 3 logical interfaces route traffic between subnets.

To configure Layer 3 logical interfaces, enable VLAN tagging and partition one or more physical ports into multiple logical interfaces, each corresponding to a VLAN ID.

Before you begin, make sure you set up your VLANs. See [“Configuring VLANs” on page 2214](#).

To configure Layer 3 logical interfaces:

1. Enable VLAN tagging:

```
[edit interfaces interface-name]
user@switch# set vlan-tagging
```

2. Bind each VLAN ID to a logical interface:

```
[edit interfaces interface-name]
user@switch# set unit logical-unit-number vlan-id vlan-id-number
```

## Configuring Link Aggregation

Use the link aggregation feature to aggregate one or more links to form a virtual link or aggregation group. The MAC client can treat this virtual link as if it were a single link. Link aggregation increases bandwidth, provides graceful degradation as failure occurs, and increases link availability.

**NOTE:** An interface with an already configured IP address cannot form part of the aggregation group.

**NOTE:** On QFX5100 and EX4600 standalone switches and on QFX5100 Virtual Chassis and EX4600 Virtual Chassis, you can configure a mixed rate of link speeds for the aggregated Ethernet bundle. Only link speeds of 40G and 10G are supported. Load balancing will not work if you configure link speeds that are not supported.

1. [Creating an Aggregated Ethernet Interface on page 2778](#)
2. [Configuring the VLAN Name and VLAN ID Number on page 2778](#)
3. [Configuring Aggregated Ethernet LACP on page 2778](#)

## Creating an Aggregated Ethernet Interface

---

To create an aggregated Ethernet interface:

1. Specify the number of aggregated Ethernet interfaces to be created:

```
[edit chassis]
user@switch# set aggregated-devices interfaces device-count device-count
```

For example, to specify 5:

```
[edit chassis]
user@switch# set aggregated-devices interfaces device-count
```

2. Specify the minimum number of links for the aggregated Ethernet interface (aex), that is, the defined bundle, to be labeled “up”:

**NOTE:** By default only one link must be up for the bundle to be labeled “up”.

```
[edit interfaces]
user@switch# set interface-name aggregated-ether-options minimum-links minimum-links
```

For example, to specify 5:

```
[edit interfaces]
user@switch# set interface-name aggregated-ether-options minimum-links 5
```

3. Specify the link speed for the aggregated Ethernet bundle:

```
[edit interfaces]
user@switch# set interface-name aggregated-ether-options link-speed link-speed
```

For example, to specify 10g:

```
[edit interfaces]
user@switch# set interface-name aggregated-ether-options link-speed 10g
```

4. Specify the members to be included within the aggregated Ethernet bundle:

```
[edit interfaces]
user@switch# set interface-name ether-options 802.3ad aex
user@switch# set interface-name ether-options 802.3ad aex
```

## Configuring the VLAN Name and VLAN ID Number

---

```
[edit vlans]
user@switch# set vlan-name vlan-id vlan-id-number
```

For example, 100.

## Configuring Aggregated Ethernet LACP

---

For aggregated Ethernet interfaces, you can configure the Link Aggregation Control Protocol (LACP). LACP is one method of bundling several physical interfaces to form one logical interface. You can configure aggregated Ethernet with or without LACP enabled.

Before you configure LACP, be sure you have configured the aggregated Ethernet bundles—also known as link aggregation groups (LAGs).

When LACP is enabled, the local and remote sides of the aggregated Ethernet links exchange protocol data units (PDUs), containing information about the state of the link. You can configure Ethernet links to actively transmit PDUs, or you can configure the links to passively transmit them, sending out LACP PDUs only when they receive them from another link. One side of the link must be configured as **active** for the link to be up.

**NOTE:** Do not add LACP to a LAG if the remote end of the LAG link is a security device, unless the security device supports LACP. Security devices often do not support LACP because they require a deterministic configuration.

To configure LACP:

1. Enable the LACP mode:

```
[edit interfaces]
user@switch# set aex aggregated-ether-options lacp mode
```

For example, to specify the mode as active, execute the following command:

```
[edit interfaces]
user@switch# set aex aggregated-ether-options lacp active
```

2. Specify the interval and speed at which the interfaces send LACP packets:

```
[edit interfaces]
user@switch# set aex aggregated-ether-options lacp periodic interval
```

For example, to specify the interval as fast, execute the following command:

```
[edit interfaces]
user@switch# set aex aggregated-ether-options lacp periodic fast
```

## Configuring Multichassis Link Aggregation

**NOTE:** Multichassis Link Aggregation (MC-LAG) is supported on QFX3500 and QFX3600 standalone switches running the original CLI, and on QFX5100 and EX4600 standalone switches running Enhanced Layer 2 Software.

Multichassis link aggregation groups (MC-LAGs) enable a client device to form a logical LAG interface between two switches. An MC-LAG provides redundancy and load balancing between the two switches, multihoming support, and a loop-free Layer 2 network without running the Spanning Tree Protocol (STP).

The MC-LAG switches use the Interchassis Control Protocol (ICCP) to exchange the control information between two MC-LAG switches.

On one end of an MC-LAG is an MC-LAG client device, such as a server, that has one or more physical links in a link aggregation group (LAG). This client device does not need to detect the MC-LAG. On the other side of MC-LAG are two MC-LAG switches. Each of the switches has one or more physical links connected to a single client device. The switches coordinate with each other to ensure that data traffic is forwarded properly.

**NOTE:** An interface with an already configured IP address cannot form part of the aggregated Ethernet interface or multichassis aggregated Ethernet interface group.

Perform the following steps on each switch that is hosting an MC-LAG:

1. Specify the same multichassis aggregated Ethernet identification number for the MC-LAG that the aggregated Ethernet interface belongs to on each switch.

```
[edit interfaces]
user@switch# set aeX aggregated-ether-options mc-ae mc-ae-id number
```

For example:

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae mc-ae-id 3
```

2. Specify a unique chassis ID for the MC-LAG that the aggregated Ethernet interface belongs to on each switch.

```
[edit interfaces]
user@switch# set aeX aggregated-ether-options mc-ae chassis-id number
```

For example:

```
[edit interfaces]
user@switch# set ae1 aggregated-ether-options mc-ae chassis-id 0
```

3. Specify the mode of the MC-LAG the aggregated Ethernet interface belongs to.

**NOTE:** Only active-active mode is supported at this time.

```
[edit interfaces]
```

```
user@switch# set aeX aggregated-ether-options mc-ae mode mode
```

For example:

```
[edit interfaces]
```

```
user@switch# set ae1 aggregated-ether-options mc-ae mode active-active
```

4. Specify whether the aggregated Ethernet interface participating in the MC-LAG is primary or secondary. Primary is **active**, and secondary is **standby**.

**NOTE:** You must configure status control on both switches hosting the MC-LAG. If one switch is in active mode, the other must be in standby mode.

```
[edit interfaces]
```

```
user@switch# set aeX aggregated-ether-options mc-ae status-control (active | standby)
```

For example:

```
[edit interfaces]
```

```
user@switch# set ae1 aggregated-ether-options mc-ae status-control active
```

5. Specify the same LACP system ID on each switch.

```
[edit interfaces]
```

```
user@switch# set aeX aggregated-ether-options lacp system-id mac-address
```

For example:

```
[edit interfaces]
```

```
user@switch# set ae1 aggregated-ether-options lacp system-id 00:01:02:03:04:05
```

6. Specify the same LACP administration key on each switch.

```
[edit interfaces]
```

```
user@switch# set aeX aggregated-ether-options lacp admin-key number
```

For example:

```
[edit interfaces]
```

```
user@switch# set ae1 aggregated-ether-options lacp admin-key 3
```

7. Configure ICCP by doing the following on each switch hosting the MC-LAG:

- a. Configure the local IP address to be used by all switches hosting the MC-LAG.

```
[edit protocols]
```

```
user@switch# set iccp local-ip-addr local-ip-address
```

For example:

```
[edit protocols]
```

```
user@switch# set iccp local-ip-addr 3.3.3.1
```

- b. (Optional) Configure the IP address of the switch and the time during which an ICCP connection must succeed between the switches hosting the MC-LAG.

Configured session establishment hold time results in faster ICCP connection establishment. The recommended value is 50 seconds.

```
[edit protocols]
```

```
user@switch# set iccp peer peer-ip-address session-establishment-hold-time seconds
```

For example:

```
[edit protocols]
```

```
user@switch# set iccp peer 3.3.3.2 session-establishment-hold-time 50
```

- c. (Optional) Configure the IP address to be used for backup liveness detection:

**NOTE:** By default, backup liveness detection is not enabled. Configure backup liveness detection if you require minimal traffic loss during a reboot. Backup liveness detection helps achieve sub-second traffic loss during an MC-LAG reboot.

```
[edit protocols]
user@switch# set iccp peer peer-ip-address backup-liveness-detection backup-peer-ip
ip-address
```

For example:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 backup-liveness-detection backup-peer-ip
10.207.64.232
```

- d. Configure the minimum interval at which the switch must receive a reply from the other switch with which it has established a Bidirectional Forwarding Detection (BFD) session.

**NOTE:** Configuring the minimum receive interval is required to enable BFD.

```
[edit protocols]
user@switch# set iccp peer peer-ip-address liveness-detection minimum-receive-interval
seconds
```

For example:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 liveness-detection minimum-receive-interval 1000
```

- e. Configure the minimum transmit interval during which a switch must receive a reply from a switch with which it has established a BFD session.

```
[edit protocols]
user@switch# set iccp peer peer-ip-address liveness-detection transmit-interval
minimum-interval seconds
```

For example:

```
[edit protocols]
user@switch# set iccp peer 3.3.3.2 liveness-detection transmit-interval minimum-interval
1000
```

8. Configure a multichassis protection link between the switches.

```
[edit]
user@switch# set multi-chassis multi-chassis-protection peer-ip-address interface
interface-name
```

For example:

```
[edit protocols]
user@switch# set multi-chassis multi-chassis-protection 3.3.3.1 interface ae0
```

9. If you are using ELS, configure the **service-id** on both switches.

The **service-id** must be the same number on both switches.

```
[edit]
user@switch# set switch-options service-id number
```

For example:

```
[edit]
user@switch# set switch-options service-id 10
```

10. Enable RSTP globally on all interfaces.

```
[edit]
user@switch# set protocols rstp interface all mode point-to-point
```

11. Disable RSTP on the ICL-PL interfaces on both switches.

```
[edit]
user@switch# set protocols rstp interface interface-name disable
```

For example:

```
[edit]
user@switch# set protocols rstp interface ae0.0 disable
```

12. Configure the MC-LAG interfaces as edge ports on both switches.

```
set protocols rstp interface interface-name
```

For example:

```
[edit]
user@switch# set protocols rstp interface ae1.0
```

13. Enable BPDU block on all interfaces except for the ICL-PL interfaces on both switches.

```
[edit]
user@switch# set protocols rstp bpdu-block-on-edge
```

For example:

```
[edit]
user@switch# set protocols rstp bpdu-block-on-edge
```

## Configuring the QSFP+ Port Type on QFX3500 Standalone Switches

By default, the four 40-Gbps QSFP+ ports are configured to operate as 10-Gigabit Ethernet (xe) ports. You can use QSFP+ to four SFP+ breakout cables or QSFP+ transceivers with fiber breakout cables to connect the 10-Gigabit Ethernet ports to other servers, storage, and switches. You can, however, configure the four 40-Gbps QSFP+ ports to operate as 40-Gigabit Ethernet (xle) ports.

**NOTE:** Port Q0 supports only three (not the typical four) 10-Gigabit Ethernet ports, because one port is reserved.

**CAUTION:** The Packet Forwarding Engine on the QFX3500 standalone switch is restarted when you commit port type configuration changes (for example, configuring or deleting an xle port). As a result, you might experience packet loss on the device.

The following steps describe how to configure either a block of ports or an individual port to operate as 40-Gigabit Ethernet (xle) ports, as well as how to delete a 40-Gigabit Ethernet (xle) configuration.

**NOTE:** When you delete an xle block of ports or individual port, the ports return to operating as 10-Gigabit Ethernet ports.

1. To configure a block of ports to operate as 40-Gigabit Ethernet (xle) ports, specify a port range:

```
[edit chassis fpc 0 pic 2]  
user@switch# set xle port-range port-range-low port-range-high
```

For example, to configure ports Q0 through Q3 to operate as 40-Gigabit Ethernet ports:

```
[edit chassis fpc 0 pic 2]  
user@switch# set xle port-range 0 3
```

2. To configure an individual port to operate as a 40-Gigabit Ethernet (xle) port, specify a port number:

```
[edit chassis fpc 0 pic 2]  
user@switch# set xle port port-number
```

For example, to configure port Q2 to operate as a 40-Gigabit Ethernet port:

```
[edit chassis fpc 0 pic 2]  
user@switch# set xle port 2
```

3. Review your configuration and issue the **commit** command.

```
[edit]  
user@switch# commit
```

```
commit complete
```

- To delete a block of ports configured as 40-Gigabit Ethernet (xle) ports (and return to the default 10-Gigabit Ethernet configuration), specify a port range:

```
[edit chassis fpc 0 pic 2]
user@switch# delete xle port-range port-range-low port-range-high
```

For example, to delete the 40-Gigabit Ethernet (xle) port configuration for ports Q0 through Q3 (and return to the default 10-Gigabit Ethernet configuration):

```
[edit chassis fpc 0 pic 2]
user@switch# delete xle port-range 0 3
```

- To delete an individual port configured as a 40-Gigabit Ethernet (xle) port (and return to the default 10-Gigabit Ethernet configuration), specify an individual port:

```
[edit chassis fpc 0 pic 2]
user@switch# delete xle port port-number
```

For example, to delete the 40-Gigabit Ethernet (xle) port configuration for port Q2 (and return to the default 10-Gigabit Ethernet configuration):

```
[edit chassis fpc 0 pic 2]
user@switch# delete xle port 2
```

- Review your configuration and issue the **commit** command.

```
[edit]
user@switch# commit
commit complete
```

## Configuring the QSFP+ Port Type on QFX5100 Devices

You can convert default 40-Gigabit Ethernet data plane uplink interfaces (fte) to 40-Gigabit Ethernet access interfaces (xle) ports, and default 40-Gigabit Ethernet interfaces (xle) to 40-Gigabit Ethernet data plane uplink interfaces (fte). Ports Q0 and Q1 are fixed fte ports and cannot be changed. Ports Q2 and Q3 are fte ports by default but can be changed to xle ports. Ports Q4 and Q5 are xle ports by default but can be changed to fte ports.

**NOTE:** You must configure xle ports in pairs, not individually, otherwise functionality is not guaranteed.

**CAUTION:** The Packet Forwarding Engine on a QFX5100 switch is restarted when you commit port type configuration changes (for example, configuring or deleting an fte or xle port). As a result, you might experience packet loss on the device.

The following steps describe how to configure either a block of ports or an individual port, as well as how to delete these configurations.

1. To configure a block of ports to operate as 40-Gigabit Ethernet interfaces (xle), specify a port range:

```
[edit chassis node-group name node-device name pic 1]
user@switch# set xle port-range port-range-low port-range-high
```

For example, to configure ports Q4 through Q5 to operate as 40-Gigabit Ethernet interfaces (xle):

```
[edit chassis node-group name node-device name pic 1]
user@switch# set xle port-range 4 5
```

2. To configure a block of ports to operate as 40-Gigabit Ethernet data plane uplink interfaces (fte), specify a port range:

```
[edit chassis node-group name node-device name pic 1]
user@switch# set fte port-range port-range-low port-range-high
```

For example, to configure ports Q4 through Q5 to operate as 40-Gigabit Ethernet data plane uplink interfaces (fte):

```
[edit chassis node-group name node-device name pic 1]
user@switch# set fte port-range 4 5
```

3. To configure an individual port to operate as a 40-Gigabit Ethernet data plane uplink interfaces (fte), specify a port number:

```
[edit chassis node-group name node-device name pic 1]
user@switch# set fte port port-number
```

For example, to configure port Q4 to operate as a 40-Gigabit Ethernet data plane uplink interfaces (fte):

```
[edit chassis node-group name node-device name pic 1]
user@switch# set fte port 4
```

4. Review your configuration and issue the **commit** command.

```
[edit]
user@switch# commit
commit complete
```

5. To delete a block of ports configured as 40-Gigabit Ethernet (xle) ports, specify a port range:

```
[edit chassis node-group name node-device name pic 1]
user@switch# delete xle port-range port-range-low port-range-high
```

For example, to delete the 40-Gigabit Ethernet access interface (xle) port configuration for ports Q2 through Q3:

```
[edit chassis node-group name node-device name pic 1]
user@switch# delete xle port-range 2 3
```

6. To delete an individual port configured as a 40-Gigabit Ethernet (xle) interface:

```
[edit chassis node-group name node-device name pic 1]
user@switch# delete xle port port-number
```

For example, to delete the 40-Gigabit Ethernet interface (xle) for port Q2:

```
[edit chassis node-group name node-device name pic 1]
user@switch# delete xle port 2
```

7. To delete a block of ports configured as 40-Gigabit Ethernet data plane uplink interfaces (fte), specify a port range:

```
[edit chassis node-group name node-device name pic 1]
user@switch# delete fte port-range port-range-low port-range-high
```

For example, to delete the block of ports configured as 40-Gigabit Ethernet data plane uplink interfaces (fte) for ports Q4 through Q5:

```
[edit chassis node-group name node-device name pic 1]
user@switch# delete fte port-range 4 5
```

8. To delete an individual port configured as a 40-Gigabit Ethernet data plane uplink interfaces (fte):

```
[edit chassis node-group name node-device name pic 1]
user@switch# delete fte port port-number
```

For example, to delete the 40-Gigabit Ethernet data plane uplink interfaces (fte) for port Q4:

```
[edit chassis node-group name node-device name pic 1]
user@switch# delete fte port 4
```

9. Review your configuration and issue the **commit** command.

```
[edit]
user@switch# commit
commit complete
```

## Configuring the Port Type on QFX3600 Standalone Switches

The QFX3600 standalone switch provides 16 40-Gbps QSFP+ ports. By default, all 16 ports operate as 40-Gigabit Ethernet (xle) ports. Optionally, you can choose to configure the 40-Gbps ports to operate as four 10-Gigabit Ethernet (xe) ports. You can use QSFP+ to four SFP+ breakout cables or QSFP+ transceivers with fiber breakout cables to connect the 10-Gigabit Ethernet ports to other servers, storage, and switches. You can configure up to 64 10-Gigabit Ethernet ports on ports Q0 through Q15.

This topic explains how to configure the port type on QFX3600 standalone switches.

**CAUTION:** The Packet Forwarding Engine on the QFX3600 standalone switch is restarted when you commit the port type configuration changes. As a result, you might experience packet loss on the switch.

The following message may be displayed in the system log file when the Packet Forwarding Engine is restarted. You can ignore this message.

Pipe write error: Broken pipe

flush operation failed

.....

The following steps describe how to configure either a block of ports or an individual port to operate as 10-Gigabit Ethernet (xe) ports, as well as how to delete a 10-Gigabit Ethernet (xe) port configuration.

.....

**NOTE:** When you delete the xe port type configuration for an individual port or a block of ports, the ports return to operating as 40-Gigabit Ethernet (xle) ports.

.....

1. To configure a block of ports to operate as 10-Gigabit Ethernet (xe) ports, specify a port range:

```
[edit chassis fpc 0 pic 0]
user@switch# set xe port-range port-range-low port-range-high
```

For example, to configure ports Q4 through Q7 to operate as 10-Gigabit Ethernet ports:

```
[edit chassis fpc 0 pic 0]
user@switch# set xe port-range 4 7
```

2. To configure an individual port to operate as a 10-Gigabit Ethernet (xe) port, specify a port number:

```
[edit chassis fpc 0 pic 0]
user@switch# set xe port port-number
```

For example, to configure port Q4 to operate as a 10-Gigabit Ethernet port:

```
[edit chassis fpc 0 pic 0]
user@switch# set xe port 4
```

3. Review your configuration and issue the **commit** command.

```
[edit chassis fpc 0 pic 0]
user@switch# commit
commit complete
```

4. To delete the 10-Gigabit Ethernet (xe) port configuration for a block of ports (and return to the default 40-Gigabit Ethernet configuration), specify a port range:

```
[edit chassis fpc 0 pic 0]
user@switch# delete xe port-range port-range-low port-range-high
```

For example, to delete the 10-Gigabit Ethernet port configuration for ports Q4 through Q7:

```
[edit chassis fpc 0 pic 0]
user@switch# delete xe port-range 4 7
```

5. To delete the 10-Gigabit Ethernet (xe) port configuration for an individual port (and return to the default 40-Gigabit Ethernet configuration), specify a port number:

```
[edit chassis fpc 0 pic 0]
user@switch# delete xe port port-number
```

For example, to delete the 10-Gigabit Ethernet port configuration for port Q4:

```
[edit chassis fpc 0 pic 0]
user@switch# delete xe port 4
```

## Configuring the Speed on Gigabit Ethernet Interfaces

The QFX3600 standalone switch provides 16 40-Gbps QSFP+ ports. By default, all 16 ports operate as 40-Gigabit Ethernet (xe) ports. Optionally, you can choose to configure the 40-Gbps ports to operate as four 10-Gigabit Ethernet (xe) ports. You can use QSFP+ to four SFP+ breakout cables or QSFP+ transceivers with fiber breakout cables to connect the 10-Gigabit Ethernet ports to other servers, storage, and switches. You can configure up to 64 10-Gigabit Ethernet ports on ports Q0 through Q15.

This topic explains how to configure the speed on Gigabit Ethernet interfaces.

1. To configure a block of ports to operate as 10-Gigabit Ethernet (xe) ports, specify a port range:

```
[edit 0]
user@switch# set port-range port-range-low port-range-high
```

For example, to configure ports Q4 through Q7 to operate as 10-Gigabit Ethernet ports:

```
[edit chassis fpc 0 pic 0]
user@switch# set xe port-range 4 7
```

2. To configure an individual port to operate as a 10-Gigabit Ethernet (xe) port, specify a port number:

```
[edit chassis fpc 0 pic 0]
user@switch# set xe port port-number
```

For example, to configure port Q4 to operate as a 10-Gigabit Ethernet port:

```
[edit chassis fpc 0 pic 0]
user@switch# set xe port 4
```

3. Review your configuration and issue the **commit** command.

```
[edit chassis fpc 0 pic 0]
user@switch# commit
commit complete
```

4. To delete the 10-Gigabit Ethernet (xe) port configuration for a block of ports (and return to the default 40-Gigabit Ethernet configuration), specify a port range:

```
[edit chassis fpc 0 pic 0]
```

```
user@switch# delete xe port-range port-range-low port-range-high
```

For example, to delete the 10-Gigabit Ethernet port configuration for ports Q4 through Q7:

```
[edit chassis fpc 0 pic 0]  
user@switch# delete xe port-range 4 7
```

5. To delete the 10-Gigabit Ethernet (xe) port configuration for an individual port (and return to the default 40-Gigabit Ethernet configuration), specify a port number:

```
[edit chassis fpc 0 pic 0]  
user@switch# delete xe port port-number
```

For example, to delete the 10-Gigabit Ethernet port configuration for port Q4:

```
[edit chassis fpc 0 pic 0]  
user@switch# delete xe port 4
```

## 802.3ad

**Syntax**    802.3ad aex;  
               lACP {  
                   force-up;  
                   (primary | backup);  
               }  
               port-priority;  
               }

**Hierarchy Level**    [edit [interfaces](#) *interface-name* [ether-options](#)]

**Release Information**    Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Specify the aggregated Ethernet logical interface number.

**NOTE:** The port-priority statement is not supported on QFabric systems.

**Options**    aex—Aggregated Ethernet logical interface number.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                   interface-control—To add this statement to the configuration.

**Hierarchy Level** [edit interfaces *interface-name* unit *logical-unit-number* family *family*],  
 [edit logical-systems *logical-system-name* interfaces *interface-name* unit *logical-unit-number*  
 family *family*]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure the interface address.

**Options** *address*—Address of the interface.

- In Junos OS Release 13.3 and later, when you configure an IPv6 host address and an IPv6 subnet address on an interface, the commit operation fails.
- In releases earlier than Junos OS Release 13.3, when you use the same configuration on an interface, the commit operation succeeds, but only one of the IPv6 addresses that was entered is assigned to the interface. The other address is not applied.

**NOTE:** If you configure the same address on multiple interfaces in the same routing instance, Junos OS uses only the first configuration, the remaining address configurations are ignored and can leave interfaces without an address. Interfaces that do not have an assigned address cannot be used as a donor interface for an unnumbered Ethernet interface.

For example, in the following configuration the address configuration of interface xe-0/0/1.0 is ignored:

```
interfaces {
  xe-0/0/0 {
    unit 0 {
      family inet {
        address 192.168.1.1/24;
      }
    }
  }
  xe-0/0/1 {
    unit 0 {
      family inet {
        address 192.168.1.1/24;
      }
    }
  }
}
```

For more information on configuring the same address on multiple interfaces, see [“Configuring the Interface Address” on page 2222](#).

The remaining statements are explained separately.

**NOTE:** The `edit logical-systems` hierarchy is not available on QFabric systems.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

**Hierarchy Level** [edit [interfaces](#) *aex*]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.  
 Statements **fcoe-lag** and **no-fcoe-lag** introduced in Junos OS Release 13.2X52-D10 for the QFX Series.  
 Statements **force-up**, **lacp**, and **resilient-hash** introduced in Junos OS Release 14.1X53-D10 for the QFX Series.

**Description** Configure properties specific to a specific aggregated Ethernet interface.

The statements are explained separately.

**Default** Options are not enabled.

**Required Privilege Level** interface—To view this statement in the configuration.  
 interface-control—To add this statement to the configuration.

| <b>Description</b>              | Backup liveness detection determines the peer status (whether it is up or down) by exchanging keep alive messages (UDP-based packets) over the management link between the two Interchassis Control Protocol (ICCP) peers. When an ICCP connection is operationally down, the status of the peers hosting a multichassis link aggregation group (MC-LAG) is detected by sending liveness detection requests to each other. Peers must respond to liveness detection requests within a specified amount of time. If the responses are not received within that time for a given number of consecutive attempts, the liveness detection check fails, and a failure action is implemented. Backup liveness detection must be configured on both peers hosting the MC-LAG. |
| <b>Required Privilege Level</b> | routing—To view this statement in the configuration.<br>routing-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.3 for QFX Series switches.                                                                                                                                                                 |
| <b>Description</b>              | Specify the container devices configuration. The <b>number</b> option specifies the number of sequentially numbered container interfaces, from <b>ci0</b> to <b>ci127</b> maximum.                                                     |
| <b>Options</b>                  | <b>number</b> —Number of container devices.<br><b>Range:</b> 1 through 128                                                                                                                                                             |
| <b>Required Privilege Level</b> | <code>chassis</code> —To view this statement in the configuration.<br><code>chassis-control</code> —To add this statement to the configuration.                                                                                        |

## craft-lockout

```
Syntax  craft-lockout {
        alarm {
            interface-type {
                link-down (red | yellow | ignore);
            }
        }
        container-devices {
            device-count number;
        }
        fpc slot {
            pic pic-number {
                fibre-channel {
                    port-range {
                        port-range-low port-range-high;
                    }
                }
            }
        }
        routing-engine {
            on-disk-failure {
                disk-failure-action (halt | reboot);
            }
        }
    }
```

**Hierarchy Level** [edit [chassis interconnect-device](#)]

**Release Information** Statement introduced in Junos Release 11.3 for the QFX Series.

**Description** Disable the physical operation of the craft interface front panel.

**Required Privilege Level** interface—To view this statement in the configuration.  
interface-control—To add this statement to the configuration.

```

**Hierarchy Level** [edit [interfaces interface-name unit logical-unit-number](#)],  
[edit [interfaces interface-range interface-name unit logical-unit-number family](#)]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure protocol family information for the logical interface on the QFX Series product.

**Default** Access interfaces on the QFX Series are set to **family ethernet-switching** by default. If you are going to change the family setting for an interface, you might have to delete this default setting or any user-configured family setting first.

You must configure a logical interface to be able to use the physical device.

**Options** See [Table 220 on page 2816](#) for protocol families available on the QFX Series interfaces. Different protocol families support different subsets of the interface types on the QFX Series.

Interface types on the switch are:

- Aggregated Ethernet (**ae**)

- Gigabit Ethernet (**ge**)
- Loopback (**lo0**)
- Management Ethernet (**me0**)
- Routed VLAN interface (RVI) (**vlan**)
- 10-Gigabit Ethernet (**xe**)

Not all interface types support all **family** substatements. Check your switch CLI for supported substatements for a particular protocol family configuration.

**Table 220: Protocol Families and Supported Interface Types**

| Family             | Description                        | Supported Interface Types |     |     |      |    |    |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>              | <p>Explicitly enable or disable symmetric Ethernet PAUSE flow control, which regulates the flow of packets from the switch to the remote side of the connection by pausing all traffic flows on a link during periods of network congestion. Symmetric flow control means that Ethernet PAUSE is enabled in both directions. The interface generates and sends Ethernet PAUSE messages when the receive buffers fill to a certain threshold and the interface responds to PAUSE messages received from the connected peer. By default, flow control is disabled.</p> <p>You can configure asymmetric flow control by including the <b>configured-flow-control</b> statement at the [edit <b>interfaces</b> <i>interface-name</i> <b>ether-options</b> hierarchy level. Symmetric flow control and asymmetric flow control are mutually exclusive features. If you attempt to configure both, the switch returns a commit error.</p> |
|                                 | <div>  <p><b>NOTE:</b> Ethernet PAUSE temporarily stops transmitting all traffic on a link when the buffers fill to a certain threshold. To temporarily pause traffic on individual “lanes” of traffic (each lane contains the traffic associated with a particular IEEE 802.1p code point, so there can be eight lanes of traffic on a link), use priority-based flow control (PFC).</p> <p>Ethernet PAUSE and PFC are mutually exclusive features, so you cannot configure both of them on the same interface. If you attempt to configure both Ethernet PAUSE and PFC on an interface, the switch returns a commit error.</p> </div>                                                                                                                                                                                                          |

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Command introduced in Junos OS Release 10.4R5 for EX Series switches.<br>Command introduced in Junos OS Release 11.1 for the QFX Series.<br>Statement introduced in Junos OS Release 12.2 for ACX Series Universal Access Routers.                                                                          |
| <b>Description</b>         | Specify the <b>hold-time</b> value to use to damp shorter interface transitions milliseconds. When an interface goes from up to down, it is not advertised to the rest of the system as being down until it has remained down for the hold-time period. Similarly, an interface is not advertised as being up until it has remained up for the hold-time period. |

### NOTE:

- We recommend that you configure the hold-time value after determining an appropriate value by performing repeated tests in the actual hardware environment. This is because the appropriate value for hold-time depends on the hardware (XFP, SFP, SR, ER, or LR) used in the networking environment.
  - The hold-time option is not available for controller interfaces.
-

**Hierarchy Level** [edit protocols]

**Release Information** Statement introduced in Junos OS Release 10.0 for MX Series routers.  
Statement introduced in Junos OS Release 12.2 for the QFX Series.  
Statement introduced in Junos OS Release 12.3R2 for EX Series switches.

**Description** Configure Interchassis Control Protocol (ICCP) between the multichassis link aggregation group (MC-LAG) peers. ICCP replicates forwarding information, validates configurations, and propagates the operational state of the MC-LAG members.

**NOTE:** Backup liveness detection is not supported on MX Series routers.

The remaining statement are explained separately.

     `}`  
     `}`

**Hierarchy Level** [edit [interfaces](#)]

**Release Information** Statement introduced in Junos OS Release 11.1 for the QFX series.

**Description** Group interfaces that share a common configuration profile.

**NOTE:** The interface range definition is supported only for Gigabit Ethernet, 10-Gigabit Ethernet, and Fibre Channel interfaces.

**Options** `interface-range-name`—Name of the interface range.

**NOTE:** You can use regular expressions and wildcards to specify the interfaces in the member range configuration. Do not use wildcards for interface types.

The remaining statements are explained separately.

**Required Privilege Level** `interface`—To view this statement in the configuration.  
     `interface-control`—To add this statement to the configuration.

## lacp (802.3ad)

---

**Syntax**    `lacp {  
              force-up;  
              (primary | backup);  
              port-priority;  
          }`

**Hierarchy Level**    [edit [interfaces interface-name ether-options 802.3ad](#)]

**Release Information**    Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Configure the Link Aggregation Control Protocol (LACP) parameters for interfaces. The remaining statement is explained separately.

**NOTE:** The port-priority statement is not supported on QFabric systems.

---

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                  interface-control—To add this statement to the configuration.

| <b>Release Information</b>      | Command introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b>              | For aggregated Ethernet interfaces only, set the required link speed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Options</b>                  | <p><b>speed</b>—For aggregated Ethernet links, you can specify the speed in bits per second either as a complete decimal number or as a decimal number followed by the abbreviation <b>k</b> (1000), <b>m</b> (1,000,000), or <b>g</b> (1,000,000,000).</p> <p>On QFX5100 standalone switches, you can configure <b>mixed</b> as the link speed. The <b>mixed</b> option allows you to configure mixed rate aggregated Ethernet bundles on a QFX5100 standalone switch with link speeds of 40G and 10G only. Load balancing will not work if you configure link speeds that are not supported.</p> <p>Aggregated Ethernet links on the QFX Series can have one of the following speed values:</p> <ul style="list-style-type: none"><li>• <b>100g</b>—Links are 100 Gbps.</li><li>• <b>100m</b>—Links are 100 Mbps.</li><li>• <b>10g</b>—Links are 10 Gbps.</li><li>• <b>1g</b>—Links are 1 Gbps.</li><li>• <b>40g</b>—Links are 40 Gbps.</li><li>• <b>50g</b>—Links are 50 Gbps.</li><li>• <b>80g</b>—Links are 80 Gbps.</li><li>• <b>8g</b>—Links are 8 Gbps.</li><li>• <b>0c192</b>—Links are OC-192.</li><li>• <b>mixed</b>—Links are 10 Gbps and 40Gbps.</li></ul> |

## mc-ae

**Syntax**    `mc-ae {  
                   chassis-id chassis-id;  
                   mc-ae-id mc-ae-id;  
                   mode (active-active);  
                   status-control (active | standby);  
                   }`

**Hierarchy Level**    [edit [interfaces aggregated-ether-options](#)]

**Release Information**    Statement introduced in Junos OS Release 12.2 for the QFX Series.

**Description**    Specify the multichassis aggregated Ethernet interface configuration.

**Options**    **chassis-id**—Specify the chassis ID for LACP to calculate the port number of the MC-LAG physical member links.

**mc-ae-id**—Specify the identification number of MC-LAG device. The two MC-LAG QFX3500 devices that manage a given MC-LAG must have the same **mc-lag-id**.

**mode (active | active)**—Specify that the MC-LAG is in active-active mode. In this mode, if a member interface of the MC-LAG goes down, traffic can still be forwarded to the QFX3500 devices hosting the MC-LAG using the interchassis link-protection link (ICL-PL). The links from the client-device connected to both of the QFX3500 devices will remain active. Only active-active mode is supported at this time.

**status-control (active | standby)**—Specify if a peer is in active or standby mode. In active mode, the peer is considered the primary device, and in standby mode it is considered the secondary device. If the ICL-PL goes down, the peer in standby mode will bring its member links to standby state. If the Interchassis Control Protocol (ICCP) connection goes down, the peer in standby mode will change the LACP system ID to the default value on its member links.

**NOTE:** You cannot have both peers hosting an MC-LAG be in active or standby mode. One peer must be in active mode, and the other peer must be in standby mode.

**Required Privilege Level**    interface—To view this statement in the configuration.  
                                          interface-control—To add this statement to the configuration.

## mc-ae-id

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Description</b>              | <p>Specify the maximum transmission unit (MTU) size for the media. Changing the media MTU size causes an interface to be deleted and added again. On a QFX3500, QFX3600, and QFX5100 switch, either standalone or as part of the QFabric system, the maximum MTU value on an untagged packet transiting through an ingress Gigabit Ethernet interface must be no more than the currently configured MTU value plus four, whereas the maximum MTU value on a tagged packet transiting through an ingress Gigabit Ethernet interface must be no more than the currently configured MTU value plus eight. The maximum MTU value on an untagged or tagged packet transiting through an ingress 10-Gigabit Ethernet interface must be no more than the currently configured MTU value plus eight.</p> <p>Keep the following points in mind if you are configuring MTU size for jumbo frames on these special types of interfaces:</p> <ul style="list-style-type: none"> <li>• <b>For LAG interfaces</b>—Configuring the jumbo MTU size on a link aggregation group (LAG) interface (<code>aex</code>) automatically configures the jumbo MTU size on the member links.</li> <li>• <b>For RVIs</b>—Jumbo frames of up to 9216 bytes are supported on the routed VLAN interface (RVI), which is named <code>vlan</code>. The RVI functions as a logical router. To route jumbo data packets on the RVI, you must configure the jumbo MTU size on the member physical interfaces of the RVI and not on the RVI itself (the <code>vlan</code> interface). However, for jumbo control packets—for example, to ping the RVI with a packet size of 6000 bytes or more—you must explicitly configure the jumbo MTU size on the interface named <code>vlan</code> (the RVI). On a QFX5100 switch, jumbo frames on the RVI are configured on the basis of the interface MTU.</li> </ul> |
|                                 | <div>  <p><b>CAUTION:</b> Setting or deleting the jumbo MTU size on the RVI (the <code>vlan</code> interface) while the switch is transmitting packets might result in dropped packets.</p> </div>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 9.6 for MX Series routers.<br>Statement introduced in Junos OS Release 12.2 for the QFX Series.                                                                                                                                                                                                                                                               |
| <b>Description</b>              | Configure the IP address of the peer that is part of the interchassis link-protection link (ICL-PL). If the Interchassis Control Connection Protocol (ICCP) is up and the interchassis link (ICL) comes up, the peer configured as standby will bring up the MC-AE interfaces shared with the active peer specified by the <b>peer</b> statement. You must specify the physical interface of the peer. |
| <b>Options</b>                  | <b>interface interface-name</b> —Specify the logical interface name of the peer.                                                                                                                                                                                                                                                                                                                       |

| Release Information      | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Description              | <div> <b>NOTE:</b> This statement does not support the Enhanced Layer 2 Software (ELS) configuration style. If your switch runs software that supports ELS, see <i>interface-mode</i>. For ELS details, see <i>Getting Started with Enhanced Layer 2 Software</i>.</div> <p>Configure whether an interface on the switch operates in access, tagged access, or trunk mode.</p>                                                                                                                                                                                                                                                                                        |
| Default                  | All switch interfaces are in access mode.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Options                  | <p><b>access</b>—Have the interface operate in access mode. In this mode, the interface can be in a single VLAN only. Access interfaces typically connect to network devices, such as PCs, printers, IP telephones, and IP cameras.</p> <p><b>tagged-access</b>—Have the interface operate in tagged-access mode. In this mode, the interface can be in multiple VLANs. Tagged access interfaces typically connect to network devices, such as PCs, printers, IP telephones, and IP cameras.</p> <p><b>trunk</b>—Have the interface operate in trunk mode. In this mode, the interface can be in multiple VLANs and can multiplex traffic between different VLANs. Trunk interfaces typically connect to other switches and to routers on the LAN.</p> |

| <b>Release Information</b>      | Statement introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                |
| <b>Description</b>              | Configure a Routing Engine to halt or reboot automatically when a hard disk error occurs. A hard disk error may cause a Routing Engine to enter a state in which it responds to local pings and interfaces remain up, but no other processes are responding. Rebooting or halting prevents this. |

| Release Information | Statement introduced in Junos OS Release 10.0 for MX Series routers.<br>Statement introduced in Junos OS Release 12.2 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Description         | Set Interchassis Control Protocol (ICCP) tracing options.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Default             | Tracing operations are disabled.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Options             | <p><b>disable</b>—(Optional) Disable the tracing operation. One use of this option is to disable a single operation when you have defined a broad group of tracing operations, such as <b>all</b>.</p> <p><b>file <i>name</i></b>—Name of the file to receive the output of the tracing operation. Enclose the name in quotation marks. By default, the log file is stored in <b>/var/log/</b>.</p> <p><b>files <i>number</i></b>—(Optional) Maximum number of trace files. When a trace file named <b><i>trace-file</i></b> reaches its maximum size, it is renamed <b><i>trace-file.0</i></b>, then <b><i>trace-file.1</i></b>, and so on, until the maximum number of trace files is reached. Then, the oldest trace file is overwritten.</p> <p>If you specify a maximum number of files, you must also specify a maximum file size with the <b>size</b> option.</p> <p><b>Range:</b> 2 through 1000 files</p> <p><b>Default:</b> 1 trace file only</p> <p><b><i>flag</i></b>—Tracing operation to perform. To specify more than one tracing operation, include multiple <b><i>flag</i></b> statements.</p> <p>The following are the tracing options:</p> <ul style="list-style-type: none"><li>• <b>all</b>—All tracing operations</li><li>• <b>config-internal</b>—Trace configuration internals.</li><li>• <b>general</b>—Trace general events.</li><li>• <b>normal</b>—All normal events.</li></ul> <p><b>Default:</b> If you do not specify this option, only unusual or abnormal operations are traced.</p> <ul style="list-style-type: none"><li>• <b>parse</b>—Trace configuration parsing.</li><li>• <b>policy</b>—Trace policy operations and actions.</li></ul> |

- **route**—Trace routing table changes.
- **state**—Trace state transitions.
- **task**—Trace protocol task processing.
- **timer**—Trace protocol task timer processing.

**no-world-readable**—(Optional) Prevent any user from reading the log file.

**size size**—(Optional) Maximum size of each trace file, in kilobytes (KB) or megabytes (MB). When a trace file named **trace-file** reaches this size, it is renamed **trace-file.0**. When the **trace-file** again reaches its maximum size, **trace-file.0** is renamed **trace-file.1** and **trace-file** is renamed **trace-file.0**. This renaming scheme continues until the maximum number of trace files is reached. Then the oldest trace file is overwritten.

If you specify a maximum file size, you must also specify a maximum number of trace files with the **files** option.

**Syntax:** **xk** to specify KB, **xm** to specify MB, or **xg** to specify GB

**Range:** 10 KB through the maximum file size supported on your system

**Default:** 1 MB

**world-readable**—(Optional) Allow any user to read the log file.

| <b>Description</b>              | <p>Configure the Bidirectional Forwarding Detection (BFD) transmit interval. The negotiated transmit interval for a peer is the interval between the sending of BFD liveness detection requests to peers. The receive interval for a peer is the minimum interval between receiving packets sent from its peer; the receive interval is not negotiated between peers. To determine the transmit interval, each peer compares its configured minimum transmit interval with its peer's minimum receive interval. The larger of the two numbers is accepted as the transmit interval for that peer.</p> <p>The remaining statements are explained separately.</p> |

## xle (Port)

|                            |                                                                                                                                                                       |
|----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <code>xle {<br/>    (port <i>port-number</i>   port-range <i>port-range-low</i> <i>port-range-high</i>);<br/>}</code>                                                 |
| <b>Hierarchy Level</b>     | [edit <code>chassis fpc slot pic pic-number</code> ]                                                                                                                  |
| <b>Release Information</b> | Statement introduced in Junos OS Release 12.2X50-D20 for the QFX Series.                                                                                              |
| <b>Description</b>         | (QFX3500 and QFX3600 standalone switches only) Configure a specific QSFP+ port or a range of QSFP+ ports to operate as 40-Gigabit Ethernet ( <i>xle</i> ) type ports. |

**CAUTION:** The Packet Forwarding Engine on the switch is restarted when you commit the port type configuration changes. As a result, you might experience packet loss on the switch.

## Monitoring System Process Information

**Purpose** View the processes running on the device.

**Action** To view the software processes running on the device:  
[edit system]

user@switch> [show system processes](#)

**Meaning** [Table 18 on page 337](#) summarizes the output fields in the system process information display.

The display includes the total CPU load and total memory utilization.

**Table 221: Summary of System Process Information Output Fields**

| Field | Values                     |
|-------|----------------------------|
| PID   | Identifier of the process. |
| Name  | Owner of the process.      |

Table 221: Summary of System Process Information Output Fields (*continued*)

| Field              | Values                                                   |
|--------------------|----------------------------------------------------------|
| State              | Current state of the process.                            |
| CPU Load           | Percentage of the CPU that is being used by the process. |
| Memory Utilization | Amount of memory that is being used by the process.      |
| Start Time         | Time of day when the process started.                    |

## Monitoring System Properties

**Purpose** View system properties such as the name, IP address, and resource usage.

**Action** To monitor system properties in the CLI, enter the following commands:

- [show system uptime](#)
- [show system users](#)
- [show system storage](#)

**Meaning** [Table 19 on page 338](#) summarizes key output fields in the system properties display.

Table 222: Summary of Key System Properties Output Fields

| Field                      | Values                                                                                                  | Additional Information                                 |
|----------------------------|---------------------------------------------------------------------------------------------------------|--------------------------------------------------------|
| <b>General Information</b> |                                                                                                         |                                                        |
| Serial Number              | Serial number of device.                                                                                |                                                        |
| Junos OS Version           | Version of Junos OS active on the switch, including whether the software is for domestic or export use. | Export software is for use outside the USA and Canada. |
| Hostname                   | Name of the device.                                                                                     |                                                        |
| IP Address                 | IP address of the device.                                                                               |                                                        |
| Loopback Address           | Loopback address.                                                                                       |                                                        |
| Domain Name Server         | Address of the domain name server.                                                                      |                                                        |
| Time Zone                  | Time zone on the device.                                                                                |                                                        |

Table 222: Summary of Key System Properties Output Fields (*continued*)

| Field                          | Values                                                                                                                                       | Additional Information                                                           |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------|
| <b>Time</b>                    |                                                                                                                                              |                                                                                  |
| Current Time                   | Current system time, in Coordinated Universal Time (UTC).                                                                                    |                                                                                  |
| System Booted Time             | Date and time when the device was last booted and how long it has been running.                                                              |                                                                                  |
| Protocol Started Time          | Date and time when the protocols were last started and how long they have been running.                                                      |                                                                                  |
| Last Configured Time           | Date and time when a configuration was last committed. This field also shows the name of the user who issued the last <b>commit</b> command. |                                                                                  |
| Load Average                   | CPU load average for 1, 5, and 15 minutes.                                                                                                   |                                                                                  |
| <b>Storage Media</b>           |                                                                                                                                              |                                                                                  |
| Internal Flash Memory          | Usage details of internal flash memory.                                                                                                      |                                                                                  |
| External Flash Memory          | Usage details of external USB flash memory.                                                                                                  |                                                                                  |
| <b>Logged in Users Details</b> |                                                                                                                                              |                                                                                  |
| User                           | Username of any user logged in to the switch.                                                                                                |                                                                                  |
| Terminal                       | Terminal through which the user is logged in.                                                                                                |                                                                                  |
| From                           | System from which the user has logged in. A hyphen indicates that the user is logged in through the console.                                 |                                                                                  |
| Login Time                     | Time when the user logged in.                                                                                                                | This is the <b>user@switch</b> field in <b>show system users</b> command output. |
| Idle Time                      | How long the user has been idle.                                                                                                             |                                                                                  |

- Related Documentation**
- [Monitoring System Process Information on page 337](#)
  - [show system processes on page 1117](#)

## Monitoring Interface Status and Traffic

**Purpose** View interface status to monitor interface bandwidth utilization and traffic statistics.

**Action** • To view interface status for all the interfaces, enter [show interfaces xe](#).

- To view status and statistics for a specific interface, enter **show interfaces xe interface-name**.
- To view status and traffic statistics for all interfaces, enter either **show interfaces xe detail** or **show interfaces xe extensive**.

**Meaning** For details about output from the CLI commands, see [show interfaces xe](#).

## Verifying That Layer 3 Logical Interfaces Are Working

**Purpose** After configuring Layer 3 logical interfaces, verify that they are set up properly and transmitting data.

- Action** 1. To determine if you have successfully created the logical interfaces and the links are up:

```
[edit interfaces]
user@switch> show interfaces interface-name terse
```

| Interface      | Admin | Link | Proto | Local      | Remote |
|----------------|-------|------|-------|------------|--------|
| ge-0/0/0       | up    | up   |       |            |        |
| ge-0/0/0.0     | up    | up   | inet  | 1.1.1.1/24 |        |
| ge-0/0/0.1     | up    | up   | inet  | 2.1.1.1/24 |        |
| ge-0/0/0.2     | up    | up   | inet  | 3.1.1.1/24 |        |
| ge-0/0/0.3     | up    | up   | inet  | 4.1.1.1/24 |        |
| ge-0/0/0.4     | up    | up   | inet  | 5.1.1.1/24 |        |
| ge-0/0/0.32767 | up    | up   |       |            |        |

2. Use the **ping** command from a device on one subnet to an address on another subnet to determine if packets were transmitted correctly on the logical interface VLANs:

```
user@switch> ping ip-address
PING 1.1.1.1 (1.1.1.1): 56 data bytes
64 bytes from 1.1.1.1: icmp_seq=0 ttl=64 time=0.157 ms
64 bytes from 1.1.1.1: icmp_seq=1 ttl=64 time=0.238 ms
64 bytes from 1.1.1.1: icmp_seq=2 ttl=64 time=0.255 ms
64 bytes from 1.1.1.1: icmp_seq=3 ttl=64 time=0.128 ms
--- 1.1.1.1 ping statistics ---
4 packets transmitted, 4 packets received, 0% packet loss
```

**Meaning** The output confirms that the logical interfaces have been created and the links are up.

**Related Documentation** • [Configuring a Layer 3 Logical Interface on page 2777](#)

## Verifying the Status of a LAG Interface

**Purpose** Verify that a link aggregation group (LAG) (**ae0**) has been created on the switch.

- Action** To verify that the **ae0** LAG has been created:

```
[edit interfaces]
show interfaces ae0 terse
```

| Interface | Admin | Link | Proto | Local | Remote |
|-----------|-------|------|-------|-------|--------|
|-----------|-------|------|-------|-------|--------|

```

ae0                up      up
ae0.0              up      up      inet      10.10.10.2/24

```

**Meaning** The output confirms that the **ae0** link is up and shows the family and IP address assigned to this link.

- Related Documentation**

  - [Example: Configuring Link Aggregation with LACP Between a QFX Series Product and an Aggregation Switch on page 2660](#)
  - [show lacp statistics interfaces \(View\) on page 3060](#)

## Verifying That LACP Is Configured Correctly and Bundle Members Are Exchanging LACP Protocol Packets

Verify that LACP has been set up correctly and that the bundle members are transmitting LACP protocol packets.

1. [Verifying the LACP Setup on page 2881](#)
2. [Verifying That LACP Packets Are Being Exchanged on page 2881](#)

### Verifying the LACP Setup

**Purpose** Verify that the LACP has been set up correctly.

**Action** To verify that LACP has been enabled as active on one end:

```

user@switch>show lacp interfaces xe-0/0/0
Aggregated interface: ae0
LACP state:
xe-0/1/0      Actor No Yes No No No Yes Fast Active
xe-0/1/0      PartnerNo Yes No No No Yes Fast Passive
LACP protocol: Receive State Transmit State Mux State
xe-0/1/0      Defaulted Fast periodic Detached

```

**Meaning** This example shows that LACP has been configured with one side as active and the other as passive. When LACP is enabled, one side must be set as active in order for the bundled link to be up.

### Verifying That LACP Packets Are Being Exchanged

**Purpose** Verify that LACP packets are being exchanged between interfaces.

**Action** Use the **show lacp statistics interfaces *interface-name*** command to display LACP BPDU exchange information.

**show lacp statistics interfaces ae0**

Aggregated interface: ae0

| LACP Statistics: | LACP Rx | LACP Tx | Unknown Rx | Illegal Rx |
|------------------|---------|---------|------------|------------|
| xe-0/0/2         | 1352    | 2035    | 0          | 0          |
| xe-0/0/3         | 1352    | 2056    | 0          | 0          |

**Meaning** The output here shows that the link is up and that PDUs are being exchanged.

## Verifying That Uplink Failure Detection Is Working Correctly

**Purpose** Verify that the switch disables the downlink interface when it detects an uplink failure.

**Action** 1. View the current uplink failure detection status:

```
user@switch> show uplink-failure-detection
Group                : group1
Uplink               : xe-0/0/0*
Downlink             : xe-0/0/1*
Failure Action       : Inactive
```

**NOTE:** The asterisk (\*) indicates that the link is up.

2. Disable the uplink interface:

[edit]

```
user@switch# set interface xe-0/0/0 disable
```

3. Save the configuration on the switch.

4. View the current uplink failure detection status:

```
user@switch> show uplink-failure-detection
Group                : group1
Uplink               : xe-0/0/0
Downlink             : xe-0/0/1
Failure Action       : Active
```

**Meaning** The output in Step 1 shows that the uplink interface is up, and hence that the downlink interface is also up, and that the status of **Failure Action** is **Inactive**.

The output in Step 4 shows that both the uplink and downlink interfaces are down (there are no asterisks after the interface name) and that the status of **Failure Action** is changed to **Active**. This output shows that uplink failure detection is working.

## monitor interface

**Syntax**    `monitor interface`  
               `<interface-name> | traffic <detail>>`

**Release Information**    Command introduced before Junos OS Release 7.4.  
                               Command introduced in Junos OS Release 9.0 for EX Series switches.  
                               Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Display real-time statistics about interfaces, updating the statistics every second. Check for and display common interface failures, such as SONET/SDH and T3 alarms, loopbacks detected, and increases in framing errors.

**NOTE:** This command is not supported on the QFX3000 QFabric system.

**Options**    **none**—Display real-time statistics for all interfaces.

**detail**—(Optional) With traffic option only, display detailed output.

**interface-name**—(Optional) Display real-time statistics for the specified interface. In a TX Matrix or TX Matrix Plus router, display real-time statistics for the physical interfaces on the specified line-card chassis (LCC) only.

**traffic**—(Optional) Display traffic data for all active interfaces. In a TX Matrix or TX Matrix Plus router, display real-time statistics for the physical interfaces on the specified LCC only.

**Additional Information**    The output of this command shows how much each field has changed since you started the command or since you cleared the counters by pressing the **c** key. For a description of the statistical information provided in the output of this command, see the **show interfaces extensive** command for a particular interface type in the [CLI Explorer](#). To control the output of the **monitor interface** command while it is running, use the keys listed in [Table 223 on page 2884](#). The keys are not case-sensitive.

**Table 223: Output Control Keys for the monitor interface Command**

| Key | Action                                                                                                                                                                                                                     |
|-----|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| c   | Clears (returns to zero) the delta counters since <b>monitor interface</b> was started. This does not clear the accumulative counter. To clear the accumulative counter, use the <b>clear interfaces interval</b> command. |
| f   | Freezes the display, halting the display of updated statistics and delta counters.                                                                                                                                         |
| i   | Displays information about a different interface. The command prompts you for the name of a specific interface.                                                                                                            |

**Table 223: Output Control Keys for the monitor interface Command** *(continued)*

| Key      | Action                                                                                                                                                                                         |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| n        | Displays information about the next interface. The <b>monitor interface</b> command displays the physical or logical interfaces in the same order as the <b>show interfaces terse</b> command. |
| q or Esc | Quits the command and returns to the command prompt.                                                                                                                                           |
| t        | Thaws the display, resuming the update of the statistics and delta counters.                                                                                                                   |

To control the output of the **monitor interface traffic** command while it is running, use the keys listed in [Table 224 on page 2885](#). The keys are not case-sensitive.

**Table 224: Output Control Keys for the monitor interface traffic Command**

| Key      | Action                                                                                                               |
|----------|----------------------------------------------------------------------------------------------------------------------|
| b        | Displays the statistics in units of bits and bits per second (bps).                                                  |
| c        | Clears (return to 0) the delta counters in the <b>Current Delta</b> column. The statistics counters are not cleared. |
| d        | Displays the <b>Current Delta</b> column (instead of the rate column) in Bps or packets per second (pps).            |
| p        | Displays the statistics in units of packets and packets per second (pps).                                            |
| q or Esc | Quits the command and returns to the command prompt.                                                                 |
| r        | Displays the rate column (instead of the <b>Current Delta</b> column) in Bps and pps.                                |

**Output Fields** [Table 225 on page 2886](#) describes the output fields for the **monitor interface** command. Output fields are listed in the approximate order in which they appear.

Table 225: monitor interface Output Fields

| Field Name               | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | Level of Output |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| <b>routerl</b>           | Hostname of the router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | All levels      |
| <b>Seconds</b>           | How long the monitor interface command has been running or how long since you last cleared the counters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | All levels      |
| <b>Time</b>              | Current time (UTC).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | All levels      |
| <b>Delay x/y/z</b>       | Time difference between when the statistics were displayed and the actual clock time. <ul style="list-style-type: none"> <li>• <b>x</b>—Time taken for the last polling (in milliseconds).</li> <li>• <b>y</b>—Minimum time taken across all pollings (in milliseconds).</li> <li>• <b>z</b>—Maximum time taken across all pollings (in milliseconds).</li> </ul>                                                                                                                                                                                                                                                                                                                        | All levels      |
| <b>Interface</b>         | Short description of the interface, including its name, status, and encapsulation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | All levels      |
| <b>Link</b>              | State of the link: <b>Up</b> , <b>Down</b> , or <b>Test</b> .                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | All levels      |
| <b>Current delta</b>     | Cumulative number for the counter in question since the time shown in the Seconds field, which is the time since you started the command or last cleared the counters.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | All levels      |
| <b>Local Statistics</b>  | (Logical interfaces only) Number and rate of bytes and packets destined to the router or switch through the specified interface. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It usually takes less than 1 second for this counter to stabilize. <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul> | All levels      |
| <b>Remote Statistics</b> | (Logical interfaces only) Statistics for traffic transiting the router or switch. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It usually takes less than 1 second for this counter to stabilize. <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul>                                                | All levels      |

Table 225: monitor interface Output Fields (*continued*)

| Field Name         | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Level of Output |
|--------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Traffic statistics | <p>Total number of bytes and packets received and transmitted on the interface. These statistics are the sum of the local and remote statistics. When a burst of traffic is received, the value in the output packet rate field might briefly exceed the peak cell rate. It usually takes less than 1 second for this counter to stabilize.</p> <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface.</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul> | All levels      |
| Description        | With the <b>traffic</b> option, displays the interface description configured at the <b>[edit interfaces <i>interface-name</i>]</b> hierarchy level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | detail          |

## Sample Output

### monitor interface (Physical)

```

user@host> monitor interface so-0/0/0
router1                               Seconds: 19                      Time: 15:46:29

Interface: so-0/0/0, Enabled, Link is Up
Encapsulation: PPP, Keepalives, Speed: 0C48
Traffic statistics:
    Input packets:                6045 (0 pps)
    Input bytes:                  6290065 (0 bps)
    Output packets:               10376 (0 pps)
    Output bytes:                 10365540 (0 bps)
Encapsulation statistics:
    Input keepalives:             1901
    Output keepalives:           1901
    NCP state: Opened
    LCP state: Opened
Error statistics:
    Input errors:                 0
    Input drops:                 0
    Input framing errors:        0
    Policed discards:            0
    L3 incompletes:              0
    L2 channel errors:           0
    L2 mismatch timeouts:        0
    Carrier transitions:         1
    Output errors:               0
    Output drops:               0
    Aged packets:               0
Active alarms : None
Active defects: None
SONET error counts/seconds:
    LOS count                    1
    LOF count                    1
    SEF count                    1
    ES-S                        0
    SES-S                        0
SONET statistics:
    BIP-B1                      458871

```

```

BIP-B2                      460072          [0]
REI-L                      465610          [0]
BIP-B3                      458978          [0]
REI-P                      458773          [0]

```

## Received SONET overhead:

```

F1      : 0x00 J0      : 0x00 K1      : 0x00
K2      : 0x00 S1      : 0x00 C2      : 0x00
C2(cmp) : 0x00 F2      : 0x00 Z3      : 0x00
Z4      : 0x00 S1(cmp) : 0x00

```

## Transmitted SONET overhead:

```

F1      : 0x00 J0      : 0x01 K1      : 0x00
K2      : 0x00 S1      : 0x00 C2      : 0xcf
F2      : 0x00 Z3      : 0x00 Z4      : 0x00

```

## monitor interface (OTN Interface)

```
user@host> monitor interface ge-7/0/0
```

```
Interface: ge-7/0/0, Enabled, Link is Up
Encapsulation: Ethernet, Speed: 10000mbps
```

## Traffic statistics:

```

Input bytes:                0 (0 bps)
Output bytes:               0 (0 bps)
Input packets:              0 (0 pps)
Output packets:             0 (0 pps)

```

## Error statistics:

```

Input errors:               0
Input drops:                0
Input framing errors:       0
Policed discards:           0
L3 incompletes:             0
L2 channel errors:          0
L2 mismatch timeouts:       0
Carrier transitions:         5
Output errors:              0
Output drops:               0
Aged packets:               0

```

Active alarms : None

Active defects: None

## Input MAC/Filter statistics:

```

Unicast packets             0
Broadcast packets           0
Multicast packets           0
Oversized frames            0
Packet reject count         0
DA rejects                  0
SA rejects                  0

```

## Output MAC/Filter Statistics:

```

Unicast packets             0
Broadcast packets           0
Multicast packets           0
Packet pad count            0
Packet error count          0

```

## OTN Link 0

| <b>Output Fields</b>            | <a href="#">Table 226 on page 2893</a> lists the output fields for the <b>show iccp</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

Table 226: show iccp

| Field Name                            | Field Description                                                                                       |
|---------------------------------------|---------------------------------------------------------------------------------------------------------|
| Redundancy Group Information for peer | Aggregated Ethernet interface name.                                                                     |
| TCP Connection                        | Specifies if the TCP connection between the peers hosting the MC-LAG is up or down.                     |
| Liveness Detection                    | Specifies if liveness detection, also known as Bidirectional Forwarding Detection (BFD), is up or down. |

Table 226: show iccp (*continued*)

| Field Name                     | Field Description                                                                                                   |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------|
| Client Application             | Specifies information regarding the state of the MCSNOOPD and ESWD client applications.                             |
| Redundancy Group IDs<br>Joined | Denotes the redundancy group unique identifier that is associated for the particular client application or process. |

## Sample Output

### show iccp

```
user@switch> show iccp
Redundancy Group Information for peer 3.3.3.2
  TCP Connection      : Established
  Liveliness Detection : Up

Client Application: MCSNOOPD

Client Application: eswd
```

| <b>Syntax</b>                   | <code>show interfaces diagnostics optics <i>interface-name</i></code>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Release Information</b>      | Command introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Description</b>              | <p>Display diagnostics data and alarms for Gigabit Ethernet, 10-Gigabit Ethernet, and QSFP+ optical transceivers installed in a QFX Series product. The information provided by this command is known as digital optical monitoring (DOM) information.</p> <p>Thresholds that trigger a high alarm, low alarm, high warning, or low warning are set by the transponder vendors. Generally, a high alarm or low alarm indicates that the optics module is not operating properly. This information can be used to diagnose why a transceiver is not working.</p> |
| <b>Options</b>                  | <i>interface-name</i> —Name of the interface associated with the port in which the transceiver is installed.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

Table 227: show interfaces diagnostics optics Output Fields

| Field Name                           | Field Description                                                                                                                                                  |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Physical interface                   | Displays the name of the physical interface.                                                                                                                       |
| Laser bias current                   | Displays the magnitude of the laser bias power setting current, in milliamperes. The laser bias provides direct modulation of laser diodes and modulates currents. |
| Laser output power                   | Displays the laser output power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm).                                                                         |
| Module temperature                   | Displays the temperature, in Celsius and Fahrenheit.                                                                                                               |
| Module voltage                       | Displays the voltage, in volts.                                                                                                                                    |
| (Not available for XFP transceivers) |                                                                                                                                                                    |

Table 227: show interfaces diagnostics optics Output Fields (*continued*)

| Field Name                                                                           | Field Description                                                                                             |
|--------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------|
| <b>Laser rx power</b><br>(Not available for SFP and SFP+ transceivers)               | Displays the laser received optical power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm).          |
| <b>Receiver signal average optical power</b><br>(Not available for XFP transceivers) | Displays the receiver signal average optical power, in milliwatts (mW) and decibels referred to 1.0 mW (dBm). |
| <b>Laser bias current high alarm</b>                                                 | Displays whether the laser bias power setting high alarm is <b>On</b> or <b>Off</b> .                         |
| <b>Laser bias current low alarm</b>                                                  | Displays whether the laser bias power setting low alarm is <b>On</b> or <b>Off</b> .                          |
| <b>Laser bias current high warning</b>                                               | Displays whether the laser bias power setting high warning is <b>On</b> or <b>Off</b> .                       |
| <b>Laser bias current low warning</b>                                                | Displays whether the laser bias power setting low warning is <b>On</b> or <b>Off</b> .                        |
| <b>Laser output power high alarm</b>                                                 | Displays whether the laser output power high alarm is <b>On</b> or <b>Off</b> .                               |
| <b>Laser output power low alarm</b>                                                  | Displays whether the laser output power low alarm is <b>On</b> or <b>Off</b> .                                |
| <b>Laser output power high warning</b>                                               | Displays whether the laser output power high warning is <b>On</b> or <b>Off</b> .                             |
| <b>Laser output power low warning</b>                                                | Displays whether the laser output power low warning is <b>On</b> or <b>Off</b> .                              |
| <b>Module temperature high alarm</b>                                                 | Displays whether the module temperature high alarm is <b>On</b> or <b>Off</b> .                               |
| <b>Module temperature low alarm</b>                                                  | Displays whether the module temperature low alarm is <b>On</b> or <b>Off</b> .                                |
| <b>Module temperature high warning</b>                                               | Displays whether the module temperature high warning is <b>On</b> or <b>Off</b> .                             |
| <b>Module temperature low warning</b>                                                | Displays whether the module temperature low warning is <b>On</b> or <b>Off</b> .                              |
| <b>Module voltage high alarm</b><br>(Not available for XFP transceivers)             | Displays whether the module voltage high alarm is <b>On</b> or <b>Off</b> .                                   |
| <b>Module voltage low alarm</b><br>(Not available for XFP transceivers)              | Displays whether the module voltage low alarm is <b>On</b> or <b>Off</b> .                                    |
| <b>Module voltage high warning</b><br>(Not available for XFP transceivers)           | Displays whether the module voltage high warning is <b>On</b> or <b>Off</b> .                                 |
| <b>Module voltage low warning</b><br>(Not available for XFP transceivers)            | Displays whether the module voltage low warning is <b>On</b> or <b>Off</b> .                                  |
| <b>Laser rx power high alarm</b>                                                     | Displays whether the receive laser power high alarm is <b>On</b> or <b>Off</b> .                              |

Table 227: show interfaces diagnostics optics Output Fields (*continued*)

| Field Name                                                                 | Field Description                                                                                                                                                                  |
|----------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Laser rx power low alarm                                                   | Displays whether the receive laser power low alarm is <b>On</b> or <b>Off</b> .                                                                                                    |
| Laser rx power high warning                                                | Displays whether the receive laser power high warning is <b>On</b> or <b>Off</b> .                                                                                                 |
| Laser rx power low warning                                                 | Displays whether the receive laser power low warning is <b>On</b> or <b>Off</b> .                                                                                                  |
| Laser bias current high alarm threshold                                    | Displays the vendor-specified threshold for the laser bias current high alarm.                                                                                                     |
| Module not ready alarm<br>(Not available for SFP and SFP+ transceivers)    | Displays whether the module not ready alarm is <b>On</b> or <b>Off</b> . When the output is <b>On</b> , the module has an operational fault.                                       |
| Module power down alarm<br>(Not available for SFP and SFP+ transceivers)   | Displays whether the module power down alarm is <b>On</b> or <b>Off</b> . When the output is <b>On</b> , the module is in a limited power mode, low for normal operation.          |
| Tx data not ready alarm<br>(Not available for SFP and SFP+ transceivers)   | Any condition leading to invalid data on the transmit path. Displays whether the Tx data not ready alarm is <b>On</b> or <b>Off</b> .                                              |
| Tx not ready alarm<br>(Not available for SFP and SFP+ transceivers)        | Any condition leading to invalid data on the transmit path. Displays whether the Tx not ready alarm is <b>On</b> or <b>Off</b> .                                                   |
| Tx laser fault alarm<br>(Not available for SFP and SFP+ transceivers)      | Laser fault condition. Displays whether the Tx laser fault alarm is <b>On</b> or <b>Off</b> .                                                                                      |
| Tx CDR loss of lock alarm<br>(Not available for SFP and SFP+ transceivers) | Transmit clock and data recovery (CDR) loss of lock. Loss of lock on the transmit side of the CDR. Displays whether the Tx CDR loss of lock alarm is <b>On</b> or <b>Off</b> .     |
| Rx not ready alarm<br>(Not available for SFP and SFP+ transceivers)        | Any condition leading to invalid data on the receive path. Displays whether the Rx not ready alarm is <b>On</b> or <b>Off</b> .                                                    |
| Rx loss of signal alarm<br>(Not available for SFP and SFP+ transceivers)   | Receive loss of signal alarm. When <b>on</b> , indicates insufficient optical input power to the module. Displays whether the Rx loss of signal alarm is <b>On</b> or <b>Off</b> . |
| Rx CDR loss of lock alarm<br>(Not available for SFP and SFP+ transceivers) | Receive CDR loss of lock. Loss of lock on the receive side of the CDR. Displays whether the Rx CDR loss of lock alarm is <b>On</b> or <b>Off</b> .                                 |
| Laser bias current low alarm threshold                                     | Displays the vendor-specified threshold for the laser bias current low alarm.                                                                                                      |
| Laser bias current high warning threshold                                  | Displays the vendor-specified threshold for the laser bias current high warning.                                                                                                   |

Table 227: show interfaces diagnostics optics Output Fields (*continued*)

| Field Name                                                                    | Field Description                                                                |
|-------------------------------------------------------------------------------|----------------------------------------------------------------------------------|
| Laser bias current low warning threshold                                      | Displays the vendor-specified threshold for the laser bias current low warning.  |
| Laser output power high alarm threshold                                       | Displays the vendor-specified threshold for the laser output power high alarm.   |
| Laser output power low alarm threshold                                        | Displays the vendor-specified threshold for the laser output power low alarm.    |
| Laser output power high warning threshold                                     | Displays the vendor-specified threshold for the laser output power high warning. |
| Laser output power low warning threshold                                      | Displays the vendor-specified threshold for the laser output power low warning.  |
| Module temperature high alarm threshold                                       | Displays the vendor-specified threshold for the module temperature high alarm.   |
| Module temperature low alarm threshold                                        | Displays the vendor-specified threshold for the module temperature low alarm.    |
| Module temperature high warning threshold                                     | Displays the vendor-specified threshold for the module temperature high warning. |
| Module temperature low warning threshold                                      | Displays the vendor-specified threshold for the module temperature low warning.  |
| Module voltage high alarm threshold<br>(Not available for XFP transceivers)   | Displays the vendor-specified threshold for the module voltage high alarm.       |
| Module voltage low alarm threshold<br>(Not available for XFP transceivers)    | Displays the vendor-specified threshold for the module voltage low alarm.        |
| Module voltage high warning threshold<br>(Not available for XFP transceivers) | Displays the vendor-specified threshold for the module voltage high warning.     |
| Module voltage low warning threshold<br>(Not available for XFP transceivers)  | Displays the vendor-specified threshold for the module voltage low warning.      |
| Laser rx power high alarm threshold                                           | Displays the vendor-specified threshold for the laser Rx power high alarm.       |
| Laser rx power low alarm threshold                                            | Displays the vendor-specified threshold for the laser Rx power low alarm.        |
| Laser rx power high warning threshold                                         | Displays the vendor-specified threshold for the laser Rx power high warning.     |

Table 227: show interfaces diagnostics optics Output Fields (*continued*)

| Field Name                           | Field Description                                                           |
|--------------------------------------|-----------------------------------------------------------------------------|
| Laser rx power low warning threshold | Displays the vendor-specified threshold for the laser Rx power low warning. |

## Sample Output

### show interfaces diagnostics optics xe-0/0/1 (SFP+ Transceiver)

**Output Fields** Table 183 on page 2385 lists the output fields for the **show interfaces fabric** command. Output fields are listed in the approximate order in which they appear.

**Table 228: show interfaces fabric Output Fields**

| Field Name                | Field Description                                                                                                    | Level of Output       |
|---------------------------|----------------------------------------------------------------------------------------------------------------------|-----------------------|
| <b>Physical Interface</b> |                                                                                                                      |                       |
| Physical interface        | Name of the physical interface.                                                                                      | All levels            |
| Enabled                   | State of the interface.                                                                                              | All levels            |
| Type                      | Physical interface type; for example, Ethernet.                                                                      | All levels            |
| Interface index           | Index number of the physical interface, which reflects its initialization sequence.                                  | detail extensive none |
| SNMP ifIndex              | SNMP index number for the physical interface.                                                                        | detail extensive none |
| Link-level type           | Encapsulation being used on the physical interface.                                                                  | All levels            |
| MTU                       | Maximum transmission unit size on the physical interface.                                                            | All levels            |
| Clocking                  | Reference clock source.                                                                                              | detail                |
| Speed                     | Speed at which the interface is running.                                                                             | All levels            |
| Duplex                    | Duplex mode of the interface, either Full-Duplex or Half-Duplex.                                                     | All levels            |
| MAC-REWRITE Error         | Specifies if the encapsulation of the packet has been changed.                                                       | none                  |
| BPDU Error                | Specifies if a BPDU has been received on a blocked interface.                                                        | none                  |
| Loopback                  | Loopback status: Enabled or Disabled. If loopback is enabled, type of loopback: Local or Remote.                     | All levels            |
| Source filtering          | Source filtering status: Enabled or Disabled.                                                                        | All levels            |
| Flow control              | Flow control status: Enabled or Disabled. This field is only displayed if asymmetric flow control is not configured. | All levels            |
| Device flags              | Information about the physical device.                                                                               | All levels            |
| Interface flags           | Information about the interface.                                                                                     | All levels            |
| CoS queues                | Number of CoS queues configured.                                                                                     | detail extensive none |
| Hold-Times                | Current interface hold-time up and hold-time down, in milliseconds.                                                  | detail                |

Table 228: show interfaces fabric Output Fields (*continued*)

| Field Name   | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Level of Output |
|--------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Input errors | <p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• Errors—Sum of the incoming frame aborts and FCS errors.</li> <li>• Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• Framing errors—Number of packets received with an invalid frame checksum (FCS).</li> <li>• Runts—Number of frames received that are smaller than the runt threshold.</li> <li>• Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle.</li> <li>• L3 incompletes—Number of incoming packets discarded because they failed Layer 3 sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored if you configure the <code>ignore-l3-incompletes</code> statement.</li> <li>• L2 channel errors—Number of times the software did not find a valid logical interface for an incoming frame.</li> <li>• L2 mismatch timeouts—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</li> <li>• FIFO errors—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• Resource errors—Sum of transmit drops.</li> </ul> | extensive       |

Table 228: show interfaces fabric Output Fields (*continued*)

| Field Name                       | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Level of Output       |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|
| Output errors                    | <p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</li> <li>Errors—Sum of the outgoing frame aborts and FCS errors.</li> <li>Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>Collisions—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug.</li> <li>Aged packets—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>FIFO errors—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>HS link CRC errors—Number of errors on the high-speed links between the ASICs responsible for handling the fabric interfaces.</li> <li>MTU errors—Number of packets whose size exceeded the MTU of the interface.</li> <li>Resource errors—Sum of transmit drops.</li> </ul> | extensive             |
| Egress queues                    | Total number of egress queues supported on the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | detail extensive      |

| Active alarms and Active defects | <p>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the switch configuration, an alarm can ring the red or yellow alarm bell on the switch, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value <b>None</b> or <b>Link</b>.</p> <ul style="list-style-type: none"> <li><b>None</b>—There are no active defects or alarms.</li> <li><b>Link</b>—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | detail extensive none |

Table 228: show interfaces fabric Output Fields (*continued*)

| Field Name                             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | Level of Output |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| MAC statistics                         | <p>Receive and Transmit statistics reported by the PIC's MAC subsystem.</p> <ul style="list-style-type: none"> <li>Total octets and total packets—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type.</li> <li>Unicast packets, Broadcast packets, and Multicast packets—Number of unicast, broadcast, and multicast packets.</li> <li>CRC/Align errors—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</li> <li>FIFO error—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>MAC control frames—Number of MAC control frames.</li> <li>MAC pause frames—Number of MAC control frames with pause operational code.</li> <li>Oversized frames—Number of packets that exceed the configured MTU.</li> <li>Jabber frames—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</li> <li>Fragment frames—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.</li> <li>VLAN tagged frames—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not. This counter is not supported on EX Series switches and is always displayed as 0.</li> <li>Code violations—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error."</li> </ul> | extensive       |
| Packet Forwarding Engine Configuration | <p>Information about the configuration of the Packet Forwarding Engine:</p> <ul style="list-style-type: none"> <li>Destination slot—FPC slot number.</li> <li>CoS transmit queue—Queue number and its associated user-configured forwarding class name.</li> <li>Bandwidth %—Percentage of bandwidth allocated to the queue.</li> <li>Buffer usec—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time.</li> <li>Priority—Queue priority: low or high.</li> <li>Limit—Displayed if rate limiting is configured for the queue. Possible values are none and exact. If exact is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If none is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | extensive       |

Table 228: show interfaces fabric Output Fields (*continued*)

| Field Name        | Field Description                                                                                                                                                                                                                                                                                                                                                                                  | Level of Output       |
|-------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|
| Item              | Type of QFabric system component being viewed. Possible values include Node group, Interconnect device, Fabric control, Fabric manager, Diagnostic routing engine, and Ungrouped Node device.                                                                                                                                                                                                      | none                  |
| Identifier        | Hardware serial identifier of a QFabric system component. When you configure an alias name for a component, the ID is displayed.                                                                                                                                                                                                                                                                   | none                  |
| Connection        | Status of a QFabric system component: either Connected or Disconnected, depending on whether or not the Director software has detected keepalive messages for the listed component.                                                                                                                                                                                                                | none                  |
| Configuration     | Whether or not the configuration for a QFabric system component has been received and installed. The configuration can be Configured, Failed (unsuccessful), Pending (in the process of being written or retried), or Unknown.                                                                                                                                                                     | none                  |
| Node group        | Name of the Node groups associated with the QFabric system, and the Node devices assigned to each Node group. The group can be either Connected or Disconnected, depending on whether or not the Director software has detected keepalive messages for the devices in the group. This field also displays the serial ID for the Node group and the status for the Node group.                      | none                  |
| Fabric control    | Name of the virtual Junos Routing Engines responsible for route selection within a QFabric system partition. The fabric control Routing Engine can be either Connected or Disconnected, depending on whether or not the Director software has detected keepalive messages for this virtual device. It also displays the identifier and configuration status for the fabric control Routing Engine. | none                  |
| Logical interface | Name of the logical interface.                                                                                                                                                                                                                                                                                                                                                                     | All levels            |
| Index             | Index number of the logical interface, which reflects its initialization sequence.                                                                                                                                                                                                                                                                                                                 | detail extensive none |
| SNMP ifIndex      | SNMP interface index number for the logical interface.                                                                                                                                                                                                                                                                                                                                             | detail extensive none |
| Flags             | Information about the logical interface.<br><br>If unicast Reverse Path Forwarding (uRPF) is explicitly configured on the specified interface, the uRPF flag appears. If uRPF was configured on a different interface (and therefore is enabled on all switch interfaces) but was not explicitly configured on the specified interface, the uRPF flag does not appear even though uRPF is enabled. | All levels            |
| Encapsulation     | Encapsulation method used on the logical interface.                                                                                                                                                                                                                                                                                                                                                | All levels            |

Table 228: show interfaces fabric Output Fields (*continued*)

| Field Name             | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Level of Output       |
|------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------|

| Local statistics       | <ul style="list-style-type: none"> <li>Input bytes—Number of bytes received on the interface.</li> <li>Output bytes—Number of bytes transmitted on the interface.</li> <li>Input packets—Number of packets received on the interface.</li> <li>Output packets—Number of packets transmitted on the interface.</li> </ul> <p><b>NOTE:</b> The bandwidth bps counter is not enabled.</p>                                                                                                 | detail extensive      |
| Transit statistics     | <ul style="list-style-type: none"> <li>Input bytes—Number of bytes received on the interface.</li> <li>Output bytes—Number of bytes transmitted on the interface.</li> <li>Input packets—Number of packets received on the interface.</li> <li>Output packets—Number of packets transmitted on the interface.</li> </ul> <p><b>NOTE:</b> The bandwidth bps counter is not enabled.</p>                                                                                                 | detail extensive      |
| <i>protocol-family</i> | Protocol family configured on the logical interface. If the protocol is inet, the IP address of the interface is also displayed.                                                                                                                                                                                                                                                                                                                                                       | brief                 |
| Generation             | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                                                                                                                                                                                                                                                      | detail extensive      |
| Route table            | Route table in which the logical interface address is located. For example, 0 refers to the routing table inet.0.                                                                                                                                                                                                                                                                                                                                                                      | detail extensive none |

## Sample Output

### show interfaces fabric

```

user@switch> show interfaces fabric
Item                               Identifier      Connection      Configuration
Node group
  BBAK3775                         Connected      Configured
  NW-NG-0                           Connected      Configured
  P2659-C                           Connected      Configured
  ptor-0                             Connected      Configured
Fabric control
  FC-0                             Connected      Configured
  FC-1                             Connected      Configured

```

### show interfaces fabric brief

```

user@switch> show interfaces fabric brief

```

Physical interface: BBAK0372:fte-0/1/0, Enabled, Physical link is Up  
 Link-level type: Ethernet, MTU: 9232, Speed: 40Gbps, Duplex: Full-Duplex,  
 Loopback: Disabled, Source filtering: Disabled, Flow control: Disabled  
 Device flags : Present Running  
 Interface flags: SNMP-Traps Internal: 0x0

Logical interface BBAK0372:fte-0/1/0.32768  
 Flags: SNMP-Traps 0x0 Encapsulation: ENET2  
 eth-switch

Physical interface: BBAK0372:fte-0/1/2, Enabled, Physical link is Up  
 Link-level type: Ethernet, MTU: 9232, Speed: 40Gbps, Duplex: Full-Duplex,  
 Loopback: Disabled, Source filtering: Disabled, Flow control: Disabled  
 Device flags : Present Running  
 Interface flags: SNMP-Traps Internal: 0x0

Logical interface BBAK0372:fte-0/1/2.32768  
 Flags: SNMP-Traps 0x0 Encapsulation: ENET2  
 eth-switch

Physical interface: BBAK0394:fte-0/1/0, Enabled, Physical link is Up  
 Link-level type: Ethernet, MTU: 9232, Speed: 40Gbps, Duplex: Full-Duplex,  
 Loopback: Disabled, Source filtering: Disabled, Flow control: Disabled  
 Device flags : Present Running  
 Interface flags: SNMP-Traps Internal: 0x4000

Logical interface BBAK0394:fte-0/1/0.32768  
 Flags: SNMP-Traps Encapsulation: ENET2  
 eth-switch

Physical interface: BBAK0394:fte-0/1/2, Enabled, Physical link is Up  
 Link-level type: Ethernet, MTU: 9232, Speed: 40Gbps, Duplex: Full-Duplex,  
 Loopback: Disabled, Source filtering: Disabled, Flow control: Disabled  
 Device flags : Present Running  
 Interface flags: SNMP-Traps Internal: 0x4000

Logical interface BBAK0394:fte-0/1/2.32768  
 Flags: SNMP-Traps Encapsulation: ENET2  
 eth-switch

Physical interface: BBAK3775:bme0, Enabled, Physical link is Up  
 Type: Ethernet, Link-level type: Ethernet, MTU: 1500, Clocking: Unspecified,  
 Speed: Unspecified  
 Device flags : Present Running

Logical interface BBAK3775:bme0.0  
 Flags: LinkAddress 0-0 Encapsulation: ENET2  
 inet 128.0.0.1/2  
 128.0.0.16/2  
 128.0.32.0/2

| <b>Release Information</b>      | Command introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Description</b>              | Display status information about the specified Gigabit Ethernet interface. This command does not display statistics for routed VLAN interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>                  | <p><b>brief   detail   extensive   terse</b>—(Optional) Display the specified level of output.</p> <p><b><i>device-name:type-fpc/pic/port</i></b>—The device name is either the serial number or the alias of the QFabric system component, such as a Node device, Interconnect device, or QFabric infrastructure. The name can contain a maximum of 128 characters and cannot contain any colons.</p> <p><b>descriptions</b>—(Optional) Display interface description strings.</p> <p><b>media</b>—(Optional) Display media-specific information about network interfaces.</p> <p><b>routing instance (all   <i>instance-name</i>)</b>—(Optional) Display the name of an individual routing-instance or display all routing-instances.</p> <p><b>snmp-index <i>snmp-index</i></b>—(Optional) Display information for the specified SNMP index of the interface.</p> <p><b>statistics</b>—(Optional) Display static interface statistics.</p> |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

The format is <b>Last flapped: year-month-day hour:minute:second timezone (hour:minute:second ago)</b> . For example, <b>Last flapped: 2008-01-16 10:52:40 UTC (3d 22:58 ago)</b> .                                                                                                                                                                                                                                                                             | <b>detail extensive none</b> |
| <b>Statistics last cleared</b> | Time when the statistics for the interface were last set to zero.                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive</b>      |
| <b>Traffic statistics</b>      | Number and rate of bytes and packets received and transmitted on the physical interface. <ul style="list-style-type: none"> <li>• <b>Input bytes</b>—Number of bytes received on the interface.</li> <li>• <b>Output bytes</b>—Number of bytes transmitted on the interface.</li> <li>• <b>Input packets</b>—Number of packets received on the interface</li> <li>• <b>Output packets</b>—Number of packets transmitted on the interface.</li> </ul> <p><b>NOTE:</b> The bandwidth bps counter is not enabled on the switch.</p> | <b>detail extensive</b>      |

Table 229: show interfaces ge Output Fields (*continued*)

| Field Name          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       | Level of Output  |
|---------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>Input errors</b> | <p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle.</li> <li>• <b>L3 incompletes</b>—Number of incoming packets discarded because they failed Layer 3 sanity checks of the headers. For example, a frame with less than 20 bytes of available IP header is discarded.</li> <li>• <b>L2 channel errors</b>—Number of times the software did not find a valid logical interface for an incoming frame.</li> <li>• <b>L2 mismatch timeouts</b>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b> |

Table 229: show interfaces ge Output Fields (*continued*)

| Field Name                              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Level of Output              |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Output errors</b>                    | <p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Collisions</b>—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug.</li> <li>• <b>Aged packets</b>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>HS link CRC errors</b>—Number of errors on the high-speed links between the ASICs responsible for handling the switch interfaces.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b>             |
| <b>Egress queues</b>                    | Total number of egress queues supported on the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>detail extensive</b>      |

| Field Name               | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | Level of Output  |
|--------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------|
| <b>MAC statistics</b>    | <p>Receive and Transmit statistics reported by the PIC's MAC subsystem.</p> <ul style="list-style-type: none"> <li>• <b>Total octets</b> and <b>total packets</b>—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type.</li> <li>• <b>Unicast packets, Broadcast packets, and Multicast packets</b>—Number of unicast, broadcast, and multicast packets.</li> <li>• <b>CRC/Align errors</b>—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</li> <li>• <b>FIFO error</b>—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>MAC control frames</b>—Number of MAC control frames.</li> <li>• <b>MAC pause frames</b>—Number of MAC control frames with <b>pause</b> operational code.</li> <li>• <b>Oversized frames</b>—Number of packets that exceeds the configured MTU.</li> <li>• <b>Jabber frames</b>—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</li> <li>• <b>Fragment frames</b>—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runts (which are normal occurrences caused by collisions) and noise hits are counted.</li> <li>• <b>VLAN tagged frames</b>—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not. This counter is not supported on EX Series switches and is always displayed as 0.</li> <li>• <b>Code violations</b>—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error."</li> </ul> | <b>extensive</b> |
| <b>Filter Statistics</b> | Receive and Transmit statistics reported by the PIC's MAC address filter subsystem.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | <b>extensive</b> |

| <b>Encapsulation</b>           | Encapsulation on the logical interface.                                                                                                                                                                                                                                                                                                                                                                               | All levels                   |
| <b>Protocol</b>                | Protocol family.                                                                                                                                                                                                                                                                                                                                                                                                      | <b>detail extensive none</b> |
| <b>Traffic statistics</b>      | Number and rate of bytes and packets received (input) and transmitted (output) on the specified interface.                                                                                                                                                                                                                                                                                                            | <b>detail extensive</b>      |
| <b>IPv6 transit statistics</b> | If IPv6 statistics tracking is enabled, number of IPv6 bytes and packets received and transmitted on the logical interface.                                                                                                                                                                                                                                                                                           | <b>extensive</b>             |
| <b>Local statistics</b>        | Number and rate of bytes and packets destined to and from the switch.                                                                                                                                                                                                                                                                                                                                                 | <b>extensive</b>             |
| <b>Transit statistics</b>      | Number and rate of bytes and packets transiting the switch.                                                                                                                                                                                                                                                                                                                                                           | <b>extensive</b>             |
| <b>Generation</b>              | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b>      |
| <b>Route Table</b>             | Route table in which the logical interface address is located. For example, 0 refers to the routing table <b>inet.0</b> .                                                                                                                                                                                                                                                                                             | <b>detail extensive none</b> |
| <b>Input Filters</b>           | Names of any input filters applied to this interface.                                                                                                                                                                                                                                                                                                                                                                 | <b>detail extensive</b>      |
| <b>Output Filters</b>          | Names of any output filters applied to this interface.                                                                                                                                                                                                                                                                                                                                                                | <b>detail extensive</b>      |
| <b>Flags</b>                   | Information about protocol family flags.<br><br>If unicast reverse-path forwarding (RPF) is explicitly configured on the specified interface, the uRPF flag is displayed. If unicast RPF was configured on a different interface (and therefore is enabled on all switch interfaces) but was not explicitly configured on the specified interface, the uRPF flag is not displayed even though unicast RPF is enabled. | <b>detail extensive</b>      |
| <b><i>protocol-family</i></b>  | Protocol family configured on the logical interface. If the protocol is <b>inet</b> , the IP address of the interface is also displayed.                                                                                                                                                                                                                                                                              | <b>brief</b>                 |
| <b>Flags</b>                   | Information about the address flags.                                                                                                                                                                                                                                                                                                                                                                                  | <b>detail extensive none</b> |
| <b>Destination</b>             | IP address of the remote side of the connection.                                                                                                                                                                                                                                                                                                                                                                      | <b>detail extensive none</b> |
| <b>Local</b>                   | IP address of the logical interface.                                                                                                                                                                                                                                                                                                                                                                                  | <b>detail extensive none</b> |
| <b>Broadcast</b>               | Broadcast address of the logical interlace.                                                                                                                                                                                                                                                                                                                                                                           | <b>detail extensive none</b> |
| <b>Generation</b>              | Unique number for use by Juniper Networks technical support only.                                                                                                                                                                                                                                                                                                                                                     | <b>detail extensive</b>      |

## Sample Output

### show interfaces

```
user@switch> show interfaces ge-0/0/9
Physical interface: ge-0/0/9, Enabled, Physical link is Down
  Interface index: 129, SNMP ifIndex: 21
  Link-level type: Ethernet, MTU: 1514, Speed: Unspecified, Loopback: Disabled,
  Source filtering: Disabled, Flow control: Enabled, Auto-negotiation: Enabled
  Remote fault: Online
  Device flags   : Present Running Down
  Interface flags: Hardware-Down SNMP-Traps Internal: 0x0
  CoS queues    : 8 supported, 8 maximum usable queues
  Hold-times    : Up 0 ms, Down 0 ms
  Current address: 00:19:e2:50:3f:41, Hardware address: 00:19:e2:50:3f:41
  Last flapped  : 2008-01-16 11:40:53 UTC (4d 02:30 ago)
  Input rate    : 0 bps (0 pps)
  Output rate   : 0 bps (0 pps)
  Ingress rate at Packet Forwarding Engine : 0 bps (0 pps)
  Ingress drop rate at Packet Forwarding Engine : 0 bps (0 pps)
  Active alarms : None
  Active defects: None

Logical interface ge-0/0/9.0 (Index 65) (SNMP ifIndex 22)
  Flags: SNMP-Traps
  Encapsulation: ENET2
  Input packets : 0
  Output packets: 0
  Protocol eth-switch
  Flags: None
```

### show interfaces brief

```
user@switch> show interfaces ge-0/0/9 brief
Physical interface: ge-0/0/9, Enabled, Physical link is Down
  Description: voice priority and tcp and icmp traffic rate-limiting filter at i
  ngress port
  Link-level type: Ethernet, MTU: 1514, Speed: Unspecified, Loopback: Disabled,
  Source filtering: Disabled, Flow control: Enabled, Auto-negotiation: Enabled,
  Remote fault: Online
  Device flags   : Present Running Down
  Interface flags: Hardware-Down SNMP-Traps Internal: 0x0
  Link flags     : None

Logical interface ge-0/0/9.0
  Flags: Device-Down SNMP-Traps Encapsulation: ENET2
  eth-switch
```

### show interfaces detail (Symmetric Flow Control and Autonegotiation Enabled)

```
user@switch> show interfaces ge-0/0/9 detail
Physical interface: ge-0/0/9, Enabled, Physical link is Up
  Interface index: 193, SNMP ifIndex: 206, Generation: 196
  Link-level type: Ethernet, MTU: 1514, Speed: Auto, Duplex: Auto,
  BPDU Error: None, MAC-REWRITE Error: None, Loopback: Disabled,
  Source filtering: Disabled, Flow control: Enabled, Auto-negotiation: Enabled,
  Remote fault: Online
  Device flags   : Present Running
  Interface flags: SNMP-Traps Internal: 0x0
  Link flags     : None
  CoS queues    : 8 supported, 8 maximum usable queues
```

```

Hold-times      : Up 0 ms, Down 0 ms
Current address: 00:1f:12:30:ff:40, Hardware address: 00:1f:12:30:ff:40
Last flapped   : 2009-05-05 06:03:05 UTC (00:22:13 ago)
Statistics last cleared: Never
Traffic statistics:
  Input bytes   : 0 0 bps
  Output bytes  : 0 0 bps
  Input packets : 0 0 pps
  Output packets: 0 0 pps
IPv6 transit statistics:
  Input bytes   : 0
  Output bytes  : 0
  Input packets : 0
  Output packets: 0
Egress queues: 8 supported, 4 in use
Queue counters:
  Queued packets  Transmitted packets  Dropped packets

  7 network-cont   0 0 0

Active alarms : None
Active defects : None

Logical interface ge-0/0/9.0 (Index 65) (SNMP ifIndex 235) (Generation 130)
Flags: SNMP-Traps Encapsulation: ENET2
Bandwidth: 0
Traffic statistics:
  Input bytes   : 0
  Output bytes  : 0
  Input packets : 0
  Output packets: 0
Local statistics:
  Input bytes   : 0
  Output bytes  : 0
  Input packets : 0
  Output packets: 0
Transit statistics:
  Input bytes   : 0 0 bps
  Output bytes  : 0 0 bps
  Input packets : 0 0 pps
  Output packets: 0 0 pps
Protocol eth-switch, Generation: 146, Route table: 0
Flags: Is-Primary
Input Filters: f1,
Output Filters: f2,,,

```

#### show interfaces detail (Asymmetric Flow Control and Autonegotiation Enabled)

| <b>Output Fields</b>            | <a href="#">Table 230 on page 2937</a> lists the output fields for the <b>show interfaces mc-ae</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

**Table 230: show interfaces mc-ae Output Fields**

| Output Field Name                    | Field Description                                               |
|--------------------------------------|-----------------------------------------------------------------|
| <b>Current State Machine's State</b> | Specifies the state of the MC-LAG initialization state machine. |

Table 230: show interfaces mc-ae Output Fields (*continued*)

| Output Field Name        | Field Description                                                                                                                                                                                |
|--------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Member Link</b>       | Specifies the identifiers of the configured multichassis link aggregated interface members.                                                                                                      |
| <b>Local Status</b>      | Specifies the status of the local link: <b>active</b> or <b>standby</b> .                                                                                                                        |
| <b>Peer Status</b>       | Specifies the status of the peer link: <b>active</b> or <b>standby</b> .                                                                                                                         |
| <b>Peer State</b>        | Specifies the status of the local and peer links in an <b>active/active</b> MC-LAG configuration                                                                                                 |
| <b>Logical Interface</b> | Specifies the identifier and unit of the AE interface.                                                                                                                                           |
| <b>Topology Type</b>     | Specifies the bridge configured on the AE.                                                                                                                                                       |
| <b>Local State</b>       | Specifies if the local device is up or down.                                                                                                                                                     |
| <b>Peer State</b>        | Specifies if the peer device is up or down.                                                                                                                                                      |
| <b>Peer Ip/MCP/State</b> | Specifies the multichassis protection (MCP) link or the interchassis link-protection link (ICL-PL) for all of the multichassis aggregated Ethernet (MC-AE) interfaces that are part of the peer. |

## Sample Output

### show interfaces mc-ae

```

user@host> show interfaces mc-ae ae1 512
Member Link           : ae0
Current State Machine's State: mcae active state
Local Status          : active
Local State           : up
Peer Status           : active
Peer State            : up
  Logical Interface    : ae0.0
  Topology Type        : bridge
  Local State          : up
  Peer State           : up
  Peer Ip/MCP/State    : 3.3.3.2 ae1.0 up

```

| <b>Physical Interface</b> |                                                                                                                                                                                                                                                      |                 |
| Physical interface        | Name of the physical interface.                                                                                                                                                                                                                      | All levels      |
| Enabled                   | State of the interface.                                                                                                                                                                                                                              | All levels      |
| Interface index           | Index number of the physical interface, which reflects its initialization sequence.                                                                                                                                                                  | detail none     |
| SNMP ifIndex              | SNMP index number for the physical interface.                                                                                                                                                                                                        | detail none     |
| Link-level type           | Encapsulation being used on the physical interface.                                                                                                                                                                                                  | All levels      |
| MTU                       | Maximum transmission unit size on the physical interface.                                                                                                                                                                                            | All levels      |
| Clocking                  | Reference clock source.                                                                                                                                                                                                                              | detail          |
| Speed                     | Speed at which the interface is running.                                                                                                                                                                                                             | All levels      |
| Duplex                    | Duplex mode of the interface, either Full-Duplex or Half-Duplex.                                                                                                                                                                                     | All levels      |
| MAC-REWRITE Error         | Specifies if the encapsulation of the packet has been changed.                                                                                                                                                                                       | none            |
| BPDU Error                | Specifies if a BPDU has been received on a blocked interface.                                                                                                                                                                                        | none            |
| Loopback                  | Loopback status: Enabled or Disabled. If loopback is enabled, type of loopback: Local or Remote.                                                                                                                                                     | All levels      |
| Source filtering          | Source filtering status: Enabled or Disabled.                                                                                                                                                                                                        | All levels      |
| Flow control              | Flow control status: Enabled or Disabled. This field is only displayed if asymmetric flow control is not configured.                                                                                                                                 | All levels      |
| Device flags              | Information about the physical device.                                                                                                                                                                                                               | All levels      |
| Interface flags           | Information about the interface.                                                                                                                                                                                                                     | All levels      |
| CoS queues                | Number of CoS queues configured.                                                                                                                                                                                                                     | detail none     |
| Hold-Times                | Current interface hold-time up and hold-time down, in milliseconds.                                                                                                                                                                                  | detail          |
| Current address           | Configured MAC address.                                                                                                                                                                                                                              | detail none     |
| Hardware address          | Hardware MAC address.                                                                                                                                                                                                                                | detail none     |
| Last flapped              | Date, time, and how long ago the interface went from down to up. The format is <b>Last flapped: year-month-day hour:minute:second:timezone (hour:minute:second ago)</b> . For example, <b>Last flapped: 2008-01-16 10:52:40 UTC (3d 22:58 ago)</b> . | detail none     |

Table 231: show interfaces statistics fabric Output Fields (*continued*)

| Field Name              | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Level of Output |
|-------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Statistics last cleared | Date, time, and how long ago the statistics for the interface were cleared. The format is <b>Statistics last cleared: year-month-day hour:minute:second:timezone (hour:minute:second ago)</b> . For example, 2010-05-17 07:51:28 PDT (00:04:33 ago).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | detail          |

| Input errors            | <p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• Errors—Sum of the incoming frame aborts and FCS errors.</li> <li>• Drops—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• Framing errors—Number of packets received with an invalid frame checksum (FCS).</li> <li>• Runt—Number of frames received that are smaller than the runt threshold.</li> <li>• Policed discards—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle.</li> <li>• L3 incompletes—Number of incoming packets discarded because they failed Layer 3 sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored if you configure the ignore-l3-incompletes statement.</li> <li>• L2 channel errors—Number of times the software did not find a valid logical interface for an incoming frame.</li> <li>• L2 mismatch timeouts—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</li> <li>• FIFO errors—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• Resource errors—Sum of transmit drops.</li> </ul> | detail none     |

Table 231: show interfaces statistics fabric Output Fields (*continued*)

| Field Name               | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Level of Output |
|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Output errors            | <p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>Carrier transitions—Number of times the interface has gone from down to up. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</li> <li>Errors—Sum of the outgoing frame aborts and FCS errors.</li> <li>Drops—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>Collisions—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug.</li> <li>Aged packets—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>FIFO errors—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>HS link CRC errors—Number of errors on the high-speed links between the ASICs responsible for handling the fabric interfaces.</li> <li>MTU errors—Number of packets whose size exceeded the MTU of the interface.</li> <li>Resource errors—Sum of transmit drops.</li> </ul> | detail none     |
| Egress queues            | Total number of egress queues supported on the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | detail          |

| Addresses, Flags       | Information about the address flags.                                                                                                                                                                                                                                                                                                                                                                                                                                                   | detail none     |
| <i>protocol-family</i> | Protocol family configured on the logical interface. If the protocol is <b>inet</b> , the IP address of the interface is also displayed.                                                                                                                                                                                                                                                                                                                                               | brief           |

Table 231: show interfaces statistics fabric Output Fields (*continued*)

| Field Name  | Field Description                                                                                                 | Level of Output |
|-------------|-------------------------------------------------------------------------------------------------------------------|-----------------|
| MTU         | Maximum transmission unit size on the physical interface.                                                         | All levels      |
| Destination | IP address of the remote side of the connection.                                                                  | detail none     |
| Local       | IP address of the logical interface.                                                                              | detail none     |
| Broadcast   | Broadcast address of the logical interlace.                                                                       | detail none     |
| Generation  | Unique number for use by Juniper Networks technical support only.                                                 | detail          |
| Route table | Route table in which the logical interface address is located. For example, 0 refers to the routing table inet.0. | detail none     |

## Sample Output

### show interfaces statistics fabric

```

user@switch> show interfaces statistic fabric
Physical interface: IC-WS001:fte-0/0/0, Enabled, Physical link is Down
  Interface index: 49174, SNMP ifIndex: 1208484473
  Link-level type: Ethernet, MTU: 9232, Speed: 40Gbps, Duplex: Full-Duplex, BPDU
  Error: None, MAC-REWRITE Error: None, Loopback: Disabled, Source filtering:
  Disabled, Flow control: Disabled
  Device flags   : Present Running
  Interface flags: SNMP-Traps Internal: 0x0
  CoS queues    : 12 supported, 12 maximum usable queues

| <b>Description</b>         | Display class-of-service (CoS) queue information for physical interfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>             | <p><b>none</b>—Show detailed CoS queue statistics for all physical interfaces.</p> <p><b>aggregate</b>—(Optional) Display the aggregated queuing statistics of all logical interfaces that have traffic-control profiles configured. (Not on the QFX Series.)</p> <p><b>both-ingress-egress</b>—(Optional) On Gigabit Ethernet Intelligent Queuing 2 (IQ2) PICs, display both ingress and egress queue statistics. (Not on the QFX Series.)</p> <p><b>egress</b>—(Optional) Display egress queue statistics.</p> <p><b>forwarding-class forwarding-class</b>—(Optional) Forwarding class name for this queue. Shows detailed CoS statistics for the queue associated with the specified forwarding class.</p> <p><b>ingress</b>—(Optional) On Gigabit Ethernet IQ2 PICs, display ingress queue statistics. (Not on the QFX Series.)</p> <p><b>interface-name interface-name</b>—(Optional) Show detailed CoS queue statistics for the specified interface.</p> <p><b>l2-statistics</b>—(Optional) Display Layer 2 statistics for MLPPP, FRF.15, and FRF.16 bundles</p> <p><b>remaining-traffic</b>—(Optional) Display the remaining-traffic queue statistics of all logical interfaces that have traffic-control profiles configured.</p> |

### Overhead for Layer 2 Statistics

Transmitted packets and transmitted byte counts are displayed for the Layer 2 level with the addition of encapsulation overheads applied for fragmentation, as shown in [Table 232 on page 2958](#). Others counters, such as packets and bytes queued (input) and drop counters, are displayed at the Layer 3 level. In the case of link fragmentation and interleaving (LFI) for which fragmentation is not applied, corresponding Layer 2 overheads are added, as shown in [Table 232 on page 2958](#).

Table 232: Layer 2 Overhead, Transmitted Packets/Bytes

| Protocol       | Fragmentation       |                                   | LFI |
|----------------|---------------------|-----------------------------------|-----|
|                | First fragmentation | Second to <i>n</i> fragmentations |     |
|                | Bytes               | Bytes                             |     |
| MLPPP (Long)   | 13                  | 12                                | 8   |
| MLPPP (short)  | 11                  | 10                                | 8   |
| MLFR (FRF15)   | 12                  | 10                                | 8   |
| MFR (FRF16)    | 10                  | 8                                 | -   |
| MCMLPPP(Long)  | 13                  | 12                                | -   |
| MCMLPPP(Short) | 11                  | 10                                | -   |

## Layer 2 Statistics—Fragmentation Overhead Calculation

## MLPPP/MC-MLPPP Overhead details:

=====

## Fragment 1:

```

Outer PPP header           : 4 bytes
Long or short sequence MLPPP header : 4 bytes or 2 bytes
Inner PPP header           : 1 byte
HDLC flag and FCS bytes    : 4 bytes

```

## Fragments 2 .. n :

```

Outer PPP header           : 4 bytes
Long or short sequence MLPPP header : 4 bytes or 2 bytes
HDLC flag and FCS bytes    : 4 bytes

```

## MLFR (FRF15) Overhead details:

=====

## Fragment 1:

```

Framereelay header        : 2 bytes
Control,NLPID             : 2 bytes
Fragmentaion header       : 2 bytes
Inner proto               : 2 bytes
HDLC flag and FCS         : 4 bytes

```

## Fragments 2 ...n :

```

Framereelay header        : 2 bytes
Control,NLPID             : 2 bytes
Fragmentaion header       : 2 bytes
HDLC flag and FCS         : 4 bytes

```

## MFR (FRF16) Overhead details:

=====

```

Fragment 1:
  Fragmentation header : 2 bytes
  Framereelay header   : 2 bytes
  Inner proto          : 2 bytes
  HDLC flag and FCS    : 4 bytes

Fragments 2 ...n :
  Fragmentation header : 2 bytes
  Framereelay header   : 2 bytes
  HDLC flag and FCS    : 4 bytes

```

## Overhead with LFI

```

MLPPP(Long & short sequence):
=====
  Outer PPP header : 4 bytes
  HDLC flag and FCS : 4 bytes

```

```

MLFR (FRF15):
=====
  Framereelay header : 2 bytes
  Control,NLPID      : 2 bytes
  HDLC flag and FCS  : 4 bytes

```

The following examples show overhead for different cases:

- A 1000-byte packet is sent to a mlppp bundle without any fragmentation. At the Layer 2 level, bytes transmitted is 1013 in 1 packet. This overhead is for MLPPP long sequence encap.
- A 1000-byte packet is sent to a mlppp bundle with a fragment threshold of 250byte. At the Layer 2 level, bytes transmitted is 1061 bytes in 5 packets.
- A 1000-byte LFI packet is sent to an mlppp bundle. At the Layer 2 level, bytes transmitted is 1008 in 1 packet.

**remaining-traffic**—(Optional) Display the queuing statistics of all logical interfaces that do not have traffic-control profiles configured. (Not on the QFX Series.)

## Additional Information

For rate-limited interfaces hosted on Modular Interface Cards (MICs), Modular Port Concentrators (MPCs), or Enhanced Queuing DPCs, rate-limit packet-drop operations occur *before* packets are queued for transmission scheduling. For such interfaces, the statistics for queued traffic do not include the packets that have already been dropped due to rate limiting, and consequently the displayed statistics for queued traffic are the same as the displayed statistics for transmitted traffic.

**NOTE:** For rate-limited interfaces hosted on other types of hardware, rate-limit packet-drop operations occur *after* packets are queued for transmission scheduling. For these other interface types, the statistics for queued traffic include the packets that are later dropped due to rate limiting, and consequently the displayed statistics for queued traffic equals the sum of the statistics for transmitted and rate-limited traffic.

On M Series routers (except for the M320 and M120 routers), this command is valid only for a PIC installed on an enhanced Flexible PIC Concentrator (FPC).

Queue statistics for aggregated interfaces are supported on the M Series and T Series routers only. Statistics for an aggregated interface are the summation of the queue statistics of the child links of that aggregated interface. You can view the statistics for a child interface by using the **show interfaces statistics** command for that child interface.

When you configure tricolor marking on a 10-port 1-Gigabit Ethernet PIC, for queues 6 and 7 only, the output does not display the number of queued bytes and packets, or the number of bytes and packets dropped because of RED. If you do not configure tricolor marking on the interface, these statistics are available for all queues.

For the 4-port Channelized OC12 IQE PIC and 1-port Channelized OC48 IQE PIC, the **Packet Forwarding Engine Chassis Queues** field represents traffic bound for a particular physical interface on the PIC. For all other PICs, the **Packet Forwarding Engine Chassis Queues** field represents the total traffic bound for the PIC.

For Gigabit Ethernet IQ2 PICs, the **show interfaces queue** command output does not display the number of tail-dropped packets. This limitation does not apply to Packet Forwarding Engine chassis queues.

When fragmentation occurs on the egress interface, the first set of packet counters shows the postfragmentation values. The second set of packet counters (under the **Packet Forwarding Engine Chassis Queues** field) shows the prefragmentation values.

The behavior of the **egress** queues for the **Routing Engine-Generated Traffic** is not same as the configured queue for MLPPP and MFR configurations.

For information about how to configure CoS, see the *Junos OS Network Interfaces Library for Routing Devices*. For related CoS operational mode commands, see the [CLI Explorer](#).

| Ingress queues in use                                                                                                                               | On Gigabit Ethernet IQ2 PICs only, total number of ingress queues in use on the specified interface.                                                                                                                                                                                                                                                                      |
| Output queues supported                                                                                                                             | Total number of output queues supported on the specified interface.                                                                                                                                                                                                                                                                                                       |
| Output queues in use                                                                                                                                | Total number of output queues in use on the specified interface.                                                                                                                                                                                                                                                                                                          |
| Egress queues supported                                                                                                                             | Total number of egress queues supported on the specified interface.                                                                                                                                                                                                                                                                                                       |
| Egress queues in use                                                                                                                                | Total number of egress queues in use on the specified interface.                                                                                                                                                                                                                                                                                                          |
| Queue counters (Ingress)                                                                                                                            | CoS queue number and its associated user-configured forwarding class name. Displayed on IQ2 interfaces. <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul> |
| Burst size                                                                                                                                          | (Logical interfaces on IQ PICs only) Maximum number of bytes up to which the logical interface can burst. The burst size is based on the shaping rate applied to the interface.                                                                                                                                                                                           |
| The following output fields are applicable to both interface component and Packet Forwarding component in the <b>show interfaces queue</b> command: |                                                                                                                                                                                                                                                                                                                                                                           |
| Queue                                                                                                                                               | Queue number.                                                                                                                                                                                                                                                                                                                                                             |
| Forwarding classes                                                                                                                                  | Forwarding class name.                                                                                                                                                                                                                                                                                                                                                    |

Table 233: show interfaces queue Output Fields (*continued*)

| Field Name                  | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Queued Packets</b>       | <p>Number of packets queued to this queue.</p> <p><b>NOTE:</b> For Gigabit Ethernet IQ2 interfaces, the Queued Packets count is calculated by the Junos OS interpreting one frame buffer as one packet. If the queued packets are very large or very small, the calculation might not be completely accurate for transit traffic. The count is completely accurate for traffic terminated on the router.</p> <p>For rate-limited interfaces hosted on MICs or MPCs only, this statistic does not include traffic dropped due to rate limiting. For more information, see <a href="#">“Additional Information” on page 2959</a>.</p> |
| <b>Queued Bytes</b>         | <p>Number of bytes queued to this queue. The byte counts vary by interface hardware. For more information, see <a href="#">Table 234 on page 2964</a>.</p> <p>For rate-limited interfaces hosted on MICs or MPCs only, this statistic does not include traffic dropped due to rate limiting. For more information, see <a href="#">“Additional Information” on page 2959</a>.</p>                                                                                                                                                                                                                                                   |
| <b>Transmitted Packets</b>  | <p>Number of packets transmitted by this queue. When fragmentation occurs on the egress interface, the first set of packet counters shows the postfragmentation values. The second set of packet counters (displayed under the <b>Packet Forwarding Engine Chassis Queues</b> field) shows the prefragmentation values.</p> <p><b>NOTE:</b> For Layer 2 statistics, see <a href="#">“Overhead for Layer 2 Statistics” on page 2957</a></p>                                                                                                                                                                                          |
| <b>Transmitted Bytes</b>    | <p>Number of bytes transmitted by this queue. The byte counts vary by interface hardware. For more information, see <a href="#">Table 234 on page 2964</a>.</p> <p><b>NOTE:</b> On MX Series routers, this number can be inaccurate when you issue the command for a physical interface repeatedly and in quick succession, because the statistics for the child nodes are collected infrequently. Wait ten seconds between successive iterations to avoid this situation.</p> <p><b>NOTE:</b> For Layer 2 statistics, see <a href="#">“Overhead for Layer 2 Statistics” on page 2957</a></p>                                       |
| <b>Tail-dropped packets</b> | Number of packets dropped because of tail drop.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>RL-dropped packets</b>   | <p>Number of packets dropped due to rate limiting.</p> <p>For rate-limited interfaces hosted on MICs, MPCs, and Enhanced Queuing DPCs only, this statistic is not included in the queued traffic statistics. For more information, see <a href="#">“Additional Information” on page 2959</a>.</p>                                                                                                                                                                                                                                                                                                                                   |
| <b>RL-dropped bytes</b>     | <p>Number of bytes dropped due to rate limiting.</p> <p>For rate-limited interfaces hosted on MICs, MPCs, and Enhanced Queuing DPCs only, this statistic is not included in the queued traffic statistics. For more information, see <a href="#">“Additional Information” on page 2959</a>.</p>                                                                                                                                                                                                                                                                                                                                     |

Table 233: show interfaces queue Output Fields (*continued*)

| Field Name          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|---------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| RED-dropped packets | <p>Number of packets dropped because of random early detection (RED).</p> <ul style="list-style-type: none"> <li>(M Series and T Series routers only) On M320 and M120 routers and the T Series routers, the total number of dropped packets is displayed. On all other M Series routers, the output classifies dropped packets into the following categories: <ul style="list-style-type: none"> <li><b>Low, non-TCP</b>—Number of low-loss priority non-TCP packets dropped because of RED.</li> <li><b>Low, TCP</b>—Number of low-loss priority TCP packets dropped because of RED.</li> <li><b>High, non-TCP</b>—Number of high-loss priority non-TCP packets dropped because of RED.</li> <li><b>High, TCP</b>—Number of high-loss priority TCP packets dropped because of RED.</li> </ul> </li> <li>(J Series routers and MX Series routers with enhanced DPCs, and T Series routers with enhanced FPCs only) The output classifies dropped packets into the following categories: <ul style="list-style-type: none"> <li><b>Low</b>—Number of low-loss priority packets dropped because of RED.</li> <li><b>Medium-low</b>—Number of medium-low loss priority packets dropped because of RED.</li> <li><b>Medium-high</b>—Number of medium-high loss priority packets dropped because of RED.</li> <li><b>High</b>—Number of high-loss priority packets dropped because of RED.</li> </ul> </li> </ul> <p><b>NOTE:</b> Due to accounting space limitations on certain Type 3 FPCs (which are supported in M320 and T640 routers), this field does not always display the correct value for queue 6 or queue 7 for interfaces on 10-port 1-Gigabit Ethernet PICs.</p> |
| RED-dropped bytes   | <p>Number of bytes dropped because of RED. The byte counts vary by interface hardware. For more information, see <a href="#">Table 234 on page 2964</a>.</p> <ul style="list-style-type: none"> <li>(M Series and T Series routers only) On M320 and M120 routers and the T Series routers, only the total number of dropped bytes is displayed. Byte counts vary by interface hardware. [Table 234 on page 2964](#) shows how the byte counts on the outbound interfaces vary depending on the interface hardware.

[Table 234 on page 2964](#) is based on the assumption that outbound interfaces are sending IP traffic with 478 bytes per packet.

Table 234: Byte Count by Interface Hardware

| Interface Hardware               | Output Level                | Byte Count Includes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Comments                                                                                                                                                                                                     |
|----------------------------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Gigabit Ethernet IQ and IQE PICs | Interface                   | <p>Queued: 490 bytes per packet, representing 478 bytes of Layer 3 packet + 12 bytes</p> <p>Transmitted: 490 bytes per packet, representing 478 bytes of Layer 3 packet + 12 bytes</p> <p>RED dropped: 496 bytes per packet representing 478 bytes of Layer 3 packet + 18 bytes</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | <p>The 12 additional bytes include 6 bytes for the destination MAC address + 4 bytes for the VLAN + 2 bytes for the Ethernet type.</p> <p>For RED dropped, 6 bytes are added for the source MAC address.</p> |
|                                  | Packet forwarding component | <p>Queued: 478 bytes per packet, representing 478 bytes of Layer 3 packet</p> <p>Transmitted: 478 bytes per packet, representing 478 bytes of Layer 3 packet</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             | —                                                                                                                                                                                                            |

Table 234: Byte Count by Interface Hardware (*continued*)

| Interface Hardware                                   | Output Level                | Byte Count Includes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Comments                                                                                                                           |
|------------------------------------------------------|-----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| IQ and IQE PICs with a SONET/SDH interface           | Interface                   | <p>Queued: 482 bytes per packet, representing 478 bytes of Layer 3 packet + 4 bytes</p> <p>Transmitted: 482 bytes per packet, representing 478 bytes of Layer 3 packet + 4 bytes</p> <p>RED dropped: 482 bytes per packet, representing 478 bytes of Layer 3 packet + 4 bytes</p>                                                                                                                                                                                                                       | The additional 4 bytes are for the Layer 2 Point-to-Point Protocol (PPP) header.                                                   |
|                                                      | Packet forwarding component | <p>Queued: 478 bytes per packet, representing 478 bytes of Layer 3 packet</p> <p>Transmitted: 486 bytes per packet, representing 478 bytes of Layer 3 packet + 8 bytes</p>                                                                                                                                                                                                                                                                                                                              | For transmitted packets, the additional 8 bytes includes 4 bytes for the PPP header and 4 bytes for a cookie.                      |
| Non-IQ PIC with a SONET/SDH interface                | Interface                   | <p>T Series, TX Series, T1600, and MX Series routers:</p> <ul style="list-style-type: none"> <li>Queued: 478 bytes of Layer 3 packet.</li> <li>Transmitted: 478 bytes of Layer 3 packet.</li> </ul> <p>M Series routers:</p> <ul style="list-style-type: none"> <li>Queued: 478 bytes of Layer 3 packet.</li> <li>Transmitted: 483 bytes per packet, representing 478 bytes of Layer 3 packet + 5 bytes</li> <li>RED dropped: 478 bytes per packet, representing 478 bytes of Layer 3 packet</li> </ul> | For transmitted packets, the additional 5 bytes includes 4 bytes for the PPP header and 1 byte for the packet loss priority (PLP). |
| Interfaces configured with Frame Relay Encapsulation | Interface                   | The default Frame Relay overhead is 7 bytes. If you configure the Frame Check Sequence (FCS) to 4 bytes, then the overhead increases to 10 bytes.                                                                                                                                                                                                                                                                                                                                                       |                                                                                                                                    |
| 1-port 10-Gigabit Ethernet IQ2 and IQ2-E PICs        | Interface                   | <p>Queued: 478 bytes of Layer 3 packet + the full Layer 2 overhead including CRC.</p> <p>Transmitted: 478 bytes of Layer 3 packet + the full Layer 2 overhead including CRC.</p>                                                                                                                                                                                                                                                                                                                        | The Layer 2 overhead is 18 bytes for non-VLAN traffic and 22 bytes for VLAN traffic.                                               |

## Sample Output

### show interfaces queue (Rate-Limited Interface on a Gigabit Ethernet MIC in an MPC)

The following example shows queue information for the rate-limited interface ge-4/2/0 on a Gigabit Ethernet MIC in an MPC. For rate-limited queues for interfaces hosted on MICs or MPCs, rate-limit packet drops occur prior to packet output queuing. In the

command output, the nonzero statistics displayed in the **RL-dropped packets** and **RL-dropped bytes** fields quantify the traffic dropped to rate-limit queue 0 output to 10 percent of 1 gigabyte (100 megabits) per second. Because the RL-dropped traffic is not included in the **Queued** statistics, the statistics displayed for queued traffic are the same as the statistics for transmitted traffic.

```
user@host> show interfaces queue ge-4/2/0
Physical interface: ge-4/2/0, Enabled, Physical link is Up
  Interface index: 203, SNMP ifIndex: 1054

Table 235: show interfaces queue fabric Output Fields

| Field Name         | Field Description               |
|--------------------|---------------------------------|
| Physical interface | Name of the physical interface. |

Table 235: show interfaces queue fabric Output Fields (*continued*)

| Field Name                | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Enabled</b>            | State of the interface. Possible values are: <ul style="list-style-type: none"> <li>Administratively down, Physical link is Down—The interface is turned off, and the physical link is inoperable.</li> <li>Administratively down, Physical link is Up—The interface is turned off, but the physical link is operational and can pass packets when it is enabled.</li> <li>Enabled, Physical link is Down—The interface is turned on, but the physical link is inoperable and cannot pass packets.</li> <li>Enabled, Physical link is Up—The interface is turned on, and the physical link is operational and can pass packets.</li> </ul> |
| <b>Interface index</b>    | Physical interface's index number, which reflects its initialization sequence.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>SNMP ifIndex</b>       | SNMP index number for the physical interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>Forwarding classes</b> | Number of forwarding classes supported and in use for the interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Egress queues</b>      | Number of output queues supported and in use on the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Queue</b>              | CoS queue number.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Transmitted</b>        | Number of packets and bytes transmitted by this queue. Information on transmitted packets and bytes can include: <ul style="list-style-type: none"> <li>Packets—Number of packets transmitted.</li> <li>Bytes—Number of bytes transmitted.</li> <li>Tail-dropped packets—Number of arriving packets dropped because output queue buffers were full.</li> <li>Total-dropped pkts—Number of transmitted packets dropped.</li> <li>Total dropped bytes—Number of transmitted bytes dropped.</li> </ul>                                                                                                                                        |
| <b>Queued</b>             | Number of packets and bytes queued to this queue. <ul style="list-style-type: none"> <li>Packets—Number of packets queued.</li> <li>Bytes—Number of bytes queued.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

## Sample Output

### show interfaces queue fabric

```

user@switch> show interfaces queue fabric
Physical interface: IC-WS001:fte-0/0/15, Enabled, Physical link is Up
  Interface index: 49178, SNMP ifIndex: 1208484475
Forwarding classes: 16 supported, 5 in use
Egress queues: 12 supported, 5 in use
Queue: 0, Forwarding classes: fabric_fcset_be

| <b>Input errors</b>       | <p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle.</li> <li>• <b>L3 incompletes</b>—Number of incoming packets discarded because they failed Layer 3 sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored if you configure the <b>ignore-l3-incompletes</b> statement.</li> <li>• <b>L2 channel errors</b>—Number of times the software did not find a valid logical interface for an incoming frame.</li> <li>• <b>L2 mismatch timeouts</b>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b>        |

Table 236: show interfaces xe Output Fields (*continued*)

| Field Name                      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Level of Output         |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Output errors</b>            | <p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Collisions</b>—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug.</li> <li>• <b>Aged packets</b>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>HS link CRC errors</b>—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b>        |
| <b>Egress queues</b>            | Total number of egress queues supported on the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>detail extensive</b> |

| <b>Active alarms and Active defects</b> | <p>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the switch configuration, an alarm can ring the red or yellow alarm bell on the switch, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value <b>None</b> or <b>Link</b>.</p> <ul style="list-style-type: none"> <li>• <b>None</b>—There are no active defects or alarms.</li> <li>• <b>Link</b>—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive none</b> |
| <b>PCS statistics</b>                   | Physical Coding Sublayer (PCS) fault conditions from the LAN PHY device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>detail extensive</b>      |
| <b>MAC statistics</b>                   | <p>Receive and Transmit statistics reported by the PIC's MAC subsystem.</p> <ul style="list-style-type: none"> <li>• <b>Total octets and total packets</b>—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type.</li> <li>• <b>Unicast packets, Broadcast packets, and Multicast packets</b>—Number of unicast, broadcast, and multicast packets.</li> <li>• <b>CRC/Align errors</b>—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</li> <li>• <b>FIFO error</b>—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>MAC control frames</b>—Number of MAC control frames.</li> <li>• <b>MAC pause frames</b>—Number of MAC control frames with <b>pause</b> operational code.</li> <li>• <b>Oversized frames</b>—Number of packets that exceeds the configured MTU.</li> <li>• <b>Jabber frames</b>—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</li> <li>• <b>Fragment frames</b>—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runs (which are normal occurrences caused by collisions) and noise hits are counted.</li> <li>• <b>VLAN tagged frames</b>—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not. This counter is not supported on EX Series switches and is always displayed as 0.</li> <li>• <b>Code violations</b>—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error."</li> </ul> | <b>extensive</b>             |
| <b>Filter statistics</b>                | Receive and Transmit statistics reported by the PIC's MAC address filter subsystem.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>extensive</b>             |

Table 236: show interfaces xe Output Fields (*continued*)

| Field Name                  | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Level of Output |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Autonegotiation information | <p>Information about link autonegotiation.</p> <ul style="list-style-type: none"> <li>• <b>Negotiation status:</b> <ul style="list-style-type: none"> <li>• <b>Incomplete</b>—Ethernet interface has the speed or link mode configured.</li> <li>• <b>No autonegotiation</b>—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation.</li> <li>• <b>Complete</b>—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.</li> </ul> </li> <li>• <b>Link partner status</b>—OK when the Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.</li> <li>• <b>Link partner:</b> <ul style="list-style-type: none"> <li>• <b>Link mode</b>—Depending on the capability of the attached Ethernet device, either <b>Full-duplex</b> or <b>Half-duplex</b>.</li> <li>• <b>Flow control</b>—Types of flow control supported by the remote Ethernet device. For Fast Ethernet interfaces, the type is <b>None</b>. For Gigabit Ethernet interfaces, types are <b>Symmetric</b> (link partner supports <b>PAUSE</b> on receive and transmit), <b>Asymmetric</b> (link partner supports <b>PAUSE</b> on transmit), and <b>Symmetric/Asymmetric</b> (link partner supports both <b>PAUSE</b> on receive and transmit or only <b>PAUSE</b> receive).</li> <li>• <b>Remote fault</b>—Remote fault information from the link partner—<b>Failure</b> indicates a receive link error. <b>OK</b> indicates that the link partner is receiving. <b>Negotiation error</b> indicates a negotiation error. <b>Offline</b> indicates that the link partner is going offline.</li> </ul> </li> <li>• <b>Local resolution:</b> <ul style="list-style-type: none"> <li>• <b>Flow control</b>—Types of flow control supported by the remote Ethernet device. For Gigabit Ethernet interfaces, types are <b>Symmetric</b> (link partner supports <b>PAUSE</b> on receive and transmit), <b>Asymmetric</b> (link partner supports <b>PAUSE</b> on transmit), and <b>Symmetric/Asymmetric</b> (link partner supports both <b>PAUSE</b> on receive and transmit or only <b>PAUSE</b> receive). For asymmetric <b>PAUSE</b>, shows if the <b>PAUSE</b> transmit and <b>PAUSE</b> receive states on the interface are <b>enable</b> or <b>disable</b>.</li> <li>• <b>Remote fault</b>—Remote fault information. <b>Link OK</b> (no error detected on receive), <b>Offline</b> (local interface is offline), and <b>Link Failure</b> (link error detected on receive).</li> </ul> </li> </ul> | extensive       |

Table 236: show interfaces xe Output Fields (*continued*)

| Field Name                                    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Level of Output              |
|-----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Packet Forwarding Engine configuration</b> | Information about the configuration of the Packet Forwarding Engine: <ul style="list-style-type: none"> <li><b>Destination slot</b>—FPC slot number.</li> <li><b>CoS transmit queue</b>—Queue number and its associated user-configured forwarding class name.</li> <li><b>Bandwidth %</b>—Percentage of bandwidth allocated to the queue.</li> <li><b>Bandwidth bps</b>—Bandwidth allocated to the queue (in bps).</li> <li><b>Buffer %</b>—Percentage of buffer space allocated to the queue.</li> <li><b>Buffer usec</b>—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time.</li> <li><b>Priority</b>—Queue priority: <b>low</b> or <b>high</b>.</li> <li><b>Limit</b>—Displayed if rate limiting is configured for the queue. Possible values are <b>none</b> and <b>exact</b>. If <b>exact</b> is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If <b>none</b> is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.</li> </ul> | <b>extensive</b>             |

user@switch> show interfaces xe-0/0/1
Physical interface: xe-0/0/1, Enabled, Physical link is Up
  Interface index: 49195, SNMP ifIndex: 591
  Link-level type: Ethernet, MTU: 1514, Speed: 10Gbps, Duplex: Full-Duplex, BPDU
  Error: None, MAC-REWRITE Error: None, Loopback: Disabled, Source filtering:
  Disabled,
  Flow control: Disabled
  Device flags   : Present Running
  Interface flags: SNMP-Traps Internal: 0x0
  Link flags     : None
  CoS queues     : 12 supported, 12 maximum usable queues
  Current address: 00:1d:b5:f7:4e:e1, Hardware address: 00:1d:b5:f7:4e:e1
  Last flapped   : 2011-06-01 00:42:03 PDT (00:02:42 ago)
  Input rate     : 0 bps (0 pps)
  Output rate    : 0 bps (0 pps)
  Active alarms  : None
  Active defects : None

Logical interface xe-0/0/1.0 (Index 73) (SNMP ifIndex 523)
  Flags: SNMP-Traps 0x0 Encapsulation: ENET2
  Input packets : 0

```

```
Output packets: 0
Protocol eth-switch, MTU: 0
Flags: Trunk-Mode
```

### show interfaces (Asymmetric Flow Control)

```
user@switch> show interfaces xe-0/0/1
Physical interface: xe-0/0/1, Enabled, Physical link is Up
  Interface index: 49195, SNMP ifIndex: 591
  Link-level type: Ethernet, MTU: 1514, Speed: 10Gbps, Duplex: Full-Duplex, BPDU
  Error: None, MAC-REWRITE Error: None, Loopback: Disabled, Source filtering:
Disabled,
  Configured-flow-control tx-buffers: off rx-buffers: on
  Device flags   : Present Running
  Interface flags: SNMP-Traps Internal: 0x0
  Link flags     : None
  CoS queues    : 12 supported, 12 maximum usable queues
  Current address: 00:1d:b5:f7:4e:e1, Hardware address: 00:1d:b5:f7:4e:e1
  Last flapped   : 2011-06-01 00:42:03 PDT (00:02:42 ago)

| <b>Input errors</b>       | <p>Input errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Errors</b>—Sum of the incoming frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the input queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Framing errors</b>—Number of packets received with an invalid frame checksum (FCS).</li> <li>• <b>Runts</b>—Number of frames received that are smaller than the runt threshold.</li> <li>• <b>Policed discards</b>—Number of frames that the incoming packet match code discarded because they were not recognized or not of interest. Usually, this field reports protocols that Junos OS does not handle.</li> <li>• <b>L3 incompletes</b>—Number of incoming packets discarded because they failed Layer 3 sanity checks of the header. For example, a frame with less than 20 bytes of available IP header is discarded. L3 incomplete errors can be ignored if you configure the <b>ignore-l3-incompletes</b> statement.</li> <li>• <b>L2 channel errors</b>—Number of times the software did not find a valid logical interface for an incoming frame.</li> <li>• <b>L2 mismatch timeouts</b>—Number of malformed or short packets that caused the incoming packet handler to discard the frame as unreadable.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the receive direction that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b>        |

Table 237: show interfaces xe Output Fields (*continued*)

| Field Name                      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Level of Output         |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>Output errors</b>            | <p>Output errors on the interface. The following paragraphs explain the counters whose meaning might not be obvious:</p> <ul style="list-style-type: none"> <li>• <b>Carrier transitions</b>—Number of times the interface has gone from <b>down</b> to <b>up</b>. This number does not normally increment quickly, increasing only when the cable is unplugged, the far-end system is powered down and then up, or another problem occurs. If the number of carrier transitions increments quickly (perhaps once every 10 seconds), the cable, the far-end system, or the PIC or PIM is malfunctioning.</li> <li>• <b>Errors</b>—Sum of the outgoing frame aborts and FCS errors.</li> <li>• <b>Drops</b>—Number of packets dropped by the output queue of the I/O Manager ASIC. If the interface is saturated, this number increments once for every packet that is dropped by the ASIC's RED mechanism.</li> <li>• <b>Collisions</b>—Number of Ethernet collisions. The Gigabit Ethernet PIC supports only full-duplex operation, so for Gigabit Ethernet PICs, this number should always remain 0. If it is nonzero, there is a software bug.</li> <li>• <b>Aged packets</b>—Number of packets that remained in shared packet SDRAM so long that the system automatically purged them. The value in this field should never increment. If it does, it is most likely a software bug or possibly malfunctioning hardware.</li> <li>• <b>FIFO errors</b>—Number of FIFO errors in the send direction as reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>HS link CRC errors</b>—Number of errors on the high-speed links between the ASICs responsible for handling the router interfaces.</li> <li>• <b>MTU errors</b>—Number of packets whose size exceeded the MTU of the interface.</li> <li>• <b>Resource errors</b>—Sum of transmit drops.</li> </ul> | <b>extensive</b>        |
| <b>Egress queues</b>            | Total number of egress queues supported on the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>detail extensive</b> |
| <b>Queue counters (Egress)</b>  | <p>CoS queue number and its associated user-configured forwarding class name.</p> <ul style="list-style-type: none"> <li>• <b>Queued packets</b>—Number of queued packets.</li> <li>• <b>Transmitted packets</b>—Number of transmitted packets.</li> <li>• <b>Dropped packets</b>—Number of packets dropped by the ASIC's RED mechanism.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | <b>detail extensive</b> |
| <b>Queue Number</b>             | The CoS queue number and the forwarding classes mapped to the queue number. The <b>Mapped forwarding class</b> column lists the forwarding classes mapped to each CoS queue.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>detail extensive</b> |
| <b>Ingress queues</b>           | Total number of ingress queues supported on the specified interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           | <b>extensive</b>        |

| <b>Active alarms and Active defects</b> | <p>Ethernet-specific defects that can prevent the interface from passing packets. When a defect persists for a certain amount of time, it is promoted to an alarm. Based on the switch configuration, an alarm can ring the red or yellow alarm bell on the switch, or turn on the red or yellow alarm LED on the craft interface. These fields can contain the value <b>None</b> or <b>Link</b>.</p> <ul style="list-style-type: none"> <li>• <b>None</b>—There are no active defects or alarms.</li> <li>• <b>Link</b>—Interface has lost its link state, which usually means that the cable is unplugged, the far-end system has been turned off, or the PIC is malfunctioning.</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | <b>detail extensive none</b> |
| <b>PCS statistics</b>                   | Physical Coding Sublayer (PCS) fault conditions from the LAN PHY device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | <b>detail extensive</b>      |
| <b>MAC statistics</b>                   | <p>Receive and Transmit statistics reported by the PIC's MAC subsystem.</p> <ul style="list-style-type: none"> <li>• <b>Total octets and total packets</b>—Total number of octets and packets. For Gigabit Ethernet IQ PICs, the received octets count varies by interface type.</li> <li>• <b>Unicast packets, Broadcast packets, and Multicast packets</b>—Number of unicast, broadcast, and multicast packets.</li> <li>• <b>CRC/Align errors</b>—Total number of packets received that had a length (excluding framing bits, but including FCS octets) of between 64 and 1518 octets, inclusive, and had either a bad FCS with an integral number of octets (FCS Error) or a bad FCS with a nonintegral number of octets (Alignment Error).</li> <li>• <b>FIFO error</b>—Number of FIFO errors that are reported by the ASIC on the PIC. If this value is ever nonzero, the PIC is probably malfunctioning.</li> <li>• <b>MAC control frames</b>—Number of MAC control frames.</li> <li>• <b>MAC pause frames</b>—Number of MAC control frames with <b>pause</b> operational code.</li> <li>• <b>Oversized frames</b>—Number of packets that exceeds the configured MTU.</li> <li>• <b>Jabber frames</b>—Number of frames that were longer than 1518 octets (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. This definition of jabber is different from the definition in IEEE-802.3 section 8.2.1.5 (10BASE5) and section 10.3.1.4 (10BASE2). These documents define jabber as the condition in which any packet exceeds 20 ms. The allowed range to detect jabber is from 20 ms to 150 ms.</li> <li>• <b>Fragment frames</b>—Total number of packets that were less than 64 octets in length (excluding framing bits, but including FCS octets), and had either an FCS error or an alignment error. Fragment frames normally increment because both runs (which are normal occurrences caused by collisions) and noise hits are counted.</li> <li>• <b>VLAN tagged frames</b>—Number of frames that are VLAN tagged. The system uses the TPID of 0x8100 in the frame to determine whether a frame is tagged or not. This counter is not supported on EX Series switches and is always displayed as 0.</li> <li>• <b>Code violations</b>—Number of times an event caused the PHY to indicate "Data reception error" or "invalid data symbol error."</li> </ul> | <b>extensive</b>             |
| <b>Filter statistics</b>                | Receive and Transmit statistics reported by the PIC's MAC address filter subsystem.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <b>extensive</b>             |

Table 237: show interfaces xe Output Fields (*continued*)

| Field Name                  | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Level of Output |
|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Autonegotiation information | <p>Information about link autonegotiation.</p> <ul style="list-style-type: none"> <li>• <b>Negotiation status:</b> <ul style="list-style-type: none"> <li>• <b>Incomplete</b>—Ethernet interface has the speed or link mode configured.</li> <li>• <b>No autonegotiation</b>—Remote Ethernet interface has the speed or link mode configured, or does not perform autonegotiation.</li> <li>• <b>Complete</b>—Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.</li> </ul> </li> <li>• <b>Link partner status</b>—OK when the Ethernet interface is connected to a device that performs autonegotiation and the autonegotiation process is successful.</li> <li>• <b>Link partner:</b> <ul style="list-style-type: none"> <li>• <b>Link mode</b>—Depending on the capability of the attached Ethernet device, either <b>Full-duplex</b> or <b>Half-duplex</b>.</li> <li>• <b>Flow control</b>—Types of flow control supported by the remote Ethernet device. For Fast Ethernet interfaces, the type is <b>None</b>. For Gigabit Ethernet interfaces, types are <b>Symmetric</b> (link partner supports <b>PAUSE</b> on receive and transmit), <b>Asymmetric</b> (link partner supports <b>PAUSE</b> on transmit), and <b>Symmetric/Asymmetric</b> (link partner supports both <b>PAUSE</b> on receive and transmit or only <b>PAUSE</b> receive).</li> <li>• <b>Remote fault</b>—Remote fault information from the link partner—<b>Failure</b> indicates a receive link error. <b>OK</b> indicates that the link partner is receiving. <b>Negotiation error</b> indicates a negotiation error. <b>Offline</b> indicates that the link partner is going offline.</li> </ul> </li> <li>• <b>Local resolution:</b> <ul style="list-style-type: none"> <li>• <b>Flow control</b>—Types of flow control supported by the remote Ethernet device. For Gigabit Ethernet interfaces, types are <b>Symmetric</b> (link partner supports <b>PAUSE</b> on receive and transmit), <b>Asymmetric</b> (link partner supports <b>PAUSE</b> on transmit), and <b>Symmetric/Asymmetric</b> (link partner supports both <b>PAUSE</b> on receive and transmit or only <b>PAUSE</b> receive). For asymmetric <b>PAUSE</b>, shows if the <b>PAUSE</b> transmit and <b>PAUSE</b> receive states on the interface are <b>enable</b> or <b>disable</b>.</li> <li>• <b>Remote fault</b>—Remote fault information. <b>Link OK</b> (no error detected on receive), <b>Offline</b> (local interface is offline), and <b>Link Failure</b> (link error detected on receive).</li> </ul> </li> </ul> | extensive       |

Table 237: show interfaces xe Output Fields (*continued*)

| Field Name                                    | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    | Level of Output              |
|-----------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Packet Forwarding Engine configuration</b> | Information about the configuration of the Packet Forwarding Engine: <ul style="list-style-type: none"> <li><b>Destination slot</b>—FPC slot number.</li> <li><b>CoS transmit queue</b>—Queue number and its associated user-configured forwarding class name.</li> <li><b>Bandwidth %</b>—Percentage of bandwidth allocated to the queue.</li> <li><b>Bandwidth bps</b>—Bandwidth allocated to the queue (in bps).</li> <li><b>Buffer %</b>—Percentage of buffer space allocated to the queue.</li> <li><b>Buffer usec</b>—Amount of buffer space allocated to the queue, in microseconds. This value is nonzero only if the buffer size is configured in terms of time.</li> <li><b>Priority</b>—Queue priority: <b>low</b> or <b>high</b>.</li> <li><b>Limit</b>—Displayed if rate limiting is configured for the queue. Possible values are <b>none</b> and <b>exact</b>. If <b>exact</b> is configured, the queue transmits only up to the configured bandwidth, even if excess bandwidth is available. If <b>none</b> is configured, the queue transmits beyond the configured bandwidth if bandwidth is available.</li> </ul> | <b>extensive</b>             |

| Aggregated interface | Aggregated Ethernet interface name.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| LACP State           | <p>LACP state information for each aggregated Ethernet interface:</p> <ul style="list-style-type: none"> <li>For a child interface configured with the <b>force-up</b> statement, LACP state displays <b>FUP</b> along with the interface name.</li> <li><b>Role</b>—Role played by the interface. It can be one of the following: <ul style="list-style-type: none"> <li><b>Actor</b>—Local device participating in the LACP negotiation.</li> <li><b>Partner</b>—Remote device participating in the LACP negotiation.</li> </ul> </li> <li><b>Exp</b>—Expired state. <b>Yes</b> indicates that the actor or partner is in an expired state. <b>No</b> indicates that the actor or partner is not in an expired state.</li> <li><b>Def</b>—Default. <b>Yes</b> indicates that the actor's receive machine is using the default operational partner information, which is administratively configured for the partner. <b>No</b> indicates that the operational partner information in use has been received in an LACP PDU.</li> <li><b>Dist</b>—Distribution of outgoing frames. <b>No</b> indicates that the distribution of outgoing frames on the link is currently disabled and is not expected to be enabled. Otherwise, the value is <b>Yes</b>.</li> <li><b>Col</b>—Collection of incoming frames. <b>Yes</b> indicates that the collection of incoming frames on the link is currently enabled and is not expected to be disabled. Otherwise, the value is <b>No</b>.</li> <li><b>Syn</b>—Synchronization. If the value is <b>Yes</b>, the link is considered to be synchronized. The link has been allocated to the correct link aggregation group, the group has been associated with a compatible aggregator, and the identity of the link aggregation group is consistent with the system ID and operational key information transmitted. If the value is <b>No</b>, the link is not synchronized. The link is currently not in the right aggregation.</li> <li><b>Aggr</b>—Ability of the aggregation port to aggregate (<b>Yes</b>) or to operate only as an individual link (<b>No</b>).</li> <li><b>Timeout</b>—LACP timeout preference. Periodic transmissions of LACP PDUs occur at either a slow or a fast transmission rate, depending upon the expressed LACP timeout preference (<b>Long Timeout</b> or <b>Short Timeout</b>).</li> <li><b>Activity</b>—Actor's or partner's port activity. <b>Passive</b> indicates the port's preference for not transmitting LAC PDUs unless its partner's control value is <b>Active</b>. <b>Active</b> indicates the port's preference to participate in the protocol regardless of the partner's control value.</li> </ul> |

| <b>Description</b>              | Display Link Aggregation Control Protocol (LACP) statistics about the specified aggregated Ethernet interface or redundant Ethernet interface. If you do not specify an interface name, LACP statistics for all interfaces are displayed.                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Options</b>                  | <i>interface-name</i> —(Optional) Name of an interface.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Uplink         | The uplink interface or interfaces configured as link-to-monitor.<br><b>NOTE:</b> The asterisk (*) indicates that the link is up.                                                                                             |
| Downlink       | The downlink interface or interfaces configured as link-to-disable.<br><b>NOTE:</b> The asterisk (*) indicates that the link is up.                                                                                           |
| Failure Action | Status of uplink failure detection: <ul style="list-style-type: none"> <li>• Active—The switch has detected an uplink failure and has brought the downlink down.</li> <li>• Inactive—The uplink or uplinks are up.</li> </ul> |

## Sample Output

### show uplink-failure-detection

```
user@switch> show uplink-failure-detection
```

Group : group1  
Uplink : ge-0/0/0\*  
Downlink : ge-0/0/1\*  
Failure Action : Inactive

Group : group2  
Uplink : ge-0/0/3.0  
Downlink : ge-0/0/4.0  
Failure Action : Active

## CHAPTER 31

# Troubleshooting

- [Troubleshooting Procedures on page 3065](#)

## Troubleshooting Procedures

---

- [Troubleshooting an Aggregated Ethernet Interface on page 3065](#)
- [Troubleshooting Multichassis Link Aggregation on page 3065](#)
- [Troubleshooting Network Interfaces on page 3071](#)

## Troubleshooting an Aggregated Ethernet Interface

**Problem**    **Description:** The `show interfaces terse` command shows that the LAG is down.

**Solution**    Check the following:

- Verify that there is no configuration mismatch.
- Verify that all member ports are up.
- Verify that a LAG is part of family ethernet-switching (Layer 2 LAG) or family inet (Layer 3 LAG).
- Verify that the LAG member is connected to the correct LAG at the other end.
- Verify that the LAG members belong to the same switch.

### MAC Addresses Learned on MC-AE Interfaces Are Not Removed from the MAC Address Table

**Problem** **Description:** When both of the multichassis aggregated Ethernet (MC-AE) interfaces on both connected multichassis link aggregation group (MC-LAG) peers are down, the MAC addresses learned on the MC-AE interfaces are not removed from the MAC address table. For example, if you disable the MC-AE interface (ae0) on both MC-LAG peers by issuing the **set interfaces ae0 disable** command and commit the configuration, the MAC table still shows the MAC addresses as being learned on the MC-AE interfaces of both MC-LAG peers:

```
user@switchA> show ethernet-switching table
Ethernet-switching table: 6 entries, 2 learned, 0 persistent entries
VLAN      MAC address      Type      Age Interfaces
v10        *                Flood     - All-members
v10        00:10:94:00:00:01 Learn(L)    3:55 ae0.0 (MCAE)
v10        00:10:94:00:00:02 Learn(R)    0 xe-0/0/9.0
v20        *                Flood     - All-members
v30        *                Flood     - All-members
v30        84:18:88:de:b1:2e Static      - Router
```

```
user@switchB> show ethernet-switching table
Ethernet-switching table: 6 entries, 2 learned, 0 persistent entries
VLAN      MAC address      Type      Age Interfaces
v10        *                Flood     - All-members
```

|     |                   |          |                |
|-----|-------------------|----------|----------------|
| v10 | 00:10:94:00:00:01 | Learn(R) | 0 ae0.0 (MCAE) |
| v10 | 00:10:94:00:00:02 | Learn    | 40 xe-0/0/10.0 |
| v20 | *                 | Flood    | - All-members  |
| v30 | *                 | Flood    | - All-members  |
| v30 | 84:18:88:df:83:0a | Static   | - Router       |

**Solution** This is expected behavior.

### MC-LAG Peer Does Not Go into Standby Mode

**Problem** **Description:** A multichassis link aggregation group (MC-LAG) peer does not go into standby mode if the MC-LAG peer IP address specified in the Interchassis Control Protocol (ICCP) configuration and the IP address specified in the multichassis protection configuration are different.

**Solution** To prevent failure to enter standby mode, make sure the peer IP address in the ICCP configurations and the IP address in multichassis protection configurations are the same.

### Secondary MC-LAG Peer with Status Control Set to Standby Becomes Inactive

**Problem** **Description:** When the interchassis control link-protection link (ICL-PL) and multichassis aggregated Ethernet (MC-AE) interfaces go down on the primary multichassis link aggregation group (MC-LAG) peer, the secondary MC-LAG peer's MC-AE interfaces with status control set to standby become inactive instead of active.

**Solution** This is expected behavior.

### Redirect Filters Take Priority over User-Defined Filters

**Problem** **Description:** Multichassis link aggregation group (MC-LAG) implicit failover redirection filters take precedence over user-configured explicit filters. This is expected behavior.

**Solution** This is expected behavior.

### Operational Command Output Is Wrong

**Problem** **Description:** After you deactivate the Interchassis Control Protocol (ICCP), the **show iccp** operational command output still shows registered client daemons, such as mcsnoopd, lacpd, and eswd.

For example:

```
user@switch> show iccp
Client Application: MCSNOOPD
Redundancy Group IDs Joined: None
```

```
Client Application: lacpd
Redundancy Group IDs Joined: 1
```

Client Application: eswd  
Redundancy Group IDs Joined: 1

The **show iccp** command output always shows registered modules regardless of whether or not ICCP peers are configured.

**Solution** This is expected behavior.

---

#### ICCP Connection Might Take Up to 60 Seconds to Become Active

**Problem** **Description:** When the Interchassis Control Protocol (ICCP) configuration and the routed VLAN interface (RVI) configuration are committed together, the ICCP connection might take up to 60 seconds to become active.

**Solution** This is expected behavior.

---

#### MAC Address Age Learned on an MC-AE Interface Is Reset to Zero

**Problem** **Description:** When you activate and then deactivate an interchassis control link-protection link (ICL-PL), the MAC address age learned on the multichassis aggregated Ethernet (MC-AE) interface is reset to zero. The next-hop interface changes trigger MAC address updates in the hardware, which then triggers aging updates in the Packet Forwarding Engine (PFE). The result is that the MAC address age is updated to zero.

For example, the ICL-PL has been deactivated, and the **show ethernet-switching table** command output shows that the MAC addresses have an age of 0.

```
user@switch> show ethernet-switching table
Ethernet-switching table: 3 entries, 2 learned, 0 persistent entries
  VLAN      MAC address      Type      Age Interfaces
  ---      -
v100        *                Flood     - All-members
v100        00:10:00:00:00:01 Learn(L)   0 ae0.0 (MCAE)
v100        00:10:00:00:00:02 Learn(L)   0 ae0.0 (MCAE)
```

**Solution** This is expected behavior.

---

#### MAC Address Is Not Learned Remotely in a Default VLAN

**Problem** **Description:** If a multichassis link aggregation group (MC-LAG) peer learns a MAC address in the default VLAN, the Interchassis Control Protocol (ICCP) does not synchronize the MAC address with the MAC address of the other MC-LAG peer.

**Solution** This is expected behavior.

---

#### Snooping Entries Learned on MC-AE Interfaces Are Not Removed

**Problem** **Description:** When multichassis aggregated Ethernet (MC-AE) interfaces are configured on a VLAN that is enabled for multicast snooping, the membership entries learned on the MC-AE interfaces on the VLAN are not cleared when the MC-AE interfaces go down.

This is done to speed up convergence time when the interfaces come up, or come up and go down.

**Solution** This is expected behavior.

---

#### ICCP Does Not Come Up After You Add or Delete an Authentication Key

---

**Problem** **Description:** The Interchassis Control Protocol (ICCP) connection is not established when you add an authentication key and then delete it only at the global ICCP level. However, authentication works correctly at the ICCP peer level.

**Solution** Delete the ICCP configuration , and then add the ICCP configuration.

---

#### Local Status Is Standby When It Should Be Active

---

**Problem** **Description:** If the multichassis aggregated Ethernet (MC-AE) interface is down when the state machine is in a synchronized state, the multichassis link aggregation group (MC-LAG) peer local status is standby. If the MC-AE interface goes down after the state machine is in an active state, then the local status remains active, and the local state indicates that the interface is down.

**Solution** This is expected behavior.

---

#### Packets Loop on the Server When ICCP Fails

---

**Problem** **Description:** When you enable backup liveness detection for a multichassis link aggregation group (MC-LAG), and the backup liveness detection packets are lost because of a temporary failure on the MC-LAG, then both of the peers in the MC-LAG remain active. If this happens, both of the MC-LAG peers send packets to the connected server.

**Solution** This is expected behavior.

---

#### Both MC-LAG Peers Use the Default System ID After a Reboot or an ICCP Configuration Change

---

**Problem** **Description:** After a reboot or after a new Interchassis Control Protocol (ICCP) configuration has been committed, and the ICCP connection does not become active, the Link Aggregation Control Protocol (LACP) messages transmitted over the multichassis aggregated Ethernet (MC-AE) interfaces use the default system ID. The configured system ID is used instead of the default system ID only after the MC-LAG peers synchronize with each other.

**Solution** This is expected behavior.

### No Commit Checks Are Done for ICL-PL Interfaces

---

**Problem** **Description:** There are no commit checks on the interface being configured as an interchassis control link-protection link (ICL-PL), so you must provide a valid interface name for the ICL-PL.

**Solution** This is expected behavior.

### Double Failover Scenario

---

**Problem** **Description:** If the following events happen in this exact order—the Interchassis Control Protocol (ICCP) goes down, and the multichassis aggregated Ethernet (MC-AE) interface on the multichassis link aggregation group (MC-LAG) peer in active mode goes down—a double failover occurs. In this scenario, the MC-LAG peer in standby mode does not detect what happens on the active MC-LAG peer. The MC-LAG peer in standby mode operates as if the MC-AE interface on the MC-LAG in active mode were up and blocks the interchassis control protocol-protection link (ICL-PL) traffic. The ICL-PL traffic is not forwarded.

**Solution** This is expected behavior.

### Multicast Traffic Floods the VLAN When the ICL-PL Interface Goes Down and Up

---

**Problem** **Description:** When the interchassis control link-protection link (ICL-PL) goes down and up, multicast traffic is flooded to all of the interfaces in the VLAN. The Packet Forwarding Engine (PFE) flag Ip4McastFloodMode for the VLAN is changed to MCAST\_FLOOD\_ALL. This problem only occurs when a multichassis link aggregation group (MC-LAG) is configured for Layer 2.

**Solution** This is expected behavior.

### Layer 3 Traffic Sent to the Standby MC-LAG Peer Is Not Redirected to Active MC-LAG Peer

---

**Problem** **Description:** When the Interchassis Control Protocol (ICCP) is down, the status of a remote MC-LAG peer is unknown. Even if the MC-LAG peer is configured as standby, the traffic is not redirected to this peer because it is assumed that this peer is down.

**Solution** This is expected behavior.

### AE Interfaces Go Down

---

**Problem** **Description:** When a multichassis aggregated Ethernet (MC-AE) interface is converted to an aggregated Ethernet (AE) interface, it retains some MC-AE properties. For example, the AE interface might retain the administrative key of the MC-AE. When this happens, the AE interface goes down.

**Solution** Restart the Link Aggregation Control Protocol (LACP) on the multichassis link aggregation group (MC-LAG) peer hosting the AE interface to bring up the AE interface. Restarting LACP removes the MC-AE properties of the AE interface.

### Flooding of Upstream Traffic

**Problem** **Description:** When MAC synchronization is enabled, the multichassis link aggregation group (MC-LAG) peer can resolve Address Resolution Protocol (ARP) entries for the MC-LAG routed VLAN interface (RVI) with either of the MC-LAG peer MAC addresses. If the downstream traffic is sent with one MAC address (MAC1) but the peer has resolved the MAC address with a different MAC address (MAC2), the MAC2 address might not be learned by any of the access layer switches. Flooding of the upstream traffic for the MAC2 address might then occur.

**Solution** Make sure that downstream traffic is sent from the MC-LAG peers periodically to prevent the MAC addresses from aging out.

## Troubleshooting Network Interfaces

### The interface on the port in which an SFP or SFP+ transceiver is installed in an SFP or SFP+ module is down

**Problem** **Description:** The QFX Series has an SFP or SFP+ module installed. The interface on the port in which an SFP or SFP+ transceiver is installed is down.

**Symptoms:** When you check the status with the CLI command **show interfaces *interface-name***, the disabled port is not listed.

**Cause** By default, the SFP or SFP+ module operates in the 10-Gigabit Ethernet mode and supports only SFP or SFP+ transceivers. The operating mode for the module is incorrectly set.

**Solution** Only SFP or SFP+ transceivers can be installed in SFP or SFP+ modules. You must configure the operating mode of the SFP or SFP+ module to match the type of transceiver you want to use. For SFP+ transceivers, configure 10-Gigabit Ethernet operating mode.

- [Understanding the Unified Forwarding Table on page 3077](#)

## Overview of Routing Options

In addition to dynamic routing protocols, you can configure static routing on QFX Series switches. You can also configure a variety of protocol-independent routing properties, such as

- Per-packet load balancing (equal cost multipath routing)
- Autonomous system numbers
- Autonomous system confederation members
- Router identifiers
- Routing table groups
- Multicast scoping

### Related Documentation

- [Understanding Virtual Router Routing Instances on page 3076](#)

## Understanding Virtual Router Routing Instances

Virtual router routing instances allow administrators to divide a QFX Series switch into multiple independent virtual routers, each with its own routing table. Virtual router routing instances enable you to isolate traffic without using multiple devices to segment your network. You can create routing instances for unicast routing protocols and PIM sparse mode.

Each virtual router routing instance consists of sets of the following:

- Routing tables
- Interfaces that belong to these routing tables
- Routing protocol configurations
- Routing option configurations

You can use virtual router routing instances to isolate customer traffic on a network and to bind customer-specific routing instances to customer-owned interfaces. Each interface can belong to only one routing instance. QFX 3500 and QFX3600 switches and QFabric systems support as many as 256 virtual router routing instances. QFX 5100 switches support as many as 512 virtual router routing instances.

## Understanding Distributed Periodic Packet Management

Periodic packet management (PPM) is responsible for processing a variety of time-sensitive periodic tasks for particular processes so that other processes can more optimally direct their resources. PPM is responsible for the periodic transmission of packets on behalf of its various client processes, which include the processes that control the Link Aggregation Control Protocol (LACP) and Bidirectional Forwarding Detection (BFD) protocol, and also for receiving packets on behalf of these client processes. PPM also gathers some statistics and sends process-specific packets. PPM cannot be disabled and is always running on any operational switch.

The responsibility for PPM processing on the switch is distributed between the Routing Engine and the access interfaces for all protocols that use PPM by default. This distributed model provides a faster response time for protocols that use PPM than the response time provided by the nondistributed model.

If distributed PPM is disabled, the PPM process runs on the Routing Engine only.

You can disable distributed PPM for all protocols that use PPM. You can also disable distributed PPM for LACP packets only.

**BEST PRACTICE:** We generally recommend that you disable distributed PPM only if Juniper Networks Customer Service advises you to do so. You should disable distributed PPM only if you have a compelling reason to disable it.

---

- [Configuring Distributed Periodic Packet Management on page 3084](#)

## Understanding Bidirectional Forwarding Detection (BFD)

The Bidirectional Forwarding Detection (BFD) protocol is a simple mechanism that detects failures in a network and works in a wide variety of network environments and topologies. In BFD operation, switches exchange BFD hello packets at a specified interval and detect a neighbor failure if they do not receive a reply after a specified interval. The BFD failure detection timers support shorter time limits than the static route failure detection mechanisms, so they can provide faster detection of failures.

To configure faster failure detection, use lower BFD timer values. The timers can automatically adapt to a higher value if an adjacency fails, and they also adapt to a higher value when a BFD session flap occurs more than three times in a span of 15 seconds. In this case, a back-off algorithm increases the receive interval by two if the local BFD instance is the reason for the session flap and increases the transmission interval by two if the remote BFD instance is the reason for the session flap.

You can use the **clear bfd adaptation** command to return BFD interval timers to their configured values. This command is hitless, meaning that it does not affect traffic flow.

**NOTE:** QFX and EX4600 switches do not support BFD timer values of less than 1 second.

## Understanding the Unified Forwarding Table

- [Using the Unified Forwarding Table to Optimize Address Storage on page 3077](#)
- [MAC Address and Host Address Memory Allocation on page 3078](#)
- [LPM Table Memory Allocation on page 3079](#)

### Using the Unified Forwarding Table to Optimize Address Storage

On QFX5100 and EX4600 switches, you can control the allocation of forwarding table memory available to store the following:

- MAC addresses.
- Layer 3 host entries.
- Longest prefix match (LPM) table entries.

**NOTE:** Starting with Junos OS 13.2X51-D15, you can allocate more memory to store prefixes in the range /65 to /127 range.

This feature gives you the flexibility to configure your switch to match the needs of your particular network environment.

### MAC Address and Host Address Memory Allocation

There are several profiles that allocate memory differently for MAC addresses and host addresses. You configure the mix that best meets your needs by choosing the appropriate profile. [Table 149 on page 2067](#) lists the profiles you can choose and the associated maximum values for the MAC address and host table entries.

**Table 241: Unified Forwarding Table Profiles**

| Profile Name               | MAC Table     | Host Table (unicast and multicast addresses) |              |             |             |             |             |
|----------------------------|---------------|----------------------------------------------|--------------|-------------|-------------|-------------|-------------|
|                            | MAC Addresses | IPv4 unicast                                 | IPv6 unicast | IPv4 (*, G) | IPv4 (S, G) | IPv6 (*, G) | IPv6 (S, G) |
| l2-profile-one             | 288K          | 16K                                          | 8K           | 8K          | 8K          | 4K          | 4K          |
| l2-profile-two             | 224K          | 80K                                          | 40K          | 40K         | 40K         | 20K         | 20K         |
| l2-profile-three (default) | 160K          | 144K                                         | 72K          | 72K         | 72K         | 36K         | 36K         |
| l3-profile                 | 96K           | 208K                                         | 104K         | 104K        | 104K        | 52K         | 52K         |
| lpm-profile                | 32K           | 16K                                          | 8K           | 8K          | 8K          | 4K          | 4K          |

Note that all entries in the host table share the same memory space. If the host table stores the maximum number of entries for any given type, the entire shared table is full and is unable to accommodate *any* entries of any other type. As you can see, different entry types occupy different amounts of memory. For example, an IPv6 unicast address occupies twice as much memory as an IPv4 unicast address, and an IPv6 multicast address occupies four times as much memory as an IPv4 unicast address.

[Table 150 on page 2067](#) lists various valid combinations that the host table can store if you use the **l2-profile-one** profile. Each row in the table represents a case in which the host table is full and cannot accommodate any more entries.

**Table 242: Example Host Table Combinations Using l2-profile-one**

| IPv4 unicast | IPv6 unicast | IPv4 multicast (*, G) | IPv4 multicast (S, G) | IPv6 multicast (*, G) | IPv6 multicast (S, G) |
|--------------|--------------|-----------------------|-----------------------|-----------------------|-----------------------|
| 16K          | 0            | 0                     | 0                     | 0                     | 0                     |
| 12K          | 2K           | 0                     | 0                     | 0                     | 0                     |
| 12K          | 0            | 2K                    | 2K                    | 0                     | 0                     |
| 8K           | 4K           | 0                     | 0                     | 0                     | 0                     |
| 4K           | 2K           | 2K                    | 2K                    | 0                     | 0                     |

Table 242: Example Host Table Combinations Using l2-profile-one (continued)

| IPv4 unicast | IPv6 unicast | IPv4 multicast (*, G) | IPv4 multicast (S, G) | IPv6 multicast (*, G) | IPv6 multicast (S, G) |
|--------------|--------------|-----------------------|-----------------------|-----------------------|-----------------------|
| 0            | 4K           | 0                     | 0                     | 1K                    | 1K                    |

LPM Table Memory Allocation

You configure the memory allocation for LPM table entries differently depending on which version of Junos OS you use. To learn how to configure memory allocation for LPM table entries see [“Configuring the Unified Forwarding Table” on page 2217](#).

- [Configuring Per-Packet Load Balancing on page 3082](#)
- [Configuring Distributed Periodic Packet Management on page 3084](#)
- [Configuring Virtual Router Routing Instances on page 3085](#)
- [Configuring the Unified Forwarding Table on page 3086](#)

## Configuring Static Routing

Static routes are routes that are manually configured and entered into the routing table.

The switch uses static routes:

- When the switch does not have a route to a destination that has a better (lower) *preference* value. The preference is an arbitrary value in the range from 0 through 255 that the software uses to rank routes received from different protocols, interfaces, or remote systems. The routing protocol process generally determines the active route by selecting the route with the lowest preference value. In the given range, **0** is the lowest and **255** is the highest.
- When the switch cannot determine the route to a destination.
- When the switch is forwarding unroutable packets.

To configure basic static route options using the CLI:

- To configure the switch's default gateway:  

```
[edit]
user@switch# set routing-options static route 0.0.0.0/0 next-hop 10.0.1.1
```
- To configure a static route and specify the next address to be used when routing traffic to the static route:  

```
[edit]
user@switch# set routing-options static route 20.0.0.0/24 next-hop 10.0.0.2.1
```
- To always keep the static route in the forwarding table:  

```
[edit]
user@switch# set routing-options static route 20.0.0.0/24 retain
```
- To prevent the static route from being readvertised:  

```
[edit]
user@switch# set routing-options static route 20.0.0.0/24 no-readvertise
```
- To remove inactive routes from the forwarding table:  

```
[edit]
user@switch# set routing-options static route 20.0.0.0/24 active
```

### Related Documentation

- [Monitoring Routing Information on page 3223](#)

## Configuring Per-Packet Load Balancing

By default, when there are multiple equal-cost paths to the same destination for the active route, Junos OS chooses one of the next-hop addresses to install into the forwarding table in a random fashion. Whenever the set of next hops for a destination changes in any way, the next-hop address is chosen again, also in a random fashion.

You can configure Junos OS so that, for the active route, all next-hop addresses for a destination are installed in the forwarding table. This is called per-packet load balancing. You can use this feature to spread traffic across multiple paths.

On a QFX3500 standalone switch, with static routing configured, whenever a route pointing to an ECMP next-hop changes to a new ECMP next-hop with a different member list but contains the exact member count as before, the location of the retained members in the new member list is the same as in the old member list.

For example, if you have the following configuration on the switch:

```
set routing-options static route 0.0.0.0/0 next-hop 11.8.12.2
set routing-options static route 0.0.0.0/0 next-hop 11.9.12.2
set routing-options static route 0.0.0.0/0 next-hop 11.10.12.2
set routing-options static route 0.0.0.0/0 next-hop 11.11.12.2
set routing-options static route 0.0.0.0/0 next-hop 11.12.12.2
set routing-options static route 0.0.0.0/0 next-hop 11.13.12.2
set routing-options static route 0.0.0.0/0 next-hop 11.14.12.2
set routing-options static route 0.0.0.0/0 next-hop 11.15.12.2
```

and want to change the first and eighth route to point to another location, you can issue the following commands:

```
delete routing-options static route 0.0.0.0/0 next-hop 11.8.12.2
delete routing-options static route 0.0.0.0/0 next-hop 11.15.12.2
set routing-options static route 0.0.0.0/0 next-hop 11.16.12.2
set routing-options static route 0.0.0.0/0 next-hop 11.17.12.2
```

This configuration does not affect the second next-hop through the seventh next-hop.

When per-packet load balancing is configured, traffic is divided into individual flows (up to a maximum of 16). Packets for an individual flow are sent out a single interface. To determine flows, the switch examines each of the following packet fields:

- Source IP address
- Destination IP address
- Protocol
- Source port number
- Destination port number
- Source interface index
- Type of service (ToS)

The switch recognizes packets in which all of these parameters are identical and ensures that these packets are sent out through the same interface. This prevents problems that might otherwise occur with packets arriving at their destination out of their original sequence.

**NOTE:** Load balancing is not supported on management interfaces.

The following steps show how to configure per-packet load balancing:

1. Define a load-balancing routing policy by including one or more **policy-statement** statements at the **[edit policy-options]** hierarchy level, defining an action of **load-balance per-packet**:

```
policy-statement policy-name {
```

```
from {  
    match-conditions;  
    route-filter destination-prefix match-type <actions>;  
    prefix-list name;  
}  
then {  
    load-balance per-packet;  
}  
}
```

2. Apply the policy to routes exported from the routing table to the forwarding table. To do this, include the **forwarding-table** and **export** statements:

```
forwarding-table {  
    export policy-name;  
}
```

## Configuring Distributed Periodic Packet Management

Periodic packet management (PPM) is responsible for processing a variety of time-sensitive periodic tasks so that other processes can more optimally direct their resources.

The responsibility for PPM processing on the switch is distributed between the Routing Engine and the access interfaces for all protocols that use PPM by default. This distributed model provides a faster response time for protocols that use PPM than the response time provided by the nondistributed model.

If distributed PPM is disabled, the PPM process runs on the Routing Engine only.

You can disable distributed PPM for all protocols that use PPM. You can also disable distributed PPM for Link Aggregation Control Protocol (LACP) packets only.

**BEST PRACTICE:** We generally recommend that you disable distributed PPM only if Juniper Networks Customer Service advises you to do so. You should disable distributed PPM only if you have a compelling reason to disable it.

---

This topic describes:

- [Disabling or Enabling Distributed Periodic Packet Management Globally on page 3085](#)
- [Disabling or Enabling Distributed Periodic Packet Management for LACP Packets on page 3085](#)

### Disabling or Enabling Distributed Periodic Packet Management Globally

Distributed PPM is enabled by default. Disable distributed PPM if you need to move all PPM processing to the Routing Engine. Enable distributed PPM if it was previously disabled and you need to run distributed PPM.

To disable distributed PPM:

```
[edit routing-options]
user@switch# set ppm no-delegate-processing
```

To enable distributed PPM if it was previously disabled:

```
[edit routing-options]
user@switch# delete ppm no-delegate-processing
```

### Disabling or Enabling Distributed Periodic Packet Management for LACP Packets

Distributed PPM is enabled by default. Disable distributed PPM for only LACP packets if you need to move all PPM processing for LACP packets to the Routing Engine.

To disable distributed PPM for LACP packets:

```
[edit protocols]
user@switch# set lacp ppm centralized
```

To enable distributed PPM for LACP packets if it was previously disabled:

```
[edit protocols]
user@switch# delete lacp ppm centralized
```

## Configuring Virtual Router Routing Instances

Use virtual router routing instances to divide a QFX Series switch into multiple independent virtual routers, each with its own routing table. Virtual router routing instances enable you to isolate traffic without using multiple devices to segment your network. You can create routing instances for unicast routing protocols and PIM sparse mode.

To configure virtual router routing instances:

1. Create a routing instance:

```
[edit routing-instances]user@switch# set routing-instance-name instance-type virtual-router
```

**NOTE:** The default routing instance, **master**, refers to the main inet.0 routing table. The master routing instance is reserved and cannot be specified as a routing instance.

2. Bind each routing instance to the corresponding interfaces:

```
[edit routing-instances]user@switch# set routing-instance-name interface
device-name:type-fpc/pic/port.logical-unit-number
```

**NOTE:** You can bind an interface to one routing instance only.

3. Create each of the logical interfaces bound to each routing instance:

```
[edit interfaces]user@switch# set device-name: type-fpc/pic/port unit logical-unit-number  
family inet address ip-address
```

**NOTE:** Do not create a logical interface using the family `ethernet-switching` option in this step. Binding an interface using the family `ethernet-switching` option to a routing instance can cause the interface to shut down.

4. (Optional) Configure routing protocols for the routing instance at the `[edit routing-instances routing-instance-name protocols]` hierarchy level.
5. (Optional) Configure routing options for the routing instance at the `[edit routing-instances routing-instance-name routing-options]` hierarchy level.

## Configuring the Unified Forwarding Table

To optimize the way your switch allocates memory for different types of addresses, you can choose a unified forwarding table profile. In addition to choosing this profile, you can also decide how you want memory allocated for longest prefix match (LPM) entries.

- [Configuring an Address-Storage Profile on page 3086](#)
- [Configuring the LPM Allocation on page 3087](#)

### Configuring an Address-Storage Profile

---

On QFX5100 and EX4600 switches, you can control the allocation of memory available to store the following:

- MAC addresses
- Layer 3 host entries
- Longest prefix match (LPM) table entries

You configure the mix that best meets your needs by choosing the appropriate profile. [Table 170 on page 2218](#) lists the profiles you can choose and the maximum values for the MAC address and host table entries.

Table 243: Unified Forwarding Table Profiles

| Profile Name                         | MAC Table     | Host Table (unicast and multicast addresses) |              |             |             |             |             |
|--------------------------------------|---------------|----------------------------------------------|--------------|-------------|-------------|-------------|-------------|
|                                      | MAC Addresses | IPv4 unicast                                 | IPv6 unicast | IPv4 (*, G) | IPv4 (S, G) | IPv6 (*, G) | IPv6 (S, G) |
| <b>l2-profile-one</b>                | 288K          | 16K                                          | 8K           | 8K          | 8K          | 4K          | 4K          |
| <b>l2-profile-two</b>                | 224K          | 80K                                          | 40K          | 40K         | 40K         | 20K         | 20K         |
| <b>l2-profile-three</b><br>(default) | 160K          | 144K                                         | 72K          | 72K         | 72K         | 36K         | 36K         |
| <b>l3-profile</b>                    | 96K           | 208K                                         | 104K         | 104K        | 104K        | 52K         | 52K         |
| <b>lpm-profile*</b>                  | 32K           | 16K                                          | 8K           | 8K          | 8K          | 4K          | 4K          |

Note that if the host table stores the maximum number of entries for any given type, the entire table is full and is unable to accommodate *any* entries of any other type. For example, an IPv6 unicast address occupies twice as much memory as an IPv4 unicast address, and an IPv6 multicast address occupies four times as much memory as an IPv4 unicast address. For more information about valid combinations of table entries see *Understanding the Unified Forwarding Table*.

To configure the profile that you want, enter and commit the following statement:

[edit]

```
user@switch# set chassis forwarding-options profile-name
```

**NOTE:** When you configure and commit a profile, the PFE process restarts and all the data interfaces on the switch go down and come back up.

The settings for **l2-profile-three** are configured by default. That is, if you do not enter a **set forwarding-options chassis profile-name** statement, these settings are configured.

### Configuring the LPM Allocation

In addition to choosing a profile, you can further optimize memory allocation for LPM table entries by configuring how many IPv6 prefixes in the range /65 through /127 you want the switch to store. The switch uses LPM entries during address lookup to match addresses to the most-specific (longest) applicable prefix. The procedures for configuring the LPM table are different depending on which version of Junos OS you are using.

- [Configuring the LPM Table With Junos OS 13.2X51-D10 and 13.2X52-D10 on page 3088](#)
- [Configuring the LPM Table With Junos OS 13.2x51-D15 on page 3089](#)

**Configuring the LPM Table With Junos OS 13.2X51-D10 and 13.2X52-D10**

With Junos OS 13.2x51-D10 and 13.2X52-D10, the switch allocates memory for 16 IPv6 prefixes in the range /65 through /127 by default. If you want to use more than 16 IPv6 prefixes in this range, you must enter and commit the following statement:

```
user@switch# set chassis forwarding-options profile-name num-65-127-prefix [1-128]
```

Each increment adds support for 16 IPv6 prefixes between /65 and /127, for a maximum of 2048 such prefixes (16 x 128 = 2048). The system supports 16 of these prefixes by default, so to increase the number of supported prefixes, you must enter a value of 2 or greater. For example, if you enter 2, the system will support 32 IPv6 prefixes in the range /65 through /127.

**NOTE:** When you configure and commit the `num-65-127-prefix` value, all the data interfaces on the switch restart. The management interfaces are unaffected.

The LPM table is shared, and each increment that you add for IPv6 prefixes in the range /65 through /127 reduces the number of table entries that are available for IPv4 prefixes and IPv6 prefixes shorter than /65. Note that IPv6 prefixes /65 and longer consume twice as much memory as shorter IPv6 prefixes and four times as much memory as IPv4 prefixes. So, for example, entering the following statement

```
user@switch# set chassis forwarding-options l2-profile-one num-65-127-prefix 2
```

provides for 16 additional IPv6 prefixes /65 or longer (for a total of 32 such prefixes) and reduces the numbers of other prefixes that can be stored, as indicated:

- 32 fewer IPv6 prefixes shorter than /65 (16 IPv6 prefixes /65 or longer consume the same amount of memory as 32 IPv6 prefixes shorter than /65), or
- 64 fewer IPv4 prefixes (16 IPv6 prefixes /65 or longer consume the same amount of memory as 64 IPv4 prefixes)

[Table 171 on page 2220](#) provides examples of valid combinations that the LPM table can store using the **l2** and **l3** profiles. Once again, each row in the table represents a case in which the table is full and cannot accommodate any more entries.

**Table 244: Example LPM Table Combinations Using l2-and l3 Profiles With Junos OS 13.2X51-D10 and 13.2X52-D10**

| num-65-127-prefix Value | IPv4 Entries | IPv6 Entries (Prefix <= 64) | IPv6 Entries (Prefix >= 65) |
|-------------------------|--------------|-----------------------------|-----------------------------|
| 1 (default)             | 16K-16       | OK                          | 16                          |
| 1 (default)             | OK           | 8K-16                       | 16                          |
| 1 (default)             | 8K-16        | 4K                          | 16                          |
| 64                      | 4K           | 4K                          | 1K                          |

Table 244: Example LPM Table Combinations Using l2-and l3 Profiles With Junos OS 13.2X51-D10 and 13.2X52-D10 (*continued*)

| num-65-127-prefix Value | IPv4 Entries | IPv6 Entries (Prefix <= 64) | IPv6 Entries (Prefix >= 65) |
|-------------------------|--------------|-----------------------------|-----------------------------|
| 64                      | 2K           | 5K                          | 1K                          |
| 64                      | 0K           | 6K                          | 1K                          |
| 128                     | 4K           | 2K                          | 2K                          |
| 128                     | 2K           | 3K                          | 2K                          |
| 128                     | 0K           | 4K                          | 2K                          |

**NOTE:** With Junos OS 13.2X51-D10 and 13.2X52-D10, the `lpm-profile` does not support IPv6 prefixes. If you use this version of Junos OS and also use the `lpm-profile`, do not configure the `num-65-127-prefix` statement. That is, leave it at its default value of 1, which allows for as many as 128K IPv4 prefixes (the maximum possible).

#### Configuring the LPM Table With Junos OS 13.2x51-D15

With Junos OS 13.2X51-D15, you can configure the memory allocation for the LPM table for the `lpm-profile` profile independently of the other profiles. In addition, Junos OS 13.2x51-D15 offers twice as much storage for IPv6 prefixes /65 through /127 (4K instead of 2K) for the `l2` and `l3` profiles.

- [Configuring the l2 and l3 profiles With Junos OS 13.2x51-D15 on page 3089](#)
- [Configuring The lpm-profile With Junos OS 13.2x51-D15 on page 3090](#)

#### Configuring the l2 and l3 profiles With Junos OS 13.2x51-D15

With Junos OS 13.2x51-D15, you can configure the switch to support as many as 4K IPv6 prefixes /65 through /127 if you are using any profile other than the `lpm-profile` profile. To do so, enter and commit the following statement:

```
user@switch# set chassis forwarding-options profile-name num-65-127-prefix [0-4]
```

Each increment adds support for 1K IPv6 prefixes between /65 and /127, for a maximum of 4K such prefixes. The default value is 1, which allocates memory for 1K of IPv6 prefixes in this range. Each increment that you add for IPv6 prefixes in the range /65 through /127 reduces the number of table entries that are available for IPv6 prefixes shorter than /65 and IPv4 prefixes. [Table 172 on page 2221](#) shows the numbers of entries that you can allocate by using the `num-65-127-prefix` statement with Junos OS 13.2X51-D15. Once again, each row represents a case in which the table is full and cannot accommodate any more entries.

Table 245: LPM Table Combinations for l2 and l3 profiles With Junos OS 13.2X51-D15

| num-65-127-prefix Value | IPv4 Entries | IPv6 Entries (Prefix <= 64) | IPv6 Entries (Prefix >= 65) |
|-------------------------|--------------|-----------------------------|-----------------------------|
|-------------------------|--------------|-----------------------------|-----------------------------|

Table 245: LPM Table Combinations for l2 and l3 profiles With Junos OS 13.2X51-D15 (*continued*)

|             |     |    |    |
|-------------|-----|----|----|
| 0           | 16K | 8K | 0K |
| 1 (default) | 12K | 6K | 1K |
| 2           | 8K  | 4K | 2K |
| 3           | 4K  | 2K | 3K |
| 4           | 0K  | 0K | 4K |

**NOTE:** When you configure the `num-65-127-prefix` value, the PFE process restarts and all the data interfaces on the switch go down and come back up. The management interfaces are unaffected.

#### Configuring The `lpm-profile` With Junos OS 13.2x51-D15

If you use the `lpm-profile` profile with Junos OS 13.2x51-D15, you can control whether the switch allocates any memory for IPv6 prefixes /65 through /127. By default, the switch supports the following with this profile:

- 128K IPv4 prefixes
- 16K IPv6 prefixes (all lengths)

You can disable support for IPv6 prefixes /65 through /127 with the `lpm-profile` profile so that there is more memory for IPv6 prefixes shorter than /65. To do so, enter and commit the following statement:

```
user@switch# set chassis forwarding-options profile-name prefix-65-127-disable
```

If you enter this statement, the switch allocates memory for the following:

- 128K IPv4 and IPv6 prefixes shorter than /65
- 0K IPv6 prefixes /65 through /127

For example, if you use the `prefix-65-127-disable` statement, each of the following combinations are valid:

- 100K IPv4 and 28K IPv6 /64 prefixes
- 64K IPv4 and 64K IPv6 /64 prefixes
- 128K IPv4 and 0K IPv6 /64 prefixes
- 0K IPv4 and 128K IPv6 /64 prefixes

## Configuration Examples

- [Examples: Configuring Per-Packet Load Balancing on page 3091](#)
- [Examples: Configuring BFD for Static Routes on page 3092](#)
- [Example: Configuring BFD Authentication for Static Routes on page 3107](#)

### Examples: Configuring Per-Packet Load Balancing

Perform per-packet load balancing for all routes:

```
[edit]
policy-options {
  policy-statement load-balancing-policy {
    then {
      load-balance per-packet;
    }
  }
}
routing-options {
  forwarding-table {
    export load-balancing-policy;
  }
}
```

Perform per-packet load balancing for a limited set of routes:

```
[edit]
policy-options {
  policy-statement load-balancing-policy {
    from {
      route-filter 192.168.10/24 orlonger;
      route-filter 9.114/16 orlonger;
    }
    then {
      load-balance per-packet;
    }
  }
}
routing-options {
  forwarding-table {
    export load-balancing-policy;
  }
}
```

---

### Understanding BFD for Static Routes

The Bidirectional Forwarding Detection (BFD) protocol is a simple hello mechanism that detects failures in a network. BFD works with a wide variety of network environments and topologies. A pair of routing devices exchanges BFD packets. Hello packets are sent at a specified, regular interval. A neighbor failure is detected when the routing device stops receiving a reply after a specified interval. The BFD failure detection timers have shorter time limits than the static route failure detection mechanisms, so they provide faster detection.

The BFD failure detection timers are adaptive and can be adjusted to be faster or slower. The lower the BFD failure detection timer value, the faster the failure detection and vice versa. For example, the timers can adapt to a higher value if the adjacency fails (that is, the timer detects failures more slowly). Or a neighbor can negotiate a higher value for a timer than the configured value. The timers adapt to a higher value when a BFD session flap occurs more than three times in a span of 15 seconds. A back-off algorithm increases the receive (Rx) interval by two if the local BFD instance is the reason for the session flap. The transmission (Tx) interval is increased by two if the remote BFD instance is the reason for the session flap. You can use the **clear bfd adaptation** command to return BFD interval timers to their configured values. The **clear bfd adaptation** command is hitless, meaning that the command does not affect traffic flow on the routing device.

By default, BFD is supported on single-hop static routes. In Junos OS Release 8.2 and later, BFD also supports multihop static routes.

To enable failure detection, include the **bfd-liveness-detection** statement in the static route configuration.

In Junos OS Release 9.1 and later, the BFD protocol is supported for IPv6 static routes. Global unicast and link-local IPv6 addresses are supported for static routes. The BFD protocol is not supported on multicast or anycast IPv6 addresses. For IPv6, the BFD protocol supports only static routes and only in Junos OS Release 9.3 and later. IPv6 for BFD is not supported for any other protocol.

To configure the BFD protocol for IPv6 static routes, include the **bfd-liveness-detection** statement at the **[edit routing-options rib inet6.0 static route destination-prefix]** hierarchy level.

In Junos OS Release 8.5 and later, you can configure a hold-down interval to specify how long the BFD session must remain up before a state change notification is sent.

To specify the hold-down interval, include the **holddown-interval** statement in the BFD configuration.

You can configure a number in the range from 0 through 255,000 milliseconds. The default is 0. If the BFD session goes down and then comes back up during the hold-down interval, the timer is restarted.

**NOTE:** If a single BFD session includes multiple static routes, the hold-down interval with the highest value is used.

To specify the minimum transmit and receive intervals for failure detection, include the **minimum-interval** statement in the BFD configuration.

This value represents both the minimum interval after which the local routing device transmits hello packets and the minimum interval after which the routing device expects to receive a reply from the neighbor with which it has established a BFD session. You can configure a number in the range from 1 through 255,000 milliseconds. Optionally, instead of using this statement, you can configure the minimum transmit and receive intervals separately using the **transmit-interval**, **minimum-interval**, and **minimum-receive-interval** statements.

**NOTE:** BFD is an intensive protocol that consumes system resources. Specifying a minimum interval for BFD of less than 100 ms for Routing Engine-based sessions and 10 ms for distributed BFD sessions can cause undesired BFD flapping.

Depending on your network environment, these additional recommendations might apply:

- For large-scale network deployments with a large number of BFD sessions, specify a minimum interval of 300 ms for Routing Engine-based sessions and 100 ms for distributed BFD sessions.
- For very large-scale network deployments with a large number of BFD sessions, contact Juniper Networks customer support for more information.
- For BFD sessions to remain up during a Routing Engine switchover event when nonstop active routing (NSR) is configured, specify a minimum interval of 2500 ms for Routing Engine-based sessions. For distributed BFD sessions with NSR configured, the minimum interval recommendations are unchanged and depend only on your network deployment.

**NOTE:** SRX Series devices do not support distributed BFD.

To specify the minimum receive interval for failure detection, include the **minimum-receive-interval** statement in the BFD configuration. This value represents the minimum interval after which the routing device expects to receive a reply from a neighbor with which it has established a BFD session. You can configure a number in the range from 1 through 255,000 milliseconds. Optionally, instead of using this statement, you

can configure the minimum receive interval using the **minimum-interval** statement at the **[edit routing-options static route destination-prefix bfd-liveness-detection]** hierarchy level.

To specify the number of hello packets not received by the neighbor that causes the originating interface to be declared down, include the **multiplier** statement in the BFD configuration.

The default value is 3. You can configure a number in the range from 1 through 255.

To specify a threshold for detecting the adaptation of the detection time, include the **threshold** statement in the BFD configuration.

When the BFD session detection time adapts to a value equal to or higher than the threshold, a single trap and a system log message are sent. The detection time is based on the multiplier of the **minimum-interval** or the **minimum-receive-interval** value. The threshold must be a higher value than the multiplier for either of these configured values. For example if the **minimum-receive-interval** is 300 ms and the **multiplier** is 3, the total detection time is 900 ms. Therefore, the detection time threshold must have a value higher than 900.

To specify the minimum transmit interval for failure detection, include the **transmit-interval** **minimum-interval** statement in the BFD configuration.

This value represents the minimum interval after which the local routing device transmits hello packets to the neighbor with which it has established a BFD session. You can configure a value in the range from 1 through 255,000 milliseconds. Optionally, instead of using this statement, you can configure the minimum transmit interval using the **minimum-interval** statement at the **[edit routing-options static route destination-prefix bfd-liveness-detection]** hierarchy level.

To specify the threshold for the adaptation of the transmit interval, include the **transmit-interval threshold** statement in the BFD configuration.

The threshold value must be greater than the transmit interval. When the BFD session transmit time adapts to a value greater than the threshold, a single trap and a system log message are sent. The detection time is based on the multiplier of the value for the **minimum-interval** or the **minimum-receive-interval** statement at the **[edit routing-options static route destination-prefix bfd-liveness-detection]** hierarchy level. The threshold must be a higher value than the multiplier for either of these configured values.

To specify the BFD version, include the **version** statement in the BFD configuration. The default is to have the version detected automatically.

To include an IP address for the next hop of the BFD session, include the **neighbor** statement in the BFD configuration.

**NOTE:** You must configure the **neighbor** statement if the next hop specified is an interface name. If you specify an IP address as the next hop, that address is used as the neighbor address for the BFD session.

---

In Junos OS Release 9.0 and later, you can configure BFD sessions not to adapt to changing network conditions.

To disable BFD adaptation, include the **no-adaptation** statement in the BFD configuration.

**NOTE:** We recommend that you not disable BFD adaptation unless it is preferable not to have BFD adaptation in your network.

**NOTE:** If BFD is configured only on one end of a static route, the route is removed from the routing table. BFD establishes a session when BFD is configured on both ends of the static route.

BFD is not supported on ISO address families in static routes. BFD does support IS-IS.

If you configure graceful Routing Engine switchover (GRES) at the same time as BFD, GRES does not preserve the BFD state information during a failover.

Junos OS also supports BFD over multihop static routes. For example, you can configure BFD over a Layer 3 path to provide path integrity over that path. You can limit the number of hops by specifying the time to live (TTL).

To configure BFD over multihop static routes, include the following statements:

```
static route destination-prefix {
  bfd-liveness-detection {
    local-address ip-address;
    minimum-receive-ttl number;
  }
}
```

To specify the source address for the multihop static route and to enable multihop BFD support, include the **local-address** statement.

To specify the number of hops, include the **minimum-receive-ttl** statement. You must configure this statement for a multihop BFD session. You can configure a value in the range from 1 through 255. It is optional for a single-hop BFD session. If you configure the **minimum-receive-ttl** statement for a single-hop session, the value must be 255.

On M Series and T Series platforms only, starting in Junos OS Release 12.3, multihop BFD runs on the CPU in the FPC, DPC, or MPC. This is referred to as *distributed BFD*. Previously, multihop BFD ran from the Routing Engine.

### Example: Configuring BFD for Static Routes

This example shows how to configure Bidirectional Forwarding Detection (BFD) for static routes.

- [Requirements on page 3096](#)
- [Overview on page 3096](#)

- [Configuration on page 3096](#)
- [Verification on page 3099](#)

### Requirements

In this example, no special configuration beyond device initialization is required.

### Overview

There are many practical applications for static routes. Static routing is often used at the network edge to support attachment to stub networks, which, given their single point of entry and egress, are well suited to the simplicity of a static route. In Junos OS, static routes have a global preference of 5. Static routes are activated if the specified next hop is reachable.

In this example, you configure the static route 192.168.47.0/24 from the provider network to the customer network, using the next-hop address of 172.16.1.2. You also configure a static default route of 0.0.0.0/0 from the customer network to the provider network, using a next-hop address of 172.16.1.1.

For demonstration purposes, some loopback interfaces are configured on Device B and Device D. These loopback interfaces provide addresses to ping and thus verify that the static routes are working.

[Figure 86 on page 3096](#) shows the sample network.

**Figure 86: Customer Routes Connected to a Service Provider**

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device B**

```

set interfaces ge-1/2/0 unit 0 description B->D
set interfaces ge-1/2/0 unit 0 family inet address 172.16.1.1/24
set interfaces lo0 unit 57 family inet address 10.0.0.1/32
set interfaces lo0 unit 57 family inet address 10.0.0.2/32
set routing-options static route 192.168.47.0/24 next-hop 172.16.1.2
set routing-options static route 192.168.47.0/24 bfd-liveness-detection minimum-interval
  1000
set protocols bfd traceoptions file bfd-trace
set protocols bfd traceoptions flag all

```

**Device D**

```

set interfaces ge-1/2/0 unit 1 description D->B
set interfaces ge-1/2/0 unit 1 family inet address 172.16.1.2/24
set interfaces lo0 unit 2 family inet address 192.168.47.5/32
set interfaces lo0 unit 2 family inet address 192.168.47.6/32
set routing-options static route 0.0.0.0/0 next-hop 172.16.1.1
set routing-options static route 0.0.0.0/0 bfd-liveness-detection minimum-interval 1000
set protocols bfd traceoptions file bfd-trace
set protocols bfd traceoptions flag all

```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For information about navigating the CLI, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure BFD for static routes:

1. On Device B, configure the interfaces.  

```

[edit interfaces]
user@B# set ge-1/2/0 unit 0 description B->D
user@B# set ge-1/2/0 unit 0 family inet address 172.16.1.1/24
user@B# set lo0 unit 57 family inet address 10.0.0.1/32
user@B# set lo0 unit 57 family inet address 10.0.0.2/32

```
2. On Device B, create a static route and set the next-hop address.  

```

[edit routing-options]
user@B# set static route 192.168.47.0/24 next-hop 172.16.1.2

```
3. On Device B, configure BFD for the static route.  

```

[edit routing-options]
user@B# set static route 192.168.47.0/24 bfd-liveness-detection minimum-interval
  1000

```
4. On Device B, configure tracing operations for BFD.  

```

[edit protocols]
user@B# set bfd traceoptions file bfd-trace
user@B# set bfd traceoptions flag all

```
5. If you are done configuring Device B, commit the configuration.  

```

[edit]
user@B# commit

```
6. On Device D, configure the interfaces.  

```

[edit interfaces]
user@D# set ge-1/2/0 unit 1 description D->B

```

```
user@D# set ge-1/2/0 unit 1 family inet address 172.16.1.2/24
user@D# set lo0 unit 2 family inet address 192.168.47.5/32
user@D# set lo0 unit 2 family inet address 192.168.47.6/32
```

7. On Device D, create a static route and set the next-hop address.

```
[edit routing-options]
user@D# set static route 0.0.0.0/0 next-hop 172.16.1.1
```

8. On Device D, configure BFD for the static route.

```
[edit routing-options]
user@D# set static route 0.0.0.0/0 bfd-liveness-detection minimum-interval 1000
```

9. On Device D, configure tracing operations for BFD.

```
[edit protocols]
user@D# set bfd traceoptions file bfd-trace
user@D# set bfd traceoptions flag all
```

10. If you are done configuring Device D, commit the configuration.

```
[edit]
user@D# commit
```

### Results

Confirm your configuration by issuing the **show interfaces**, **show protocols**, and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
Device B user@B# show interfaces
ge-1/2/0 {
  unit 0 {
    description B->D;
    family inet {
      address 172.16.1.1/24;
    }
  }
}
lo0 {
  unit 57 {
    family inet {
      address 10.0.0.1/32;
      address 10.0.0.2/32;
    }
  }
}

user@D# show protocols
bfd {
  traceoptions {
    file bfd-trace;
    flag all;
  }
}

user@B# show routing-options
static {
```

```

        route 192.168.47.0/24 {
            next-hop 172.16.1.2;
            bfd-liveness-detection {
                minimum-interval 1000;
            }
        }
    }
}

Device D user@D# show interfaces
ge-1/2/0 {
    unit 1 {
        description D->B;
        family inet {
            address 172.16.1.2/24;
        }
    }
}
lo0 {
    unit 2 {
        family inet {
            address 192.168.47.5/32;
            address 192.168.47.6/32;
        }
    }
}

user@D# show routing-options
static {
    route 0.0.0.0/0 {
        next-hop 172.16.1.1;
        bfd-liveness-detection {
            minimum-interval 1000;
        }
    }
}
}

```

### Verification

Confirm that the configuration is working properly.

- [Verifying That BFD Sessions Are Up on page 3099](#)
- [Viewing Detailed BFD Events on page 3100](#)

### Verifying That BFD Sessions Are Up

**Purpose** Verify that the BFD sessions are up, and view details about the BFD sessions.

**Action** From operational mode, enter the **show bfd session extensive** command.

```

user@B> show bfd session extensive

```

| Address    | State | Interface  | Detect Time | Transmit Interval | Multiplier |
|------------|-------|------------|-------------|-------------------|------------|
| 172.16.1.2 | Up    | lt-1/2/0.0 | 3.000       | 1.000             | 3          |

```

Client Static, TX interval 1.000, RX interval 1.000
Session up time 00:14:30
Local diagnostic None, remote diagnostic None
Remote state Up, version 1

```

```

Replicated, routing table index 172
Min async interval 1.000, min slow interval 1.000
Adaptive async TX interval 1.000, RX interval 1.000
Local min TX interval 1.000, minimum RX interval 1.000, multiplier 3
Remote min TX interval 1.000, min RX interval 1.000, multiplier 3
Local discriminator 2, remote discriminator 1
Echo mode disabled/inactive

```

```

1 sessions, 1 clients
Cumulative transmit rate 1.0 pps, cumulative receive rate 1.0 pps

```

```
user@D> show bfd session extensive
```

| Address    | State | Interface  | Detect Time | Transmit Interval | Multiplier |
|------------|-------|------------|-------------|-------------------|------------|
| 172.16.1.1 | Up    | lt-1/2/0.1 | 3.000       | 1.000             | 3          |

```

Client Static, TX interval 1.000, RX interval 1.000
Session up time 00:14:35
Local diagnostic None, remote diagnostic None
Remote state Up, version 1
Replicated, routing table index 170
Min async interval 1.000, min slow interval 1.000
Adaptive async TX interval 1.000, RX interval 1.000
Local min TX interval 1.000, minimum RX interval 1.000, multiplier 3
Remote min TX interval 1.000, min RX interval 1.000, multiplier 3
Local discriminator 1, remote discriminator 2
Echo mode disabled/inactive

```

```

1 sessions, 1 clients
Cumulative transmit rate 1.0 pps, cumulative receive rate 1.0 pps

```

**Meaning** The TX interval 1.000, RX interval 1.000 output represents the setting configured with the **minimum-interval** statement. All of the other output represents the default settings for BFD. To modify the default settings, include the optional statements under the **bfd-liveness-detection** statement.

### Viewing Detailed BFD Events

**Purpose** View the contents of the BFD trace file to assist in troubleshooting, if needed.

**Action** From operational mode, enter the **file show /var/log/bfd-trace** command.

```

user@B> file show /var/log/bfd-trace
Nov 23 14:26:55 Data (9) len 35: (hex) 42 46 44 20 70 65 72 69 6f 64 69 63 20
78 6d 69 74 20 72

78 6d 69 74 20 74

```

**Meaning** BFD messages are being written to the trace file.

### Example: Enabling BFD on Qualified Next Hops in Static Routes

This example shows how to configure a static route with multiple possible next hops. Each next hop has Bidirectional Forwarding Detection (BFD) enabled.

- [Requirements on page 3101](#)
- [Overview on page 3101](#)
- [Configuration on page 3102](#)
- [Verification on page 3104](#)

#### Requirements

In this example, no special configuration beyond device initialization is required.

#### Overview

In this example, Device B has the static route **192.168.47.0/24** with two possible next hops. The two next hops are defined using two **qualified-next-hop** statements. Each next hop has BFD enabled.

BFD is also enabled on Device D because BFD must be enabled on both ends of the connection.

A next hop is included in the routing table if the BFD session is up. The next hop is removed from the routing table if the BFD session is down.

See [Figure 87 on page 3101](#).

**Figure 87: BFD Enabled on Qualified Next Hops**

### Configuration

**CLI Quick Configuration** To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**Device B**

```
set interfaces fe-0/1/0 unit 2 description secondary-B->D
set interfaces fe-0/1/0 unit 2 family inet address 192.168.2.1/24
set interfaces ge-1/2/0 unit 0 description B->D
set interfaces ge-1/2/0 unit 0 family inet address 172.16.1.1/24
set routing-options static route 192.168.47.0/24 qualified-next-hop 192.168.2.2
  bfd-liveness-detection minimum-interval 60
set routing-options static route 192.168.47.0/24 qualified-next-hop 172.16.1.2
  bfd-liveness-detection minimum-interval 60
```

**Device D**

```
set interfaces fe-0/1/0 unit 3 description secondary-D->B
set interfaces fe-0/1/0 unit 3 family inet address 192.168.2.2/24
set interfaces ge-1/2/0 unit 1 description D->B
set interfaces ge-1/2/0 unit 1 family inet address 172.16.1.2/24
set routing-options static route 0.0.0.0/0 qualified-next-hop 192.168.2.1
set routing-options static route 0.0.0.0/0 qualified-next-hop 172.16.1.1
set routing-options static route 0.0.0.0/0 bfd-liveness-detection minimum-interval 60
```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a static route with two possible next hops, both with BFD enabled:

1. On Device B, configure the interfaces.

```
[edit interfaces fe-0/1/0]
user@B# set unit 2 description secondary-B->D
user@B# set unit 2 family inet address 192.168.2.1/24

[edit interfaces ge-1/2/0]
user@B# set unit 0 description B->D
user@B# set unit 0 family inet address 172.16.1.1/24
```
2. On Device B, configure the static route with two next hops, both with BFD enabled.

```
[edit routing-options static route 192.168.47.0/24]
user@B# set qualified-next-hop 192.168.2.2 bfd-liveness-detection minimum-interval
60
user@B# set qualified-next-hop 172.16.1.2 bfd-liveness-detection minimum-interval
60
```
3. On Device D, configure the interfaces.

```
[edit interfaces fe-0/1/0]
user@D# set unit 3 description secondary-D->B
user@D# set unit 3 family inet address 192.168.2.2/24

[edit interfaces ge-1/2/0]
user@D# set unit 1 description D->B
```

```
user@D# set unit 1 family inet address 172.16.1.2/24
```

4. On Device D, configure a BFD-enabled default static route with two next hops to the provider network.

In this case, BFD is enabled on the route, not on the next hops.

```
[edit routing-options static route 0.0.0.0/0]
user@D# set qualified-next-hop 192.168.2.1
user@D# set qualified-next-hop 172.16.1.1
user@D# set bfd-liveness-detection minimum-interval 60
```

**Results** Confirm your configuration by issuing the **show interfaces** and **show routing-options** commands. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
user@B# show interfaces
fe-0/1/0 {
  unit 2 {
    description secondary-B->D;
    family inet {
      address 192.168.2.1/24;
    }
  }
}
ge-1/2/0 {
  unit 0 {
    description B->D;
    family inet {
      address 172.16.1.1/24;
    }
  }
}

user@B# show routing-options
static {
  route 192.168.47.0/24 {
    qualified-next-hop 192.168.2.2 {
      bfd-liveness-detection {
        minimum-interval 60;
      }
    }
    qualified-next-hop 172.16.1.2 {
      bfd-liveness-detection {
        minimum-interval 60;
      }
    }
  }
}

user@D# show interfaces
fe-0/1/0 {
  unit 3 {
    description secondary-D->B;
    family inet {
      address 192.168.2.2/24;
    }
  }
}
```

```
    }  
  }  
  ge-1/2/0 {  
    unit 1 {  
      description D->B;  
      family inet {  
        address 172.16.1.2/24;  
      }  
    }  
  }  
}  
  
user@D# show routing-options  
static {  
  route 0.0.0.0/0 {  
    qualified-next-hop 192.168.2.1;  
    qualified-next-hop 172.16.1.1;  
    bfd-liveness-detection {  
      minimum-interval 60;  
    }  
  }  
}
```

If you are done configuring the devices, enter **commit** from configuration mode.

### ***Verification***

Confirm that the configuration is working properly.

- [Checking the Routing Tables on page 3104](#)
- [Verifying the BFD Sessions on page 3105](#)
- [Removing BFD from Device D on page 3105](#)
- [Removing BFD from One Next Hop on page 3106](#)

### ***Checking the Routing Tables***

**Purpose** Make sure that the static route appears in the routing table on Device B with two possible next hops.

**Action** user@B> show route 192.168.47.0 extensive  
 inet.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)  
 192.168.47.0/24 (1 entry, 1 announced)  
 TSI:  
 KRT in-kernel 192.168.47.0/24 -> {192.168.2.2}  
     \*Static Preference: 5  
         Next hop type: Router  
         Address: 0x9334010  
         Next-hop reference count: 1  
         Next hop: 172.16.1.2 via ge-1/2/0.0  
         Next hop: 192.168.2.2 via fe-0/1/0.2, selected  
         State: <Active Int Ext>  
         Age: 9  
         Task: RT  
         Announcement bits (1): 3-KRT  
         AS path: I

**Meaning** Both next hops are listed. The next hop 192.168.2.2 is the selected route.

### *Verifying the BFD Sessions*

**Purpose** Make sure that the BFD sessions are up.

**Action** user@B> show bfd session

| Address     | State | Interface  | Detect Time | Transmit Interval | Multiplier |
|-------------|-------|------------|-------------|-------------------|------------|
| 172.16.1.2  | Up    | ge-1/2/0.0 | 0.720       | 0.240             | 3          |
| 192.168.2.2 | Up    | fe-0/1/0.2 | 0.720       | 0.240             | 3          |

2 sessions, 2 clients

Cumulative transmit rate 8.3 pps, cumulative receive rate 8.3 pps

**Meaning** The output shows that the BFD sessions are up.

### *Removing BFD from Device D*

**Purpose** Demonstrate what happens when the BFD session is down for both next hops.

**Action** 1. Deactivate BFD on Device D.

```
[edit routing-options static route 0.0.0.0/0]
user@D# deactivate bfd-liveness-detection
user@D# commit
```

2. Rerun the show bfd session command on Device B.

user@B> show bfd session

| Address     | State | Interface  | Detect Time | Transmit Interval | Multiplier |
|-------------|-------|------------|-------------|-------------------|------------|
| 172.16.1.2  | Down  | ge-1/2/0.0 | 3.000       | 1.000             | 3          |
| 192.168.2.2 | Down  | fe-0/1/0.2 | 3.000       | 1.000             | 3          |

2 sessions, 2 clients

Cumulative transmit rate 2.0 pps, cumulative receive rate 2.0 pps

3. Rerun the **show route 192.168.47.0** command on Device B.

```
user@B> show route 192.168.47.0
```

**Meaning** As expected, when the BFD sessions are down, the static route is removed from the routing table.

### *Removing BFD from One Next Hop*

**Purpose** Demonstrate what happens when only one next hop has BFD enabled.

- Action** 1. If it is not already deactivated, deactivate BFD on Device D.

```
[edit routing-options static route 0.0.0.0/0]
user@D# deactivate bfd-liveness-detection
user@D# commit
```

2. Deactivate BFD on one of the next hops on Device B.

```
[edit routing-options static route 192.168.47.0/24 qualified-next-hop 172.16.1.2]
user@B# deactivate bfd-liveness-detection
user@B# commit
```

3. Rerun the **show bfd session** command on Device B.

```
user@B> show bfd session
```

| Address     | State | Interface  | Detect Time | Transmit Interval | Multiplier |
|-------------|-------|------------|-------------|-------------------|------------|
| 192.168.2.2 | Down  | fe-0/1/0.2 | 3.000       | 1.000             | 3          |

4. Rerun the **show route 192.168.47.0 extensive** command on Device B.

```
user@B> show route 192.168.47.0 extensive
```

```
inet.0: 5 destinations, 5 routes (5 active, 0 holddown, 0 hidden)
192.168.47.0/24 (1 entry, 1 announced)
TSI:
KRT in-kernel 192.168.47.0/24 -> {172.16.1.2}
  *Static Preference: 5
    Next hop type: Router, Next hop index: 624
    Address: 0x92f0178
    Next-hop reference count: 3
    Next hop: 172.16.1.2 via ge-1/2/0.0, selected
    State: <Active Int Ext>
    Age: 2:36
    Task: RT
    Announcement bits (1): 3-KRT
    AS path: I
```

**Meaning** As expected, the BFD session is down for the 192.168.2.2 next hop. The 172.16.1.2 next hop remains in the routing table, and the route remains active, because BFD is not a condition for this next hop to remain valid.

### Understanding BFD Authentication for Static Routes

Bidirectional Forwarding Detection (BFD) enables rapid detection of communication failures between adjacent systems. By default, authentication for BFD sessions is disabled. However, when you run BFD over Network Layer protocols, the risk of service attacks can be significant.

**NOTE:** We strongly recommend using authentication if you are running BFD over multiple hops or through insecure tunnels.

Beginning with Junos OS Release 9.6, Junos OS supports authentication for BFD sessions running over IPv4 and IPv6 static routes. BFD authentication is not supported on MPLS OAM sessions. BFD authentication is only supported in the Canada and United States version of the Junos OS image and is not available in the export version.
