| <b>Release Information</b> | Command introduced before Junos OS Release 7.4.<br>Command introduced in Junos OS Release 9.0 for EX Series switches.<br>Option <b>sfc</b> introduced for the TX Matrix Plus router in Junos OS Release 9.6.<br>Command introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Description</b>         | Display information about software processes that are running on the router or switch and that have controlling terminals.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| <b>Options</b>             | <p><b>none</b>—Display standard information about system processes.</p> <p><b>brief   detail   extensive   summary</b>—(Optional) Display the specified level of detail.</p> <p><b>adaptive-services</b>—(Optional) Display the configuration management process that manages the configuration for stateful firewall, Network Address Translation (NAT), intrusion detection services (IDS), and IP Security (IPsec) services on the Adaptive Services PIC.</p> <p><b>alarm-control</b>—(Optional) Display the process to configure the system alarm.</p> <p><b>all-chassis</b>—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display standard system process information about all the T640 routers (in a routing matrix based on the TX Matrix router) or all the T1600 or T4000 routers (in a routing matrix based on the TX Matrix Plus router) in the chassis.</p> <p><b>all-lcc</b>—(TX Matrix routers and TX Matrix Plus router only) (Optional) Display standard system process information for all T640 routers (or line-card chassis) connected to the TX Matrix router. Display standard system process information for all connected T1600 or T4000 LCCs.</p> <p><b>all-members</b>—(EX4200 switches and MX Series routers only) (Optional) Display standard system process information for all members of the Virtual Chassis configuration.</p> <p><b>ancpd-service</b>—Display the Access Node Control Protocol (ANCP) process, which works with a special Internet Group Management Protocol (IGMP) session to collect outgoing interface mapping events in a scalable manner.</p> <p><b>application-identification</b>—Display the process that identifies an application using intrusion detection and prevention (IDP) to allow or deny traffic based on applications running on standard or nonstandard ports.</p> <p><b>audit-process</b>—(Optional) Display the RADIUS accounting process.</p> <p><b>auto-configuration</b>—Display the Interface Auto-Configuration process.</p> <p><b>bootp</b>—Display the process that enables a router, switch, or interface to act as a Dynamic Host Configuration Protocol (DHCP) or bootstrap protocol (BOOTP) relay agent. DHCP relaying is disabled.</p> |

**captive-portal-content-delivery**—Display the HTTP redirect service by specifying the location to which a subscriber's initial Web browser session is redirected, enabling initial provisioning and service selection for the subscriber.

**ce-l2tp-service**—(Optional) (M10, M10i, M7i, and MX Series routers only) Display the Universal Edge Layer 2 Tunneling Protocol (L2TP) process, which establishes L2TP tunnels and Point-to-Point Protocol (PPP) sessions through L2TP tunnels.

**cfm**—Display Ethernet Operations, Administration, and Maintenance (OAM) connectivity fault management (CFM) process, which can be used to monitor the physical link between two switches.

**chassis-control**—(Optional) Display the chassis management process.

**class-of-service**—(Optional) Display the class-of-service (CoS) process, which controls the router's or switch's CoS configuration.

**clksyncd-service**—Display the external clock synchronization process, which uses synchronous Ethernet (SyncE).

**craft-control**—Display the process for the I/O of the craft interface.

**database-replication**—(EX Series switches and MX Series routers only) (Optional) Display the database replication process.

**datapath-trace-service**—Display the packet path tracing process.

**dhcp-service**—(EX Series switches and MX Series routers only) (Optional) Display the Dynamic Host Configuration Protocol process, which enables a DHCP server to allocate network IP addresses and deliver configuration settings to client hosts without user intervention.

**diameter-service**—(Optional) Display the diameter process.

**disk-monitoring**—(Optional) Display the disk monitoring process, which checks the health of the hard disk drive on the Routing Engine.

**dynamic-flow-capture**—(Optional) Display the dynamic flow capture (DFC) process, which controls DFC configurations on Monitoring Services III PICs.

**ecc-error-logging**—(Optional) Display the error checking and correction (ECC) process, which logs ECC parity errors in memory on the Routing Engine.

**ethernet-connectivity-fault-management**— Display the process that provides IEEE 802.1ag OAM connectivity fault management (CFM) database information for CFM maintenance association end points (MEPs) in a CFM session.

**ethernet-link-fault-management**—(EX Series switches and MX Series routers only) (Optional) Display the process that provides the OAM link fault management (LFM) information for Ethernet interfaces.

**event-processing**—(Optional) Display the event process (eventd).

**firewall**—(Optional) Display the firewall management process, which manages the firewall configuration and enables accepting or rejecting packets that are transiting an interface on a router or switch.

**general-authentication-service**—(EX Series switches and MX Series routers only)  
(Optional) Display the general authentication process.

**health (pid *process-identifier* | process-name *process-name*)**—(Optional) Display process health information, either by process id (PID) or by process name.

**host-processes**—Display process information of processes running on the host system.

**iccp-service**—Display the Inter-Chassis Communication Protocol (ICCP) process.

**idp-policy**—Display the intrusion detection and prevention (IDP) protocol process.

**ilmi**—Display the Integrated Local Management Interface (ILMI) protocol process, which provides bidirectional exchange of management information between two ATM interfaces across a physical connection.

**inet-process**—Display the IP multicast family process.

**init**—Display the process that initializes the USB modem.

**interface-control**—(Optional) Display the interface process, which controls the router's or switch's physical interface devices and logical interfaces.

**kernel-replication**—(Optional) Display the kernel replication process, which replicates the state of the backup Routing Engine when graceful Routing Engine switchover (GRES) is configured.

**l2-learning**—(Optional) Display the Layer 2 address flooding and learning process.

**l2cpd-service**—Display the Layer 2 Control Protocol process, which enables features such as Layer 2 protocol tunneling and nonstop bridging.

**lACP**—(Optional) Display the Link Aggregation Control Protocol (LACP) process. LACP provides a standardized means for exchanging information between partner systems on a link to allow their link aggregation control instances to reach agreement on the identity of the LAG to which the link belongs, and then to move the link to that LAG, and to enable the transmission and reception processes for the link to function in an orderly manner.

**lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display standard system process information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display standard system process information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display standard system process information for the local Virtual Chassis member.

**local-policy-decision-function**—Display the process for the Local Policy Decision Function, which regulates collection of statistics related to applications and application groups and tracking of information about dynamic subscribers and static interfaces.

**logical-system-mux**—Display the logical router multiplexer process (lrmuxd), which manages the multiple instances of the routing protocols process (rpd) on a machine running logical routers.

**mac-validation**—Display the MAC validation process, which configures MAC address validation for subscriber interfaces created on demux interfaces in dynamic profiles on MX Series routers.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display standard system process information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**mib-process**—(Optional) Display the MIB II process, which provides the router's MIB II agent.

**mobile-ip**—(Optional) Display the Mobile IP process, which configures Junos OS Mobile IP features.

**moundd-service**—(EX Series switches and MX Series routers only) (Optional) Display the service for NFS mounts requests.

**mpls-traceroute**—(Optional) Display the MPLS Periodic Traceroute process.

**mspd**—(Optional) Display the Multiservice process.

**multicast-snooping**—(EX Series switches and MX Series routers only) (Optional) Display the multicast snooping process, which makes Layer 2 devices such as VLAN switches aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.

**named-service**—(Optional) Display the DNS Server process, which is used by a router or a switch to resolve hostnames into addresses.

**neighbor-liveness**—Display the process, which specifies the maximum length of time that the router waits for its neighbor to re-establish an LDP session.

**nfsd-service**—(Optional) Display the Remote NFS Server process, which provides remote file access for applications that need NFS-based transport.

**ntp**—Display the Network Time Protocol (NTP) process, which provides the mechanisms to synchronize time and coordinate time distribution in a large, diverse network.

**packet-triggered-subscribers**—Display the packet-triggered subscribers and policy control (PTSP) process, which allows the application of policies to dynamic subscribers that are controlled by a subscriber termination device.

**peer-selection-service**—(Optional) Display the Peer Selection Service process.

**periodic-packet-services**—Display the Periodic packet management process, which is responsible for processing a variety of time-sensitive periodic tasks so that other processes can more optimally direct their resources.

**pfe**—Display the Packet Forwarding Engine management process.

**pgcp-service**—(Optional) Display the pgcpd service process running on the Routing Engine.

**pgm**—Display the Pragmatic General Multicast (PGM) protocol process, which enables a reliable transport layer for multicast applications.

**pic-services-logging**—(Optional) Display the logging process for some PICs. With this process, also known as fsad (the file system access daemon), PICs send special logging information to the Routing Engine for archiving on the hard disk.

**ppp**—(Optional) Display the Point-to-Point Protocol (PPP) process, which is the encapsulation protocol process for transporting IP traffic across point-to-point links.

**ppp-service**—Display the Universal edge PPP process, which is the encapsulation protocol process for transporting IP traffic across universal edge routers.

**pppoe**—(Optional) Display the Point-to-Point Protocol over Ethernet (PPPoE) process, which combines PPP that typically runs over broadband connections with the Ethernet link-layer protocol that allows users to connect to a network of hosts over a bridge or access concentrator.

**process-monitor**—Display the process health monitor process (pmond).

**providers**—(Optional) Display provider processes.

**redundancy-interface-process**—(Optional) Display the ASP redundancy process.

**remote-operations**—(Optional) Display the remote operations process, which provides the ping and traceroute MIBs.

**resource-cleanup**—Display the resource cleanup process.

**resource-limits (brief | detail) process-name**—(Optional) Display process resource limits.

**routing**—(Optional) Display the routing protocol process.

**sampling**—(Optional) Display the sampling process, which performs packet sampling based on particular input interfaces and various fields in the packet header.

**sbc-configuration-process**—Display the session border controller (SBC) process of the border signaling gateway (BSG).

**scc**—(TX Matrix routers only) (Optional) Display standard system process information for the TX Matrix router (or switch-card chassis).

**sdk-service**—Display the SDK Service process, which runs on the Routing Engine and is responsible for communications between the SDK application and Junos OS. Although the SDK Service process is present on the router, it is turned off by default.

**secure-neighbor-discovery**—(EX Series switches and MX Series routers only) (Optional) Display the secure Neighbor Discovery Protocol (NDP) process, which provides support for protecting NDP messages.

**send**—(Optional) Display the Secure Neighbor Discovery Protocol (SEND) process, which provides support for protecting Neighbor Discovery Protocol (NDP) messages.

**service-deployment**—(Optional) Display the service deployment process, which enables Junos OS to work with the Session and Resource Control (SRC) software.

**sfc number**—(TX Matrix Plus routers only) (Optional) Display system process information for the TX Matrix Plus router. Replace **number** with 0.

**snmp**—Display the SNMP process, which enables the monitoring of network devices from a central location and provides the router's or switch's SNMP master agent.

**sonet-aps**—Display the SONET Automatic Protection Switching (APS) process, which monitors any SONET interface that participates in APS.

**static-subscribers**—(Optional) Display the Static subscribers process, which associates subscribers with statically configured interfaces and provides dynamic service activation and activation for these subscribers.

**tunnel-oamd**—(Optional) Display the Tunnel OAM process, which enables the Operations, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol tunneling (L2PT) allows service providers to send Layer 2 protocol data units (PDUs) across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.

**vrrp**—(EX Series switches and MX Series routers only) (Optional) Display the Virtual Router Redundancy Protocol (VRRP) process, which enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.

**watchdog**—Display the watchdog timer process, which enables the watchdog timer when Junos OS encounters a problem.

**wide**—(Optional) Display process information that might be wider than 80 columns.

**Additional Information** By default, when you issue the **show system processes** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

**Output Fields** [Table 60 on page 1124](#) describes the output fields for the **show system processes** command. Output fields are listed in the approximate order in which they appear.

**Table 60: show system processes Output Fields**

| Field Name           | Field Description                                                                                                                                                    | Level of Output         |
|----------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|
| <b>last pid</b>      | Last process identifier assigned to the process.                                                                                                                     | brief extensive summary |
| <b>load averages</b> | Three load averages followed by the current time.                                                                                                                    | brief extensive summary |
| <b>processes</b>     | Number of existing processes and the number of processes in each state ( <b>sleeping</b> , <b>running</b> , <b>starting</b> , <b>zombies</b> , and <b>stopped</b> ). | brief extensive summary |
| <b>Mem</b>           | Information about physical and virtual memory allocation.                                                                                                            | brief extensive summary |
| <b>Swap</b>          | Information about physical and virtual memory allocation.                                                                                                            | brief extensive summary |

Table 60: show system processes Output Fields (*continued*)

| Field Name | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Level of Output          |

| <b>Description</b>                    | Display pending system reboots or halts.                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>Options</b>                        | <b>none</b> —Display pending reboots or halts on the active Routing Engine.<br><br><b>all-chassis</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display halt or reboot request information for all the T640 routers in the chassis that are connected to the TX Matrix router. On a TX Matrix router, display halt or reboot request information for all the T1600 or T4000 routers in the chassis that are connected to the TX Matrix Plus router. |

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Display halt or reboot request information for all members of the Virtual Chassis configuration.

**all-lcc**—(TX Matrix routers and TX Matrix Plus router only) (Optional) On a TX Matrix router, display system halt or reboot request information for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display halt or reboot request information for all connected T1600 or T4000 LCCs.

**both-routing-engines**—(Systems with multiple Routing Engines) (Optional) Display halt or reboot request information on both Routing Engines.

**infrastructure *name***—(QFabric systems only) (Optional) Display reboot request information on the fabric manager Routing Engines and fabric control Routing Engines.

**interconnect-device *name***—(QFabric systems only) (Optional) Display reboot request information on the Interconnect device.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display halt or reboot request information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display halt or reboot request information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display halt or reboot request information for the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display halt or reboot request information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Display reboot request information on the Node group.

**scc**—(TX Matrix router only) (Optional) Display halt or reboot request information for the TX Matrix router (or switch-card chassis).

**sfc**—(TX Matrix Plus router only) (Optional) Display halt or reboot request information for the TX Matrix Plus router.

**Additional Information** By default, when you issue the **show system reboot** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) backup Routing Engines that are connected to it.

**Required Privilege Level** maintenance

| <b>Release Information</b>            | Command introduced before Junos OS Release 7.4.<br>Command introduced in Junos OS Release 9.0 for EX Series switches.<br><b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6.<br>Command introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                             |
| <b>Description</b>                    | Display the Junos OS extensions loaded on your router or switch.                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Options</b>                        | <b>none</b> —Display standard information about all loaded Junos OS extensions.<br><br><b>all-chassis</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display system software information for all the T640 routers (TX Matrix Router) or all the routers (TX Matrix Plus Router) in the chassis.<br><br><b>all-lcc</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system software information for all T640 routers connected to the |

TX Matrix router. On a TX Matrix Plus router, display system software information for all connected T1600 or T4000 LCCs.

**all-members**—(EX4200 switches only) (Optional) Display the system software running on all members of the Virtual Chassis configuration.

**backup**—(J Series routers only) (Optional) Display the status of old system software packages only.

**detail**—(Optional) Display detailed information about available Junos OS extensions.

**infrastructure name**—(QFabric systems only) (Optional) Display the system software running on the fabric control Routing Engine and the fabric manager Routing Engine.

**interconnect-device name**—(QFabric systems only) (Optional) Display the system software running on the Interconnect device.

**lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system software information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system software information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches only) (Optional) Display the system software running on the local Virtual Chassis member.

**member member-id**—(EX4200 switches only) (Optional) Display the system software running on the specified member of the Virtual Chassis configuration. Replace *member-id* with a value from 0 through 9.

**node-group name**—(QFabric systems only) (Optional) Display the system software running on the Node group.

**scc**—(Routing matrix only) (Optional) Display the system software running on a TX Matrix router (or switch-card chassis).

**sfc**—(TX Matrix Plus routers only) (Optional) Display system software information for the TX Matrix Plus router.

**Required Privilege Level** maintenance

| <b>Syntax</b>                   | <b>show system software restore-point-status</b>                                                                                                                                                                                                                                                           |
| <b>Release Information</b>      | Command introduced in Junos OS Release 14.1X53-D15 for the QFX Series.                                                                                                                                                                                                                                     |
| <b>Description</b>              | Display the status of the restore point for the QFabric system. A restore-point contains both a snapshot of the software and a configuration file for the QFabric system. You can only create one restore-point. When you create a new restore-point, the existing restore-point, if available, is erased. |

| <b>Output Fields</b>            | <a href="#">Table 63 on page 1160</a> lists the output fields for the <b>show system software restore-point status</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                    |

**Table 63: show system software restore-point status Output Fields**

| Field Name            | Field Description                                                 |
|-----------------------|-------------------------------------------------------------------|
| <b>Member</b>         | Name of the Director device.                                      |
| <b>Creation Time</b>  | Time when the restore-point was created.                          |
| <b>Status</b>         | Status of restore-point creation.                                 |
| <b>Restore volume</b> | Name and path to restore volume used to create the restore-point. |

## Sample Output

### show system software restore-point status

```

user@qfabric> show system software restore-point status
Member  Creation Time   Status  Restore volume

**all-chassis**—(TX Matrix and TX Matrix Plus routers only) (Optional) Display system statistics for a protocol for all the routers in the chassis.

**all-lcc**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for a protocol for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for a protocol for all routers (line-card chassis) connected to the TX Matrix Plus router

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Display system statistics for a protocol for all members of the Virtual Chassis configuration.

**lcc number**—(TX Matrix and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system statistics for a protocol for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system statistics for a protocol for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display system statistics for a protocol for the local Virtual Chassis member.

**member member-id**—(EX4200 switches and MX Series routers only) (Optional) Display system statistics for a protocol for the specified member of the Virtual Chassis

configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**scc**—(TX Matrix routers only) (Optional) Display system statistics for a protocol for the TX Matrix router (or switch-card chassis).

**sfc number**—(TX Matrix Plus routers only) (Optional) Display system statistics for a protocol for the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

**Additional Information** By default, when you issue the **show system statistics** command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on the TX Matrix router) or T1600 (in a routing matrix based on the TX Matrix Plus router) backup Routing Engines that are connected to it.

## Sample Output

### show system statistics

```
user@host> show system statistics
ip:
    3682087 total packets received
    0 bad header checksums
    0 with size smaller than minimum
    0 with data size < data length
    0 with header length < data size
    0 with data length < header length
    0 with incorrect version number
    0 packets destined to dead next hop
    0 fragments received
    0 fragments dropped (dup or out of space)
    0 fragments dropped (queue overflow)
    0 fragments dropped after timeout
    0 fragments dropped due to over limit
    0 packets reassembled ok
    3664774 packets for this host
    17316 packets for unknown/unsupported protocol
    0 packets forwarded
    0 packets not forwardable
    0 redirects sent
    6528 packets sent from this host
    0 packets sent with fabricated ip header
    0 output packets dropped due to no bufs
    0 output packets discarded due to no route
```

```
0 output datagrams fragmented
0 fragments created
0 datagrams that can't be fragmented
0 packets with bad options
1123 packets with options handled without error
0 strict source and record route options
0 loose source and record route options
0 record route options
0 timestamp options
0 timestamp and address options
0 timestamp and prespecified address options
0 option packets dropped due to rate limit
1123 router alert options
0 multicast packets dropped (no iflist)
0 packets dropped (src and int don't match)
icmp:
0 drops due to rate limit
0 calls to icmp_error
0 errors not generated because old message was icmp
Output histogram:
    echo reply: 75
0 messages with bad code fields
0 messages less than the minimum length
0 messages with bad checksum
0 messages with bad source address
0 messages with bad length
0 echo drops with broadcast or multicast destination address
0 timestamp drops with broadcast or multicast destination address
Input histogram:
    echo: 75
    router advertisement: 130
75 message responses generated
tcp:
3844 packets sent
    3618 data packets (1055596 bytes)
    0 data packets (0 bytes) retransmitted

**sfc** option introduced for the TX Matrix Plus router in JUNOS Release 9.6.  
 Command introduced in Junos OS Release 11.1 for the QFX Series.  
 Option **invoke-on (all-routing-engines | other-routing-engine)** introduced in Junos OS Release 14.1

**Description** Display statistics about the amount of free disk space in the router's or switch's file systems.

**Options** **none**—Display standard information about the amount of free disk space in the router's or switch's file systems.

**detail**—(Optional) Display detailed output.

**invoke-on all-routing-engines**—(Optional) Display the system storage information on all master and backup Routing Engines on a routing matrix based on the TX Matrix or TX Matrix Plus router or on a router that has dual Routing Engines.

**invoke-on other-routing-engines**—(Optional) Display the system storage information on the other Routing Engine. For example, if you issue this command on the master Routing Engine on an M320 router, the JUNOS Software displays the system storage information on the backup Routing Engine. On a routing matrix based on the TX Matrix or TX Matrix Plus router, if you issue this command on the TX Matrix or TX Matrix Plus router's master Routing Engine, the JUNOS Software displays all the system storage information on all the backup Routing Engines.

**all-chassis**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display system storage statistics for all the routers in the chassis.

**all-lcc**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system storage statistics for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display system storage statistics for all routers connected to the TX Matrix Plus router.

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Display system storage statistics for all members of the Virtual Chassis configuration.

**infrastructure name**—(QFabric systems only) (Optional) Display system storage statistics for the fabric control Routing Engines or fabric manager Routing Engines.

**interconnect-device name**—(QFabric systems only) (Optional) Display system storage statistics for the Interconnect device.

**lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display system storage statistics for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display system storage statistics for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display system storage statistics for the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display system storage statistics for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Display system storage statistics for the Node group.

**scc**—(TX Matrix routers only) (Optional) Display system storage statistics for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display system storage statistics for the TX Matrix Plus router. Replace *number* with 0.

**Additional Information** By default, when you issue the **show system storage** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

**Output Fields** Table 64 on page 1199 describes the output fields for the **show system storage** command. Output fields are listed in the approximate order in which they appear.

**Table 64: show system storage Output Fields**

| Field Name        | Field Description                                      |
|-------------------|--------------------------------------------------------|
| <b>Filesystem</b> | Name of the filesystem.                                |
| <b>Size</b>       | Size of the filesystem.                                |
| <b>Used</b>       | Amount of space used in the filesystem.                |
| <b>Avail</b>      | Amount of space available in the filesystem.           |
| <b>Capacity</b>   | Percentage of the filesystem space that is being used. |
| <b>Mounted on</b> | Directory in which the filesystem is mounted.          |

## Sample Output

### show system storage

```

user@host> show system storage

| <b>Description</b>                    | Display the current time and information about how long the router or switch, router or switch software, and routing protocols have been running.                                                                                                                                                                                                                                                                                                                                                                                        |
| <b>Options</b>                        | <b>none</b> —Show time since the system rebooted and processes started.<br><br><b>all-chassis</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) Show time since the system rebooted and processes started on all the routers in the chassis.<br><br><b>all-lcc</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show time since the system rebooted and processes started for all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus |

router, show time since the system rebooted and processes started for all connected T1600 or T4000 LCCs.

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Show time since the system rebooted and processes started on all members of the Virtual Chassis configuration.

**director-group *name***—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the Director group.

**infrastructure *name***—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the fabric control Routing Engine and fabric manager Routing Engine.

**interconnect-device *name***—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the Interconnect device.

**invoke-on**—(MX Series routers only) (Optional) Display the time since the system rebooted and processes started on the master Routing Engine, backup Routing Engine, or both, on a router with two Routing Engines.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show time since the system rebooted and processes started for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, show time since the system rebooted and processes started for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Show time since the system rebooted and processes started on the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Show time since the system rebooted and processes started on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Show time since the system rebooted and processes started on the Node group.

**scc**—(TX Matrix routers only) (Optional) Show time since the system rebooted and processes started for the TX Matrix router (or switch-card chassis).

**sfc number**—(TX Matrix Plus routers only) (Optional) Show time since the system rebooted and processes started for the TX Matrix Plus router. Replace *number* with 0.

**Additional Information** By default, when you issue the **show system uptime** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

**Output Fields** Table 65 on page 1206 describes the output fields for the **show system uptime** command. Output fields are listed in the approximate order in which they appear.

**Table 65: show system uptime Output Fields**

| Field Name               | Field Description                                                                                                                 |
|--------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| <b>Current time</b>      | Current system time in UTC.                                                                                                       |
| <b>System booted</b>     | Date and time when the Routing Engine on the router or switch was last booted and how long it has been running.                   |
| <b>Protocols started</b> | Date and time when the routing protocols were last started and how long they have been running.                                   |
| <b>Last configured</b>   | Date and time when a configuration was last committed. Also shows the name of the user who issued the last <b>commit</b> command. |
| <b>time and up</b>       | Current time, in the local time zone, and how long the router or switch has been operational.                                     |
| <b>users</b>             | Number of users logged in to the router or switch.                                                                                |
| <b>load averages</b>     | Load averages for the last 1 minute, 5 minutes, and 15 minutes.                                                                   |

## Sample Output

### show system uptime

| <b>Release Information</b>            | Command introduced before Junos OS Release 7.4.<br>Command introduced in Junos OS Release 9.0 for EX Series switches.<br><b>sfc</b> option introduced for the TX Matrix Plus router in JUNOS OS Release 9.6.<br>Command introduced in Junos OS Release 11.1 for the QFX Series. |
| <b>Description</b>                    | List information about the users who are currently logged in to the router or switch.                                                                                                                                                                                           |

**NOTE:** The `show system users` command lists the information about administrative users that are logged in to a router or switch using the CLI, J-Web, or an SSH client. The output does not list information about web users or automated users that are logged in from a remote client application using Junos XML APIs, such as NETCONF.

- Options**
- none**—List information about the users who are currently logged in to the router or switch.
  - all-chassis**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Show users currently logged in to all the routers in the chassis.
  - all-lcc**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show users currently logged in to all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, show users currently logged in to all connected T1600 or T4000 LCCs.
  - all-members**—(MX Series routers only) (Optional) Display users currently logged in to all members of the Virtual Chassis configuration.

**lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, show users currently logged in to a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, show users currently logged in to a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(MX Series routers only) (Optional) Display users currently logged in to the local Virtual Chassis member.

**member member-id**—(MX Series routers only) (Optional) Display users currently logged in to the specified member of the Virtual Chassis configuration. Replace *member-id* with a value of 0 or 1.

**no-resolve**—(Optional) Do not attempt to resolve IP addresses to hostnames.

**scc**—(TX Matrix routers only) (Optional) Show users currently logged in to the TX Matrix router (or switch-card chassis).

**sfc number**—(TX Matrix Plus routers only) (Optional) Show users currently logged in to the TX Matrix Plus router. Replace *number* with 0.

**Additional Information** By default, when you issue the **show system users** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

**Output Fields** Table 66 on page 1211 describes the output fields for the **show system users** command. Output fields are listed in the approximate order in which they appear.

**Table 66: show system users Output Fields**

| Field Name           | Field Description                                                                                            |
|----------------------|--------------------------------------------------------------------------------------------------------------|
| <i>time and up</i>   | Current time, in the local time zone, and how long the router or switch has been operational.                |
| <i>users</i>         | Number of users logged in to the router or switch.                                                           |
| <i>load averages</i> | Load averages for the last 1 minute, 5 minutes, and 15 minutes.                                              |
| <b>USER</b>          | Username.                                                                                                    |
| <b>TTY</b>           | Terminal through which the user is logged in.                                                                |
| <b>FROM</b>          | System from which the user has logged in. A hyphen indicates that the user is logged in through the console. |
| <b>LOGIN@</b>        | Time when the user logged in.                                                                                |
| <b>IDLE</b>          | How long the user has been idle.                                                                             |
| <b>WHAT</b>          | Processes that the user is running.                                                                          |

## Sample Output

### show system users

| <b>Description</b>                    | Display the usage of Junos OS kernel memory listed first by size of allocation and then by type of usage. Use the <b>show system virtual-memory</b> command for troubleshooting with Juniper Networks Customer Support.                                                                                                                                                                                                                                                                                                                                          |
| <b>Options</b>                        | <b>none</b> —Display kernel dynamic memory usage information.<br><br><b>all-chassis</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) Display kernel dynamic memory usage information for all chassis.<br><br><b>all-lcc</b> —(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display kernel dynamic memory usage information for all T640 routers connected to the TX Matrix router. On a TX Matrix Plus router, display kernel dynamic memory usage information for all connected T1600 or T4000 LCCs. |

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Display kernel dynamic memory usage information for all members of the Virtual Chassis configuration.

**infrastructure *name***—(QFabric systems only) (Optional) Display kernel dynamic memory usage information for the fabric control Routing Engine and fabric manager Routing Engine.

**interconnect-device *name***—(QFabric systems only) (Optional) Display kernel dynamic memory usage information for the Interconnect device.

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display kernel dynamic memory usage information for a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, display kernel dynamic memory usage information for a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display kernel dynamic memory usage information for the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display kernel dynamic memory usage information for the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**node-group *name***—(QFabric systems only) (Optional) Display kernel dynamic memory usage information for the Node group.

**scc**—(TX Matrix routers only) (Optional) Display kernel dynamic memory usage information for the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display kernel dynamic memory usage information for the TX Matrix Plus router. Replace *number* with 0.

**Additional Information** By default, when you issue the **show system virtual-memory** command on the master Routing Engine of a TX Matrix router or a TX Matrix Plus router, the command is broadcast to all the master Routing Engines of the LCCs connected to it in the routing matrix. Likewise, if you issue the same command on the backup Routing Engine of a TX Matrix

or a TX Matrix Plus router, the command is broadcast to all backup Routing Engines of the LCCs that are connected to it in the routing matrix.

**NOTE:** The `show system virtual-memory` command with the `| display XML` pipe option now displays XML output for the command in the parent tags: `<vmstat-memstat-malloc>`, `<vmstat-memstat-zone>`, `<vmstat-sumstat>`, `<vmstat-intr>`, and `<vmstat-kernel-state>` with each child element as a separate XML tag. In Junos OS Releases 10.1 and earlier, the `| display XML` option for this command does not have an XML API element and the entire output is displayed in a single `<output>` tag element.

|                          |                                                                                                                                                                                                                                                                                                                                                                                   |

| Output Fields            | <a href="#">Table 67 on page 1217</a> lists the output fields for the <code>show system virtual-memory</code> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                    |

Table 67: show system virtual-memory Output Fields

| Field Name                       | Field Description                                                                                                                                     |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------|
| Memory statistics by bucket size |                                                                                                                                                       |
| <b>Size</b>                      | Memory block size (bytes). The kernel memory allocator appropriates blocks of memory whose size is exactly a power of 2.                              |
| <b>In Use</b>                    | Number of memory blocks of this size that are in use (bytes).                                                                                         |
| <b>Free</b>                      | Number of memory blocks of this size that are free (bytes).                                                                                           |
| <b>Requests</b>                  | Number of memory allocation requests made.                                                                                                            |
| <b>HighWater</b>                 | Maximum value the free list can have. Once the system starts reclaiming physical memory, it continues until the free list is increased to this value. |
| <b>Couldfree</b>                 | Total number of times that the free elements for a bucket size exceed the high-water mark for that bucket size.                                       |
| Memory usage type by bucket size |                                                                                                                                                       |
| <b>Size</b>                      | Memory block size (bytes).                                                                                                                            |
| <b>Type(s)</b>                   | Kernel modules that are using these memory blocks. For a definition of each type, refer to a FreeBSD book.                                            |
| Memory statistics by type        |                                                                                                                                                       |
| <b>Type</b>                      | Kernel module that is using dynamic memory.                                                                                                           |
| <b>InUse</b>                     | Number of memory blocks used by this type. The number is rounded up.                                                                                  |
| <b>MemUse</b>                    | Amount of memory in use, in kilobytes (KB).                                                                                                           |
| <b>HighUse</b>                   | Maximum memory ever used by this type.                                                                                                                |
| <b>Limit</b>                     | Maximum memory that can be allocated to this type.                                                                                                    |
| <b>Requests</b>                  | Total number of dynamic memory allocation requests this type has made.                                                                                |
| <b>Type Limit</b>                | Number of times requests were blocked for reaching the maximum limit.                                                                                 |
| <b>Kern Limit</b>                | Number of times requests were blocked for the kernel map.                                                                                             |
| <b>Size(s)</b>                   | Memory block sizes this type is using.                                                                                                                |
| Memory Totals                    |                                                                                                                                                       |
| <b>In Use</b>                    | Total kernel dynamic memory in use (bytes, rounded up).                                                                                               |
| <b>Free</b>                      | Total kernel dynamic memory free (bytes, rounded up).                                                                                                 |

Table 67: show system virtual-memory Output Fields (*continued*)

| Field Name       | Field Description                                                    |
|------------------|----------------------------------------------------------------------|
| <b>Requests</b>  | Total number of memory allocation requests.                          |
| <b>ITEM</b>      | Kernel module that is using memory.                                  |
| <b>Size</b>      | Memory block size (bytes).                                           |
| <b>Limit</b>     | Maximum memory that can be allocated to this type.                   |
| <b>Used</b>      | Number of memory blocks used by this type. The number is rounded up. |
| <b>Free</b>      | Number of memory blocks available to this type.                      |
| <b>Requests</b>  | Total number of memory allocation requests this type has made.       |
| <b>interrupt</b> | Timer events and scheduling interruptions.                           |
| <b>total</b>     | Total number of interruptions for each type.                         |
| <b>rate</b>      | Interruption rate.                                                   |
| <b>Total</b>     | Total for all interruptions.                                         |

## Sample Output

### show system virtual-memory

```

user@host> show system virtual-memory

| <b>Release Information</b>            | Command introduced before Junos OS Release 7.4.<br>Command introduced in Junos OS Release 9.0 for EX Series switches.<br><b>sfc</b> option introduced for the TX Matrix Plus router in Junos OS Release 9.6.<br>Command introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                           |
| <b>Description</b>                    | Display the hostname and version information about the software running on the router or switch.<br><br>Beginning in Junos OS Release 13.3, the <b>show version</b> command output includes the <b>Junos</b> field that displays the Junos OS version running on the device. This field provides a consistent means of identifying the Junos OS version, rather than extracting that information from the list of installed sub-packages. |
| <b>Options</b>                        | <b>none</b> —Display standard information about the hostname and version of the software running on the router or switch.                                                                                                                                                                                                                                                                                                                 |

**brief | detail**—(Optional) Display the specified level of output.

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Display standard information about the hostname and version of the software running on all members of the Virtual Chassis configuration.

**component all**—(QFabric systems only) (Optional) Display the host name and version information about the software running on all the components on the QFabric system.

**component *component-name***—(QFabric systems only) (Optional) Display the host name and version information about the software running on a specific QFabric system component. Replace *component-name* with the name of the QFabric system component. The *component-name* can be the name of a diagnostics Routing Engine, Director group, fabric control Routing Engine, fabric manager Routing Engine, Interconnect device, or Node group.

**local**—(EX4200 switches and MX Series routers only) (Optional) Display standard information about the hostname and version of the software running on the local Virtual Chassis member.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Display standard information about the hostname and version of the software running on the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**scc**—(TX Matrix routers only) (Optional) Display the hostname and version information about the software running on the TX Matrix router (or switch-card chassis).

**lcc *number***—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, display the host name and version information about the software running on for a specified T640 router (line-card chassis or LCC) that is connected to the TX Matrix router. On a TX Matrix Plus router, display the host name and version information about the software running for a specified T1600 or T4000 router (LCC) that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**sfc *number***—(TX Matrix Plus routers only) (Optional) Display the hostname and version information about the software running on the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Additional Information</b>   | By default, when you issue the <b>show version</b> command on a TX Matrix or TX Matrix Plus master Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) or T1600 or T4000 (in a routing matrix based on a TX Matrix Plus router) master Routing Engines connected to it. Likewise, if you issue the same command on the TX Matrix or TX Matrix Plus backup Routing Engine, the command is broadcast to all the T640 (in a routing matrix based on a TX Matrix router) or T1600 or T4000 (in a routing matrix based on a TX Matrix Plus router) backup Routing Engines that are connected to it. |
| <b>Required Privilege Level</b> | view                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

## Sample Output

### show version (Devices Running Junos OS Release 13.3 and Later)

The following output is from the MX240 Router and shows the **Junos** field introduced in Junos OS 13.3. Depending on the platform running Junos OS 13.3, you might see different installed sub-packages, but the **Junos** field is common across all platforms that run Junos OS 13.3 and later.

**Release Information**   Command introduced before Junos OS Release 7.4.  
                              Command introduced in Junos OS Release 9.0 for EX Series switches.  
                              **mpls** option introduced in Junos OS Release 9.2.  
                              Command introduced in Junos OS Release 11.1 for the QFX Series.  
                              **propagate-ttl** option introduced in Junos OS Release 12.1.

**Description**   Display the route that packets take to a specified network host. Use **traceroute** as a debugging tool to locate points of failure in a network.

**Options**   **host**—IP address or name of remote host.

**as-number-lookup**—(Optional) Display the autonomous system (AS) number of each intermediate hop on the path from the host to the destination.

**bypass-routing**—(Optional) Bypass the normal routing tables and send requests directly to a system on an attached network. If the system is not on a directly attached

network, an error is returned. Use this option to display a route to a local system through an interface that has no route through it.

**clns**—(Optional) Trace the route belonging to the Connectionless Network Service (CLNS).

**gateway address**—(Optional) Address of a router or switch through which the route transits.

**inet | inet6**—(Optional) Trace the route belonging to IPv4 or IPv6, respectively.

**interface *interface-name***—(Optional) Name of the interface over which to send packets.

**logical-system *logical-system-name***—(Optional) Perform this operation on all logical systems or on a particular logical system.

**monitor *host***—(Optional) Display real-time monitoring information for the specified host.

**mpls (*ldp FEC address | rsvp label-switched-path name*)**—(Optional) See *traceroute mpls ldp* and *traceroute mpls rsvp*.

**no-resolve**—(Optional) Do not attempt to determine the hostname that corresponds to the IP address.

**propagate-ttl**—(Optional) On the PE routing device, use this option to view locally generated Routing Engine transit traffic. This is applicable for MPLS L3VPN traffic only.

Use for troubleshooting, when you want to view hop-by-hop information from the local provider router to the remote provider router, when TTL decrementing is disabled on the core network using the **no-propagate-ttl** configuration statement.

**NOTE:** Using **propagate-ttl** with **traceroute** on the CE router does not show hop-by-hop information.

**routing-instance *routing-instance-name***—(Optional) Name of the routing instance for the traceroute attempt.

**source *source-address***—(Optional) Source address of the outgoing traceroute packets.

**tos *value***—(Optional) Value to include in the IP type-of-service (ToS) field. The range of values is 0 through 255.

**ttl *value***—(Optional) Maximum time-to-live value to include in the traceroute request. The range of values is 0 through 128.

**wait *seconds***—(Optional) Maximum time to wait for a response to the traceroute request.

**Required Privilege Level** network

**Output Fields** [Table 68 on page 1290](#) describes the output fields for the **traceroute** command. Output fields are listed in the approximate order in which they appear.

**Table 68: traceroute Output Fields**

| Field Name             | Field Description                                             |
|------------------------|---------------------------------------------------------------|
| <b>traceroute to</b>   | IP address of the receiver.                                   |
| <b>hops max</b>        | Maximum number of hops allowed.                               |
| <b>byte packets</b>    | Size of packets being sent.                                   |
| <i>number-of-hops</i>  | Number of hops from the source to the named router or switch. |
| <i>router-name</i>     | Name of the router or switch for this hop.                    |
| <i>address</i>         | Address of the router or switch for this hop.                 |
| <b>Round trip time</b> | Average round-trip time, in milliseconds (ms).                |

## Sample Output

### traceroute

```
user@host> traceroute santacruz
traceroute to green.company.net (10.156.169.254), 30 hops max, 40 byte packets
 1 blue23 (10.168.1.254)  2.370 ms  2.853 ms  0.367 ms
 2 red14 (10.168.255.250) 0.778 ms  2.937 ms  0.446 ms
 3 yellow (10.156.169.254) 7.737 ms  89.905 ms  0.834 ms
```

### traceroute as-number-lookup host

```
user@host> traceroute as-number-lookup 10.100.1.1
traceroute to 10.100.1.1 (10.100.1.1), 30 hops max, 40 byte packets
 1 10.39.1.1 (10.39.1.1) 0.779 ms  0.728 ms  0.562 ms
 2 10.39.1.6 (10.39.1.6) [AS 32] 0.657 ms  0.611 ms  0.617 ms
 3 10.100.1.1 (10.100.1.1) [AS 10, 40, 50] 0.880 ms  0.808 ms  0.774 ms
```

### traceroute no-resolve

```
user@host> traceroute santacruz no-resolve
```

```

traceroute to green.company.net (10.156.169.254), 30 hops max, 40 byte packets
 1  10.168.1.254  0.458 ms  0.370 ms  0.365 ms
 2  10.168.255.250  0.474 ms  0.450 ms  0.444 ms
 3  10.156.169.254  0.931 ms  0.876 ms  0.862 ms

```

### traceroute propagate-ttl

```

user@host> traceroute propagate-ttl 100.200.2.2 routing-instance VPN-A
traceroute to 100.200.2.2 (100.200.2.2) from 1.1.0.2, 30 hops max, 40 byte packets

 1  1.2.0.2 (1.2.0.2)  2.456 ms  1.753 ms  1.672 ms
    MPLS Label=299776 CoS=0 TTL=1 S=0
    MPLS Label=299792 CoS=0 TTL=1 S=1
 2  1.3.0.2 (1.3.0.2)  1.213 ms  1.225 ms  1.166 ms
    MPLS Label=299792 CoS=0 TTL=1 S=1
 3  100.200.2.2 (100.200.2.2)  1.422 ms  1.521 ms  1.443 ms

```

### traceroute (Between CE Routers, Layer 3 VPN)

```

user@host> traceroute vpn09
traceroute to vpn09.skybank.net (10.255.14.179), 30 hops max, 40
byte packets
 1  10.39.10.21 (10.39.10.21)  0.598 ms  0.500 ms  0.461 ms
 2  10.39.1.13 (10.39.1.13)  0.796 ms  0.775 ms  0.806 ms
    MPLS Label=100006 CoS=0 TTL=1 S=1
 3  vpn09.skybank.net (10.255.14.179)  0.783 ms  0.716 ms  0.686

```

### traceroute (Through an MPLS LSP)

```

user@host> traceroute mpls1
traceroute to 10.168.1.224 (10.168.1.224), 30 hops max, 40 byte packets
 1  mpls1-sr0.company.net (10.168.200.101)  0.555 ms  0.393 ms  0.367 ms
    MPLS Label=1024 CoS=0 TTL=1
 2  mpls5-lo0.company.net (10.168.1.224)  0.420 ms  0.394 ms  0.401 ms

```

## traceroute monitor

| <b>Release Information</b>      | Command introduced in Junos OS Release 8.0<br>Command introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| <b>Description</b>              | Display live monitoring of each hop in the route that packets take to a specified network host. Use as a debugging tool to locate points of failure in a network.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>                  | <p><b><i>host</i></b>—IP address or name of remote host.</p> <p><b><i>count value</i></b>—Number of ping requests, in packets, to send in summary mode. The default value is <b>10</b>.</p> <p><b><i>inet   inet6</i></b>—(Optional) Trace the route belonging to IPv4 or IPv6, respectively.</p> <p><b><i>interval seconds</i></b>—(Optional) Number of seconds to wait before sending ping requests. The default value is <b>1</b>.</p> <p><b><i>no resolve</i></b>—(Optional) Do not attempt to display addresses symbolically.</p> <p><b><i>size value</i></b>—(Optional) Receive the specified number of bytes for each packet. The range is <b>0</b> through <b>65468</b> bytes. The default value is <b>64</b>.</p> <p><b><i>source source-address</i></b>—(Optional) Source address of the outgoing ping packets.</p> <p><b><i>summary</i></b>—(Optional) Generate and display a summary of live monitoring of each hop on the route that packets take to a specified network host.</p> |
| <b>Required Privilege Level</b> | network                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| <b>List of Sample Output</b>    | <a href="#">traceroute monitor on page 1293</a>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |

**Output Fields** Table 69 on page 1293 describes the output fields for the **traceroute monitor** command. Output fields are listed in the approximate order in which they appear.

**Table 69: traceroute monitor Output Fields**

| Field Name   | Field Description                                                                                                       |
|--------------|-------------------------------------------------------------------------------------------------------------------------|
| <b>Host</b>  | Hostname or IP address of the router at each hop.                                                                       |
| <b>Loss%</b> | Percent of packet loss. The number of ping responses divided by the number of ping requests, specified as a percentage. |
| <b>Snt</b>   | Number of ping requests sent to the router at this hop.                                                                 |
| <b>Last</b>  | Most recent round-trip time, in milliseconds, to the router at this hop.                                                |
| <b>Avg</b>   | Average round-trip time, in milliseconds, to the router at this hop.                                                    |
| <b>Best</b>  | Shortest round-trip time, in milliseconds, to the router at this hop.                                                   |
| <b>Wrst</b>  | Longest round-trip time, in milliseconds, to the router at this hop.                                                    |
| <b>StDev</b> | Standard deviation of round-trip times, in milliseconds, to the router at this hop.                                     |

## Sample Output

### traceroute monitor

```
user@host> traceroute monitor 10.16.0.1
```

### Creating an Emergency Boot Device

If Junos OS on the device is damaged in some way that prevents the software from loading properly, you can use an emergency boot device to repartition the primary disk and load a fresh installation of Junos OS. Use the following procedure to create an emergency boot device.

Before you begin, you need to download the installation media image for your device and Junos OS release from <http://www.juniper.net/customers/support/>.

**NOTE:** In the following procedure, we assume that you are creating the emergency boot device on a QFX device. You can create the emergency boot device on another Juniper Networks switch or router, or any PC or laptop that supports Linux. The steps you take to create the emergency boot device vary, depending on the device.

To create an emergency boot device:

1. Use FTP to copy the installation media image into the **/var/tmp** directory on the device.
2. Insert a USB device into the USB port.
3. From the Junos OS command-line interface (CLI), start the shell:

```
user@device> start shell
%
```

4. Switch to the root account using the **su** command:

```
% su
Password: password
```

**NOTE:** The password is the root password for the device. If you logged in to the device as root, you do not need to perform this step.

5. Enter the following command on the QFX3500, QFX3600, and QFX3600-I devices:

```
root@device% dd if=/var/tmp/filename of=/dev/da1 bs=16k
```

The device writes the installation media image to the USB device:

```
root@device% dd if=/var/tmp/install-media-qfx3500.junos_11.1 of=/dev/da1 bs=16k
11006+1 records in
11006+1 records out
180332544 bytes transferred in 71.764266 secs (2512846 bytes/sec)
```

6. Enter the following command on the QFX5100 and EX4600 devices:

```
root@device% dd if=/var/tmp/filename of=/dev/da0 bs=1048576
```

The device writes the installation media image to the USB device:

```
root@device% dd if=/var/tmp/jinstall-vjunos-usb-13.2.img of=/dev/da0 bs=1048576
11006+1 records in
11006+1 records out
180332544 bytes transferred in 71.764266 secs (2512846 bytes/sec)
```

**NOTE:** QFX5100 and EX4600 devices automatically create a recovery Junos OS image.

The “Select a recovery image” menu appears on the console when one of these switches is booted and unable to load a version of Junos OS. You can follow the instructions in the “Select a recovery image” menu to load the Junos OS image for one of these switches.

7. Log out of the shell:

```
root@device% exit
% exit
user@device>
```

## Performing a Recovery Installation

If Junos OS on your device is damaged in some way that prevents the software from loading correctly, you may need to perform a recovery installation using an emergency boot device (for example, a USB flash drive) to restore the default factory installation. Once you have recovered the software, you need to restore the device configuration. You can either create a new configuration as you did when the device was shipped from the factory, or if you saved the previous configuration, you can simply restore that file to the device.

You can also use a system snapshot as a bootup option when your Junos OS or configuration is damaged. The system snapshot feature takes a “snapshot” of the files currently used to run the device—the complete contents of the `/config` directories, which include the running Juniper Networks Junos OS, the active configuration, and the rescue configuration, as well as the host OS—and copies all of these files into an external USB flash drive. See *Understanding System Snapshot*.

If at all possible, you should try to perform the following steps before you perform the recovery installation:

1. Ensure that you have an emergency boot device to use during the installation. See [“Creating an Emergency Boot Device” on page 180](#) for information on how to create an emergency boot device.
2. Copy the existing configuration in the file `/config/juniper.conf.gz` from the device to a remote system, such as a server, or to an emergency boot device. For extra safety, you can also copy the backup configurations (the files named `/config/juniper.conf.n`, where *n* is a number from 0 through 9) to a remote system or to an emergency boot device.

**WARNING:** The recovery installation process completely overwrites the entire contents of the internal flash storage.

3. Copy any other stored files to a remote system as desired.

To reinstall Junos OS:

1. Insert the emergency boot device into the QFX Series device.
2. Reboot the QFX Series device.

**NOTE:** Do not power off the device if it is already on.

```
[edit system]
user@device> request system reboot
```

If you do not have access to the CLI, power cycle the QFX Series device.

The emergency boot device (external USB install media) is detected. At this time, you can load the Junos OS from the emergency boot device onto the internal flash storage.

3. The software prompts you with the following options:

```
External USB install media detected.  
You can load Junos from this media onto an internal drive.  
Press 'y' to proceed, 'f' to format and install, or 'n' to abort.  
Do you wish to continue ([y]/f/n)? f
```

4. Type **f** to format the internal flash storage and install the Junos OS on the emergency boot device onto the internal flash storage.

If you do not want to format the internal flash storage, type **y**.

The following messages are displayed:

```
Installing packages from external USB drive da1  
Packages will be installed to da0, media size: 8G
```

```
Processing format options  
Fri September 4 01:18:44 UTC 2012
```

```
-- IMPORTANT INFORMATION --  
Installer has detected settings to format system boot media.  
This operation will erase all data from your system.
```

```
Formatting installation disk .. this will take a while, please wait  
Disabling platform watchdog - threshold 12 mins
```

```
Determining installation slice  
Fri September 4 01:27:07 UTC 2012
```

5. The device copies the software from the emergency boot device, occasionally displaying status messages. Copying the software can take up to 12 minutes.

When the device is finished copying the software, you are presented with the following prompt:

```
*** Fri September 4 01:19:00 UTC 2012***  
Installation successful..  
Please select one of the following options:  
Reboot to installed Junos after removing install media (default) ... 1  
Reboot to installed Junos by disabling install media ..... 2  
Exit to installer debug shell ..... 3  
Install Junos to alternate slice ..... 4  
Your choice: 4  
NOTE: System installer will now install Junos to alternate slice  
Do not power off or remove the external installer media or  
interrupt the installation mechanism.
```

6. Select **4** to install Junos OS to the alternate slice of the partition, and then press Enter.
7. Remove the emergency boot device when prompted and then press Enter. The device then reboots from the internal flash storage on which the software was just installed. When the reboot is complete, the device displays the login prompt.
8. Create a new configuration as you did when the device was shipped from the factory, or restore the previously saved configuration file to the device.

**Related Documentation** • [Creating an Emergency Boot Device on page 180](#)

## Rebooting and Halting a Device

To reboot the switch, issue the **request system reboot** command.

```
user@switch> request system reboot ?
Possible completions:
<[Enter]>      Execute this command
all-members    Reboot all virtual chassis members
at            Time at which to perform the operation
both-routing-engines  Reboot both the Routing Engines
fast-boot      Enable fast reboot
in            Number of minutes to delay before operation
local         Reboot local virtual chassis member
member        Reboot specific virtual chassis member (0..9)
message       Message to display to all users
other-routing-engine  Reboot the other Routing Engine
|            Pipe through a command
{master:0}
```

```
user@switch> request system reboot
Reboot the system ? [yes,no] (no) yes
Rebooting switch
```

**NOTE:** Not all options shown in the preceding command output are available on all QFX Series and EX4600 devices. For example, the **fast-boot** option is available only on QFX5100. See the documentation for the [request system reboot](#) command for details about options.

Similarly, to halt the switch, issue the **request system halt** command.

**CAUTION:** Before entering this command, you must have access to the switch's console port in order to bring up the Routing Engine.

```
user@switch> request system halt ?
Possible completions:
<[Enter]>      Execute this command
all-members    Halt all virtual chassis members
at            Time at which to perform the operation
backup-routing-engine  Halt backup Routing Engine
both-routing-engines  Halt both Routing Engines
in            Number of minutes to delay before operation
local         Halt local virtual chassis member
member        Halt specific virtual chassis member (0..9)
message       Message to display to all users
other-routing-engine  Halt other Routing Engine
|            Pipe through a command
```

**NOTE:** When you issue this command on an individual component in a QFabric system, you will receive a warning that says “Hardware-based members will halt, Virtual Junos Routing Engines will reboot.” If you want to halt only one member, use the member option. You cannot issue this command from the QFabric CLI.

Issuing the **request system halt** command on the switch halts the Routing Engine. To reboot a Routing Engine that has been halted, you must connect through the console.

**Related Documentation**

## Recovering from a Failed Software Installation

**Problem**    **Description:** If the Junos OS appears to have been installed but the CLI does not work, or if the switch has no software installed, you can use this recovery installation procedure to install the Junos OS.

**Solution**    If a Junos OS image already exists on the switch, you can either install the new Junos OS package in a separate partition, in which case both Junos OS images remain on the switch, or you can remove the existing Junos OS image before you start the new installation process.

**NOTE:** QFX5100 and EX4600 switches do not have a separate partition to reinstall a Junos OS image.

A recovery image is created automatically on these switches. If a previously-running switch is powered on and unable to boot using a Junos OS image, you can boot the switch using the recovery Junos OS image by selecting an option in the “Select a recovery image” menu.

We suggest creating a system snapshot on your QFX5100 or EX4600 switch onto the external USB flash drive, and using the snapshot for recovery purposes. The system snapshot feature takes a “snapshot” of the files currently used to run the device—the complete contents of the /config directories, which include the running Juniper Networks Junos OS, the active configuration, and the rescue configuration, as well as the host OS—and copies all of these files into an external USB flash drive. See “[Creating a Snapshot and Using It to Boot a QFX Series Switch](#)” on page 181.

To perform a recovery installation:

1. Power on the switch. The loader script starts.
2. After the message **Loading /boot/defaults/loader.conf** appears, you are prompted with the following message:

**Hit [Enter] to boot immediately, or space bar for command prompt.**

Press the Spacebar to enter the manual loader. The **loader>** prompt appears.

**NOTE:** The loader prompt does not appear on QFX5100 and EX4600 switches.

On QFX5100 and EX4600 switches only, a recovery image is automatically saved if a previously-running switch is powered on and unable to boot using a Junos OS image.

The “Select a recovery image” menu appears on the console when one of these switches is booted and unable to load a version of Junos OS. Follow the instructions in the “Select a recovery image” menu to load the recovery version of Junos OS for one of these switches.

You can ignore the remainder of this procedure if you are using a QFX5100 or EX4600 switch.

3. Enter the following command:

```
loader> install [– –format] [– –external] source
```

where:

- **format**—Enables you to erase the installation media before installing the installation package. If you do not include this option, the system installs the new Junos OS in a different partition from that of the most recently installed Junos OS.
- **external**—Installs the installation package onto external media (a USB stick, for example).
- **source**—Represents the name and location of the Junos OS package, either on a server on the network or as a file on an external media, as shown in the following two examples:
  - Network address of the server and the path on the server; for example, **tftp://192.171.28/junos/jinstall-qfx-11.1R1.5-domestic-signed.tgz**
  - Junos OS package on a USB device (commonly stored in the root drive as the only file), for example, **file:///jinstall-qfx-11.1R1.5-domestic-signed.tgz**.

The installation now proceeds normally and ends with a login prompt.

## Recovering the Root Password

If you forget the root password, you can use the password recovery procedure to reset the root password.

**NOTE:** The root password cannot be recovered on a QFabric system.

**NOTE:** You need console access to the switch to recover the root password.

To recover the root password:

1. Power off the switch by switching off the AC power outlet of the device or, if necessary, by pulling the power cords out of the device's power supplies.
2. Turn off the power to the management device, such as a PC or laptop computer, that you want to use to access the CLI.
3. Plug one end of the Ethernet rollover cable supplied with the device into the RJ-45-to-DB-9 serial port adapter supplied with the device.
4. Plug the RJ-45-to-DB-9 serial port adapter into the serial port on the management device.
5. Connect the other end of the Ethernet rollover cable to the console port on the device.
6. Turn on the power to the management device.
7. On the management device, start your asynchronous terminal emulation application (such as Microsoft Windows Hyperterminal) and select the appropriate **COM** port to use (for example, **COM1**).
8. Configure the port settings as follows:
  - Bits per second: 9600
  - Data bits: 8
  - Parity: None
  - Stop bits: 1
  - Flow control: None
9. Power on the device by (if necessary) plugging the power cords into the device's power supply, or turning on the power to the device by switching on the AC power outlet the device is plugged into.

The terminal emulation screen on your management device displays the device's boot sequence.

10. When the following prompt appears, press the Spacebar to access the device's bootstrap loader command prompt:

Hit [Enter] to boot immediately, or space bar for command prompt.  
Booting [kernel] in 9 seconds...

11. At the following prompt, enter **boot -s** to start up the system in single-user mode.  

```
ok boot -s
```
12. At the following prompt, enter **recovery** to start the root password recovery procedure.  

```
Enter full pathname of shell or 'recovery' for root password recovery or RETURN for /bin/sh: recovery
```
13. Enter configuration mode in the CLI.
14. Set the root password. For example:  

```
user@switch# set system root-authentication plain-text-password
```
15. At the following prompt, enter the new root password. For example:  

```
New password: juniper1
Retype new password:
```
16. At the second prompt, reenter the new root password.
17. After you have finished configuring the password, commit the configuration.  

```
root@host# commit
commit complete
```
18. Exit configuration mode in the CLI.
19. Exit operational mode in the CLI.
20. At the prompt, enter **y** to reboot the device.  

```
Reboot the system? [y/n] y
```

## Troubleshooting Network Interfaces

### The interface on the port in which an SFP or SFP+ transceiver is installed in an SFP or SFP+ module is down

- |                 |                                                                                                                                                                                                                                                                                                                          |
|-----------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Problem</b>  | <p><b>Description:</b> The QFX Series has an SFP or SFP+ module installed. The interface on the port in which an SFP or SFP+ transceiver is installed is down.</p> <p><b>Symptoms:</b> When you check the status with the CLI command <b>show interfaces <i>interface-name</i></b>, the disabled port is not listed.</p> |
| <b>Cause</b>    | By default, the SFP or SFP+ module operates in the 10-Gigabit Ethernet mode and supports only SFP or SFP+ transceivers. The operating mode for the module is incorrectly set.                                                                                                                                            |
| <b>Solution</b> | Only SFP or SFP+ transceivers can be installed in SFP or SFP+ modules. You must configure the operating mode of the SFP or SFP+ module to match the type of transceiver you want to use. For SFP+ transceivers, configure 10-Gigabit Ethernet operating mode.                                                            |

## Troubleshooting an Aggregated Ethernet Interface

- |                |                                                                                          |
|----------------|------------------------------------------------------------------------------------------|
| <b>Problem</b> | <b>Description:</b> The <b>show interfaces terse</b> command shows that the LAG is down. |
|----------------|------------------------------------------------------------------------------------------|

**Solution** Check the following:

- Verify that there is no configuration mismatch.
- Verify that all member ports are up.
- Verify that a LAG is part of family ethernet-switching (Layer 2 LAG) or family inet (Layer 3 LAG).
- Verify that the LAG member is connected to the correct LAG at the other end.
- Verify that the LAG members belong to the same switch.

### QFabric System Overview

The architecture of legacy data centers contrasts significantly with the revolutionary Juniper Networks data center solution.

This topic covers:

- [Legacy Data Center Architecture on page 1307](#)
- [QFX Series QFabric System Architecture on page 1309](#)

#### Legacy Data Center Architecture

---

Service providers and companies that support data centers are familiar with legacy multi-tiered architectures, as seen in [Figure 19 on page 1308](#).

Figure 19: Legacy Data Center Architecture

The *access layer* connects servers and other devices to a Layer 2 switch and provides an entry point into the data center. Several access switches are in turn connected to intermediate Layer 2 switches at the *aggregation layer* (sometimes referred to as the *distribution layer*) to consolidate traffic. A *core layer* interconnects the aggregation layer switches. Finally, the core switches are connected to Layer 3 routers in the *routing layer* to send the aggregated data center traffic to other data centers or a wide area network (WAN), receive external traffic destined for the data center, and interconnect different Layer 2 broadcast domains within the data center.

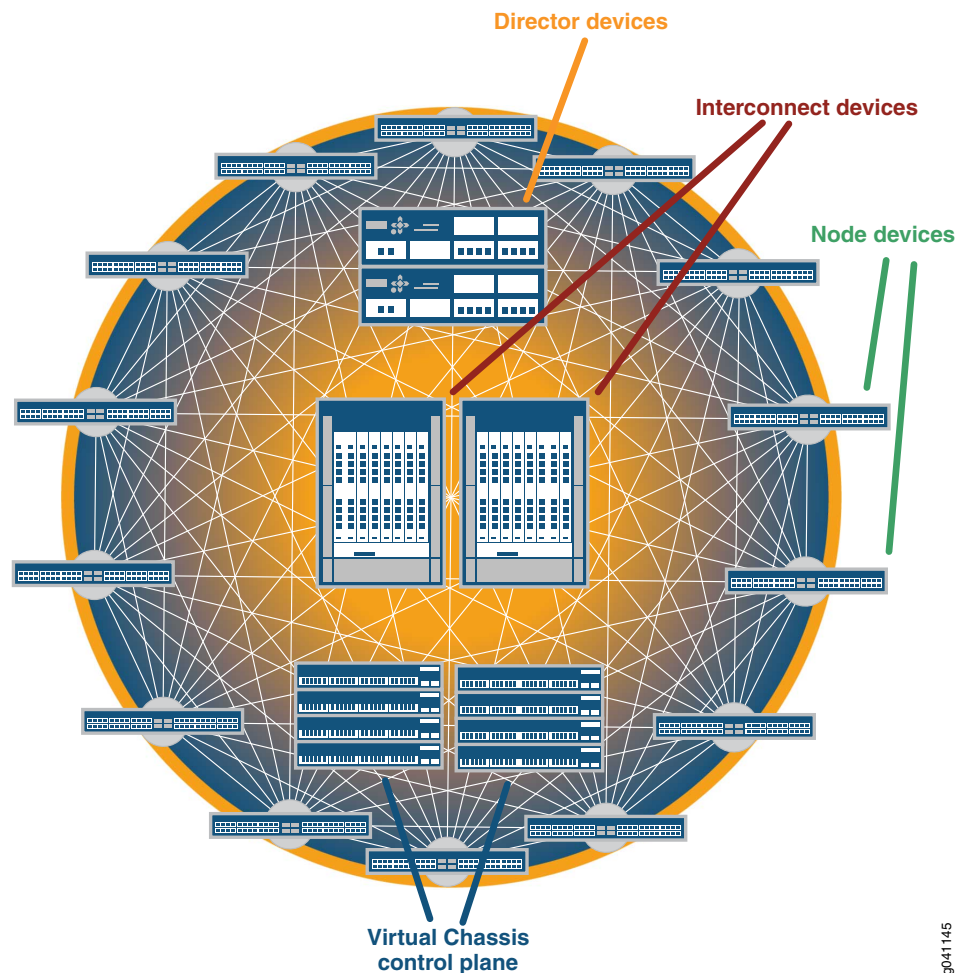

The problems that exist with the multi-tiered data center architecture include:

- **Limited scalability**—The demands for electrical power, cooling, cabling, rack space, and port density increase exponentially as the traditional data center expands, which prohibits growth after minimal thresholds are met.
- **Inefficient resource usage**—Up to 50 percent of switch ports in a legacy data center are used to interconnect different tiers rather than support server and storage connections. In addition, traffic that ideally should move horizontally between servers within a data center often must also be sent vertically up through the tiers to reach a router and down through the tiers to reach the required destination server.
- **Increased latency**—By requiring the devices at each tier level to perform multiple iterations of packet and frame processing, the data plane traffic takes significantly longer to reach its destination than if the sending and receiving devices were directly connected. This processing overhead results in potentially poor performance for time-sensitive applications, such as voice, video, or financial transactions.

### QFX Series QFabric System Architecture

In contrast to legacy multi-tiered data center architectures, the Juniper Networks QFX Series QFabric System architecture provides a simplified networking environment that solves the most challenging issues faced by data center operators. A fabric is a set of devices that act in concert to behave as a single switch. It is a highly scalable, distributed, Layer 2 and Layer 3 networking architecture that provides a high-performance, low-latency, and unified interconnect solution for next-generation data centers as seen in Figure 20 on page 1309.

Figure 20: QFX Series QFabric System Architecture

9041145

A QFabric system collapses the traditional multi-tiered data center model into a single tier where all access layer devices (known in the QFabric system model as *Node devices*) are essentially directly connected to all other access layer devices across a very large scale fabric backplane (known in the QFabric system model as the *Interconnect device*). Such an architecture enables the consolidation of data center endpoints (such as servers, storage devices, memory, appliances, and routers) and provides better scaling and network virtualization capabilities than traditional data centers.

Essentially, a QFabric system can be viewed as a single, nonblocking, low-latency switch that supports thousands of 10-Gigabit Ethernet ports or 2-Gbps, 4-Gbps, or 8-Gbps Fibre Channel ports to interconnect servers, storage, and the Internet across a high-speed, high-performance fabric. The entire QFabric system is managed as a single entity through a *Director group*, containing redundant hardware and software components that can be expanded and scaled as the QFabric system grows in size. In addition, the Director group automatically senses when devices are added or removed from the QFabric system and dynamically adjusts the amount of processing resources required to support the system. Such intelligence helps the QFabric system use the minimum amount of power to run the system efficiently, but not waste energy on unused components.

As a result of the QFabric system architecture, data center operators are now realizing the benefits of this next-generation architecture, including:

- **Low latency**—Because of its inherent advantages in this area, the QFabric system provides an excellent foundation for mission-critical applications such as financial transactions and stock trades, as well as time-sensitive applications such as voice and video.
- **Enhanced scalability**—The QFabric system can be managed as a single entity and provides support for thousands of data center devices. As Internet traffic continues to grow exponentially with the increase in high-quality video transmissions and rise in the number of mobile devices used worldwide, the QFabric system can keep pace with the demands for bandwidth, applications, and services offered by the data center.
- **Virtualization-enabled**—The QFabric system was designed to work seamlessly with virtual servers, virtual appliances, and other virtual devices, allowing for even greater scalability, expandability, and rapid deployment of new services than ever before. Migrating to virtual devices also results in significant costs savings, fueled by reduced space requirements, decreased needs for power and cooling, and increased processing capabilities.
- **Simplicity**—Although the QFabric system can scale to hundreds of devices and thousands of ports, you can still manage the QFabric system as a single system.
- **Flexibility**—You can deploy the QFabric system as an entire system or in stages.
- **Convergence**—Because the congestion-free fabric is lossless, all traffic in a QFabric system can be converged onto a single network. As a result, the QFabric system supports Ethernet, Fibre Channel over Ethernet, and native Fibre Channel packets and frames.

Flat, nonblocking, and lossless, the network fabric offered by the QFabric system has the scale and flexibility to meet the needs of small, medium, and large-sized data centers for years to come.

## Understanding QFabric System Terminology

To understand the QFabric system environment and its components, you should become familiar with the terms defined in [Table 70 on page 1311](#).

**Table 70: QFabric System Terms**

| Term                          | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Clos network fabric           | Three-stage switching network in which switch elements in the middle stages are connected to all switch elements in the ingress and egress stages. In the case of QFabric system components, the three stages are represented by an ingress chipset, a midplane chipset, and an egress chipset in an Interconnect device (such as a QFX3008-I Interconnect device). In Clos networks, which are well known for their nonblocking properties, a connection can be made from any idle input port to any idle output port, regardless of the traffic load in the rest of the system.                            |
| Director device               | Hardware component that processes fundamental QFabric system applications and services, such as startup, maintenance, and inter-QFabric system device communication. A set of Director devices with hard drives can be joined to form a <i>Director group</i> , which provides redundancy and high availability by way of additional memory and processing power. (See also <i>Director group</i> .)                                                                                                                                                                                                         |
| Director group                | <p>Set of Director devices that host and load-balance internal processes for the QFabric system. The Director group handles tasks such as QFabric system network topology discovery, Node and Interconnect device configuration, startup, and DNS, DHCP, and NFS services. Operating a Director group is a minimum requirement to manage a QFabric system.</p> <p>The Director group runs the Director software for management applications and runs dual processes in active/standby mode for maximum redundancy and high availability. (See also <i>Director software</i> and <i>Director device</i>.)</p> |
| Director software             | Software that handles QFabric system administration tasks, such as fabric management and configuration. The Junos OS-based Director software runs on the <i>Director group</i> , provides a single, consolidated view of the QFabric system, and enables the main QFabric system administrator to configure, manage, monitor, and troubleshoot QFabric system components from a centralized location. To access the Director software, log in to the default partition. (See also <i>Director device</i> and <i>Director group</i> .)                                                                        |
| fabric control Routing Engine | Virtual Junos OS Routing Engine instance used to control the exchange of routes and flow of data between QFabric system hardware components within a partition. The fabric control Routing Engine runs on the Director group.                                                                                                                                                                                                                                                                                                                                                                                |
| fabric manager Routing Engine | Virtual Junos OS Routing Engine instance used to control the initialization and maintenance of QFabric system hardware components belonging to the default partition. The fabric manager Routing Engine runs on the Director group.                                                                                                                                                                                                                                                                                                                                                                          |
| infrastructure                | QFabric system services processed by the virtual Junos Routing Engines operating within the Director group. These services, such as fabric management and fabric control, support QFabric system functionality and high availability.                                                                                                                                                                                                                                                                                                                                                                        |

Table 70: QFabric System Terms (*continued*)

| Term                              | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interconnect device               | QFabric system component that acts as the primary fabric for data plane traffic traversing the QFabric system between Node devices. Examples of Interconnect devices include the QFX3008-I Interconnect device in a QFX3000-G QFabric system, the QFX5100-24Q configured as an Interconnect device, and the QFX3600-I Interconnect device in a QFX3000-M QFabric system. (See also <i>Node device</i> .)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Junos Space                       | Carrier-class network management system for provisioning, monitoring, and diagnosing Juniper Networks routing, switching, security, and data center platforms.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| network Node group                | Set of one to eight Node devices that connects to an external network.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| network Node group Routing Engine | Virtual Junos OS Routing Engine instance that handles routing processes for a network Node group. The network Node group Routing Engine runs on the Director group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Node device                       | Routing and switching device that connects to endpoints (such as servers or storage devices) or external network peers, and is connected to the QFabric system through an Interconnect device. You can deploy Node devices similarly to the way a top-of-rack switch is implemented. Examples of Node devices include the QFX3500 Node device, QFX3600 Node device, and QFX5100 Node device. (See also <i>Interconnect device</i> and <i>network Node group</i> .)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| partition                         | <p>Collection of physical or logical QFabric system hardware components (such as Node devices) that provides fault isolation, separation, and security.</p> <p>In their initial state, all QFabric system components belong to a <i>default partition</i>.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| QFabric system                    | <p>Highly scalable, distributed, Layer 2 and Layer 3 networking architecture that provides a high-performance, low-latency, and unified interconnect solution for next-generation data centers. A QFabric system collapses the traditional multi-tier data center model, enables the consolidation of data center endpoints (such as servers, storage devices, memory, appliances, and routers), and provides better scaling and network virtualization capabilities than traditional data centers.</p> <p>Essentially, a QFabric system can be viewed as a single, nonblocking, low-latency switch that supports thousands of 10-Gigabit Ethernet ports or 2-Gbps, 4-Gbps or 8-Gbps Fibre Channel ports to interconnect servers, storage, and the Internet across a high-speed, high-performance fabric. The QFabric system must have sufficient resources and devices allocated to handle the <i>Director group</i>, <i>Node device</i>, and <i>Interconnect device</i> functions and capabilities.</p> |

Table 70: QFabric System Terms (*continued*)

| Term                         | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QFabric system control plane | <p>Internal network connection that carries control traffic between QFabric system components. The QFabric system control plane includes management connections between the following QFabric system hardware and software components:</p> <ul style="list-style-type: none"> <li>• <i>Node devices</i>, such as the QFX3500 Node device.</li> <li>• <i>Interconnect devices</i>, such as the QFX3008-I Interconnect device.</li> <li>• <i>Director group processes</i>, such as management applications, provisioning, and topology discovery.</li> <li>• <i>Control plane Ethernet switches</i> to provide interconnections to all QFabric system devices and processes. For example, you can use EX Series EX4200 switches running in Virtual Chassis mode for this purpose.</li> </ul> <p>To maintain high availability, the QFabric system control plane uses a different network than the QFabric system data plane, and uses a fabric provisioning protocol and a fabric management protocol to establish and maintain the QFabric system.</p> |
| QFabric system data plane    | <p>Redundant, high-performance, and scalable data plane that carries QFabric system data traffic. The QFabric system data plane includes the following high-speed data connections:</p> <ul style="list-style-type: none"> <li>• 10-Gigabit Ethernet connections between QFabric system endpoints (such as servers or storage devices) and Node devices.</li> <li>• 40-Gbps quad small form-factor pluggable plus (QSFP+) connections between Node devices and Interconnect devices.</li> <li>• 10-Gigabit Ethernet connections between external networks and a Node device acting as a network Node group.</li> </ul> <p>To maintain high availability, the QFabric system data plane is separate from the QFabric system control plane.</p>                                                                                                                                                                                                                                                                                                         |
| QFabric system endpoint      | Device connected to a Node device port, such as a server, a storage device, memory, an appliance, a switch, or a router.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| QFabric system fabric        | Distributed, multistage network that consists of a queuing and scheduling system that is implemented in the Node device, and a distributed cross-connect system that is implemented in Interconnect devices. The QFabric system fabric is part of the QFabric system data plane.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| QFX3500 Node device          | <p>Node device that connects to either endpoint systems (such as servers and storage devices) or external networks in a QFabric system. It is packaged in an industry-standard 1U, 19-inch rack-mounted enclosure.</p> <p>The QFX3500 Node device provides up to 48 10-Gigabit Ethernet interfaces to connect to the endpoints. Twelve of these 48 interfaces can be configured to support 2-Gbps, 4-Gbps or 8-Gbps Fibre Channel, and 36 of the interfaces can be configured to support Gigabit Ethernet. Also, there are four uplink connections to connect to Interconnect devices in a QFabric system. These uplinks use 40-Gbps quad small form-factor pluggable plus (QSFP+) interfaces. (See also <i>QFX3500 switch</i>.)</p>                                                                                                                                                                                                                                                                                                                  |

Table 70: QFabric System Terms (*continued*)

| Term                | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QFX3500 switch      | <p>Standalone data center switch with 10-Gigabit Ethernet access ports and 40-Gbps quad, small form-factor pluggable plus (QSFP+) uplink interfaces. You can (optionally) configure some of the access ports as 2-Gbps, 4-Gbps, or 8-Gbps Fibre Channel ports or Gigabit Ethernet ports.</p> <p>The QFX3500 switch can be converted to a QFabric system Node device as part of a complete QFabric system. The switch is packaged in an industry-standard 1U, 19-inch rack-mounted enclosure. (See also <i>QFX3500 Node device</i>.)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| QFX3600 Node device | <p>Node device that connects to either endpoint systems (such as servers and storage devices) or external networks in a QFabric system. It is packaged in an industry-standard 1U, 19-inch rack-mounted enclosure.</p> <p>The QFX3600 Node device provides 16 40-Gbps QSFP+ ports. By default, 4 ports (labeled <b>Q0</b> through <b>Q3</b>) are configured for 40-Gbps uplink connections between your Node device and your Interconnect device, and 12 ports (labeled <b>Q4</b> through <b>Q15</b>) use QSFP+ direct-attach copper (DAC) breakout cables or QSFP+ transceivers with fiber breakout cables to support 48 10-Gigabit Ethernet interfaces for connections to either endpoint systems (such as servers and storage devices) or external networks. Optionally, you can choose to configure the first eight ports (<b>Q0</b> through <b>Q7</b>) for uplink connections between your Node device and your Interconnect device, and ports <b>Q2</b> through <b>Q15</b> for 10-Gigabit Ethernet connections to either endpoint systems or external networks. (See also <i>QFX3600 switch</i>.)</p> |
| QFX3600 switch      | <p>Standalone data center switch with 16 40-Gbps quad, small form-factor pluggable plus (QSFP+) interfaces. By default, all the 16 ports operate as 40-Gigabit Ethernet ports. Optionally, you can choose to configure the 40-Gbps ports to operate as four 10-Gigabit Ethernet ports. You can use QSFP+ to four SFP+ breakout cables to connect the 10-Gigabit Ethernet ports to other servers, storage, and switches.</p> <p>The QFX3600 switch can be converted to a QFabric system Node device as part of a complete QFabric system. The switch is packaged in an industry-standard 1U, 19-inch rack-mounted enclosure. (See also <i>QFX3600 Node device</i>.)</p>                                                                                                                                                                                                                                                                                                                                                                                                                                      |

Table 70: QFabric System Terms (*continued*)

| Term                        | Definition                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
|-----------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| QFX5100 Node device         | <p>QFabric system Node device that connects to either endpoint systems (such as servers and storage devices) or external networks. All three supported models are packaged in an industry-standard 1U, 19-inch rack-mounted enclosure. A QFX5100 Node device can be any of these models:</p> <ul style="list-style-type: none"> <li>• QFX5100-48S<br/>By default, the QFX5100-48S Node device provides 48 10-Gigabit Ethernet interfaces to connect to the endpoints. There are also six 40-Gbps quad small form-factor pluggable plus (QSFP+) interfaces, of which four are uplinks (FTE).</li> <li>• QFX5100-48T<br/>By default, the QFX5100-48T Node device provides 48 10GBASE-T interfaces to connect to endpoints. There are also six 40-Gbps QSFP+ interfaces, of which four are uplinks (FTE)</li> <li>• QFX5100-24Q<br/>By default, the QFX5100-24Q Node device provides 24 40-Gigabit Ethernet QSFP+ interfaces to connect to the endpoints. The QFX5100-24Q has two expansion bays. The number of additional interfaces available depends on the expansion module and the System mode configured for the Node device.</li> </ul> <p>By default, on the QFX5100-48S Node device and QFX5100-48T Node device, the first 4 ports (labeled <b>fte-0/1/0</b> through <b>fte-0/1/3</b>) are configured for 40-Gbps uplink connections between your Node device and your Interconnect devices, and 2 ports (labeled <b>xle-0/1/4</b> and <b>xle-0/1/5</b>) use QSFP+ direct-attach copper (DAC) breakout cables or QSFP+ transceivers with fiber breakout cables to support 8 10-Gigabit Ethernet interfaces for connections to either endpoint systems (such as servers and storage devices) or external networks. Optionally, you can choose to configure the middle 2 ports (<b>xle-0/1/2</b> and <b>xle-0/1/3</b>) for additional connections to either endpoint systems or external networks.</p> <p>(See also <i>QFX3500 Node device</i> and <i>QFX3600 Node device</i>.)</p> |
| redundant server Node group | Set of two Node devices that connect to servers or storage devices. Link aggregation group (LAG) interfaces can span the Node devices within a redundant server Node group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| rolling upgrade             | Method used in the QFabric system to upgrade the software for components in a systematic, low-impact way. A rolling upgrade begins with the Director group, proceeds to the fabric (Interconnect devices), and finishes with the Node groups.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Routing Engine              | <p>Juniper Networks-proprietary processing entity that implements QFabric system control plane functions, routing protocols, system management, and user access. Routing Engines can be either physical or virtual entities.</p> <p>The Routing Engine functions in a QFabric system are sometimes handled by Node devices (when connected to endpoints), but mostly implemented by the Director group (to provide support for QFabric system establishment, maintenance, and other tasks).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Table 70: QFabric System Terms (*continued*)

| Term                          | Definition                                                                                                                                                                                                                                                                                                       |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| routing instance              | Private collection of routing tables, interfaces, and routing protocol parameters unique to a specific customer. The set of interfaces is contained in the routing tables, and the routing protocol parameters control the information in the routing tables.<br><br>(See also <i>virtual private network</i> .) |
| server Node group             | Set of one or more Node devices that connect to servers or storage devices.                                                                                                                                                                                                                                      |
| virtual LAN (VLAN)            | Unique Layer 2 broadcast domain for a set of ports selected from the components available in a partition. VLANs allow manual segmentation of larger Layer 2 networks and help to restrict access to network resources. To interconnect VLANs, Layer 3 routing is required.                                       |
| virtual private network (VPN) | Layer 3 routing domain within a partition. VPNs maintain privacy with a tunneling protocol, encryption, and security procedures. In a QFabric system, a Layer 3 VPN is configured as a <i>routing instance</i> .                                                                                                 |
| flow group                    | Force redundant multicast streams to flow through different interconnect devices to prevent a single interconnect device from potentially dropping both streams of multicast traffic during a failure.                                                                                                           |

## Understanding Interfaces on the QFabric System

This topic describes:

- [Four-Level Interface Naming Convention on page 1316](#)
- [QSFP+ Interfaces on page 1317](#)
- [Link Aggregation on page 1320](#)

### Four-Level Interface Naming Convention

When you configure an interface on the QFabric system, the interface name needs to follow a four-level naming convention that enables you to identify an interface as part of either a Node device or a Node group. Include the name of the network or server Node group at the beginning of the interface name.

The four-level interface naming convention is:  
*device-name:type-fpc/pic/port*

where *device-name* is the name of the Node device or Node group. The remainder of the naming convention elements are the same as those in the QFX3500 switch interface naming convention.

An example of a four-level interface name is:  
*node2:xe-0/0/2*

### QSFP+ Interfaces

The QFX3500 Node device provides four 40-Gbps QSFP+ (quad small form-factor pluggable plus) interfaces (labeled **Q0** through **Q3**) for uplink connections between your Node device and your Interconnect devices.

The QFX3600 Node device provides 16 40-Gbps QSFP+ interfaces. By default, 4 interfaces (labeled **Q0** through **Q3**) are configured for 40-Gbps uplink connections between your Node device and your Interconnect devices, and 12 interfaces (labeled **Q4** through **Q15**) use QSFP+ direct-attach copper (DAC) breakout cables or QSFP+ transceivers with fiber breakout cables to support 48 10-Gigabit Ethernet interfaces for connections to either endpoint systems (such as servers and storage devices) or external networks. Optionally, you can choose to configure the first eight interfaces (Q0 through Q7) for uplink connections between your Node device and your Interconnect devices, and interfaces Q2 through Q15 for 10-Gigabit Ethernet or 40-Gigabit Ethernet connections to either endpoint systems or external networks (see [“Configuring the Port Type on QFX3600 Node Devices” on page 1503](#)). [Table 71 on page 1317](#) shows the port mappings for QFX3600 Node devices.

**Table 71: QFX3600 Node Device Port Mappings**

| Port Number | 10-Gigabit Ethernet Interfaces (On PIC 0) | 40-Gigabit Ethernet Interfaces (On PIC 1) | 40-Gigabit Data Plane Uplink Interfaces (On PIC 1) |
|-------------|-------------------------------------------|-------------------------------------------|----------------------------------------------------|
| <b>Q0</b>   | Not supported on this port                | xle-0/1/0                                 | fte-0/1/0                                          |
| <b>Q1</b>   | Not supported on this port                | xle-0/1/1                                 | fte-0/1/1                                          |
| <b>Q2</b>   | xe-0/0/8                                  | xle-0/1/2                                 | fte-0/1/2                                          |
|             | xe-0/0/9                                  |                                           |                                                    |
|             | xe-0/0/10                                 |                                           |                                                    |
|             | xe-0/0/11                                 |                                           |                                                    |
| <b>Q3</b>   | xe-0/0/12                                 | xle-0/1/3                                 | fte-0/1/3                                          |
|             | xe-0/0/13                                 |                                           |                                                    |
|             | xe-0/0/14                                 |                                           |                                                    |
|             | xe-0/0/15                                 |                                           |                                                    |

Table 71: QFX3600 Node Device Port Mappings (*continued*)

The QFX5100-48S Node device provides 48 10-Gigabit Ethernet interfaces and 6 40-Gbps QSFP+ interfaces. By default, 4 interfaces (labeled **48** through **51**) are configured for 40-Gbps uplink connections between your Node device and your Interconnect devices, and 2 interfaces (labeled **52** and **53**) support 40-Gigabit Ethernet connections to either endpoint systems (such as servers and storage devices) or external networks. Optionally, you can choose to configure the middle two interfaces (**50** and **51**) for 40-Gigabit Ethernet connections to either endpoint systems or external networks, and you can choose to configure the last two interfaces (**52** and **53**) for uplink connections between your Node device and your Interconnect devices (see [“Configuring the QSFP+ Port Type on QFX5100 Devices” on page 2785](#)). [Table 72 on page 1320](#) shows the port mappings for QFX5100-48S Node devices.

Table 72: QFX5100-48S Node Device Port Mappings

| Port Number | 40-Gigabit Ethernet Interfaces (On PIC 1) | 40-Gigabit Data Plane Uplink Interfaces (On PIC 1) |
|-------------|-------------------------------------------|----------------------------------------------------|
| 48          | Not supported on this PIC                 | fte-0/1/0                                          |
| 49          | Not supported on this PIC                 | fte-0/1/1                                          |
| 50          | xle-0/1/2                                 | fte-0/1/2                                          |
| 51          | xle-0/1/3                                 | fte-0/1/3                                          |
| 52          | xle-0/1/4                                 | fte-0/1/4                                          |
| 53          | xle-0/1/5                                 | fte-0/1/5                                          |

### Link Aggregation

Link aggregation enables you to create link aggregation groups across Node devices within a network Node group or redundant server Node group. You can include up to eight Ethernet interfaces in a LAG. You can have up to 48 LAGs within a redundant server Node group, and 128 LAGs in a network Node group. To configure a LAG, include the **aggregated-devices** statement at the **[edit chassis node-group node-group-name]** hierarchy level and the **device-count** statement at the **[edit chassis node-group node-group-name aggregated-devices ethernet]** hierarchy level. Additionally, include any aggregated Ethernet options (**minimum-links** and **link-speed**) at the **[edit interfaces interface-name aggregated-ether-options]** hierarchy level and the **802.3ad** statement at the **[edit interfaces interface-name ether-options]** hierarchy level. To configure the Link Aggregation Control Protocol (LACP), include the **lacp** statement at the **[edit interfaces aggregated-ether-options]** hierarchy level.

### QFabric System Hardware Architecture Overview

The QFabric system is a single-layer networking tier that connects servers and storage devices to one another across a high-speed, unified core fabric. You can view the QFabric system as a single, extremely large, nonblocking, high-performance Layer 2 and Layer 3 switching system. The reason you can consider the QFabric system as a single system is that the Director software running on the Director group allows the main QFabric system administrator to access and configure every device and port in the QFabric system from a single location. Although you configure the system as a single entity, the fabric contains four major hardware components. The hardware components can be chassis-based, group-based, or a hybrid of the two. As a result, it is important to understand the four types of generic QFabric system components and their functions, regardless of which hardware environment you decide to implement. A representation of these components is shown in [Figure 21 on page 1321](#).

Figure 21: QFabric System Hardware Architecture

9041135

The four major QFabric system components include the following:

- **Director group**—The *Director group* is a management platform that establishes, monitors, and maintains all components in the QFabric system. It is a set of Director devices that run the Junos operating system (Junos OS) on top of a CentOS foundation. The Director group handles tasks such as QFabric system network topology discovery, Node and Interconnect device configuration and startup, and Domain Name System (DNS), Dynamic Host Configuration Protocol (DHCP), and Network File System (NFS) services. The Director group also runs the software for management applications, hosts and load-balances internal processes for the QFabric system, and starts additional QFabric system processes as requested.
- **Node devices**—A *Node device* is a hardware system located on the ingress of the QFabric system that connects to endpoints (such as servers or storage devices) or external networks, and is connected to the heart of the QFabric system through an Interconnect device. A Node device can be used in a manner similar to how a top-of-rack switch is implemented. By default, Node devices connect to servers or storage devices. However, when you group Node devices together to connect to a network that is external to the QFabric system, the formation is known as a *network Node group*.
- **Interconnect devices**—An *Interconnect device* acts as the primary fabric for data plane traffic traversing the QFabric system between Node devices. To reduce latency to a minimum, the Interconnect device implements multistage Clos switching to provide nonblocking interconnections between any of the Node devices in the system.
- **Control plane network**—The *control plane network* is an out-of-band Gigabit Ethernet management network that connects all QFabric system components. For example, you can use a group of EX4200 Ethernet switches configured as a Virtual Chassis to enable the control plane network. The control plane network connects the Director group to the management ports of the Node and Interconnect devices. By keeping the control plane network separate from the data plane, the QFabric system can scale to support thousands of servers and storage devices.

The four major QFabric system components can be assembled from a variety of hardware options. Currently supported hardware configurations are shown in [Table 73 on page 1322](#).

**Table 73: Supported QFabric System Hardware Configurations**

| QFabric System Configuration | Director Group         | Node Device                                                                                                                                                                  | Interconnect Device                                                                                                                    | Control Plane Device                                                                                                                                                        |
|------------------------------|------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

To complete the system, external Routing Engines (such as the fabric manager Routing Engines, network Node group Routing Engines, and fabric control Routing Engines) run on the Director group and implement QFabric system control plane functions. The control plane network provides the control plane connections between the Node devices, the Interconnect devices, and the Routing Engines running on the Director group.

### QFX3000-G QFabric System Features

A QFX3000-G QFabric system provides the following key features:

- Support for up to 128 Node devices and 4 Interconnect devices, which provides a maximum of 6144 10-Gigabit Ethernet ports.
- Low port-to-port latencies that scale as the system size grows from 48 to 6144 10-Gigabit Ethernet ports.
- Support for up to 384,000 total ingress queues at each Node device to the QFabric system Interconnect backplane.
- Support for Converged Enhanced Ethernet (CEE) traffic.

## QFX3000-M QFabric System Features

---

A QFX3000-M QFabric system provides the following key features:

- Support for up to 32 Node devices and 4 QFX5100-24Q Interconnect devices or 16 Node device and 4 QFX3600-I Interconnect devices.

**NOTE:** You may not mix QFX5100-24Q Interconnect devices with QFX3600-I Interconnect devices on the same QFX3000-M QFabric system.

- Low port-to-port latencies that scale as the system size grows from 48 to 768 10-Gigabit Ethernet ports.

## Understanding the Director Group

Because the Director group provides management services for the QFabric system, it is important to understand the components of the cluster and how the Director group supports the needs of the greater fabric.

- [Director Group Components on page 1324](#)
- [Director Group Services on page 1325](#)

### Director Group Components

---

When you build a Director group, consider the following elements and concepts.

- **Director device**—A single management device for the QFabric system. Director devices with a hard drive provide full processing services and are used to build the Director group.
- **Director group**—A set of Director devices. The Director group is essential to the QFabric system, which cannot operate properly without it. The Director group shares and load-balances processing tasks for the QFabric system, performs topology discovery, assigns identifiers to QFabric system components, and manages interfabric communication. The primary devices in a Director group are Director devices that

contain hard drives. The Director devices run dual processes in active or standby mode for maximum redundancy.

When you add additional Director devices to the group, the Director group coordinates their activities and distributes processing loads across all available Director devices. The additional Director devices provide the Director group with additional memory and processing power. Supplementing the Director group with extra Director devices allows the group to scale efficiently and serve the needs of the entire QFabric system as it grows.

### Director Group Services

The Director group is a management platform that establishes, monitors, and maintains all components in the QFabric system. It is a set of Director devices that run the Junos operating system (Junos OS) on top of a CentOS foundation. The Director group handles tasks such as QFabric system network topology discovery, Node and Interconnect device configuration and startup, and Domain Name System (DNS), Dynamic Host Configuration Protocol (DHCP), and Network File System (NFS) services. The Director group also runs the software for management applications, hosts and load-balances internal processes for the QFabric system, maintains configuration and topology databases, and starts additional QFabric system processes as requested.

Another critical role provided by the Director group is the hosting of the virtual Junos Routing Engines. These Routing Engines provide services for the QFabric system to keep it operating smoothly.

## Understanding Routing Engines in the QFabric System

Routing Engines perform many important processing tasks in the QFabric system. Knowing where the Routing Engines are located and what services they provide enables you to troubleshoot the QFabric system and ensure that it is running the way it should.

This topic covers:

- [Hardware-Based Routing Engines on page 1325](#)
- [Software-Based External Routing Engines on page 1326](#)

### Hardware-Based Routing Engines

A traditional Juniper Networks Routing Engine is a hardware field-replaceable unit that runs routing protocols, builds the routing and switching tables, sends routing information to the Packet Forwarding Engine, and handles several software processes for the device (such as interface control, chassis component monitoring, system management, and user access). Node devices that are part of server Node groups in the QFabric system that connect to servers or storage devices implement Routing Engine functions locally using this traditional hardware method.

## Software-Based External Routing Engines

The QFabric system also uses external Routing Engines that run in software on the Director group. In contrast with traditional Routing Engines, the functions and processes provided by software-based Routing Engines are segmented, specialized, and distributed across multiple Routing Engine instances running on the Director group. Such separation provides redundancy for these functions and enables the QFabric system to scale.

[Figure 22 on page 1326](#) shows the external Routing Engine types.

**Figure 22: External Routing Engine Types**

These special-purpose external Routing Engine instances running on the Director group provide the following major services for the QFabric system:

- **Fabric manager Routing Engine**—Provides services to all devices in the QFabric system, such as system initialization, topology discovery, internal IP address and ID assignment, and interdevice communication. The fabric manager Routing Engine authenticates Interconnect and Node devices, and maintains a database for system components. A single fabric manager Routing Engine instance is generated to manage the entire QFabric system.
- **Fabric control Routing Engine**—Runs the fabric control protocol to share route information between available devices in a partition. A pair of redundant route distribution Routing Engine instances is generated for every partition in the QFabric system, and both instances are active.
- **Diagnostic Routing Engine**—Gathers operational information that allows QFabric system administrators to monitor the health of the QFabric system. A single Routing Engine instance is generated for the entire QFabric system.
- **Network Node group Routing Engine**—Provides Routing Engine functionality for groups of Node devices bundled together as a single Layer 3 routing device, which is used to connect to external networks. A pair of redundant Routing Engine instances is generated for every network Node group in the QFabric system.

## Understanding Interconnect Devices

Interconnect devices in a QFabric system provide a way for the Node devices to connect with one another over a high-speed backplane. By understanding the role of Interconnect devices, you can harness the benefits of low latency, superb scalability, and minimum packet processing offered by a single-tier data center architecture.

This topic covers:

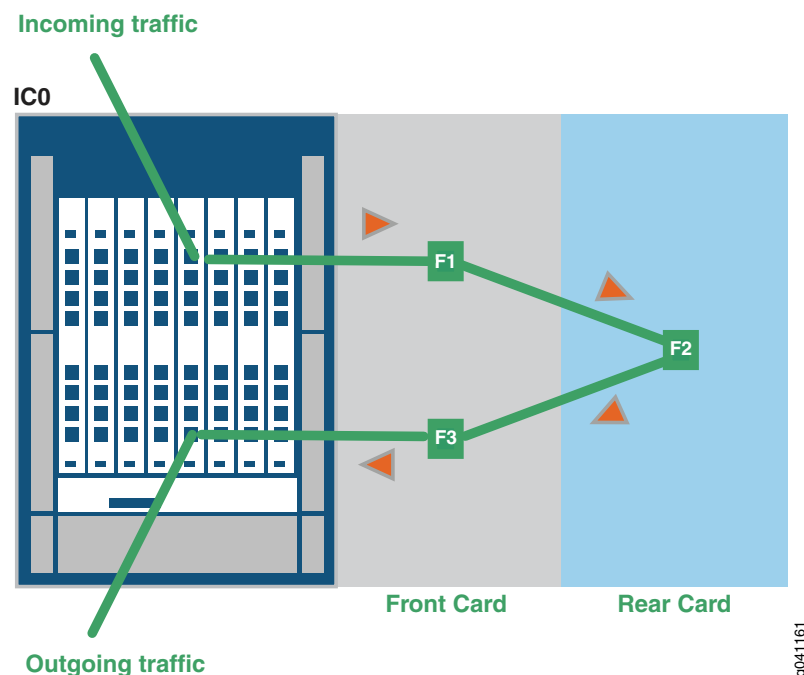

- [Interconnect Device Introduction on page 1327](#)
- [QFX3008-I Interconnect Devices on page 1328](#)
- [QFX3600-I Interconnect Devices on page 1329](#)
- [QFX5100-24Q Interconnect Devices on page 1330](#)

### Interconnect Device Introduction

*Interconnect devices* act as the primary fabric for data plane traffic traversing the QFabric system between Node devices. The main task for the Interconnect devices is to transfer traffic between the Node devices as quickly as possible across a high-speed, available path backplane. To reduce latency to a minimum, larger Interconnect devices (such as the QFX3008-I Interconnect device) implement multistage Clos switching to provide nonblocking connections between any of the Node devices in the system.

[Figure 23 on page 1327](#) shows an example of how Clos switching works in the QFX3008-I Interconnect device.

**Figure 23: Clos Switching for QFX3008-I Interconnect Devices**

Traffic enters a QSFP+ port from a Node device, and an ingress chipset provides stage F1 processing. For the F2 stage, the frame is sent to a rear card and processed by a

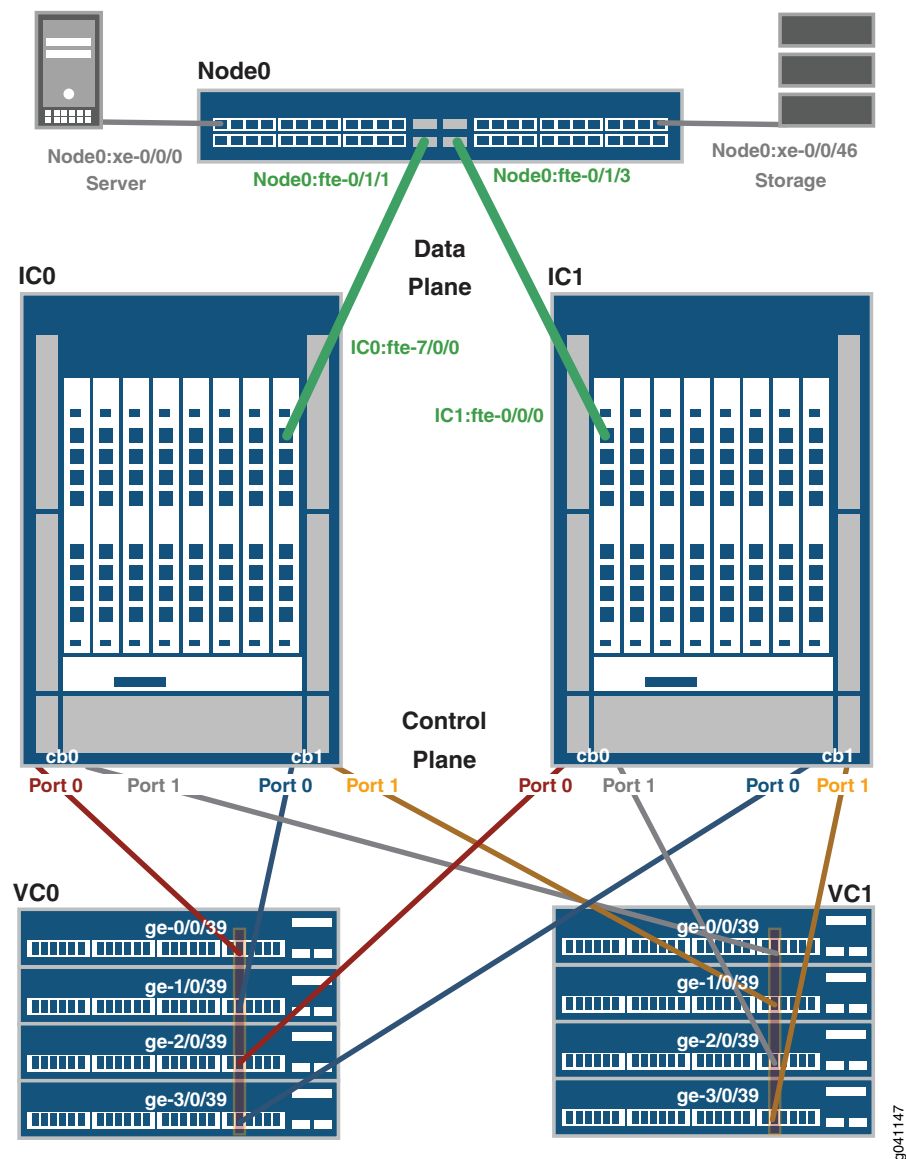

midplane chipset. Lastly, an egress chipset on the front card QSFP+ port handles processing tasks for the F3 stage. At each of the three Clos stages, a switching table chooses the best path and determines where to send the frame to reach the next stage. The F1 and F3 stages can be handled by the same front card or different front cards, depending on the best path selected by the fabric. After the frame traverses the Interconnect device backplane, the Interconnect device sends the frame to the egress Node device.

### **QFX3008-I Interconnect Devices**

---

The QFX3008-I Interconnect device contains eight slots in the front of the chassis. In each slot, you can install a front card containing 16 40-Gbps quad small form-factor pluggable plus (QSFP+) ports. A fully configured system offers a total capacity of 128 QSFP+ connections. These front card ports attach to the high-speed backplane to reach the eight slots in the rear of the chassis, which provide the heavy-duty interconnections for the entire QFX3000-G QFabric system. In addition, four interfaces (two per Control Board) provide Gigabit Ethernet access to the control plane management network. [Figure 24 on page 1329](#) shows an example of the data plane and control plane connections for QFX3008-I Interconnect devices.

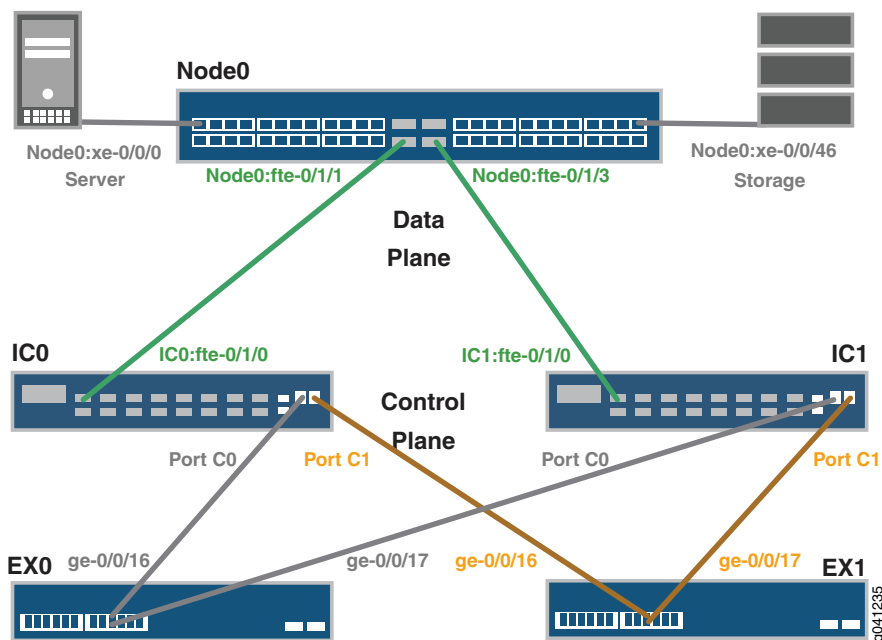

Figure 24: QFX3008-I Data Plane and Control Plane Connections

### QFX3600-I Interconnect Devices

The QFX3600-I Interconnect device has 16 40-Gbps quad small form-factor pluggable plus (QSFP+) ports that provide interconnections for the entire QFX3000-M QFabric system. In addition, two management ports provide Gigabit Ethernet access to the control plane management network. [Figure 25 on page 1330](#) shows an example of the data plane and control plane connections for a QFX3600-I Interconnect device.

Figure 25: QFX3600-I Data Plane and Control Plane Connections

### QFX5100-24Q Interconnect Devices

The QFX5100-24Q switch can be configured to operate either as an Interconnect device or as a Node device in a QFX3000-M QFabric system. The QFX5100-24Q has 24 40-Gbps QSFP+ ports and can hold an additional 8 40-Gbps QSFP+ ports. These QSFP+ ports provide interconnects for the entire QFabric system. QFX5100 devices have a minimum of two management ports: a 10/100/1000BASE-T RJ-45 port and a 1-Gbps SFP ports. If you plan to use all fiber connections, be sure to order the product SKUs have an additional 1-Gbps SFP port that can be used either for fiber or copper connections.

Figure 26: QFX5100-24Q Data Plane and Control Plane Connections

## Understanding Node Devices

Node devices in a QFabric system provide a way for servers, storage devices, and external networks to connect to the QFabric system. By understanding the role of Node devices, you can design your QFabric system topology to take advantage of the unique benefits offered by a single-tier data center architecture.

This topic covers:

- [Node Device Introduction on page 1331](#)
- [QFX3500 Node Devices on page 1331](#)
- [QFX3600 Node Devices on page 1332](#)
- [QFX5100 Node Devices on page 1333](#)

### Node Device Introduction

A *Node device* in the QFabric system connects either endpoint systems (such as application servers and storage devices) or external networks to Interconnect devices. It can be used similarly to the way a top-of-rack switch is implemented in a data center. Node devices provide an access point to the QFabric system, allowing data to flow into and out of the QFabric system. Because all Node devices in the QFabric system connect through a backplane of Interconnect devices, in essence all Node devices are connected to one another. This directly connected design model eliminates multiple tiers of aggregation and core devices and provides minimum latency, maximum scalability, and rapid transport of server-to-server traffic and QFabric system-to-external network traffic.

Sets of Node devices can be bundled together into *Node groups*, in which each group operates as a single virtual entity. Node groups that connect to servers and storage devices are known as *server Node groups*, and Node groups that connect to external networks are known as *network Node groups*.

### QFX3500 Node Devices

A QFX3500 Node device provides up to 48 10-Gigabit Ethernet interfaces to connect to endpoints or external networks. You can configure 12 of these 48 interfaces to support 2-Gbps, 4-Gbps, or 8-Gbps Fibre Channel. You can also configure the remaining 36 interfaces with Gigabit Ethernet.

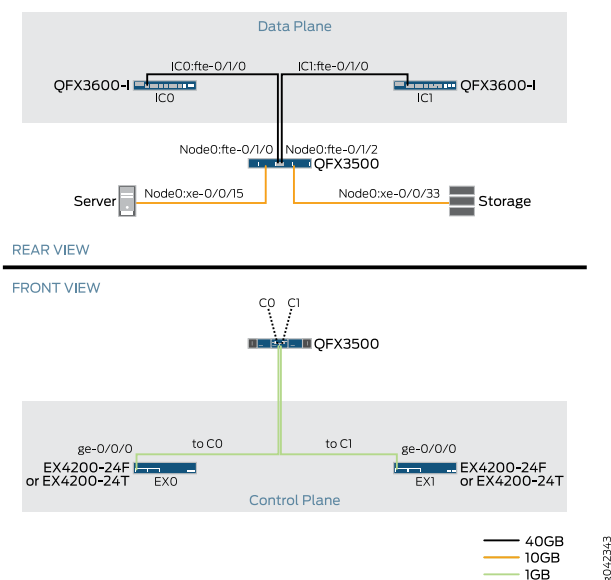

**NOTE:** You can configure interface ports 0 through 47 as 10-Gigabit Ethernet ports, 0 through 5 and 42 through 47 as Fibre Channel over Ethernet ports, and 6 through 41 as Gigabit Ethernet ports. However, you cannot configure any Fibre Channel over Ethernet ports as Gigabit Ethernet ports or vice versa.

In addition to these server and network interfaces, there are four uplink interfaces to connect the QFX3500 Node device to Interconnect devices in a QFabric system. These uplinks use 40-Gbps quad small form-factor pluggable plus (QSFP+) interfaces.

The control plane requires two management ports on the QFX3500 chassis to connect the Node device to the control plane network. [Figure 27 on page 1332](#) shows an example of the data plane and control plane connections for a QFX3500 Node device.

**Figure 27: QFX3500 Data Plane and Control Plane Connections**

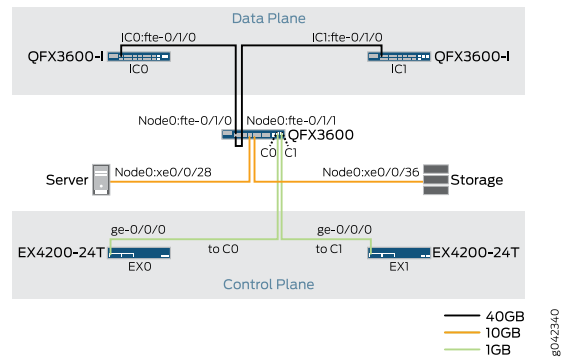

### QFX3600 Node Devices

A QFX3600 Node device provides 16 40-Gbps QSFP+ interfaces. By default, 4 interfaces (labeled **Q0** through **Q3**) are configured for 40-Gbps uplink connections between your QFX3600 Node device and your Interconnect device, and 12 interfaces (labeled **Q4** through **Q15**) use QSFP+ direct-attach copper (DAC) breakout cables or QSFP+ transceivers with fiber breakout cables to support 48 10-Gigabit Ethernet interfaces for connections to either endpoint systems or external networks. Optionally, you can choose to configure the first eight interfaces (**Q0** through **Q7**) for uplink connections between your Node device and your Interconnect devices, and interfaces **Q2** through **Q15** for 10-Gigabit Ethernet or 40-Gigabit Ethernet connections to either endpoint systems or external networks.

The control plane requires two management ports on the QFX3600 chassis to connect the Node device to the control plane network. [Figure 28 on page 1333](#) shows an example of the data plane and control plane connections for a QFX3600 Node device.

Figure 28: QFX3600 Data Plane and Control Plane Connections

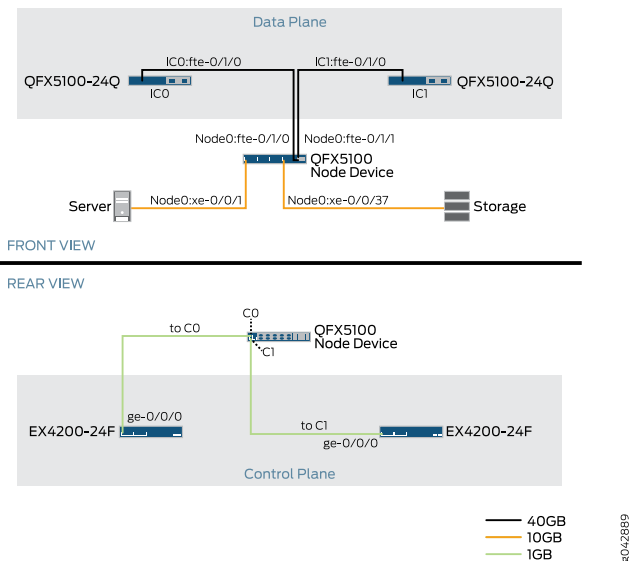

### QFX5100 Node Devices

Three models of the QFX5100 line of switches are supported as Node devices on a QFabric system:

- QFX5100-48S
- QFX5100-48T
- QFX5100-24Q

Figure 29 on page 1333 shows an example of the data plane and control plane connections for a QFX5100 Node device.

Figure 29: QFX5100 Data Plane and Control Plane Connections

- QFX5100-48S

A QFX5100-48S Node device provides 48 10-Gigabit Ethernet interfaces to connect to endpoints or external networks and 6 40-Gbps QSFP+ interfaces. By default, 4 of

the QSFP+ interfaces (labeled **fte-0/1/0** through **fte-0/1/1**) are configured for 40-Gbps uplink connections between your Node device and your Interconnect devices, and 2 QSFP+ interfaces (labeled **xle-0/1/4** and **xle-0/1/5**) provide 40-Gigabit Ethernet connections to either endpoint systems (such as servers and storage devices) or external networks. Optionally, you can choose to configure the middle two interfaces (**xle-0/1/8** and **xle-0/1/15**) for 10-Gigabit Ethernet or 40-Gigabit Ethernet connections to either endpoint systems or external networks, and you can choose to configure the last two interfaces (**fte-0/1/4** and **fte-0/1/5**) for uplink connections between your Node device and your Interconnect devices.

- QFX5100-48T

A QFX5100-48T Node device provides 48 10GBASE-T interfaces to connect to endpoints or external networks and 6 40-Gbps QSFP+ interfaces.

By default, 4 of the QSFP+ interfaces (labeled **fte-0/1/0** through **fte-0/1/3**) are configured for 40-Gbps uplink connections between your Node device and your Interconnect devices, and 2 QSFP+ interfaces (labeled **xle-0/1/4** and **xle-0/1/5**) provide 40-Gigabit Ethernet connections to either endpoint systems (such as servers and storage devices) or external networks. Optionally, you can choose to configure the middle two interfaces (**xle-0/1/8** and **xle-0/1/15**) for 10-Gigabit Ethernet or 40-Gigabit Ethernet connections to either endpoint systems or external networks, and you can choose to configure the last two interfaces (**fte-0/1/4** and **fte-0/1/5**) for uplink connections between your Node device and your Interconnect devices.

- QFX5100-24Q

A QFX5100-24Q Node device provides 24 QSFP+ interfaces **fte-0/1/0** through **fte-0/1/7** as uplinks and **xle-0/1/8** to **xle-0/1/23** as endpoint systems or external networks.

The QFX5100-24Q has two expansion bays. With the optional QFX-EM-4Q expansion modules, the QFX5100-24Q can provide an additional 8 40-Gbps interfaces that are channelized into 10G ports. The expansion modules do not support the XLE media type. Valid interfaces are in the range of **xe-0/2/0** to **xe-0/2/15** for the first expansion module and from **xe-0/3/0** to **xe-03/15** in the second expansion module, which provides a total of 32 x 10Gbps bandwidth.

The control plane requires two management ports on the QFX5100 chassis to connect the Node device to the control plane network.

## Understanding Node Groups

Node groups help you combine multiple Node devices into a single virtual entity within the QFabric system to enable redundancy and scalability at the edge of the data center.

This topic covers:

- [Network Node Groups on page 1335](#)
- [Server Node Groups on page 1335](#)

### Network Node Groups

A set of one or more Node devices that connect to an external network is called a *network Node group*. The network Node group also relies on two external Routing Engines running on the Director group. These redundant *network Node group Routing Engines* run the routing protocols required to support the connections from the network Node group to external networks.

When configured, the Node devices within a network Node group and the network Node group Routing Engines work together in tandem as a single entity. By default, network Node group Routing Engines are part of the **NW-NG-0** network Node group but no Node devices are included in the group. As a result, you must configure Node devices to be part of a network Node group.

In a QFabric system deployment that requires connectivity to external networks, you can modify the automatically generated network Node group by including its preset name **NW-NG-0** in the Node group configuration. Within a network Node group, you can include a minimum of one Node device up to a maximum of eight Node devices. By adding more Node devices to the group, you provide enhanced scalability and redundancy for your network Node group.

**NOTE:** The QFabric system creates a single **NW-NG-0** network Node group for the default partition. You cannot configure a second network Node group inside the default partition. The remaining Node devices within the default partition are reserved to connect to servers, storage, or other endpoints internal to the QFabric system. These Node devices either can be retained in the automatically generated server Node groups or can be configured as part of a redundant server Node group.

### Server Node Groups

A *server Node group* is a set of one or more Node devices that connect to servers or storage devices. Unlike Node devices that are part of a network Node group and rely on an external Routing Engine, a Node device within a server Node group connects directly to endpoints and implements the Routing Engine functions locally, using the local CPU built into the Node device itself.

There are two different server Node group types:

- **Autogenerated server Node group**—By default, each Node device is placed in its own self-named Node group to connect to servers and storage. No configuration is necessary, but the QFabric system provides no redundancy for this type of Node group.
- **Redundant server Node group**—You can override the default, autogenerated server Node group assignment by manually configuring a *redundant server Node group* that contains a maximum of two Node devices. You can use a redundant server Node group to provide multihoming services to servers and storage, as well as configure aggregated LAG connections that span the two Node devices.

**NOTE:** The Node devices in a redundant server Node group must be of the same type, either two QFX3500 Node devices, two QFX3600 Node devices, or two QFX5100 Node devices. You cannot mix and match different Node device models in the same redundant server Node group.

## Understanding Port Oversubscription on Node Devices

Each Node device in a QFabric system can have a different port oversubscription configuration. For example, you can have a Node device with 3:1 port oversubscription, another with 6:1 oversubscription, and yet another with 1:1 oversubscription.

The port oversubscription ratio on a Node device is based on the total amount of bandwidth from the server-facing connections and the total number of uplink connections to the Interconnect devices.. To determine your oversubscription ratio, multiply the number of server ports by the server-port speed, multiply the number of uplink ports by the uplink-port speed, and divide the total server-facing bandwidth by the total uplink-facing bandwidth. For example, If you use 32 10-Gigabit Ethernet server ports (320 gigabits) and 8 40-Gigabit Ethernet uplink ports (320 gigabits) on a QFX3600 Node device, you can configure 1:1 port oversubscription by connecting the eight uplink ports (labeled Q0 through Q7) from the Node device to the Interconnect devices and splitting the remaining 8 40-Gigabit Ethernet ports into 32 10-Gigabit Ethernet server ports.

Other important factors to consider are:

- When you connect more than one port on a Node device to an Interconnect device, you reduce the overall number of Node devices supported on the QFabric system.
- When you have two Interconnect devices and a single connection from each Node device, you can connect any remaining ports as access ports not server ports.

[Table 74 on page 1337](#) shows the oversubscription ratio for ports on QFX3500 Node devices in default mode based on the number of Interconnect devices and the number of connections from each Node device to each Interconnect device.

**Table 74: Oversubscription Ratio on QFX3500 Node Devices**

| Number of Interconnect Devices | Number of Connections from Each Node Device to Each Interconnect Device | Oversubscription Ratio on Node Device |
|--------------------------------|-------------------------------------------------------------------------|---------------------------------------|
| 2                              | 1                                                                       | 6:1                                   |
| 2                              | 2                                                                       | 3:1                                   |
| 4                              | 1                                                                       | 3:1                                   |

[Table 75 on page 1337](#) shows the oversubscription ratio for ports on QFX3600 Node devices in default modbased on the number of Interconnect devices and the number of connections from each Node device to each Interconnect device.

**Table 75: Oversubscription Ratio on QFX3600 Node Devices**

| Number of Interconnect Devices | Number of Connections from Each Node Device to Each Interconnect Device | Oversubscription Ratio on Node Device |
|--------------------------------|-------------------------------------------------------------------------|---------------------------------------|
| 2                              | 1                                                                       | 6:1                                   |
| 2                              | 2                                                                       | 3:1                                   |
| 2                              | 4                                                                       | 1:1                                   |
| 4                              | 1                                                                       | 3:1                                   |
| 4                              | 2                                                                       | 1:1                                   |

[Table 76 on page 1337](#) shows the oversubscription ratio for ports on QFX5100-48S Node devices and QFX5100-48T Node devices based on the number of Interconnect devices and the number of connections from each Node device to each Interconnect device.

**Table 76: Oversubscription Ratio on QFX5100-48S and QFX5100-48T Node Devices**

| Number of Interconnect Devices | Number of Connections from Each Node Device to Each Interconnect Device | Oversubscription Ratio on Node Device |
|--------------------------------|-------------------------------------------------------------------------|---------------------------------------|
| 2                              | 2                                                                       | 3.5:1                                 |
| 2                              | 1                                                                       | 8:1                                   |
| 4                              | 1                                                                       | 3.5:1                                 |

Unlike other Node Devices, the QFX5100-24Q supports the QFX-EM-4Q expansion module, that impact the oversubscription ratio. [Table 77 on page 1338](#) shows the

oversubscription ratio for the base model without expansion modules inserted into the device and with two QFX-EM-4Q modules installed. Other factors that impact the oversubscription ratio include the system mode selected for the device. See [Table 78 on page 1338](#) for details on system mode.

**Table 77: Oversubscription Ratio on QFX5100-24Q Node Devices**

| Number of Interconnect Devices | Number of Connections from Each Node Device to Each Interconnect Device | Oversubscription Ratio on Node Device | Oversubscription Ratio on Node Device with Two QFX-EM-4Q Installed |
|--------------------------------|-------------------------------------------------------------------------|---------------------------------------|--------------------------------------------------------------------|
| 2                              | 1                                                                       | 8:1                                   | 12:1                                                               |
| 2                              | 2                                                                       | 4:1                                   | 6:1                                                                |
| 2                              | 4                                                                       | 2:1                                   | 3:1                                                                |
| 2                              | 8                                                                       | N/A                                   | 1:1                                                                |
| 4                              | 1                                                                       | 4:1                                   | 6:1                                                                |
| 4                              | 2                                                                       | 2:1                                   | 3:1                                                                |
| 4                              | 4                                                                       | N/A                                   | 1:1                                                                |

[Table 78 on page 1338](#) shows the ports the default port configuration and identifies the ports that can be converted on Node devices. Because the QFX5100-24Q has expansion bays that allow you to add additional types of ports, see [Table 79 on page 1339](#) for the supported system modes and default configuration of that Node device.

**Table 78: Port Configurations on Node Devices**

| Model   | Total Ports                                                                 | Fixed FTE Ports | Ports that can be configured FTE or XLE | Ports that can be configured XLE or XE | Default Configuration                                                                                                                   |

### Understanding the QFabric System Software Architecture

The software architecture for the QFabric system environment has been designed to provide a high-speed, low-latency, nonblocking fabric for data center traffic. This topic explores how the software architecture for a QFabric system supports these goals.

Key components of the QFabric system software architecture include:

- A single administrative view of all QFabric system components provides unified management, configuration, monitoring, and troubleshooting of the QFabric system. This view is provided by the QFX Series Director software running on the Director group. A primary administrator can access the unified view through the default partition.
- A fabric control protocol enables rapid transport of data traffic between QFabric system components. This unique feature of the software architecture distributes route information for each device within the QFabric system, and removes the need to run spanning-tree protocols inside the QFabric system network.
- A fabric management protocol provides rapid transport of control traffic between QFabric system components. This protocol helps identify and initialize QFabric system resources, supports device redundancy, and supports management communication throughout the QFabric system.
- A control plane network that is separate from the data plane network provides high availability for the QFabric system.

The software also provides access to relevant features in the Junos operating system (Junos OS) that support QFabric system functionality. Support is available for most switching features available on EX Series Ethernet switches and many routing features available on M Series, MX Series, and T Series routing platforms.

## Understanding the Director Software

The Director software provides a single view into the QFabric system so that it can be managed as a single entity. This topic explains how the Director software interacts with the components of the QFabric system to maintain operations from a central location.

Because the QFabric system consists of multiple Director, Node, and Interconnect devices, the architects of the QFabric system determined that it would be useful to manage the entire system as a single logical entity. As a result, the Director software handles administration tasks for the entire QFabric system, such as fabric management and configuration. The Director software runs on the *Director group*, provides a single consolidated view of the QFabric system, and enables the main QFabric system administrator to configure, manage, monitor, and troubleshoot QFabric system components from a centralized location. In the Junos operating system (Junos OS) command-line interface (CLI), you can access the Director software by logging in to the default partition.

The Director software handles the following major tasks for the QFabric system:

- Provides command-line interface (CLI) access to all QFabric system components that you have permission to manage or view.
- Evaluates configuration statements and operational mode commands for their scope and sends requests to the applicable Director, Node, and Interconnect devices. (This operation is sometimes referred to as *scattering*.)
- Consolidates responses from Director, Node, and Interconnect devices, and displays output from the devices in a unified, centralized manner. (This operation is sometimes referred to as *gathering*.)
- Coordinates configuration and operational efforts with a database housed in the Director group to store and retrieve configurations, software images, event logs, and system log messages.
- Facilitates control plane communication between the Node devices, the Routing Engine services running on the Director group, and the Interconnect devices.
- Runs parallel processes on the Director group devices to provide high availability for the QFabric system.
- Coordinates interactions with QFabric system components to provide load balancing of processing tasks across the Director group devices.
- Manages user access and privileges.
- Enables you to configure, manage, monitor, and troubleshoot QFabric system components that are assigned to you.
- Gathers QFabric system inventory and topology details.

- Offers a way to manage Director group devices, including the ability to add and delete Director devices in the group, set and switch mastership in the Director group, and monitor Director group status.
- Provides a centralized way to coordinate software upgrades for QFabric system components.

The Director software provides a backbone of functionality that supports the entire QFabric system. It is an essential component of the QFabric system that enables you to implement the system in a logical and efficient way.

## Understanding Partitions

Partitions provide a way to allocate specified virtual and physical resources within your QFabric system. This topic covers:

- [QFabric System Default Partition on page 1342](#)

### QFabric System Default Partition

By default, all equipment and virtual resources in the QFabric system belong to the *default partition*. As a result, the QFabric system in its initial state has a single broadcast domain that is administered by a single main administrator. [Figure 30 on page 1343](#) shows a topology with the default settings—a single collection that contains all the devices in the QFabric system.

Figure 30: QFabric System Topology - Default Partition

g041145

**NOTE:** The initial release of the QFabric system supports a single default partition. All equipment and resources belong to the default partition.

A partition provides the following functions:

- Fault isolation and separation from other partitions at the control plane level.
- A separate configuration domain for the Node devices within the partition.
- A Layer 2 domain in which MAC learning takes place, and members of the same VLAN can communicate with each other. To provide network connectivity between partitions, you need to enable Layer 3 routing by way of a routed VLAN interface (RVI).

## Understanding the QFabric System Control Plane

The control plane in the QFabric system transports management traffic between QFabric system components to facilitate system operations, configuration, and maintenance.

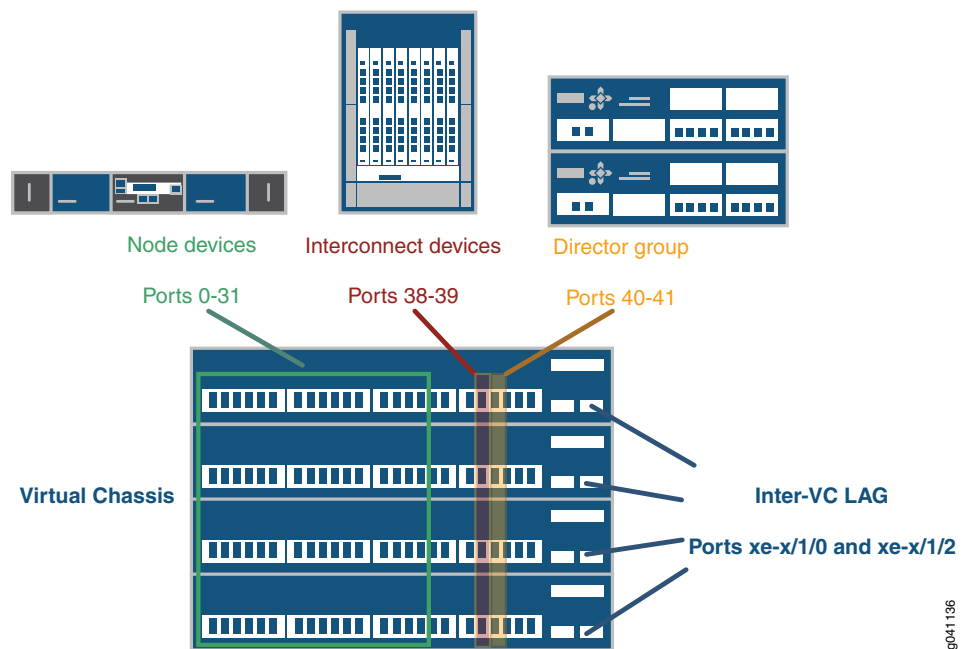

This topic covers:

- [Control Plane Elements on page 1345](#)
- [Control Plane Services on page 1346](#)

## Control Plane Elements

Control traffic within a QFabric system is carried across a redundant, scalable, out-of-band, Ethernet switching network called the *control plane* network. To maintain high availability, the QFabric system control plane is separated from the QFabric system data plane. [Figure 31 on page 1345](#) shows a diagram of the QFabric system devices that compose the control plane network.

Figure 31: QFabric System Control Plane Network

The control plane consists of the following elements:

- **Control plane switches**—Provide connectivity to the management interfaces of all QFabric system components in the control plane network, including the Node devices, the Interconnect devices, and the Director group. When you interconnect all QFabric system devices to the control plane switches, the Director group can manage the entire system. Depending on the size and scale of your QFabric system, the control plane switches might be standalone switches or might be groups of switches bundled into a Virtual Chassis (See the Example topics in the Related Documentation section of this topic to learn more about the control plane switch configuration required for your QFabric system.)

For example, the control plane switch for the QFX3000-G QFabric system requires two Virtual Chassis containing four EX4200 switch members each. The two Virtual Chassis connect to each other across a 10-Gigabit Ethernet LAG link to provide maximum resiliency for the QFabric system control plane.

- **Connections between the management interfaces of the Node devices and the control plane switches**—Enable control plane connectivity from the Node devices to the rest of the QFabric system. You must connect two management interfaces from

each Node device to the control plane switches. Connect each interface to a different control plane switch to provide system resiliency.

- **Connections between the management interfaces of the Interconnect devices and the control plane switches**—Enable control plane connectivity from the Interconnect devices to the rest of the QFabric system. You must connect the interfaces in each Interconnect device to the control plane switches. Connect each interface to a different control plane switch to provide system resiliency.

For example, on QFX3008-I Interconnect devices, there are two Control Boards and two interfaces per Control Board, for a total of four connections per Interconnect device. To provide system resiliency, connect one interface from each Control Board to the first Virtual Chassis, and connect the second interface from each Control Board to the second Virtual Chassis.

- **Connections between the network module interfaces of the Director group and the control plane switches**—Enable control plane connectivity from the Director group to the rest of the QFabric system. You must connect some interfaces from the first network module in a Director device to one control plane switch, and connect some interfaces from the second network module in a Director device to the second control plane switch. Also, you must connect the ports from the first network module to the primary control plane switch for each Director device (which may vary depending on the configuration of your Director group).

For the most current guidance on the QFabric control plane configuration and cabling recommendations, see:

- [Example: Configuring the Virtual Chassis for a Copper-Based QFX3000-G QFabric System Control Plane on page 1400](#)
- [Example: Configuring a Fiber-Based Control Plane for the QFX3000-G QFabric System](#)
- [Example: Configuring EX4200 Switches for the QFX3000-M QFabric System Control Plane on page 1444](#)
- **Routing Engines**—Although they are automatically provisioned, specialized Routing Engines implement services such as default QFabric system infrastructure, device management, route sharing, and diagnostics to support the QFabric system. Routing Engines for control plane functions are virtual entities that run on the Director group.
- **Fabric management protocol**—A link-state protocol runs on the control plane network to identify and initialize QFabric system resources, support device redundancy, and support management communication throughout the QFabric system. The protocol is enabled by default.

---

### Control Plane Services

The QFabric system control plane provides the infrastructure to support the following services for the QFabric system:

- System initialization
- Topology discovery
- Internal IP address and unique ID assignment

- Route information sharing
- Configuration delivery to Node devices
- Interdevice communication between Node devices, Interconnect devices, and the Director group

Many of these services are provided by the external Routing Engines that run in software on the Director group.

## Understanding the QFabric System Data Plane

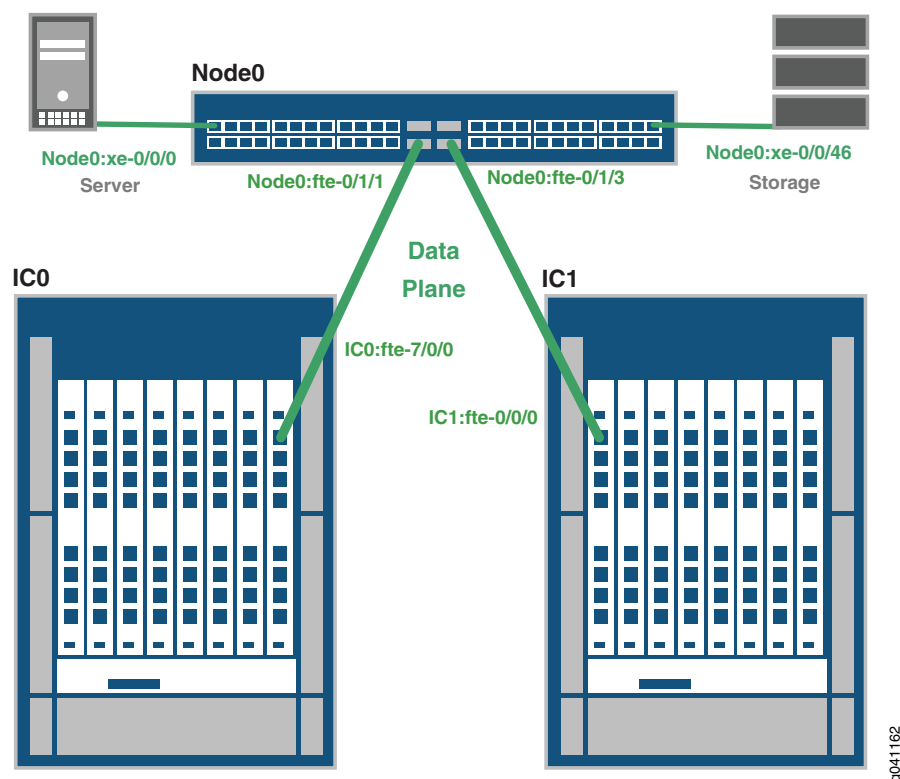

The data plane in the QFabric system transfers application traffic between QFabric system components rapidly and efficiently. This topic covers:

- [Data Plane Components on page 1347](#)
- [QFabric System Fabric on page 1348](#)

### Data Plane Components

Data traffic within a QFabric system is carried across a redundant, high-performance, and scalable *data plane*. To maintain high availability, the QFabric system data plane is separated physically from the QFabric system control plane and uses a different network. [Figure 32 on page 1348](#) shows an example diagram of the QFabric system data plane network.

Figure 32: QFabric System Data Plane Network

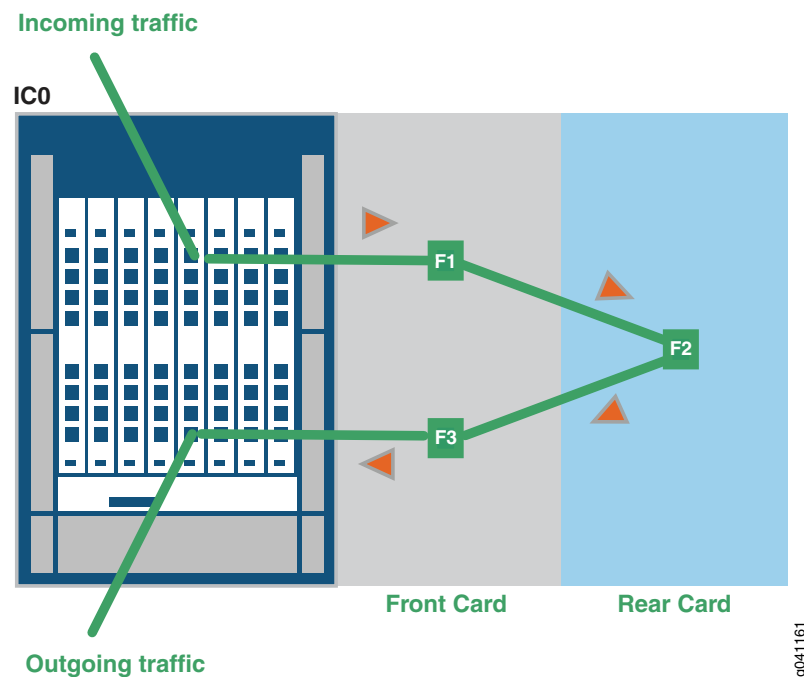

The QFabric system data plane includes the following high-speed data connections and elements:

- 10-Gigabit Ethernet or 2-Gbps, 4-Gbps, or 8-Gbps Fibre Channel connections between QFabric system endpoints (such as servers or storage devices) and the Node devices.
- 40-Gbps quad, small form-factor pluggable plus (QSFP+) connections between the Node devices and the Interconnect devices.
- 10-Gigabit Ethernet connections between external networks and the Node devices contained in the network Node group.
- A fabric control protocol, used to distribute route information to all devices connected to the QFabric system data plane.

### QFabric System Fabric

Unlike traditional data centers that employ a multi-tiered hierarchy of switches, a QFabric system contains a single tier of Node devices connected to one another across a backplane of Interconnect devices. The QFabric system fabric is a distributed, multistage network that consists of a fabric queuing and scheduling system implemented in the Node devices, and a distributed cross-connect system implemented in the Interconnect devices. The cross-connect system for the QFX3008-I Interconnect device is shown as an example in [Figure 33 on page 1349](#).

Figure 33: QFX3008-I Interconnect Device Cross-Connect System

The design of the cross-connect system provides multistage Clos switching, which results in nonblocking paths for data traffic and any-to-any connectivity for the Node devices. Because all Node devices are connected through the Interconnect device, the QFabric system offers very low port-to-port latencies. In addition, dynamic load balancing and low-latency packet flows provide for scaling the port count and bandwidth capacity of a QFabric system.

## Understanding Software Upgrade on the QFabric System

The QFabric system software package contains software for the QFabric system infrastructure and for all of the different component devices in the QFabric system: Director group, Interconnect devices, and Node devices.

- [Operational Software Commands on page 1350](#)
- [Operational Reboot Commands on page 1351](#)

---

### Operational Software Commands

The **request system software download** CLI command enables you to download the software package to various locations: for example, USB device, remote server, or FTP site.

The following CLI commands enable you to install the software for the Director group, Interconnect devices, Node devices, and the QFabric system infrastructure. You may need to specify the **reboot** option depending on which devices or QFabric infrastructure you are installing the software. The **reboot** option works differently depending on whether you install the software on the QFabric system infrastructure or on a particular device in the QFabric system.

- **request system software add component all**

This command installs software for the Director group, fabric control Routing Engine, fabric manager Routing Engine, Interconnect devices, and network and server Node groups.

- **request system software add component director-group**

This command installs software for the Director group and the default partition, which is where you access the QFabric system CLI.

- **request system software add component fabric**

This command installs the software for the fabric control Routing Engines and the Interconnect devices.

- **request system software add component *node-group-name***

This command installs software for a server Node group or a network Node group.

Additionally, you can back up your current QFabric configuration file and installation-specific parameters using the **request system software configuration-backup** command. We recommend that you save this file to an external location, like an FTP site or USB device, but you can save it locally.

### Operational Reboot Commands

The following commands enable you to reboot the entire QFabric system, various Node devices, or the QFabric system infrastructure:

- **request system reboot all**

This command reboots the Director group, fabric control Routing Engines, fabric manager Routing Engine, Interconnect devices, and network and server Node groups.

- **request system reboot director-group**

This command reboots the Director group and the default partition, which is where you access the QFabric system CLI.

- **request system reboot fabric**

This command reboots the fabric control Routing Engines and the Interconnect devices.

- **request system reboot node-group**

This command reboots a server Node group or a network node group.

- [Upgrading Software on a QFabric System on page 148](#)

## Understanding Nonstop Software Upgrade for QFabric Systems

The framework that underlies a nonstop software upgrade in a QFabric system enables you to upgrade the system in a step-by-step manner and minimize the impact to the continuous operation of the system. This topic explains how a nonstop software upgrade works in a QFabric system, the steps that are involved, and the procedures that you need to implement to experience the benefits of this style of software upgrade.

Nonstop software upgrade enables some QFabric system components to continue operating while similar components in the system are being upgraded. In general, the QFabric system upgrades redundant components in stages so that some components remain operational and continue forwarding traffic while their equivalent counterparts upgrade to a new version of software.

**TIP:** Use the following guidelines to decide when to implement a nonstop software upgrade:

- If you need to upgrade all components of the system in the shortest amount of time (approximately one hour) and you do not need to retain the forwarding resiliency of the data plane, issue the **request system software add component all** command to perform a standard software upgrade. All components of the QFabric system upgrade simultaneously and

expediently, but this type of upgrade does not provide resiliency or switchover capabilities.

- If you need to minimize service impact, preserve the forwarding operations of the data plane during the upgrade, and are willing to take the extra time required for component switchovers (in many cases, several hours), issue the three nonstop software upgrade commands (`request system software nonstop-upgrade (director-group | fabric | node-group)`) described in this topic in the correct order.

NOTE:

- Before you begin a nonstop software upgrade, issue the `request system software download` command to copy the software to the QFabric system.
- Each of the 3 nonstop software upgrade steps must be considered parts of the whole process. You must complete all 3 steps of a nonstop software upgrade in the correct order to ensure the proper operation of the QFabric system.
- Open two SSH sessions to the QFabric CLI. Use one session to monitor the upgrade itself and use a second session to verify that the QFabric system components respond to operational mode commands as expected. For more information on verification of the upgrade, see [“Verifying Nonstop Software Upgrade for QFabric Systems” on page 1554](#).
- Issue the `show fabric administration inventory` command to verify that all upgraded components are operational at the end of a step before beginning the next step.
- Once you start the nonstop software upgrade process, we strongly recommend that you complete all 3 steps within 12 hours.

---

The three steps to a successful nonstop software upgrade must be performed in the following order:

- Director group—The first step upgrades the Director devices, the fabric manager Routing Engine, and the diagnostic Routing Engine. To perform the first step, issue the **`request system software nonstop-upgrade director-group`** command. The key actions that occur during a Director group upgrade are:
  1. Connecting to the QFabric system by way of an SSH connection. This action establishes a load-balanced CLI session on one of the Director devices in the Director group.
  2. The QFabric system downloads and installs the new software in both Director devices.
  3. The Director device hosting the CLI session becomes the master for all QFabric system processes running on the Director group, such as the fabric manager and network Node group Routing Engines.

4. The QFabric system installs the new software for the backup fabric manager Routing Engine on the backup Director device.
5. The backup Director device reboots to activate the new software.
6. The master Director device begins a 15 minute sequence that includes a temporary suspension of QFabric services and a QFabric database transfer. You cannot issue operational mode commands in the QFabric CLI during this period.
7. The QFabric system installs the new software for the fabric manager and diagnostic Routing Engines on the Director group master.
8. The QFabric system switches mastership of all QFabric processes from the master Director device to the backup Director device.
9. The master Director device reboots to activate the new software.
10. The CLI session terminates, and logging back in to the QFabric system with a new SSH connection establishes the session on the new master Director device (the original backup).
11. The previous master Director device resumes operation as a backup and the associated processes (such as the fabric manager and network Node group Routing Engines) become backup as well. The fabric control Routing Engine associated with this Director device returns to active status.

**NOTE:** After the Director group nonstop software upgrade completes, any Interconnect device or Node device that reboots will automatically download the new software, install it, and reboot again. As a result, try not to restart any QFabric system devices before you complete the rest of the nonstop software upgrade steps.

**TIP:**

- To enable BGP and OSPF to continue operating on the network Node group during a Director group nonstop service upgrade, we recommend that you configure graceful restart for these routing protocols. For more information on graceful restart, see [“Configuring Graceful Restart for QFabric Systems”](#) on page 1512.
  - Wait 15 minutes after the second Director device returns to service and hosts Routing Engine processes before proceeding to step 2—the fabric upgrade. You can verify the operational status of both Director devices by issuing the `show fabric administration inventory director-group status` command. Also, issue the `show fabric administration inventory infrastructure` command to verify when the Routing Engine processes become load balanced (typically, there will be three to four Routing Engines running on each Director device).
- Fabric—The second step upgrades the Interconnect devices and the fabric control Routing Engines. To perform the second step, issue the **request system software**

**nonstop-upgrade fabric** command. The key actions that occur during a fabric upgrade are:

1. The QFabric system downloads, validates, and installs the new software in all Interconnect devices and fabric control Routing Engines (FC-0 and FC-1).
2. One fabric control Routing Engine reboots and comes back online.
3. The other fabric control Routing Engine reboots and comes back online.
4. The first Interconnect device reboots, comes back online, and resumes the forwarding of traffic.
5. Subsequent Interconnect devices reboot one at a time, come back online, and return to service.

**NOTE:**

- If the software does not load properly on any one of the fabric components, all components revert back to the original software version.
  - If one of the components in a fabric upgrade does not reboot successfully, issue the **request system reboot fabric** command to reattempt the rebooting process for this fabric component and activate the new software.
- 

- **Node group**—The third and final step upgrades Node groups. You can choose to upgrade a network Node group, a redundant server Node group, or individual server Node groups. You can upgrade the Node groups one at a time or in groups (known as upgrade groups). However, you must upgrade all Node groups in your QFabric system before you can complete the nonstop software upgrade process. To perform the third step, issue the **request system software nonstop-upgrade node-group** command.

The key actions that occur during a network Node group upgrade are:

1. The QFabric system copies the new software to each Node device one at a time.
2. The QFabric system validates and then installs the new software in all Node devices simultaneously.
3. The system copies the software to the network Node group Routing Engines.
4. The QFabric system validates and then installs the software in the network Node group Routing Engines one at a time -- first the backup, then the master.
5. The backup network Node group Routing Engine reboots and comes back online.
6. The supporting Node devices reboot and come back online one at a time.

**NOTE:** To reduce the total upgrade duration, configure an upgrade group. All Node devices within the upgrade group reboot at the same time.

7. The master network Node group Routing Engine relinquishes mastership to the backup, reboots, and comes back online.

The key actions that occur during a redundant server Node group upgrade are:

1. The QFabric system copies the new software to the backup Node device, then the master Node device.
2. The QFabric system validates and then installs the new software on the backup Node device, then the master Node device.
3. The backup Node device reboots, comes back online, and becomes the master Node device.
4. The previous master Node device reboots and comes back online as a backup Node device.

**NOTE:** For redundant server Node groups, both Node devices must be online before the upgrade will proceed. If one of the devices is no longer available, remove the Node device from the Node group configuration before you issue the nonstop software upgrade command.

The key actions that occur during a server Node group upgrade for a Node group that contains one member are:

1. The Node device downloads the software package and validates the software.
2. The Node device installs the software and reboots.

**NOTE:** Because there is no redundancy for Node groups containing a single Node device, traffic loss occurs when the device reboots during the upgrade.

## Understanding Statements and Commands on the QFabric System

- [Chassis Statements on page 1356](#)
- [Chassis Commands on page 1356](#)

### Chassis Statements

---

The following chassis statements enable you to configure various options for your Interconnect devices, Node groups (network and server), and Node devices:

- **interconnect-device**
- **node-group**
- **node-device**

### Chassis Commands

---

The Junos OS CLI contains additions to the existing chassis commands. These additions reflect new options as a result of adding the **interconnect-device**, **node-group**, and **node-device** chassis statements at the **[edit chassis]** hierarchy level.

The following chassis commands enable you to monitor and configure the QFabric system hardware and software options at various hierarchy levels:

- **clear chassis display message**
- **request chassis beacon**
- **request chassis cb** (QFX3000-G QFabric systems only)
- **request chassis fabric** (QFX3000-G QFabric systems only)
- **request chassis fpc**
- **request chassis routing-engine master**
- **set chassis aggregated-devices**
- **set chassis alarm**
- **set chassis container-devices**
- **set chassis craft-lockout**
- **set chassis display**
- **set chassis fpc**
- **set chassis routing-engine**
- **show chassis alarms**
- **show chassis beacon**
- **show chassis environment**
- **show chassis fan** (QFX3000-G QFabric systems only)
- **show chassis fabric**

- `show chassis firmware`
- `show chassis fpc`
- `show chassis hardware`
- `show chassis lcd`
- `show chassis led`
- `show chassis location`
- `show chassis mac-addresses`
- `show chassis nonstop-upgrade`
- `show chassis pic`
- `show chassis routing-engine`
- `show chassis temperature-thresholds`
- `show chassis zones`

## Understanding Network Management Implementation on the QFabric System

This topic describes network management features on the QFabric system that are implemented differently than on other devices running Junos OS.

The following network management features are supported on the QFabric system:

- **System log messages**—The QFabric system monitors events that occur on its component devices, distributes system log messages about those events to all external system log message servers (hosts) that are configured, and archives the messages. Component devices include Node devices, Interconnect devices, Director devices, and the Virtual Chassis. You configure system log messages at the **[edit system syslog]** hierarchy level. Use the **show log filename** operational mode command to view messages.
- **Simple Network Management Protocol (SNMP) Version 1 (v1) and v2c**—SNMP monitors network devices from a central location. The SNMP implementation on the QFabric system supports the basic SNMP architecture of Junos OS with some limitations, including a reduced set of MIB objects, read-only access for SNMP communities, and limited support for SNMP requests. You configure SNMP at the **[edit snmp]** hierarchy level. Only the **show snmp statistics** operational mode command is supported, but you can issue SNMP requests using external SNMP client applications.
- **Advanced Insight Solutions (AIS)**—AIS provides tools and processes to automate the delivery of support services for the QFabric system. AIS components include Advanced Insight Scripts (AI-Scripts) and Advanced Insight Manager (AIM). You install AI-Scripts using the **request system scripts add** operational mode command. However, the **jais-activate-scripts.slax** file used during installation is preconfigured for the QFabric system and cannot be changed.

**NOTE:** Do not install Junos Space and AIS on the control plane network EX4200 switches or EX4200 Virtual Chassis in a QFX3000 QFabric system

---

- [Overview of Junos OS System Log Messages on page 6642](#)
- [Understanding the Implementation of SNMP on the QFabric System on page 1359](#)
- [SNMP MIBs Support on page 6612](#)

## Understanding the Implementation of SNMP on the QFabric System

SNMP monitors network devices from a central location. The QFabric system supports the basic SNMP architecture of Junos OS, but its implementation of SNMP differs from that of other devices running Junos OS. This topic provides an overview of the SNMP implementation on the QFabric system.

As in other SNMP systems, the SNMP manager resides on the network management system (NMS) of the network to which the QFabric system belongs. The SNMP agent resides in the QFabric Director software and is responsible for receiving and distributing all traps as well as responding to all the queries of the SNMP manager. For example, traps that are generated by a Node device are sent to the SNMP agent in the Director software, which in turn processes and sends them to the target IP addresses that are defined in the SNMP configuration.

**NOTE:** In its SNMP implementation, the QFabric system acts as an SNMP proxy server, and requires more time to process SNMP requests than a typical Junos OS device does. The default timeout setting on most SNMP client applications is 3 seconds, which is not enough time for the QFabric system to respond to SNMP requests, so the results of your `mibwalk` command may be incomplete. For this reason, we recommend that you change the SNMP timeout setting to 5 seconds or longer for the QFabric system to complete the responses to your requests.

Support for SNMP on the QFabric system includes:

- Support for the SNMP Version 1 (v1) and v2.

**NOTE:** Only SNMPv2 traps are supported on the QFabric system.

- Support for the following standard MIBs:
  - RFC 1155, *Structure and Identification of Management Information for TCP/IP-based Internets*
  - RFC 1157, *A Simple Network Management Protocol (SNMP)*
  - RFC 1212, *Concise MIB Definitions*
  - RFC 1213, *Management Information Base for Network Management of TCP/IP-Based Internets: MIB-II* (partial support, including the system group and interfaces group)

## Understanding the Implementation of System Log Messages on the QFabric System

This topic provides an overview of system log (syslog) messages as implemented on the QFabric system.

The QFabric system monitors events that occur on its component devices and distributes system log messages about those events to all external system log message servers (hosts) that are configured. Component devices may include Node devices, Interconnect devices, Director devices, and the Virtual Chassis. Messages are stored for viewing only in the QFabric system database. To view the messages, issue the **show log** command.

You configure system log messages by using the **host** and **file** statements at the **[edit system syslog]** hierarchy level. Use the **show log filename** operational mode command to view the messages.

**NOTE:** On the QFabric system, a syslog file named **messages** with a size of 100 MB is configured by default. If you do not configure a filename, you can use the default filename **messages** with the **show log filename** command.

All messages with a severity level of notice or higher are logged. Messages with a facility level of **interactive-commands** on Node devices are not logged.

The QFabric system supports the following system log message features:

- The **file *filename*** and **host *hostname*** statements at the **[edit system syslog]** hierarchy level are supported. Other statements at that hierarchy level are not supported.
- You can specify the maximum amount of data that is displayed when you issue the **show log *filename*** command by configuring the **file *filename* archive *maximum-file-size*** statement.
- You can specify that one or more system log message servers receive messages, which are sent to each server that is configured.
- If you configured an alias for a device or interface, the alias is displayed in the message for the device or interface.
- The level of detail that is included in a message depends on the facility and severity levels that are configured. Messages include the highest level of detail available for the configured facility and severity levels.
- The unit of time is measured and displayed in seconds, and not milliseconds. If you attempt to configure the **time-format** option in milliseconds, the log output displays **000**.

Starting in Junos OS Release 13.1, the QFabric system supports these additional syslog features:

- You can filter the output of the **show log *filename*** operational mode command by device type and device ID or device alias when you specify the ***device-type (device-id | device-alias)*** optional parameters. Device types include **director-device**, **infrastructure-device**, **interconnect-device**, and **node-device**.
- You can specify the syslog structured data output format when you configure the **structured-data** statement at the **[edit system syslog file *filename*]** and **[edit system syslog host *hostname*]** hierarchy levels.

**NOTE:** Information displayed in the structured data output for system logs originating from the Director software may not be complete.

---

- You can filter the types of logs that the Director group collects from a component device when you configure the **filter all *facility severity*** or **filter all match *regular-expression*** statements at the **[edit system syslog]** hierarchy level.

Unsupported syslog features include:

- File access to syslog messages
- Monitoring of syslog messages

## Understanding User and Access Management Features on the QFabric System

The QFabric system supports the following user and access management features:

- User authentication
- RADIUS
- Link Layer Discovery Protocol (LLDP)
- SSH
- TACACS+
- Access privilege management

The specific functionality, features, options, syntax, and hierarchy levels of some of the user and access management commands and configuration statements implemented on the QFabric system may differ somewhat from the same commands and configuration statements on standard Junos OS. See the configuration statement or command topic in the documentation set for additional information, and use the help (?) command-line function to display specific information as needed.

Some user and access management features are not yet fully supported in the full QFabric architecture, although full support is planned for future releases. The user and access management features currently unsupported on the QFabric system include:

- Full RADIUS server support, including RADIUS accounting
- **accounting-options** configuration statement hierarchy
- **tacplus-options** configuration statement

## Understanding QFabric System Login Classes

In some cases (such as device-level troubleshooting), it is useful to log in to individual QFabric system components so you can view and manage issues on a per-device basis. This topic explains the login classes that provide individual component access within a QFabric system.

**NOTE:** Under normal operating conditions, you should manage the QFabric system as a single entity by using the QFabric system default partition command-line interface (CLI). The default partition CLI provides you with the ability to configure and monitor your entire QFabric system from a central location and should be used as the primary way to manage the system.

The QFabric system offers three special preset login classes that provide different levels of access to individual components within a QFabric system:

- **qfabric-admin**—Provides the ability to log in to individual QFabric system components and manage them. This class is equivalent to setting the following permissions: **access, admin, clear, firewall, interface, maintenance, network, reset, routing, secret, security,**

**snmp**, **system**, **trace**, and **view**. The *qfabric-admin* class also enables you issue all operational mode commands except **configure**. To provide QFabric system component-level login and management privileges, include the **qfabric-admin** statement at the **[edit system login user *username* authentication remote-debug-permission]** hierarchy level.

- **qfabric-operator**—Provides the privilege to log in to individual QFabric system components and view component operations and configurations. This class is equivalent to setting the following permissions: **trace** and **view**. The *qfabric-operator* class also enables you issue the **monitor** and **show log messages** operational mode commands. To provide limited QFabric system component-level access, include the **qfabric-operator** statement at the **[edit system login user *username* authentication remote-debug-permission]** hierarchy level.
- **qfabric-user**—Prevents access to individual QFabric system components. This class is the default setting for all QFabric system users and is equivalent to the preset Junos OS class of **unauthorized**. To prevent a user from accessing individual QFabric system components, include the **qfabric-user** statement at the **[edit system login user *username* authentication remote-debug-permission]** hierarchy level.

When you perform the initial setup for the Director group, you must specify a username and password for QFabric components. Once configured, this information is stored in the QFabric system and mapped to the QFabric system login classes. Such mapping allows users with the proper login class (**qfabric-admin** or **qfabric-operator**) to log in automatically to a component without being prompted for the username and password.

After you assign the **qfabric-admin** or **qfabric-operator** class to a user, the user can log in to an individual QFabric system component by issuing the **request component login *component-name*** command. You can access Node devices, Interconnect devices, and virtual Junos Routing Engines (diagnostics, fabric control, and fabric manager) one at a time when you issue this command. To leave the CLI prompt of a component and return to the QFabric system default partition CLI, issue the **exit** command from the component's operational mode CLI prompt.

## Understanding Interfaces on the QFabric System

This topic describes:

- [Four-Level Interface Naming Convention on page 1365](#)
- [QSFP+ Interfaces on page 1365](#)
- [Link Aggregation on page 1368](#)

### Four-Level Interface Naming Convention

When you configure an interface on the QFabric system, the interface name needs to follow a four-level naming convention that enables you to identify an interface as part of either a Node device or a Node group. Include the name of the network or server Node group at the beginning of the interface name.

The four-level interface naming convention is:

*device-name:type-fpc/pic/port*

where *device-name* is the name of the Node device or Node group. The remainder of the naming convention elements are the same as those in the QFX3500 switch interface naming convention.

An example of a four-level interface name is:

*node2:xe-0/0/2*

### QSFP+ Interfaces

The QFX3500 Node device provides four 40-Gbps QSFP+ (quad small form-factor pluggable plus) interfaces (labeled **Q0** through **Q3**) for uplink connections between your Node device and your Interconnect devices.

The QFX3600 Node device provides 16 40-Gbps QSFP+ interfaces. By default, 4 interfaces (labeled **Q0** through **Q3**) are configured for 40-Gbps uplink connections between your Node device and your Interconnect devices, and 12 interfaces (labeled **Q4** through **Q15**) use QSFP+ direct-attach copper (DAC) breakout cables or QSFP+ transceivers with fiber breakout cables to support 48 10-Gigabit Ethernet interfaces for connections to either endpoint systems (such as servers and storage devices) or external networks. Optionally, you can choose to configure the first eight interfaces (Q0 through Q7) for uplink connections between your Node device and your Interconnect devices, and interfaces Q2 through Q15 for 10-Gigabit Ethernet or 40-Gigabit Ethernet connections to either endpoint systems or external networks (see [“Configuring the Port Type on QFX3600 Node Devices” on page 1503](#)). [Table 71 on page 1317](#) shows the port mappings for QFX3600 Node devices.

**Table 80: QFX3600 Node Device Port Mappings**

| Port Number | 10-Gigabit Ethernet Interfaces<br>(On PIC 0)   | 40-Gigabit Ethernet<br>Interfaces (On PIC 1) | 40-Gigabit Data Plane<br>Uplink Interfaces (On PIC 1) |
|-------------|------------------------------------------------|----------------------------------------------|-------------------------------------------------------|
| <b>Q0</b>   | Not supported on this port                     | xle-0/1/0                                    | fte-0/1/0                                             |
| <b>Q1</b>   | Not supported on this port                     | xle-0/1/1                                    | fte-0/1/1                                             |
| <b>Q2</b>   | xe-0/0/8<br>xe-0/0/9<br>xe-0/0/10<br>xe-0/0/11 | xle-0/1/2                                    | fte-0/1/2                                             |

|             | xe-0/0/59                                    |                                              |                                                       |
| Q15         | xe-0/0/60                                    | xle-0/1/15                                   | Not supported on this port                            |
|             | xe-0/0/61                                    |                                              |                                                       |
|             | xe-0/0/62                                    |                                              |                                                       |
|             | xe-0/0/63                                    |                                              |                                                       |

The QFX5100-48S Node device provides 48 10-Gigabit Ethernet interfaces and 6 40-Gbps QSFP+ interfaces. By default, 4 interfaces (labeled **48** through **51**) are configured for 40-Gbps uplink connections between your Node device and your Interconnect devices, and 2 interfaces (labeled **52** and **53**) support 40-Gigabit Ethernet connections to either endpoint systems (such as servers and storage devices) or external networks. Optionally,

you can choose to configure the middle two interfaces (**50** and **51**) for 40-Gigabit Ethernet connections to either endpoint systems or external networks, and you can choose to configure the last two interfaces (**52** and **53**) for uplink connections between your Node device and your Interconnect devices (see [“Configuring the QSFP+ Port Type on QFX5100 Devices” on page 2785](#)). [Table 72 on page 1320](#) shows the port mappings for QFX5100-48S Node devices.

**Table 81: QFX5100-48S Node Device Port Mappings**

| Port Number | 40-Gigabit Ethernet Interfaces (On PIC 1) | 40-Gigabit Data Plane Uplink Interfaces (On PIC 1) |
|-------------|-------------------------------------------|----------------------------------------------------|
| 48          | Not supported on this PIC                 | fte-0/1/0                                          |
| 49          | Not supported on this PIC                 | fte-0/1/1                                          |
| 50          | xle-0/1/2                                 | fte-0/1/2                                          |
| 51          | xle-0/1/3                                 | fte-0/1/3                                          |
| 52          | xle-0/1/4                                 | fte-0/1/4                                          |
| 53          | xle-0/1/5                                 | fte-0/1/5                                          |

### Link Aggregation

Link aggregation enables you to create link aggregation groups across Node devices within a network Node group or redundant server Node group. You can include up to eight Ethernet interfaces in a LAG. You can have up to 48 LAGs within a redundant server Node group, and 128 LAGs in a network Node group. To configure a LAG, include the **aggregated-devices** statement at the **[edit chassis node-group node-group-name]** hierarchy level and the **device-count** statement at the **[edit chassis node-group node-group-name aggregated-devices ethernet]** hierarchy level. Additionally, include any aggregated Ethernet options (**minimum-links** and **link-speed**) at the **[edit interfaces interface-name aggregated-ether-options]** hierarchy level and the **802.3ad** statement at the **[edit interfaces interface-name ether-options]** hierarchy level. To configure the Link Aggregation Control Protocol (LACP), include the **lACP** statement at the **[edit interfaces aggregated-ether-options]** hierarchy level.

## Understanding Layer 3 Features on the QFabric System

The QFabric system supports the following Layer 3 features:

- Static routes, which enable you to manually configure and enter routes directly into the routing table.

- Routed VLAN Interfaces, which are a special type of Layer 3 virtual interface that enable you to forward packets between VLANs without using a router to connect the VLANs. Using this approach to connect VLANs reduces complexity and avoids the costs associated with purchasing, installing, managing, powering, and cooling another device.
- Routing protocols for routing traffic. The following routing protocols are supported on QFabric systems:
  - Border Gateway Protocol (BGP), which is an exterior gateway protocol (EGP) for routing traffic between autonomous systems (ASs).
  - Open Shortest Path First (OSPF) protocol, which is an interior gateway protocol (IGP) for routing traffic within an autonomous system (AS). QFabric systems support OSPFv1 and OSPFv2.

## NOTE:

- When you configure routing protocols on the QFabric system, you must use interfaces from the Node devices assigned to the network Node group. If you try to configure routing protocols on interfaces from the Node devices assigned to server Node groups, the configuration commit operation fails.
- You can configure routing protocols by including statements at the [edit protocols] hierarchy level. If you want to isolate customer traffic on your network, you can configure virtual router routing instances at the [edit routing-instances] hierarchy level, and configure routing protocols for each virtual router routing instance by including statements at the [edit routing-instances *routing-instance-name* protocols] hierarchy level.

## Understanding Security Features on the QFabric System

The QFabric system supports the following security features:

- Firewall filters provide rules that define whether to accept or discard packets that are transiting an interface. If a packet is accepted, you can configure additional actions to perform on the packet, such as class-of-service (CoS) marking (grouping similar types of traffic together and treating each type of traffic as a class with its own level of service priority) and traffic policing (controlling the maximum rate of traffic sent or received).
- Policing (rate-limiting) traffic allows you to control the maximum rate of traffic sent or received on an interface and to provide multiple priority levels or classes of service. You use policers to apply limits to traffic flow and set consequences for packets that exceed these limits—usually applying a higher loss priority—so that if packets encounter downstream congestion, they can be discarded first. Policers apply only to unicast packets.
- MAC limiting protects against flooding of the Ethernet switching table (also known as the MAC forwarding table or Layer 2 forwarding table). You enable this feature on

Layer 2 interfaces (ports). MAC limiting sets a limit on the number of MAC addresses that can be learned on a single Layer 2 access interface or on all the Layer 2 access interfaces on the switch. Junos OS provides two MAC limiting methods:

- **Maximum number of MAC addresses**—You configure the maximum number of dynamic MAC addresses allowed per interface. When the limit is exceeded, incoming packets with new MAC addresses can be ignored, dropped, or logged. You can also specify that the interface be shut down or temporarily disabled.
- **Allowed MAC**—You configure specific “allowed” MAC addresses for the access interface. Any MAC address that is not in the list of configured addresses is not learned, and the switch logs an appropriate message. Allowed MAC binds MAC addresses to a VLAN so that the address does not get registered outside the VLAN. If an allowed MAC setting conflicts with a dynamic MAC setting, the allowed MAC setting takes precedence.
- **Storm control** causes a switch to monitor traffic levels and take a specified action when a specified traffic level—called the storm control level—is exceeded, thus preventing packets from proliferating and degrading service. You can configure switches to drop broadcast and unknown unicast packets, shut down interfaces, or temporarily disable interfaces when the storm control level is exceeded.

## Understanding Port Mirroring on the QFabric System

Port mirroring copies unicast packets entering or exiting a port or entering a VLAN and sends the copies to a local interface for monitoring. Use port mirroring to send traffic to applications that analyze traffic for purposes such as monitoring compliance, enforcing policies, detecting intrusions, monitoring and predicting traffic patterns, correlating events, and so on.

## Understanding Fibre Channel Fabrics on the QFabric System

A Fibre Channel (FC) fabric on a QFabric system is a construct that you configure on a QFX3500 Node device when the Node device is in FCoE-FC gateway mode. The FC fabric on a QFabric Node device is not the same as an FC fabric on a storage area network (SAN). The FC fabric on a QFabric Node device is local to that particular node device. We call the FC fabric on a QFabric Node device a *local FC fabric* to differentiate it from an FC fabric on the SAN.

**NOTE:** The QFX3600 Node device does not support FC or FCoE features.

A local FC fabric does not span Node devices and does not span the fabric Interconnect device. Local FC fabrics are entirely contained on a single Node device. A local FC fabric creates associations that connect FCoE devices that have converged network adapters (CNAs) on the Ethernet network to an FC switch or FCoE forwarder (FCF) on the FC network. A local FC fabric consists of:

- A unique fabric name.
- A unique fabric ID.
- One or more FCoE VLAN interfaces that include one or more 10-Gigabit Ethernet interfaces connected to FCoE devices. The FCoE VLANs transport traffic between the FCoE servers and the FCoE-FC gateway. Each FCoE VLAN must carry only FCoE traffic. You cannot mix FCoE traffic and standard Ethernet traffic on the same VLAN.

The 10-Gigabit Ethernet interfaces that connect to FCoE devices must include a native VLAN to transport FIP traffic because FIP VLAN discovery and notification frames are exchanged as untagged packets.

Each FCoE VLAN interface can present multiple VF\_Port interfaces to the FCoE network.

- One or more native FC interfaces. The native FC interfaces transport traffic between the gateway and the FC switch or FCF.

**TIP:** If the network does not use a dual-rail architecture for redundancy, configure more than one native FC interface for each local FC fabric to create redundant connections between the FCoE devices and the FC network. If one physical link goes down, any sessions it carried can log in again and connect to the FC network on a different interface.

All of the FC and FCoE traffic that belongs to a local FC fabric on a Node device must enter and exit that Node device. This means that the FC switch or FCF and the FCoE devices in the Ethernet network must be connected to the same Node device. The interfaces that connect to the FC switch and the interfaces that connect to the FCoE devices must be included in the local FC fabric. You cannot configure a local FC fabric that spans more than one Node device.

Traffic flows from FC and FCoE devices that are not in the same local FC fabric remain separate and cannot communicate with each other through the FCoE-FC gateway.

**NOTE:** The QFabric system enforces commit checks to ensure that local FC fabrics and FCoE VLANs on FCoE-FC gateways do not span more than one Node device.

## Understanding CoS Fabric Forwarding Class Sets

Fabric forwarding class sets (fabric fc-sets) are similar to the fc-sets (priority groups) you configure on Node devices. The major differences are:

1. Fabric fc-sets group traffic for transport across the QFX3008-I or QFX3600-I Interconnect device (the fabric). Node device fc-sets group traffic on a Node device for transport across that Node device.
2. Fabric fc-sets are global. They apply to the entire fabric. Node device fc-sets apply only to the Node device on which they are configured.
3. Fabric fc-sets are mapped directly to Interconnect device output queues; in this way, they behave similarly to forwarding classes on a Node device.

Fabric fc-sets map to Interconnect device fabric output queues statically—you cannot configure the mapping of fabric fc-sets to fabric output queues. All traffic in a fabric fc-set maps to the same output queue.

Node device fc-sets include forwarding classes that map to Node device output queues, and you can configure the mapping of forwarding classes to output queues (or you can use the default mapping). Because output queues are mapped to forwarding classes, different classes of traffic in a Node device fc-set can be mapped to different output queues.

Node device fc-sets consist of forwarding classes containing traffic that requires similar CoS treatment. (Forwarding classes are default forwarding classes or user-defined forwarding classes.) You can configure CoS for each fc-set to determine how the traffic of its forwarding classes is scheduled on a Node device.

When traffic exits a Node device interface and enters an Interconnect device fabric interface, the Interconnect device uses the same forwarding classes to group traffic. The forwarding classes are mapped to global fabric fc-sets for transport across the fabric. Like fc-sets on a Node device, fabric fc-sets also contain traffic that requires similar CoS treatment. Also like fc-sets on a Node device, you can configure CoS on fabric fc-sets.

Fabric fc-sets reside on the Interconnect device and are global to the QFabric system. Fabric fc-sets apply to all traffic that traverses the fabric. The mapping of forwarding classes to fabric fc-sets is global and applies to all forwarding classes with traffic that traverses the fabric from all connected Node devices. You can change the mapping of forwarding classes to fabric fc-sets. All mapping changes you make are global. For example, if you change the fabric fc-set to forwarding class mapping of the default best-effort forwarding class, then every Node device's best-effort forwarding class traffic that traverses the fabric is mapped to that fabric fc-set. The CoS you configure on a fabric fc-set applies to all the traffic that belongs to that fabric fc-set, from all connected Node devices.

This topic describes:

- [Default Fabric Forwarding Class Sets on page 1374](#)
- [Fabric Forwarding Class Set Configuration and Implementation on page 1377](#)
- [QFabric System CoS on page 1379](#)

- [Viewing Fabric Forwarding Class Set Information on page 1381](#)
- [Summary of Fabric Forwarding Class Set and Node Device Forwarding Class Set Differences on page 1383](#)

### Default Fabric Forwarding Class Sets

Interconnect devices have 12 default fabric fc-sets, including five visible default fabric fc-sets, four for unicast traffic and one for multidestination (multicast, broadcast, and destination lookup failure) traffic.

There are also seven hidden default fabric fc-sets. There are three hidden default fabric fc-sets for multidestination traffic that you can use if you want to map different multidestination forwarding classes to different multidestination fabric fc-sets. There are four hidden default fabric fc-sets for lossless traffic that you can use to map different lossless forwarding classes (priorities) to different lossless fabric fc-sets.

[Table 82 on page 1374](#) shows the default fabric fc-sets:

**Table 82: Default Fabric Forwarding Class Sets**

| Fabric Forwarding Class Set Name | Characteristics                                                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>fabric_fcset_be</b>           | Transports best-effort unicast traffic across the fabric.                                                                                                                                                                                                                                                                                                                                                                             |
| <b>fabric_fcset_strict_high</b>  | Transports unicast traffic that has been configured with <b>strict-high</b> priority and in the <b>network-control</b> forwarding class across the fabric. This fabric fc-set receives as much bandwidth across the fabric as it needs to service the traffic in the group up to the entire fabric interface bandwidth. For this reason, exercise caution when mapping traffic to this fabric fc-set to avoid starving other traffic. |
| <b>fabric_fcset_noloss1</b>      | Transports unicast traffic in the default <b>fcoe</b> forwarding class across the fabric.                                                                                                                                                                                                                                                                                                                                             |
| <b>fabric_fcset_noloss2</b>      | Transports unicast traffic in the default <b>no-loss</b> forwarding class across the fabric.                                                                                                                                                                                                                                                                                                                                          |
| <b>fabric_fcset_noloss3</b>      | (Hidden) No traffic is assigned by default to this fabric fc-set. Unless traffic is mapped to this fabric fc-set, this fabric fc-set remains hidden. This fabric fc-set is valid only for lossless forwarding classes.                                                                                                                                                                                                                |
| <b>fabric_fcset_noloss4</b>      | (Hidden) No traffic is assigned by default to this fabric fc-set. Unless traffic is mapped to this fabric fc-set, this fabric fc-set remains hidden. This fabric fc-set is valid only for lossless forwarding classes.                                                                                                                                                                                                                |
| <b>fabric_fcset_noloss5</b>      | (Hidden) No traffic is assigned by default to this fabric fc-set. Unless traffic is mapped to this fabric fc-set, this fabric fc-set remains hidden. This fabric fc-set is valid only for lossless forwarding classes.                                                                                                                                                                                                                |

Table 82: Default Fabric Forwarding Class Sets (*continued*)

| Fabric Forwarding Class Set Name | Characteristics                                                                                                                                                                                                               |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>fabric_fcset_noloss6</b>      | (Hidden) No traffic is assigned by default to this fabric fc-set. Unless traffic is mapped to this fabric fc-set, this fabric fc-set remains hidden. This fabric fc-set is valid only for lossless forwarding classes.        |
| <b>fabric_fcset_multicast1</b>   | Transports multdestination traffic in the <b>mcast</b> forwarding class across the fabric. This fabric fc-set is valid only for multdestination forwarding classes.                                                           |
| <b>fabric_fcset_multicast2</b>   | (Hidden) No traffic is assigned by default to this fabric fc-set. Unless traffic is mapped to this fabric fc-set, this fabric fc-set remains hidden. This fabric fc-set is valid only for multdestination forwarding classes. |
| <b>fabric_fcset_multicast3</b>   | (Hidden) No traffic is assigned by default to this fabric fc-set. Unless traffic is mapped to this fabric fc-set, this fabric fc-set remains hidden. This fabric fc-set is valid only for multdestination forwarding classes. |
| <b>fabric_fcset_multicast4</b>   | (Hidden) No traffic is assigned by default to this fabric fc-set. Unless traffic is mapped to this fabric fc-set, this fabric fc-set remains hidden. This fabric fc-set is valid only for multdestination forwarding classes. |

The five default forwarding classes (**best-effort**, **fcoe**, **no-loss**, **network-control**, and **mcast**) are mapped to the fabric fc-sets by default as shown in [Table 83 on page 1375](#).

Table 83: Default Forwarding Class to Fabric Forwarding Class Set Mapping

| Forwarding Class                                                          | Fabric Forwarding Class Set | Fabric Output Queue | Maximum MTU Supported for Lossless Operation |
|---------------------------------------------------------------------------|-----------------------------|---------------------|----------------------------------------------|
| <b>best-effort</b>                                                        | fabric_fcset_be             | 0                   | NA                                           |
| <b>network-control</b>                                                    | fabric_fcset_strict_high    | 7                   | NA                                           |
| <b>fcoe</b>                                                               | fabric_fcset_noloss1        | 1                   | 9K                                           |
| <b>no-loss</b>                                                            | fabric_fcset_noloss2        | 2                   | 9K                                           |
| <b>mcast</b>                                                              | fabric_fcset_multicast1     | 8                   | NA                                           |
| No forwarding classes are mapped by default to this hidden fabric fc-set. | fabric_fcset_noloss3        | 3                   | 9k                                           |

**Table 83: Default Forwarding Class to Fabric Forwarding Class Set Mapping (*continued*)**

| Forwarding Class                                                          | Fabric Forwarding Class Set | Fabric Output Queue | Maximum MTU Supported for Lossless Operation |
|---------------------------------------------------------------------------|-----------------------------|---------------------|----------------------------------------------|
| No forwarding classes are mapped by default to this hidden fabric fc-set. | fabric_fcset_noloss4        | 4                   | 9k                                           |
| No forwarding classes are mapped by default to this hidden fabric fc-set. | fabric_fcset_noloss5        | 5                   | 9k                                           |
| No forwarding classes are mapped by default to this hidden fabric fc-set. | fabric_fcset_noloss6        | 6                   | 9k                                           |
| No forwarding classes are mapped by default to this hidden fabric fc-set. | fabric_fcset_multicast2     | 9                   | NA                                           |
| No forwarding classes are mapped by default to this hidden fabric fc-set. | fabric_fcset_multicast3     | 10                  | NA                                           |
| No forwarding classes are mapped by default to this hidden fabric fc-set. | fabric_fcset_multicast4     | 11                  | NA                                           |

The maximum fiber cable length between the QFabric system Node device and the QFabric system Interconnect device is 150 meters.

**TIP:** If you explicitly configure lossless forwarding classes, we recommend that you map each user-configured lossless forwarding class to an unused fabric fc-set (fabric\_fcset\_noloss3 through fabric\_fcset\_noloss6) on a one-to-one basis: one lossless forwarding class mapped to one lossless fabric fc-set.

The reason for one-to-one mapping is to avoid fate sharing of lossless flows. Because each fabric fc-set is mapped statically to an output queue, when you map more than one forwarding class to a fabric fc-set, all of the traffic in all of the forwarding classes that belong to the fabric fc-set uses the same output queue. If that output queue becomes congested due to congestion caused by one of the flows, the other flows are also affected. (They share fate because the flow that congests the output queue affects flows that are not experiencing congestion.)

If you want to map different multdestination forwarding classes to different multdestination fabric fc-sets, use one or more of the hidden multdestination fabric fc-sets.

**NOTE:** The global mapping of forwarding classes to fabric fc-sets is independent of the mapping of forwarding classes to Node device fc-sets. Global mapping of forwarding classes to fabric fc-sets occurs only on the Interconnect device. The Node device mapping of forwarding classes to fc-sets does not affect the global mapping of forwarding classes to fabric fc-sets on the Interconnect device, and vice versa.

When you define new forwarding classes on a Node device, you explicitly map those forwarding classes to Node device fc-sets. However, new (user-created) forwarding classes are mapped by default to fabric fc-sets. (You can override the default mapping if you want to configure the forwarding class to fabric fc-set mapping explicitly, as described in the next section.)

By default:

- All best-effort traffic forwarding classes that you create are mapped to the **fabric\_fcset\_be** fabric fc-set.
- All lossless traffic forwarding classes that you create are mapped to the **fabric\_fcset\_noloss1** or **fabric\_fcset\_noloss2** fabric fc-set.

**NOTE:** To avoid fate sharing, we recommend that you configure one-to-one mapping of user-configured lossless forwarding classes to lossless fabric fc-sets instead of using the default mapping. You can also use firewall filters to mitigate fate sharing by separating flows that belong to the same forwarding class as the traffic traverses the Interconnect device (see [“Understanding How to Mitigate Fate Sharing on a QFabric System Interconnect Device by Remapping Traffic Flows \(Forwarding Classes\)”](#) on page 6006 for more information.)

- All multidestination traffic forwarding classes that you create are mapped to the **fabric\_fcset\_multicast1** fabric fc-set.
- All **strict-high** priority traffic and **network-control** forwarding classes that you create are mapped to the **fabric\_fcset\_strict\_high** fabric fc-set.

### Fabric Forwarding Class Set Configuration and Implementation

You can map forwarding classes to fabric fc-sets and configure CoS scheduling for fabric fc-sets. This section describes:

- [Mapping Forwarding Classes to Fabric Forwarding Class Sets on page 1377](#)
- [Fabric Forwarding Class Set Implementation on page 1378](#)

#### **Mapping Forwarding Classes to Fabric Forwarding Class Sets**

If you do not want to use the default mapping of forwarding classes to fabric fc-sets, you can map forwarding classes to fabric fc-sets in the same way as you map forwarding classes to Node device fc-sets. To do this, use exactly the same statement that you use

to map forwarding classes to fc-sets, but instead of specifying a Node device fc-set name, specify a fabric fc-set name.

**NOTE:** The global mapping of forwarding classes to fabric fc-sets does not affect the mapping of forwarding classes to Node device fc-sets. The global forwarding class mapping to fabric fc-sets pertains to the traffic only when it enters, traverses, and exits the fabric. The forwarding class mapping to fc-sets on a Node device is valid within that Node device.

Mapping forwarding classes to fabric fc-sets does not affect the scheduling configuration of the forwarding classes or fc-sets on Node devices. Fabric fc-set scheduling pertains to traffic only when it enters, traverses, and exits the Interconnect device fabric.

If you change the mapping of a forwarding class to a fabric fc-set, the new mapping is global and applies to all traffic in that forwarding class, regardless of which Node device forwards the traffic to the Interconnect device.

- 
- To assign one or more forwarding classes to a fabric fc-set:

```
[edit class-of-service]
```

```
user@switch# set forwarding-class-sets fabric-forwarding-class-set-name class  
forwarding-class-name
```

For example, to map a user-defined forwarding class named **best-effort-2** to the fabric fc-set **fabric\_fcset\_be**:

```
[edit class-of-service]
```

```
user@switch# set forwarding-class-sets fabric_fcset_be class best-effort-2
```

**NOTE:** Because fabric fc-set configuration is global, in this example all forwarding classes with the name **best-effort-2** on all of the Node devices connected to the fabric use the **fabric\_fcset\_be** fabric fc-set to transport traffic across the fabric.

---

### ***Fabric Forwarding Class Set Implementation***

The following rules apply to fabric fc-sets:

- You cannot create new fabric fc-sets. Only the twelve default fabric fc-sets are available.
- You cannot delete a default fabric fc-set.
- You cannot attach a fabric fc-set to a Node device interface. Fabric fc-sets are used only on the Interconnect device fabric, not on Node devices.
- You can map only multidestination forwarding classes to multidestination fabric fc-sets.
- You cannot map multidestination forwarding classes to unicast fabric fc-sets.
- You cannot map unicast forwarding classes to multidestination fabric fc-sets.

---

### QFabric System CoS

---

When traffic enters and exits the same QFabric system Node device, CoS works the same as it works on a standalone switch.

However, when traffic enters a QFabric system Node device, crosses the Interconnect device, and then exits a different Node device, CoS is applied differently:

1. Traffic entering the ingress Node device receives the CoS configured at the Node ingress (packet classification and congestion notification profile for PFC).
2. When traffic goes from the ingress Node device to the Interconnect device, the fabric fc-set CoS is applied to the traffic.
3. When traffic goes from the Interconnect device to the egress Node device, the egress Node device applies CoS at the egress port (egress queue scheduling, WRED, and IEEE 802.1p or DSCP code-point rewrite).

Traffic that traverses the Interconnect device can use the default CoS fabric scheduling or you can configure two-tier hierarchical CoS scheduling explicitly on fabric fc-sets as described in [“Understanding CoS Scheduling Across the QFabric System” on page 5984](#).

---

### Support for Flow Control and Lossless Transport Across the Fabric

---

The Interconnect device incorporates flow control mechanisms to support lossless transport during periods of congestion on the fabric. To support the priority-based flow control (PFC) feature on the Node devices, the fabric interfaces use LLFC to support lossless transport for up to six IEEE 802.1p priorities when the following two configuration constraints are met:

1. The IEEE 802.1p priority used for the traffic that requires lossless transport is mapped to a lossless forwarding class on the Node devices.
2. The lossless forwarding class must be mapped to a lossless fabric fc-set on the Interconnect device (**fabric\_fcset\_noloss1**, **fabric\_fcset\_noloss2**, **fabric\_fcset\_noloss3**, **fabric\_fcset\_noloss4**, **fabric\_fcset\_noloss5**, or **fabric\_fcset\_noloss6**).

When traffic meets the two configuration constraints, the fabric propagates the back pressure from the egress Node device across the fabric to the ingress Node device during periods of congestion. However, to achieve end-to-end lossless transport across the switch, you must also configure a congestion notification profile to enable PFC on the Node device ingress ports.

For all other combinations of IEEE 802.1p priority to forwarding class mapping and all other combinations of forwarding class to fabric fc-set mapping, the congestion control mechanism is normal packet drop. For example:

- **Case 1**—If the IEEE 802.1p priority 5 is mapped to the lossless **fcoe** forwarding class, and the **fcoe** forwarding class is mapped to the **fabric\_fcset\_noloss1** fabric fc-set, then the congestion control mechanism is PFC.
- **Case 2**—If the IEEE 802.1p priority 5 is mapped to the lossless **fcoe** forwarding class, and the **fcoe** forwarding class is mapped to the **fabric\_fcset\_be** fabric fc-set, then the congestion control mechanism is packet drop.
- **Case 3**—If the IEEE 802.1p priority 5 is mapped to the lossless **no-loss** forwarding class, and the **no-loss** forwarding class is mapped to the **fabric\_fcset\_noloss2** fabric fc-set, then the congestion control mechanism is PFC.
- **Case 4**—If the IEEE 802.1p priority 5 is mapped to the lossless **no-loss** forwarding class, and the **no-loss** forwarding class is mapped to the **fabric\_fcset\_be** fabric fc-set, then the congestion control mechanism is packet drop.
- **Case 5**—If the IEEE 802.1p priority 5 is mapped to the **best-effort** forwarding class, and the **best-effort** forwarding class is mapped to the **fabric\_fcset\_be** fabric fc-set, then the congestion control mechanism is packet drop.
- **Case 6**—If the IEEE 802.1p priority 5 is mapped to the **best-effort** forwarding class, and the **best-effort** forwarding class is mapped to the **fabric\_fcset\_noloss1** fabric fc-set, then the congestion control mechanism is packet drop.

**NOTE:** Lossless transport across the fabric also must meet the following two conditions:

1. The maximum cable length between the Node device and the Interconnect device is a 150 meters of fiber cable.
2. The maximum frame size is 9216 bytes.

If the MTU is 9216 KB, in some cases the QFabric system supports only five lossless forwarding classes instead of six lossless forwarding classes because of headroom buffer limitations.

---

The number of IEEE 802.1p priorities (forwarding classes) the QFabric system can support for lossless transport across the Interconnect device fabric depends on several factors:

- **Approximate fiber cable length**—The longer the fiber cable that connects Node device fabric (FTE) ports to the Interconnect device fabric ports, the more data the connected ports need to buffer when a pause is asserted. (The longer the fiber cable, the more frames are traversing the cable when a pause is asserted. Each port must be able to store all of the “in transit” frames in the buffer to preserve lossless behavior and avoid dropping frames.)
- **MTU size**—The larger the maximum frame sizes the buffer must hold, the fewer frames the buffer can hold. The larger the MTU size, the more buffer space each frame consumes.
- **Total number of Node device fabric ports connected to the Interconnect device**—The higher the number of connected fabric ports, the more headroom buffer space the

Node device needs on those fabric ports to support the lossless flows that traverse the Interconnect device. Because more buffer space is used on the Node device fabric ports, less buffer space is available for the Node device access ports, and a lower total number of lossless flows are supported.

The QFabric system supports six lossless priorities (forwarding classes) under most conditions. The priority group headroom that remains after allocating headroom to lossless flows is sufficient to support best-effort and multdestination traffic.

Table 84 on page 1381 shows how many lossless priorities the QFabric system supports under different conditions (fiber cable lengths and MTUs) in cases when the QFabric system supports fewer than six lossless priorities. The number of lossless priorities is the same regardless of how many Node device FTE ports are connected to the Interconnect device. However, the higher the number of FTE ports connected to the Interconnect device, the lower the number of total lossless flows supported. In all cases that are not shown in Table 84 on page 1381, the QFabric system supports six lossless priorities.

**NOTE:** The system does not perform a configuration commit check that compares available system resources with the number of lossless forwarding classes configured. If you commit a configuration with more lossless forwarding classes than the system resources can support, frames in lossless forwarding classes might be dropped.

**Table 84: Lossless Priority (Forwarding Class) Support for Node Devices When Fewer than Six Lossless Priorities Are Supported**

| MTU in Bytes | Fiber Cable Length in Meters (Approximate) | Maximum Number of Lossless Priorities (Forwarding Classes) on the Node Device |
|--------------|--------------------------------------------|-------------------------------------------------------------------------------|
| 9216 (9K)    | 100                                        | 5                                                                             |
| 9216 (9K)    | 150                                        | 5                                                                             |

**NOTE:** The total number of lossless flows decreases as resource consumption increases. For a Node device, the higher the number of FTE ports connected to the Interconnect device, the larger the MTU, and the longer the fiber cable length, the fewer total lossless flows the QFabric system can support.

### Viewing Fabric Forwarding Class Set Information

You can display information about fabric fc-sets using the same CLI command you use to display information about Node device fc-sets:

```
user@switch> show class-of-service forwarding-class-set
Forwarding class set: fabric_fcset_be, Type: fabric-type, Forwarding class set
index: 1
  Forwarding class      Index
  best-effort           0
```

Forwarding class set: fabric\_fcset\_mcast1, Type: fabric-type, Forwarding class set index: 5

|                  |       |
|------------------|-------|
| Forwarding class | Index |
| mcast            | 8     |

Forwarding class set: fabric\_fcset\_mcast2, Type: fabric-type, Forwarding class set index: 6

Forwarding class set: fabric\_fcset\_mcast3, Type: fabric-type, Forwarding class set index: 7

Forwarding class set: fabric\_fcset\_mcast4, Type: fabric-type, Forwarding class set index: 8

Forwarding class set: fabric\_fcset\_noloss1, Type: fabric-type, Forwarding class set index: 2

|                  |       |
|------------------|-------|
| Forwarding class | Index |
| fcoe             | 1     |

Forwarding class set: fabric\_fcset\_noloss2, Type: fabric-type, Forwarding class set index: 3

|                  |       |
|------------------|-------|
| Forwarding class | Index |
| no-loss          | 2     |

Forwarding class set: fabric\_fcset\_noloss3, Type: fabric-type, Forwarding class set index: 9

Forwarding class set: fabric\_fcset\_noloss4, Type: fabric-type, Forwarding class set index: 10

Forwarding class set: fabric\_fcset\_noloss5, Type: fabric-type, Forwarding class set index: 11

Forwarding class set: fabric\_fcset\_noloss6, Type: fabric-type, Forwarding class set index: 12

Forwarding class set: fabric\_fcset\_strict\_high, Type: fabric-type, Forwarding class set index: 4

|                  |       |
|------------------|-------|
| Forwarding class | Index |
| network-control  | 3     |

Table 85 on page 1382 describes the meaning of the **show class-of-service forwarding-class-set** output fields when you display fabric fc-set information.

**Table 85: show class-of-service forwarding-class-set Command Output Fields**

| Field Name                 | Field Description                                                                                                                                 |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| Forwarding class set       | Name of the fabric forwarding class set.                                                                                                          |
| Type                       | Type of forwarding class set: <ul style="list-style-type: none"> <li>Fabric-type—Fabric fc-set</li> <li>Normal-type—Node device fc-set</li> </ul> |
| Forwarding class set index | Index of this forwarding class set.                                                                                                               |

**Table 85: show class-of-service forwarding-class-set Command Output Fields (*continued*)**

| Field Name              | Field Description              |
|-------------------------|--------------------------------|
| <b>Forwarding class</b> | Name of a forwarding class.    |
| <b>Index</b>            | Index of the forwarding class. |

### Summary of Fabric Forwarding Class Set and Node Device Forwarding Class Set Differences

Table 86 on page 1383 summarizes the differences between fabric fc-sets and fc-sets:

**Table 86: Summary of Differences Between Fabric fc-sets and Local fc-sets**

| Characteristic                                 | Fabric fc-set                                                                                                                                 | Local fc-set                                                                                          |
|------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|
| Location                                       | QFX3008-I or QFX3600-I Interconnect device (the fabric).                                                                                      | QFabric Node device.                                                                                  |
| Global or local                                | Global, valid for the entire fabric.                                                                                                          | Local to the Node device on which the fc-set is configured.                                           |
| Ability to create (define) a new fc-set        | No. Use the 12 default fabric fc-sets provided.                                                                                               | Yes.                                                                                                  |
| Ability to configure CoS                       | User-configurable using fabric fc-set scheduler maps.                                                                                         | User-configurable using traffic control profiles.                                                     |
| Ability to map forwarding classes to an fc-set | Yes. Mapping is global and applies to all forwarding classes across the Interconnect device fabric (traffic from all connected Node devices). | Yes. Mapping is local to a Node device and applies only to the forwarding classes on the Node device. |

## Licenses

---

- [Junos OS Feature Licenses on page 1384](#)
- [Software Features That Require Licenses on the QFX Series on page 1384](#)
- [Junos OS Feature License Keys on page 1386](#)

### Junos OS Feature Licenses

Some Junos OS software features require a license to activate the feature. To enable a licensed feature, you need to purchase, install, manage, and verify a license key that corresponds to each licensed feature. To conform to Junos OS feature licensing requirements, you must purchase one license per feature per device. The presence of the appropriate software license key on your device determines whether you are eligible to configure and use the licensed feature.

To speed deployment of licensed features, Junos OS software implements an honor-based licensing structure and provides you with a 30-day grace period to use a licensed feature without a license key installed. The grace period begins when you configure the feature and your device uses the licensed feature for the first time, but not necessarily when you install the license. After the grace period expires, the system generates system log messages saying that the feature requires a license. To clear the error message and use the licensed feature properly, you must install and verify the required license.

For information about how to purchase software licenses, contact your Juniper Networks sales representative.

### Software Features That Require Licenses on the QFX Series

**NOTE:** If you try to configure a feature that is not licensed, you will receive syslog messages saying that you are using a feature that is licensable and that you do not possess a license for the feature. If you try to commit configuration changes for a feature that is not licensed, you will receive a commit warning saying that you have exceeded the allowed license limit for the feature.

[Table 9 on page 64](#) lists the licenses you can purchase for each QFX Series software feature.

For information about how to purchase a software license, contact your Juniper Networks sales representative.

Table 87: Junos OS Feature Licenses and Model Numbers for QFX Series Devices

| Licensed Software Feature                                                                                                                                            | Supported Devices                                       | Number of Licenses Required                                                       | Model Number           |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------|-----------------------------------------------------------------------------------|------------------------|
| QFX Series advanced feature license for Border Gateway Protocol (BGP), Intermediate System-to-Intermediate System (IS-IS), and Multi-protocol Label Switching (MPLS) | QFX3500, QFX3600, QFX5100-48S, and QFX5100-48T switches | One per switch                                                                    | QFX-JSL-EDGE-ADV1      |
| QFX Series advanced feature license for Border Gateway Protocol (BGP), Intermediate System-to-Intermediate System (IS-IS), and Multi-protocol Label Switching (MPLS) | QFX5100-24Q and QFX5100-96S switches                    | One per switch                                                                    | QFX5100-HDNSE-LIC      |
| Virtual Extensible Local Area Network (VXLAN) and Open vSwitch Database (OVSDb)                                                                                      | QFX5100-48S and QFX5100-48T switches                    | One per switch, two per Virtual Chassis and Virtual Chassis Fabric                | QFX-JSL-EDGE-ADV1      |
| Virtual Extensible Local Area Network (VXLAN) and Open vSwitch Database (OVSDb)                                                                                      | QFX5100-24Q and QFX5100-96S switches                    | One per switch, two per Virtual Chassis and Virtual Chassis Fabric                | QFX5100-HDNSE-LIC      |
| QFX Series advanced feature license for Border Gateway Protocol (BGP)                                                                                                | QFX3100 Director device                                 | One per Node device in a network Node group                                       | QFX-JSL-DRCTR-ADV1     |
| QFX Series advanced feature license for Fibre Channel                                                                                                                | QFX3500 switch                                          | One per switch on which fibre channel ports are configured                        | QFX-JSL-EDGE-FC        |
| QFX Series advanced feature license for Fibre Channel                                                                                                                | QFX3100 Director device                                 | One per QFX3500 Node device on which fibre channel ports are configured           | QFX-JSL-DRCTR-FC       |
| QFX Series advanced feature license for Fibre Channel - Capacity 16                                                                                                  | QFX3100 Director device                                 | One for up to 16 QFX3500 Node devices on which fibre channel ports are configured | QFX-JSL-DRCTR-FC-C16   |
| QFX Series feature license for enabling fabric mode                                                                                                                  | QFX3500 and QFX3600 device                              | One per device                                                                    | QFX3000-JSL-EDGE-FAB   |
| QFX Series feature license for base software for QFX3000-G QFabric system                                                                                            | QFX3100 Director device                                 | One per QFX3000-G QFabric system                                                  | QFX3008-JSL-DRCTR-FAB  |
| QFX Series feature license for base software for QFX3000-M QFabric system                                                                                            | QFX3100 Director device                                 | One per QFX3000-M QFabric system                                                  | QFX3000M-JSL-DRCTR-FAB |

Table 87: Junos OS Feature Licenses and Model Numbers for QFX Series Devices (*continued*)

| Licensed Software Feature    | Supported Devices                                    | Number of Licenses Required          | Model Number |
|------------------------------|------------------------------------------------------|--------------------------------------|--------------|
| Virtual Chassis Fabric (VCF) | All member devices in a Virtual Chassis Fabric (VCF) | Two per Virtual Chassis Fabric (VCF) | QFX-VCF-LIC  |

## Junos OS Feature License Keys

Some Junos OS software features require a license to be activated. To enable each licensed feature, you must purchase, install, manage, and verify a license key that corresponds to the licensed feature.

### Release-Tied License Keys and Upgrade Licenses on MX Series Routers

The Junos OS licensing infrastructure currently associates a license feature with attributes such as date, platform, and validity. In addition to these attributes, for MX Series routers running Junos OS Release 12.2 and later, a licensed feature can be associated with a release number at the time of generating the license key. This type of release-tied license key is used to validate a particular licensed feature while attempting a software upgrade. The upgrade process aborts if the release number in the license key is earlier than the Junos OS release number to which the system is being upgraded.

Additionally, an upgrade license key can be generated for a release-tied licensed feature. An upgrade license key is used for carrying forward a capacity license to the upgrade release. Although an upgrade license might be an acceptable license on the current release, it does not add to the existing capacity limit. The capacity added in the upgrade license key is valid for the upgrade software release only.

The release number embedded in the license key indicates the maximum release number up to which Junos OS can be upgraded.

As an example, assume that your system is running Junos OS Release 12.2 and is using the **scale-subscriber** licensed feature with a later release-tied upgrade license key installed. If you request a software upgrade to the later release of Junos OS, the software upgrade operation fails and the following error message is displayed:

```
mgd: error: No valid upgrade license found for feature 'scale-subscriber'.
Aborting Software upgrade.
Validation failed
```

In this example, to successfully upgrade to the later release of Junos OS, the release number included in the upgrade license key should be greater than or equal to the later release number. Also, you can perform software upgrades up to the previous release without any additional license keys to retain the existing scale limit.

#### NOTE:

When you install a release-tied license, the following apply:

- You can purchase an upgrade capacity license only if a base capacity license for the same scale-tier has already been generated or purchased.
- You cannot install an upgrade license if the capacity does not match any of the existing base capacity licenses on the system.
- The license installation fails when you install a lower release number license key on a higher software release number.
- A release-tied license can be installed on a Junos OS release number that is lower than or equal to the release number included in the license key. For example, a 12.2 license key is valid on Junos OS Release 12.1.
- An upgrade license is valid only on the target release number specified in the license key, but can be installed on an earlier Junos OS release. For example, a 4 K scale-tier upgrade license for Junos OS Release 12.2 can be installed on an earlier release, and the installed count of licenses remains unaltered.
- Release-tied licenses of the previous release are not deleted on upgrading Junos OS to a newer release version.

### Licensable Ports on MX5, MX10, and MX40 Routers

Starting with Junos OS Release 12.2, license keys are available to enhance the port capacity on MX5, MX10, and MX40 routers up to the port capacity of an MX80 router. The MX5, MX10, and MX40 routers are derived from the modular MX80 chassis with similar slot and port assignments, and provide all functionality available on an MX80 router, but at a lower capacity. Restricting port capacity is achieved by making a set of MIC slots and ports licensable. MICs without a license are locked, and are unlocked or made usable by installing appropriate upgrade licenses.

The base capacity of a router is identified by the Ideeprom assembly ID (I2C ID), which defines the board type. However, the Junos OS licensing infrastructure allows the use of restricted ports without a license for a grace period of 30 days. After the grace period expires, the router reverts back to the base capacity if no upgrade license is purchased and installed for the locked ports. The I2C ID along with an upgrade license determine the final capacity of an MX5, MX10, or MX40 router.

The MX5, MX10, MX40, and MX80 routers support the following types of MICs:

- A built-in 10-Gigabit Ethernet MIC with four 10-Gigabit Ethernet ports
- Two front-pluggable MICs

A feature ID is assigned to every license upgrade for enhancing port capacity.

[Table 10 on page 68](#) displays the chassis types and their associated port capacity, I2C ID, base capacity, feature ID, feature name, and the final capacity after a license upgrade.

**Table 88: Upgrade Licenses for Enhancing Port Capacity**

| Chassis Type | Port Capacity | I2C ID | Base Capacity                                                                                                                                               | Feature ID and Feature Name | Upgrade Capacity                                                                                                                 |
|--------------|---------------|--------|-------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| MX5          | 20G           | 0x556  | Slot 1 <ul style="list-style-type: none"> <li>• 1/MIC0</li> </ul>                                                                                           | f1—MX5 to MX10 upgrade      | Slot 1 and 2 <ul style="list-style-type: none"> <li>• 1/MIC0</li> <li>• 1/MIC1</li> </ul>                                        |
| MX10         | 40G           | 0x555  | Slot 1 and 2 <ul style="list-style-type: none"> <li>• 1/MIC0</li> <li>• 1/MIC1</li> </ul>                                                                   | f2—MX10 to MX40 upgrade     | Slot 2 and first 2 ports on Slot 0 <ul style="list-style-type: none"> <li>• 1/MIC1</li> <li>• First 2 ports on 0/MIC0</li> </ul> |
| MX40         | 60G           | 0x554  | Slot 1, SSlot 2 and first 2 ports on Slot 0 <ul style="list-style-type: none"> <li>• 1/MIC0</li> <li>• 1/MIC1</li> <li>• First 2 ports on 0/MIC0</li> </ul> | f3—MX40 to MX80 upgrade     | Slot 2 and all ports on Slot 0 <ul style="list-style-type: none"> <li>• 1/MIC1</li> <li>• All 4 ports on 0/MIC0</li> </ul>       |

When installing an upgrade license for enhancing port capacity on MX5, MX10 and MX40 routers, consider the following:

- To upgrade an MX5 router to MX80 router capacity, licenses for all three features (f1, f2, f3) must be installed. All three features can be provided in a single license key.
- To upgrade an MX10 router to MX40 router capacity, installing a license key with f2 feature is sufficient.
- Non-applicable feature IDs in a license key reject the upgrade license. For example:
  - An f1 feature ID on an MX10 upgrade license key rejects the license.
  - Feature IDs f1 and f2 on an MX40 upgrade license key reject the entire license.

#### Port Activation on MX104 Routers

Starting with Junos OS Release 13.3, license keys are available to activate the ports on the MX104 router. MX104 routers have four built-in ports. By default, in the absence of valid licenses, all four built-in ports are deactivated. By installing licenses, you can activate any two of the four or all of the four built-in ports. For instance, you can install a license

to activate the first two built-in ports (xe-2/0/0 and xe-2/0/1) or you can install a license to activate the next two built-in ports (xe-2/0/2 and xe-2/0/3). You can also install a license to activate all four built-in ports (xe-2/0/0, xe-2/0/1, xe-2/0/2, and xe-2/0/3). If you have already activated two of the built-in ports, you can install an additional license to activate the other two built-in ports on the MX104 router.

A feature ID is assigned to every license for activating the built-in ports on the MX104 router. The port license model with the feature ID is described in [Table 11 on page 69](#).

**Table 89: Port Activation License Model for MX104 Routers**

| Feature ID | Feature Name                        | Functionality                                                        |
|------------|-------------------------------------|----------------------------------------------------------------------|
| F1         | MX104 2X10G Port Activate (0 and 1) | Ability to activate first two built-in ports (xe-2/0/0 and xe-2/0/1) |
| F2         | MX104 2X10G Port Activate (2 and 3) | Ability to activate next two built-in ports (xe-2/0/2 and xe-2/0/3)  |

Both the features are also provided in a single license key for ease of use. To activate all four ports, you must either install the licenses for both the features listed in [Table 11 on page 69](#) or the single license key for both features. If you install the single license key when feature IDs F1 and F2 are already installed, the license does not get rejected. Also, MX104 routers do not support the graceful license expiry policy. A graceful license expiry policy allows the use of a feature for a certain period of time (usually a grace period of 30 days), and reverts if the license for that feature is not installed after the grace period.

- [Performing the QFabric System Initial Setup on a QFX3100 Director Group on page 1471](#)

### QFabric System Initial and Default Configuration Information

Once you install the hardware for the QFabric system, you can configure the Junos operating system (Junos OS) to begin using the system. This topic discusses which setup activities you need to perform and which activities are handled automatically by the QFabric system.

The fabric manager Routing Engine in the Director group automatically handles some of the initial setup activities, including:

- Assignment of IP addresses and unique identifiers to each QFabric system component by way of the management control plane
- Inclusion of all QFabric system devices within the default partition
- Establishment of interdevice communication and connectivity through the use of a fabric provisioning protocol and a fabric management protocol

The initial configuration tasks you need to perform to bring up the QFabric system and make it operational include:

- Converting any standalone devices, such as QFX3500 and QFX3600 devices, to Node device mode (see [“Converting the Device Mode for a QFabric System Component” on page 1394](#))
- Setting up the QFabric system control plane cabling, topology, and configuration
  - To set up the control plane cabling, topology, and configuration for the QFX3000-G QFabric system, see [“Example: Configuring the Virtual Chassis for a Copper-Based QFX3000-G QFabric System Control Plane” on page 1400](#).
  - To set up a copper or fiber-based control plane cabling, topology, and configuration for the QFX3000-M QFabric system, see [“Example: Configuring EX4200 Switches for the QFX3000-M QFabric System Control Plane” on page 1444](#).
- Accessing the Director group through a console connection, turning on the devices, and running through the initial setup script (see [“Performing the QFabric System Initial Setup on a QFX3100 Director Group” on page 1471](#)), which prompts you to:
  - Set IP addresses for the Director devices in the Director group.
  - Set an IP address for the default partition.
  - Add the software serial number for your QFabric system. (Review the e-mail containing the software serial number that you received from Juniper Networks when you purchased your QFabric system.)
  - Set the starting MAC address and the range of MAC addresses for the QFabric system. (See [“Generating the MAC Address Range for a QFabric System” on page 1470](#) for this information.)
  - Set a root password for the Director devices.
  - Set a root password for the QFabric system components, such as Node devices, Interconnect devices, and infrastructure.
- Logging into the default partition by using the IP address you configured when you ran the Director group initial setup script (See [“Gaining Access to the QFabric System Through the Default Partition” on page 1480](#))
- Configuring basic system settings for the default partition, such as time, location, and default gateways

**NOTE:** Unlike other Juniper Networks devices that run Junos OS, a QFabric system does not have a default factory configuration (containing the basic configuration settings for system logging, interfaces, protocols, and so on) that is loaded when you first install and power on the Director devices. Therefore, you must configure all the settings required for your QFabric system through the default partition CLI.

---

- Configuring aliases for Node devices (see [“Configuring Aliases for the QFabric System” on page 1489](#))

- Configuring VLANs and interfaces for the QFabric system devices
- Configuring redundant server Node groups to provide resiliency for server and storage connections (see [“Configuring Node Groups for the QFabric System” on page 1499](#))
- Configuring a network Node group to connect the QFabric system to external networks (see [“Configuring Node Groups for the QFabric System” on page 1499](#))
- Configuring the port type on QFX3600 Node devices (see [“Configuring the Port Type on QFX3600 Node Devices” on page 1503](#))
- Configuring routing protocols to run on the network Node group interfaces and reach external networks

**NOTE:** When you configure routing protocols on the QFabric system, you must use interfaces from the Node devices assigned to the network Node group. If you try to configure routing protocols on interfaces from the Node devices assigned to server Node groups, the configuration commit operation fails.

- Generating and adding the license keys for the QFabric system (see [“Generating the License Keys for a QFabric System” on page 71](#) and [“Adding New Licenses \(CLI Procedure\)” on page 73](#))

## Converting the Device Mode for a QFabric System Component

You can configure some devices to act as a standalone switch or participate in a QFabric system in a particular role. To change the role of your device, you must set the device mode. [Table 90 on page 1394](#) shows the device modes available for various devices.

**Table 90: Support for device mode options**

| Device mode         | QFX3500   | QFX3600   | QFX5100                 |
|---------------------|-----------|-----------|-------------------------|
| Interconnect device | N/A       | Supported | Supported for QFX3000-M |
| Node device         | Supported | Supported | Supported               |
| Standalone          | Supported | Supported | N/A                     |

To convert a device to a different mode, issue the **request chassis device-mode** command and specify the desired device mode. You verify the current and future device mode with the **show chassis device-mode** command.

When you convert a device from standalone mode to either Node device or Interconnect device mode, the software prepares the device to be configured automatically by the QFabric system. However, changing the device mode erases all configuration data on the device.

**NOTE:** The QFX3600 switch requires Jloader Release 1.1.8 before you can convert the switch to Interconnect device mode. For more information, see: [Jloader 1.1.8 Release for QFX-Series Platforms](#).

**CAUTION:** We recommend that you back up your device configuration to an external location before converting a device to a different device mode.

The following procedures illustrate the conversion options available when you modify a device mode:

- Convert from standalone switch mode to Node device mode
- Convert from Node device mode to Interconnect device mode
- Convert from Interconnect device mode to Node device mode
- Convert from Node device mode or Interconnect device mode to standalone switch mode

### Standalone Switch to Node Device

To convert your device from standalone mode to Node device mode, follow these steps:

1. Connect to your standalone device through the console port and log in as the root user.

2. Back up your device configuration to an external location.

```
root@switch# save configuration-name external-path
```

3. Upgrade the software on your device to a QFabric system **Node and Interconnect device** software package that matches the QFabric system complete software package used by your QFabric system. If the complete software package for your QFabric system is named `jinstall-qfabric-13.2X52-D10.2.rpm`, you need to install the `jinstall-qfabric-5-13.2X52-D10.2-domestic-signed.tgz` package on your QFX5100 device and the `jinstall-qfx-13.2X52-D10.2-domestic-signed.tgz` package on your QFX3500 or QFX3600 device. Matching the two software packages ensures a smooth and successful addition of the device to the QFabric system inventory.

```
root@switch# request system software add software-package-name reboot
```

**NOTE:** After you install the correct software, the QFX5100 device is placed into Node device mode by default and cannot be converted to any other mode in Junos OS Release 13.2X52-D10.

4. Check the current device mode by issuing the **show chassis device-mode** command.

```
root@switch> show chassis device-mode
Current device-mode : Standalone
Future device-mode after reboot : Standalone
```

5. Issue the **request chassis device-mode** command and select the desired device mode.

```
root@switch> request chassis device-mode node-device
Device mode set to 'node-device' mode.
Please reboot the system to complete the process.
```

6. Verify the future device mode by issuing the **show chassis device-mode** command.

```
root@switch> show chassis device-mode
Current device-mode : Standalone
Future device-mode after reboot : Node-device
```

7. Reboot the device.

```
root@switch> request system reboot
Reboot the system ? [yes,no] (no) yes
```

```
Shutdown NOW!
[pid 34992]
```

```
root@switch>
```

```
*** FINAL System shutdown message from root@switch ***
System going down IMMEDIATELY
```

8. Verify that the new device mode has been enabled by issuing the **show chassis device-mode** command.

```
root@switch> show chassis device-mode
```

```
Current device-mode : Node-device
Future device-mode after reboot : Node-device
```

9. To enable a converted device to participate in the QFabric system, locate the applicable network cables for your device and connect the device ports to the control plane and data plane.
10. (Optional) If you change the device back from Node device mode to standalone mode, restore the saved backup configuration from your external location.

```
root@switch# load configuration-name external-path
```

### Node Device to Interconnect Device

To convert your device from Node device mode to Interconnect device mode, follow these steps:

1. From the default partition CLI prompt, back up your QFabric system configuration to an external location.

```
user@qfabric# save configuration-name external-path
```

2. Connect to your device through the console port and log in as the root user.
3. Check the current device mode by issuing the **show chassis device-mode** command.

```
root@switch> show chassis device-mode
Current device-mode : Node-device
Future device-mode after reboot : Node-device
```

4. Issue the **request chassis device-mode** command and select the desired device mode.

```
root@switch> request chassis device-mode interconnect-device
Device mode set to 'interconnect-device' mode.
Please reboot the system to complete the process.
```

5. Verify the future device mode by issuing the **show chassis device-mode** command.

```
root@switch> show chassis device-mode
Current device-mode : Node-device
Future device-mode after reboot : Interconnect-device
```

6. Reboot the device.

```
root@switch> request system reboot
Reboot the system ? [yes,no] (no) yes
```

```
Shutdown NOW!
[pid 34992]
```

```
root@switch>
```

```
*** FINAL System shutdown message from root@switch ***
System going down IMMEDIATELY
```

7. Verify that the new device mode has been enabled by issuing the **show chassis device-mode** command.

```
root@switch> show chassis device-mode
```

```
Current device-mode : Interconnect-device
Future device-mode after reboot : Interconnect-device
```

8. To enable a converted device to participate in the QFabric system in its new role, move the device to a different rack (as needed), locate the applicable network cables for your device, connect the device ports to the control plane and data plane per the design for your specific QFabric system, and reconfigure any aliases for the device at the QFabric default partition CLI prompt.

## Interconnect Device to Node Device

To convert your device from Interconnect device mode to Node device mode, follow these steps:

1. From the default partition CLI prompt, back up your QFabric system configuration to an external location.

```
user@qfabric# save configuration-name external-path
```

2. Connect to your device through the console port and log in as the root user.
3. Check the current device mode by issuing the **show chassis device-mode** command.

```
root@switch> show chassis device-mode
Current device-mode : Interconnect-device
Future device-mode after reboot : Interconnect-device
```

4. Issue the **request chassis device-mode** command and select the desired device mode.

```
root@switch> request chassis device-mode node-device
Device mode set to 'node-device' mode.
Please reboot the system to complete the process.
```

5. Verify the future device mode by issuing the **show chassis device-mode** command.

```
root@switch> show chassis device-mode
Current device-mode : Interconnect-device
Future device-mode after reboot : Node-device
```

6. Reboot the device.

```
root@switch> request system reboot
Reboot the system ? [yes,no] (no) yes
```

```
Shutdown NOW!
[pid 34992]
```

```
root@switch>
```

```
*** FINAL System shutdown message from root@switch ***
System going down IMMEDIATELY
```

7. Verify that the new device mode has been enabled by issuing the **show chassis device-mode** command.

```
root@switch> show chassis device-mode
Current device-mode : Node-device
Future device-mode after reboot : Node-device
```

8. To enable a converted device to participate in the QFabric system in its new role, move the device to a different rack (as needed), locate the applicable network cables for your device, connect the device ports to the control plane and data plane per the

design for your specific QFabric system, and reconfigure any aliases for the device at the QFabric default partition CLI prompt.

### QFabric Component (Interconnect or Node Device) to Standalone Switch

To convert your QFabric component from either Interconnect device mode or Node device mode to standalone switch mode, follow these steps:

1. From the default partition CLI prompt, back up your QFabric system configuration to an external location.

```
user@qfabric# save configuration-name external-path
```

2. Connect to the desired QFabric component through the console port of the device and log in as the root user.

3. Check the current device mode by issuing the **show chassis device-mode** command.

```
root@node1> show chassis device-mode
Current device-mode : Node-device
Future device-mode after reboot : Node-device
```

4. Issue the **request chassis device-mode standalone** command to convert the component to standalone switch mode, while the component is still connected to the QFabric system.

```
root@node1> request chassis device-mode standalone
Device mode set to 'standalone' mode.
Please reboot the system to complete the process.
```

**NOTE:** Always convert the device mode to standalone before you remove the component from the QFabric system. If you remove the component from the QFabric system before converting the device mode to standalone, the switch might not operate properly. For example, the output of the **show chassis hardware** command might display no FPCs or interfaces for the switch.

5. Verify the future device mode by issuing the **show chassis device-mode** command.

```
root@node1> show chassis device-mode
Current device-mode : Node-device
Future device-mode after reboot : Standalone
```

6. Reboot the component to complete the conversion process.

```
root@node1> request system reboot
Reboot the system ? [yes,no] (no) yes
```

```
Shutdown NOW!
[pid 34992]
```

```
root@node1>
```

```
*** FINAL System shutdown message from root@node1 ***
System going down IMMEDIATELY
```

7. Disconnect and remove the component from the QFabric system. You may now operate the device as a standalone switch.

## Example: Configuring the Virtual Chassis for a Copper-Based QFX3000-G QFabric System Control Plane

This example shows you how to connect QFabric system components and configure the Virtual Chassis used by a copper-based QFX3000-G QFabric system control plane network. Proper wiring of Director devices, Interconnect devices, and Node devices to the Virtual Chassis, combined with a standard configuration, enables you to bring up the internal QFabric system management network and prepare your QFabric system for full operation.

---

### Requirements

This example uses the following hardware and software components:

- One QFX3000-G QFabric system containing:
  - Two QFX3100 Director devices
  - Two QFX3008-I Interconnect devices
  - Eight QFX3500 Node devices
- Eight EX4200-48T switches, used to make two redundant Virtual Chassis with four members apiece
- Junos OS Release 12.3R6.6 for the EX Series switches used in the Virtual Chassis
- Junos OS Release 13.2X52-D10 for the QFX Series

Before you begin:

- Rack, mount, and install your QFabric system hardware (Director group, Interconnect devices, and Node devices). For more information, see *Installing and Connecting a QFX3100 Director Device*, *Installing and Connecting a QFX3008-I Interconnect Device*, and *Installing and Connecting a QFX3500 Device*.
- Rack, mount, and install your Virtual Chassis hardware (EX4200 switches). For more information, see *Installing and Connecting an EX4200 Switch*.
- Create two Virtual Chassis of four members each. For more information, see *Configuring an EX4200, EX4500, or EX4550 Virtual Chassis (CLI Procedure)*.

---

### Overview

The QFX3000-G QFabric system control plane network connects the Director group, Interconnect devices, and Node devices in a QFabric system across a pair of redundant Virtual Chassis. By separating the management control plane from the data plane, the QFabric system can scale efficiently. The control plane network uses Gigabit Ethernet

cabling and connections between components, and a 10-Gigabit Ethernet backbone between the redundant Virtual Chassis.

Specific ports have been reserved on the Virtual Chassis to connect to each of the QFabric system device types. Such design simplifies installation and facilitates timely deployment of a QFabric system. It also permits the use of a standard Virtual Chassis configuration included as part of this example. The standard configuration can scale from the minimum topology of eight Node devices shown in this example to the maximum of 128 Node devices for a fully implemented QFX3000-G QFabric system.

### Topology

Figure 34 on page 1401 shows the general port ranges where QFabric system devices must be connected to the Virtual Chassis. For each Virtual Chassis member, connect ports 0 through 31 to Node devices, ports 38 and 39 to Interconnect devices, and ports 40 and 41 to Director devices. Table 91 on page 1402 shows the details of the QFabric system device-to-Virtual Chassis port mappings.

**Figure 34: QFX3000-G QFabric System Control Plane—Virtual Chassis Port Ranges**

#### CAUTION:

- The control plane network within a QFabric system should be considered a critical component of the system that should not be shared with other network traffic. In order to scale efficiently, the control plane network must be reserved for the QFabric system and its components. As a result, the ports of the QFabric system control plane must never be used for any purpose other than to transport QFabric system control plane traffic, and we neither recommend nor support the connection of other devices to the QFabric system control plane network.
- Do not install Junos Space and AI-Scripts (AIS) on the control plane network Virtual Chassis in a QFX3000-G QFabric system.

**NOTE:** Not all port numbers are represented in Table 91 on page 1402, and ports 32 through 37 and ports 42 through 47 are reserved for future uses.

Table 91 on page 1402 shows the specific mappings of QFabric system control plane network ports from the Virtual Chassis to the QFabric system components.

Table 91: QFX3000-G QFabric System Virtual Chassis Control Plane Port Assignments

Next, connect the Director devices to the Virtual Chassis. In general, you want to accomplish the following:

- Connect three ports from one network module in a Director device to the first Virtual Chassis, and three ports from the second network module to the second Virtual Chassis. You need to repeat these connections from the second Director device to both Virtual Chassis to provide resiliency for the system.
- Connect the Director devices to each other and create a Director group. You can use either straight-through RJ-45 patch cables or crossover cables, because the Director devices contain autosensing modules. Connect one port from each network module on the first Director device to one port in each network module on the second Director device.

Figure 35 on page 1406 shows the specific ports on the Director group that you must connect to the Virtual Chassis and interconnect between the Director devices.

**Figure 35: QFX3000-G QFabric System Control Plane—Director Group to Virtual Chassis Connections**

In this specific example, connect ports 0, 1, and 2 from module 0 on Director device DG0 to port 40 on Virtual Chassis VC0 (ge-0/0/40, ge-1/0/40, and ge-2/0/40), and connect ports 0, 1, and 2 from module 1 to port 40 on Virtual Chassis VC1 (ge-0/0/40, ge-1/0/40, and ge-2/0/40).

For Director device DG1, connect ports 0, 1, and 2 from module 0 to port 41 on Virtual Chassis VC0 (ge-0/0/41, ge-1/0/41, and ge-2/0/41), and connect ports 0, 1, and 2 from module 1 to port 41 on Virtual Chassis VC1 (ge-0/0/41, ge-1/0/41, and ge-2/0/41).

To form the Director group, connect module 0, port 3 on Director device DG0 to module 0, port 3 on Director device DG1. Similarly, connect module 1, port 3 on Director device DG0 to module 1, port 3 on Director device DG1. Table 92 on page 1406 shows the port mappings for the Director group in this example.

**Table 92: Director Group Port Mappings**

| Director Device | Virtual Chassis VC0                                                                                                                                                                                                                     | Virtual Chassis VC1                                                                                                                                                                                                                     |

| DG0             | <ul style="list-style-type: none"> <li>Module 0, port 0 to ge-0/0/40 on VC0</li> <li>Module 0, port 1 to ge-1/0/40 on VC0</li> <li>Module 0, port 2 to ge-2/0/40 on VC0</li> <li>Module 0, port 3 to module 0, port 3 on DG1</li> </ul> | <ul style="list-style-type: none"> <li>Module 1, port 0 to ge-0/0/40 on VC1</li> <li>Module 1, port 1 to ge-1/0/40 on VC1</li> <li>Module 1, port 2 to ge-2/0/40 on VC1</li> <li>Module 1, port 3 to module 1, port 3 on DG1</li> </ul> |
| DG1             | <ul style="list-style-type: none"> <li>Module 0, port 0 to ge-0/0/41 on VC0</li> <li>Module 0, port 1 to ge-1/0/41 on VC0</li> <li>Module 0, port 2 to ge-2/0/41 on VC0</li> <li>Module 0, port 3 to module 0, port 3 on DG0</li> </ul> | <ul style="list-style-type: none"> <li>Module 1, port 0 to ge-0/0/41 on VC1</li> <li>Module 1, port 1 to ge-1/0/41 on VC1</li> <li>Module 1, port 2 to ge-2/0/41 on VC1</li> <li>Module 1, port 3 to module 1, port 3 on DG0</li> </ul> |

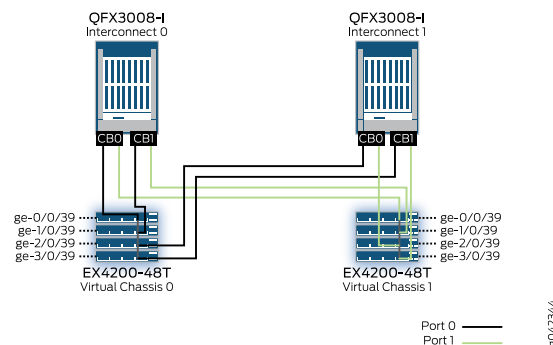

In the software, the ports of each network module are reversed, numbered from right to left, and incremented sequentially across modules. If you issue interface operational commands directly on the Director device, please note the following port mappings as shown in Table 93 on page 1407:

**Table 93: Hardware to Software Port Mappings for Director Device Network Modules**

| Network Module | Port 0 | Port 1 | Port 2 | Port 3 |
|----------------|--------|--------|--------|--------|
| Module 0       | eth5   | eth4   | eth3   | eth2   |
| Module 1       | eth9   | eth8   | eth7   | eth6   |

Figure 36 on page 1407 shows the specific ports on the Interconnect devices that you must connect to the Virtual Chassis. In general, connect one port from each Control Board module in an Interconnect device to the first Virtual Chassis, and a second port from each Control Board module to the second Virtual Chassis.

**Figure 36: QFX3000-G QFabric System Control Plane—Interconnect Device to Virtual Chassis Connections**

In this specific example, for both Interconnect devices IC0 and IC1, connect port 0 from CB0 and CB1 to Virtual Chassis VC0 and port 1 from CB0 and CB1 to Virtual Chassis VC1. Connect the port 0 cables to port 39 on Virtual Chassis VC0 (ge-0/0/39, ge-1/0/39, ge-2/0/39, and ge-3/0/39), and connect the port 1 cables to port 39 on Virtual Chassis VC1 (ge-0/0/39, ge-1/0/39, ge-2/0/39, and ge-3/0/39). Table 94 on page 1407 shows the port mappings for the Interconnect devices in this example.

**Table 94: Interconnect Device Port Mappings**

| Interconnect Device | Virtual Chassis VC0                                                                                          | Virtual Chassis VC1                                                                                          |
|---------------------|--------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| IC0                 | <ul style="list-style-type: none"> <li>CB0, port 0 to ge-0/0/39</li> <li>CB1, port 0 to ge-1/0/39</li> </ul> | <ul style="list-style-type: none"> <li>CB0, port 1 to ge-0/0/39</li> <li>CB1, port 1 to ge-1/0/39</li> </ul> |
| IC1                 | <ul style="list-style-type: none"> <li>CB0, port 0 to ge-2/0/39</li> <li>CB1, port 0 to ge-3/0/39</li> </ul> | <ul style="list-style-type: none"> <li>CB0, port 1 to ge-2/0/39</li> <li>CB1, port 1 to ge-3/0/39</li> </ul> |

As required, you can extend the number of Interconnect devices from two to four. For additional Interconnect devices IC2 and IC3, connect port 0 from CB0 and CB1 to Virtual Chassis VC0 and port 1 from CB0 and CB1 to Virtual Chassis VC1. Connect the port 0 cables to port 38 on Virtual Chassis VC0 (ge-0/0/38, ge-1/0/38, ge-2/0/38, and ge-3/0/38), and connect the port 1 cables to port 38 on Virtual Chassis VC1 (ge-0/0/38,

ge-1/0/38, ge-2/0/38, and ge-3/0/38). [Table 95 on page 1408](#) shows the port mappings needed to extend the number of Interconnect devices in this example to four devices.

**Table 95: Interconnect Device Port Mappings for Two Additional Devices**

| Interconnect Device | Virtual Chassis VC0                                                                                          | Virtual Chassis VC1                                                                                          |
|---------------------|--------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| IC2                 | <ul style="list-style-type: none"> <li>CB0, port 0 to ge-0/0/38</li> <li>CB1, port 0 to ge-1/0/38</li> </ul> | <ul style="list-style-type: none"> <li>CB0, port 1 to ge-0/0/38</li> <li>CB1, port 1 to ge-1/0/38</li> </ul> |
| IC3                 | <ul style="list-style-type: none"> <li>CB0, port 0 to ge-2/0/38</li> <li>CB1, port 0 to ge-3/0/38</li> </ul> | <ul style="list-style-type: none"> <li>CB0, port 1 to ge-2/0/38</li> <li>CB1, port 1 to ge-3/0/38</li> </ul> |

[Figure 37 on page 1408](#), [Figure 38 on page 1408](#), and [Figure 39 on page 1408](#) show the specific ports on the Node devices that you must connect to the Virtual Chassis. In general, connect the first management port from a Node device to the first Virtual Chassis, and the second management port to the second Virtual Chassis.

**Figure 37: QFX3000-G QFabric System Control Plane—QFX3500 Node Device to Virtual Chassis Connections**

**Figure 38: QFX3000-G QFabric System Control Plane—QFX3600 Node Device to Virtual Chassis Connections**

**Figure 39: QFX3000-G QFabric System Control Plane—QFX5100 Node Device to Virtual Chassis Connections**

In this specific example, for Node device Node0, connect port C0 (also known as me0) to Virtual Chassis 0 port ge-0/0/0, and connect port C1 (also known as me1) to Virtual Chassis 1 port ge-0/0/0.

For the remaining seven Node devices, connect port C0 to the ge-0/0/X port on Virtual Chassis 0 that matches the Node device number. Similarly, connect port C1 to the port on Virtual Chassis 1 that matches the Node device number. For example, you would connect Node device Node5 to port ge-0/0/5. [Table 96 on page 1409](#) shows the full set of port mappings for the Node devices in this example.

**Table 96: Node Device Port Mappings**

| Node Device | Virtual Chassis 0 | Virtual Chassis 1 |
|-------------|-------------------|-------------------|
| Node0       | C0 to ge-0/0/0    | C1 to ge-0/0/0    |
| Node1       | C0 to ge-0/0/1    | C1 to ge-0/0/1    |
| Node2       | C0 to ge-0/0/2    | C1 to ge-0/0/2    |
| Node3       | C0 to ge-0/0/3    | C1 to ge-0/0/3    |
| Node4       | C0 to ge-0/0/4    | C1 to ge-0/0/4    |
| Node5       | C0 to ge-0/0/5    | C1 to ge-0/0/5    |
| Node6       | C0 to ge-0/0/6    | C1 to ge-0/0/6    |
| Node7       | C0 to ge-0/0/7    | C1 to ge-0/0/7    |

[Figure 40 on page 1409](#) shows the specific ports on the members of the first Virtual Chassis that you must connect to the members of the second Virtual Chassis. These connections create a link aggregation bundle (LAG) that provides redundancy and resiliency for the Virtual Chassis portion of the control plane. In general, connect each 10-Gigabit Ethernet uplink port from the first Virtual Chassis to the corresponding 10-Gigabit Ethernet uplink port on the second Virtual Chassis.

**Figure 40: QFX3000-G QFabric System Control Plane—Inter-Virtual Chassis LAG Connections**

In this specific example, for Virtual Chassis VC0, connect port xe-0/1/0 to Virtual Chassis VC1 port xe-0/1/0. For the remaining seven 10-Gigabit Ethernet uplink ports, connect each port from VC0 to the corresponding port on VC1. For example, you would connect the xe-2/1/2 port on VC0 to port xe-2/1/2 on VC1, and so on.

[Table 97 on page 1410](#) shows the full set of port mappings for the Virtual Chassis LAG connections in this example.

Table 97: Virtual Chassis LAG Port Mappings

| VCO and VC1   | Member 0             | Member 1             | Member 2             | Member 3             |
|---------------|----------------------|----------------------|----------------------|----------------------|
| Uplink port 0 | xe-0/1/0 to xe-0/1/0 | xe-1/1/0 to xe-1/1/0 | xe-2/1/0 to xe-2/1/0 | xe-3/1/0 to xe-3/1/0 |
| Uplink port 2 | xe-0/1/2 to xe-0/1/2 | xe-1/1/2 to xe-1/1/2 | xe-2/1/2 to xe-2/1/2 | xe-3/1/2 to xe-3/1/2 |

### Configuration

- [xref target has no title]

#### CLI Quick Configuration

To quickly configure the QFabric system control plane Virtual Chassis, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

**NOTE:** The configuration files for a QFabric system control plane network are also available for download from the QFX Series section of the Junos OS software download page at <https://www.juniper.net/support/downloads/junos.html>.

**Step-by-Step  
Procedure**

The following example requires that you navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode*.

To configure a Virtual Chassis for the QFabric system control plane network:

1. Create a configuration group to define global QFabric system control plane properties. Enable commit synchronization and graceful switchover, set up the number of aggregated Ethernet devices, configure alarm and LCD management, activate loop prevention, nonstop bridging, and storm control, configure Link Layer Discovery Protocol (LLDP), specify a global VLAN (VLAN100) and 802.1q tunneling, define options for aggregated Ethernet interfaces, and enable the uplink module for 10-Gigabit Ethernet operation.

Enable class of service (CoS) for the QFabric system control plane network. Establish forwarding classes, priorities, scheduler maps, classifiers, and queues for three types of traffic: control traffic, interdevice traffic, and best-effort traffic. Apply the qfabric group settings to the configuration.

```

2. Configure interfaces for the QFabric system control plane network. Set the interface ranges where Node devices (0 through 31), Interconnect devices (38 and 39), and Director devices (40 and 41) connect to the control plane network through the Virtual Chassis. Configure the inter-Virtual Chassis LAG connections for the ae8 interface and apply the ae-interfaces configuration group to the remaining aggregated Ethernet interfaces (ae0 through ae7).

```

```

**Results** To view the configuration, issue the **show** command in configuration mode or the **show configuration** command in operational mode. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

The following configuration is the standard configuration that applies universally to both Virtual Chassis in your QFabric system control plane network.

```

To verify the syntax of your configuration before committing it, enter **commit check** from configuration mode. If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the Virtual Chassis configuration is working properly.

- [Verifying the QFabric System Control Plane—Virtual Chassis VC0 on page 1426](#)
- [Verifying the QFabric System Control Plane—Virtual Chassis VC1 on page 1434](#)

#### *Verifying the QFabric System Control Plane—Virtual Chassis VC0*

**Purpose** Verify that your first Virtual Chassis is operational.

**Action** Connect to the Junos OS CLI of Virtual Chassis VC0, either from your management network or from the console port of the master Virtual Chassis member. In operational mode, enter the **show virtual-chassis status** and **show interfaces terse** commands.

### Sample Output

```

{master:0}
user@vc0> show virtual-chassis status

```

Virtual Chassis ID: c809.2c5d.9f7b

| Member ID | Status | Serial No    | Model      | Mastership<br>priority | Role     | Neighbor List<br>ID Interface |

**Meaning** In the output of the **show virtual-chassis status** command, if all four members appear, the Virtual Chassis is operational.

In the output of the **show interfaces terse** command, if all interfaces that connect to the QFabric system devices are listed as up (such as ge-0/0/39, ge-1/0/39, ge-2/0/39, and ge-3/0/39 for the Interconnect devices; ge-0/0/40, ge-1/0/40, and ge-2/0/40 for the Director devices; ge-0/0/0 through ge-0/0/7 for the Node devices; and xe-0/1/0, xe-0/1/2, xe-1/1/0, xe-1/1/2, xe-2/1/0, xe-2/1/2, xe-3/1/0, and xe-3/1/2 for the inter-Virtual Chassis connections), the control plane is properly connected.

#### *Verifying the QFabric System Control Plane—Virtual Chassis VC1*

**Purpose** Verify that your second Virtual Chassis is operational.

**Action** Connect to the Junos OS CLI of Virtual Chassis VC1, either from your management network or from the console port of the master Virtual Chassis member. In operational mode, enter the **show virtual-chassis status** and **show interfaces terse** commands.

### Sample Output

```

{master:0}
user@vc1> show virtual-chassis status

Virtual Chassis ID: c809.2c5d.9f8a

Member ID  Status  Serial No  Model  Mastership  Role  Neighbor List

```

**Meaning** In the output of the **show virtual-chassis status** command, if all four members appear, the Virtual Chassis is operational.

In the output of the **show interfaces terse** command, if all interfaces that connect to the QFabric system devices are listed as up (such as ge-0/0/39, ge-1/0/39, ge-2/0/39, and ge-3/0/39 for the Interconnect devices; ge-0/0/40, ge-1/0/40, and ge-2/0/40 for the Director devices; ge-0/0/0 through ge-0/0/7 for the Node devices; and xe-0/1/0, xe-0/1/2, xe-1/1/0, xe-1/1/2, xe-2/1/0, xe-2/1/2, xe-3/1/0, and xe-3/1/2 for the inter-Virtual Chassis connections), the control plane is properly connected.

## Importing a QFX3000-G QFabric System Control Plane Virtual Chassis Configuration with a USB Flash Drive

There are two methods of importing the configuration file to the QFabric control plane Virtual Chassis. You can load the configuration file onto a USB flash drive from the Juniper Networks software download site before inserting the USB flash drive into the Virtual Chassis USB port, or you can copy and paste the configuration from the following example (see “[Example: Configuring the Virtual Chassis for a Copper-Based QFX3000-G QFabric System Control Plane](#)” on page 1400).

Before you begin:

- Rack, mount, and install your QFabric system hardware (Director group, Interconnect devices, and Node devices). For more information, see *Installing and Connecting a QFX3100 Director Device*, *Installing and Connecting a QFX3008-I Interconnect Device*, and *Installing and Connecting a QFX3500 Device*.
- Rack, mount, and install your Virtual Chassis hardware (EX4200 switches). For more information, see *Installing and Connecting an EX4200 Switch*.
- Create two Virtual Chassis of four members each. For more information, see *Configuring an EX4200, EX4500, or EX4550 Virtual Chassis (CLI Procedure)*
- Select a USB flash drive that meets the QFabric control plane Virtual Chassis USB port specifications. See *USB Port Specifications for an EX Series Switch*.
- Use a computer or other device to load the configuration file from the Internet and copy it to the USB flash drive.

To import the Virtual Chassis configuration file into a USB flash drive:

1. In a browser, go to <http://www.juniper.net/support/downloads/junos.html>.

The Junos Platforms Download Software page appears.

**NOTE:** To access the download site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website <https://www.juniper.net/registration/Register.jsp>.

2. Click **QFX3100** in the **QFX Series** section.

The QFX3100 Download Software page appears.

3. From the **Release** list, select the number of the software version for which you want to download the Virtual Chassis configuration file.
4. Select the **Software** tab and then click **QFX3000-G QFabric System - Control Plane Virtual Chassis Configuration** in the **QFabric System Install Package and Media** section.  
A login page appears.
5. Enter your user ID and password and press **Enter**.

6. Read the End User License Agreement, select the **I agree** option button, and then click **Proceed**.
7. Save the Virtual Chassis configuration file onto the USB flash drive using your computer or other device.
8. Remove the USB flash drive from the computer or other device.
9. Insert the USB flash drive into the USB port on the EX4200 switch.
10. Save the file to `/var/home/username`.
11. Load the configuration file into the switch.  

```
user@switch# load override filename
```
12. Commit the configuration.  

```
user@switch# commit  
Load complete
```
13. Remove the USB flash drive from the switch.

**Related Documentation** • [Example: Configuring the Virtual Chassis for a Copper-Based QFX3000-G QFabric System Control Plane on page 1400](#)

### Example: Configuring EX4200 Switches for the QFX3000-M QFabric System Control Plane

This example shows you how to connect QFabric system components and configure the EX4200 switches used for the QFX3000-M QFabric system control plane network. Proper wiring of Director devices, Interconnect devices, and Node devices to the EX4200 switches, combined with a standard configuration, enables you to bring up the internal QFabric system management network and prepare your QFabric system for full operation.

**NOTE:** The EX4200 switch configuration is the same for both the copper-based and fiber-based QFX3000-M QFabric system control plane networks. Hence, a separate example for configuring EX4200 switches for the fiber-based control plane network is not provided.

However, because you cannot mix and match fiber and copper in the same control plane network, you must select only one type of control plane for each QFX3000-M QFabric system you install. The primary focus of this example is a copper-based control plane network. Before you use this example to configure a fiber-based control plane network, ensure that you have installed and wired the QFabric system hardware and EX4200 switches as required for a fiber-based control plane network (see *QFX3000-M QFabric System Installation Overview*).

- [Verification on page 1465](#)

## Requirements

This example uses the following hardware and software components:

- One QFX3000-M QFabric system containing:
  - Two QFX3100 Director devices with 1000BASE-T network modules installed
  - Two QFX3600-I Interconnect devices
  - Eight QFX3500 Node devices with a 1000BASE-T management board installed
- Two EX4200-24T switches with SFP+ uplink module installed
- Junos OS Release 13.2X52-D10 for the QFabric system components
- Junos OS Release 12.3R6.6 for the EX Series switches

Before you begin:

- Rack, mount, and install your QFabric system hardware (Director group, Interconnect devices, and Node devices). For more information, see *Installing and Connecting a QFX3100 Director Device*, *Installing and Connecting a QFX3600 or QFX3600-I Device*, and *Installing and Connecting a QFX3500 Device*.
- Rack, mount, and install your EX4200 switches. For more information, see *Installing and Connecting an EX4200 Switch*.

## Overview

The QFX3000-M QFabric system control plane network connects the Director group, Interconnect devices, and Node devices in a QFabric system across a pair of redundant EX4200 switches. By separating the management control plane from the data plane, the QFabric system can scale efficiently. The copper-based control plane network uses Gigabit Ethernet cabling and connections between components, and two 1-Gigabit Ethernet connections configured in a link aggregation group (LAG) between the redundant EX4200 switches.

Specific ports have been reserved on the EX4200 switches to connect to each of the QFabric system device types. Such design simplifies installation and facilitates timely deployment of a QFabric system. It also permits the use of a standard EX4200 switch configuration included as part of this example. The standard configuration can scale from the 8 Node devices shown in this example to a maximum of 16 Node devices.

## Topology

[Figure 41 on page 1446](#) shows the general port ranges where QFabric system devices must be connected to the EX4200 switches. For each EX4200 switch, connect ports 0 through 15 to Node devices, ports 16 through 19 to Interconnect devices, ports 20 through 23 to Director devices, and uplink ports 0 and 1 to the other control plane switch as an inter-switch LAG. [Table 98 on page 1446](#) shows the details of the QFabric system component-to-EX4200 switch port mappings.

**Figure 41: QFX3000-M QFabric System Control Plane—EX4200 Switch Port Ranges**

**CAUTION:**

- The control plane network within a QFabric system is a critical component of the system that should not be shared with other network traffic. In order to scale efficiently, the control plane network must be reserved for the QFabric system and its components. As a result, the ports of the QFabric system control plane must never be used for any purpose other than to transport QFabric system control plane traffic, and we neither recommend nor support the connection of other devices to the QFabric system control plane network.
- Do not install Junos Space and AI-Scripts (AIS) on the control plane network EX4200 switches in a QFX3000-M QFabric system.

Table 98 on page 1446 shows the specific mappings of QFabric system control plane network ports from the QFabric system components to the EX4200 switches.

**NOTE:** The uplink ports 2 and 3 on the EX4200 switches are reserved for future use.

| Reserved<br>Uplink port 2 (ge-0/1/2)                | Reserved<br>Uplink port 2 (ge-0/1/2)                | Future use               |
| Reserved<br>Uplink port 3 (ge-0/1/3)                | Reserved<br>Uplink port 3 (ge-0/1/3)                | Future use               |

Next, connect the Director devices to the EX4200 switches. In general, you want to accomplish the following:

- Connect two ports from one network module in a Director device to the first EX4200 switch, and two ports from the second network module to the second EX4200 switch.
- Connect the Director devices to each other and create a Director group. You can use either straight-through RJ-45 patch cables or crossover cables, because the Director devices contain autosensing modules. Connect one port from each network module on the first Director device to one port in each network module on the second Director device.

[Figure 42 on page 1449](#) shows the specific ports on the Director group that you must connect to the EX4200 switches and interconnect between the Director devices.

**Figure 42: QFX3000-M QFabric System Control Plane—Director Group to EX4200 Switch Connections**

In this specific example, connect ports **0** and **1** from module **0** on Director device DG0 to ports **20** and **21** on EX4200 switch EX0 (ge-0/0/20 and ge-0/0/21), and connect ports **0** and **1** from module **1** to ports **20** and **21** on the *second* EX4200 switch EX1 (ge-0/0/20 and ge-0/0/21).

For Director device DG1, connect ports **0** and **1** from module **0** to ports **22** and **23** on EX4200 switch EX0 (ge-0/0/22 and ge-0/0/23), and connect ports **0** and **1** from module **1** to ports **22** and **23** on the *second* EX4200 switch EX1 (ge-0/0/22 and ge-0/0/23).

To form the Director group, connect port **3** on module **0** on Director device DG0 to port **3** on module **0** on Director device DG1. Similarly, connect port **3** on module **1** on Director device DG0 to port **3** on module **1** on Director device DG1. [Table 99 on page 1449](#) shows the port mappings for the Director group in this example.

**Table 99: Director Group Port Mappings**

| Director Device | EX4200 Switch EX0                                                                                                                                                                                                                                                   | EX4200 Switch EX1                                                                                                                                                                                                                                                   |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DG0             | <ul style="list-style-type: none"> <li>DG0 module 0, port <b>0</b> to port <b>20</b> on EX0 (ge-0/0/20)</li> <li>DG0 module 0, port <b>1</b> to port <b>21</b> on EX0 (ge-0/0/21)</li> <li>DG0 module 0, port <b>3</b> to module 0, port <b>3</b> on DG1</li> </ul> | <ul style="list-style-type: none"> <li>DG0 module 1, port <b>0</b> to port <b>20</b> on EX1 (ge-0/0/20)</li> <li>DG0 module 1, port <b>1</b> to port <b>21</b> on EX1 (ge-0/0/21)</li> <li>DG0 module 1, port <b>3</b> to module 1, port <b>3</b> on DG1</li> </ul> |
| DG1             | <ul style="list-style-type: none"> <li>DG1 module 0, port <b>0</b> to port <b>22</b> on EX0 (ge-0/0/22)</li> <li>DG1 module 0, port <b>1</b> to port <b>23</b> on EX0 (ge-0/0/23)</li> <li>DG1 module 0, port <b>3</b> to module 0, port <b>3</b> on DG0</li> </ul> | <ul style="list-style-type: none"> <li>DG1 module 1, port <b>0</b> to port <b>22</b> on EX1 (ge-0/0/22)</li> <li>DG1 module 1, port <b>1</b> to port <b>23</b> on EX1 (ge-0/0/23)</li> <li>DG1 module 1, port <b>3</b> to module 1, port <b>3</b> on DG0</li> </ul> |

In the software, the ports of each network module on a Director device are reversed, numbered from right to left, and incremented sequentially across modules. If you issue interface operational commands directly on the Director device, note the following port mappings as shown in [Table 93 on page 1407](#):

**Table 100: Hardware to Software Port Mappings for Director Device Network Modules**

| Network Module | Port 0 | Port 1 | Port 2 | Port 3 |
|----------------|--------|--------|--------|--------|
| Module 0       | eth5   | eth4   | eth3   | eth2   |
| Module 1       | eth9   | eth8   | eth7   | eth6   |

Figure 43 on page 1450 shows the specific ports on the QFX3600-I Interconnect devices that you must connect to the EX4200 switches. In general, connect the first management port in an Interconnect device to the first EX4200 switch, and the second management port to the second EX4200 switch.

**Figure 43: QFX3000-M QFabric System Control Plane—Interconnect Device to EX4200 Switch Connections**

In this specific example, for both Interconnect devices IC0 and IC1, connect management port **C0** to EX4200 switches EX0 and EX1 and management port **C1** to EX4200 switches EX0 and EX1. Connect the management port **C0** cables to port 16 on EX4200 switches EX0 and EX1 (ge-0/0/16), and connect the management port **C1** cables to port 17 on EX4200 switches EX0 and EX1 (ge-0/0/17). Table 101 on page 1450 shows the port mappings for the Node devices in this example.

**Table 101: Interconnect Device Port Mappings**

| Interconnect Device | EX4200 Switch EX0                                     | EX4200 Switch EX1                                     |
|---------------------|-------------------------------------------------------|-------------------------------------------------------|
| IC0                 | IC0, management port <b>C0</b> to port 16 (ge-0/0/16) | IC0, management port <b>C1</b> to port 16 (ge-0/0/16) |
| IC1                 | IC1, management port <b>C0</b> to port 17 (ge-0/0/17) | IC1, management port <b>C1</b> to port 17 (ge-0/0/17) |

Figure 44 on page 1451, Figure 45 on page 1451, and Figure 46 on page 1451 show the specific ports on the Node devices that you must connect to the EX4200 switches when using a copper-based control plane. In general, connect the first management port from a Node device to the first EX4200 switch, and the second management port to the second EX4200 switch.

Figure 44: QFX3000-M QFabric System Control Plane—QFX3500 Node Device to EX4200 Switch Connections

Figure 45: QFX3000-M QFabric System Control Plane—QFX3600 Node Device to EX4200 Switch Connections

Figure 46: QFX3000-M QFabric System Control Plane—QFX5100 Node Device to EX4200 Switch Connections

When implementing a fiber-based control plane, refer to [Figure 47 on page 1451](#), [Figure 48 on page 1451](#), and [Figure 49 on page 1451](#) for the proper control plane connections.

Figure 47: QFX3000-M QFabric System Fiber-Based Control Plane—QFX3500 Node Device to EX4200 Switch Connections

Figure 48: QFX3000-M QFabric System Fiber-Based Control Plane—QFX3600 Node Device to EX4200 Switch Connections

Figure 49: QFX3000-M QFabric System Fiber-Based Control Plane—QFX5100 Node Device to EX4200 Switch Connections

In this specific example, for Node device Node0, connect management port **C0** (also known as me5) to EX4200 switch EX0 port **0** (ge-0/0/0), and connect management port **C1** (also known as me6) to the *second* EX4200 switch EX1 port **0** (ge-0/0/0).

For the remaining seven Node devices, connect management port **C0** to the *ge-0/0/X* port on EX4200 switch EX0 that matches the Node device number. Similarly, connect management port **C1** to the port on the *second* EX4200 switch EX1 that matches the Node device number. For example, you would connect Node device Node5 to port **5** (ge-0/0/5). [Table 96 on page 1409](#) shows the full set of port mappings for the Node devices in this example.

**Table 102: Node Device to EX4200 Switch Port Mappings**

| Node Device | EX4200 Switch EX0                                            | EX4200 Switch EX1                                            |
|-------------|--------------------------------------------------------------|--------------------------------------------------------------|
| Node0       | Node0, management port <b>C0</b> to port <b>0</b> (ge-0/0/0) | Node0, management port <b>C1</b> to port <b>0</b> (ge-0/0/0) |
| Node1       | Node1, management port <b>C0</b> to port <b>1</b> (ge-0/0/1) | Node1, management port <b>C1</b> to port <b>1</b> (ge-0/0/1) |
| Node2       | Node2, management port <b>C0</b> to port <b>2</b> (ge-0/0/2) | Node2, management port <b>C1</b> to port <b>2</b> (ge-0/0/2) |
| Node3       | Node3, management port <b>C0</b> to port <b>3</b> (ge-0/0/3) | Node3, management port <b>C1</b> to port <b>3</b> (ge-0/0/3) |
| Node4       | Node4, management port <b>C0</b> to port <b>4</b> (ge-0/0/4) | Node4, management port <b>C1</b> to port <b>4</b> (ge-0/0/4) |
| Node5       | Node5, management port <b>C0</b> to port <b>5</b> (ge-0/0/5) | Node5, management port <b>C1</b> to port <b>5</b> (ge-0/0/5) |
| Node6       | Node6, management port <b>C0</b> to port <b>6</b> (ge-0/0/6) | Node6, management port <b>C1</b> to port <b>6</b> (ge-0/0/6) |
| Node7       | Node7, management port <b>C0</b> to port <b>7</b> (ge-0/0/7) | Node7, management port <b>C1</b> to port <b>7</b> (ge-0/0/7) |

[Figure 50 on page 1453](#) shows the specific uplink ports on the first EX4200 switch that you must connect to the second EX4200 switch. These connections create a link aggregation group (LAG) that provides redundancy and resiliency for the EX4200 switch portion of the control plane. In general, connect each 1-Gigabit Ethernet uplink port from the first EX4200 switch to the corresponding 1-Gigabit Ethernet uplink port on the second EX4200 switch.

Figure 50: QFX3000-M QFabric System Control Plane—Inter-EX4200 Switch LAG Connections

In this specific example, for EX4200 switch EX0, connect uplink port 0 (ge-0/1/0) to EX4200 switch EX1 uplink port 0 (ge-0/1/0). Then connect uplink port 1 (ge-0/1/1) on EX4200 switch EX0 to uplink port 1 (ge-0/1/1) on EX4200 switch EX1.

Table 97 on page 1410 shows the port mappings for the EX4200 switch LAG connections in this example.

Table 103: EX4200 Switch LAG Port Mappings

| EX0 and EX1   | EX0                  | EX1                  |
|---------------|----------------------|----------------------|
| Uplink port 0 | ge-0/1/0 to ge-0/1/0 | ge-0/1/0 to ge-0/1/0 |
| Uplink port 1 | ge-0/1/1 to ge-0/1/1 | ge-0/1/1 to ge-0/1/1 |

### Configuration

- [xref target has no title]

#### CLI Quick Configuration

To configure the QFX3000-M QFabric system control plane EX4200 switches quickly, copy the following commands, paste them in a text file, remove any line breaks, change any details necessary to match your network, and then copy and paste the commands into the EX4200 switch CLI at the [edit] hierarchy level.

```

set groups qfabric chassis aggregated-devices ethernet device-count 3

```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure a EX4200 switch for the QFX3000-M QFabric system control plane network:

1. Create a configuration group called `qfabric` to define global QFabric system control plane properties. Set up the number of aggregated Ethernet devices, configure alarm and LCD management, activate loop prevention and storm control, specify a global VLAN (VLAN 100) and 802.1q tunneling, define options for aggregated Ethernet interfaces, and apply the `qfabric` group settings to the configuration.

```
[edit]
user@switch# set groups qfabric chassis aggregated-devices ethernet device-count
3
user@switch# set groups qfabric chassis alarm management-ethernet link-down
ignore
user@switch# set groups qfabric chassis lcd-menu fpc 0 menu-item
maintenance-menu disable
user@switch# set groups qfabric protocols rstp interface ae2.0 mode point-to-point
user@switch# set groups qfabric protocols rstp interface all edge
user@switch# set groups qfabric protocols rstp interface all no-root-port
user@switch# set groups qfabric protocols rstp bpdu-block-on-edge
user@switch# set groups qfabric protocols lldp interface all
user@switch# set groups qfabric ethernet-switching-options storm-control interface
all bandwidth 10000
user@switch# set groups qfabric vlans qfabric vlan-id 100
user@switch# set groups qfabric vlans qfabric dot1q-tunneling
user@switch# set groups qfabric-int interfaces <*> mtu 9216
user@switch# set groups qfabric-int interfaces <*> unit 0 family ethernet-switching
port-mode access
user@switch# set groups qfabric-int interfaces <*> unit 0 family ethernet-switching
vlan members qfabric
user@switch# set groups qfabric-ae interfaces <*> aggregated-ether-options
link-speed 1g
user@switch# set groups qfabric-ae interfaces <*> aggregated-ether-options lacp
active
user@switch# set apply-groups qfabric
```

2. Configure interfaces for the QFabric system control plane network. Enable the EX4200 switch SFP+ uplink module for 1-Gigabit Ethernet operation. Set the interface ranges where Node devices (0 through 15), Interconnect devices (16 and 17), and Director devices (20 through 23) connect to the control plane network through the EX4200 switches. Configure the inter-EX4200 switch LAG connections for the ae2 interface and apply the `qfabric-int` and `qfabric-ae` configuration groups to the aggregated Ethernet interfaces (ae0 and ae1) for the Director devices.

```

```

**Results** To view the configuration, issue the **show** command in configuration mode or the **show configuration** command in operational mode. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

The following configuration is the standard configuration that applies universally to both EX4200 switches in your QFabric system control plane network.

```

To verify the syntax of your configuration prior to committing it, enter **commit check** from configuration mode. If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the EX4200 switch configuration is working properly.

- [Verifying the QFX3000-M QFabric System Control Plane—EX4200 Switch EX0 on page 1465](#)
- [Verifying the QFX3000-M QFabric System Control Plane—EX4200 Switch EX1 on page 1466](#)

#### *Verifying the QFX3000-M QFabric System Control Plane—EX4200 Switch EX0*

**Purpose** Verify that the control plane is properly connected on your first EX4200 switch.

**Action** Connect to the Junos OS CLI of EX4200 switch EX0, either from your management network or from the console port of the switch. In operational mode, enter the **show interfaces terse** command.

### Sample Output

```
user@ex0> show interfaces terse
```

**Meaning** In the output of the **show interfaces terse** command, if all interfaces that connect to the QFabric system devices are listed as **up** (such as ge-0/0/16 and ge-0/0/17 for the Interconnect devices; ge-0/0/20 through ge-0/0/23 for the Director devices; ge-0/0/0 through ge-0/0/7 for the Node devices; and ge-0/1/0 and ge-0/1/1 for the inter-EX4200 switch connections), the control plane is properly connected.

#### **Verifying the QFX3000-M QFabric System Control Plane—EX4200 Switch EX1**

**Purpose** Verify that the control plane is properly connected on your second EX4200 switch.

**Action** Connect to the Junos OS CLI of EX4200 switch EX1, either from your management network or from the console port of the switch. In operational mode, enter the **show interfaces terse** command.

### Sample Output

```
user@ex1> show interfaces terse
```

| Interface   | Admin | Link | Proto      | Local     | Remote |

## Importing a QFX3000-M QFabric System Control Plane EX4200 Switch Configuration with a USB Flash Drive

There are two methods of importing the configuration file to the QFX3000-M QFabric system control plane EX4200 switches.

- Download the configuration file onto a USB flash drive from the Juniper Networks software download site before inserting the USB flash drive into the EX4200 switch USB port
- Copy and paste the configuration from “[Example: Configuring EX4200 Switches for the QFX3000-M QFabric System Control Plane](#)” on page 1444.

**NOTE:** The EX4200 switch configuration is the same for both the copper-based and fiber-based QFX3000-M QFabric system control plane networks.

Before you begin:

- Rack, mount, and install your QFabric system hardware (Director group, Interconnect devices, and Node devices). For more information, see *Installing and Connecting a QFX3100 Director Device*, *Installing and Connecting a QFX3600 or QFX3600-I Device*, and *Installing and Connecting a QFX3500 Device*.
- Rack, mount, and install your EX4200 switches for the QFabric system control plane. For more information, see *Installing and Connecting an EX4200 Switch*.
- Select a USB flash drive that meets the EX4200 switch USB port specifications. See *USB Port Specifications for an EX Series Switch*.
- Use a computer or other device to download the configuration file from the Internet and copy it to the USB flash drive.

To import the control plane EX4200 switch configuration file onto a USB flash drive:

1. In a browser, go to <http://www.juniper.net/support/downloads/junos.html>.

The Junos Platforms - Download Software page appears.

**NOTE:** To access the download site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website <https://www.juniper.net/registration/Register.jsp>.

2. In the QFX Series box, select **QFX3000-M QFabric System**.

The QFX3000-M QFabric System - Download Software page appears.

3. Click the **Software** tab and select the software release number from the **Release** list that appears to the right of the Software tab.

A login screen appears.

4. In the QFabric System Control Plane Network section, select **QFX3000-M Control Plane Network Configuration**.

A login screen appears.

5. Enter your user ID and password and click **Login**.
6. Read the End User License Agreement, select the **I agree** option button, and then click **Proceed**.
7. Save the configuration file onto the USB flash drive using your computer or other device.
8. Insert the USB flash drive into the USB port on the EX4200 switch.
9. Save the file to the `/var/home/username` directory on the EX4200 switch.
10. Load the configuration file into the switch.

```
user@switch# load override filename
```

11. Commit the configuration.

```
user@switch# commit
Load complete
```

12. Remove the USB flash drive from the switch.

## Generating the MAC Address Range for a QFabric System

Each QFabric system requires a range of reserved MAC addresses that is assigned by Juniper Networks. You must specify the MAC address range when you perform the initial setup of the QFX3100 Director group (see [“Performing the QFabric System Initial Setup on a QFX3100 Director Group” on page 1471](#)). Additionally, refer to [Activate Your QFabric System](#) for more information.

When you purchase a QFabric system, you receive an e-mail containing a software serial number from Juniper Networks. You can use the software serial number to generate the MAC address range for your QFabric system.

To generate the MAC address range for a QFabric system:

1. In a browser, log in to the Juniper Networks License Management System at <https://www.juniper.net/lcrs/license.do>.

The Manage Product Licenses page appears.

**NOTE:** To access the licensing site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website <https://www.juniper.net/registration/Register.jsp>.

2. On the Generate Licenses tab, select **QFX Series Product** from the drop-down list, and click **Go**.

The Generate Licenses - QFX Series Product page appears.

3. Select the **QFX Series Product Fabric** option button, and click **Continue**.

The Generate Licenses - QFX Series Product Fabrics page appears.

4. In the **Software Serial No** field, enter the software serial number for your QFabric system, and press the Tab key.

The starting MAC address and number of MAC addresses for your QFabric system are displayed.

5. (Optional) Click **Download/Email MAC Address** to download or e-mail the MAC address range.

The Download/Email MAC Address page appears.

To download the MAC address range:

- Select the **Download to this computer** option button, and click **OK**.

To e-mail the MAC address range:

- Select the **Send e-mail to e-mail ID** option button, and click **OK**.

#### Related Documentation

- [Performing the QFabric System Initial Setup on a QFX3100 Director Group on page 1471](#)

## Performing the QFabric System Initial Setup on a QFX3100 Director Group

You must perform the initial setup of the QFX3100 Director group through the console port. (Before configuring the QFX3100 Director group, see *Installing and Connecting a QFX3100 Director Device*.)

Before you begin connecting and configuring a QFX3100 Director group, set the following parameter values on the console server or PC:

- Baud Rate—9600
- Flow Control—None

- Data—8
- Parity—None
- Stop Bits—1
- DCD State—Disregard

**NOTE:** When you use the SecureCRT client to connect to a Director device for the initial setup of a QFabric system, the backspace key does not work. As a workaround, use the Shift+Delete key combination in SecureCRT as a backspace key equivalent or use a different UNIX client to support the backspace key natively.

The initial setup requires that you specify certain values for your QFabric system. These include:

- Software serial number for your QFabric system (found in the e-mail containing the software serial number that you received from Juniper Networks when you purchased your QFabric system)
- IP addresses and a default gateway IP address for your QFabric system default partition
- IP addresses for your Director group device management ports
- Range of reserved MAC addresses for your QFabric system (see [“Generating the MAC Address Range for a QFabric System” on page 1470](#) or [Activate Your QFabric System](#) for this information)
- Root password for your Director group
- Root password for the QFabric system components such as the Node devices, Interconnect devices, and infrastructure
- [Performing an Initial Setup on page 1472](#)
- [Restoring a Backup Configuration on page 1475](#)

### **Performing an Initial Setup**

---

The initial setup can be performed either manually or by using a previously saved backup configuration.

To connect and configure the QFX3100 Director group manually from the console:

1. Connect the console port of one of the Director devices to a laptop or PC using an RJ-45 to DB-9 rollover cable. An RJ-45 to DB-9 rollover cable is supplied with each QFX3100 Director device. The console (**CONSOLE**) port is located on the front panel of the device.
2. Log in as **root**. If the software booted before you connected to the console port, you might need to press the Enter key for the prompt to appear.

dg0 login: **root**

**NOTE:** The prompt is either dg0 login or dg1 login depending on the Director device to which you connected your cable.

3. For manual configuration or for initial installation, enter **no** when prompted to specify the backup file. The current Director device configuration is displayed.

#### Initial Configuration

Before you can access the QFabric system, you must complete the initial setup of the Director group by using the steps that follow. If the initial setup procedure does not complete successfully, log out of the Director device and then log back in to restart this setup menu.

Continue? [y/n]: **y**

You may enter the configuration manually or restore from a backup.

Specify a backup file? [y/n]: **n**

Existing local configuration:

4. Enter the IP addresses and prefixes for both Director devices.

**NOTE:** The Director group devices and QFabric system default partition IP addresses must be on the same subnet as your management network.

Please enter the Director Group 0 IP address and prefix: **ip address/prefix**

Please enter the Director Group 1 IP address and prefix: **ip address/prefix**

Please enter the Director Group Subnet Mask: **subnet mask**

5. Enter the gateway IP address for the Director group.

Please enter the Director Group gateway IP address: **gateway ip address**

6. Enter the default partition IP address. (You will use this address to log in to the QFabric system on subsequent connections.)

Please enter the QFabric default partition IP address: **ip address**

7. (Optional) Enter the IPv6 addresses for both Director devices and the gateway IPv6 address for the Director group.

Would you like to input IPv6 addresses for Director Group nodes? (y/n): **y**

Please enter the Director Group 0 IPv6 address or 'y' to use /0: **IPv6 address**

Please enter the Director Group 1 IPv6 address or 'y' to use /0: **IPv6 address**

Please enter the Director Group gateway IPv6 address or 'y' to use /0 : **IPv6 address**

8. Enter the MAC address information.

Please enter the starting MAC address: **mac address**

Please enter the number of MAC addresses: **number of mac addresses**

**NOTE:** The minimum number of MAC addresses accepted is 4000.

9. Enter the QFabric system software serial number.

Please enter the QFabric serial ID: **serial id**

10. Create the Director device root password.

Please enter a Director device root password: **director-device-password**

Please re-enter password: **director-device password**

11. Create a password for the QFabric system components.

**NOTE:** If you need to change the component password after the QFabric system is operational, issue the device-authentication statement at the [edit system] hierarchy level in the QFabric default partition CLI.

Please enter a password for QFabric components (Node devices, Interconnect devices, and infrastructure): *component-password*  
 Please re-enter password: *component-password*  
 Note: please record your passwords for recovery purposes.

**CAUTION:** Carefully save your passwords for future reference, because some cannot be recovered on a QFabric system.

12. Enter the QFabric system platform type.

Supported platform types:

1. QFX3000-G
2. QFX3000-M

Please select product type: *number corresponding to platform type*

13. Confirm the initial configuration. Ensure that the information is accurate before proceeding.

Does the following configuration appear correct?

|                                           |                            |
|-------------------------------------------|----------------------------|
| Director Group 0 IPv4/Prefix              | [10.94.200.9/24]           |
| Director Group 1 IPv4/Prefix              | [10.94.200.10/24]          |
| Director Group IPv4 Gateway               | [10.94.200.250]            |
| Director Group 0 IPv6/Prefix              | [2000:1:2:3::a5e:c809/64]  |
| Director Group 1 IPv6/Prefix              | [2000:1:2:3::a5e:c80a/64]  |
| Director Group IPv6 Gateway               |                            |
| [2000:0001:0002:0003:0226:88ff:fe7b:e880] |                            |
| QFabric Default Partition (IPv6 address)  | [2000:1:2:3::0a5e:c802/64] |
| QFabric Serial ID                         | [qfsn-0123456789]          |
| Director Device Password                  | [*****]                    |

**NOTE:** Only addresses of the IP version(s) you entered will appear in the configuration.

14. Confirm the initial setup.

[y/n]: y

**CAUTION:** Resetting this initial configuration requires assistance from Juniper Networks customer support or [“Performing a QFabric System Recovery Installation on the Director Group” on page 123](#). As a result, make sure you are certain the values you entered are correct before you enter **yes**.

15. The director device displays the configuration.

Saving temporary configuration...  
 Configuring peer...  
 Configuring local interfaces...

```

Configuring interface eth0 with [10.49.214.74/24:10.49.214.254]

Applying the QFabric component password
First install initial configuration, generating and sharing SSH keys.
First install initial configuration, generating SSH keys.
Configuration complete. Director Group services will auto start within 30
seconds.

```

## Restoring a Backup Configuration

Before you restore a backup configuration for the Director group:

- You must have a backup configuration file. You create the backup file with the [request system software configuration-backup](#) command and save it on an external USB flash drive.
- If you need to reinstall the system software, perform that operation first (see [“Performing a QFabric System Recovery Installation on the Director Group” on page 123](#)).

To connect and configure the Director group with a backup configuration:

1. Log in as **root**. If the software booted before you connected to the console port, you might need to press the Enter key for the prompt to appear.

```
dg0 login: root
```

**NOTE:** The prompt is either **dg0 login** or **dg1 login** depending on the Director device to which you connected your cable.

2. To use a previously saved backup configuration, enter **yes** when prompted to specify the backup file and then enter the path and filename of the backup configuration.

```
Specify a back up file? [y/n]: y
```

```
Please specify the full path of the configuration backup file: path/filename
```

3. Confirm the restoration of the configuration from the backup. Ensure that the information is accurate before proceeding.

```
Does the following configuration appear correct?
```

```

Director Group 0 IP/Prefix      [10.49.214.74/24]
Director Group 1 IP/Prefix      [10.49.214.75/24]
Director Group Gateway          [10.49.214.254]
Starting MAC address            [00:11:00:00:00:00]
Number of MAC addresses         [4000]
QFabric Default Partition IP    [10.49.214.150]
QFabric serial ID               [qfsn-123456789]
Director Device Password        [*****]
QFabric component Password      [*****]
Product Type:                   [QFX3000-G]

```

4. Confirm the backup restoration.

```
[y/n]: y
```

The Director device displays the configuration.

```
Saving temporary configuration...
Configuring peer...
Configuring local interfaces...

## Understanding QFabric System Administration Tasks and Utilities

The following items describe QFabric system components, common administration tasks that you perform on the QFabric system, or utilities that help you to manage the QFabric system and its components.

- **Converting the device mode (QFX3500 and QFX3600 devices)**—Enables you to convert a QFX3500, QFX3600, or QFX5100 device into a Node device so it can be deployed within a QFabric system. By default, QFX3500, QFX3600, and QFX5100 devices operate in *standalone* mode. Before the devices can participate within a QFabric system environment, you must change the device mode for the switch to *node-device* mode. To convert a QFX3500, QFX3600, or QFX5100 device from standalone mode to Node device mode, connect to the console port of the device, issue the **request chassis device-mode node-device** command, verify the future device mode with the **show chassis device-mode** command, connect the management port of the device to the QFabric system control plane, and reboot the device.

**NOTE:**

- Before you convert the device mode, you must upgrade the software on your standalone device to a QFabric system Node and Interconnect device software package that matches the QFabric system complete software package used by your QFabric system. For example, if the complete software package for your QFabric system is named `jinstall-qfabric-11.3X30.6.rpm`, you need to install the `jinstall-qfx-11.3X30.6-domestic-signed.tgz` package on your standalone device. Matching the two software packages ensures a smooth and successful addition of the device to the QFabric system inventory.
  - Converting the device mode erases the switch configuration. We recommend that you save your configuration to an external server or USB flash drive before executing the device mode conversion commands and rebooting the switch.
- 
- **QFabric system control plane Ethernet network (EX4200 switches to support the QFabric system)**—Provides a separate control plane network within the QFabric system to handle management traffic. This design enables the data plane network to focus on efficient, low-latency delivery of data, voice, and video traffic.
    - The QFX3000-G QFabric system control plane uses two sets of four EX4200 switches each, configured as a pair of Virtual Chassis to connect all components within the QFabric system. The dual Virtual Chassis architecture provides redundancy and high availability to ensure reliable QFabric system operation for the Director group, the Interconnect devices, and the Node devices.
    - The QFX3000-M QFabric system control plane uses two EX4200 switches to connect all components within the QFabric system. The two EX4200 switches provide redundancy and high availability to ensure reliable QFabric system operation for the Director group, the Interconnect devices, and the Node devices.

Because the level of detail necessary to fully understand the control plane connections, cabling, topology, and configuration is beyond the scope of this topic, see:

- [“Example: Configuring the Virtual Chassis for a Copper-Based QFX3000-G QFabric System Control Plane” on page 1400](#) for information about a QFX3000-G QFabric system with a copper-based control plane

- [“Example: Configuring EX4200 Switches for the QFX3000-M QFabric System Control Plane” on page 1444](#) for information about a QFX3000-M QFabric system with a copper or fiber-based control plane
- **QFabric system data plane network**—Provides a separate network to handle rapid delivery of data plane traffic. The data plane uses QSFP+ interfaces and fiber-optic cabling to connect QFabric system components at speeds of 40 Gbps. By creating a redundant set of connections between the Node devices and the backplane-like Interconnect devices, the data plane enables the Node devices to appear as if they are directly connected to one another in a single tier. To view the connection status of the QFabric system data plane, issue the **show chassis fabric connectivity** command.
- **Director group (QFX3100 Director devices within a QFabric system)**—Provides a redundant, resilient platform that manages the QFabric system components. Two QFX3100 Director devices work together to ensure high availability of the system and load-balance system processes, such as the command-line interface (CLI) and shared storage. To configure the Director group for operation, install and cable two Director devices as a Director group, connect to the console port of one of the Director devices, and perform the initial setup. The setup script starts automatically the first time you power on the Director device. For more information, see [“Performing the QFabric System Initial Setup on a QFX3100 Director Group” on page 1471](#). To monitor the status of the Director group, log in to the QFabric system default partition and issue the **show fabric administration inventory director-group status** command.
- **Automatic detection and configuration of QFabric system components**—Enables QFabric system components to join the QFabric system automatically. When you install the QFabric system, activate the control plane and Director group, and power on the Node and Interconnect devices, the Director group recognizes these devices, sends each device its own portion of the Junos OS configuration, and adds them to the QFabric system inventory. By default, each individual Node device is placed into a unique server Node group that contains only that single Node device. No configuration is required for the default assignments. The default settings can be overridden when you add Node devices into a redundant server Node group (containing a pair of Node devices) or a network Node group (that can contain up to eight Node devices, run routing protocols, and connect to external networks).
- **QFabric system Routing Engines**—Support the QFabric system by providing virtual, redundant instances of Junos OS that run on the Director group. The Routing Engines perform fabric management tasks, maintain control of the fabric, and host the operation of routing protocols for network Node groups. Because they are generated in pairs, the Routing Engines provide additional high availability for the QFabric system. No configuration is required. To view the status of the QFabric system Routing Engines, issue the **show fabric administration inventory infrastructure** command.
- **QFabric system command-line interface**—Enables you to configure all components of the QFabric system from a single location by using the Junos OS CLI. To access this central location, you need to log in to the QFabric system default partition (an IP address you specify during the initial setup of the Director group). For more information, see [“Performing the QFabric System Initial Setup on a QFX3100 Director Group” on page 1471](#).

Most existing Junos OS configuration statements and operational mode commands are supported (for example, interfaces, VLANs, protocols, and firewall filters).

To view QFabric system components and check connectivity of the system, issue the **show fabric administration inventory** commands.

- **Alias configuration for Director devices, Interconnect devices, and Node devices**—Enables you to set user-defined aliases for QFabric system Director devices, Interconnect devices, and Node devices to facilitate usability of the QFabric system as it scales. Aliased names appear in the output of many QFabric system operational commands, such as **show fabric administration inventory**. To map the hardware serial number of a Director device, Interconnect device or Node device to a user-defined name, see [“Configuring Aliases for the QFabric System” on page 1489](#).
- **Node group configuration**—Enables you to cluster several Node devices together to provide redundancy, resiliency, and high availability at the ingress and egress points of the QFabric system. There are two types of Node groups you can configure:
  - **Redundant server Node group**—Enables the grouped Node devices to connect the QFabric system to local servers and storage devices. A redundant server Node group can contain a maximum of two Node devices and supports LAG connections that can span both devices.

**NOTE:** The Node devices in a redundant server Node group must be of the same type, such as a QFX3500 Node, a QFX3600 Node, or a QFX5100 Node. For example, you cannot add a QFX3500 and a QFX3600 Node device to the same redundant server Node group.

- **Network Node group**—Enables the grouped Node devices to connect the QFabric system to external networks and run routing protocols such as BGP and OSPF. A network Node group can contain up to eight Node devices and supports LAG connections.

**NOTE:**

- The name of the network Node group in the default partition, *NW-NG-0*, is preset. You must use this name when adding Node devices to the network Node group. You cannot specify a different name.
- When you configure routing protocols on the QFabric system, you must use interfaces from the Node devices assigned to the network Node group. If you try to configure routing protocols on interfaces from the Node devices assigned to server Node groups, the configuration commit operation fails.

To configure a redundant server Node group, include two Node devices with the **node-device node-device-name** statement at the **[edit fabric resources node-group node-group-name]** hierarchy level.

To configure a network Node group, include the **network-domain** statement at the **[edit fabric resources node-group NW-NG-0]** hierarchy level. In addition, include between

two and eight Node devices with the **node-device *node-device-name*** statement at the **[edit fabric resources node-group NW-NG-0]** hierarchy level.

## Gaining Access to the QFabric System Through the Default Partition

This topic explains how to log in to the QFabric system default partition so you can access the Junos OS command-line interface (CLI) and configure the system.

Before you access the QFabric system default partition:

- Install the QFabric system hardware components, including connecting the network and power cables.
- Convert any QFX3500, QFX3600, or QFX5100 standalone devices to *node-device* mode.
- Connect all components to the control plane Ethernet network.
- Turn on the Director group and run the initial setup script. Remember to write down the IP address of the default partition, which must be on the same subnetwork as your management network.

To access the default partition:

1. Open an SSH connection to the QFabric default partition. Use the IP address you set for the default partition as part of the QFabric initial setup procedure. In your network, you can simplify access to the QFabric system by mapping the default partition IP address to a name.

```
[root@customer ~]# ssh root@192.168.1.49
Last login: Fri Sep  2 21:34:54 2011 from customer
Juniper QFabric Director 11.3.5043 2011-08-26 18:05:21 UTC
```

```
RUNNING ON DIRECTOR DEVICE : dg1
root@qfabric>
```

**NOTE:** The QFabric system is load balanced, so the CLI session might be hosted on either Director device DG0 or DG1.

2. Enter configuration mode (the default mode in the QFabric system is **configure private**), configure a root password and hostname for the default partition, and assign QFabric administrator privileges to the root user.

```
root@qfabric> configure
warning: Using private edit on QF/Director
warning: uncommitted changes will be discarded on exit
Entering configuration mode

[edit]

root@qfabric# set system root-authentication plain-text-password
New password: My-Password
Retype new password: My-Password

root@qfabric# set system root-authentication remote-debug-permission qfabric-admin
root@qfabric# set system host-name my-qfabric

[edit]

root@qfabric# commit
commit complete

[edit]
root@my-qfabric#
```

3. Configure your QFabric system as needed. You can configure routing protocols, interfaces, VLANs, and other features as needed. Keep in mind that interfaces require the four-level interface naming convention (*device-name:fpic/pic/port*).

### Example: Configuring QFabric System Login Classes

This example shows you how to assign the correct login class to users so they can access components within a QFabric system.

- [Requirements on page 1482](#)
- [Overview on page 1482](#)
- [Configuration on page 1483](#)
- [Verification on page 1485](#)

## Requirements

---

This example uses the following hardware and software components:

- One QFX3000-G QFabric system containing:
  - Two QFX3100 Director devices
  - Two QFX3008-I Interconnect devices
  - Eight QFX3500 Node devices
  - Junos OS Release 12.2 for these QFX Series components
- Eight EX4200 switches, used to make two redundant Virtual Chassis with four members apiece
- Junos OS Release 12.1R1.9 for the EX Series switches used in the Virtual Chassis

Before you begin:

- Perform the initial setup of the QFabric system on the Director group, which includes the creation of a username and password for the QFabric system components. See [“Performing the QFabric System Initial Setup on a QFX3100 Director Group” on page 1471](#).

## Overview

---

The QFabric system offers three special preset login classes that provide different levels of access to individual components within a QFabric system (such as Node devices and Interconnect devices). The *qfabric-admin* class provides the ability to log in to individual QFabric system components and manage them. The *qfabric-operator* class enables the user to log in to individual components and view component-level operations and configurations. The *qfabric-user* class prevents access to individual QFabric system components.

You include these classes in your configuration at the **[edit system login user *username* authentication remote-debug-permission]** hierarchy level. The key task is to decide which class you should apply to users based on their need to access QFabric system components.

**NOTE:** To set QFabric system login classes for a root user, include the **remote-debug-permission** statement at the **[edit system root-authentication]** hierarchy level and specify the *qfabric-admin* class.

If you assign the *qfabric-admin* or the *qfabric-operator* class to a user, the QFabric system maps the user to a list of authorized users who are permitted to access components. To facilitate ease of use, the QFabric system uses the component password you specified during the initial setup of the Director group. When users assigned the *qfabric-admin* or the *qfabric-operator* class log in to a component by issuing the **request component login** operational mode command, the QFabric system verifies the class and sends the

username and password to the component. The component accepts these credentials and permits access.

**NOTE:**

- The three QFabric system login classes give access to the components only. To provide access to the QFabric system as a whole through the default partition command-line interface (CLI), you must configure the usual Junos OS login classes or permissions (such as the *super-user* class). For more information about login classes, see [“Junos OS Login Classes Overview” on page 1828](#).
- If you have completed the QFabric system initial setup and the system is operational, you can change the component password by issuing the `device-authentication` statement at the `[edit system]` hierarchy level in the QFabric default partition CLI.

### Topology

This example defines three users: Adam, Oscar, and Ulf. Adam needs to manage QFabric system components, Oscar needs limited access, and Ulf should not have any access to the components. As a result, assign the `qfabric-admin` class to Adam, the `qfabric-operator` class to Oscar, and the `qfabric-user` class to Ulf. However, all three users should have all permissions to access the QFabric system CLI.

### Configuration

- [\[xref target has no title\]](#)

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the `[edit]` hierarchy level.

```
set system login class all-qfabric permissions all
set system login user Adam class all-qfabric
set system login user Adam authentication encrypted-password
"$1$aoYSFkve$G/dYqsTV5iSvVW2sND69U."
set system login user Adam authentication remote-debug-permission qfabric-admin
set system login user Oscar class all-qfabric
set system login user Oscar authentication encrypted-password
"$1$3e.3wJQ8$31SrZV0.efdRbk.ZJncKm0"
set system login user Oscar authentication remote-debug-permission qfabric-operator
set system login user Ulf class all-qfabric
set system login user Ulf authentication encrypted-password
"$1$qt9Ncm0o$okNYSN8O4fVITE/SHBdYj0"
set system login user Ulf authentication remote-debug-permission qfabric-user
```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To provide the same access to the QFabric system CLI for all users, but different QFabric system component-level access to different users:

1. Define and provide all-qfabric access and passwords to all three users. This administrator-defined class provides full permissions, enabling the users to log in to the QFabric system default partition and use the CLI. Alternatively, you can assign the super-user class to these users to accomplish the same goal.

```
[edit]
user@qfabric# set system login class all-qfabric permissions all
user@qfabric# set system login user Adam class all-qfabric
user@qfabric# set system login user Adam authentication encrypted-password
"$1$aoYSFkvE$G/dYqsTV5iSvVW2sND69U."
user@qfabric# set system login user Oscar class all-qfabric
user@qfabric# set system login user Oscar authentication encrypted-password
"$1$3e.3wJQ8$31SrV0.efdRbk.ZJncKm0"
user@qfabric# set system login user Ulf class all-qfabric
user@qfabric# set system login user Ulf authentication encrypted-password
"$1$qt9Ncm0o$okNYSN8O4fvITE/SHBdYj0"
```

2. Provide qfabric-admin component access to Adam so he can manage QFabric system components.

```
[edit]
user@qfabric# set system login user Adam authentication remote-debug-permission
qfabric-admin
```

3. Provide qfabric-operator component access to Oscar so he can view the CLI at the QFabric system components.

```
[edit]
user@qfabric# set system login user Oscar authentication remote-debug-permission
qfabric-operator
```

4. Assign qfabric-user component restrictions to Ulf to prevent him from accessing the QFabric system components.

```
[edit]
user@qfabric# set system login user Ulf authentication remote-debug-permission
qfabric-user
```

**Results** From configuration mode, confirm your configuration by entering the **show** command. If the output does not display the intended configuration, repeat the configuration instructions in this example to correct it.

For brevity, this **show** command output includes only the configuration that is relevant to this example.

```
[edit]
system {
  login {
    class all-qfabric {
```

```

        permissions all;
    }
    user Adam {
        class all-qfabric;
        authentication {
            encrypted-password "$1$aoYSFkVE$G/dYqsTV5iSvVW2sND69U."; ##
            SECRET-DATA
            remote-debug-permission qfabric-admin;
        }
    }
    user Oscar {
        class all-qfabric;
        authentication {
            encrypted-password "$1$3e.3wJQ8$31SrZV0.efdBk.ZJncKm0"; ## SECRET-DATA
            remote-debug-permission qfabric-operator;
        }
    }
    user Ulf {
        class all-qfabric;
        authentication {
            encrypted-password "$1$qt9Ncm0o$okNYSN8O4fVITE/SHBdYj0"; ##
            SECRET-DATA
            remote-debug-permission qfabric-user;
        }
    }
}

```

If you are done configuring the device, enter **commit** from configuration mode.

### Verification

Confirm that the QFabric system and component-level access configuration is working properly for all three users. Adam, Oscar, and Ulf should have equivalent, full-permission access to the QFabric system CLI. Adam should have management-level access to components. Oscar should have read-only access to components. Ulf should have no component-level access.

- [Verifying qfabric-operator Access on page 1487](#)
- [Verifying qfabric-user Access on page 1488](#)

#### *Verifying qfabric-admin Access*

**Purpose** Verify that Adam can access the QFabric system CLI at the default partition and manage QFabric system components.

**Action** From a management station on your network, issue the **ssh user@qfabric** command and enter the password to open an SSH session for Adam to the QFabric system. Issue the **?** command to view the CLI operational mode commands that Adam has permission to use on the QFabric system default partition.

```

> ssh Adam@qfabric.network.net
Warning: Permanently added 'qfabric.network.net' (RSA) to the list of known hosts.

```

```
Adam@qfabric.network.net's password:
Last login: Sun Nov 20 14:12:29 2011 from 192.168.28.19
Juniper QFabric Director 11.3.5510 2011-10-21 16:31:44 UTC
```

```
RUNNING ON DIRECTOR DEVICE : dg0
Adam@qfabric>
```

```
Adam@qfabric> ?
Possible completions:
clear          Clear information in the system
configure      Manipulate software configuration information
file           Perform file operations
help           Provide help information
load           Load information from file
op             Invoke an operation script
ping           Ping remote target
quit           Exit the management session
request        Make system-level requests
restart        Restart software process
save           Save information to file
set            Set CLI properties, date/time, craft interface message
show           Show system information
telnet         Telnet to another host
test           Perform diagnostic debugging
traceroute     Trace route to remote host
```

Issue the **request component login ?** command to view the components that Adam can access. Next, issue the **request component login *component-name*** command to log in to a Node device without being prompted for a username or password.

```
Adam@qfabric> request component login ?
Possible completions:
<[Enter]>      Execute this command
<node-name>    Inventory name for the remote node
BBAK0372       Node device
BBAK0394       Node device
DRE-0          Diagnostic routing engine
EE3093         Node device

NW-NG-0        Node group
WS001/RE0      Interconnect device control board
WS001/RE1      Interconnect device control board
|              Pipe through a command
```

```
Adam@qfabric> request component login EE3093
Warning: Permanently added 'qfnode-ee3093,169.254.128.14' (RSA) to the list of
known hosts.
--- JUNOS 11.3I built 2011-11-04 12:46:16 UTC
{master}
```

Finally, issue the **?** command to view the CLI operational mode commands that Adam has the permission to use on the Node device. Notice that the CLI prompt now indicates Adam's component access level (**qfabric-admin**) as the username and the Node device identifier (**EE3093**) as the host.

```
qfabric-admin@EE3093> ?
Possible completions:
clear          Clear information in the system
```

| load       | Load information from file                             |
| monitor    | Show real-time debugging information                   |
| mtrace     | Trace multicast path from source to receiver           |
| op         | Invoke an operation script                             |
| ping       | Ping remote target                                     |
| quit       | Exit the management session                            |
| request    | Make system-level requests                             |
| restart    | Restart software process                               |
| save       | Save information to file                               |
| set        | Set CLI properties, date/time, craft interface message |
| show       | Show system information                                |
| ssh        | Start secure shell on another host                     |
| start      | Start shell                                            |
| telnet     | Telnet to another host                                 |
| test       | Perform diagnostic debugging                           |
| traceroute | Trace route to remote host                             |

**Meaning** The output shows that Adam has received the proper permissions to access the QFabric system CLI and log in to individual components with management-level access.

#### *Verifying qfabric-operator Access*

**Purpose** Verify that Oscar can access the QFabric system CLI at the default partition and view the CLI on the QFabric system components.

**Action** From a management station on your network, issue the **ssh user@qfabric** command and enter the password to open an SSH session for Oscar to the QFabric system. Issue the **?** command to view the CLI operational mode commands that Oscar has permission to use on the QFabric system default partition. Notice that these permissions are the same as those given to Adam.

```
> ssh Oscar@qfabric.network.net
Warning: Permanently added 'qfabric.network.net' (RSA) to the list of known hosts.
Oscar@qfabric.network.net's password:
Last login: Sun Nov 19 19:21:29 2011 from 192.168.28.14
Juniper QFabric Director 11.3.5510 2011-10-22 18:33:41 UTC
```

```
RUNNING ON DIRECTOR DEVICE : dg1
Oscar@qfabric>
```

```
Oscar@qfabric> ?
Possible completions:
clear          Clear information in the system
configure      Manipulate software configuration information
file           Perform file operations
help           Provide help information
load           Load information from file
op             Invoke an operation script
ping           Ping remote target
quit           Exit the management session
request        Make system-level requests
restart        Restart software process
save           Save information to file
set            Set CLI properties, date/time, craft interface message
show           Show system information
```

|            |                              |
|------------|------------------------------|
| telnet     | Telnet to another host       |
| test       | Perform diagnostic debugging |
| traceroute | Trace route to remote host   |

Issue the **request component login *component-name*** command to log in to a Node device without being prompted for a username or password.

```
Oscar@qfabric> request component login EE3093
Warning: Permanently added 'qfnode-ee3093,169.254.128.14' (RSA) to the list of
known hosts.
--- JUNOS 11.3I built 2011-11-04 12:46:16 UTC
{master}
```

Finally, issue the **?** command to view the CLI operational mode commands that Oscar has permission to use on the Node device. Notice that the CLI prompt now indicates Oscar's component access level (**qfabric-operator**) as the username and the Node device identifier (**EE3093**) as the host. Additionally, Oscar has fewer CLI commands available than Adam because of Oscar's read-only qfabric-operator login class.

```
qfabric-operator@EE3093> ?
Possible completions:
  file      Perform file operations
  help      Provide help information
  load      Load information from file
  op        Invoke an operation script
  quit      Exit the management session
  request   Make system-level requests
  save      Save information to file
  set       Set CLI properties, date/time, craft interface message
  show      Show system information
  start     Start shell
  test      Perform diagnostic debugging
```

**Meaning** The output shows that Oscar has full permissions to access the QFabric system CLI, but only read-only access when he logs in to individual components. Oscar's permissions on the QFabric system are the same as Adam's, but Oscar has fewer permissions than Adam on the Node device.

### ***Verifying qfabric-user Access***

**Purpose** Verify that Ulf has full access to the QFabric system CLI at the default partition but cannot access the QFabric system components.

**Action** From a management station on your network, issue the **ssh *user*@qfabric** command and enter the password to open an SSH session for Ulf to the QFabric system. Issue the **?** command to view the CLI operational mode commands that Ulf has permission to use on the QFabric system default partition. Notice that these permissions are the same as those given to Adam and Oscar.

```
> ssh Ulf@qfabric.network.net
Warning: Permanently added 'qfabric.network.net' (RSA) to the list of known hosts.
Ulf@qfabric.network.net's password:
Last login: Sun Nov 17 17:12:24 2011 from 192.168.28.22
Juniper QFabric Director 11.3.5510 2011-10-23 19:23:31 UTC
```

RUNNING ON DIRECTOR DEVICE : dg0

```

Ulf@qfabric>

Ulf@qfabric> ?
Possible completions:
clear          Clear information in the system
configure      Manipulate software configuration information
file           Perform file operations
help           Provide help information
load           Load information from file
op             Invoke an operation script
ping           Ping remote target
quit           Exit the management session
request        Make system-level requests
restart        Restart software process
save           Save information to file
set            Set CLI properties, date/time, craft interface message
show           Show system information
telnet         Telnet to another host
test           Perform diagnostic debugging
traceroute     Trace route to remote host

```

When Ulf issues the **request component login *component-name*** command, the Node device denies his access attempt.

```

Ulf@qfabric> request component login EE3093
error: User Ulf does not have sufficient permissions to login to device EE3093

```

**Meaning** The output shows that Ulf has full permissions to access the QFabric system CLI in the same way as Adam and Oscar. However, unlike Adam and Oscar, Ulf cannot access individual components because of the qfabric-user login class assigned to him.

- Related Documentation**
- [Understanding QFabric System Login Classes on page 1363](#)
  - [remote-debug-permission on page 1542](#)
  - [request component login on page 1587](#)

## Configuring Aliases for the QFabric System

This topic explains how to configure aliases for components of the QFabric system, such as Director devices, Interconnect devices, and Node devices. Aliases replace the hardware serial numbers of components, making it easier to identify system devices and simplify configuration tasks.

Before you create aliases in a QFabric system:

- Issue one of the **show fabric administration inventory** commands to view the components that are available for aliasing and their hardware serial numbers.

**NOTE:** The following rules apply to QFabric component alias naming:

- Alias names must use alphabetic (A through Z and a through z), numeric (0 through 9), or dash (-) characters.
- The maximum length of an alias name is 30 characters.
- Alias names are case sensitive. For example, MY-NG-1 and my-ng-1 refer to different components.
- You cannot use the reserved names **all**, **fabric**, or **director-group** as an alias name.

To create an alias for a Node device:

1. Discover the serial number of the Node device you wish to rename by issuing the **set fabric aliases node-device ?** context-sensitive help command.

```
root@qfabric# set fabric aliases node-device ?
Possible completions:
<aliasable-item-name>  The name of the item to be aliased
BBAK8309               Node device
BBAK8283               Node device
BBAK8891               Node device
BBAK8868               Node device
BBAK8276               Node device
BBAK8273               Node device
[edit]
```

As an alternate way to discover the serial number for a Node device, issue the **show fabric administration inventory node-devices** command. In this case, the serial numbers for the Node devices are **BBAK8309BBAK8283BBAK8891BBAK8868BBAK8276** and **BBAK8273**.

```
root@qfabric> show fabric administration inventory node-devices
```

| Item        | Identifier | Connection | Configuration |
|-------------|------------|------------|---------------|
| Node device |            |            |               |
| BBAK8309    |            | Connected  |               |
| BBAK8283    |            | Connected  |               |
| BBAK8891    |            | Connected  |               |
| BBAK8868    |            | Connected  |               |
| BBAK8276    |            | Connected  |               |
| BBAK8273    |            | Connected  |               |

2. Specify the serial number of the Node device and the desired alias name by including the **node-device** statement at the **[edit fabric aliases]** hierarchy level.

```
[edit fabric aliases]
root@qfabric# set node-device BBAK8309 Node0
root@qfabric# set node-device BBAK8283 Node1
root@qfabric# set node-device BBAK8891 Node2
root@qfabric# set node-device BBAK8868 Node3
root@qfabric# set node-device BBAK8276 Node4
root@qfabric# set node-device BBAK8273 Node5
```

3. Review your configuration and issue the **commit** command.

```
[edit]
root@qfabric# show fabric
aliases {
    node-device BBAK8309 {
        Node0;
    }
    node-device BBAK8283 {
        Node1;
    }
    node-device BBAK8891 {
        Node2;
    }
    node-device BBAK8868 {
        Node3;
    }
    node-device BBAK8276 {
        Node4;
    }
    node-device BBAK8273 {
        Node5;
    }
}

[edit]
root@qfabric# commit
commit complete
```

4. To view that your aliases are operational, issue the **show fabric administration inventory node-devices** command.

```
root@qfabric> show fabric administration inventory node-devices
```

| Item        | Identifier | Connection | Configuration |
|-------------|------------|------------|---------------|
| Node device |            |            |               |
| node0       | BBAK8309   | Connected  |               |
| node1       | BBAK8283   | Connected  |               |
| node2       | BBAK8891   | Connected  |               |
| node3       | BBAK8868   | Connected  |               |
| node4       | BBAK8276   | Connected  |               |
| node5       | BBAK8273   | Connected  |               |

**NOTE:** If you attempt to commit all configuration settings for a new Node group (such as the Node group itself, aliasing, and other features) at the same time, the commit operation might appear to succeed when it actually has failed. For this reason, we recommend configuring and verifying Node groups and aliases first, followed by configuring and verifying other features. Establishing the Node groups and aliases first enables the QFabric system to reject any potentially unsupported configuration. The resulting commit errors indicate where the configuration problem lies. To verify the establishment of Node groups and aliases before configuring other features, issue the **show fabric administration inventory** command.

To create an alias for a Node group:

- Specify a name for the Node group when you include the **node-group** statement at the **[edit fabric resources]** hierarchy level.

**NOTE:** You cannot use the **aliases** statement at the **[edit fabric]** hierarchy level to create an aliased name for a Node group.

To create an alias for a Director device:

1. Discover the serial number of the Director device you wish to rename by issuing the **set fabric aliases director-device ?** context-sensitive help command.

```
root@qfabric# set fabric aliases director-device ?
Possible completions:
  <aliasable-item-name>  The name of the item to be aliased
    0281052011000001    Director device
    0281052011000032    Director device
[edit]
```

As an alternate way to discover the serial number for a Director device, issue the **show fabric administration inventory director-group status** command. In this case, the serial number for Director device DG0 is **0281052011000001** and the serial number for Director device DG1 is **0281052011000032**.

```
root@qfabric> show fabric administration inventory director-group status
Director Group Status Tue Jun  5 15:11:26 UTC 2012
```

To create an alias for an Interconnect device:

1. Discover the serial number of the Interconnect device you wish to rename by issuing the **set fabric aliases interconnect-device ?** context-sensitive help command.

```
root@qfabric# set fabric aliases interconnect-device ?
Possible completions:
  <aliasable-item-name>  The name of the item to be aliased
    IC-F1249              Interconnect device
    IC-F4912              Interconnect device
[edit]
```

As an alternate way to discover the serial number for an Interconnect device, issue the **show fabric administration inventory interconnect-devices** command. In this case, the serial numbers for the Interconnect devices are **IC-F1249** and **IC-F4912**.

```
root@qfabric> show fabric administration inventory interconnect-devices
```

| Item                | Identifier | Connection | Configuration |
|---------------------|------------|------------|---------------|
| Interconnect device |            |            |               |
| IC-F1249            |            | Connected  | Configured    |
| F1249/RE0           |            | Connected  |               |
| IC-F4912            |            | Connected  | Configured    |
| F4912/RE0           |            | Connected  |               |

2. Specify the serial number of the Interconnect device and the desired alias name by including the **interconnect-device** statement at the **[edit fabric aliases]** hierarchy level.

```
[edit fabric aliases]
root@qfabric# set interconnect-device IC-F1249 Interconnect0
root@qfabric# set interconnect-device IC-F4912 Interconnect1
```

3. Review your configuration and issue the **commit** command.

```
[edit]
root@qfabric# show fabric
aliases {
  interconnect-device IC-F1249 {
    Interconnect0;
  }
  interconnect-device IC-F4912 {
    Interconnect1;
  }
}

[edit]
root@qfabric# commit
commit complete
```

4. To view that your aliases are operational, issue the **show fabric administration inventory interconnect-devices** command.

```
root@qfabric> show fabric administration inventory interconnect-devices
```

| Item                | Identifier | Connection | Configuration |
|---------------------|------------|------------|---------------|
| Interconnect device |            |            |               |

## Configuring Node Groups for the QFabric System

This topic explains how to configure Node groups for Node devices within the QFabric system. Node groups provide redundancy for Node devices and make your QFabric system more resilient.

There are three types of Node groups in a QFabric system:

- **Automatically generated server Node groups**—By default, every Node device that joins the QFabric system is placed within an automatically generated server Node group that contains one Node device (the device itself). Server Node groups connect to servers and storage devices.
- **Network Node groups**—You can assign up to eight Node devices to a network Node group. When grouped together, the Node devices within a network Node group connect to other routers running routing protocols such as OSPF and BGP.
- **Redundant server Node groups**—You can assign two Node devices to a redundant server Node group. When grouped together, you can create link aggregation groups (LAGs) that span the interfaces on both Node devices to provide resiliency and redundancy.

Before you create Node groups in a QFabric system:

- Make sure your QFabric system is operational.
- Issue the **show fabric administration inventory node-devices** command to display the Node devices that are available to add to a Node group.
- Issue the **show fabric administration inventory node-groups** command to display the existing Node groups.

**NOTE:** The following rules apply to QFabric Node group naming:

- Node group names must use alphabetic (A through Z and a through z), numeric (0 through 9), or dash (-) characters.
- The maximum length of a Node group name is 30 characters.
- Node group names are case sensitive. For example, MY-NG-1 and my-ng-1 refer to different components.
- You cannot use the reserved names **all**, **fabric**, or **director-group** as a Node group name.

**NOTE:** If you attempt to commit all configuration settings for a new Node group (such as the Node group itself, aliasing, and other features) at the same time, the commit operation might appear to succeed when it actually has failed. For this reason, we recommend configuring and verifying Node groups and aliases first, followed by configuring and verifying other features. Establishing the Node groups and aliases first enables the QFabric system to reject any potentially unsupported configuration. The resulting commit errors indicate where the configuration problem lies. To verify the establishment of Node groups and aliases before configuring other features, issue the **show fabric administration inventory** command.

To display an automatically generated server Node group:

- Issue the **show fabric administration inventory node-groups** command and look for Node groups containing a single Node device that has the same name or serial number as the server Node group.

```
root@qfabric> show fabric administration inventory node-groups
```

| Item       | Identifier | Connection | Configuration |
|------------|------------|------------|---------------|
| Node group |            |            |               |
| BBAK8281   |            | Connected  | Configured    |
| BBAK8281   |            | Connected  |               |
| BBAK8835   |            | Connected  | Configured    |
| BBAK8835   |            | Connected  |               |
| NW-NG-0    |            | Connected  | Configured    |
| Node0      | BBAK8309   | Connected  |               |
| Node1      | BBAK8283   | Connected  |               |
| S1         |            | Connected  | Configured    |
| Node2      | BBAK8891   | Connected  |               |
| Node3      | BBAK8868   | Connected  |               |

To create a network Node group:

1. Specify the Node devices you wish to add to the network Node group by including the **node-device** statement at the **[edit fabric resources node-group NW-NG-0]** hierarchy level.

**NOTE:**

- The network Node group must use the predefined name NW-NG-0. You must use this name when adding Node devices to the network Node group. You cannot specify a different name. Also, you can configure only one network Node group per partition.
- When you configure routing protocols on the QFabric system, you must use interfaces from the Node devices assigned to the network Node group. If you try to configure routing protocols on interfaces from the Node devices assigned to server Node groups, the configuration commit operation fails.

[edit]

```
root@qfabric# set fabric resources node-group NW-NG-0 node-device Node0
root@qfabric# set fabric resources node-group NW-NG-0 node-device Node1
```

2. To designate the Node group as a network Node group, include the **network-domain** statement at the **[edit fabric resources node-group NW-NG-0]** hierarchy level.

[edit]

```
root@qfabric# set fabric resources node-group NW-NG-0 network-domain
```

3. Review your configuration and issue the **commit** command.

[edit]

```
root@qfabric# show fabric
resources {
    node-group NW-NG-0 {
        network-domain;
        node-device Node0;
        node-device Node1;
    }
}
```

[edit]

```
root@qfabric# commit
commit complete
```

**NOTE:** When you add or delete Node devices from a Node group configuration, the corresponding Node devices reboot when you commit the configuration change.

4. To determine if your network Node group is operational, issue the **show fabric administration inventory node-groups** command in operational mode.

```
root@qfabric>show fabric administration inventory node-groups NW-NG-0
```

| Item       | Identifier | Connection | Configuration |
|------------|------------|------------|---------------|
| Node group |            |            |               |

|         |          |           |            |
|---------|----------|-----------|------------|
| NW-NG-0 |          | Connected | Configured |
| Node0   | BBAK8309 | Connected |            |
| Node1   | BBAK8283 | Connected |            |

To create a redundant server Node group:

1. Specify the two Node devices you wish to add to the redundant server Node group by including the **node-device** statement at the **[edit fabric resources node-group node-group-name]** hierarchy level.

**NOTE:** Ensure that the two Node devices are of the same type, either two QFX3500 Node devices, two QFX3600 Node devices, or two QFX5100 Node devices. You cannot add different Node device types to the same redundant server Node group.

[edit]

```
root@qfabric# set fabric resources node-group S1 node-device Node2
root@qfabric# set fabric resources node-group S1 node-device Node3
```

2. Review your configuration and issue the **commit** command.

[edit]

```
root@qfabric# show fabric
resources {
  node-group S1 {
    node-device Node2;
    node-device Node3;
  }
}
```

[edit]

```
root@qfabric# commit
commit complete
```

**NOTE:** When you add or delete Node devices from a Node group configuration, the corresponding Node devices reboot when you commit the configuration change.

3. To determine if your redundant server Node groups are operational, issue the **show fabric administration inventory node-groups redundant-server-node-group-name** command in operational mode.

```
root@qfabric> show fabric administration inventory node-groups S1
```

| Item       | Identifier | Connection | Configuration |
|------------|------------|------------|---------------|
| Node group |            |            |               |
| S1         |            | Connected  | Configured    |
| Node2      | BBAK8891   | Connected  |               |
| Node3      | BBAK8868   | Connected  |               |

## Configuring the Port Type on QFX3600 Node Devices

The QFX3600 Node device provides 16 40-Gbps QSFP+ ports. By default, four ports (labeled **Q0** through **Q3**) operate as 40-gigabit data plane (*fte*) uplink ports for uplink connections between your Node device and your Interconnect devices. Twelve ports (labeled **Q4** through **Q15**) operate as 10-Gigabit Ethernet (*xe*) ports to support 48 10-Gigabit Ethernet interfaces for connections to either endpoint systems or external networks. Optionally, you can choose to configure ports **Q0** through **Q7** to operate as 40-gigabit data plane uplink ports, and ports **Q2** through **Q15** to operate as 10-Gigabit Ethernet or 40-Gigabit Ethernet (*xle*) ports.

**NOTE:** You can use QSFP+ to four SFP+ breakout cables or QSFP+ transceivers with fiber breakout cables to connect the 10-Gigabit Ethernet ports to other devices.

**NOTE:** When you delete the port type configuration for an individual port or a block of ports, the ports return to operating in their default port type. For example, when you delete the 40-Gigabit Ethernet (*xle*) port configuration for port **Q4**, the port returns to operating as a 10-Gigabit Ethernet (*xe*) port.

**NOTE:** When the 40-Gigabit Ethernet (*xle*) ports of a QFX3600 Node device carry traffic at the full line rate, loss of untagged Layer 2 or Layer 3 traffic going across the fabric might occur, as well as increased latency on the Node device. Such effects result from the addition of a 4-byte header to packets traversing the uplink ports on the Node device. The percentage of traffic loss depends on the size of the packets: the greater the packet size, the lower the traffic loss and vice versa. This problem does not affect tagged traffic.

This topic explains how to configure the port type on QFX3600 Node devices.

Before you configure the port type on QFX3600 Node devices:

- Make sure your QFabric system is operational.
- Issue the **show fabric administration inventory node-groups** command to display the existing Node groups and the Node devices in each Node group.

**NOTE:**

- Only ports Q0 through Q7 can be configured to operate as 40-gigabit data plane (fte) uplink ports.
- Only ports Q2 through Q15 can be configured to operate as 10-Gigabit Ethernet (xe) or 40-Gigabit Ethernet (xle) ports.

**CAUTION:** The Packet Forwarding Engine on the QFX3600 Node device is restarted when you commit the port type configuration changes. As a result, you might experience packet loss on the Node device.

The following message may be displayed in the system log file when the Packet Forwarding Engine is restarted. You can ignore this message.

Pipe write error: Broken pipe

flush operation failed

The following steps describe how to configure either a block of ports or an individual port to operate as 40-gigabit data plane uplink (fte) ports, as well as how to delete a 40-gigabit data plane uplink (fte) port configuration.

1. To configure a block of ports to operate as 40-gigabit data plane uplink (fte) ports, specify a port range:

```
[edit chassis node-group name node-device name pic 1]  
root@qfabric# set fte port-range port-range-low port-range-high
```

For example, to configure ports Q4 through Q7 to operate as 40-gigabit data plane uplink ports:

```
[edit chassis node-group BBAK8281 node-device BBAK8309 pic 1]  
root@qfabric# set fte port-range 4 7
```

2. To configure an individual port to operate as a 40-gigabit data plane uplink (fte) port, specify a port number:

```
[edit chassis node-group name node-device name pic 1]  
root@qfabric# set fte port port-number
```

For example, to configure port Q4 to operate as a 40-gigabit data plane uplink port:

```
[edit chassis node-group BBAK8281 node-device BBAK8309 pic 1]  
root@qfabric# set fte port 4
```

3. Review your configuration and issue the **commit** command.

```
[edit]  
root@qfabric# commit  
commit complete
```

4. To delete the 40-gigabit data plane uplink (fte) port configuration for a block of ports, specify a port range:

```
[edit chassis node-group name node-device name pic 1]
root@qfabric# delete fte port-range port-range-low port-range-high
```

For example, to delete the 40-gigabit data plane uplink port configuration for ports Q4 through Q7:

```
[edit chassis node-group BBAK8281 node-device BBAK8309 pic 1]
root@qfabric# delete fte port-range 4 7
```

5. To delete the 40-gigabit data plane uplink (fte) port configuration for an individual port, specify a port number:

```
[edit chassis node-group name node-device name pic 1]
root@qfabric# delete fte port port-number
```

For example, to delete the 40-gigabit data plane uplink port configuration for port Q4:

```
[edit chassis node-group BBAK8281 node-device BBAK8309 pic 1]
root@qfabric# delete fte port 4
```

The following steps describe how to configure either a block of ports or an individual port to operate as 10-Gigabit Ethernet (xe) ports, as well as how to delete a 10-Gigabit Ethernet (xe) port configuration.

1. To configure a block of ports to operate as 10-Gigabit Ethernet (xe) ports, specify a port range:

```
[edit chassis node-group name node-device name pic 0]
root@qfabric# set xe port-range port-range-low port-range-high
```

For example, to configure ports Q4 through Q7 to operate as 10-Gigabit Ethernet ports:

```
[edit chassis node-group BBAK8281 node-device BBAK8309 pic 0]
root@qfabric# set xe port-range 4 7
```

2. To configure an individual port to operate as a 10-Gigabit Ethernet port, specify a port number:

```
[edit chassis node-group name node-device name pic 0]
root@qfabric# set xe port port-number
```

For example, to configure port Q4 to operate as a 10-Gigabit Ethernet port:

```
[edit chassis node-group BBAK8281 node-device BBAK8309 pic 0]
root@qfabric# set xe port 4
```

3. Review your configuration and issue the **commit** command.

```
[edit]
root@qfabric# commit
commit complete
```

4. To delete the 10-Gigabit Ethernet (xe) port configuration for a block of ports, specify a port range:

```
[edit chassis node-group name node-device name pic 0]
root@qfabric# delete xe port-range port-range-low port-range-high
```

For example, to delete the 10-Gigabit Ethernet port configuration for ports Q4 through Q7:

```
[edit chassis node-group BBAK8281 node-device BBAK8309 pic 0]
root@qfabric# delete xe port-range 4 7
```

5. To delete the 10-Gigabit Ethernet (xe) port configuration for an individual port, specify a port number:

```
[edit chassis node-group name node-device name pic 0]
root@qfabric# delete xe port port-number
```

For example, to delete the 10-Gigabit Ethernet port configuration for port Q4:

```
[edit chassis node-group BBAK8281 node-device BBAK8309 pic 0]
root@qfabric# delete xe port 4
```

The following steps describe how to configure either a block of ports or an individual port to operate as 40-Gigabit Ethernet (xle) ports, as well as how to delete a 40-Gigabit Ethernet (xle) port configuration.

1. To configure a block of ports to operate as 40-Gigabit Ethernet (xle) ports, specify a port range:

```
[edit chassis node-group name node-device name pic 1]
root@qfabric# set xle port-range port-range-low port-range-high
```

For example, to configure ports Q4 through Q7 to operate as 40-Gigabit Ethernet ports:

```
[edit chassis node-group BBAK8281 node-device BBAK8309 pic 1]
root@qfabric# set xle port-range 4 7
```

2. To configure an individual port to operate as a 40-Gigabit Ethernet (xle) port, specify a port number:

```
[edit chassis node-group name node-device name pic 1]
root@qfabric# set xle port port-number
```

For example, to configure port Q4 to operate as a 40-Gigabit Ethernet port:

```
[edit chassis node-group BBAK8281 node-device BBAK8309 pic 1]
root@qfabric# set xle port 4
```

3. Review your configuration and issue the **commit** command.

```
[edit]
root@qfabric# commit
commit complete
```

4. To delete the 40-Gigabit Ethernet (xle) port configuration for block of ports, specify a port range:

```
[edit chassis node-group name node-device name pic 1]
root@qfabric# delete xle port-range port-range-low port-range-high
```

For example, to delete the 40-Gigabit Ethernet port configuration for ports Q4 through Q7:

```
[edit chassis node-group BBAK8281 node-device BBAK8309 pic 1]
root@qfabric# delete xle port-range 4 7
```

5. To delete the 40-Gigabit Ethernet (xle) port configuration for an individual port, specify a port number:

```
[edit chassis node-group name node-device name pic 1]
root@qfabric# delete xle port port-number
```

For example, to delete the 40-Gigabit Ethernet port configuration for port Q4:

```
[edit chassis node-group BBAK8281 node-device BBAK8309 pic 1]
root@qfabric# delete xle port 4
```

## Example: Configuring SNMP

By default, SNMP is disabled on devices running Junos OS. This example describes the steps for configuring SNMP on the QFabric system.

- [Requirements on page 1507](#)
- [Overview on page 1507](#)
- [Configuration on page 1507](#)

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 12.2
- Network management system (NMS) (running the SNMP manager)
- QFabric system (running the SNMP agent) with multiple Node devices

### Overview

Because SNMP is disabled by default on devices running Junos OS, you must enable SNMP on your device by including configuration statements at the **[edit snmp]** hierarchy level. At a minimum, you must configure the **community public** statement. The community defined as public grants read-only access to MIB data to any client.

If no **clients** statement is configured, all clients are allowed. We recommend that you always include the **restrict** option to limit SNMP client access to the switch.

The network topology in this example includes an NMS, a QFabric system with four Node devices, and external SNMP servers that are configured for receiving traps.

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network

configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set snmp name "snmp qfabric" description "qfabric0 switch"
set snmp location "Lab 4 Row 11" contact "qfabric-admin@qfabric0"
set snmp community public authorization read-only
set snmp client-list list0 192.168.0.0/24
set snmp community public client-list-name list0
set snmp community public clients 192.170.0.0/24 restrict
set snmp trap-group "qf-traps" destination-port 155 targets 192.168.0.100
```

#### Step-by-Step Procedure

The following example requires that you navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure SNMP on the QFabric system:

**NOTE:** If the name, description, location, contact, or community name contains spaces, enclose the text in quotation marks (" ").

1. Configure the SNMP system name:

```
[edit snmp]
user@switch# set name "snmp qfabric"
```

2. Specify a description.

```
[edit snmp]
user@switch# set description "qfabric0 system"
```

This string is placed into the MIB II sysDescription object.

3. Specify the physical location of the QFabric system.

```
[edit snmp]
user@switch# set location "Lab 4 Row 11"
```

This string is placed into the MIB II sysLocation object.

4. Specify an administrative contact for the SNMP system.

```
[edit snmp]
user@switch# set contact "qfabric-admin@qfabric0"
```

This name is placed into the MIB II sysContact object.

5. Specify a unique SNMP community name and the read-only authorization level.

**NOTE:** The read-write option is not supported on the QFabric system.

```
[edit snmp]
user@switch# set community public authorization read-only
```

6. Create a client list with a set of IP addresses that can use the SNMP community.

```
[edit snmp]
user@switch# set client-list list0 192.168.0.0/24
user@switch# set community public client-list-name list0
```

7. Specify IP addresses of clients that are restricted from using the community.

```
[edit snmp]
user@switch# set community public clients 192.170.0.0/24 restrict
```

8. Configure a trap group, destination port, and a target to receive the SNMP traps in the trap group.

```
[edit snmp]
user@switch# set trap-group "qf-traps" destination-port 155 targets 192.168.0.100
```

**NOTE:** You do not need to include the **destination-port** statement if you use the default port 162.

The trap group qf-traps is configured to send traps to 192.168.0.100.

**Results** From configuration mode, confirm your configuration by entering the **show** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@switch# show
snmp {
  name "snmp qfabric";
  description "qfabric0 system";
  location "Lab 4 Row 11";
  contact "qfabric-admin@qfabric0";
  client-list list0 {
    192.168.0.0/24;
  }
  community public {
    authorization read-only;
    clients {
      197.170.0.0/24 restrict;
    }
  }
  trap-group qf-traps {
    destination-port 155;
    targets {
      192.168.0.100;
    }
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

- [snmp on page 1957](#)

## Example: Configuring System Log Messages

The QFabric system monitors events that occur on its component devices and distributes system log messages about those events to all external system log message servers (hosts) that are configured. Component devices may include Node devices, Interconnect devices, Director devices, and the Virtual Chassis. Messages are stored for viewing only in the QFabric system database. To view the messages, issue the **show log** command.

This example describes how to configure system log messages on the QFabric system.

- [Requirements on page 1510](#)
- [Overview on page 1510](#)
- [Configuration on page 1510](#)

---

### Requirements

This example uses the following hardware and software components:

- Junos OS Release 12.2
- QFabric system
- External servers that can be configured as system log message hosts

---

### Overview

Component devices that generate system log message events may include Node devices, Interconnect devices, Director devices, and the control plane switches. The following configuration example includes these components in the QFabric system:

- Director software running on the Director group
- Control plane switches
- Interconnect device
- Multiple Node devices

---

### Configuration

#### CLI Quick Configuration

To quickly configure this example, copy the following commands, paste them into a text file, remove any line breaks, change any details necessary to match your network configuration, and then copy and paste the commands into the CLI at the **[edit]** hierarchy level.

```
set system syslog host 10.1.1.12 any error
set system syslog file qflogs
set system syslog file qflogs structured-data brief
set system syslog file qflogs archive size 1g
```

**Step-by-Step Procedure** The following example requires that you navigate various levels in the configuration hierarchy. For instructions on how to do that, see *Using the CLI Editor in Configuration Mode* in the *CLI User Guide*.

To configure system messages from the QFabric Director device:

1. Specify a host, any facility, and the **error** severity level.

```
[edit system syslog]
user@switch# set host 10.1.1.12 any error
```

**NOTE:** You can configure more than one system log message server (host). The QFabric system sends the messages to each server configured.

2. (Optional) Specify a filename to capture log messages.

**NOTE:** On the QFabric system, a syslog file named **messages** is configured implicitly with facility and severity levels of **any any** and a file size of 100 MBs. Therefore, you cannot specify the filename **messages** in your configuration, and automatic command completion does not work for that filename.

```
[edit system syslog]
user@switch# set file qflogs structured-data brief
user@switch# set file qflogs
```

3. (Optional) Configure the maximum size of your system log message archive file. This example specifies an archive size of 1 GB.

```
[edit system syslog]
user@switch# set file qflogs archive size 1g
```

**Results** From configuration mode, confirm your configuration by entering the **show system** command. If the output does not display the intended configuration, repeat the instructions in this example to correct the configuration.

```
[edit]
user@switch# show system
syslog {
  file qflogs {
  }
  host 10.1.1.12 {
    any error;
  }
}
```

If you are done configuring the device, enter **commit** from configuration mode.

## Configuring Graceful Restart for QFabric Systems

When you configure graceful restart in the QFabric CLI, the QFabric system applies the configuration to the network Node group to participate in graceful restart operations with devices external to the QFabric system. Such configuration preserves routing table state and helps neighboring routing devices to resume routing operations more quickly after a system restart. This also enables the network Node group to resume routing operations rapidly if there is a restart in the QFabric system (such as a software upgrade). As a result, we recommend enabling graceful restart for routing protocols in the QFabric CLI.

**NOTE:** The QFabric system also uses graceful restart internally within the fabric to facilitate interfabric resiliency and recovery. This internal feature is enabled by default with no configuration required.

- [Enabling Graceful Restart on page 1512](#)
- [Configuring Graceful Restart Options for BGP on page 1513](#)
- [Configuring Graceful Restart Options for OSPF and OSPFv3 on page 1514](#)
- [Tracking Graceful Restart Events on page 1515](#)

### Enabling Graceful Restart

---

By default, graceful restart is disabled. To enable graceful restart, include the **graceful-restart** statement at the **[edit routing-instance *instance-name* routing-options]** or **[edit routing-options]** hierarchy level.

For example:

```
routing-options {  
    graceful-restart;  
}
```

To configure the duration of the graceful restart period, include the **restart-duration** at the **[edit routing-options graceful-restart]** hierarchy level.

**NOTE:** Helper mode (the ability to assist a neighboring router attempting a graceful restart) is enabled by default when you start the routing platform, even if graceful restart is not enabled. You can disable helper mode on a per-protocol basis.

[edit]

```

routing-options {
  graceful-restart {
    disable;
    restart-duration seconds;
  }
}

```

To disable graceful restart globally, include the **disable** statement at the **[edit routing-options graceful-restart]** hierarchy level.

When graceful restart is enabled for all routing protocols at the **[edit routing-options graceful-restart]** hierarchy level, you can disable graceful restart on a per-protocol basis.

**NOTE:** If you configure graceful restart after a BGP or LDP session has been established, the BGP or LDP session restarts and the peers negotiate graceful restart capabilities. Also, the BGP peer routing statistics are reset to zero.

### Configuring Graceful Restart Options for BGP

To configure the duration of the BGP graceful restart period, include the **restart-time** statement at the **[edit protocols bgp graceful-restart]** hierarchy level. To set the length of time the router waits to receive messages from restarting neighbors before declaring them down, include the **stale-routes-time** statement at the **[edit protocols bgp graceful-restart]** hierarchy level.

```

[edit]
protocols {
  bgp {
    graceful-restart {
      disable;
      restart-time seconds;
      stale-routes-time seconds;
    }
  }
}
routing-options {
  graceful-restart;
}

```

To disable BGP graceful restart capability for all BGP sessions, include the **disable** statement at the **[edit protocols bgp graceful-restart]** hierarchy level.

**NOTE:** To set BGP graceful restart properties or disable them for a group, include the desired statements at the **[edit protocols bgp group group-name graceful-restart]** hierarchy level.

To set BGP graceful restart properties or disable them for a specific neighbor in a group, include the desired statements at the **[edit protocols bgp group group-name neighbor ip-address graceful-restart]** hierarchy level.

**NOTE:** Configuring graceful restart for BGP resets the BGP peer routing statistics to zero. Also, existing BGP sessions restart, and the peers negotiate graceful restart capabilities.

### Configuring Graceful Restart Options for OSPF and OSPFv3

To configure the duration of the OSPF/OSPFv3 graceful restart period, include the **restart-duration** statement at the **[edit protocols (ospf | ospf3) graceful-restart]** hierarchy level. To specify the length of time for which the router notifies helper routers that it has completed graceful restart, include the **notify-duration** at the **[edit protocols (ospf | ospf3) graceful-restart]** hierarchy level. Strict OSPF link-state advertisement (LSA) checking results in the termination of graceful restart by a helping router. To disable strict LSA checking, include the **no-strict-lsa-checking** statement at the **[edit protocols (ospf | ospf3) graceful-restart]** hierarchy level.

```
[edit]
protocols {
  ospf | ospfv3 {
    graceful-restart {
      disable;
      helper-disable
      no-strict-lsa-checking;
      notify-duration seconds;
      restart-duration seconds;
    }
  }
}
routing-options {
  graceful-restart;
}
```

To disable OSPF/OSPFv3 graceful restart, include the **disable** statement at the **[edit protocols (ospf | ospf3) graceful-restart]** hierarchy level.

Starting with Release 11.3, the Junos OS supports both the standard (based on RFC 3623, *Graceful OSPF Restart*) and the restart signaling-based (as specified in RFC 4811, RFC 4812, and RFC 4813) helper modes for OSPF version 2 graceful restart configurations. Both the standard and restart signaling-based helper modes are enabled by default. To disable the helper mode for OSPF version 2 graceful restart configurations, include the **helper-disable <both | restart-signaling | standard>** statement at the **[edit protocols ospf graceful-restart]** hierarchy level. Note that the last committed statement always takes precedence over the previous one.

```
[edit protocols ospf]
graceful-restart {
  helper-disable <both | restart-signaling | standard>
}
```

To reenabling the helper mode, delete the **helper-disable** statement from the configuration by using the **delete protocols ospf graceful-restart helper-disable <restart-signaling | standard | both>** command. In this case also, the last executed command takes precedence over the previous ones.

**NOTE:**

Restart signaling-based helper mode is not supported for OSPFv3 configurations. To disable helper mode for OSPFv3 configurations, include the **helper-disable** statement at the [edit protocols ospfv3 graceful-restart] hierarchy level.

**TIP:** You can also track graceful restart events with the traceoptions statement at the [edit protocols (ospf | ospf3)] hierarchy level. For more information, see “Tracking Graceful Restart Events” on page 1515.

**NOTE:** If you configure BFD and graceful restart for OSPF, graceful restart might not work as expected.

### Tracking Graceful Restart Events

To track the progress of a graceful restart event, you can configure graceful restart trace options flags for IS-IS and OSPF/OSPFv3. To configure graceful restart trace options, include the **graceful-restart** statement at the [edit protocols *protocol* traceoptions flag] hierarchy level:

```
[edit protocols]
isis {
  traceoptions {
    flag graceful-restart;
  }
}
(ospf | ospf3) {
  traceoptions {
    flag graceful-restart;
  }
}
```

| <b>Options</b>                                                                                                                                                                                                                                                                | <p><b>encrypted-password "<i>password</i>"</b>— Specify the MD5 or other encrypted authentication password. You can specify only one encrypted password.</p> <p>You cannot configure a blank password for the <b>encrypted-password</b> option using blank quotation marks (" "). You must configure a password of 1 through 128 characters and enclose the password in quotation marks.</p> <p><b>plain-text-password</b>—Plain-text password. The CLI prompts you for the password and then encrypts it. The CLI displays the encrypted version, and the software places the encrypted version in its user database. You can specify only one plain-text password.</p> |

**Hierarchy Level** [edit]

**Release Information** Statement introduced in Junos OS Release 11.3 for the QFX Series.

**Description** (QFabric systems only) Define resources, routing options, fabric control protocol settings, and the mapping of user-defined names to QFabric system components.

The remaining statements are explained separately.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

| <b>Release Information</b> | Statement introduced before Junos OS Release 7.4.<br>Statement introduced in Junos OS Release 9.0 for EX Series switches.<br>Statement introduced in Junos OS Release 12.1 for the QFX Series.                                                                                                                                                         |
| <b>Description</b>         | Configure graceful restart globally to enable the feature. You cannot enable graceful restart for specific protocols unless graceful restart is also enabled globally. You can, optionally, modify the global settings at the individual protocol level.                                                                                               |

### NOTE:

- For VPNs, the **graceful-restart** statement allows a router whose VPN control plane is undergoing a restart to continue to forward traffic while recovering its state from neighboring routers.
  - For BGP, if you configure graceful restart after a BGP session has been established, the BGP session restarts and the peers negotiate graceful restart capabilities.
  - LDP sessions flap when **graceful-restart** configurations change.
-

| <b>Description</b>              | <p>Configure graceful restart for BGP. Graceful restart allows a routing device undergoing a restart to inform its adjacent neighbors and peers of its condition. Graceful restart is disabled by default.</p> <p>To configure the duration of the BGP graceful restart period, include the <b>restart-time</b> statement at the [edit protocols bgp graceful-restart] hierarchy level. To set the length of time the router waits to receive messages from restarting neighbors before declaring them down, include the <b>stale-routes-time</b> statement at the [edit protocols bgp graceful-restart] hierarchy level.</p> <hr/> <div>  <p><b>NOTE:</b> If you configure graceful restart after a BGP session has been established, the BGP session restarts and the peers negotiate graceful restart capabilities.</p> </div> <hr/> <p>Configure graceful restart globally at the [edit routing-options] or [edit routing-instances <i>instance-name</i> routing-options] hierarchy level to enable the feature. You cannot enable graceful restart for specific protocols unless graceful restart is also enabled globally. You can, optionally, modify the global settings at the individual protocol level.</p> <p>The remaining statements are explained separately.</p> |

| <b>Description</b>         | <p>Configure graceful restart for OSPF.</p> <p>Graceful restart allows a routing device to restart with minimal effects to the network, and is enabled for all routing protocols at the [edit routing-options] hierarchy level.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Options</b>             | <p><b>disable</b>—Disable graceful restart for OSPF.</p> <p><b>helper-disable (standard   restart-signaling   both)</b>—Disable helper mode for graceful restart. When helper mode is disabled, a device cannot help a neighboring device that is attempting to restart. Beginning with Junos OS Release 11.4, you can configure restart signaling-based helper mode for OSPFv2 graceful restart configurations. The <b>standard</b>, <b>restart-signaling</b>, and <b>both</b> options are only supported for OSPFv2. Specify <b>standard</b> to disable helper mode for standard graceful restart (based on RFC 3623). Specify <b>restart-signaling</b> to disable helper mode for restart signaling-based graceful restart (based on RFC 4811, RFC 4812, and RFC 4813). Specify <b>both</b> to disable helper mode for both standard and restart signaling-based graceful restart. The last committed statement takes precedence over the previously configured statement.</p> <p><b>Default:</b> Helper mode is enabled by default. For OSPFv2, both standard and restart-signaling based helper modes are enabled by default.</p> <p><b>no-strict-lsa-checking</b>—Disable strict OSPF link-state advertisement (LSA) checking to prevent the termination of graceful restart by a helping router. LSA checking is enabled by default.</p> |

**NOTE:** The **helper-disable** statement and the **no-strict-lsa-checking** statement cannot be configured at the same time. If you attempt to configure both

statements at the same time, the routing device displays a warning message when you enter the `show protocols (ospf | ospf3)` command.

.....  
**notify-duration seconds**—Estimated time needed to send out purged grace LSAs over all the interfaces.

**Range:** 1 through 3600 seconds

**Default:** 30 seconds

**restart-duration seconds**—Estimated time needed to reacquire a full OSPF neighbor from each area.

**Range:** 1 through 3600 seconds

**Default:** 180 seconds

| <b>Release Information</b>      | Statement introduced in Junos OS Release 12.2 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| <b>Description</b>              | (QFabric systems only) Disable the default <i>make-before-break</i> multicast feature on QFabric systems to prevent the duplication of system traffic. This feature increases the speed of data plane traffic, but carries the risk of minor traffic losses when compared with the default make-before-break method of creating new multicast fabric paths before tearing down the old paths. The absence of the <b>no-make-before-break</b> configuration statement implies that the make-before-break default system behavior is in effect. |
| <b>Required Privilege Level</b> | admin—To view this statement in the configuration.<br>admin-control—To add this statement to the configuration.                                                                                                                                                                                                                                                                                                                                                                                                                               |

|----------------------------|----------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <code>node-device <i>node-device-name</i> {<br/>    <i>assigned-node-device-name</i>;<br/>}</code> |
| <b>Hierarchy Level</b>     | [edit fabric aliases]                                                                              |
| <b>Release Information</b> | Statement introduced in Junos OS Release 11.3 for the QFX Series.                                  |
| <b>Description</b>         | (QFabric systems only) Specify the mapping of user-defined names to QFabric system Node devices.   |

**NOTE:** The following rules apply to QFabric component alias naming:

- Alias names must use alphabetic (A through Z and a through z), numeric (0 through 9), or dash (-) characters.
- The maximum length of an alias name is 30 characters.
- Alias names are case sensitive. For example, MY-NG-1 and my-ng-1 refer to different components.
- You cannot use the reserved names **all**, **fabric**, or **director-group** as an alias name.

|                                 |                                                                                                                                                                                                                                                                                                                                                       |
|---------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Options</b>                  | <p><i>node-device-name</i>—Specify a user-defined name for a QFabric system Node device.</p> <p><i>assigned-node-device-name</i>—Specify the Node device identifier or name that has been provided. Identifiers are usually autogenerated by the Director software, and names are usually provided by the administrator of the default partition.</p> |

## node-group (Resources)

|                            |                                                                                                                                    |
|----------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>              | <code>node-group <i>node-group-name</i> {<br/>    <i>network-domain</i>;<br/>    node-device <i>node-device-name</i>;<br/>}</code> |
| <b>Hierarchy Level</b>     | [edit fabric resources]                                                                                                            |
| <b>Release Information</b> | Statement introduced in Junos OS Release 11.3 for the QFX Series.                                                                  |
| <b>Description</b>         | (QFabric systems only) Define Node groups within a QFabric system.                                                                 |

**NOTE:** The following rules apply to QFabric Node group naming:

- The network Node group must use the predefined name *NW-NG-0*. You must use this name when adding Node devices to the network Node group. You cannot specify a different name. Also, you can configure only one network Node group per partition.
- Node group names must use alphabetic (A through Z and a through z), numeric (0 through 9), or dash (-) characters.
- The maximum length of a Node group name is 30 characters.
- Node group names are case sensitive. For example, MY-NG-1 and my-ng-1 refer to different components.
- You cannot use the reserved names *all*, *fabric*, or *director-group* as a Node group name.

The remaining statements are explained separately.

## pic (Port)

**Syntax** `pic pic-number {  
     fte {  
         (port port-number | port-range port-range-low port-range-high);  
     }  
     xe {  
         (port port-number | port-range port-range-low port-range-high);  
     }  
}`

**Hierarchy Level** [edit `chassis interconnect-device name fpc slot`]

**Release Information** Statement introduced in Junos OS Release 12.2 for the QFX Series.

**Description** (QFX3600 Node device only) Configure port types on QFX3600 Node devices.

**CAUTION:** The Packet Forwarding Engine on the QFX3600 Node device is restarted when you commit the port type configuration changes. As a result, you might experience packet loss on the Node device.

**Options** `pic pic-number`—Number of the physical interface card (PIC) on which you want to configure port types. Specify **0** to configure `xe` (10-Gigabit Ethernet) type ports. Specify **1** to configure `fte` (40-gigabit data plane uplink) type ports.

`fte`—Configure a specific port or a range of ports to operate as 40-gigabit data plane uplink ports.

`xe`—Configure a specific port or a range of ports to operate as four 10-Gigabit Ethernet ports.

`port-number`—Port number on which you want to configure the port type. Valid values are 0 through 7 if the port type is `fte`, and 2 through 15 if the port type is `xe`.

`port-range-low`—Lowest-numbered port in the range of ports. The lowest possible value is 0 if the port type is `fte`. The lowest possible value is 2 if the port type is `xe`.

`port-range-high`—Highest-numbered port in the range of ports. The highest possible value is 7 if the port type is `fte`. The highest possible value is 15 if the port type is `xe`.

**NOTE:**

- By default, ports Q0 through Q3 operate as `fte` type ports, and ports Q4 through Q15 operate as `xe` type ports.
- Only ports Q0 through Q7 can be configured as `fte` type ports.
- Only ports Q2 through Q15 can be configured as `xe` type ports.

**NOTE:** When you delete the port type configuration for an individual port or a block of ports, the ports return to operating in their default port type.

**Required Privilege Level** routing—To view this statement in the configuration.  
routing-control—To add this statement to the configuration.

## protocols (Fabric)

**Syntax**

```
protocols {
  fabric-control {
    graceful-restart {
      restart-time seconds;
      stale-routes-time seconds;
    }
  }
}
```

**Hierarchy Level** [edit fabric]

**Release Information** Statement introduced in Junos OS Release 13.2X52-D10 for the QFX Series.

**Description** Specify attributes for the fabric control protocol.  
  
The remaining statements are explained separately.

**Required Privilege Level** admin—To view this statement in the configuration.  
admin-control—To add this statement to the configuration.

**Related Documentation** • [Understanding Routing Engines in the QFabric System on page 1325](#)

| <b>Release Information</b>      | Statement introduced in Junos OS Release 13.2X52-D10 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| <b>Description</b>              | <p>Configure the duration of the graceful restart period for the fabric control Routing Engine.</p> <p>The graceful restart resynchronization process takes longer when the QFabric system contains node groups that have a large number of VLANs. The graceful-restart duration should, therefore, be set higher when the QFabric system contains at least one node group with a large number of VLANs.</p> <p>Configure a restart time of 600 seconds if the number of VLAN members (vmembers) exceeds 32k.</p> |
|                                 | <div><b>CAUTION:</b> Configuring the restart time restarts the session between the fabric control Routing Engine and the Node groups. Traffic is dropped as a result of this restart. Normal QFabric system operations should resume once the session has restarted without any further user actions.</div>                                                                                                                      |
| <b>Options</b>                  | <p><b>seconds</b>—Duration of the graceful restart period.</p> <p><b>Default:</b> 300 seconds</p> <p><b>Range:</b> 300 to 900 seconds</p>                                                                                                                                                                                                                                                                                                                                                                         |

## Performing a Nonstop Software Upgrade on the QFabric System

**NOTE:** Before you can perform a nonstop software upgrade to Junos OS Release 13.1X50-D10, you must have Junos OS Release 12.2X50-D42 or later installed. You cannot perform a nonstop software upgrade with Junos OS Release 12.2X50-D41 or earlier. Contact the Juniper Technical Assistance Center for information on how to download Junos OS Release 12.2X50-D42. Performing a standard software upgrade (that is, issuing the `request system software add component all` command) does not require that you upgrade to an intermediate Junos OS software release.

To perform a nonstop software upgrade to Junos OS Release 13.1X50-D10:

1. First perform a nonstop software upgrade to Junos OS Release 12.2X50-D42.
2. Then perform a nonstop software upgrade to Junos OS Release 13.1X50-D10.

Nonstop software upgrade enables you to upgrade a QFabric system with minimal packet loss and maximum uptime. This feature introduces several high availability improvements to the QFabric system software upgrade process, including:

- Upgrading members of a Director group or Node group one at a time so that one device in the group is always operational
- Switching mastership of Routing Engine processes to the backup Director device before upgrading the master Director device
- Rebooting Interconnect devices and fabric control Routing Engines one at a time, so that one Interconnect device or one fabric control Routing Engine is always operational
- Switching mastership of a Node group to the backup Node device before upgrading the master Node device
- Specifying an upgrade group if you want all Node devices in a Node group to be upgraded in parallel (which shortens the time of the upgrade)
- Rebooting devices automatically as part of the nonstop upgrade process

When performing a nonstop upgrade, start with the Director group upgrade, then issue the fabric upgrade, and end with the Node group upgrades.

**NOTE:** Because there is no redundancy for Node groups containing a single Node device, traffic loss occurs when the device reboots during the upgrade. For node-groups defined with two node-devices, both must be online in order for upgrade to succeed.

**NOTE:** Before you install the software, we recommend that you back up your current configuration files by issuing the `request system software configuration-backup` command.

**NOTE:** Before you can perform a nonstop software upgrade in your QFabric system, you must first upgrade your system to Junos OS Release 12.2 by using a conventional upgrade method such as issuing the `request system software add component all` command.

This topic describes the following tasks:

- [Backing Up the Current Configuration Files on page 1551](#)
- [Downloading Software Files Using a Browser on page 1551](#)
- [Retrieving Software Files for Download on page 1552](#)
- [Performing a Nonstop Software Upgrade for Director Devices in a Director Group on page 1552](#)
- [Performing a Nonstop Software Upgrade for Interconnect Devices and Other Fabric-Related Components on page 1552](#)
- [\(Optional\) Creating Upgrade Groups for Node Groups on page 1553](#)
- [Performing a Nonstop Software Upgrade on a Node Group on page 1553](#)

## Backing Up the Current Configuration Files

To back up your current configuration files:

```
user@qfabric> request system software configuration-backup path
```

Back up the configuration files to a local directory, remote server, or removable drive (for example, an external USB flash drive).

For example:

```
user@qfabric> request system software configuration-backup/media/USB/
```

## Downloading Software Files Using a Browser

**NOTE:** To access the download site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website <https://www.juniper.net/registration/Register.jsp>.

1. Using a Web browser, navigate to the <http://www.juniper.net/support>.
  2. Click **Download Software**.
  3. In the **Switching** box, click **Junos OS Platforms**.
  4. In the **QFX Series** section, click the name of the platform for which you want to download software.
  5. Click the **Software** tab and select the release number from the **Release** drop-down list.
  6. Select the complete install package you want to download in the **QFabric System Install Package** section:
    - If you want to upgrade the entire QFabric system, select **QFabric System - Complete Install Package**.
    - If you want to upgrade either a single Node or Interconnect device for recovery purposes, select **Node and Interconnect Device Install Package**. For information on how to perform a recovery installation on either a Node or Interconnect device, see [“Performing a Recovery Installation” on page 120](#).
- A login screen appears.
7. Enter your user ID and password and press **Enter**.
  8. Read the End User License Agreement, select the **I agree** option button, and then click **Proceed**.
  9. Save the **jinstall-qfabric-version.rpm** file on your computer.

### Retrieving Software Files for Download

---

Retrieve the software from the location in which you downloaded it. To do this, issue the **request system software download** command. The software package is copied from where you downloaded it and is placed locally on the QFabric system.

- To retrieve the software:

```
user@qfabric> request system software download /path/package-name
```

For example:

```
user@qfabric> request system software download  
ftp://server/files/jinstall-qfabric-12.2X50-D10.3.rpm
```

### Performing a Nonstop Software Upgrade for Director Devices in a Director Group

---

**NOTE:** If you reboot any Node groups or Interconnect devices after you perform a nonstop upgrade on the Director group, these devices are upgraded to the same version of software that is running on the Director group.

---

To upgrade the software on the Director devices in a Director group:

- Issue the **request system software nonstop-upgrade director-group package-name** command.

For example:

```
user@qfabric> request system software nonstop-upgrade director-group  
jinstall-qfabric-12.2X50-D10.3.rpm
```

### Performing a Nonstop Software Upgrade for Interconnect Devices and Other Fabric-Related Components

---

Before you perform a nonstop upgrade on the Interconnect devices and other fabric-related components, verify that both Director devices in the Director group are online. Both Director devices must be online before you attempt to perform a nonstop upgrade. To verify that both Director devices are online, issue the **show fabric administration inventory director-group status** command.

To install the software on the Interconnect device and other components in the fabric:

- Issue the **request system software nonstop-upgrade fabric package-name** command.

For example:

```
user@qfabric> request system software nonstop-upgrade fabric  
jinstall-qfabric-12.2X50-D10.3.rpm
```

### (Optional) Creating Upgrade Groups for Node Groups

Upgrade groups enable two or more Node devices in a Node group, or an entire Node group, to be rebooted at the same time. If you do not create an upgrade group, the Node devices are upgraded one at a time. Before performing a nonstop upgrade on a Node group, create an upgrade group and include the devices you want to reboot at the same time.

**NOTE:** If you add Node devices that have links to the same link aggregation group (LAG), there might be traffic loss.

- Create the upgrade group by issuing the **set chassis node-group node-group-name nssu upgrade-group upgrade-group-name node-devices** command at the [edit chassis] hierarchy.

For example:

```
user@qfabric# set chassis node-group nodegroup1 nssu upgrade-group upgrade1 node-devices
[ node1 node2 ]
```

### Performing a Nonstop Software Upgrade on a Node Group

When you perform a nonstop software upgrade on a network Node group, the Node devices in the network Node group are upgraded in a serial fashion except when upgrade groups are configured. If you perform a nonstop upgrade on a redundant server Node group, both Node devices must be online for a successful upgrade. If one of the Node devices is no longer available, remove it from the configuration before you perform the nonstop software upgrade. If you perform a nonstop upgrade on a Node group with only one Node device, traffic loss occurs while the Node device is rebooting.

**NOTE:** You can upgrade multiple Node groups with this command. However, if more than one Node group is specified, there may be traffic loss depending on the topology of the network.

To install software on a Node group:

- Issue the **request system software nonstop-upgrade node-group node-group-name package-name** command.

To perform a nonstop upgrade on one Node group:

```
user@qfabric> request system software nonstop-upgrade node-group nodegroup1
jinstall-qfabric-12.2X50-D10.3.rpm
```

To perform a nonstop upgrade on more than one Node group:

```
user@qfabric> request system software nonstop-upgrade node-group [nodegroup1
nodegroup2 nodegroup3] jinstall-qfabric-12.2X50-D10.3.rpm
```

## Verifying Nonstop Software Upgrade for QFabric Systems

This topic discusses how you can monitor the progress of each of the three steps in a nonstop software upgrade. By identifying the key actions and events that define this process, you can track the status of the upgrade with confidence.

**TIP:** When performing a nonstop software upgrade, open two SSH sessions to the QFabric CLI. Use one session to monitor the upgrade itself and use a second session to verify that the QFabric system components respond to operational mode commands as expected.

- [Verifying a Director Group Nonstop Software Upgrade on page 1554](#)
- [Verifying a Fabric Nonstop Software Upgrade on page 1567](#)
- [Verifying a Redundant Server Node Group Nonstop Software Upgrade on page 1568](#)
- [Verifying a Network Node Group Nonstop Software Upgrade on page 1572](#)

### Verifying a Director Group Nonstop Software Upgrade

**Purpose** During the Director group portion of a nonstop software upgrade, you should expect to see the Director device that hosts the CLI session selected as the master device. When mastership of all processes moves to the master, the QFabric system upgrades the backup Director device and this Director device reboots. After the backup Director device comes back online, the master Director device suspends CLI operations for 15 minutes, upgrades itself, and reboots. At this point, the backup becomes the new master Director device and you can issue CLI operational commands. Finally, the former master comes back online as a backup and both devices are operational once again. In addition to the steps below, you can issue the **show system software upgrade status** command to view the progress of the upgrade.

**Action** 1. In one SSH session to the QFabric CLI, verify the current status of the QFabric system by issuing the **show fabric administration inventory**, **show fabric administration inventory director-group status**, and **show fabric session-host** commands. In this case, Director device DG0 is the master device but DG1 hosts the CLI session.

```
session1@qfabric> show fabric administration inventory
```

| Item       | Identifier | Connection | Configuration |

CP Link [1/3]                  up

```

```

session1@qfabric> show fabric session-host
Identifier: 0281052011000032

```

- In a second SSH session to the QFabric CLI, issue the request for the Director group nonstop software upgrade.

```

root@qfabric> request system software nonstop-upgrade director-group
jinstall-qfabric-12.2X50-D10.3.rpm

```

- If the CLI session is being hosted by the master Director device, skip to step 4. However, if the CLI session is hosted by the backup Director device, the Director group mastership switches to the backup device after you issue the nonstop software upgrade command. In this example, mastership switches to Director device DG1.

```

 [Peer Update Status]: Peer completed phase one of rolling upgrade

- When the system upgrades and reboots the backup Director device DGO, notice how this device is not displayed in the output of the **show fabric administration inventory director-group status** command. Because Director device DG1 appears, this means that the DG1 is operational and acts as the master device.

**NOTE:** If your second SSH session is being hosted by the rebooting Director device, your session terminates and you need to log back in to establish a new session running on the active Director device.

```
session1@qfabric> show fabric administration inventory director-group status
Director Group Status Tue Jun  5 15:41:14 UTC 2012
```

### Verifying a Fabric Nonstop Software Upgrade

**Purpose** During the fabric portion of a nonstop software upgrade, you should expect to see both fabric control Routing Engines upgrade first, followed by the upgrade of each Interconnect device one at a time. In addition to the steps below, you can issue the **show system software upgrade status** command to view the progress of the upgrade.

**Action** 1. In an SSH session to the QFabric CLI, issue the request for the fabric nonstop software upgrade.

```

root@qfabric> request system software nonstop-upgrade fabric
jinstall-qfabric-12.2X50-D10.3.rpm

```

2. Issue the **show system software upgrade status** command to view the status of the upgrade.

```

root@qfabric> show system software upgrade status
Wed Jan 16 22:06:02 2013 Software nonstop upgrade on:
                    RSNG in progress

```

3. During the redundant server Node group upgrade, the backup Node device (in this case, P1571-C) is upgraded first and appears in the **Disconnected** state in the output of the **show fabric administration inventory** command.

```

session1@qfabric> show fabric administration inventory

```

| Item                      | Identifier | Connection   | Configuration |
|---------------------------|------------|--------------|---------------|
| Node group                |            |              |               |

## Verifying a Network Node Group Nonstop Software Upgrade

**Purpose** During the network Node group portion of a nonstop software upgrade, you should expect to see the backup network Node group Routing Engine upgrade first, followed by the Node devices within the network Node group upgrading one at a time, and ending with the upgrade of the master network Node group Routing Engine. In addition to the steps below, you can issue the **show system software upgrade status** command to view the progress of the upgrade.

**NOTE:** If you configure an upgrade group for Node groups containing 2 or more Node devices, all Node devices within the upgrade group reboot at the same time.

**Action** 1. In an SSH session to the QFabric CLI, issue the request for the network Node group nonstop software upgrade.

```
root@qfabric> request system software nonstop-upgrade node-group NW-NG-0
jinstall-qfabric-12.2X50-D10.3.rpm
Upgrading target(s): NW-NG-0
```

```
[NW-NG-0 2012-06-01 09:45:06]: Starting with package

[NW-NG-0 2012-06-01 10:18:37]: Preparing for Switchover
[NW-NG-0 2012-06-01 10:18:55]: Switchover Completed
[Status 2012-06-01 10:18:58]: Upgrade completed with 0 errors
Success

```

2. Issue the **show system software upgrade status** command to view the status of the upgrade.

```

root@qfabric> show system software upgrade status
Wed Jan 16 22:06:02 2013 Software nonstop upgrade on:
NW-NG-0 in progress

```

3. Verify the progress of the upgrade by issuing the **show chassis nonstop-upgrade node-group**, **show fabric administration inventory**, **show fabric administration inventory infrastructure**, and **show fabric administration inventory node-groups NW-NG-0** commands. You should see the backup network Node group Routing Engine reboot first, followed by each Node device within the network Node group, and ending with the reboot of master network Node group Routing Engine. Restarting devices appear as **Disconnected** in the output of the **show fabric administration inventory** command and restarting Routing Engines do not appear in output of the **show fabric administration inventory infrastructure** command until they return to service.

## Upgrading Software on a QFabric System

The QFabric system software package contains software for all of the different components in the QFabric system, such as the Director group, Interconnect devices, Node devices, and other QFabric system components. You can upgrade the software on all of the QFabric components at the same time using the **request system software add package-name component all reboot** command.

**NOTE:** Downgrading software on a QFabric system is not supported.

This topic describes the following tasks:

- [Backing Up the Current Configuration Files on page 1574](#)
- [Downloading Software Files Using a Browser on page 1574](#)
- [Retrieving Software Files for Download on page 1575](#)
- [Installing the Software Package on the Entire QFabric System on page 1575](#)

---

### Backing Up the Current Configuration Files

---

To back up your current configuration files:

```
user@switch> request system software configuration-backup path
```

Back up the configuration files to a local directory, remote server, or removable drive (for example, an external USB flash drive).

For example:

```
user@switch> request system software configuration-backup /media/USB/
```

---

### Downloading Software Files Using a Browser

---

**NOTE:** To access the download site, you must have a service contract with Juniper Networks and an access account. If you need help obtaining an account, complete the registration form at the Juniper Networks website <https://www.juniper.net/registration/Register.jsp>.

---

1. Using a Web browser, navigate to the <http://www.juniper.net/support>.
  2. Click **Download Software**.
  3. In the **Switching** box, click **Junos OS Platforms**.
  4. In the **QFX Series** section, click the name of the platform for which you want to download software.
  5. Click the **Software** tab and select the release number from the **Release** drop-down list.
  6. Select the complete install package you want to download in the **QFabric System Install Package** section:
    - If you want to upgrade the entire QFabric system, select **QFabric System - Complete Install Package**.
    - If you want to upgrade either a single Node or Interconnect device for recovery purposes, select **Node and Interconnect Device Install Package**. For information on how to perform a recovery installation on either a Node or Interconnect device, see [“Performing a Recovery Installation” on page 120](#).
- A login screen appears.
7. Enter your user ID and password and click **Login**.

8. Read the End User License Agreement, select the **I agree** option button, and then click **Proceed**.
9. Save the **jinstall-qfabric-version.rpm** file on your computer.

### Retrieving Software Files for Download

Retrieve the software from the location in which you downloaded it. To do this, issue the **request system software download** command. The software package is copied from where you downloaded it and is placed locally on the QFabric system.

- To retrieve the software:

```
user@switch> request system software download /path/package-name
```

For example:

```
user@switch> request system software download
ftp://server/files/jinstall-qfabric-11.3X30.6.rpm
```

### Installing the Software Package on the Entire QFabric System

**NOTE:** On a QFabric system, a QFX3500 Node device or QFX3600 Node device might not be able to participate as a Node device in the QFabric system if the Node device is running a different version of software from that of the Director group. This mismatch of software versions between the Node device and the Director group can occur when the Node device is introduced into the setup, and both Director devices go offline before the Node device completes its auto-upgrade process to upgrade its software version to the same software version running on the Director group. The workaround is to reboot the QFX3500 or QFX3600 Node device once the Director group comes back online. The QFX3500 or QFX3600 Node device will initiate auto-upgrade and upgrade its software version from the Director group.

1. Issue the **request system software add package-name component all reboot** command.

For example:

```
user@switch> request system software add jinstall-qfabric-11.3X30.6.rpm component all
reboot
```

**NOTE:** If you receive an error message after issuing the **request system software add package-name component all reboot** command that says that the configuration file cannot be loaded as is, you will need to enter configuration mode, make any necessary changes to the configuration file, and then commit the changes.

**NOTE:** The default value for a QFabric system software upgrade is `validate`. The validation step adds up to 10 minutes to the overall software upgrade. If the validation fails, the upgrade does not proceed and the QFabric system automatically issues the `request system software rollback` command to restore the current software image. If you upgrade more than one component (for example, by issuing the `component all` option), validation failure on one device stops the upgrade process for the other devices. If you do not want to validate the software package against the current configuration, issue the `no-validate` option.

2. After the reboot has finished, verify that the new version of software has been properly installed by issuing the `show version component all` command.

```
user@switch> show version component all

## Performing System Backup and Recovery for a QFabric System

Many routers and switches require an administrator to recover the software package and the configuration file for the device separately. In the case of a device failure, this means the administrator might need to perform two separate tasks (if neither the software package nor the configuration file can be recovered).

In contrast, the QFabric system uses a unique mechanism that saves the backup and recovery files for both the Junos OS software and the system configuration into a single collection. The following QFabric system backup and recovery mechanism simplifies and streamlines the recovery process so you can return to normal operations as quickly as possible.

To backup and recover your QFabric system:

1. (First time only) Implement the following one-time procedure to prepare your QFabric system to use the system backup and recovery feature:
  - Insert a Juniper Networks software installation USB flash drive into the master Director device. (This drive was provided to you as one of the components of your QFabric system shipment.)
  - Issue the **request system software format-qfabric-backup** command. The contents and format of the USB flash drive are copied to the Director group shared directory and are used as the basis for all future backup and recovery operations.  

```
user@qfabric> request system software format-qfabric-backup
Copying QFabric USB template image from /dev/sdb(Unigen,PQS4000,4009 MB).....
```
  - Remove the Juniper Networks software installation USB drive from the master Director device.
2. Issue the **request system software system-backup** command to backup the software package and configuration file. This command saves the current files necessary to recover the QFabric system. The files are saved to a shared memory directory in the Director group.

**NOTE:** As you upgrade your system with new software and change the system configuration over time, remember to reissue this command periodically to save the newest files for recovery purposes.

---

```
user@qfabric> request system software system-backup
```

```
user@qfabric>
```

3. Insert a 4 GB or larger USB flash drive into the master Director device for your Director group, and issue the **request system software system-backup usb-create** command. This command copies the recovery files that have been backed up in the Director group and transfers them to the USB flash drive to create a recovery USB drive.

**NOTE:** Issuing this command overwrites the contents of the USB flash drive with the QFabric system recovery files.

```
user@qfabric> request system software system-backup usb-create /dev/sdb
Issuing this command will overwrite the contents of the USB drive.
Continue? [yes,no] (no) yes
```

```
This operation will access the USB drive on 0281042010000013.
Are you sure you want to continue? [yes,no] (no) yes
```

```
Copying QFabric recovery media to /dev/sdb...
Successfully copied QFabric recovery media to /dev/sdb
```

4. Remove the recovery USB drive from the Director device, and store it securely in a known location that you will remember when you need to use the recovery USB drive.
5. If the QFabric system fails, power off the Director group, insert the recovery USB drive into the master Director device of your Director group, turn on power to the Director device, and follow the prompts to recover your system. This step restores the software package and the configuration file for your QFabric system.

## QFabric System Operational Mode Commands

Table 104 on page 1580 summarizes the command line interface (CLI) commands that you can use to monitor and troubleshoot the QFabric system operations.

**Table 104: QFabric System Operational Mode Commands**

| Task                                                                                                  | Command                                                                 |
|-------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------|
| Select the operating mode for the device.                                                             | <code>request chassis device-mode</code>                                |
| Set the Interconnect device Flexible PIC Concentrator (FPC) offline or online for the QFabric system. | <code>request chassis fabric fpc</code>                                 |
| Log in to individual QFabric system components for device level troubleshooting.                      | <code>request component login</code>                                    |
| Select a Director device to become the new primary device within a Director group.                    | <code>request fabric administration director-group change-master</code> |
| Remove a disconnected component from the QFabric system inventory.                                    | <code>request fabric administration remove</code>                       |

Table 104: QFabric System Operational Mode Commands (*continued*)

| Task                                                                                                                                                                                                                 | Command                                                                 |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------|
| Add a MAC range to the MAC pool assigned to the QFabric system.                                                                                                                                                      | <code>request fabric administration system mac-pool add</code>          |
| Delete a MAC range from the MAC block assigned to the QFabric system.                                                                                                                                                | <code>request fabric administration system mac-pool delete</code>       |
| Halt a Director device.                                                                                                                                                                                              | <code>request system halt director-device</code>                        |
| Reboot QFabric system components.                                                                                                                                                                                    | <code>request system reboot</code>                                      |
| Upgrade the software version of the QFabric system by using the nonstop software upgrade method (which preserves forwarding functionality during the upgrade and enables components to upgrade on a rotating basis). | <code>request system software nonstop-upgrade</code>                    |
| Save the software package and system configuration files to be able to recover the QFabric system in the case of a system failure.                                                                                   | <code>request system software system-backup</code>                      |
| Specify information to be displayed on the LCD panel of a QFabric system device.                                                                                                                                     | <code>set chassis display message</code>                                |
| Display information about the operating mode of the device.                                                                                                                                                          | <code>show chassis device-mode</code>                                   |
| Display the status of Ethernet switching in the Control Board of an Interconnect device.                                                                                                                             | <code>show chassis ethernet-switch interconnect-device cb</code>        |
| Display the status of Ethernet switching in the Flexible PIC Controller (FPC) of an Interconnect device.                                                                                                             | <code>show chassis ethernet-switch interconnect-device fpc</code>       |
| Display the status of the data plane connections in the QFabric system.                                                                                                                                              | <code>show chassis fabric connectivity</code>                           |
| Display the fabric management status of devices in your QFabric system.                                                                                                                                              | <code>show chassis fabric device</code>                                 |
| Display information shown on the LCD screen of a QFabric system device.                                                                                                                                              | <code>show chassis lcd</code>                                           |
| Display the status of a nonstop software upgrade for a Node group.                                                                                                                                                   | <code>show chassis nonstop-upgrade node-group</code>                    |
| Display all devices that belong to the QFabric system.                                                                                                                                                               | <code>show fabric administration inventory</code>                       |
| Display the Director devices that belong to a QFabric system Director group.                                                                                                                                         | <code>show fabric administration inventory director-group status</code> |
| Display the services running on the Director group for the QFabric system.                                                                                                                                           | <code>show fabric administration inventory infrastructure</code>        |

Table 104: QFabric System Operational Mode Commands (*continued*)

| Task                                                                                          | Command                                                                |
|-----------------------------------------------------------------------------------------------|------------------------------------------------------------------------|
| Display the Interconnect devices that belong to a QFabric system.                             | <code>show fabric administration inventory interconnect-devices</code> |
| Display the Node devices that belong to the QFabric system.                                   | <code>show fabric administration inventory node-devices</code>         |
| Display the Node groups and the corresponding Node devices that belong to the QFabric system. | <code>show fabric administration inventory node-groups</code>          |
| Display all devices that belong to the QFabric system.                                        | <code>show fabric inventory</code>                                     |
| Display the MAC addresses that belong to a QFabric system Director group.                     | <code>show fabric administration system mac-pool</code>                |
| Display the Director device that hosts the QFabric CLI session.                               | <code>show fabric session-host</code>                                  |
| Display the system log messages in the specified file.                                        | <code>show log</code>                                                  |
| Display the status of a QFabric system software upgrade.                                      | <code>show system software upgrade status</code>                       |

## Filtering Operational Mode Command Output in a QFabric System

When you issue an operational mode command in a QFabric system, the output generated can be fairly extensive because of the number of components contained within the system. To make the output more accessible, you can filter the output by appending the **| filter** option to the end of most Junos OS commands.

- To filter operational mode command output and limit it to a Node group, include the **| filter node-group node-group-name** option at the end of your Junos OS operational mode command.

```
root@qfabric> show interfaces terse | filter node-group NW-NG-0
```

| Interface         | Admin | Link | Proto | Local     | Remote  |
|-------------------|-------|------|-------|-----------|---------|
| NW-NG-0:dsc       | up    | up   |       |           |         |
| NW-NG-0:em0       | up    | up   |       |           |         |
| NW-NG-0:em1       | up    | up   |       |           |         |
| NW-NG-0:gre       | up    | up   |       |           |         |
| NW-NG-0:ipip      | up    | up   |       |           |         |
| NW-NG-0:lo0       | up    | up   |       |           |         |
| NW-NG-0:lo0.16384 | up    | up   | inet  | 127.0.0.1 | --> 0/0 |
| NW-NG-0:lo0.16385 | up    | up   | inet  |           |         |
| NW-NG-0:lsi       | up    | up   |       |           |         |
| NW-NG-0:mtun      | up    | up   |       |           |         |
| NW-NG-0:pimd      | up    | up   |       |           |         |
| NW-NG-0:pime      | up    | up   |       |           |         |
| NW-NG-0:tap       | up    | up   |       |           |         |
| Node01:ge-0/0/10  | up    | up   |       |           |         |
| Node01:ge-0/0/40  | up    | up   |       |           |         |

```
Node01:ge-0/0/41      up    up
vlan                  up    up
```

- To filter operational mode command output and limit it to a set of Node groups, include the **| filter node-group** option at the end of your Junos OS operational mode command and specify the list of Node group names in brackets.

```
root@qfabric> show ethernet-switching interfaces | filter node-group [NW-NG-0 RSNG-1]
```

| Interface     | State | VLAN members | Tag | Tagging  | Blocking  |
|---------------|-------|--------------|-----|----------|-----------|
| NW-NG-0:ae0.0 | up    | v200         | 200 | tagged   | unblocked |
|               |       | v50          | 50  | tagged   | unblocked |
|               |       | v51          | 51  | tagged   | unblocked |
|               |       | v52          | 52  | tagged   | unblocked |
|               |       | v53          | 53  | tagged   | unblocked |
| RSNG-1:ae0.0  | up    | v200         | 200 | untagged | unblocked |
| RSNG-1:ae47.0 | up    | v50          | 50  | tagged   | unblocked |
|               |       | v51          | 51  | tagged   | unblocked |
|               |       | v52          | 52  | tagged   | unblocked |
|               |       | v53          | 53  | tagged   | unblocked |

[request chassis device-mode node-device \(Starting in Interconnect Device or Standalone Mode\) on page 1585](#)

[request chassis device-mode standalone \(Starting in Interconnect Device or Node Device Mode\) on page 1585](#)

[request chassis device-mode standalone \(Starting in Standalone Mode\) on page 1585](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

[request chassis device-mode interconnect-device \(Starting in Node Device or Standalone Mode\)](#)

```
user@switch> request chassis device-mode interconnect-device
Device mode set to 'interconnect-device' mode.
Please reboot the system to complete the process.
```

[request chassis device-mode node-device \(Starting in Interconnect Device or Standalone Mode\)](#)

```
user@switch> request chassis device-mode node-device
Device mode set to 'node-device' mode.
Please reboot the system to complete the process.
```

[request chassis device-mode standalone \(Starting in Interconnect Device or Node Device Mode\)](#)

```
user@switch> request chassis device-mode standalone
Device mode set to 'standalone' mode.
Please reboot the system to complete the process.
```

[request chassis device-mode standalone \(Starting in Standalone Mode\)](#)

```
user@switch> request chassis device-mode standalone
Device mode set to 'standalone' mode.
No reboot required.
```

## request chassis fabric fpc

## Sample Output

### request chassis fabric fpc online

```
user@qfabric> request chassis fabric fpc interconnect-device IC-YW3781 offline slot 15
Graceful offline of the fabric card has been initiated. Please wait 20 seconds
before offlining or removing the card.
```

### request chassis fabric fpc offline

```
user@qfabric> request chassis fabric fpc interconnect-device IC-YW3781 online slot 15
Bring the FPC online by issuing the "request chassis fpc online" command.
```

## request component login

## Sample Output

The three sample output displays show the results of attempts to log in to Node device EE3093. The results differ depending on the privilege level assigned to the user.

### request component login (with qfabric-admin Privileges)

```
admin@qfabric> request component login EE3093
Warning: Permanently added 'qfabric-node-ee3093,169.254.128.41' (RSA) to the list
of known hosts.
--- JUNOS 11.3I built 2011-11-04 12:46:16 UTC
{master}
qfabric-admin@node-ee3093> ?
Possible completions:
clear          Clear information in the system
file           Perform file operations
help           Provide help information
load           Load information from file
monitor        Show real-time debugging information
mtrace        Trace multicast path from source to receiver
op             Invoke an operation script
ping           Ping remote target
quit           Exit the management session
request        Make system-level requests
restart        Restart software process
save           Save information to file
set            Set CLI properties, date/time, craft interface message
show           Show system information
ssh            Start secure shell on another host
start          Start shell
```

```
telnet          Telnet to another host
test           Perform diagnostic debugging
traceroute     Trace route to remote host{master}
qfabric-admin@node-ee3093>
```

#### request component login (with qfabric-operator Privileges)

```
operator@qfabric> request component login EE3093
Warning: Permanently added 'qfabric-node-ee3093,169.254.128.41' (RSA) to the list
of known hosts.

## Sample Output

### request fabric administration remove interconnect-device

```
user@qfabric> request fabric administration remove interconnect-device IC1
Device successfully removed
```

## Sample Output

`request fabric administration remove node-device`

```
user@qfabric> request fabric administration remove node-device node5
Device successfully removed
```

## request fabric administration system mac-pool add

| Description               | Stop the router or switch software.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

**NOTE:** When you issue this command on an individual component—for example, a Node device—in a QFabric system, you will receive a warning that says “Hardware-based members will halt, Virtual Junos Routing Engines will reboot.” If you want to halt only one member of a Node group, issue this command with the **member** option on the Node device CLI, because you cannot issue this command from the QFabric CLI. Also, issuing this command might cause traffic loss on an individual component.

When you issue this command on a QFX5100 switch, you are not prompted to reboot. You must power cycle the switch to reboot.

**Options**    **none**—Stop the router or switch software immediately.

**all-chassis**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) Halt all chassis.

**all-lcc**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, halt all T640 routers (or line-card chassis) connected to the TX Matrix router. On a TX Matrix Plus router, halt all T1600 or T4000 routers connected to the TX Matrix Plus router.

**all-members**—(EX4200 switches and MX Series routers only) (Optional) Halt all members of the Virtual Chassis configuration.

**at time** —(Optional) Time at which to stop the software, specified in one of the following ways:

- **now**—Stop the software immediately. This is the default.
- **+minutes**—Number of minutes from now to stop the software.
- **yymmddhhmm**—Absolute time at which to stop the software, specified as year, month, day, hour, and minute.
- **hh:mm**—Absolute time on the current day at which to stop the software.

**backup-routing-engine**—(Optional) Halt the backup Routing Engine. This command halts the backup Routing Engine, regardless from which Routing Engine the command is executed. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is halted. If you issue the command from the backup Routing Engine, the backup Routing Engine is halted.

**both-routing-engines**—(Optional) Halt both Routing Engines at the same time.

**director-device *director-device-id***—(QFabric systems only) Halt a specific Director device.

**lcc number**—(TX Matrix routers and TX Matrix Plus routers only) (Optional) On a TX Matrix router, halt a specific T640 router that is connected to the TX Matrix router. On a TX Matrix Plus router, halt a specific router that is connected to the TX Matrix Plus router.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**local**—(EX4200 switches and MX Series routers only) (Optional) Halt the local Virtual Chassis member.

**in *minutes***—(Optional) Number of minutes from now to stop the software. This option is an alias for the at *+minutes* option.

**media (compact-flash | disk | removable-compact-flash | usb)**—(Optional) Boot medium for the next boot. (The options **removable-compact-flash** and **usb** pertain to J Series routers only.)

**media (external | internal)**—(EX Series and QFX Series switches and MX Series routers only) (Optional) Halt the boot media:

- **external**—Halt the external mass storage device.
- **internal**—Halt the internal flash device.

**member *member-id***—(EX4200 switches and MX Series routers only) (Optional) Halt the specified member of the Virtual Chassis configuration. For EX4200 switches, replace *member-id* with a value from 0 through 9. For an MX Series Virtual Chassis, replace *member-id* with a value of 0 or 1.

**message "*text*"**—(Optional) Message to display to all system users before stopping the software.

**other-routing-engine**—(Optional) Halt the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is halted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is halted.

**scc**—(TX Matrix routers only) (Optional) Halt the TX Matrix router (or switch-card chassis).

**sfc *number***—(TX Matrix Plus routers only) (Optional) Halt the TX Matrix Plus router (or switch-fabric chassis). Replace *number* with 0.

**slice *slice***—(EX Series and QFX Series switches only) (Optional) Halt a partition on the boot media. This option has the following suboptions:

- 1—Halt partition 1.
- 2—Halt partition 2.

- **alternate**—Reboot from the alternate partition.

**Additional Information** On the M7i router, the **request system halt** command does not immediately power down the Packet Forwarding Engine. The power-down process can take as long as 5 minutes.

On a TX Matrix router and TX Matrix Plus router if you issue the **request system halt** command on the master Routing Engine, all the master Routing Engines connected to the routing matrix are halted. If you issue this command on the backup Routing Engine, all the backup Routing Engines connected to the routing matrix are halted.

**NOTE:** If you have a router or switch with two Routing Engines and you want to shut the power off to the router or switch or remove a Routing Engine, you must first halt the backup Routing Engine (if it has been upgraded), and then halt the master Routing Engine. To halt a Routing Engine, issue the **request system halt** command. You can also halt both Routing Engines at the same time by issuing the **request system halt both-routing-engines** command.

**Required Privilege Level** maintenance

**List of Sample Output**

- [request system halt on page 1599](#)
- [request system halt \(In 2 Hours\) on page 1599](#)
- [request system halt \(Immediately\) on page 1599](#)
- [request system halt \(At 1:20 AM\) on page 1599](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system halt

```
user@host> request system halt
Halt the system ? [yes,no] (no) yes

*** FINAL System shutdown message from root@section2 ***
System going down IMMEDIATELY
Terminated
...
syncing disks... 11 8 done
The operating system has halted.
Please press any key to reboot.
```

### request system halt (In 2 Hours)

The following example, which assumes that the time is 5 PM (1700), illustrates three different ways to request that the system stop 2 hours from now:

```
user@host> request system halt at +120
user@host> request system halt in 120
user@host> request system halt at 19:00
```

### request system halt (Immediately)

```
user@host> request system halt at now
```

### request system halt (At 1:20 AM)

To stop the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

```
user@host> request system halt at yymmdd120
request system halt at 120
Halt the system at 120? [yes,no] (no) yes
```

## request system reboot

---

**Syntax (QFX Series and EX4600)**    request system reboot  
                                 <all <graceful>>  
                                 <all-members | local | member *member-id*>  
                                 <at time>  
                                 <both-routing-engines>  
                                 <director-device *name*>  
                                 <director-group <graceful>>  
                                 <fabric <graceful>>  
                                 <fast-boot>  
                                 <in minutes>  
                                 <media >  
                                 <message "text">  
                                 <node-group *name*>  
                                 <other-routing-engine>  
                                 <slice (1 | 2 | alternate)>

**Release Information**    Command introduced in Junos OS Release 11.1 for the QFX Series.  
                                 Command introduced in Junos OS Release 13.2X51-D25 for EX4600 switches.

**Description**    Reboot the Junos OS.

**NOTE:** On a QFabric system, to avoid traffic loss on the network Node group, switch mastership of the Routing Engine to the backup Routing Engine, and then reboot.

---

Reboot requests are recorded in the system log files, which you can view with the **show log messages** command. You can view the process names with the **show system processes** command.

**Options**    **none**—Reboots the software immediately.

**all**—(QFabric systems only) (Optional) Reboots the software on the Director group, fabric control Routing Engines, fabric manager Routing Engines, Interconnect devices, and network and server Node groups.

**all-members | local | member *member-id***—(Optional) Specify which member of the Virtual Chassis to reboot:

- **all-members**—Reboots each switch that is a member of the Virtual Chassis.
- **local**—Reboots the local switch, meaning the switch you are logged into, only.
- **member *member-id***—Reboots the specified member switch of the Virtual Chassis.

**at time**—(Optional) Time at which to reboot the software, specified in one of the following ways:

- **+minutes**—Number of minutes from now to reboot the software.
- **hh:mm**—Absolute time on the current day at which to reboot the software, specified in 24-hour time.
- **now**—Stop or reboot the software immediately. This is the default.
- **yymmddhhmm**—Absolute time at which to reboot the software, specified as year, month, day, hour, and minute.

**both-routing-engines**—(Optional) Reboot both Routing Engines at the same time.

**director-device *name***—(QFabric systems only) (Optional) Reboots the software on the Director device and the default partition (QFabric CLI).

**director-group**—(QFabric systems only) (Optional) Reboots the software on the Director group and the default partition (QFabric CLI).

**fabric**—(QFabric systems only) (Optional) Reboots the fabric control Routing Engines and the Interconnect devices.

**fast-boot**—(QFX5100 only) (Optional) Enhances the reboot time. The switch reboots in such a way as to minimize downtime of network ports by not bringing the network ports down immediately as in the normal reboot option. There is minimal traffic loss while the forwarding device is reprogrammed.

**graceful**—(QFabric systems only) (Optional) Allows the QFabric component to reboot with minimal impact to network traffic. This option is only available for the **all**, **fabric**, and **director-group** options.

**in minutes**—(Optional) Number of minutes from now to reboot the software. This option is an alias for the **at +minutes** option.

**media (external | internal)**—(Optional) Boot medium for the next boot. The external option reboots the switch using a software package stored on an external boot source, such as a USB flash drive. The internal option reboots the switch using a software package stored in an internal memory source.

**message "text"**—(Optional) Message to display to all system users before rebooting the software.

**node-group *name***—(QFabric systems only) (Optional) Reboots the software on a server Node group or a network Node group.

**other-routing-engine**—(Optional) Reboot the other Routing Engine from which the command is issued. For example, if you issue the command from the master Routing Engine, the backup Routing Engine is rebooted. Similarly, if you issue the command from the backup Routing Engine, the master Routing Engine is rebooted.

**routing-engine**—(Optional) Reboot the Routing Engine.

**slice (1 | 2 | alternate)**—(Optional) Reboot using the specified partition on the boot media. This option has the following suboptions:

**NOTE:** The slice option is not supported on the QFX5100 switch or the EX4600 switch, because there is no alternate slice when Junos OS boots as a Virtual Machine (VM). To switch to a previous version of Junos OS, issue the `request system software rollback` command.

- 1—Reboot from partition 1.
- 2—Reboot from partition 2.
- **alternate**—Reboot from the alternate partition, which is the partition that did not boot the switch at the last bootup.

**Required Privilege Level** maintenance

**Related Documentation**

- [Rebooting and Halting a Device on page 188](#)

**Output Fields** When you enter this command, you are provided feedback on the status of your request.

## Sample Output

### request system reboot

```
user@switch> request system reboot
Reboot the system ? [yes,no] (no)
```

### request system reboot (At 2300)

```
user@switch> request system reboot at 2300 message ?Maintenance time!?
Reboot the system ? [yes,no] (no) yes

shutdown: [pid 186]
*** System shutdown message from root@berry.network.net ***
System going down at 23:00
```

### request system reboot (In 2 Hours)

The following example, which assumes that the time is 5 PM (1700), illustrates three different ways to request the system to reboot in 2 hours:

```
user@switch> request system reboot at +120
user@switch> request system reboot in 120
user@switch> request system reboot at 19:00
```

### request system reboot (Immediately)

```
user@switch> request system reboot at now
```

### request system reboot (At 1:20 AM)

To reboot the system at 1:20 AM, enter the following command. Because 1:20 AM is the next day, you must specify the absolute time.

```
user@switch> request system reboot at 06060120
request system reboot at 120
Reboot the system at 120? [yes,no] (no) yes
```

#### **request system reboot director-device**

```
user@switch> request system reboot director-device Node1
Issuing this command may interrupt traffic forwarding.
Continue? [yes,no] (no)
```

#### **request system reboot director-group**

```
user@switch> request system reboot director-group
Issuing this command may interrupt traffic forwarding.
Continue? [yes,no] (no)
```

#### **request system reboot director-group graceful**

```
user@switch> request system reboot director-group graceful
Issuing this command may interrupt this traffic forwarding.
Continue? [yes,no] (no)
```

| <b>Release Information</b> | Command introduced in Junos OS Release 12.2 for the QFX Series.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| <b>Description</b>         | Nonstop software upgrade enables you to upgrade a QFabric system with minimal packet loss and maximum uptime. You should upgrade the devices in the following order: Director group, fabric controls and Interconnect devices, and network and server Node groups.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Options</b>             | <p><i>package-name</i>—Location from which the software is to be installed. For example:</p> <ul style="list-style-type: none"> <li>• <i>protocol://hostname/pathname/package-name</i>—For a software package or bundle that is to be downloaded and installed from a remote location. Replace <b>protocol</b> with one of the following: <ul style="list-style-type: none"> <li>• <b>ftp</b>—File Transfer Protocol.<br/>Use <b>ftp://hostname/pathname/package-name</b>. To specify authentication credentials, use <b>ftp://&lt;username&gt;:&lt;password&gt;@hostname/pathname/package-name</b>. To have the system prompt you for the password, specify <b>prompt</b> in place of the password. If a password is required, and you do not specify the password or <b>prompt</b>, an error message is displayed.</li> <li>• <b>http</b>—Hypertext Transfer Protocol.<br/>Use <b>http://hostname/pathname/package-name</b>. To specify authentication credentials, use <b>http://&lt;username&gt;:&lt;password&gt;@hostname/pathname/package-name</b>. If a password is required and you omit it, you are prompted for it.</li> <li>• <b>scp</b>—Secure copy (available only for Canada and U.S. version).<br/>Use <b>scp://hostname/pathname/package-name</b>. To specify authentication credentials, use <b>scp://&lt;username&gt;:&lt;password&gt;@hostname/pathname/package-name</b>.</li> </ul> </li> </ul> |

### NOTE:

- The *pathname* in the protocol is the relative path to the user's home directory on the remote system and not the root directory.

**director-group**—Install software package on the Director group and Fabric managers.

**fabric**—Install software package on the Interconnect devices and Fabric controls.

**node-group *name*** —Install software package on the redundant server Node group, server Node group, or network Node group.

## request system software system-backup

**Syntax** request system software system-backup  
<usb-create>

**Release Information** Command introduced in Junos OS Release 13.1 for the QFX Series.

**Description** (QFabric systems only) Save a copy of the current QFabric system configuration file and the current software package for recovery purposes. You can use these saved files to restore your QFabric system to full operation after a system failure or shutdown.

**Options** **none**—Copy the QFabric system software package and system configuration file to a Director group recovery directory.

**NOTE:** If this command fails, insert a Juniper Networks software installation USB flash drive into the master Director device and issue the **request system software format-qfabric-backup** command. For more details about this prerequisite procedure that is required before you can use the QFabric system backup and recovery feature, see [“Performing System Backup and Recovery for a QFabric System” on page 1578](#).

**usb-create**—Copy the QFabric system software package and system configuration file from the Director group recovery directory to a USB flash drive. When the files have been copied, you can use the USB flash drive to help your QFabric system recover from a failure condition.

**NOTE:** You must issue the **request system software system-backup** command (which saves the files to the Director group) before you can issue the **request system software system-backup usb-create** command.

**Required Privilege Level** maintenance

**List of Sample Output** [request system software system-backup on page 1612](#)  
[request system software system-backup usb-create on page 1612](#)

**Output Fields** When you enter these commands, you are provided feedback on the status of your request.

## Sample Output

### request system software system-backup

```
user@qfabric> request system software system-backup
```

```
user@qfabric>
```

### request system software system-backup usb-create

```
user@qfabric> request system software system-backup usb-create /dev/sdb
Issuing this command will overwrite the contents of the USB drive.
Continue? [yes,no] (no) yes
```

```
This operation will access the USB drive on 0281042010000013.
Are you sure you want to continue? [yes,no] (no) yes
```

```
Copying QFabric recovery media to /dev/sdb...
Successfully copied QFabric recovery media to /dev/sdb
```

## set chassis display message

| <b>Release Information</b>            | Command introduced before Junos OS Release 7.4.<br>Command introduced in Junos OS Release 9.0 for EX Series switches.<br><i>sfc</i> option for TX Matrix Plus router introduced in Junos OS Release 9.6.                                                                                                    |
| <b>Description</b>                    | Display or stop a text message on the craft interface display, which is on the front of the router, or on the LCD panel display on the switch. The craft interface alternates the display of text messages with standard craft interface messages three times, switching between messages every 60 seconds. |

**NOTE:** On T Series routers, when this command is executed with the **permanent** option, the display of the text message alternates with that of the standard craft interface message continuously every 60 seconds.

By default, on both the router and the switch, the text message is displayed for 5 minutes. The craft interface display has four 20-character lines. The LCD panel display has two 16-character lines, and text messages appear only on the second line.

**Options**    **"message"**—Message to display. On the craft interface display, if the message is longer than 20 characters, it wraps onto the next line. If a word does not fit on one line, the entire word moves down to the next line. Any portion of the message that does not fit on the display is truncated. An empty pair of quotation marks ("" ) deletes the text message from the craft interface display. On the LCD panel display, the message is limited to 16 characters.

**fpc-slot slot-number**—(TX Matrix Plus routers and EX4200 and QFX Series only) On the router or switch, display the text message on the craft interface for a specific Flexible PIC Concentrator (FPC). Replace **slot-number** with a value from 0 through 31. On the switch, display the text message for a specific member of a Virtual Chassis, where **fpc-slot slot-number** corresponds to the member ID. Replace **slot-number** with a value from 0 through 9. On the QFX Series, the **slot-number** is always 0. On a TX Matrix Plus router with 3D SIBs replace **slot-number** with a value from 0 through 63.

**lcc number**—(TX Matrix router and TX Matrix Plus router only) (Optional) Line-card chassis number.

Replace *number* with the following values depending on the LCC configuration:

- 0 through 3, when T640 routers are connected to a TX Matrix router in a routing matrix.
- 0 through 3, when T1600 routers are connected to a TX Matrix Plus router in a routing matrix.
- 0 through 7, when T1600 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.
- 0, 2, 4, or 6, when T4000 routers are connected to a TX Matrix Plus router with 3D SIBs in a routing matrix.

**permanent**—(Optional) Display a text message on the craft interface display or LCD panel display permanently.

**scc**—(TX Matrix routers only) Display the text message on the craft interface display of the TX Matrix router (switch-card chassis).

**sfc number**—(TX Matrix Plus routers only) Display the text message on the craft interface display of the TX Matrix Plus router (or switch-fabric chassis).

**Required Privilege Level**

[set chassis display message \(Creating\) on page 1614](#)  
[set chassis display message \(Deleting\) on page 1615](#)

**Output Fields**

See *show chassis craft-interface* for an explanation of output fields.

## Sample Output

### set chassis display message (Creating)

The following example shows how to set the display message and verify the result:

```
user@host> set chassis display message "NOC contact Dusty (888) 555-1234"
message sent

user@host> show chassis craft-interface
Red alarm:      LED off, relay off
Yellow alarm:   LED off, relay off
Host OK LED:    On
Host fail LED:  Off
```

```

FPCs      0  1  2  3  4  5  6  7
-----
Green  ..  *..  *  *.
Red    .....
LCD screen:
+-----+
|NOC contact Dusty |
|(888) 555-1234    |
+-----+

```

### set chassis display message (Deleting)

The following example shows how to delete the display message and verify that the message is removed:

```

user@host> set chassis display message ""
message sent

```

```

user@host> show chassis craft-interface
Red alarm:      LED off, relay off
Yellow alarm:   LED off, relay off
Host OK LED:    On
Host fail LED:  Off
FPCs      0  1  2  3  4  5  6  7
-----
Green  ..  *..  *  *.
Red    .....
LCD screen:

| <b>Output Fields</b>            | <a href="#">Table 105 on page 1617</a> lists the output fields for the <b>show chassis device-mode</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

Table 105: show chassis device-mode Output Fields

| Field Name                      | Field Description                                                                                                                                          |
|---------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Current device-mode             | Existing operational mode for the device. The device can be in Interconnect device mode, Node device mode, or standalone mode.                             |
| Future device-mode after reboot | Future operational mode for the device after you reboot it. The device can be set to enter Interconnect device mode, Node device mode, or standalone mode. |
|                                 | <b>NOTE:</b> To set the future mode of the device, issue the <b>request chassis device-mode</b> command.                                                   |

## Sample Output

### show chassis device-mode (Interconnect Device Mode)

```
user@switch> show chassis device-mode
Current device-mode : Interconnect-device
Future device-mode after reboot : Interconnect-device
```

### show chassis device-mode (Interconnect Device Mode, but Node Device-Ready)

```
user@switch> show chassis device-mode
Current device-mode : Interconnect-device
Future device-mode after reboot : Node-device
```

### show chassis device-mode (Interconnect Device Mode, but Standalone-Ready)

```
user@switch> show chassis device-mode
Current device-mode : Interconnect-device
Future device-mode after reboot : Standalone
```

### show chassis device-mode (Node Device Mode)

```
user@switch> show chassis device-mode
Current device-mode : Node-device
Future device-mode after reboot : Node-device
```

### show chassis device-mode (Node Device Mode, but Interconnect Device-Ready)

```
user@switch> show chassis device-mode
Current device-mode : Node-device
Future device-mode after reboot : Interconnect-device
```

### show chassis device-mode (Node Device Mode, but Standalone-Ready)

```
user@switch> show chassis device-mode
Current device-mode : Node-device
Future device-mode after reboot : Standalone
```

### show chassis device-mode (Standalone Mode)

```
user@switch> show chassis device-mode
Current device-mode : Standalone
Future device-mode after reboot : Standalone
```

### show chassis device-mode (Standalone Mode, but Interconnect Device-Ready)

```
user@switch> show chassis device-mode
```

```
Current device-mode : Standalone
Future device-mode after reboot : Interconnect-device
```

**show chassis device-mode (Standalone Mode, but Node Device-Ready)**

```
user@switch> show chassis device-mode
Current device-mode : Standalone
Future device-mode after reboot : Node-device
```

## show chassis ethernet-switch interconnect-device cb

| <b>List of Sample Output</b>    | <a href="#">show chassis ethernet-switch interconnect-device cb on page 1623</a><br><a href="#">show chassis ethernet-switch interconnect-device cb detail on page 1624</a><br><a href="#">show chassis ethernet-switch interconnect-device cb detail slot port on page 1630</a>                                                                                                                                                                                                                                                                                   |
| <b>Output Fields</b>            | <a href="#">Table 23 on page 504</a> lists the output fields for the <b>show chassis ethernet-switch interconnect-device cb</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                   |

Table 106: show chassis ethernet-switch interconnect-device fpc Output Fields

| Field Name                                 | Field Description                                                                                                                                                                                                                         |
|--------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Link is good on port n connected to device | <p>Information about the link between each port on the FPC's Ethernet switch and one of the following devices:</p> <ul style="list-style-type: none"> <li>• FWD-SWITCH-0</li> <li>• FWD-SWITCH-1</li> <li>• CB0</li> <li>• CB1</li> </ul> |

Table 106: show chassis ethernet-switch interconnect-device fpc Output Fields (*continued*)

| Field Name                               | Field Description                                                                                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Speed is                                 | Speed at which the Ethernet link is running: <b>10 Mb</b> When the device is <b>RE</b> or <b>Other RE</b> on the TX Matrix router, the speed is <b>1000 Mb</b> .                                                                                                                                                                                                                                                                |
| Duplex is                                | Duplex type of the Ethernet link: <b>full</b> or <b>half</b> .                                                                                                                                                                                                                                                                                                                                                                  |
| Autonegotiate is Enabled (or Disabled)   | By default, built-in Fast Ethernet ports on a PIC autonegotiate whether to operate at 10 Mbps or 100 Mbps. All other interfaces automatically choose the correct speed based on the PIC type and whether the PIC is configured to operate in multiplexed mode (using the <b>no-concatenate</b> statement at the <b>[edit chassis]</b> hierarchy level, as described in the <i>Junos OS System Basics Configuration Guide</i> ). |
| Flow Control TX is Enabled (or Disabled) | Flow control in the transmit direction is enabled (or disabled). Flow control regulates the flow of packets from the switch to the remote side of the connection.                                                                                                                                                                                                                                                               |
| Flow Control RX is Enabled (or Disabled) | Flow control in the receive direction is enabled (or disabled). Flow control regulates the flow of packets from the remote side of the connection to the switch.                                                                                                                                                                                                                                                                |
| TX Octets                                | Number of octets sent.                                                                                                                                                                                                                                                                                                                                                                                                          |
| TX Packets 64 Octets                     | Number of transmitted packets of size 64 octets.                                                                                                                                                                                                                                                                                                                                                                                |
| TX Packets 65-127 Octets                 | Number of transmitted frames of size 65 through 127 octets.                                                                                                                                                                                                                                                                                                                                                                     |
| TX Packets 128-255 Octets                | Number of transmitted frames of size 128 through 255 octets.                                                                                                                                                                                                                                                                                                                                                                    |
| TX Packets 256-511 Octets                | Number of transmitted frames of size 256 through 511 octets.                                                                                                                                                                                                                                                                                                                                                                    |
| TX Packets 512-1023 Octets               | Number of transmitted frames of size 512 through 1023 octets.                                                                                                                                                                                                                                                                                                                                                                   |
| TX Packets 1024-1518 Octets              | Number of transmitted frames of size 1024 through 1518 octets.                                                                                                                                                                                                                                                                                                                                                                  |
| TX Packets 1519-2047 Octets              | Number of transmitted frames of size 1519 through 2047 octets.                                                                                                                                                                                                                                                                                                                                                                  |
| TX Packets 2048-4095 Octets              | Number of transmitted frames of size 2048 through 4095 octets.                                                                                                                                                                                                                                                                                                                                                                  |
| TX Packets 4096-9216 Octets              | Number of transmitted frames of size 4096 through 9216 octets.                                                                                                                                                                                                                                                                                                                                                                  |
| TX Packets 9217-16383 Octets             | Number of transmitted frames of size 9217 through 16383 octets.                                                                                                                                                                                                                                                                                                                                                                 |
| TX Multicast packets                     | Number of multicast packets sent.                                                                                                                                                                                                                                                                                                                                                                                               |

Table 106: show chassis ethernet-switch interconnect-device fpc Output Fields (*continued*)

| Field Name                 | Field Description                                                                       |
|----------------------------|-----------------------------------------------------------------------------------------|
| TX Broadcast packets       | Number of broadcast packets sent.                                                       |
| TX Single Collision frames | Number of packets sent after one collision.                                             |
| TX Mult. Collision frames  | Number of packets sent after multiple collisions.                                       |
| TX Late Collision Frames   | Number of packets aborted during sending because of collisions after 64 bytes.          |
| TX Excessive collisions    | Number of packets not sent because of too many collisions.                              |
| TX Collision frames        | Number of collision packets sent.                                                       |
| TX PAUSEMAC Ctrl Frames    | Number of Media Access Control (MAC) frames containing PAUSE commands sent.             |
| TX MAC ctrl frames         | Number of MAC control packets sent.                                                     |
| TX Frame deferred Xmns     | Number of frames deferred in x milliseconds.                                            |
| TX Oversize Packets        | Number of oversized packets sent.                                                       |
| TX Jabbers                 | Total number of frames sent that exceed the maximum byte count and contain CRC errors . |
| TX FCS Error Counter       | Number of packets discarded because of frame check sequence errors.                     |
| TX Fragment Counter        | Number of fragmented packets sent.                                                      |
| TX Byte Counter            | Number of bytes sent.                                                                   |
| RX Octets                  | Number of octets received.                                                              |
| RX Packets 64 Octets       | Number of received packets of size 64 octets.                                           |
| RX Packets 65-127 Octets   | Number of received packets of size 65 through 127 octets.                               |
| RX Packets 128-255 Octets  | Number of received packets of size 128 through 255 octets.                              |
| RX Packets 256-511 Octets  | Number of received packets of size 256 through 511 octets.                              |
| RX Packets 512-1023 Octets | Number of received packets of size 512 through 1023 octets.                             |

Table 106: show chassis ethernet-switch interconnect-device fpc Output Fields (*continued*)

| Field Name                  | Field Description                                                                           |
|-----------------------------|---------------------------------------------------------------------------------------------|
| RX Packets 1024-1518 Octets | Number of received packets of size 65 through 127 octets.                                   |
| RX Packets 1519-2047 Octets | Number of received packets of size 1519 through 2047 octets.                                |
| RX Packets 2048-4095 Octets | Number of received packets of size 2048 through 4095 octets.                                |
| RX Packets 4096-9216 Octets | Number of received packets of size 4096 through 9216 octets.                                |
| RX Multicast Packets        | Number of multicast packets received.                                                       |
| RX Broadcast Packets        | Number of broadcast packets received.                                                       |
| RX FCS Errors               | Number of packets discarded because of frame check sequence errors.                         |
| RX Align Errors             | Number of incomplete octets received.                                                       |
| RX Fragments                | Number of fragmented packets received.                                                      |
| RX Symbol errors            | Number of symbols received that the router did not correctly decode.                        |
| RX Unsupported opcodes      | Number of packets received with unsupported op codes.                                       |
| RX Out of Range Length      | Number of packets received with an out of range length.                                     |
| RX False Carrier Errors     | Number of packets received with false carrier errors.                                       |
| RX Undersize Packets        | Number of undersized packets received.                                                      |
| RX Oversize Packets         | Number of oversized packets received.                                                       |
| RX Jabbers                  | Total number of frames received that exceed the maximum byte count and contain CRC errors . |
| RX 1519-1522 Good Vlan frms |                                                                                             |
| RX MTU Exceed Counter       | Number of packets received that exceed the MTU.                                             |
| RX Control Frame Counter    | Number of control frames received.                                                          |
| RX Pause Frame Counter      | Number of pause frames received.                                                            |

Table 106: show chassis ethernet-switch interconnect-device fpc Output Fields (*continued*)

| Field Name      | Field Description         |
|-----------------|---------------------------|
| RX Byte Counter | Number of bytes received. |

## Sample Output

### show chassis ethernet-switch interconnect-device cb

```

user@switch> show chassis ethernet-switch interconnect-device IC-WS001 cb
Displaying summary for switch 0
Link is down on XE port 1 connected to device: FPC7

| <b>Output Fields</b>            | <a href="#">Table 23 on page 504</a> lists the output fields for the <b>show chassis ethernet-switch interconnect-device fpc</b> command. Output fields are listed in the approximate order in which they appear.                                                                                                                                                                                                                                                                                                                                                         |

Table 107: show chassis ethernet-switch interconnect-device fpc Output Fields

| Field Name                                 | Field Description                                                                                                                                                                                                                                                                                                                                                                                                               |
|--------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Link is good on port n connected to device | Information about the link between each port on the FPC's Ethernet switch and one of the following devices: <ul style="list-style-type: none"> <li>• FWD-SWITCH-0</li> <li>• FWD-SWITCH-1</li> <li>• CB0</li> <li>• CB1</li> </ul>                                                                                                                                                                                              |
| Speed is                                   | Speed at which the Ethernet link is running: <b>10 Mb</b> When the device is <b>RE</b> or <b>Other RE</b> on the TX Matrix router, the speed is <b>1000 Mb</b> .                                                                                                                                                                                                                                                                |
| Duplex is                                  | Duplex type of the Ethernet link: <b>full</b> or <b>half</b> .                                                                                                                                                                                                                                                                                                                                                                  |
| Autonegotiate is Enabled (or Disabled)     | By default, built-in Fast Ethernet ports on a PIC autonegotiate whether to operate at 10 Mbps or 100 Mbps. All other interfaces automatically choose the correct speed based on the PIC type and whether the PIC is configured to operate in multiplexed mode (using the <b>no-concatenate</b> statement at the <b>[edit chassis]</b> hierarchy level, as described in the <i>Junos OS System Basics Configuration Guide</i> ). |
| TX Octets                                  | Number of octets sent.                                                                                                                                                                                                                                                                                                                                                                                                          |
| TX Packets 64 Octets                       | Number of transmitted frames of size 64 octets.                                                                                                                                                                                                                                                                                                                                                                                 |
| TX Packets 65-127 Octets                   | Number of transmitted frames of size 65 through 127 octets.                                                                                                                                                                                                                                                                                                                                                                     |
| TX Packets 128-255 Octets                  | Number of transmitted frames of size 128 through 255 octets.                                                                                                                                                                                                                                                                                                                                                                    |
| TX Packets 256-511 Octets                  | Number of transmitted frames of size 256 through 511 octets.                                                                                                                                                                                                                                                                                                                                                                    |
| TX Packets 512-1023 Octets                 | Number of transmitted frames of size 512 through 1023 octets.                                                                                                                                                                                                                                                                                                                                                                   |
| TX Packets 1024-1518 Octets                | Number of transmitted frames of size 1024 through 1518 octets.                                                                                                                                                                                                                                                                                                                                                                  |
| TX Packets 1519-2047 Octets                | Number of transmitted frames of size 1519 through 2047 octets.                                                                                                                                                                                                                                                                                                                                                                  |
| TX Packets 2048-4095 Octets                | Number of transmitted frames of size 2048 through 4095 octets.                                                                                                                                                                                                                                                                                                                                                                  |
| TX Packets 4096-9216 Octets                | Number of transmitted frames of size 4096 through 9216 octets.                                                                                                                                                                                                                                                                                                                                                                  |
| TX Packets 9217-16383 Octets               | Number of transmitted frames of size 9217 through 16383 octets.                                                                                                                                                                                                                                                                                                                                                                 |
| TX Multicast packets                       | Number of multicast packets sent.                                                                                                                                                                                                                                                                                                                                                                                               |

Table 107: show chassis ethernet-switch interconnect-device fpc Output Fields (*continued*)

| Field Name                 | Field Description                                                                       |
|----------------------------|-----------------------------------------------------------------------------------------|
| TX Broadcast packets       | Number of broadcast packets sent.                                                       |
| TX Single Collision frames | Number of packets sent after one collision.                                             |
| TX Mult. Collision frames  | Number of packets sent after multiple collisions.                                       |
| TX Late Collision Frames   | Number of packets aborted during sending because of collisions after 64 bytes.          |
| TX Excessive collisions    | Number of packets not sent because of too many collisions.                              |
| TX Collision frames        | Number of collision packets sent.                                                       |
| TX PAUSEMAC Ctrl Frames    | Number of Media Access Control (MAC) frames containing PAUSE commands sent.             |
| TX MAC ctrl frames         | Number of MAC control packets sent.                                                     |
| TX Frame deferred Xmns     | Number of frames deferred in x milliseconds.                                            |
| TX Oversize Packets        | Number of oversized packets sent.                                                       |
| TX Jabbers                 | Total number of frames sent that exceed the maximum byte count and contain CRC errors . |
| TX FCS Error Counter       | Number of packets discarded because of frame check sequence errors.                     |
| TX Fragment Counter        | Number of fragmented packets sent.                                                      |
| TX Byte Counter            | Number of bytes sent.                                                                   |
| RX Octets                  | Number of octets received.                                                              |
| RX Packets 64 Octets       | Number of received packets of size 64 octets.                                           |
| RX Packets 65-127 Octets   | Number of received packets of size 65 through 127 octets.                               |
| RX Packets 128-255 Octets  | Number of received packets of size 128 through 255 octets.                              |
| RX Packets 256-511 Octets  | Number of received packets of size 256 through 511 octets.                              |
| RX Packets 512-1023 Octets | Number of received packets of size 512 through 1023 octets.                             |

Table 107: show chassis ethernet-switch interconnect-device fpc Output Fields (*continued*)

| Field Name                  | Field Description                                                                           |
|-----------------------------|---------------------------------------------------------------------------------------------|
| RX Packets 1024-1518 Octets | Number of received packets of size 65 through 127 octets.                                   |
| RX Packets 1519-2047 Octets | Number of received packets of size 1519 through 2047 octets.                                |
| RX Packets 2048-4095 Octets | Number of received packets of size 2048 through 4095 octets.                                |
| RX Packets 4096-9216 Octets | Number of received packets of size 4096 through 9216 octets.                                |
| RX Multicast Packets        | Number of multicast packets received.                                                       |
| RX Broadcast Packets        | Number of broadcast packets received.                                                       |
| RX FCS Errors               | Number of packets discarded because of frame check sequence errors.                         |
| RX Align Errors             | Number of incomplete octets received.                                                       |
| RX Fragments                | Number of fragmented packets received.                                                      |
| RX Symbol errors            | Number of symbols received that the router did not correctly decode.                        |
| RX Unsupported opcodes      | Number of packets received with unsupported op codes.                                       |
| RX Out of Range Length      | Number of packets received with an out of range length.                                     |
| RX False Carrier Errors     | Number of packets received with false carrier errors.                                       |
| RX Undersize Packets        | Number of undersized packets received.                                                      |
| RX Oversize Packets         | Number of oversized packets received.                                                       |
| RX Jabbers                  | Total number of frames received that exceed the maximum byte count and contain CRC errors . |
| RX 1519-1522 Good Vlan frms | Number of transmitted frames of size 1519 through 1522 octets that are good VLAN frames.    |
| RX MTU Exceed Counter       | Number of packets received that exceed the MTU.                                             |
| RX Control Frame Counter    | Number of control frames received.                                                          |
| RX Pause Frame Counter      | Number of pause frames received.                                                            |

Table 107: show chassis ethernet-switch interconnect-device fpc Output Fields (*continued*)

| Field Name      | Field Description         |
|-----------------|---------------------------|
| RX Byte Counter | Number of bytes received. |

## Sample Output

### show chassis ethernet-switch interconnect-device fpc

```

user@qfabric> show chassis ethernet-switch interconnect-device IC-WS001 fpc
Summary for switch on FC0
Link is good on GE port 2 connected to device: FWD-SWITCH-0
  Speed is 1000Mb
  Duplex is full
  Autonegotiate is Disabled
  Flow Control TX is Disabled
  Flow Control RX is Disabled
  TX Octets          124638
  RX Octets          86496

Link is good on GE port 4 connected to device: FWD-SWITCH-1
  Speed is 1000Mb
  Duplex is full
  Autonegotiate is Disabled
  Flow Control TX is Disabled
  Flow Control RX is Disabled
  TX Octets          82191
  RX Octets          58979

Link is good on XE port 28 connected to device: CB0
  Speed is 10000Mb
  Duplex is full
  Autonegotiate is Enabled
  Flow Control TX is Disabled
  Flow Control RX is Disabled
  TX Octets          145475
  RX Octets          206828

Link is good on XE port 29 connected to device: CB1
  Speed is 10000Mb
  Duplex is full
  Autonegotiate is Enabled
  Flow Control TX is Disabled
  Flow Control RX is Disabled
  TX Octets           1
  RX Octets           0

Summary for switch on FC1
Link is good on GE port 2 connected to device: FWD-SWITCH-0
  Speed is 1000Mb
  Duplex is full
  Autonegotiate is Disabled
  Flow Control TX is Disabled
  Flow Control RX is Disabled
  TX Octets          82290
  RX Octets          59443

Link is good on GE port 4 connected to device: FWD-SWITCH-1

```

```
Speed is 1000Mb
Duplex is full
Autonegotiate is Disabled
Flow Control TX is Disabled
Flow Control RX is Disabled
TX Octets          40900
RX Octets          30013

Link is good on XE port 28 connected to device: CB0
Speed is 10000Mb
Duplex is full
Autonegotiate is Enabled
Flow Control TX is Disabled
Flow Control RX is Disabled
TX Octets          89456
RX Octets          123189

Link is good on XE port 29 connected to device: CB1
Speed is 10000Mb
Duplex is full
Autonegotiate is Enabled
Flow Control TX is Disabled
Flow Control RX is Disabled
TX Octets          1
RX Octets          0

| <b>Output Fields</b>            | <p><a href="#">Table 109 on page 1668</a> lists the output fields for the <b>show chassis fabric device</b> command. Output fields are listed in the approximate order in which they appear.</p>                                                                                                                                             |

**Table 109: show chassis fabric device Output Fields**

| Field Name        | Field Description                                                                                                                                                                                                         |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Device ID         | Hardware serial identifier of the QFabric system component.                                                                                                                                                               |
| Type              | Model number of the QFabric system component. Values include qfxc08-3008 (QFX3008-I Interconnect device), qfx3600-I (QFX3600-I Interconnect device, qfx3500 (QFX3500 Node device), and qfx3600-16q (QFX3600 Node device). |
| Management status | Displays keepalive status for fabric management processes on a specific device. Values include <b>On</b> and <b>Off</b> .                                                                                                 |
| Hardware status   | Displays operational status of the device participating in fabric management (such as <b>Ok</b> ).                                                                                                                        |

## Sample Output

### show chassis fabric device

```

user@qfabric> show chassis fabric device

Device ID: node2, Type: qfx3500
Management status: On, Hardware status: Ok

```

Device ID: node3, Type: qfx3500  
Management status: On, Hardware status: Ok

Device ID: node0, Type: qfx3500  
Management status: On, Hardware status: Ok

Device ID: node1, Type: qfx3500  
Management status: On, Hardware status: Ok

## show chassis lcd

---

| Description                                       | Display the information that appears on the LCD panel of EX3200, EX3300, EX4200, EX4500, EX6200, and EX8200 switches, XRE200 External Routing Engines, QFX Series standalone switches, and Interconnect devices and Node devices within a QFabric system. Display the status of the currently selected port parameter of the Status LED for each network port on the device.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Options                                           | <p><b>none</b>—Display the information that appears on the LCD panel (for any EX Series member switch in a Virtual Chassis or for XRE200 External Routing Engines, display the information for all Virtual Chassis members). Display the status of the currently selected port parameter of the Status LED for each network port.</p> <p><b>fpc-slot &lt;<i>fpc-slot-number</i>&gt;</b>—(Optional) Display the information as follows:</p> <ul style="list-style-type: none"><li>(EX3200, EX3300, EX4200, and EX4500 switches, or the QFX Series) Display the information that appears on the LCD panel for either an FPC slot with no <b>fpc-slot-number</b> value specified or for the FPC slot specified by <b>fpc-slot 0</b>. <b>fpc-slot</b> refers to the switch itself and <b>0</b> is the only valid value for <b>fpc-slot-number</b>. Output for these options is the same as for the <b>none</b> option.<br/><br/>Also display the status of the currently selected port parameter of the Status LED for each network port.</li><li>(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) If no <b>fpc-slot-number</b> value is specified, display the information that appears on the LCD panel for all members of the Virtual Chassis. Output for this option is the same as for the <b>none</b> option. If the <b>fpc-slot-number</b> value is specified (it equals the <b>member-id</b> value), display the information for the specified member.<br/><br/>Also display the status of the currently selected port parameter of the Status LED for each network port.</li><li>(EX6200 or EX8200 switches)—Display the information that appears on the LCD panel for the line card in the line-card slot specified by the <b>fpc-slot-number</b> value.</li></ul> |

Also display the status of the currently selected port parameter of the Status LED for each network port.

**interconnect-device *device-id***—(QFabric systems only) (Optional) Display the front panel contents and LED status of all the ports on the Interconnect device.

**menu**—(Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel.

**menu all-members**—(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) (Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel for all Virtual Chassis members.

**menu local**—(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) (Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel for the Virtual Chassis member from which you issued the command.

**menu member *member-id***—(EX Series Virtual Chassis member switches or XRE200 External Routing Engines) (Optional) Display the names of the menus and menu options that are currently enabled on the LCD panel for the specified Virtual Chassis member.

**node-device *device-id***—(QFabric systems only) (Optional) Display the front panel contents and LED status of all the ports on the Node device.

**Output Fields** [Table 35 on page 905](#) lists the output fields for the **show chassis lcd** command. Output fields are listed in the approximate order in which they appear.

**Table 110: show chassis lcd Output Fields**

| Field Name                                                                                          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
|-----------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>membernumber</b> (XRE200 External Routing Engine)                                                | Member ID of the device whose content is being displayed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| <b>Front panel contents for slot</b>                                                                | FPC slot number of the switch whose content is being displayed. The number is always <b>0</b> , except for EX4200 switches in a Virtual Chassis, where it is the member ID value.                                                                                                                                                                                                                                                                                                                                                                            |
| <b>Front panel contents</b> (EX6200, EX8200 switch, XRE200 External Routing Engine, and QFX Series) | <p>On EX6200 switches, EX8200 switches, and XRE200 External Routing Engines, no slot number is displayed.</p> <p>On XRE200 External Routing Engines, this field appears under the <b>member number</b> field for each member device in the EX8200 Virtual Chassis.</p>                                                                                                                                                                                                                                                                                       |
| <b>LCD screen</b>                                                                                   | <p>The first line displays the hostname (for Virtual Chassis members, displays the member ID, the current role, and hostname; for EX8200 switches, displays <b>RE</b> and the hostname). The second line displays the currently selected port parameter of the Status LED and the alarms counter. The Status LED port parameters are:</p> <ul style="list-style-type: none"> <li>• <b>ADM</b>—Administrative</li> <li>• <b>SPD</b>—Speed</li> <li>• <b>DPX</b>—Duplex</li> <li>• <b>POE</b>—Power over Ethernet (EX3200 and EX4200 switches only)</li> </ul> |
| <b>LEDs status</b>                                                                                  | Current state of the Alarms, System, and Master LEDs (chassis status LEDs).                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| <b>Interface</b>                                                                                    | Names of the interfaces on the switch.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| <b>LED (ADM/SPD/DPX/POE)</b>                                                                        | <p>State of the currently selected port parameter of the Status LED for the interface. The Status LED port parameters are:</p> <p><b>NOTE:</b> The XRE200 External Routing Engine always displays the <b>NA</b> parameter. The QFX Series products do not have any of the port parameters listed below.</p> <ul style="list-style-type: none"> <li>• <b>ADM</b>—Administrative</li> <li>• <b>SPD</b>—Speed</li> <li>• <b>DPX</b>—Duplex</li> <li>• <b>NA</b>—Not applicable.</li> <li>• <b>POE</b>—Power over Ethernet</li> </ul>                            |
| <b>fpcx</b>                                                                                         | On standalone EX Series and QFX Series switches, always <b>0</b> . On EX Series Virtual Chassis member switches, member ID of the Virtual Chassis member whose LCD menu is displayed.                                                                                                                                                                                                                                                                                                                                                                        |

## Sample Output

### show chassis lcd (Two-Member EX4200 Virtual Chassis)

```
user@switch> show chassis lcd
```

## Front panel contents for slot: 0

```

-----

#### show chassis lcd fpc-slot 2 (EX8200 Switch)

show chassis lcd fpc-slot 2

| Interface | LED (ADM/SPD/DPX) |
|-----------|-------------------|
| xe-2/0/0  | Off               |
| xe-2/0/1  | Off               |
| xe-2/0/2  | Off               |
| xe-2/0/3  | Off               |
| xe-2/0/4  | Off               |
| xe-2/0/5  | Off               |
| xe-2/0/6  | Off               |
| xe-2/0/7  | Off               |

#### show chassis lcd menu (EX4200 Switch)

```
user@switch> show chassis lcd menu
fpc0:
```

```
-----
status-menu
status-menu vcp-status
status-menu power-status
status-menu environ-menu
status-menu show-version
maintenance-menu
maintenance-menu halt-menu
maintenance-menu system-reboot
maintenance-menu rescue-config
maintenance-menu vc-uplink-config
maintenance-menu factory-default
```

On an EX4200 switch in a Virtual Chassis, the output for the **show chassis lcd menu** **all-members** command is the same as the output for the **show chassis lcd menu** command.

#### show chassis lcd menu (EX8200 Switch)

```
user@switch> show chassis lcd menu
status-menu
status-menu sf-status1-menu
status-menu sf-status2-menu
status-menu psu-status1-menu
```

```

status-menu psu-status2-menu
status-menu environ-menu
status-menu show-version
maintenance-menu
maintenance-menu halt-menu
maintenance-menu system-reboot
maintenance-menu rescue-config
maintenance-menu factory-default

```

| <b>Reason</b> | Reason for the state (if the line card is offline).                                                                                                                                                                                         |

## Sample Output

### show chassis nonstop-upgrade node-group

```

user@qfabric> show chassis nonstop-upgrade node-group NW-NG-0
Item           Status           Reason
P1550-C       Online

```

## show fabric administration inventory

---

**Syntax**    show fabric administration inventory  
              <brief | detail | summary | terse>  
              <director-group (status)>  
              <infrastructure (fabric-controls | fabric-managers | diagnostic-routing-engines)>  
              <interconnect-devices *interconnect-device-name*>  
              <node-devices *node-device-name*>  
              <node-groups *node-group-name*>  
              <summary>

**Release Information**    Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description**    (QFabric systems only) Display all devices that belong to the QFabric system. You can narrow the level of output by specifying a device type.

**NOTE:** If your Node devices do not appear in the output of the **show fabric administration inventory** command, check the cabling of your system.

---

**Options**    none—Display all devices within a QFabric system.

**brief | detail | summary | terse**—(Optional) Display the specified level of output.

**director-group (status)**—(Optional) Display the status for the Director group within a QFabric system.

**infrastructure (fabric-controls | fabric-managers | diagnostic-routing-engines)**—(Optional) Display information for the fabric control Routing Engine, fabric manager Routing Engine, and diagnostic Routing Engine running on the Director group for the QFabric system.

**interconnect-devices *interconnect-device-name***—(Optional) Display a specific Interconnect device within a QFabric system.

**node-devices *node-device-name***—(Optional) Display a specific Node device within a QFabric system.

**node-groups *node-group-name***—(Optional) Display a specific Node group within a QFabric system.

**Required Privilege Level**    admin

| Field Name          | Field Description                                                                                                                                                                                                                                                                                                                                                                                                 | Level of Output |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Item                | Type of QFabric system component being viewed. Possible values include <b>Node group</b> , <b>Interconnect device</b> , <b>Fabric control</b> , <b>Fabric manager</b> , <b>Diagnostic routing engine</b> , <b>Director group</b> , and <b>Ungrouped Node device</b> .                                                                                                                                             | detail<br>none  |
| Identifier          | Hardware serial identifier of a QFabric system component. When you configure an alias name for a component, the ID is displayed.                                                                                                                                                                                                                                                                                  | detail<br>none  |
| Connection          | Status of a QFabric system component: either <b>Connected</b> or <b>Disconnected</b> , depending on whether or not the Director software has detected keepalive messages for the listed component.                                                                                                                                                                                                                | detail<br>none  |
| Configuration       | Whether or not the configuration for a QFabric system component has been received and installed. The configuration can be <b>Configured</b> , <b>Failed</b> (with details about the failure), <b>Pending</b> (in the process of being written or retried), or <b>Unknown</b> .                                                                                                                                    | detail<br>none  |
| Node group          | Name of the Node groups associated with the QFabric system, and the Node devices assigned to each Node group. The group can be either <b>Connected</b> or <b>Disconnected</b> , depending on whether or not the Director software has detected keepalive messages for the devices in the group. This field also displays the serial ID for the Node group and the status for the Node group.                      | detail<br>none  |
| Interconnect device | Name of the Interconnect devices associated with the Node group. The device can be either <b>Connected</b> or <b>Disconnected</b> , depending on whether or not the Director software has detected keepalive messages for the device. This field also displays the serial ID and configuration status for the Interconnect device.                                                                                | detail<br>none  |
| Fabric manager      | Name of the primary virtual Junos Routing Engine associated with the QFabric system. The fabric manager Routing Engine can be either <b>Connected</b> or <b>Disconnected</b> , depending on whether or not the Director software has detected keepalive messages for this virtual device. It also displays the identifier and configuration status for the fabric manager Routing Engine.                         | detail<br>none  |
| Fabric control      | Name of the virtual Junos Routing Engines responsible for route selection within a QFabric system partition. The fabric control Routing Engine can be either <b>Connected</b> or <b>Disconnected</b> , depending on whether or not the Director software has detected keepalive messages for this virtual device. It also displays the identifier and configuration status for the fabric control Routing Engine. | detail<br>none  |

Table 112: show fabric administration inventory Output Fields (*continued*)

| Field Name                      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                             | Level of Output |
|---------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|
| Diagnostic routing engine       | Name of the virtual Junos Routing Engine responsible for troubleshooting and diagnostic utilities within a QFabric system partition. The diagnostic Routing Engine can be either <b>Connected</b> or <b>Disconnected</b> , depending on whether or not the Director software has detected keepalive messages for this virtual device. It also displays the identifier and configuration status for the diagnostic Routing Engine.             | detail<br>none  |
| Director group                  | Identifier for the Director devices that are part of the Director group in a QFabric system. Each Director device can be either <b>Connected</b> or <b>Disconnected</b> , depending on whether or not the Director software has detected keepalive messages for the device.                                                                                                                                                                   | detail<br>none  |
| Connection uptime               | Length of time the component has been operational. The time is listed in days, hours, minutes, and seconds ( <b>D+HH:MM:SS</b> ).                                                                                                                                                                                                                                                                                                             | detail          |
| Network domain                  | Indicates whether a Node group is a network Node group ( <b>Yes</b> ) or a server Node group ( <b>No</b> ).                                                                                                                                                                                                                                                                                                                                   | detail          |
| Member id                       | Member identification number for a Node device within a Node group.                                                                                                                                                                                                                                                                                                                                                                           | detail          |
| Node group master               | Indicates whether or not a Node device acts as a master device within a Node group. Values for this field are <b>Yes</b> or <b>No</b> .                                                                                                                                                                                                                                                                                                       | detail          |
| Configuration checkout failed   | Provides troubleshooting details about a failed configuration on a component. This field includes the following output: <ul style="list-style-type: none"> <li>• <b>Edit path</b>—Displays the configuration hierarchy level where the problem occurs.</li> <li>• <b>Statement</b>—Displays the configuration statement that causes the problem.</li> <li>• <b>Message</b>—Provides a suggested workaround to resolve the problem.</li> </ul> | detail          |
| Member                          | Name of a Routing Engine allocated to an Interconnect device.                                                                                                                                                                                                                                                                                                                                                                                 | detail          |
| Master                          | Indicates whether or not a Routing Engine acts as a master device within an Interconnect device. Values are <b>Yes</b> or <b>No</b> .                                                                                                                                                                                                                                                                                                         | detail          |
| Total Node devices              | Number of connected and disconnected Node devices in the QFabric system.                                                                                                                                                                                                                                                                                                                                                                      | summary         |
| Total connected Node devices    | Number of available Node devices in the QFabric system.                                                                                                                                                                                                                                                                                                                                                                                       | summary         |
| Total disconnected Node devices | Number of unavailable Node devices in the QFabric system.                                                                                                                                                                                                                                                                                                                                                                                     | summary         |
| Total Interconnect devices      | Number of Interconnect devices in the QFabric system.                                                                                                                                                                                                                                                                                                                                                                                         | summary         |

**Table 113: show fabric administration inventory director-group status Output Fields**

| Field Name            | Field Description                                                                            |
|-----------------------|----------------------------------------------------------------------------------------------|
| Director Group Status | Timestamp for the Director group status report.                                              |
| Member                | Name of the Director device.                                                                 |
| Status                | Current operational mode of the Director device: <b>online</b> or <b>offline</b> .           |
| Role                  | High availability operational role of the Director device: <b>master</b> or <b>standby</b> . |
| Mgmt Address          | Management IP address of the Director device.                                                |
| CPU                   | Percentage of CPU processing memory being used by the Director device.                       |
| Free Memory           | Available storage memory on the Director device.                                             |

Table 113: show fabric administration inventory director-group status Output Fields (*continued*)

| Field Name                      | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|---------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| VMs                             | Number of virtual machines operating on the Director device. A Routing Engine issue exists on a particular Director device when the system displays a star (*) in the <b>VMs</b> column along with the following message: <b>Error in retrieving VM Count in dgX</b> .                                                                                                                                                                                                                                 |
| Up Time                         | Length of time the Director device has been operating.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Device Id/Alias                 | Name or identifier of the Director device.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Master Services                 | Operational status of the database server, load balancer, and QFabric partition address.                                                                                                                                                                                                                                                                                                                                                                                                               |
| Director Group Managed Services | Operational status of the shared file system, network file system, virtual machine server, and DHCP load balancer.                                                                                                                                                                                                                                                                                                                                                                                     |
| Hard Drive Status               | Operational status of the Director device hard drive, including information about the volume identifier, physical identifiers, and SCSI identifiers. There is also status information for the drive partitions, including directory size, available and used drive space, utilization, and directory locations. A hard drive issue exists when the system displays one of the following messages: <b>Error in retrieving Hard disk status</b> or <b>Error in retrieving Hard disk storage status</b> . |
| Director Group Processes        | Operational status of the Director group processes, such as device managers, SSH, NFS, FTP, system log messages, and SNMP.                                                                                                                                                                                                                                                                                                                                                                             |
| Interface Link Status           | Operational status of the Director device interfaces, such as the management interface, the control plane bridge interface, the control plane LAG, the control plane links (where the first number represents the Ethernet module [0 or 1] and the second number represents the port [0 - 3]), and the inter-Director crossover LAG. The state of the interfaces can be <b>up</b> or <b>down</b> . The <b>Active</b> designation indicates that a control plane link is active.                        |

| Field Name         | Field Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
|--------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PID                | Process identifier for the component.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| CPU-Use (%)        | Percentage of CPU processing memory being used by the component.                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Fabric control     | <p>Name of the virtual Junos Routing Engines responsible for route selection within a QFabric system partition.</p> <p>With the <b>fabric-controls</b> option, the fabric control Routing Engine can be either <b>Connected</b> or <b>Disconnected</b>, depending on whether or not the Director software has detected keepalive messages for this virtual device. This field also displays the identifier and configuration status for the fabric control Routing Engine.</p>                    |
| Fabric manager     | <p>Name of the virtual Junos Routing Engine that manages the QFabric system.</p> <p>With the <b>fabric-managers</b> option, the fabric manager Routing Engine can be either <b>Connected</b> or <b>Disconnected</b>, depending on whether or not the Director software has detected keepalive messages for this virtual device. This field also displays the identifier and configuration status for the fabric manager Routing Engine.</p>                                                       |
| Network Node group | Name of the virtual Junos Routing Engine instance that handles routing processes for a network Node group.                                                                                                                                                                                                                                                                                                                                                                                        |
| Diagnostic         | <p>Name of the virtual Junos Routing Engine responsible for troubleshooting and diagnostic utilities within a QFabric system partition.</p> <p>With the <b>diagnostic-routing-engines</b> option, the diagnostic Routing Engine can be either <b>Connected</b> or <b>Disconnected</b>, depending on whether or not the Director software has detected keepalive messages for this virtual device. It also displays the identifier and configuration status for the diagnostic Routing Engine.</p> |
| Item               | Type of QFabric system component being viewed.                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Identifier         | Hardware serial identifier of a QFabric system component.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Connection         | Status of a QFabric system component: either <b>Connected</b> or <b>Disconnected</b> , depending on whether or not the Director software has detected keepalive messages for the listed component.                                                                                                                                                                                                                                                                                                |
| Configuration      | Whether or not the configuration for a QFabric system component has been received and installed. The configuration can be <b>Configured</b> , <b>Failed</b> (unsuccessful), <b>Pending</b> (in the process of being written or retried), or <b>Unknown</b> .                                                                                                                                                                                                                                      |

## Sample Output

### show fabric administration inventory infrastructure

```

user@qfabric> show fabric administration inventory infrastructure
dg0:
Routing Engine Type      Hostname                      PID      CPU-Use(%)
-----
Fabric manager           FM-0                          9832     1.0
Network Node group       QFabric_default_NW-NG-1_RE1   24633    4.2
Fabric control            QFabric_default_FC-1_RE0      25374    1.8

```

#### show fabric administration inventory infrastructure fabric-controls

```
user@qfabric> show fabric administration inventory infrastructure fabric-controls fabric-controls
```

| Item           | Identifier | Connection | Configuration |
|----------------|------------|------------|---------------|
| Fabric control |            |            |               |
| FC-0           |            | Connected  | Configured    |
| FC-1           |            | Connected  | Configured    |

#### show fabric administration inventory infrastructure fabric-managers

```
user@qfabric> show fabric administration inventory infrastructure fabric-managers
```

| Item           | Identifier | Connection | Configuration |
|----------------|------------|------------|---------------|
| Fabric manager |            |            |               |
| FM-0           |            | Connected  | Configured    |

#### show fabric administration inventory infrastructure diagnostic-routing-engines

```
user@qfabric> show fabric administration inventory infrastructure diagnostic-routing-engines
```

| Item                      | Identifier | Connection | Configuration |
|---------------------------|------------|------------|---------------|
| Diagnostic routing engine |            |            |               |
| DRE-0                     |            | Connected  | Configured    |

## show fabric administration inventory interconnect-devices

|                                 |                                                                                                                                                                                                                                                                                                                                                                                                                 |

| Field Name          | Field Description                                                                                                                                                                                                                                            |
|---------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Interconnect device | Name of the Interconnect devices associated with the partition.                                                                                                                                                                                              |
| Item                | Type of QFabric system component being viewed.<br><br>Interconnect devices either display the alias name (if configured) or the hardware serial identifier and Control Board Routing Engine numbers.                                                         |
| Identifier          | Hardware serial identifier of a QFabric system component. When you configure an alias name for a component, the ID is displayed.                                                                                                                             |
| Connection          | Status of a QFabric system component: either <b>Connected</b> or <b>Disconnected</b> , depending on whether or not the Director software has detected keepalive messages for the listed component.                                                           |
| Configuration       | Whether or not the configuration for a QFabric system component has been received and installed. The configuration can be <b>Configured</b> , <b>Failed</b> (unsuccessful), <b>Pending</b> (in the process of being written or retried), or <b>Unknown</b> . |

## Sample Output

### show fabric administration inventory interconnect-devices

```
user@qfabric> show fabric administration inventory interconnect-devices
```

| Item                | Identifier | Connection | Configuration |
|---------------------|------------|------------|---------------|
| Interconnect device |            |            |               |
| IC-YW3781           |            | Connected  | Configured    |
|                     | YW3781/RE0 | Connected  |               |
|                     | YW3781/RE1 | Connected  |               |
| IC-YW3798           |            | Connected  | Configured    |
|                     | YW3798/RE0 | Connected  |               |
|                     | YW3798/RE1 | Connected  |               |

### show fabric administration inventory interconnect-devices device-name

```
user@qfabric> show fabric administration inventory interconnect-devices IC-YW3781
```

| Item                | Identifier | Connection | Configuration |
|---------------------|------------|------------|---------------|
| Interconnect device |            |            |               |
| IC-YW3781           |            | Connected  | Configured    |
|                     | YW3781/RE0 | Connected  |               |
|                     | YW3781/RE1 | Connected  |               |

## show fabric administration inventory node-devices

**Syntax** `show fabric administration inventory node-devices node-device-name`

**Release Information** Command introduced in Junos OS Release 11.3 for the QFX Series.

**Description** (QFabric systems only) Display the Node devices that belong to the QFabric system.

**NOTE:** If your Node devices do not appear in the output of the `show fabric administration inventory node-devices` command, check the cabling of your system.

**Options** **none**—Display all Node devices within the QFabric system.

***node-device-name***—Display a specific Node device within the QFabric system.

**Required Privilege Level** admin

**Output Fields** [Table 116 on page 1699](#) lists the output fields for the `show fabric administration inventory node-devices` command. Output fields are listed in the approximate order in which they appear.

**Table 116: show fabric administration inventory node-devices Output Fields**

| Field Name  | Field Description                                                                                                                                                                                                                                                                                                   |
|-------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Item        | Type of QFabric system component being viewed.                                                                                                                                                                                                                                                                      |
| Identifier  | Hardware serial identifier of a QFabric system component.                                                                                                                                                                                                                                                           |
| Connection  | Status of a QFabric system component: either <b>Connected</b> or <b>Not Connected</b> , depending on whether or not the Director software has detected keepalive messages for the listed component.                                                                                                                 |
| Node device | Name of the Node devices associated with the Node group. The device can be either <b>Connected</b> or <b>Not Connected</b> , depending on whether or not the Director software has detected keepalive messages for the device. This field also displays the serial ID and configuration status for the Node device. |

## Sample Output

### show fabric administration inventory node-devices

```
user@qfabric> show fabric administration inventory node-devices
Item                Identifier          Connection
Node device
node1               P3749-C           Connected
node2               P3767-C           Connected
node3               P3850-C           Connected
node4               P3947-C           Connected
```

### show fabric administration inventory node-devices device-name

```
user@qfabric> show fabric administration inventory node-devices node0
Item                Identifier          Connection
Node device
node1               P3749-C           Connected
```

## show fabric administration inventory node-groups

|                                 |                                                                                                                                                                                                                                                                                                        |

| <b>Output Fields</b>            | <a href="#">Table 118 on page 1703</a> lists the output fields for the <b>show fabric administration system mac-pool</b> command. Output fields are listed in the approximate order in which they appear.                       |

Table 118: show fabric administration system mac-pool Output Fields

| Field Name     | Field Description                                                 |
|----------------|-------------------------------------------------------------------|
| MAC Block Base | Starting MAC address for the pool assigned to the QFabric system. |
| Total MACs     | Total number of MAC addresses assigned to the QFabric system.     |
| Available MACs | Number of available MAC addresses from the total.                 |

## Sample Output

### show fabric administration system mac-pool

```

user@qfabric> show fabric administration system mac-pool
  Mac Block Base      Total MACs      Available MACs
  00:11:00:00:00:00    4096           4084
  02:00:00:11:22:00    10             10

```

## show fabric inventory

---

**Syntax**    `show fabric inventory`  
              `<brief | detail | terse>`  
              `<infrastructure fabric-controls <FC-0 | FC-1>>`  
              `<node-devices node-device-name>`  
              `<node-groups node-group-name>`

**Release Information**    Command introduced in Junos OS Release 12.2 for the QFX Series.

**Description**    (QFabric systems only) Display Node devices, Node groups, and fabric control Routing Engines that belong to the QFabric system. You can narrow the level of output by specifying a device type.

### NOTE:

- If you have administrator privileges, issue the `show fabric administration inventory` command to view all devices in your QFabric system (including Interconnect devices and Director devices).
  - If your Node devices do not appear in the output of the `show fabric inventory` command, check the cabling of your system.
- 

**Options**    `none`—Display all devices within a QFabric system.

`brief | detail | terse`—(Optional) Display the specified level of output.

`infrastructure fabric-controls <FC-0 | FC-1>`—(Optional) Display information for all fabric control Routing Engines running on the Director group within the QFabric system, or the individual fabric control Routing Engine you specify (either FC-0 or FC-1).

`node-devices node-device-name`—(Optional) Display a specific Node device within a QFabric system.

`node-groups node-group-name`—(Optional) Display a specific Node group within a QFabric system.

**Required Privilege Level**    admin

**Output Fields** [Table 119 on page 1705](#) lists the output fields for the **show fabric inventory** command. Output fields are listed in the approximate order in which they appear.

**Table 119: show fabric inventory Output Fields**

| Field Name     | Field Description                                                                                                                                                                                                                                                                                                                                                                                                 |
|----------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Item           | Type of QFabric system component being viewed. Possible values include <b>Node device</b> , <b>Node group</b> , <b>Fabric control</b> , and <b>Ungrouped Node device</b> .                                                                                                                                                                                                                                        |
| Identifier     | Hardware serial identifier of a QFabric system component.                                                                                                                                                                                                                                                                                                                                                         |
| Connection     | Status of a QFabric system component: either <b>Connected</b> or <b>Disconnected</b> , depending on whether or not the Director software has detected keepalive messages for the listed component.                                                                                                                                                                                                                |
| Configuration  | Whether or not the configuration for a QFabric system component has been received and installed. The configuration can be <b>Configured</b> , <b>Failed</b> (unsuccessful), <b>Pending</b> (in the process of being written or retried), or <b>Unknown</b> .                                                                                                                                                      |
| Node group     | Name of the Node groups associated with the QFabric system, and the Node devices assigned to each Node group. The group can be either <b>Connected</b> or <b>Disconnected</b> , depending on whether or not the Director software has detected keepalive messages for the devices in the group. This field also displays the serial ID for the Node group and the status for the Node group.                      |
| Node device    | Name of the Node devices associated with the Node group. The device can be either <b>Connected</b> or <b>Disconnected</b> , depending on whether or not the Director software has detected keepalive messages for the device. This field also displays the serial ID and configuration status for the Node device.                                                                                                |
| Fabric control | Name of the virtual Junos Routing Engines responsible for route selection within a QFabric system partition. The fabric control Routing Engine can be either <b>Connected</b> or <b>Disconnected</b> , depending on whether or not the Director software has detected keepalive messages for this virtual device. It also displays the identifier and configuration status for the fabric control Routing Engine. |

## Sample Output

**show fabric inventory**

```
user@qfabric> show fabric inventory
```

| Item                  | Identifier | Connection   | Configuration |
|-----------------------|------------|--------------|---------------|
| Ungrouped Node device |            |              |               |
| P3747-C               |            | Disconnected |               |
| Node group            |            |              |               |
| NW-NG-0               |            | Connected    | Configured    |
| Node-1                | P4093-C    | Connected    |               |
| RSNG-1                |            | Connected    | Configured    |
| Node-2                | P4514-C    | Connected    |               |
| Node-3                | P3917-C    | Connected    |               |
| Fabric control        |            |              |               |
| FC-0                  |            | Connected    | Configured    |
| FC-1                  |            | Connected    | Configured    |

**show fabric inventory infrastructure fabric-controls**

```
user@qfabric> show fabric inventory infrastructure fabric-controls
```

| Item           | Identifier | Connection | Configuration |
|----------------|------------|------------|---------------|
| Fabric control |            |            |               |
| FC-0           |            | Connected  | Configured    |
| FC-1           |            | Connected  | Configured    |

**show fabric inventory node-devices**

```
user@qfabric> show fabric inventory node-devices
```

| Item        | Identifier | Connection | Configuration |
|-------------|------------|------------|---------------|
| Node device |            |            |               |
| Node-1      | P4093-C    | Connected  |               |
| Node-2      | P4514-C    | Connected  |               |
| Node-3      | P3917-C    | Connected  |               |

**show fabric inventory node-groups**

```
user@qfabric> show fabric inventory node-groups
```

| Item       | Identifier | Connection | Configuration |
|------------|------------|------------|---------------|
| Node group |            |            |               |
| NW-NG-0    |            | Connected  | Configured    |
| Node-1     | P4093-C    | Connected  |               |
| RSNG-1     |            | Connected  | Configured    |
| Node-2     | P4514-C    | Connected  |               |
| Node-3     | P3917-C    | Connected  |               |

## show fabric session-host

|                                 |                                                                                                                                                                                                                      |
|---------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Syntax</b>                   | show fabric session-host                                                                                                                                                                                             |
| <b>Release Information</b>      | Command introduced in Junos OS Release 12.2 for the QFX Series.                                                                                                                                                      |
| <b>Description</b>              | (QFabric systems only) Display the Director device within the Director group that hosts the QFabric CLI session.                                                                                                     |

| <b>Description</b>                | List log files, display log file contents, or display information about users who have logged in to the router or switch.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| <b>Options</b>                    | <b>none</b> —List all log files.<br><br><b>&lt;all-lcc   lcc number   scc&gt;</b> —(TX Matrix routers only) (Optional) Display logging information about all T640 routers (or line-card chassis) or a specific T640 router (replace <i>number</i> with a value from 0 through 3) connected to a TX Matrix router. Or, display logging information about the TX Matrix router (or switch-card chassis).<br><br><b>device-type</b> —(QFabric system only) (Optional) Display log messages for only one of the following device types: <ul style="list-style-type: none"><li>• <b>director-device</b>—Display logs for Director devices.</li><li>• <b>infrastructure-device</b>—Display logs for the logical components of the QFabric system infrastructure, including the diagnostic Routing Engine, fabric control Routing Engine, fabric manager Routing Engine, and the default network Node group and its backup (NW-NG-0 and NW-NG-0-backup).</li><li>• <b>interconnect-device</b>—Display logs for Interconnect devices.</li><li>• <b>node-device</b>—Display logs for Node devices.</li></ul> |

**NOTE:** If you specify the *device-type* optional parameter, you must also specify either the *device-id* or *device-alias* optional parameter.

---

**(device-id | device-alias)**—If a device type is specified, display logs for a device of that type. Specify either the device ID or the device alias (if configured).

**filename**—(Optional) Display the log messages in the specified log file. For the routing matrix, the filename must include the chassis information.

**NOTE:** The *filename* parameter is mandatory for the QFabric system. If you did not configure a syslog filename, specify the default filename of messages.

**user <username>**—(Optional) Display logging information about users who have recently logged in to the router or switch. If you include *username*, display logging information about the specified user.

**Required Privilege Level** trace

### Performing System Backup and Recovery for a QFabric System

Many routers and switches require an administrator to recover the software package and the configuration file for the device separately. In the case of a device failure, this means the administrator might need to perform two separate tasks (if neither the software package nor the configuration file can be recovered).

In contrast, the QFabric system uses a unique mechanism that saves the backup and recovery files for both the Junos OS software and the system configuration into a single collection. The following QFabric system backup and recovery mechanism simplifies and streamlines the recovery process so you can return to normal operations as quickly as possible.

To backup and recover your QFabric system:

1. (First time only) Implement the following one-time procedure to prepare your QFabric system to use the system backup and recovery feature:
  - Insert a Juniper Networks software installation USB flash drive into the master Director device. (This drive was provided to you as one of the components of your QFabric system shipment.)
  - Issue the **request system software format-qfabric-backup** command. The contents and format of the USB flash drive are copied to the Director group shared directory and are used as the basis for all future backup and recovery operations.

```
user@qfabric> request system software format-qfabric-backup
Copying QFabric USB template image from /dev/sdb(Unigen,PQS4000,4009 MB).....
```

- Remove the Juniper Networks software installation USB drive from the master Director device.
- 2. Issue the **request system software system-backup** command to backup the software package and configuration file. This command saves the current files necessary to recover the QFabric system. The files are saved to a shared memory directory in the Director group.

**NOTE:** As you upgrade your system with new software and change the system configuration over time, remember to reissue this command periodically to save the newest files for recovery purposes.

```
user@qfabric> request system software system-backup
```

```
user@qfabric>
```

- 3. Insert a 4 GB or larger USB flash drive into the master Director device for your Director group, and issue the **request system software system-backup usb-create** command. This command copies the recovery files that have been backed up in the Director group and transfers them to the USB flash drive to create a recovery USB drive.

**NOTE:** Issuing this command overwrites the contents of the USB flash drive with the QFabric system recovery files.

```
user@qfabric> request system software system-backup usb-create /dev/sdb
Issuing this command will overwrite the contents of the USB drive.
Continue? [yes,no] (no) yes
```

```
This operation will access the USB drive on 0281042010000013.
Are you sure you want to continue? [yes,no] (no) yes
```

```
Copying QFabric recovery media to /dev/sdb...
Successfully copied QFabric recovery media to /dev/sdb
```

- 4. Remove the recovery USB drive from the Director device, and store it securely in a known location that you will remember when you need to use the recovery USB drive.
- 5. If the QFabric system fails, power off the Director group, insert the recovery USB drive into the master Director device of your Director group, turn on power to the Director device, and follow the prompts to recover your system. This step restores the software package and the configuration file for your QFabric system.

## Performing a QFabric System Recovery Installation on the Director Group

If the software on your QFabric system is damaged in some way that prevents the software from loading correctly, or you need to upgrade the software on your QFabric system, you may need to perform a recovery installation on the Director group.

If possible, perform the following steps before you perform the recovery installation:

1. Ensure that you have an emergency boot device (for example, an external USB flash drive) for each of your Director devices to use during the recovery installation.

You can either use the external USB flash drive containing the software supplied by Juniper Networks, or you can use an external USB flash drive supplied by Juniper Networks on which you install the QFabric system install media.

2. Because the recovery installation process completely overwrites the entire contents of the Director device, make sure you back up any configuration files and initial setup information on a different external USB flash drive before you begin a recovery installation. You will need to restore this information as part of recovery process.

Use the **request system software configuration-backup** command to back up your configuration files and initial setup information:

```
user@switch> request system software configuration-backup path
```

**NOTE:** To recover the Director group, you must upgrade both Director devices in parallel. If you are recovering only one Director device in a Director group, and the software version will remain the same between the two Director devices, make sure that the other Director device is powered on and operational. If the software version of the Director device you are recovering will be different, make sure that the other Director device is powered off and is not operational.

- (Optional) Creating an Emergency Boot Device Using a Juniper Networks External Blank USB Flash Drive on page 1715
- Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software on page 1717

### (Optional) Creating an Emergency Boot Device Using a Juniper Networks External Blank USB Flash Drive

If you do not have an external USB flash drive preloaded with the software from Juniper Networks to use as an emergency boot device, you can create your own, using a blank external USB flash drive provided by Juniper Networks. Download the install media from the Juniper Networks Support website onto your UNIX workstation, uncompress and untar the software, and then burn the software image onto your Juniper Networks external USB (4-gigabyte) flash drive. Make sure you create two emergency boot devices, one for each Director device, so you can perform a recovery installation in parallel.

1. Using a Web browser, navigate to the <http://www.juniper.net/support>.
2. Click **Download Software**.
3. In the *Switchingbox*, click *Junos OS Platforms*.
4. In the *QFX Series* section, click the name of the platform for which you want to download software.

5. Click the *Software* tab and select the release number from the *Release* drop-down list.
6. Select the complete install media you want to download in the *QFabric System Install Media* section.  
  
A login screen appears.
7. Enter your name and password and press **Enter**.
8. Read the End User License Agreement, click the **I agree** radio button, and then click **Proceed**.
9. Log in and save the install media file to your UNIX workstation.
10. Use FTP to access the UNIX workstation where the install media resides.  
  
`ftp ftp://hostname/pathname install-media-qfabric-<version>.img.tgz`
11. When prompted, enter your username and password.
12. Make sure you are in binary mode by entering **binary** at the prompt.  
  
`binary`
13. Use the **get** command to transfer the installation package from the FTP host to your UNIX workstation.  
  
`get install-media-qfabric-<version>.img.tgz`
14. Close the FTP session:  
  
`bye`
15. Untar the *install-media-qfabric-<version>.img.tgz* file on your UNIX workstation.  
  
`tar -xvzf install-media-qfabric-11.3X30.6.img.tgz`
16. Insert a blank external USB (4-gigabyte) flash drive supplied by Juniper Networks into your UNIX workstation.
17. Burn the software image you just downloaded to your UNIX workstation onto your external USB flash drive using the **dd** command:  
  
`dd if=install-media-qfabric-11.3X30.6.img of=/dev/sdb bs=16k  
250880+0 records in  
250880+0 records out  
4110417920 bytes (4.1 GB) copied, 5.10768 seconds, 805 MB/s`
18. Perform the steps in [“Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software” on page 87](#) to continue with the recovery installation.

## Performing a Recovery Installation Using a Juniper Networks External USB Flash Drive with Preloaded Software

This procedure describes how to perform a recovery installation using an external USB flash drive that contains Junos OS software.

**NOTE:** Since the recovery installation process completely overwrites the entire contents of the Director device, you will need to restore the required configuration files and initial setup information. The following procedure assumes you previously saved these backup files with the **request system software configuration-backup** command. Ensure that you have these backup files available on an external USB flash drive before you perform the following steps.

1. Insert the external USB flash drive into the Director device.
2. Perform one of the following tasks:
  - If you have access to the default partition, reboot the Director device by issuing the **request system reboot director-group** command.
  - If you do not have access to the default partition, power cycle the Director device.

The following menu appears on the Director device console when the Director device boots up:

```
Juniper Networks QFabric Director Install/Recovery Media
- To boot from the local disk, wait 10 seconds or press the Enter key.
- To reinstall the QFabric software on this Director device, type: install
```

3. Type **install** and then press **Enter** to install the software on the Director device.

Once the installation process is complete, the Director device reboots, and the following menu appears on the Director device console:

```
Juniper Networks QFabric Director Install/Recovery Media
- To boot from the local disk, wait 10 seconds or press the Enter key.
- To reinstall the QFabric software on this Director device, type: install
```

4. Press **Enter**.

The Director device reboots from the local disk on which the software was just installed.

5. Log in as root on the Director device.

The following menu appears on the Director device console:

```
Before you can access the QFabric system, you must complete the initial setup
of the Director group by using the steps that follow.
If the initial setup procedure does not complete successfully, log out of the
Director device and then log back in to restart
this setup menu.
```

```
Continue?[y/n]
```

6. Enter **n** to bypass the initial setup script and enter the Director device root directory, where you can mount the external USB flash drive containing the configuration files and initial setup information.

7. Issue the **ls /mnt** command to list the *mount* directory.

```
root@dg0 ~]# ls /mnt
```

8. Issue the **mkdir** command to create a directory within the mount directory.

```
root@dg0 ~]# mkdir /mnt/myusb
```

9. Issue the **mount /dev/sdb2 /mnt/myusb/** command to mount the external USB flash drive to the local drive of the Director device.

```
root@dg0 ~]# mount /dev/sdb2 /mnt/myusb/
```

10. Issue the **ls -la /mnt/myusb/** command to verify the contents of your mounted external USB flashdrive.

```
root@dg0 ~]# ls -la /mnt/myusb/
total 1770884
drwxr-xr-x 2 root root      4096 Sep  7 05:16 .
drwxr-xr-x 3 root root      4096 Sep  7 10:15 ..
-rw-r--r-- 1 root root     4249 Sep  7 03:52 mybackup-20110907
```

11. Exit the Director device and log back in as root on the Director device.

The following menu appears:

Before you can access the QFabric system, you must complete the initial setup of the Director group by using the steps that follow.

If the initial setup procedure does not complete successfully, log out of the Director device and then log back in to restart this setup menu.

```
Continue?[y/n] y
Initial Configuration
```

You may enter the configuration manually or restore from a backup.

```
Specify a backup file? [y/n] : y
Please specify the full path of the configuration backup file. :
/mnt/myusb/mybackup-20110907
```

12. Enter **y** to continue.

13. Enter **y** and specify the path to the backup configuration file located on the external USB flash drive.

```
/mnt/myusb/mybackup-20110907
```

The following messages appear:

```
Saving temporary configuration...
Configuring peer...
connect error for 1.1.1.2:9001
Configuring local interfaces...
Configuring interface eth0 with [10.49.213.163/24:10.49.213.254]
Configured interface eth0 with [10.49.213.163/24:10.49.213.254]
Configuring QFabric software with initial pool of 4000 MAC addresses
[00:10:00:00:00:00 - 00:10:00:00:0f:3b]
Configuring QFabric address [10.49.213.50]
Reconfiguring QFabric software static configuration
Applying the new Director Device password
Applying the QFabric component password
```

First install initial configuration, generating and sharing SSH keys.  
 First install initial configuration, generating SSH keys.  
 connect error for 1.1.1.2:9001  
 Shared SSH keys.  
 Configuration complete. Director Group services will auto start within 30 seconds.

The Director device reboots from the local disk on which the software was just installed.  
 Exit the Director device session and log in to the QFabric default partition CLI.

14. Issue the **request system software configuration-restore** command and specify the path to the backup configuration file located on the external USB flash drive to load the previously saved QFabric system configuration.

15. From the default partition, issue the **request system reboot node-group all** command to reboot all of the Node groups in the QFabric system to ensure that all Node devices are running the same version of software as the Director-group.

```
user@switch> request system reboot node-group all
```

16. From the default partition, issue the **request system reboot fabric** command to reboot the Interconnect devices and the other components in the fabric in the QFabric system to ensure that Interconnect devices are running the same version of software as the Director group.

```
user@switch> request system reboot fabric
```

17. Log in to the default partition and issue the **show version component all** command to verify that all components are running the same version of software.

```
user@switch> show version component all
```

## Performing a Recovery Installation

If Junos OS on your device is damaged in some way that prevents the software from loading correctly, you may need to perform a recovery installation using an emergency boot device (for example, a USB flash drive) to restore the default factory installation. Once you have recovered the software, you need to restore the device configuration. You can either create a new configuration as you did when the device was shipped from the factory, or if you saved the previous configuration, you can simply restore that file to the device.

You can also use a system snapshot as a bootup option when your Junos OS or configuration is damaged. The system snapshot feature takes a “snapshot” of the files currently used to run the device—the complete contents of the `/config` directories, which include the running Juniper Networks Junos OS, the active configuration, and the rescue configuration, as well as the host OS—and copies all of these files into an external USB flash drive. See *Understanding System Snapshot*.

If at all possible, you should try to perform the following steps before you perform the recovery installation:

1. Ensure that you have an emergency boot device to use during the installation. See [“Creating an Emergency Boot Device” on page 180](#) for information on how to create an emergency boot device.
2. Copy the existing configuration in the file `/config/juniper.conf.gz` from the device to a remote system, such as a server, or to an emergency boot device. For extra safety, you can also copy the backup configurations (the files named `/config/juniper.conf.n`, where *n* is a number from 0 through 9) to a remote system or to an emergency boot device.

**WARNING:** The recovery installation process completely overwrites the entire contents of the internal flash storage.

3. Copy any other stored files to a remote system as desired.

To reinstall Junos OS:

1. Insert the emergency boot device into the QFX Series device.
2. Reboot the QFX Series device.

**NOTE:** Do not power off the device if it is already on.

```
[edit system]
user@device> request system reboot
```

If you do not have access to the CLI, power cycle the QFX Series device.

The emergency boot device (external USB install media) is detected. At this time, you can load the Junos OS from the emergency boot device onto the internal flash storage.

3. The software prompts you with the following options:

```
External USB install media detected.
You can load Junos from this media onto an internal drive.
Press 'y' to proceed, 'f' to format and install, or 'n' to abort.
Do you wish to continue ([y]/f/n)? f
```

4. Type **f** to format the internal flash storage and install the Junos OS on the emergency boot device onto the internal flash storage.

If you do not want to format the internal flash storage, type **y**.

The following messages are displayed:

```
Installing packages from external USB drive da1
Packages will be installed to da0, media size: 8G
```

```
Processing format options
Fri September 4 01:18:44 UTC 2012
```

```
-- IMPORTANT INFORMATION --
Installer has detected settings to format system boot media.
This operation will erase all data from your system.
```

```
Formatting installation disk .. this will take a while, please wait
Disabling platform watchdog - threshold 12 mins
```

```
Determining installation slice
Fri September 4 01:27:07 UTC 2012
```

5. The device copies the software from the emergency boot device, occasionally displaying status messages. Copying the software can take up to 12 minutes.

When the device is finished copying the software, you are presented with the following prompt:

```
*** Fri September 4 01:19:00 UTC 2012***
Installation successful..
Please select one of the following options:
Reboot to installed Junos after removing install media (default) ... 1
Reboot to installed Junos by disabling install media ..... 2
Exit to installer debug shell ..... 3
Install Junos to alternate slice ..... 4
Your choice: 4
NOTE: System installer will now install Junos to alternate slice
Do not power off or remove the external installer media or
interrupt the installation mechanism.
```

6. Select **4** to install Junos OS to the alternate slice of the partition, and then press Enter.
7. Remove the emergency boot device when prompted and then press Enter. The device then reboots from the internal flash storage on which the software was just installed. When the reboot is complete, the device displays the login prompt.
8. Create a new configuration as you did when the device was shipped from the factory, or restore the previously saved configuration file to the device.

## Creating an Emergency Boot Device

If Junos OS on the device is damaged in some way that prevents the software from loading properly, you can use an emergency boot device to repartition the primary disk and load a fresh installation of Junos OS. Use the following procedure to create an emergency boot device.

Before you begin, you need to download the installation media image for your device and Junos OS release from <http://www.juniper.net/customers/support/>.

**NOTE:** In the following procedure, we assume that you are creating the emergency boot device on a QFX device. You can create the emergency boot device on another Juniper Networks switch or router, or any PC or laptop that supports Linux. The steps you take to create the emergency boot device vary, depending on the device.

To create an emergency boot device:

1. Use FTP to copy the installation media image into the **/var/tmp** directory on the device.
2. Insert a USB device into the USB port.
3. From the Junos OS command-line interface (CLI), start the shell:

```
user@device> start shell
%
```

4. Switch to the root account using the **su** command:

```
% su
Password: password
```

**NOTE:** The password is the root password for the device. If you logged in to the device as root, you do not need to perform this step.

5. Enter the following command on the QFX3500, QFX3600, and QFX3600-I devices:

```
root@device% dd if=/var/tmp/filename of=/dev/da1 bs=16k
```

The device writes the installation media image to the USB device:

```
root@device% dd if=/var/tmp/install-media-qfx3500.junos_11.1 of=/dev/da1 bs=16k
11006+1 records in
11006+1 records out
180332544 bytes transferred in 71.764266 secs (2512846 bytes/sec)
```

6. Enter the following command on the QFX5100 and EX4600 devices:

```
root@device% dd if=/var/tmp/filename of=/dev/da0 bs=1048576
```

The device writes the installation media image to the USB device:

```
root@device% dd if=/var/tmp/jinstall-vjunos-usb-13.2.img of=/dev/da0 bs=1048576
11006+1 records in
11006+1 records out
180332544 bytes transferred in 71.764266 secs (2512846 bytes/sec)
```

**NOTE:** QFX5100 and EX4600 devices automatically create a recovery Junos OS image.

The “Select a recovery image” menu appears on the console when one of these switches is booted and unable to load a version of Junos OS. You can follow the instructions in the “Select a recovery image” menu to load the Junos OS image for one of these switches.

7. Log out of the shell:

```
root@device% exit
% exit
user@device>
```

**Table 122: Configuration File Terms**

| Term                      | Definition                                                                                                                                                                                                                                                                                          |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| active configuration      | Current committed configuration of a switch.                                                                                                                                                                                                                                                        |
| candidate configuration   | Working copy of the configuration that allows users to make configurational changes without causing any operational changes until this copy is committed.                                                                                                                                           |
| configuration group       | Group of configuration statements that can be inherited by the rest of the configuration.                                                                                                                                                                                                           |
| commit a configuration    | Check configuration for proper syntax, activate and mark as the current configuration file running on the switching platform.                                                                                                                                                                       |
| configuration hierarchy   | Junos OS configuration consists of a hierarchy of statements. There are two types of statements: container statements, which contain other statements, and leaf statements, which do not contain other statements. All the container and leaf statements together form the configuration hierarchy. |
| default configuration     | Default configuration contains the initial values set for each configuration parameter when a switch is shipped.                                                                                                                                                                                    |
| rescue configuration      | Well-known configuration that recovers a switch from a configuration that denies management access. You set a current committed configuration to be the rescue configuration through the CLI.                                                                                                       |
| roll back a configuration | Return to a previously committed configuration.                                                                                                                                                                                                                                                     |

## Software Overview

---

- [Forms of the configure Command on page 1730](#)
- [Junos OS Commit Model for Router or Switch Configuration on page 1731](#)
- [Understanding Configuration Files on page 1732](#)
- [Understanding How the Junos OS Configuration Is Stored on page 1733](#)

### Forms of the configure Command

The Junos OS supports three forms of the **configure** command: **configure**, **configure private**, and **configure exclusive**. These forms control how users edit and commit configurations and can be useful when multiple users configure the software. See [Table 123 on page 1730](#).

**Table 123: Forms of the configure Command**

| Command          | Edit Access                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Commit Access                                                                                                                                                                                                                                                      |
|------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

## Junos OS Commit Model for Router or Switch Configuration

The router or switch configuration is saved using a commit model—a candidate configuration is modified as desired and then committed to the system. When a configuration is committed, the router or switch checks the configuration for syntax errors, and if no errors are found, the configuration is saved as **juniper.conf.gz** and activated. The formerly active configuration file is saved as the first rollback configuration file (**juniper.conf.1.gz**), and any other rollback configuration files are incremented by 1. For example, **juniper.conf.1.gz** is incremented to **juniper.conf.2.gz**, making it the second rollback configuration file. The router or switch can have a maximum of 49 rollback configurations (numbered 1 through 49) saved on the system.

On the router or switch, the active configuration file and the first three rollback files (**juniper.conf.gz.1**, **juniper.conf.gz.2**, **juniper.conf.gz.3**) are located in the **/config** directory. If the file **rescue.conf.gz** is saved on the system, this file should also be saved in the **/config** directory. The factory default files are located in the **/etc/config** directory.

There are two mechanisms used to propagate the configurations between Routing Engines within a router or switch:

- Synchronization—Propagates a configuration from one Routing Engine to a second Routing Engine within the same router or switch chassis.

**NOTE:** The QFX3500 switch has only one Routing Engine.

To synchronize configurations, use the **commit synchronize** CLI command. If one of the Routing Engines is locked, the synchronization fails. If synchronization fails because of a locked configuration file, you can use the **commit synchronize force** command. This command overrides the lock and synchronizes the configuration files.

- Distribution—Propagates a configuration across the routing plane on a multichassis router or switch. Distribution occurs automatically. There is no user command available to control the distribution process. If a configuration is locked during a distribution of a configuration, the locked configuration does not receive the distributed configuration file, so the synchronization fails. You need to clear the lock before the configuration and resynchronize the routing planes.

**NOTE:** When you use the **commit synchronize force** CLI command on a multichassis platform, the forced synchronization of the configuration files does not affect the distribution of the configuration file across the routing plane. If a configuration file is locked on a router or switch remote from the router or switch where the command was issued, the synchronization fails on the remote router or switch. You need to clear the lock and reissue the **synchronization** command.

## Understanding Configuration Files

A configuration file stores the complete configuration of a switch. The current configuration of a switch is called the active configuration. You can alter this current configuration and you can also return to a previous configuration or to a rescue configuration.

Juniper Networks Junos OS saves the 50 most recently committed configuration files on a switch so that you can return to a previous configuration. The configuration files are named:

- **juniper.conf.gz**—The current active configuration.
- **juniper.conf.1.gz** to **juniper.conf.49.gz**—Rollback configurations.

To make changes to the configuration file, you have to work in the configuration mode in the CLI. When making changes to a configuration file, you are viewing and changing the candidate configuration file. The candidate configuration allows you to make configuration changes without causing operational changes to the active configuration or causing potential damage to your current network operations. Once you commit the changes made to the candidate configuration, the system updates the active configuration.

## Understanding How the Junos OS Configuration Is Stored

When you edit a configuration, you work in a copy of the current configuration to create a candidate configuration. The changes you make to the candidate configuration are visible in the CLI immediately, so if multiple users are editing the configuration at the same time, all users can see all changes.

To have a candidate configuration take effect, you *commit* the changes. At this point, the candidate file is checked for proper syntax, activated, and marked as the current, operational software configuration file. If multiple users are editing the configuration, when you commit the candidate configuration, all changes made by all the users take effect.

In addition to saving the current configuration, the CLI saves the current operational version and the previous 49 versions of committed configurations. The most recently committed configuration is version 0, which is the current operational version and the default configuration that the system returns to if you roll back to a previous configuration. The oldest saved configuration is version 49.

By default, the Junos OS saves the current configuration and three previous versions of the committed configuration on the CompactFlash card. The currently operational Junos OS configuration is stored in the file **juniper.conf.gz**, and the last three committed configurations are stored in the files **juniper.conf.1.gz**, **juniper.conf.2.gz**, and **juniper.conf.3.gz**. These four files are located in the router or switch's CompactFlash card in the directory **/config**.

The remaining 46 previous versions of committed configurations, the files **juniper.conf.4** through **juniper.conf.49**, are stored in the directory **/var/db/config** on the hard disk.

### Comparing Configuration Changes with a Prior Version

In configuration mode only, when you have made changes to the configuration and want to compare the candidate configuration with a prior version, you can use the **compare** command to display the configuration. The **compare** command compares the candidate configuration with either the current committed configuration or a configuration file and displays the differences between the two configurations. To compare configurations, specify the **compare** command after the pipe:

[edit]

```
user@host# show | compare (filename| rollback n)
```

**filename** is the full path to a configuration file. The file must be in the proper format: a hierarchy of statements.

**n** is the index into the list of previously committed configurations. The most recently saved configuration is number 0, and the oldest saved configuration is number 49. If you do not specify arguments, the candidate configuration is compared against the active configuration file (`/config/juniper.conf`).

The comparison output uses the following conventions:

- Statements that are only in the candidate configuration are prefixed with a plus sign (+).
- Statements that are only in the comparison file are prefixed with a minus sign (-).
- Statements that are unchanged are prefixed with a single blank space ( ).

The following example shows various changes, then a comparison of the candidate configuration with the active configuration, showing only the changes made at the `[edit protocols bgp]` hierarchy level:

```
[edit]
user@host# edit protocols bgp
[edit protocols bgp]
user@host# show
group my-group {
  type internal;
  hold-time 60;
  advertise-inactive;
  allow 1.1.1.1/32;
}
group fred {
  type external;
  peer-as 33333;
  allow 2.2.2.2/32;
}
group test-peers {
  type external;
  allow 3.3.3.3/32;
}
[edit protocols bgp]
user@host# set group my-group hold-time 90
[edit protocols bgp]
user@host# delete group my-group advertise-inactive
[edit protocols bgp]
user@host# set group fred advertise-inactive
[edit protocols bgp]
user@host# delete group test-peers
[edit protocols bgp]
user@host# show | compare
[edit protocols bgp group my-group]
-hold-time 60;
+hold-time 90;
-advertise-inactive;
```

```
[edit protocols bgp group fred]
+advertise-inactive;
[edit protocols bgp]
-group test-peers {
  -type external;
  -allow 3.3.3.3/32;
}
[edit protocols bgp]
user@host# show
group my-group {
  type internal;
  hold-time 90;
  allow 1.1.1.1/32;
}
group fred {
  type external;
  advertise-inactive;
  peer-as 3333;
  allow 2.2.2.2/32;
}
```

## Compressing the Current Configuration File

By default, the current operational configuration file is compressed, and is stored in the file **juniper.conf.gz**, in the **/config** file system, along with the last three committed versions of the configuration. If you have large networks, the current configuration file might exceed the available space in the **/config** file system. Compressing the current configuration file enables the file to fit in the file system, typically reducing the size of the file by 90 percent. You might want to compress your current operation configuration files when they reach 3 megabytes (MB) in size.

When you compress the current configuration file, the names of the configuration files change. To determine the size of the files in the **/config** file system, issue the **file list /config detail** command.

**NOTE:** We recommend that you compress the configuration files (this is the default) to minimize the amount of disk space that they require.

- If you want to compress the current configuration file, include the **compress-configuration-files** statement at the **[edit system]** hierarchy level:

```
[edit system]
compress-configuration-files;
```

Commit the current configuration file to include the **compression-configuration-files** statement. Commit the configuration again to compress the current configuration file:

```
[edit system]
user@host# set compress-configuration-files
user@host# commit
```

```
commit complete
user@host# commit
commit complete
```

- If you do not want to compress the current operational configuration file, include the **no-compress-configuration-files** statement at the **[edit system]** hierarchy level:

```
[edit system]
no-compression-configuration-files;
```

Commit the current configuration file to include the **no-compress-configuration-files** statement. Commit the configuration again to uncompress the current configuration file:

```
[edit system]
user@host# commit
commit complete
user@host# commit
commit complete
```

## Creating and Returning to a Rescue Configuration

A *rescue configuration* allows you to define a known working configuration or a configuration with a known state that you can roll back to at any time. This alleviates the necessity of having to remember the rollback number with the **rollback** command. You use the rescue configuration when you need to roll back to a known configuration or as a last resort if your router or switch configuration and the backup configuration files become damaged beyond repair.

To save the most recently committed configuration as the rescue configuration so that you can return to it at any time, issue the **request system configuration rescue save** command:

```
user@host> request system configuration rescue save
```

To return to the rescue configuration, use the **rollback rescue** configuration mode command:

```
[edit]
user@host# rollback rescue
load complete
```

**NOTE:** If the rescue configuration does not exist, or if the rescue configuration is not a complete, viable configuration, the **rollback** command fails, an error message appears, and the current configuration remains active.

To activate the rescue configuration that you have loaded, use the **commit** command:

```
[edit]
user@host# rollback rescue
```

```
load complete
[edit]
user@host# commit
```

To delete an existing rescue configuration, issue the **request system configuration rescue delete** command:

```
user@host> request system configuration rescue delete
user@host>
```

For more information about the **request system configuration rescue delete** and **request system configuration rescue save** commands, see the [CLI Explorer](#).

## Loading a Configuration from a File

You can create a file, copy the file to the local router, and then load the file into the CLI. After you have loaded the file, you can commit it to activate the configuration on the router, or you can edit the configuration interactively using the CLI and commit it at a later time.

You can also create a configuration while typing at the terminal and then load it. Loading a configuration from the terminal is generally useful when you are cutting existing portions of the configuration and pasting them elsewhere in the configuration.

To load an existing configuration file that is located on the router, use the **load** configuration mode command:

```
[edit]
user@host# load (factory-default | merge | override | patch | replace | set | update)
filename <relative>
```

For information about specifying the filename, see *Viewing Files and Directories on a Device Running Junos OS*.

To load a configuration from the terminal, use the following version of the **load** configuration mode command. Press Ctrl-d to end input.

```
[edit]
user@host# load (factory-default | merge | override | patch | replace | set | update)
terminal <relative>
```

To replace an entire configuration, specify the **override** option at any level of the hierarchy. A **load override** operation completely replaces the current candidate configuration with the file you are loading. Thus, if you saved a complete configuration, use this option.

An **override** operation discards the current candidate configuration and loads the configuration in **filename** or the configuration that you type at the terminal. When you use the **override** option and commit the configuration, all system processes reparse the configuration. For an example, see [Figure 51 on page 1767](#).

To replace portions of a configuration, specify the **replace** option. The **load replace** operation looks for **replace:** tags that you added to the loaded file, and replaces the parts of the candidate configuration with whatever is specified after the tag. This is useful when you want more control over exactly what is being changed. For this operation to work, you must include **replace:** tags in the file or configuration you type at the terminal. The software searches for the **replace:** tags, deletes the existing statements of the same name, if any, and replaces them with the incoming configuration. If there is no existing statement of the same name, the **replace** operation adds to the configuration the statements marked with the **replace:** tag. For an example, see [Figure 52 on page 1768](#).

If, in an **override** or **merge** operation, you specify a file or type text that contains **replace:** tags, the **replace:** tags are ignored and the **override** or **merge** operation is performed.

If you are performing a **replace** operation and the file you specify or text you type does not contain any **replace:** tags, the **replace** operation is effectively equivalent to a **merge** operation. This might be useful if you are running automated scripts and cannot know in advance whether the scripts need to perform a **replace** or a **merge** operation. The scripts can use the **replace** operation to cover either case.

The **load merge** operation adds the saved file to the existing candidate configuration. This is useful if you are adding new configuration sections. For example, suppose that you are adding a BGP configuration to the **[edit protocols]** hierarchy level, where there was no BGP configuration before, you can use the **load merge** operation to combine the saved file configuration to the existing candidate configuration. If the existing configuration and the incoming configuration contain conflicting statements, the statements in the incoming configuration override those in the existing configuration.

To replace only the configuration that has changed, specify the **update** option at any level of the hierarchy. The **load update** operation compares the candidate configuration and the file you are loading, and only changes the parts of the candidate configuration that are different from the new configuration. You would use this, for example, if there is an existing BGP configuration and the file you are loading changes it in some way.

To change part of the configuration with a patch file, specify the **patch** option. The **load patch** operation loads a file or terminal input that contains configuration changes. First, on a device that already has the configuration changes, you type the **show | compare** command to output the differences between two configurations. Then you can load the differences on another router. The advantage of the **load patch** command is that it saves you from having to copy snippets from different hierarchy levels into a text file prior to loading them into the target device. This might be a useful time saver if you are configuring several devices with the same options. For example, suppose that you configure a routing policy on Device router1 and you want to replicate the policy configuration on Device router2, router3, and router4, you can use the **load patch** operation.

First, run the **show | compare** command.

```
user@router1# show | compare rollback 3
[edit protocols ospf]
+ export default-static;
- export static-default
[edit policy-options]
+ policy-statement default-static {
```

```
+      from protocol static;
+      then accept;
+  }
```

Copy the output of the **show | compare** command to the clipboard, making sure to include the hierarchy levels. On Device router2, router3, and router4, type **load patch terminal** and paste the output. Press Enter and then press Ctrl-d to end the operation. If the patch input specifies different values for an existing statement, the patch input overrides the existing statement.

To use the **merge**, **replace**, **set**, or **update** option without specifying the full hierarchy level, specify the **relative** option. For example:

```
[edit system]
user@host# show static-host-mapping
bob sysid 987.654.321ab
[edit system]
user@host# load replace terminal relative
[Type ^D at a new line to end input]
replace: static-host-mapping {
  bob sysid 0123.456.789bc;
}
load complete
[edit system]
user@host# show static-host-mapping
bob sysid 0123.456.789bc;
```

To load a configuration that contains the **set** configuration mode command, specify the **set** option. This option executes the configuration instructions line by line as they are stored in a file or from a terminal. The instructions can contain any configuration mode command, such as **set**, **edit**, **exit**, and **top**. For an example, see [Figure 55 on page 1769](#).

To copy a configuration file from another network system to the local router, you can use the SSH and Telnet utilities, as described in the [CLI Explorer](#).

**NOTE:** If you are using Junos OS in a Common Criteria environment, system log messages are created whenever a secret attribute is changed (for example, password changes or changes to the RADIUS shared secret). These changes are logged during the following configuration load operations:

```
load merge
load replace
load override
load update
```

For more information, see the *Secure Configuration Guide for Common Criteria and Junos-FIPS*.

#### Related Documentation

- [Examples: Loading a Configuration from a File on page 1767](#)

## Loading a Previous Configuration File

You can use the **rollback** <*number*> command to return to a previously committed configuration file. A switch saves the last 50 committed configurations, including the rollback number, date, time, and name of the user who issued the **commit** configuration command.

### Syntax

**rollback** <*number*>

### Options

- **none**—Return to the most recently saved configuration.
- **number**—Configuration to return to.
  - **Range:** 0 through 49. The most recently saved configuration is number 0, and the oldest saved configuration is number 49.
  - **Default:** 0

To return to a configuration prior to the most recently committed one:

1. Specify the rollback number (here, 1 is entered and the configuration returns to the previously committed configuration):

```
[edit]
user@switch# rollback 1
load complete
```

2. Activate the configuration you have loaded:

```
[edit]
user@switch# commit
```

**Related Documentation**

- [Configuration File Terms on page 25](#)

## Returning to the Most Recently Committed Junos OS Configuration

To return to the most recently committed configuration and load it into configuration mode without activating it, use the **rollback** configuration mode command:

```
[edit]
user@host# rollback

load complete
```

To activate the configuration to which you rolled back, use the **commit** command:

```
[edit]
user@host# rollback
load complete
[edit]
user@host# commit
```

## Returning to a Previously Committed Junos OS Configuration

This topic explains how you can return to a configuration prior to the most recently committed one, and contains the following sections:

- [Returning to a Configuration Prior to the One Most Recently Committed on page 1743](#)
- [Displaying Previous Configurations on page 1743](#)
- [Comparing Configuration Changes with a Prior Version on page 1744](#)
- [Creating and Returning to a Rescue Configuration on page 1746](#)
- [Saving a Configuration to a File on page 1747](#)

### Returning to a Configuration Prior to the One Most Recently Committed

To return to a configuration prior to the most recently committed one, include the configuration number, 0 through 49, in the **rollback** command. The most recently saved configuration is number 0 (which is the default configuration to which the system returns), and the oldest saved configuration is number 49.

```
[edit]
user@host# rollback number
load complete
```

### Displaying Previous Configurations

To display previous configurations, including the rollback number, date, time, the name of the user who committed changes, and the method of commit, use the **rollback ?** command.

```
[edit]
user@host# rollback ?

### Comparing Configuration Changes with a Prior Version

In configuration mode only, when you have made changes to the configuration and want to compare the candidate configuration with a prior version, you can use the **compare** command to display the configuration. The **compare** command compares the candidate configuration with either the current committed configuration or a configuration file and displays the differences between the two configurations. To compare configurations, specify the **compare** command after the pipe:

```
[edit]
user@host# show | compare (filename) rollback n)
```

***filename*** is the full path to a configuration file. The file must be in the proper format: a hierarchy of statements.

*n* is the index into the list of previously committed configurations. The most recently saved configuration is number 0, and the oldest saved configuration is number 49. If you do not specify arguments, the candidate configuration is compared against the active configuration file (`/config/juniper.conf`).

The comparison output uses the following conventions:

- Statements that are only in the candidate configuration are prefixed with a plus sign (+).
- Statements that are only in the comparison file are prefixed with a minus sign (-).
- Statements that are unchanged are prefixed with a single blank space ( ).

The following example shows various changes, then a comparison of the candidate configuration with the active configuration, showing only the changes made at the **[edit protocols bgp]** hierarchy level:

```
[edit]
user@host# edit protocols bgp
[edit protocols bgp]
user@host# show
group my-group {
    type internal;
    hold-time 60;
    advertise-inactive;
    allow 1.1.1.1/32;
}
group fred {
    type external;
    peer-as 33333;
    allow 2.2.2.2/32;
}
group test-peers {
    type external;
    allow 3.3.3.3/32;
}
[edit protocols bgp]
user@host# set group my-group hold-time 90
[edit protocols bgp]
user@host# delete group my-group advertise-inactive
[edit protocols bgp]
user@host# set group fred advertise-inactive
[edit protocols bgp]
user@host# delete group test-peers
[edit protocols bgp]
user@host# show | compare
[edit protocols bgp group my-group]
-hold-time 60;
+hold-time 90;
-advertise-inactive;
[edit protocols bgp group fred]
+advertise-inactive;
[edit protocols bgp]
-group test-peers {
```

```
-type external;  
-allow 3.3.3.3/32;  
}  
[edit protocols bgp]  
user@host# show  
group my-group {  
  type internal;  
  hold-time 90;  
  allow 1.1.1.1/32;  
}  
group fred {  
  type external;  
  advertise-inactive;  
  peer-as 3333;  
  allow 2.2.2.2/32;  
}
```

---

### Creating and Returning to a Rescue Configuration

A *rescue configuration* allows you to define a known working configuration or a configuration with a known state that you can roll back to at any time. This alleviates the necessity of having to remember the rollback number with the **rollback** command. You use the rescue configuration when you need to roll back to a known configuration or as a last resort if your router or switch configuration and the backup configuration files become damaged beyond repair.

To save the most recently committed configuration as the rescue configuration so that you can return to it at any time, issue the **request system configuration rescue save** command:

```
user@host> request system configuration rescue save
```

To return to the rescue configuration, use the **rollback rescue** configuration mode command:

```
[edit]  
user@host# rollback rescue  
load complete
```

**NOTE:** If the rescue configuration does not exist, or if the rescue configuration is not a complete, viable configuration, the rollback command fails, an error message appears, and the current configuration remains active.

---

To activate the rescue configuration that you have loaded, use the **commit** command:

```
[edit]  
user@host# rollback rescue  
load complete  
[edit]  
user@host# commit
```

To delete an existing rescue configuration, issue the **request system configuration rescue delete** command:

```
user@host> request system configuration rescue delete
user@host>
```

For more information about the **request system configuration rescue delete** and **request system configuration rescue save** commands, see the [CLI Explorer](#).

### Saving a Configuration to a File

Save the Junos OS configuration to a file so that you can edit it with a text editor of your choice. You can save your current configuration to an ASCII file, which saves the configuration in its current form, including any uncommitted changes. If more than one user is modifying the configuration, all changes made by all users are saved.

To save software configuration changes to an ASCII file, use the **save** configuration mode command:

```
[edit]
user@host# save filename
[edit]
user@host#
```

The contents of the current level of the statement hierarchy (and below) are saved, along with the statement hierarchy containing it. This allows a section of the configuration to be saved, while fully specifying the statement hierarchy.

By default, the configuration is saved to a file in your home directory, which is on the flash drive.

When you issue this command from anywhere in the hierarchy (except the top level), a **replace** tag is automatically included at the beginning of the file. You can use the **replace** tag to control how a configuration is loaded from a file.

```
user@host> file show /var/home/user/myconf
replace:
protocols {
  bgp {
    disable;
    group int {
      type internal;
    }
  }
  isis {
    disable;
    interface all {
      level 1 disable;
    }
    interface fxp0.0 {
      disable;
    }
  }
  ospf {
    traffic-engineering;
    reference-bandwidth 4g;
    ...
  }
}
```

## Reverting to the Default Factory Configuration

If for any reason the current active configuration fails, you can revert to the default factory configuration. The default factory configuration contains the basic configuration settings. This is the first configuration of the switch, and it is loaded when the switch is first installed and powered on.

The **load factory default** command is a standard Junos OS configuration command. This configuration command replaces the current active configuration with the default factory configuration.

To revert the switch to the rescue configuration:

1. 

```
[edit]
user@switch# load factory-default
[edit]
user@switch# delete system commit factory-settings
[edit]
user@switch# commit
```

- Related Documentation**
- [Understanding Configuration Files on page 1732](#)
  - [Loading a Previous Configuration File on page 1742](#)
  - [Reverting to the Rescue Configuration on page 191](#)

## Reverting to the Rescue Configuration

If someone inadvertently commits a configuration that denies management access to a device and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration. The rescue configuration is a previously committed, valid configuration.

To revert the switch to the rescue configuration:

1. Enter the **load override** command.

```
[edit]
user@switch# load override filename
```
2. Commit your changes.

```
[edit]
user@switch# commit filename
```

- Related Documentation**

## Rolling Back Junos OS Configuration Changes

This topic shows how to use the **rollback** command to return to the most recently committed Junos OS configuration. The **rollback** command is useful if you make configuration changes and then decide not to keep the changes.

The following procedure shows how to configure an SNMP health monitor on a device running Junos OS and then return to the most recently committed configuration that does not include the health monitor. When configured, the SNMP health monitor provides the network management system (NMS) with predefined monitoring for file system usage, CPU usage, and memory usage on the device.

1. Enter configuration mode:

```
user@host> configure
entering configuration mode
[edit]
user@host#
```

2. Show the current configuration (if any) for SNMP:

```
[edit]
user@host# show snmp
```

No **snmp** statements appear because SNMP has not been configured on the device.

3. Configure the health monitor:

```
[edit]
user@host# set snmp health-monitor
```

4. Show the new configuration:

```
[edit]
user@host# show snmp
health-monitor;
```

The **health-monitor** statement indicates that SNMP health monitoring is configured on the device.

5. Enter the **rollback** configuration mode command to return to the most recently committed configuration:

```
[edit]
user@host# rollback
load complete
```

6. Show the configuration again to make sure your change is no longer present:

```
[edit]
user@host# show snmp
```

No **snmp** configuration statements appear. The health monitor is no longer configured.

7. Enter the **commit** command to activate the configuration to which you rolled back:

```
[edit]
```

```
user@host# commit
```

8. Exit configuration mode:

```
[edit]
user@host# exit
Exiting configuration mode
```

You can also use the **rollback** command to return to earlier configurations.

## Saving a Configuration to a File

Save the Junos OS configuration to a file so that you can edit it with a text editor of your choice. You can save your current configuration to an ASCII file, which saves the configuration in its current form, including any uncommitted changes. If more than one user is modifying the configuration, all changes made by all users are saved.

To save software configuration changes to an ASCII file, use the **save** configuration mode command:

```
[edit]
user@host# save filename
[edit]
user@host#
```

The contents of the current level of the statement hierarchy (and below) are saved, along with the statement hierarchy containing it. This allows a section of the configuration to be saved, while fully specifying the statement hierarchy.

By default, the configuration is saved to a file in your home directory, which is on the flash drive.

When you issue this command from anywhere in the hierarchy (except the top level), a **replace** tag is automatically included at the beginning of the file. You can use the **replace** tag to control how a configuration is loaded from a file.

```
user@host> file show /var/home/user/myconf
replace:
protocols {
  bgp {
    disable;
    group int {
      type internal;
    }
  }
  isis {
    disable;
    interface all {
      level 1 disable;
    }
    interface fxp0.0 {
      disable;
    }
  }
}
```

```

    }
    ospf {
        traffic-engineering;
        reference-bandwidth 4g;
        ...
    }
}

```

## Setting or Deleting the Rescue Configuration

A rescue configuration is user-defined configuration that restores connectivity to the device. You set a current committed configuration to be the rescue configuration through the CLI. If someone inadvertently commits a configuration that denies management access to a device and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration. The rescue configuration is a previously committed, valid configuration. We recommend that the rescue configuration include the IP address (accessible from the network) for the management port.

To set the current active configuration as the rescue configuration:

```
user@switch> request system configuration rescue save
```

To delete an existing rescue configuration:

```
user@switch> request system configuration rescue delete
```

- [Loading a Previous Configuration File on page 1742](#)
- [Configuration File Terms on page 25](#)
- [CLI Explorer](#)

## Uploading a Configuration File

You can create a configuration file on your local system, copy the file to the switch, and then load the file into the CLI. After you have loaded the configuration file, you can commit it to activate the configuration on the switch. You can also edit the configuration interactively using the CLI and commit it at a later time.

To upload a configuration file from your local system:

1. Create the configuration file using a text editor such as Notepad, making sure that the syntax of the configuration file is correct. For more information about testing the syntax of a configuration file see the *Junos OS System Basics and Services Command Reference* at <http://www.juniper.net/techpubs/software/junos/index.html>.
2. In the configuration text file, use an option to perform the required action when the file is loaded. [Table 124 on page 1752](#) lists and describes some options for the **load** command.

Table 124: Options for the load Command

| Options         | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>merge</b>    | Combines the current active configuration and the configuration in the filename you specify or the one that you type at the terminal. A <b>merge</b> operation is useful when you are adding a new section to an existing configuration. If the active configuration and the incoming configuration contain conflicting statements, the statements in the incoming configuration override those in the active configuration.                                                    |
| <b>override</b> | Discards the current candidate configuration and loads the configuration in the filename you specify or the one that you type at the terminal. When you use the <b>override</b> option and commit the configuration, all system processes reparse the configuration. You can use the <b>override</b> option at any level of the hierarchy.                                                                                                                                      |
| <b>replace</b>  | Searches for the <b>replace</b> tags, deletes the existing statements of the same name, if any, and replaces them with the incoming configuration. If there is no existing statement of the same name, the <b>replace</b> operation adds the statements marked with the <b>replace</b> tag to the active configuration.<br><br><b>NOTE:</b> For this operation to work, you must include <b>replace</b> tags in the text file or in the configuration you type at the terminal. |

- Press Ctrl+a to select all the text in the configuration file.
- Press Ctrl+c to copy the contents of the configuration text file to the Clipboard.
- Log in to the switch using your username and password.
- To enter configuration mode:  
user@switch> **configure**  
  
You will see this output, with the hash or pound mark indicating configuration mode.  
Entering configuration mode  
[edit]  
user@switch#
- Load the configuration file:  
[edit]  
user@switch# **load merge terminal**
- At the cursor, paste the contents of the Clipboard using the mouse and the Paste icon:  
[edit]  
user@switch# **load merge terminal**  
[Type ^D at a new line to end input]  
>Cursor is here. Paste the contents of the clipboard here<
- Press Enter.
- Press Ctrl+d to set the end-of-file marker.

To view results of the configuration steps before committing the configuration, type the **show** command at the user prompt.

To commit these changes to the active configuration, type the **commit** command at the user prompt. You can also edit the configuration interactively using the CLI and commit it at a later time.

## Using Junos OS to Configure a Router or Switch to Transfer Its Configuration to an Archive Site

You can configure a router or switch to transfer its configuration to an archive file periodically. The following tasks describe how to transfer the configuration to an archive site:

1. [Configuring the Router or Switch to Transfer Its Currently Active Configuration to an Archive on page 1753](#)
2. [Configuring the Transfer Interval for Periodic Transfer of the Active Configuration to an Archive Site on page 1753](#)
3. [Configuring Transfer of the Current Active Configuration When a Configuration Is Committed on page 1754](#)
4. [Configuring Archive Sites for Transfer of Active Configuration Files on page 1754](#)

### Configuring the Router or Switch to Transfer Its Currently Active Configuration to an Archive

If you want to back up your device's current configuration to an archive site, you can configure the router or switch to transfer its currently active configuration by FTP or secure copy (SCP) periodically or after each commit.

To configure the router or switch to transfer its currently active configuration to an archive site, include statements at the **[edit system archival configuration]** hierarchy level:

```
[edit system archival configuration]
archive-sites {
  ftp://username<:password>@host-address<:port>/url-path;
  scp://username<:password>@host-address<:port>/url-path;
}
transfer-interval interval;
transfer-on-commit;
```

**NOTE:** When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks (") and enclose the IPv6 host address in brackets ([ ]). For example, "ftp://username<:password>@[ipv6-host-address]<:port>/url-path"

### Configuring the Transfer Interval for Periodic Transfer of the Active Configuration to an Archive Site

To configure the router or switch to periodically transfer its currently active configuration to an archive site, include the **transfer-interval** statement at the **[edit system archival configuration]** hierarchy level:

```
[edit system archival configuration]
transfer-interval interval;
```

The *interval* is a period of time ranging from 15 through 2880 minutes.

### Configuring Transfer of the Current Active Configuration When a Configuration Is Committed

---

To configure the router or switch to transfer its currently active configuration to an archive site each time you commit a candidate configuration, include the **transfer-on-commit** statement at the **[edit system archival configuration]** hierarchy level:

```
[edit system archival configuration]
transfer-on-commit;
```

**NOTE:** When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks (") and enclose the IPv6 host address in brackets ([ ]). For example,  
"scp://username<:password>@[ipv6-host-address]<:port>/url-path"

### Configuring Archive Sites for Transfer of Active Configuration Files

---

When you configure the router or switch to transfer its configuration files, you specify an archive site to which the files are transferred. If you specify more than one archive site, the router or switch attempts to transfer files to the first archive site in the list, moving to the next site only if the transfer fails.

When you use the **archive-sites** statement, you can specify a destination as an FTP URL, or SCP-style remote file specification. The URL type **file://** is also supported.

To configure the archive site, include the **archive-sites** statement at the **[edit system archival configuration]** hierarchy level:

```
[edit system archival configuration]
archive-sites {
  ftp://username@host:<port>url-path password password;
  scp://username@host:<port>url-path password password;
  file://<path>/<filename>;
}
```

**NOTE:** When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks (") and enclose the IPv6 host address in brackets ([ ]). For example,  
"scp://username<:password>@[ipv6-host-address]<:port>/url-path"

When you specify the archive site, do not add a forward slash (/) to the end of the URL.

The destination filename is saved in the following format, where *n* corresponds to the number of the compressed configuration rollback file that has been archived:

```
<router-name>_juniper.conf.n.gz_YYYYMMDD_HHMMSS
```

.....

**NOTE:** The time included in the destination filename is always in Coordinated Universal Time (UTC) regardless of whether the time on the router is configured as UTC or the local time zone. The default time zone on the router or switch is UTC.

.....

| <b>Description</b>         | <p>Specify where to transfer the current configuration files. When specifying a URL in a Junos OS statement using an IPv6 host address, you must enclose the entire URL in quotation marks ( " ") and enclose the IPv6 host address in brackets ( [ ] ). For example, "scp://username&lt;:password&gt;@[ipv6-host-address]&lt;:port&gt;/url-path"</p> <p>If you specify more than one archive site, the router or switch attempts to transfer the configuration files to the first archive site in the list, moving to the next only if the transfer fails.</p> <p>The destination filename is saved in the following format, where <i>n</i> corresponds to the number of the compressed configuration rollback file that has been archived:</p> <p><b><i>router-name_juniper.conf.n.gz_YYYYMMDD_HHMMSS.</i></b></p> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> <b>NOTE:</b> The time included in the destination filename is always in Coordinated Universal Time (UTC) regardless of whether the time on the router or switch is configured as UTC or the local time zone. The default time zone on the router or switch is UTC.</p> </div> <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p> <b>NOTE:</b> The [edit system archival] hierarchy is not available on QFabric systems.</p> </div> |
| <b>Options</b>             | <p>The prefix used in the configuration statement determines the form of transfer:</p> <p><b>file://</b> —transfer on a path to a named file</p> <p><b>ftp://</b> —transfer using active FTP server</p> <p><b>pasvftp://</b> —transfer to a device that only accepts passive FTP services</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**Hierarchy Level** [edit system archival]

**Release Information** Statement introduced before Junos OS Release 7.4.  
Statement introduced in Junos OS Release 9.0 for EX Series switches.  
Statement introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Configure the router or switch to periodically transfer its currently active configuration (or after each commit).

**NOTE:** The [edit system archival] hierarchy is not available on QFabric systems.

**Options** The remaining statements are explained separately.

**Required Privilege Level** system—To view this statement in the configuration.  
system-control—To add this statement to the configuration.

## Default Configurations

- [QFX3500 Switch Default Configuration on page 1761](#)

### QFX3500 Switch Default Configuration

Each QFX Series product is programmed with a factory default configuration that contains the values set for each configuration parameter when a switch is shipped. The default configuration file sets values for system parameters such as **syslog** and **commit**, configures storm control and Ethernet switching on all interfaces, and enables IGMP snooping, RSTP, and LLDP protocols.

When you commit changes to the configuration, a new configuration file is created, which becomes the active configuration. You can always revert to the factory default configuration if you need to.

The following factory default configuration file is for a QFX3500 switch with 48 ports:

**NOTE:** In this example, xe-0/0/0 through xe-0/0/47 are the network interface ports.

```
protocols {
  igmp-snooping {
    vlan all;
  }
  rstp;
  lldp {
    interface all;
  }
}
interfaces {
  xe-0/0/0 {
    unit 0 {
      family ethernet-switching;
    }
  }
  xe-0/0/1 {
    unit 0 {
      family ethernet-switching;
    }
  }
  xe-0/0/2 {
    unit 0 {
      family ethernet-switching;
    }
  }
  xe-0/0/3 {
    unit 0 {
      family ethernet-switching;
    }
  }
  xe-0/0/4 {
    unit 0 {
      family ethernet-switching;
    }
  }
  xe-0/0/5 {
    unit 0 {
      family ethernet-switching;
    }
  }
  xe-0/0/6 {
    unit 0 {
      family ethernet-switching;
    }
  }
```

```
}
xe-0/0/7 {
  unit 0 {
    family ethernet-switching;
  }
}
xe-0/0/8 {
  unit 0 {
    family ethernet-switching;
  }
}
xe-0/0/9 {
  unit 0 {
    family ethernet-switching;
  }
}
xe-0/0/10 {

## Sample Output

### clear log

The following sample commands list log file information, clear the contents of a log file, and then display the updated log file information:

```
user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:
-----
-rw-r-----  1 root  wheel          26450 Jun 23 18:47 /var/log/sampled
total 1

user@host> clear log lcc0-re0:sampled
lcc0-re0:
-----

user@host> file list lcc0-re0:/var/log/sampled detail
lcc0-re0:
-----
-rw-r-----  1 root  wheel           57 Sep 15 03:44 /var/log/sampled
total 1
```

## Sample Output

### file archive (Multiple Files)

The following sample command archives all message files in the local directory `/var/log/messages` as the single file `messages-archive.tar`.

```
user@host> file archive source /var/log/messages* destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.
user@host>
```

### file archive (Single File)

The following sample command archives one message file in the local directory `/var/log/messages` as the single file `messages-archive.tar`.

```
user@host> file archive source /var/log/messages destination /var/log/messages-archive.tar
/usr/bin/tar: Removing leading / from absolute path names in the archive.
user@host
```

#### file archive (with Compression)

The following sample command archives and compresses all message files in the local directory **/var/log/messages** as the single file **messages-archive.tgz**.

```
user@host> file archive compress source /var/log/messages* destination
/var/log/messages-archive.tgz
/usr/bin/tar: Removing leading / from absolute path names in the archive.
```

## file checksum md5

## Sample Output

### file checksum sha1

```
user@host> file checksum sha1 /var/db/scripts/opscript.slax
```

```
SHA1 (/var/db/scripts/commitscript.slax) = ba9e47120c7ce55cff29afd73eacd370e162c676
```

## file checksum sha-256

---

| <b>Description</b>              | <p>Compare two local files and describe the differences between them in default, context, or unified output styles:</p> <ul style="list-style-type: none"> <li>• <b>Default</b>—In the first line of output, <b>c</b> means lines were changed between the two files, <b>d</b> means lines were deleted between the two files, and <b>a</b> means lines were added between the two files. The numbers preceding this alphabetical marker represent the first file, and the lines after the alphabetical marker represent the second file. A left angle bracket (&lt;) in front of output lines refers to the first file. A right angle bracket (&gt;) in front of output lines refers to the second file.</li> <li>• <b>Context</b>—The display is divided into two parts. The first part is the first file; the second part is the second file. Output lines preceded by an exclamation point (!) have changed. Additions are marked with a plus sign (+), and deletions are marked with a minus sign (-).</li> <li>• <b>Unified</b>—The display is preceded by the line number from the first and the second file (xx,xxx,x). Before the line number, additions to the file are marked with a plus sign (+), and deletions to the file are marked with a minus sign (-). The body of the output contains the affected lines. Changes are viewed as additions plus deletions.</li> </ul> |
| <b>Options</b>                  | <p><b>files <i>filename</i></b>—Names of two local files to compare.</p> <p><b>context</b>—(Optional) Display output in context format.</p> <p><b>ignore-white-space</b>—(Optional) Ignore changes in the amount of white space.</p> <p><b>unified</b>—(Optional) Display output in unified format.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| <b>Release Information</b>      | Command introduced before Junos OS Release 7.4.<br>Command introduced in Junos OS Release 9.0 for EX Series switches.<br>Command introduced in Junos OS Release 11.1 for the QFX Series.                                                                                                                                                                             |
| <b>Description</b>              | Display a list of files on the local router or switch.                                                                                                                                                                                                                                                                                                               |
| <b>Options</b>                  | <p><b>none</b>—Display a list of all files for the current directory.</p> <p><b>detail   recursive</b>—(Optional) Display detailed output or descend recursively through the directory hierarchy, respectively.</p> <p><b>filename</b>—(Optional) Display a list of files. For a routing matrix, the filename must include the chassis information.</p>              |
| <b>Additional Information</b>   | The default directory is the home directory of the user logged in to the router or switch. To view available directories, enter a space and then a backslash (/) after the <b>file list</b> command. To view files within a specific directory, include a backslash followed by the directory and, optionally, subdirectory name after the <b>file list</b> command. |
| <b>Required Privilege Level</b> | maintenance                                                                                                                                                                                                                                                                                                                                                          |

## Sample Output

### file rename

The following example lists the files in `/var/tmp`, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list /var/tmp
dcd.core
rpd.core
snmpd.core

user@host> file rename /var/tmp/dcd.core /var/tmp/dcd.core.990413
user@host> file list /var/tmp
dcd.core.990413
rpd.core
snmpd.core
```

### file rename (Routing Matrix)

The following example lists the files in `/var/tmp`, renames one of the files, and then displays the list of files again to reveal the newly named file.

```
user@host> file list lcc0-re1:/var/tmp
lcc0-re1:
-----

/var/tmp:
.pccardd
sartre.conf
snmpd
syslogd.core-tarball.0.tgz
```

```
user@host> file rename lcc0-re0:/var/tmp/snmpd /var/tmp/snmpd.rr
```

```
user@host> file list lcc0-re1:/var/tmp
```

```
lcc0-re1:
```

```
-----
```

```
/var/tmp:
```

```
.pccardd
```

```
sartre.conf
```

```
snmpd.rr
```

```
syslogd.core-tarball.0.tgz
```

## Sample Output

### show system commit

```
user@host> show system commit
0   2003-07-28 19:14:04 PDT by root via other
1   2003-07-25 22:01:36 PDT by regress via cli
2   2003-07-25 22:01:32 PDT by regress via cli
3   2003-07-25 21:30:13 PDT by root via button
4   2003-07-25 13:46:48 PDT by regress via cli
5   2003-07-25 05:33:21 PDT by root via autoinstall
...
rescue 2002-05-10 15:32:03 PDT by root via other
```

### show system commit (At a Particular Time)

```
user@host> show system commit
commit requested by root via cli at Tue May  7 15:59:00 2002
```

### show system commit (At the Next Reboot)

```
user@host> show system commit
commit requested by root via cli at reboot
```

### show system commit (Rollback Pending)

```
user@host> show system commit
0 2005-01-05 15:00:37 PST by root via cli commit confirmed, rollback in 3mins
```

### show system commit (QFX Series)

```
user@switch> show system commit
0 2011-11-25 19:17:49 PST by root via cli
```

## show system configuration archival

---

**Syntax**    show system configuration archival

**Release Information**    Introduced in Junos OS Release 7.6.  
Command introduced in Junos OS Release 9.0 for EX Series switches.  
Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description**    Display directory and number of files queued for archival transfer.

**NOTE:** The [edit system configuration] hierarchy is not available on QFabric systems.

---

**Options**    This command has no options.

**Required Privilege Level**    maintenance

**List of Sample Output**    [show system configuration archival on page 1794](#)

### Sample Output

show system configuration archival

```
user@host> show system configuration archival

/var/transfer/config/:
total 8
```

## show system configuration rescue

    }  
}  
.....
```

## show system rollback

**Syntax** `show system rollback number`  
`<compare number>`

**Release Information** Command introduced before Junos OS Release 7.4.  
 Command introduced in Junos OS Release 9.0 for EX Series switches.  
 Command introduced in Junos OS Release 11.1 for the QFX Series.

**Description** Display the contents of a previously committed configuration, or the differences between two previously committed configurations.

**NOTE:** The `show system rollback` command is a purely operational mode command and cannot be issued with `run` from the configuration mode.

**Options** *number*—Number of a configuration to view. The output displays the configuration. The range of values is 0 through 49.

*compare number*—(Optional) Number of another previously committed (rollback) configuration to compare to rollback *number*. The output displays the differences between the two configurations. The range of values is 0 through 49.

**Required Privilege Level** view

**List of Sample Output** [show system rollback compare on page 1797](#)

## Sample Output

### show system rollback compare

```
user@host> show system rollback 3 compare 1
[edit]
+ interfaces {
+   ge-1/1/1 {
+     unit 0 {
+       family inet {
+         filter {
+           input mf_plp;
+         }
+         address 14.1.1.1/30;
+       }
+     }
+   }
+   ge-1/2/1 {

## Sample Output

### test configuration

```

user@host> test configuration terminal
[Type ^D to end input]
system {
host-name bluesky;
paris-23;
login;
}
terminal:3:(8) syntax error: paris
[edit system]
    'paris-23;'
    syntax error
terminal:4:(11) statement must contain additional statements: ;
[edit system login]
    'login ;'
    statement must contain additional statements
configuration syntax failed

```

## CHAPTER 16

# Troubleshooting

- [Troubleshooting Procedures on page 1801](#)

## Troubleshooting Procedures

---

- [Loading a Previous Configuration File on page 1801](#)
- [Reverting to the Default Factory Configuration on page 1802](#)
- [Reverting to the Rescue Configuration on page 1802](#)

### Loading a Previous Configuration File

You can use the **rollback** *<number>* command to return to a previously committed configuration file. A switch saves the last 50 committed configurations, including the rollback number, date, time, and name of the user who issued the **commit** configuration command.

#### Syntax

**rollback** *<number>*

#### Options

- **none**—Return to the most recently saved configuration.
- **number**—Configuration to return to.
  - **Range:** 0 through 49. The most recently saved configuration is number 0, and the oldest saved configuration is number 49.
  - **Default:** 0

To return to a configuration prior to the most recently committed one:

1. Specify the rollback number (here, 1 is entered and the configuration returns to the previously committed configuration):

```
[edit]
user@switch# rollback 1
load complete
```

2. Activate the configuration you have loaded:

```
[edit]
```

```
user@switch# commit
```

**Related Documentation**

- [Configuration File Terms on page 25](#)

## Reverting to the Default Factory Configuration

If for any reason the current active configuration fails, you can revert to the default factory configuration. The default factory configuration contains the basic configuration settings. This is the first configuration of the switch, and it is loaded when the switch is first installed and powered on.

The **load factory default** command is a standard Junos OS configuration command. This configuration command replaces the current active configuration with the default factory configuration.

To revert the switch to the rescue configuration:

1. 

```
[edit]
user@switch# load factory-default
[edit]
user@switch# delete system commit factory-settings
[edit]
user@switch# commit
```

**Related Documentation**

- [Understanding Configuration Files on page 1732](#)
- [Loading a Previous Configuration File on page 1742](#)
- [Reverting to the Rescue Configuration on page 191](#)

## Reverting to the Rescue Configuration

If someone inadvertently commits a configuration that denies management access to a device and the console port is not accessible, you can overwrite the invalid configuration and replace it with the rescue configuration. The rescue configuration is a previously committed, valid configuration.

To revert the switch to the rescue configuration:

1. Enter the **load override** command.

```
[edit]
user@switch# load override filename
```
2. Commit your changes.

```
[edit]
user@switch# commit filename
```

## Understanding Software Infrastructure and Processes

Junos OS includes processes for Internet Protocol (IP) routing and for managing interfaces, networks, and the switch.

Junos OS runs on the Routing Engine. The Routing Engine kernel coordinates communication among the Junos OS processes and provides a link to the Packet Forwarding Engine.

Using the Junos OS command-line interface (CLI), you configure switching features and set the properties of network interfaces. After activating a software configuration, use either the Junos Space or CLI user interface to monitor, manage operations, and diagnose protocol and network connectivity problems.

- [Routing Engine and Packet Forwarding Engine on page 1805](#)
- [Junos OS Processes on page 1806](#)

## Routing Engine and Packet Forwarding Engine

---

A switch has two primary software processing components:

- **Packet Forwarding Engine**—Processes packets; applies filters, routing policies, and other features; and forwards packets to the next hop along the route to their final destination.
- **Routing Engine**—Provides three main functions:
  - Creates the packet forwarding switch, which provides route lookup, filtering, and switching on incoming data packets, and then directs outbound packets to the appropriate interface for transmission to the network.

- Maintains the routing tables used by the switch and controls the routing protocols that run on the switch.
- Provides control and monitoring functions for the switch, including controlling power and monitoring system status.

### Junos OS Processes

Junos OS running on the Routing Engine and Packet Forwarding Engine consists of multiple processes that are responsible for individual functions.

The separation of functions provides operational stability, because each process accesses its own protected memory space. In addition, because each process is a separate software package, you can selectively upgrade all or part of the Junos OS for added flexibility.

Table 5 on page 43 describes the primary Junos OS processes.

**Table 126: Junos OS Processes**

| Process                                              | Name          | Description                                                                                                                                                                                                                                                                                                                                                                                                        |
|------------------------------------------------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Chassis process                                      | chassisd      | <p>Detects hardware on the system that is used to configure network interfaces.</p> <p>Monitors the physical status of hardware components and field-replaceable units (FRUs), detecting when environment sensors such as temperature sensors are triggered.</p> <p>Relays signals and interrupts—for example, when devices are taken offline, so that the system can close sessions and shut down gracefully.</p> |
| DNS Server process                                   | named-service | Resolves hostnames into addresses.                                                                                                                                                                                                                                                                                                                                                                                 |
| Dynamic Host Configuration Protocol (DHCP) process   | dhcp-service  | Enables a DHCP server to allocate network IP addresses and deliver configuration settings to client hosts without user intervention.                                                                                                                                                                                                                                                                               |
| Ethernet switching process                           | eswd          | <p>Handles Layer 2 switching functionality such as MAC address learning, Spanning Tree Protocol, and access port security.</p> <p>Manages Ethernet switching interfaces, VLANs, and VLAN interfaces.</p>                                                                                                                                                                                                           |
| Firewall management process                          | firewall      | Manages the firewall configuration and helps accept or reject packets that are transiting an interface on a switch.                                                                                                                                                                                                                                                                                                |
| Forwarding process                                   | pfem          | Defines how routing protocols operate on the partition. The overall performance of the partition is largely determined by the effectiveness of the forwarding process.                                                                                                                                                                                                                                             |
| Interface process                                    | dcd           | Configures and monitors network interfaces by defining physical characteristics such as link encapsulation, hold times, and keepalive timers.                                                                                                                                                                                                                                                                      |
| Integrated Local Management Interface (ILMI) process | ilmi          | Provides bidirectional exchange of management information between two ATM interfaces across a physical connection.                                                                                                                                                                                                                                                                                                 |

Table 126: Junos OS Processes (*continued*)

| Process                                           | Name               | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|---------------------------------------------------|--------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Link Management Protocol (LMP) process            | link-management    | Establishes and maintains LMP control channels.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Management process                                | mgd                | <p>Provides communication between the other processes and an interface to the configuration database.</p> <p>Populates the configuration database with configuration information and retrieves the information when queried by other processes to ensure that the system operates as configured.</p> <p>Interacts with the other processes when commands are issued through one of the user interfaces on the partition.</p> <p>If a process terminates or fails to start when called, the management process attempts to restart it a limited number of times to prevent thrashing and logs any failure information for further investigation.</p> |
| Multicast snooping process                        | multicast-snooping | Makes Layer 2 devices, such as VLAN switches, aware of Layer 3 information, such as the media access control (MAC) addresses of members of a multicast group.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Secure Neighbor Discovery (SEND) Protocol process | send               | Protects Neighbor Discovery Protocol (NDP) messages.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Simple Network Management Protocol (SNMP) process | snmp               | Enables the monitoring of network devices from a central location and provides the switch's SNMP master agent.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Tunnel OAM process                                | tunnel-oamd        | Enables the Operations, Administration, and Maintenance of Layer 2 tunneled networks. Layer 2 protocol tunneling (L2PT) allows service providers to send Layer 2 protocol data units (PDUs) across the provider's cloud and deliver them to Juniper Networks EX Series Ethernet Switches that are not part of the local broadcast domain.                                                                                                                                                                                                                                                                                                           |
| Virtual Router Redundancy Protocol (VRRP) process | vrrp               | Enables hosts on a LAN to make use of redundant routing platforms on that LAN without requiring more than the static configuration of a single default route on the hosts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

## Understanding User and Access Management Features on the QFabric System

The QFabric system supports the following user and access management features:

- User authentication
- RADIUS
- Link Layer Discovery Protocol (LLDP)

- SSH
- TACACS+
- Access privilege management

The specific functionality, features, options, syntax, and hierarchy levels of some of the user and access management commands and configuration statements implemented on the QFabric system may differ somewhat from the same commands and configuration statements on standard Junos OS. See the configuration statement or command topic in the documentation set for additional information, and use the help (?) command-line function to display specific information as needed.

Some user and access management features are not yet fully supported in the full QFabric architecture, although full support is planned for future releases. The user and access management features currently unsupported on the QFabric system include:

- Full RADIUS server support, including RADIUS accounting
- **accounting-options** configuration statement hierarchy
- **tacplus-options** configuration statement

---

## Overview of Template Accounts for RADIUS and TACACS+ Authentication

When you use local password authentication, you must create a local user account for every user who wants to access the system. However, when you are using RADIUS or TACACS+ authentication, you can create single accounts (for authorization purposes) that are shared by a set of users. You create these accounts using the remote and local user template accounts. When a user is using a template account, the command-line interface (CLI) username is the login name; however, the privileges, file ownership, and effective user ID are inherited from the template account.

## Understanding Login Authentication

You can control access to your network using several different authentication methods—media access control (MAC) RADIUS, for example. Authentication prevents unauthorized devices and users from gaining access to your LAN. For MAC RADIUS authentication, end devices must be authenticated before they receive an IP address from a DHCP server.

You can enable end devices to access the network without authenticating on the RADIUS server by configuring the MAC address of the end device in the static MAC bypass list by configuring the MAC address using the **authentication-whitelist** statement.

You can configure one or more authentication methods on a single interface and thereby enable fallback to the next method if the first or second method is unsuccessful.

On a single interface you can configure one or a combination of several authentication methods.

This topic covers:

- [MAC RADIUS Authentication on page 1809](#)

### MAC RADIUS Authentication

You can configure MAC RADIUS authentication on interfaces that are connected to end devices.

The EAP method supported for MAC RADIUS authentication is EAP-MD5.

When you configure the **mac-radius restrict** option, the switch immediately attempts a MAC- RADIUS authentication by sending a request to the RADIUS server for authentication of the MAC address of the end device. If MAC address of the end device is configured for RADIUS authentication, LAN access between the two switches is created.

## Understanding LLDP

The device uses Link Layer Discovery Protocol (LLDP) to learn and distribute device information on network links. The information enables the switch to identify a variety of devices quickly. This quick identification results in a LAN that interoperates smoothly and efficiently.

LLDP-capable devices transmit information in type, length, and value (TLV) messages to neighbor devices. Device information can include specifics, such as chassis and port identification and system name and system capabilities. The TLVs leverage this information from parameters that have already been configured in Junos OS.

The device supports the following basic TLVs:

- **Chassis Identifier**—The MAC address associated with the local system.
- **Port Identifier**—The port identification for the specified port in the local system.
- **Port Description**—The user-configured port description. The port description can be a maximum of 256 characters.
- **System Name**—The user-configured name of the local system. The system name can be a maximum of 256 characters.
- **System Description**—The system description containing information about the software and current image running on the system. This information cannot be configured, but is taken from the software.
- **System Capabilities**—The primary function performed by the system. The capabilities that system supports are defined; for example, bridge or router. This information cannot be configured, but is based on the model of the product.
- **Management Address**—The IP management address of the local system.

The device supports the following 802.3 TLVs:

- **Power via MDI**—A TLV that advertises media dependent interface (MDI) power support, power source equipment (PSE) power pair, and power class information.
- **MAC/PHY Configuration Status**—A TLV that advertises information about the physical interface, such as autonegotiation status and support and MAU type. The information cannot be configured, but is based on the physical interface structure.
- **Link Aggregation**—A TLV that advertises whether the port is aggregated and its aggregated port ID.
- **Maximum Frame Size**—A TLV that advertises the Maximum Transmission Unit (MTU) of the interface sending LLDP frames.
- **Port Vlan**—A TLV that advertises the VLAN name configured on the interface.

## Understanding RADIUS Accounting

Devices support IETF RFC 2866, *RADIUS Accounting*. Configuring RADIUS accounting on the device supports collecting statistical data about users logging in to or out from a LAN and sending the data to a RADIUS accounting server. The statistical data gathered can be used for general network monitoring, analyzing and tracking usage patterns, or billing a user based upon the amount of time or type of services accessed.

To configure RADIUS accounting, specify one or more RADIUS accounting servers to receive the statistical data from the device, and select the type of accounting data to be collected.

The RADIUS accounting server you specify can be the same server used for RADIUS authentication, or it can be a separate RADIUS server. You can specify a list of RADIUS accounting servers. If the primary server (the first one configured) is unavailable, each RADIUS server in the list is tried in the order in which they are configured in the Junos OS.

The RADIUS accounting process between the device and a RADIUS server works like this:

1. A RADIUS accounting server listens for User Datagram Protocol (UDP) packets on a specific port. For example, on FreeRADIUS, the default port is 1813.
2. The device forwards an *accounting-request* packet containing an event record to the accounting server. The event record associated with this supplicant contains an *Acct-Status-Type* attribute whose value indicates the beginning of user service for this supplicant. When the supplicant's session ends, the accounting request contains an *Acct-Status-Type* attribute value indicating the end of user service. The RADIUS accounting server records this as a stop-accounting record containing session information and the length of the session.
3. The RADIUS accounting server logs these events in a file as start-accounting or stop-accounting records. On FreeRADIUS, the filename is the server's address; for example, 122.69.1.250.
4. The accounting server sends an *accounting-response* packet back to the device confirming it has received the accounting request.
5. If the device does not receive a response from the server, it continues to send accounting requests until an accounting response is returned from the accounting server.

The statistics collected through this process can be displayed from the RADIUS server; to see those statistics, the user accesses the log file configured to receive them.

## Understanding VSAs

Devices support the configuration of RADIUS server attributes specific to Juniper Networks. These attributes are known as vendor-specific attributes (VSAs) and are described in RFC 2138, *Remote Authentication Dial In User Service (RADIUS)*.

Through VSAs, you can configure port-filtering attributes on the RADIUS server. VSAs are cleartext fields sent from the RADIUS server to the device as a result of authentication success or failure. Authentication prevents unauthorized user access by blocking a supplicant at the port until the device is authenticated by the RADIUS server. The VSA attributes are interpreted by the device during authentication, and the device takes appropriate actions. Implementing port-filtering attributes with authentication on the RADIUS server provides a central location for controlling LAN access for supplicants.

These port-filtering attributes specific to Juniper Networks are encapsulated in a RADIUS server VSA with the vendor ID set to the Juniper Networks ID number, 2636.

As well as configuring port-filtering attributes through VSAs, you can apply a port firewall filter that has already been configured on the device directly to the RADIUS server. Like port-filtering attributes, the filter is applied during the authentication process, and its actions are applied at the device port. Adding a port firewall filter to a RADIUS server eliminates the need to add the filter to multiple ports and devices.

## Juniper Networks Vendor-Specific RADIUS Attributes

Junos OS supports the configuration of Juniper Networks RADIUS vendor-specific attributes (VSAs). These VSAs are encapsulated in a RADIUS vendor-specific attribute with the vendor ID set to the Juniper Networks ID number, 2636. [Table 127 on page 1812](#) lists the Juniper Networks VSAs you can configure.

**Table 127: Juniper Networks Vendor-Specific RADIUS Attributes**

| Name                    | Description                                                                                                                                  | Type | Length | String                                                    |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|------|--------|-----------------------------------------------------------|
| Juniper-Local-User-Name | Indicates the name of the user template used by this user when logging in to a device. This attribute is used only in Access-Accept packets. | 1    | ≥3     | One or more octets containing printable ASCII characters. |

Table 127: Juniper Networks Vendor-Specific RADIUS Attributes (*continued*)

| Name                         | Description                                                                                                                                                                                                                              | Type | Length | String                                                                                                                                                                                                                            |
|------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|--------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Juniper-Allow-Commands       | Contains an extended regular expression that enables the user to run operational mode commands in addition to the commands authorized by the user's login class permission bits. This attribute is used only in Access-Accept packets.   | 2    | ≥3     | One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">“Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands”</a> on page 1831.      |
| Juniper-Deny-Commands        | Contains an extended regular expression that denies the user permission to run operation mode commands authorized by the user's login class permission bits. This attribute is used only in Access-Accept packets.                       | 3    | ≥3     | One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">“Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands”</a> on page 1831.      |
| Juniper-Allow-Configuration  | Contains an extended regular expression that enables the user to run configuration mode commands in addition to the commands authorized by the user's login class permission bits. This attribute is used only in Access-Accept packets. | 4    | ≥3     | One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">“Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies”</a> on page 1830. |
| Juniper-Deny-Configuration   | Contains an extended regular expression that denies the user permission to run configuration commands authorized by the user's login class permission bits. This attribute is used only in Access-Accept packets.                        | 5    | ≥3     | One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">“Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies”</a> on page 1830. |
| Juniper-Interactive-Command  | Indicates the interactive command entered by the user. This attribute is used only in Accounting-Request packets.                                                                                                                        | 8    | ≥3     | One or more octets containing printable ASCII characters.                                                                                                                                                                         |
| Juniper-Configuration-Change | Indicates the interactive command that results in a configuration (database) change. This attribute is used only in Accounting-Request packets.                                                                                          | 9    | ≥3     | One or more octets containing printable ASCII characters.                                                                                                                                                                         |

Table 127: Juniper Networks Vendor-Specific RADIUS Attributes (*continued*)

| Name                        | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | Type | Length          | String                                                                                                                                                                                                                                            |
|-----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------|-----------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Juniper-User-Permissions    | <p>Contains information the server uses to specify user permissions. This attribute is used only in Access-Accept packets.</p> <p><b>NOTE:</b> When the <b>Juniper-User-Permissions</b> attribute is configured to grant the Junos OS <b>maintenance</b> or <b>all</b> permissions on a RADIUS server, the UNIX wheel group membership is not automatically added to a user's list of group memberships. Some operations such as running the <b>su root</b> command from a local shell require wheel group membership permissions. However, when a user is configured locally with the permissions <b>maintenance</b> or <b>all</b>, the user is automatically granted membership to the UNIX wheel group. Therefore, we recommend that you create a template user account with the required permissions and associate individual user accounts with the template user account.</p> | 10   | ≥3              | <p>One or more octets containing printable ASCII characters.</p> <p>The string is a list of permission flags separated by a space. The exact name of each flag must be specified in its entirety. See <a href="#">Table 129 on page 1817</a>.</p> |
| Juniper-Authentication-Type | Indicates the authentication method (local database, or RADIUS server) used to authenticate a user. If the user is authenticated using a local database, the attribute value shows 'local'. If the user is authenticated using RADIUS server, the attribute value shows 'remote'.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   | 11   | ≥5              | One or more octets containing printable ASCII characters.                                                                                                                                                                                         |
| Juniper-Session-Port        | Indicates the source port number of the established session.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | 12   | size of integer | Integer                                                                                                                                                                                                                                           |

For more information about the VSAs, see RFC 2138, *Remote Authentication Dial In User Service (RADIUS)*.

## Juniper Networks Vendor-Specific TACACS+ Attributes

Junos OS supports the configuration of Juniper Networks TACACS+ vendor-specific attributes (VSAs). These VSAs are encapsulated in a TACACS+ vendor-specific attribute with the vendor ID set to the Juniper Networks ID number, 2636. [Table 128 on page 1815](#) lists the Juniper Networks VSAs you can configure.

**Table 128: Juniper Networks Vendor-Specific TACACS+ Attributes**

| Name                       | Description                                                                                                                                                                          | Length | String                                                                                                                                                                                                                             |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>local-user-name</b>     | Indicates the name of the user template used by this user when logging in to a device.                                                                                               | ≥3     | One or more octets containing printable ASCII characters.                                                                                                                                                                          |
| <b>allow-commands</b>      | Contains an extended regular expression that enables the user to run operational mode commands in addition to those commands authorized by the user's login class permission bits.   | ≥3     | One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">Table 133 on page 1831</a> .                                                                              |
| <b>allow-configuration</b> | Contains an extended regular expression that enables the user to run configuration mode commands in addition to those commands authorized by the user's login class permission bits. | ≥3     | One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">“Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies” on page 1830</a> . |
| <b>deny-commands</b>       | Contains an extended regular expression that denies the user permission to run operational mode commands authorized by the user's login class permission bits.                       | ≥3     | One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">Table 133 on page 1831</a> .                                                                              |
| <b>deny-configuration</b>  | Contains an extended regular expression that denies the user permission to run configuration mode commands authorized by the user's login class permission bits.                     | ≥3     | One or more octets containing printable ASCII characters, in the form of an extended regular expression. See <a href="#">Table 132 on page 1830</a> .                                                                              |

Table 128: Juniper Networks Vendor-Specific TACACS+ Attributes (*continued*)

| Name                       | Description                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          | Length          | String                                                                                |
|----------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------|---------------------------------------------------------------------------------------|
| <b>user-permissions</b>    | <p>Contains information the server uses to specify user permissions.</p> <p><b>NOTE:</b> When the <b>user-permissions</b> attribute is configured to grant the Junos OS <b>maintenance</b> or <b>all</b> permissions on an IPv4 or IPv6 TACACS+ server, the UNIX wheel group membership is not automatically added to a user's list of group memberships. Some operations such as running the <b>su root</b> command from a local shell require wheel group membership permissions. However, when a user is configured locally with the permissions <b>maintenance</b> or <b>all</b>, the user is automatically granted membership to the UNIX wheel group. Therefore, we recommend that you create a template user account with the required permissions and associate individual user accounts with the template user account.</p> | ≥3              | One or more octets containing printable ASCII characters. See Table 129 on page 1817. |
| <b>authentication-type</b> | Indicates the authentication method (local database, or TACACS+ server) used to authenticate a user. If the user is authenticated using a local database, the attribute value shows 'local'. If the user is authenticated using TACACS+ server, the attribute value shows 'remote'.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  | ≥5              | One or more octets containing printable ASCII characters.                             |
| <b>session-port</b>        | Indicates the source port number of the established session.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         | size of integer | Integer                                                                               |

## Understanding Junos OS Access Privilege Levels

Each top-level command-line interface (CLI) command and each configuration statement have an access privilege level associated with them. Users can execute only those commands and configure and view only those statements for which they have access privileges. The access privileges for each login class are defined by one or more *permission flags*.

For each login class, you can explicitly deny or allow the use of operational and configuration mode commands that would otherwise be permitted or not allowed by a privilege level specified in the **permissions** statement.

The following sections provide additional information about permissions:

- [Junos OS Login Class Permission Flags on page 1817](#)
- [Allowing or Denying Individual Commands for Junos OS Login Classes on page 1820](#)

### Junos OS Login Class Permission Flags

The **permissions** statement specifies one or more of the permission flags listed in [Table 129 on page 1817](#). Permission flags are not cumulative, so for each class you must list all the permission flags needed, including **view** to display information and **configure** to enter configuration mode. Two forms of permissions control for individual parts of the configuration are:

- "Plain" form—Provides read-only capability for that permission type. An example is **interface**.
- Form that ends in **-control**—Provides read and write capability for that permission type. An example is **interface-control**.

[Table 129 on page 1817](#) lists the Junos<sup>®</sup> operating system (Junos OS) login class permission flags that you can configure by including the **permissions** statement at the **[edit system login class *class-name*]** hierarchy level.

**Table 129: Login Class Permission Flags**

| Permission Flag       | Description                                                                                                                                   |
|-----------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|
| <b>access</b>         | Can view the access configuration in configuration mode and with the <b>show configuration</b> operational mode command.                      |
| <b>access-control</b> | Can view and configure access information at the <b>[edit access]</b> hierarchy level.                                                        |
| <b>admin</b>          | Can view user account information in configuration mode and with the <b>show configuration</b> operational mode command.                      |
| <b>admin-control</b>  | Can view user accounts and configure them at the <b>[edit system login]</b> hierarchy level.                                                  |
| <b>all-control</b>    | Can access all operational mode commands and configuration mode commands. Can modify configuration in all the configuration hierarchy levels. |
| <b>clear</b>          | Can clear (delete) information learned from the network that is stored in various network databases by using the <b>clear</b> commands.       |
| <b>configure</b>      | Can enter configuration mode by using the <b>configure</b> command.                                                                           |
| <b>control</b>        | Can perform all control-level operations—all operations configured with the <b>-control</b> permission flags.                                 |
| <b>field</b>          | Can view field debug commands. Reserved for debugging support.                                                                                |
| <b>firewall</b>       | Can view the firewall filter configuration in configuration mode.                                                                             |

Table 129: Login Class Permission Flags (*continued*)

| Permission Flag                       | Description                                                                                                                                                                                                                                                                                                                                                                                                          |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>firewall-control</b>               | Can view and configure firewall filter information at the <b>[edit firewall]</b> hierarchy level.                                                                                                                                                                                                                                                                                                                    |
| <b>floppy</b>                         | Can read from and write to the removable media.                                                                                                                                                                                                                                                                                                                                                                      |
| <b>flow-tap</b>                       | Can view the flow-tap configuration in configuration mode.                                                                                                                                                                                                                                                                                                                                                           |
| <b>flow-tap-control</b>               | Can view the flow-tap configuration in configuration mode and can configure flow-tap configuration information at the <b>[edit services flow-tap]</b> hierarchy level.                                                                                                                                                                                                                                               |
| <b>flow-tap-operation</b>             | <p>Can make flow-tap requests to the router or switch. For example, a Dynamic Tasking Control Protocol (DTCP) client must have <b>flow-tap-operation</b> permission to authenticate itself to the Junos OS as an administrative user.</p> <p><b>NOTE:</b> The <b>flow-tap-operation</b> option is not included in the <b>all-control</b> permissions flag.</p>                                                       |
| <b>ldp-profiler-operation</b>         | Can view profiler data.                                                                                                                                                                                                                                                                                                                                                                                              |
| <b>interface</b>                      | Can view the interface configuration in configuration mode and with the <b>show configuration</b> operational mode command.                                                                                                                                                                                                                                                                                          |
| <b>interface-control</b>              | <p>Can view chassis, class of service (CoS), groups, forwarding options, and interfaces configuration information. Can edit configuration at the following hierarchy levels:</p> <ul style="list-style-type: none"> <li>• <b>[edit chassis]</b></li> <li>• <b>[edit class-of-service]</b></li> <li>• <b>[edit groups]</b></li> <li>• <b>[edit forwarding-options]</b></li> <li>• <b>[edit interfaces]</b></li> </ul> |
| <b>maintenance</b>                    | Can perform system maintenance, including starting a local shell on the router and becoming the superuser in the shell by using the <b>su root</b> command, and can halt and reboot the router by using the <b>request system</b> commands.                                                                                                                                                                          |
| <b>network</b>                        | Can access the network by using the <b>ping</b> , <b>ssh</b> , <b>telnet</b> , and <b>traceroute</b> commands.                                                                                                                                                                                                                                                                                                       |
| <b>pgcp-session-mirroring</b>         | Can view the <b>pgcp</b> session mirroring configuration.                                                                                                                                                                                                                                                                                                                                                            |
| <b>pgcp-session-mirroring-control</b> | Can modify the <b>pgcp</b> session mirroring configuration.                                                                                                                                                                                                                                                                                                                                                          |
| <b>reset</b>                          | Can restart software processes by using the <b>restart</b> command and can configure whether software processes are enabled or disabled at the <b>[edit system processes]</b> hierarchy level.                                                                                                                                                                                                                       |

Table 129: Login Class Permission Flags (*continued*)

| Permission Flag         | Description                                                                                                                                                                                                                                                                                                                |
|-------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>rollback</b>         | Can use the <b>rollback</b> command to return to a previously committed configuration other than the most recently committed one.                                                                                                                                                                                          |
| <b>routing</b>          | Can view general routing, routing protocol, and routing policy configuration information in configuration and operational modes.                                                                                                                                                                                           |
| <b>routing-control</b>  | Can view general routing, routing protocol, and routing policy configuration information and can configure general routing at the <b>[edit routing-options]</b> hierarchy level, routing protocols at the <b>[edit protocols]</b> hierarchy level, and routing policy at the <b>[edit policy-options]</b> hierarchy level. |
| <b>secret</b>           | Can view passwords and other authentication keys in the configuration.                                                                                                                                                                                                                                                     |
| <b>secret-control</b>   | Can view passwords and other authentication keys in the configuration and can modify them in configuration mode.                                                                                                                                                                                                           |
| <b>security</b>         | Can view security configuration in configuration mode and with the <b>show configuration</b> operational mode command.                                                                                                                                                                                                     |
| <b>security-control</b> | Can view and configure security information at the <b>[edit security]</b> hierarchy level.                                                                                                                                                                                                                                 |
| <b>shell</b>            | Can start a local shell on the router or switch by using the <b>start shell</b> command.                                                                                                                                                                                                                                   |
| <b>snmp</b>             | Can view Simple Network Management Protocol (SNMP) configuration information in configuration and operational modes.                                                                                                                                                                                                       |
| <b>snmp-control</b>     | Can view SNMP configuration information and can modify SNMP configuration at the <b>[edit snmp]</b> hierarchy level.                                                                                                                                                                                                       |
| <b>system</b>           | Can view system-level information in configuration and operational modes.                                                                                                                                                                                                                                                  |
| <b>system-control</b>   | Can view system-level configuration information and configure it at the <b>[edit system]</b> hierarchy level.                                                                                                                                                                                                              |
| <b>trace</b>            | Can view trace file settings and configure trace file properties.                                                                                                                                                                                                                                                          |
| <b>trace-control</b>    | Can modify trace file settings and configure trace file properties.                                                                                                                                                                                                                                                        |
| <b>view</b>             | Can use various commands to display current system-wide, routing table, and protocol-specific values and statistics. Cannot view the secret configuration.                                                                                                                                                                 |

Table 129: Login Class Permission Flags (*continued*)

| <b>view-configuration</b> | Can view all of the configuration excluding secrets, system scripts, and event options.<br><br><b>NOTE:</b> Only users with the <b>maintenance</b> permission can view commit script, op script, or event script configuration. |

### Allowing or Denying Individual Commands for Junos OS Login Classes

By default, all top-level CLI commands have associated access privilege levels. Users can execute only those commands and view only those statements for which they have access privileges. For each login class, you can explicitly deny or allow the use of operational and configuration mode commands that would otherwise be permitted or not allowed by a privilege level specified in the **permissions** statement.

Permission flags are used to grant a user access to operational mode commands and configuration hierarchy levels and statements. By specifying a specific permission flag on the user's login class at the **[edit system login class]** hierarchy level, you grant the user access to the corresponding commands and configuration hierarchy levels and statements. To grant access to all commands and configuration statements, use the **all** permissions flag. For permission flags that grant access to configuration hierarchy levels and statements, the flags grant read-only privilege to that configuration. For example, the **interface** permissions flag grants read-only access to the **[edit interfaces]** hierarchy level. The **-control** form of the flag grants read-write access to that configuration. Using the preceding example, **interface-control** grants read-write access to the **[edit interfaces]** hierarchy level.

- The **all** login class permission bits take precedence over extended regular expressions when a user issues **rollback** command with **rollback** permission flag enabled.
- Expressions used to allow and deny commands for users on RADIUS and TACACS+ servers have been simplified. Instead of a single, long expression with multiple commands (**allow-commands=cmd1 cmd2 ... cmdn**), you can specify each command as a separate expression. This new syntax is valid for **allow-configuration**, **deny-configuration**, **allow-commands**, **deny-commands**, and all user permission bits.
- Users cannot issue the **load override** command when specifying an extended regular expression. Users can only issue the **merge**, **replace**, and **patch** configuration commands.
- If you allow and deny the same commands, the **allow-commands** permissions take precedence over the permissions specified by the **deny-commands**. For example, if you include **allow-commands "request system software add"** and **deny-commands "request system software add"**, the login class user is allowed to install software using the **request system software add** command.
- Regular expressions for **allow-commands** and **deny-commands** can also include the **commit**, **load**, **rollback**, **save**, **status**, and **update** commands.
- If you specify a regular expression for **allow-commands** and **deny-commands** with two different variants of a command, the longest match is always executed.

For example, if you specify a regular expression for **allow-commands** with the **commit-synchronize** command and a regular expression for **deny-commands** with the **commit** command, users assigned to such a login class would be able to issue the **commit synchronize** command, but not the **commit** command. This is because **commit-synchronize** is the longest match between **commit** and **commit-synchronize** and it is specified for **allow-commands**.

## Junos OS Authentication Order for RADIUS, TACACS+, and Password Authentication

Using the **authentication-order** statement, you can prioritize the order in which the Junos OS tries the different authentication methods when verifying user access to a router or switch.

If the **authentication-order** is remote-server then local, Junos OS will retry the local server if the remote-server is unreachable or has timed out. However, if the remote-server rejects the authentication, Junos OS will not retry the authentication.

If none of the configured authentication methods accept the login credentials and if a reject response is received, the login attempt fails. If no response is received from any configured authentication method, the Junos OS consults local password authentication as a last resort.

### Using RADIUS or TACACS+ Authentication

You can configure the Junos OS to be both a RADIUS and TACACS+ authentication client.

If an authentication method included in the **[authentication-order]** statement is not available, or if the authentication is available but returns a reject response, the Junos OS tries the next authentication method included in the **authentication-order** statement.

The RADIUS or TACACS+ server authentication might fail because of the following reasons:

- The authentication method is configured, but the corresponding authentication servers are not configured. For instance, the RADIUS and TACACS+ authentication methods are included in the **authentication-order** statement, but the corresponding RADIUS or TACACS+ servers are not configured at the respective **[edit system radius-server]** and **[edit system tacplus-server]** hierarchy levels.
- The RADIUS or TACACS+ server does not respond within the timeout period configured at the **[edit system radius-server]** or **[edit system tacplus-server]** hierarchy levels.
- The RADIUS or TACACS+ server is not reachable because of a network problem.

The RADIUS or TACACS+ server authentication might return a reject response because of the following reasons:

- The user profiles of users accessing a router or switch might not be configured on the RADIUS or TACACS+ server.
- The user enters incorrect logon credentials.

### Using Local Password Authentication

You can explicitly configure the password authentication method or use this method as a fallback mechanism when remote authentication servers fail. The password authentication method consults the local user profiles configured at the **[edit system login]** hierarchy level. Users can log in to a router or switch using their local username and password in the following scenarios:

- The password authentication method (password) is explicitly configured as one of the authentication methods in the **[authentication-order authentication-methods]** statement. In this case, the password authentication method is tried if no previous authentication accepts the logon credentials. This is true whether the previous authentication method fails to respond or returns a reject response because of an incorrect username or password.
- The password authentication method is not explicitly configured as one of the authentication methods in the **authentication-order authentication-methods** statement. In this case, the password authentication method is tried only if all configured authentication methods fail to respond. It is not consulted if any configured authentication method returns a reject response because of an incorrect username or password.

### Order of Authentication Attempts

Table 130 on page 1822 describes how the **authentication-order** statement at the **[edit system]** hierarchy level determines the procedure that the Junos OS uses to authenticate users for access to a router or switch.

Table 130: Order of Authentication Attempts

| Syntax                              | Order of Authentication Attempts                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

**NOTE:** If SSH public keys are configured, SSH user authentication first tries to perform public key authentication before using the authentication methods configured in the authentication-order statement. If you want SSH logins to use the authentication methods configured in the authentication-order statement without first trying to perform public key authentication, do not configure SSH public keys.

In a routing matrix based on a TX Matrix router, the authentication order must be configured only at the configuration groups `re0` and `re1`. The authentication order must not be configured at the `[edit system]` hierarchy. This is because the authentication order for the routing matrix is controlled on the switch-card chassis (or TX Matrix router) or switch-fabric chassis (for TX Matrix Plus router) only.

In Junos OS Release 10.0 and later, the superuser (belonging to the super-user login class) is also authenticated based on the authentication order that is configured for TACACS+, RADIUS, or password authentication using the authentication-order statement. For example, if the only configured authentication order is TACACS+, the superuser can only be authenticated by the TACACS+ server and password authentication cannot be used as an alternative. However, in Junos OS Release 9.6 and earlier, the superuser can use password authentication to login, even if password authentication is not configured explicitly using the authentication-order statement.

## Junos OS User Authentication Methods

The Junos OS supports three methods of user authentication: local password authentication, Remote Authentication Dial-In User Service (RADIUS), and Terminal Access Controller Access Control System Plus (TACACS+).

With local password authentication, you configure a password for each user allowed to log in to the router or switch.

RADIUS and TACACS+ are authentication methods for validating users who attempt to access the router or switch using telnet. They are both distributed client-server systems—the RADIUS and TACACS+ clients run on the router or switch, and the server runs on a remote network system.

You can configure the router or switch to be both a RADIUS and TACACS+ client, and you can also configure authentication passwords in the Junos OS configuration file. You can prioritize the methods to configure the order in which the software tries the different authentication methods when verifying user access.

## Junos OS User Accounts Overview

User accounts provide one way for users to access the switch. (Users can access the switch without accounts if you configured RADIUS or TACACS+ servers, as described in [“Junos OS User Authentication Methods” on page 1825](#).) For each account, you define the login name for the user and, optionally, information that identifies the user. After you have created an account, the software creates a home directory for the user.

For each user account, you can define the following:

- Username—(Optional) Name that identifies the user. It must be unique within the switch. Do not include spaces, colons, or commas in the username. The username can be up to 64 characters long.
- User’s full name—(Optional) If the full name contains spaces, enclose it in quotation marks. Do not include colons or commas.
- User identifier (UID)—(Optional) Numeric identifier that is associated with the user account name. The identifier must be in the range from 100 through 64,000 and must be unique within the switch. If you do not assign a UID to a username, the software assigns one when you commit the configuration, preferring the lowest available number.
- You must ensure that the UID is unique. However, it is possible to assign the same UID to different users. If you do this, the CLI displays a warning when you commit the configuration and then assigns the duplicate UID.
- User’s access privilege—(Required) One of the login classes you defined in the **class** statement at the **[edit system login]** hierarchy level, or one of the default classes listed in [“Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies” on page 1830](#).
- Authentication method or methods and passwords that the user can use to access the switch—(Optional) You can use SSH or a Message Digest 5 (MD5) password, or you can enter a plain-text password that Junos OS encrypts using MD5-style encryption before entering it in the password database. For each method, you can specify the user’s password. If you configure the **plain-text-password** option, you are prompted to enter and confirm the password:

```
[edit system login user user-name]
user@switch# set authentication plain-text-password
New password: type password here
Retype new password: retype password here
```

The default requirements for plain-text passwords are:

- The password must be between 6 and 128 characters long
- You can include most character classes in a password (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended.
- Valid passwords must contain at least one change of case or character class.

For each user account and for root logins, you can configure more than one public RSA or DSA key for user authentication. When a user logs in using a user account or as root, the configured public keys are referenced to determine whether the private key matches any of them.

For SSH authentication, you can also copy the contents of an SSH key file into the configuration.

To load an SSH key file, use the **load-key-file** statement. This statement loads RSA (SSH version 1 and SSH version 2) and DSA (SSH version 2) public keys.

If you load the SSH keys file, the contents of the file are copied into the configuration immediately after you enter the **load-key-file** statement. To view the SSH key entries, use the configuration mode **show** command. For example:

```
[edit system login user boojum]
user@switch# set authentication load-key-file my-host:.ssh/identity.pub
.file.19692 | 0 KB | 0.3 kB/s | ETA: 00:00:00 | 100%
[edit system]
user@switch# show
root-authentication {
  ssh-rsa "1024 35 9727638204084251055468226757249864241630322
207404962528390382038690141584534964170019610608358722961563
475784918273603361276441874265946893207739108344813125957722
625461667999278316123500438660915866283822489746732605661192
181489539813862940327687806538169602027491641637359132693963
44008443 boojum@juniper.net"; # SECRET-DATA
}
```

An account for the user **root** is always present in the configuration. You configure the password for **root** using the **root-authentication** statement, as described in [“Configuring the Root Password” on page 1846](#).

Junos-FIPS and Common Criteria have special password requirements. FIPS and Common Criteria passwords must be between 10 and 20 characters in length. Passwords must use at least three of the five defined character sets (uppercase letters, lowercase letters, digits, punctuation marks, and other special characters). If Junos-FIPS is installed on the switch, you cannot configure passwords unless they meet this standard.

  - [Junos OS Login Classes Overview on page 1828](#)

## Junos OS Login Classes Overview

All users who can log in to the router or switch must be in a login class. With login classes, you define the following:

- Access privileges that users have when they are logged in to the router or switch
- Commands and statements that users can and cannot specify
- How long a login session can be idle before it times out and the user is logged out

You can define any number of login classes and then apply one login class to an individual user account.

The Junos operating system (Junos OS) contains a few predefined login classes, which are listed in [Table 131 on page 1828](#). The predefined login classes cannot be modified.

**Table 131: Predefined System Login Classes**

| Login Class             | Permission Flag Set                    |
|-------------------------|----------------------------------------|
| operator                | clear, network, reset, trace, and view |
| read-only               | view                                   |
| superuser or super-user | all                                    |
| unauthorized            | None                                   |

### NOTE:

- You cannot modify a predefined login class name. If you issue the `set` command on a predefined class name, the Junos OS appends `-local` to the login class name. The following message also appears:  

```
warning: '<class-name>' is a predefined class name; changing to '<class-name>-local'
```
- You cannot issue the `rename` or `copy` command on a predefined login class. Doing so results in the following error message:  

```
error: target '<class-name>' is a predefined class
```

- [Defining Junos OS Login Classes](#)
  - [Defining Junos OS Login Classes on page 1860](#)
  - [Understanding QFabric System Login Classes on page 1363](#)

## Understanding QFabric System Login Classes

In some cases (such as device-level troubleshooting), it is useful to log in to individual QFabric system components so you can view and manage issues on a per-device basis. This topic explains the login classes that provide individual component access within a QFabric system.

**NOTE:** Under normal operating conditions, you should manage the QFabric system as a single entity by using the QFabric system default partition command-line interface (CLI). The default partition CLI provides you with the ability to configure and monitor your entire QFabric system from a central location and should be used as the primary way to manage the system.

The QFabric system offers three special preset login classes that provide different levels of access to individual components within a QFabric system:

- **qfabric-admin**—Provides the ability to log in to individual QFabric system components and manage them. This class is equivalent to setting the following permissions: **access, admin, clear, firewall, interface, maintenance, network, reset, routing, secret, security, snmp, system, trace, and view**. The *qfabric-admin* class also enables you issue all operational mode commands except **configure**. To provide QFabric system component-level login and management privileges, include the **qfabric-admin** statement at the **[edit system login user *username* authentication remote-debug-permission]** hierarchy level.
- **qfabric-operator**—Provides the privilege to log in to individual QFabric system components and view component operations and configurations. This class is equivalent to setting the following permissions: **trace** and **view**. The *qfabric-operator* class also enables you issue the **monitor** and **show log messages** operational mode commands. To provide limited QFabric system component-level access, include the **qfabric-operator** statement at the **[edit system login user *username* authentication remote-debug-permission]** hierarchy level.
- **qfabric-user**—Prevents access to individual QFabric system components. This class is the default setting for all QFabric system users and is equivalent to the preset Junos OS class of **unauthorized**. To prevent a user from accessing individual QFabric system components, include the **qfabric-user** statement at the **[edit system login user *username* authentication remote-debug-permission]** hierarchy level.

When you perform the initial setup for the Director group, you must specify a username and password for QFabric components. Once configured, this information is stored in the QFabric system and mapped to the QFabric system login classes. Such mapping allows users with the proper login class (**qfabric-admin** or **qfabric-operator**) to log in automatically to a component without being prompted for the username and password.

After you assign the **qfabric-admin** or **qfabric-operator** class to a user, the user can log in to an individual QFabric system component by issuing the **request component login *component-name*** command. You can access Node devices, Interconnect devices, and virtual Junos Routing Engines (diagnostics, fabric control, and fabric manager) one at a

time when you issue this command. To leave the CLI prompt of a component and return to the QFabric system default partition CLI, issue the **exit** command from the component's operational mode CLI prompt.

## Regular Expressions for Allowing and Denying Junos OS Configuration Mode Hierarchies

Use extended regular expressions to specify which configuration mode hierarchies are denied or allowed. You specify these regular expressions in the **allow/deny-configuration-regexps** and **allow/deny-configuration** statements at the **[edit system login class]** hierarchy level, or by specifying Juniper Networks vendor-specific TACACS+ or RADIUS attributes in your authentication server's configuration. If regular expressions are received during TACACS+ or RADIUS authentication, they merge with any regular expressions configured on the local router or switch.

[Table 132 on page 1830](#) lists common regular expression operators that you can use for allowing or denying configuration mode .

Command regular expressions implement the extended (modern) regular expressions, as defined in POSIX 1003.2.

**Table 132: Configuration Mode Hierarchies—Common Regular Expression Operators**

| Operator | Match                                                                                                                                                                                                                                                                                                                   |
|----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          | One of two or more terms separated by the pipe. Each term must be a complete standalone expression enclosed in parentheses ( ), with no spaces between the pipe and the adjacent parentheses. For example, <b>(show system alarms) (show system software)</b> .                                                         |
| ^        | At the beginning of an expression, used to denote where the command begins, where there might be some ambiguity.                                                                                                                                                                                                        |
| \$       | Character at the end of a command. Used to denote a command that must be matched exactly up to that point. For example, <b>allow-commands "show interfaces\$"</b> means that the user can issue the <b>show interfaces</b> command but cannot issue <b>show interfaces detail</b> or <b>show interfaces extensive</b> . |
| [ ]      | Range of letters or digits. To separate the start and end of a range, use a hyphen ( - ).                                                                                                                                                                                                                               |
| ( )      | A group of commands, indicating a complete, standalone expression to be evaluated; the result is then evaluated as part of the overall expression. Parentheses must be used in conjunction with pipe operators as explained .                                                                                           |

**Table 132: Configuration Mode Hierarchies—Common Regular Expression Operators (*continued*)**

| Operator | Match                                 |
|----------|---------------------------------------|
| *        | Zero or more terms.                   |
| +        | One or more terms.                    |
| .        | Any character except for a space " ". |

## Regular Expressions for Allowing and Denying Junos OS Operational Mode Commands

Use extended regular expressions to specify which operational mode commands are denied or allowed. [Table 133 on page 1831](#) lists common regular expression operators that can be used in the operational mode commands. Command regular expressions implement the extended (modern) regular expressions as defined in POSIX 1003.2.

**Table 133: Common Regular Expression Operators to Allow or Deny Operational Mode Commands**

| Operator | Match                                                                                                                                                                                                                                                                                                                              |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|          | One of two or more terms separated by the pipe ( ) symbol. Each term must be a complete standalone expression enclosed in parentheses ( ), with no spaces between the pipe and the adjacent parentheses. For example, ( <b>show system alarms</b> )( <b>show system software</b> ).                                                |
| ^        | At the beginning of an expression, used to denote where the command begins, and where there might be some ambiguity.                                                                                                                                                                                                               |
| \$       | Character at the end of a command. Used to denote a command that must be matched exactly up to that point. For example, <b>allow-commands "show interfaces\$"</b> means that the user can issue the <b>show interfaces</b> command but cannot issue the <b>show interfaces detail</b> or <b>show interfaces extensive</b> command. |
| [ ]      | Range of letters or digits. To separate the start and end of a range, use a hyphen (-).                                                                                                                                                                                                                                            |
| ( )      | A group of commands, indicating a complete, standalone expression to be evaluated; the result is then evaluated as part of the overall expression. Parentheses must always be used in conjunction with pipe operators as explained above.                                                                                          |

If a regular expression contains a syntax error, it becomes invalid, and although the user can log in, the permission granted or denied by the regular expression does not take effect. When regular expressions configured on TACACS+ or RADIUS servers merge with regular expressions configured on the router or switch, if the final expression has a syntax

error, the overall result is an invalid regular expression. If a regular expression does not contain any operators, all varieties of the command are allowed. For example, if the following statement is included in the configuration, the user can issue the commands **show interfaces detail** and **show interfaces extensive** in addition to showing an individual interface:

```
allow-commands "show interfaces";
```

## Special Requirements for Junos OS Plain-Text Passwords

Junos OS has special requirements when you create plain-text passwords on a router or switch. [Table 134 on page 1832](#) shows the default requirements.

**Table 134: Special Requirements for Plain-Text Passwords**

| Junos OS                                                                                                                                                                                       | Junos-FIPS                                                                                                                                                                                     |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| The password must be between 6 and 128 characters long.                                                                                                                                        | FIPS passwords must be between 10 and 20 characters long                                                                                                                                       |
| You can include most character classes in a password (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended. | You can include most character classes in a password (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters). Control characters are not recommended. |
| Valid passwords must contain at least one change of case or character class.                                                                                                                   | Passwords must use at least three of the five defined character classes (uppercase letters, lowercase letters, numbers, punctuation marks, and other special characters).                      |

You can change the requirements for plain-text passwords.

Junos OS supports the following five character classes for plain-text passwords:

- Lowercase letters
- Uppercase letters
- Numbers
- Punctuation
- Special characters: ! @ # \$ % ^ & \* , + < > ; ;

Control characters are not recommended.

You can include the **plain-text-password** statement at the following hierarchy levels:

- **[edit system diag-port-authentication]**
- **[edit system pic-console-authentication]**
- **[edit system root-authentication]**

- [edit system login user *username* authentication]

The **change-type** statement specifies whether the password is checked for the following:

- The total number of character sets used (**character-set**)
- The total number of character set changes (**set-transitions**)

For example, the following password:

MyPassWd@2

has four character sets (uppercase letters, lowercase letters, special characters, and numbers) and seven character set changes (M–y, y–P, P–a, s–W, W–d, d–@, and @–2).

The **change-type** statement is optional. If you omit the **change-type** option, Junos-FIPS plain-text passwords are checked for character sets, and Junos OS plain-text passwords are checked for character set changes.

The **minimum-changes** statement specifies how many character sets or character set changes are required for the password. This statement is optional. If you do not use the **minimum-changes** statement, character sets are not checked for Junos OS. If the **change-type** statement is configured for the **character-set** option, then the **minimum-changes** value must be 5 or less, because Junos OS only supports five character sets.

The **format** statement specifies the hash algorithm (**md5**, **sha1**, **sha256**, **sha512** or **des**) for authenticating plain-text passwords. This statement is optional. For Junos OS, the default format is **md5**. For Junos-FIPS, only **sha1** is supported.

**NOTE:** Starting with Junos OS Release 13.3, the sha1 does not enable secure, protected specification of passwords and we recommend that you do not use the sha1 algorithm to configure passwords. Instead, you can use the sha256 or sha512 to specify passwords by using the 256-bit and 512-bit cryptographic hash algorithm respectively for a robust and reliable operation.

The **maximum-length** statement specifies the maximum number of characters allowed in a password. This statement is optional. By default, Junos OS passwords have no maximum; however, only the first 128 characters are significant. Junos-FIPS passwords must be 20 characters or less. The range for Junos OS maximum-length passwords is from 20 to 128 characters.

The **minimum-length** statement specifies the minimum number of characters required for a password. This statement is optional. By default, Junos OS passwords must be at least 6 characters long, and Junos-FIPS passwords must be at least 10 characters long. The range is from 6 to 20 characters.

Changes to password requirements do not take effect until the configuration is committed. When requirements change, only newly created, plain-text passwords are checked; existing passwords are not checked against the new requirements.

The default configuration for Junos OS plain-text passwords is:

```
[edit system login]
passwords {
  change-type character-sets;
  format md5;
  minimum-changes 1;
  minimum-length 6;
}
```

The default configuration for Junos-FIPS plain-text passwords is:

```
[edit system login]
passwords {
  change-type set-transitions;
  format sha1;
  maximum-length 20;
  minimum-changes 3;
  minimum-length 10;
}
```

## Configuring Access Privilege Levels

Each top-level command-line interface (CLI) command and each configuration statement have an access privilege level associated with it. Users can execute only those commands and configure and view only those statements for which they have access privileges.

To configure access privilege levels, include the **permissions** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]  
permissions [ permissions ];
```

### Related Documentation

- *permissions*

## Configuring Login Tips

The Junos OS CLI provides the option of configuring login tips for the user. By default, the **tip** command is not enabled when a user logs in.

- To enable tips, include the **login-tip** statement at the **[edit system login class *class-name*]** hierarchy level:

```
[edit system login class class-name]  
login-tip;
```

Adding this statement enables the **tip** command for the class specified, provided the user logs in using the CLI.

## Configuring Junos OS User Accounts

User accounts provide one way for users to access the router or switch. For each account, you define the login name for the user and, optionally, information that identifies the user. After you have created an account, the software creates a home directory for the user.

To create user accounts, include the **user** statement at the **[edit system login]** hierarchy level:

```
[edit system login]
user username {
  class class-name;
  class {
    (encrypted-password "password" | plain-text-password);
    ssh-rsa "public-key";
    ssh-dsa "public-key";
  }
  full-name complete-name;
  uid uid-value;
  class class-name;
}
```

## Configuring LLDP

Devices use Link Layer Discovery Protocol (LLDP) and Link Layer Discovery Protocol Media Endpoint Discovery (LLDP-MED) to learn and distribute device information on network links. The information allows the device to identify a variety of devices quickly. The result is a LAN that interoperates smoothly and efficiently.

The LLDP protocol cannot be enabled by issuing the **set protocols lldp** statement at the **[edit]** hierarchy level. Enable the LLDP protocol by configuring it on all interfaces or on specific interfaces.

To configure basic LLDP options using the CLI:

1. Configure the advertisement interval in seconds:

```
[edit protocols lldp]
user@switch# set advertisement-interval 45
```

2. Specify the multiplier used in combination with the **advertisement-interval** value to determine the length of time LLDP information is held before it is discarded:

```
[edit protocols lldp]
user@switch# set hold-multiplier 5
```

3. Configure LLDP on all interfaces or on a specific interface:

```
[edit protocols lldp]
user@switch# set interface (LLDP) all
```

4. Configure tracing operations for the LLDP protocol:

```
[edit protocols lldp]
user@switch# set traceoptions file lldptrace
```

#### Related Documentation

## Configuring the Junos OS Authentication Order for RADIUS, TACACS+, and Local Password Authentication

Using the **authentication-order** statement, you can prioritize the order in which the Junos OS tries the different authentication methods when verifying user access to a router or switch.

To configure the authentication order, include the **authentication-order** statement at the **[edit system]** hierarchy level:

```
[edit system]
authentication-order [ authentication-methods ];
```

Specify one or more of the following authentication methods in the preferred order, from first tried to last tried:

- **radius**—Verify the user using RADIUS authentication services
- **tacplus**—Verify the user using TACACS+ authentication services.
- **password**—Verify the user using the username and password configured locally by including the authentication statement at the **[edit system login user]** hierarchy level.

The CHAP authentication sequence cannot take more than 30 seconds. If it takes longer to authenticate a client, the authentication is abandoned and a new sequence is initiated.

For example, if you configure three RADIUS servers so that the router or switch attempts to contact each server three times, and with each retry the server times out after 3 seconds, then the maximum time given to the RADIUS authentication method before CHAP considers it a failure is 27 seconds. If you add more RADIUS servers to this configuration, they might not be contacted because the authentication process might be abandoned before these servers are tried.

The Junos OS enforces a limit on the number of standing authentication server requests that the CHAP authentication can have at one time. Thus, an authentication server method—RADIUS, for example—might fail to authenticate a client when this limit is exceeded. If it fails, the authentication sequence is reinitiated by the router or switch until authentication succeeds and the link is brought up. However, if the RADIUS servers are not available and if additional authentication methods such as **tacplus** or **password** are configured along with **radius**, the next authentication method is tried.

The following example shows how to configure **radius** and **password** authentication:

```
[edit system]
user@switch# authentication-order [ radius password ];
```

The following example shows how to delete the **radius** statement from the authentication order:

```
[edit system]
user@switch# delete authentication-order radius
```

The following example shows how to insert the **tacplus** statement after the **radius** statement:

```
[edit system]
user@switch# insert authentication-order tacplus after radius
```

#### Related Documentation

- *authentication-order*

## Configuring Local User Template Accounts for User Authentication

You use local user template accounts when you need different types of templates for authentication. Each template can define a different set of permissions appropriate for the group of users who use that template. These templates are defined locally on the router or switch and referenced by the TACACS+ and RADIUS authentication servers.

When you configure local user templates and a user logs in, Junos OS issues a request to the authentication server to authenticate the user's login name. If a user is authenticated, the server returns the local username to Junos OS, which then determines whether a local username is specified for that login name (**local-username** for TACACS+, **Juniper-Local-User** for RADIUS). If so, Junos OS selects the appropriate local user template locally configured on the router or switch. If a local user template does not exist for the authenticated user, the router or switch defaults to the **remote** template.

To configure different access privileges for users who share the local user template account, include the **allow-commands** and **deny-commands** commands in the authentication server configuration file.

To configure a local user template, include the **user local-username** statement at the **[edit system login]** hierarchy level and specify the privileges you want to grant to the local users to whom the template applies:

```
[edit system login]
user local-username {
  full-name "Local user account";
  uid uid-value;
  class class-name;
}
```

This example configures the **sales** and **engineering** local user templates:

```
[edit]
system {
  login {
    user sales {
      uid uid-value;
```

```
        class class-name;
    }
    user engineering {
        uid uid-value;
        class class-name;
    }
}

user = simon {
    ...
    service = junos-exec {
        local-user-name = sales
        allow-commands = "configure"
        deny-commands = "shutdown"
    }
}
user = rob {
    ...
    service = junos-exec {
        local-user-name = sales
        allow-commands = "(request system) | (show rip neighbor)"
        deny-commands = "clear"
    }
}
user = harold {
    ...
    service = junos-exec {
        local-user-name = engineering
        allow-commands = "monitor | help | show | ping | traceroute"
        deny-commands = "configure"
    }
}
user = jim {
    ...
    service = junos-exec {
        local-user-name = engineering
        allow-commands = "show bgp neighbor"
        deny-commands = "telnet | ssh"
    }
}
```

When the login users Simon and Rob are authenticated, the router or switch applies the sales local user template. When login users Harold and Jim are authenticated, the router or switch applies the engineering local user template.

Documentation**

- [Overview of Template Accounts for RADIUS and TACACS+ Authentication on page 1809](#)
- [user \(Access\)](#)
- [user \(Access\) on page 335](#)

## Configuring Management Access

To define the management access settings for the routing platform:

1. Next to Allow Telnet Access, select the check box to allow remote Telnet access to the routing platform.
2. Next to Allow SSH Access, selected the check box to allow remote SSH access to the routing platform.
3. Click **Apply** to apply the configuration.

### Related Documentation

- [Example: Configuring Access Privilege Levels on page 1873](#)

## Configuring RADIUS System Accounting

With RADIUS accounting enabled, Juniper Networks routers or switches, acting as RADIUS clients, can notify the RADIUS server about user activities such as software logins, configuration changes, and interactive commands. The framework for RADIUS accounting is described in RFC 2866.

Tasks for configuring RADIUS system accounting are:

1. [Configuring Auditing of User Events on a RADIUS Server on page 1841](#)
2. [Specifying RADIUS Server Accounting and Auditing Events on page 1842](#)
3. [Configuring RADIUS Server Accounting on page 1842](#)

### Configuring Auditing of User Events on a RADIUS Server

To audit user events, include the following statements at the **[edit system accounting]** hierarchy level:

```
[edit system accounting]
events [ events ];
destination {
  radius {
    server {
      server-address {
        accounting-port port-number;
        secret password;
        source-address address;
        retry number;
        timeout seconds;
      }
    }
  }
}
```

### Specifying RADIUS Server Accounting and Auditing Events

---

To specify the events you want to audit when using a RADIUS server for authentication, include the **events** statement at the **[edit system accounting]** hierarchy level:

```
[edit system accounting]
events [ events ];
```

**events** is one or more of the following:

- **login**—Audit logins
- **change-log**—Audit configuration changes
- **interactive-commands**—Audit interactive commands (any command-line input)

### Configuring RADIUS Server Accounting

---

To configure RADIUS server accounting, include the **server** statement at the **[edit system accounting destination radius]** hierarchy level:

```
server {
  server-address {
    accounting-port port-number;
    secret password;
    source-address address;
    retry number;
    timeout seconds;
  }
}
```

**server-address** specifies the address of the RADIUS server. To configure multiple RADIUS servers, include multiple **server** statements.

**NOTE:** If no RADIUS servers are configured at the **[edit system accounting destination radius]** statement hierarchy level, the Junos OS uses the RADIUS servers configured at the **[edit system radius-server]** hierarchy level.

**accounting-port *port-number*** specifies the RADIUS server accounting port number.

The default port number is 1813.

**NOTE:** If you enable RADIUS accounting at the **[edit access profile *profile-name* accounting-order]** hierarchy level, accounting is triggered on the default port of 1813 even if you do not specify a value for the **accounting-port** statement.

You must specify a secret (password) that the local router or switch passes to the RADIUS client by including the **secret** statement. If the password contains spaces, enclose the entire password in quotation marks (" ").

In the **source-address** statement, specify a source address for the RADIUS server. Each RADIUS request sent to a RADIUS server uses the specified source address. The source address is a valid IPv4 address configured on one of the router or switch interfaces.

Optionally, you can specify the number of times that the router or switch attempts to contact a RADIUS authentication server by including the **retry** statement. By default, the router or switch retries three times. You can configure the router or switch to retry from 1 through 10 times.

Optionally, you can specify the length of time that the local router or switch waits to receive a response from a RADIUS server by including the **timeout** statement. By default, the router or switch waits 3 seconds. You can configure the timeout to be from 1 through 90 seconds.

If you use the **enhanced-accounting** statement at the **[edit system radius-options]** hierarchy level, the RADIUS attributes such as access method, remote port, and access privileges can be audited. You can limit the number of attribute values to be displayed for auditing by using the **enhanced-avs-max <number>** statement at the **[edit system accounting]** hierarchy level.

```
[edit system radius-options]
enhanced-accounting;

[edit system accounting]
enhanced-avs-max <number>;
```

## Configuring RADIUS Authentication (QFX Series)

RADIUS authentication is a method of authenticating users who attempt to access the router or switch. Tasks to configure RADIUS authentication are:

**NOTE:** The **source-address** statement is not supported at the **[edit system radius-options]** or **[edit system-radius-server name]** hierarchies on the QFabric system.

- [Configuring RADIUS Server Details on page 1843](#)
- [Configuring MS-CHAPv2 for Password-Change Support on page 1844](#)
- [Specifying a Source Address for the Junos OS to Access External RADIUS Servers on page 1845](#)

### Configuring RADIUS Server Details

To use RADIUS authentication on the router or switch, configure information about one or more RADIUS servers on the network by including one **radius-server** statement at the **[edit system]** hierarchy level for each RADIUS server:

```
[edit system]
radius-server server-address {
  accounting-port port-number;
  port number;
  retry number;
```

```
secret password;  
source-address source-address;  
timeout seconds;  
}
```

**server-address** is the address of the RADIUS server.

You can specify a port on which to contact the RADIUS server. By default, port number **1812** is used (as specified in RFC 2865). You can also specify an accounting port to send accounting packets. The default is **1813** (as specified in RFC 2866).

You must specify a password in the **secret password** statement. If the password contains spaces, enclose it in quotation marks. The secret used by the local router or switch must match that used by the server.

Optionally, you can specify the amount of time that the local router or switch waits to receive a response from a RADIUS server (in the **timeout** statement) and the number of times that the router or switch attempts to contact a RADIUS authentication server (in the **retry** statement). By default, the router or switch waits 3 seconds. You can configure this to be a value from 1 through 90 seconds. By default, the router or switch retries connecting to the server three times. You can configure this to be a value from 1 through 10 times.

You can use the **source-address** statement to specify a logical address for individual or multiple RADIUS servers.

To configure multiple RADIUS servers, include multiple **radius-server** statements.

To configure a set of users that share a single account for authorization purposes, you create a template user. To do this, include the **user** statement at the **[edit system login]** hierarchy level, as described in [“Overview of Template Accounts for RADIUS and TACACS+ Authentication” on page 1809](#).

You can also configure RADIUS authentication at the **[edit access]** and **[edit access profile]** hierarchy level. Junos OS uses the following search order to determine which set of servers are used for authentication:

1. **[edit access profile profile-name radius-server server-address]**
2. **[edit access radius-server server-address]**
3. **[edit system radius-server server-address]**

---

### Configuring MS-CHAPv2 for Password-Change Support

You can configure the Microsoft implementation of the Challenge Handshake Authentication Protocol version 2 (MS-CHAPv2) on the router or switch to support changing of passwords. This feature provides users accessing a router or switch the option of changing the password when the password expires, is reset, or is configured to be changed at the next login.

Before you configure MS-CHAPv2 for password-change support, ensure that you:

- Configure the RADIUS server authentication parameters

- Set the **authentication-order** to use the RADIUS server for the initial password attempt

To configure MS-CHAP-v2, include the following statements at the **[edit system radius-options]** hierarchy level:

```
[edit system radius-options]
password-protocol mschap-v2;
```

The following example shows statements for configuring the MS-CHAPv2 password protocol, password authentication order, and user accounts:

```
[edit]
system {
  authentication-order [ radius password ];
  radius-server {
    192.168.69.149 secret "$9$G-j.5Qz6tpBk.1hrlXxUjiq5Qn/C"; ## SECRET-DATA
  }
  radius-options {
    password-protocol mschap-v2;
  }
  login {
    user bob {
      class operator;
    }
  }
}
```

### Specifying a Source Address for the Junos OS to Access External RADIUS Servers

You can specify which source address Junos OS uses when accessing your network to contact an external RADIUS server for authentication. You can also specify which source address Junos OS uses when contacting a RADIUS server for sending accounting information.

To specify a source address for a RADIUS server, include the **source-address** statement at the **[edit system radius-server server-address]** hierarchy level:

```
[edit system radius-server server-address]
source-address source-address;
```

**source-address** is a valid IP address configured on one of the router or switch interfaces.

## Configuring Remote Template Accounts for User Authentication

By default, the Junos OS uses remote template accounts for user authentication when:

- The authenticated user does not exist locally on the router or switch.
- The authenticated user's record in the authentication server specifies local user, or the specified local user does not exist locally on the router or switch.

To configure the remote template account, include the **user remote** statement at the **[edit system login]** hierarchy level and specify the privileges you want to grant to remote users:

```
[edit system login]
user remote {
  full-name "All remote users";
  uid uid-value;
  class class-name;
}
```

To configure different access privileges for users who share the remote template account, include the **allow-commands** and **deny-commands** statements in the authentication server configuration file.

## Configuring the Root Password

Junos OS is preinstalled on the router or switch. When the router or switch is powered on, it is ready to be configured. Initially, you log in as the user "root" with no password.

**NOTE:** If you configure a blank password using the **encrypted-password** statement at the **[edit system root-authentication]** hierarchy level for root authentication, you can commit a configuration, but you are *not* able to log in as superuser and gain root level access to the router or switch.

After you log in, you should configure the root (superuser) password by including the **root-authentication** statement at the **[edit system]** hierarchy level:

```
[edit system]
root-authentication {
  (encrypted-password "password" | load-key-password URL | plain-text-password);
  ssh-dsa "public-key";
  ssh-rsa "public-key";
}
```

If you configure the **plain-text-password** option, you are prompted to enter and confirm the password:

```
[edit system]
user@switch# set root-authentication plain-text-password
New password: type password here
Retype new password: retry password here
```

To load an SSH key file, enter the **load-key-file** statement. This statement loads RSA (SSH version 1 and SSH version 2) and DSA (SSH version 2) public keys.

You can also configure SSH RSA keys and SSH DSA keys to authenticate root logins. You can configure more than one public RSA or DSA key for SSH authentication of root logins as well as for user accounts. When a user logs in as root, the public keys are referenced to determine whether the private key matches any of them.

If you load the SSH keys file, the contents of the file are copied into the configuration immediately after you enter the **load-key-file** statement. To view the SSH keys entries, use the configuration mode **show** command. For example:

```
[edit system]
user@switch# set root-authentication load-key-file my-host:.ssh/identity.pub
.file.19692 | 0 KB | 0.3 kB/s | ETA: 00:00:00 | 100%
[edit system]
user@switch# show
root-authentication {
  ssh-rsa "1024 35 9727638204084251055468226757249864241630322
  20740496252839038203869014158453496417001961060835872296
  15634757491827360336127644187426594689320773910834481012
  68312595772262546166799927831612350043866091586628382248
  97467326056611921489539813965561563786211940327687806538
  16960202749164163735913269396344008443 boojum@juniper.net"; #
  SECRET-DATA
}
```

Junos-FIPS software has special password requirements. FIPS passwords must be between 10 and 20 characters in length. Passwords must use at least three of the five defined character sets (uppercase letters, lowercase letters, digits, punctuation marks, and other special characters). If Junos-FIPS is installed on the router or switch, you cannot configure passwords unless they meet this standard. If you use the **encrypted-password** option, then a null-password (empty) is not permitted.

You cannot configure a blank password for **encrypted-password** using blank quotation marks (" "). You must configure a password whose number of characters range from 1 through 128 characters and enclose the password in quotation marks.

## Configuring SNMP

SNMP is implemented in the Junos OS Software running on the QFX Series products. By default, SNMP is not enabled. To enable SNMP, you must include the SNMP configuration statements at the **[edit]** hierarchy level.

To configure the minimum requirements for SNMP, include the following statements at the **[edit]** hierarchy level of the configuration:

```
[edit]
snmp {
  community public;
}
```

To configure complete SNMP features, include the following statements at the **[edit]** hierarchy level of the configuration:

```
snmp {
  client-list client-list-name {
    ip-addresses;
  }
  community community-name {
    authorization authorization;
    client-list-name client-list-name;
    clients {
      address restrict;
    }
    logical-system logical-system-name {
      routing-instance routing-instance-name {
        clients {
          addresses;
        }
      }
    }
    routing-instance routing-instance-name {
      clients {
        addresses;
      }
    }
    view view-name;
  }
  contact contact;
  description description;
  filter-duplicates;
  filter-interfaces;
  health-monitor {
    falling-threshold integer;
    interval seconds;
    rising-threshold integer;
  }
  interface [ interface-names ];
  location location;
  name name;
  nonvolatile {
    commit-delay seconds;
  }
}
```

```

}
rmon {
  alarm index {
    description description;
    falling-event-index index;
    falling-threshold integer;
    falling-threshold-interval seconds;
    interval seconds;
    request-type;
    rising-event-index index;
    rising-threshold integer;
    sample-type (absolute-value | delta-value);
    startup-alarm (falling-alarm | rising-alarm | rising-or-falling alarm);
    syslog-subtag syslog-subtag;
    variable oid-variable;
  }
  event index {
    community community-name;
    description description;
    type type;
  }
  history history-index {
    bucket-size number;
    interface interface-name;
    interval seconds;
    owner owner-name;
  }
}
traceoptions {
  file filename <files number> <size size> <world-readable | no-world-readable> <match
    regular-expression>;
  flag flag;
}
trap-group group-name {

## Configuring SSH Host Keys for Secure Copying of Data

Secure Shell (SSH) uses encryption algorithms to generate a host, server, and session key system that ensures secure data transfer. You can configure SSH host keys to support secure copy (SCP) as an alternative to FTP for the background transfer of data such as configuration archives and event logs. To configure SSH support for SCP, you must complete the following tasks:

- Specify SSH known hosts by including hostnames and host key information in the Routing Engine configuration hierarchy.
- Set an SCP URL to specify the host from which to receive data. Setting this attribute automatically retrieves SSH host key information from the SCP server.
- Verify that the host key is authentic.
- Accept the secure connection. Accepting this connection automatically stores host key information in the local host key database. Storing host key information in the configuration hierarchy automates the secure handshake and allows background data transfer using SCP.

Tasks to configure SSH host keys for secure copying of data are:
